Ambassador	Eric	Bost	Ambassador	BostEM@state.gov

Global Fund

What is the planned funding for Global Fund Technical Assistance in FY 2008?	$0
Does the USG assist GFATM proposal writing?	No
Does the USG participate on the CCM?	No

Table 2: Prevention, Care, and Treatment Targets

2.1 Targets for Reporting Period Ending September 30, 2008

Prevention	National 2-7-10 (Focus Country Only)	USG Downstream (Direct) Target End FY2008	USG Upstream (Indirect) Target End FY2008	USG Total Target End FY2008
End of Plan Goal	1,806,271			
1.2 - Number of pregnant women who received HIV counseling and testing for PMTCT and received their test results	0	198,396	501,604	700,000
1.3 - Number of HIV-infected pregnant women who received antiretroviral prophylaxis for PMTCT in a PMTCT setting	0	54,678	120,322	175,000

Care (1)	National 2-7-10 (Focus Country Only)	USG Downstream (Direct) Target End FY2008	USG Upstream (Indirect) Target End FY2008	USG Total Target End FY2008
		1,396,288	403,672	1,799,960
End of Plan Goal	2,500,000			
6.2 - Total number of individuals provided with HIV-related palliative care (including TB/HIV)	0	979,807	403,672	1,383,479
***7.2 - Number of HIV-infected clients attending HIV care/treatment services that are receiving treatment for TB disease (a subset of indicator 6.2)	0	84,743	115,458	200,201
8.1 - Number of OVC served by OVC programs	0	416,481	0	416,481
9.2 - Number of individuals who received counseling and testing for HIV and received their test results (including TB)	0	777,763	1,258,237	2,036,000

Treatment	National 2-7-10 (Focus Country Only)	USG Downstream (Direct) Target End FY2008	USG Upstream (Indirect) Target End FY2008	USG Total Target End FY2008
		213,388	166,612	380,000
End of Plan Goal	500,000			
11.4 - Number of individuals receiving antiretroviral therapy at the end of the reporting period	0	213,388	166,612	380,000

Human Resources for Health	National 2-7-10 (Focus Country Only)	USG Downstream (Direct) Target End FY2008	USG Upstream (Indirect) Target End FY2008	USG Total Target End FY2008
End of Plan Goal	0			

2.2 Targets for Reporting Period Ending September 30, 2009

	National 2-7-10 (Focus Country Only)	USG Downstream (Direct) Target End FY2009	USG Upstream (Indirect) Target End FY2009	USG Total Target End FY2009
Prevention				
End of Plan Goal	1,806,271			
1.2 - Number of pregnant women who received HIV counseling and testing for PMTCT and received their test results	0	319,341	430,659	750,000
1.3 - Number of HIV-infected pregnant women who received antiretroviral prophylaxis for PMTCT in a PMTCT setting	0	77,493	112,507	190,000
	National 2-7-10 (Focus Country Only)	**USG Downstream (Direct) Target End FY2009**	**USG Upstream (Indirect) Target End FY2009**	**USG Total Target End FY2009**
Care (1)		1,689,416	583,284	2,272,700
End of Plan Goal	2,500,000			
6.2 - Total number of individuals provided with HIV-related palliative care (including TB/HIV)	0	1,235,086	547,344	1,782,430
***7.2 - Number of HIV-infected clients attending HIV care/treatment services that are receiving treatment for TB disease (a subset of indicator 6.2)	0	93,244	146,756	240,000
8.1 - Number of OVC served by OVC programs	0	454,330	35,940	490,270
9.2 - Number of individuals who received counseling and testing for HIV and received their test results (including TB)	0	1,139,726	896,274	2,036,000
	National 2-7-10 (Focus Country Only)	**USG Downstream (Direct) Target End FY2009**	**USG Upstream (Indirect) Target End FY2009**	**USG Total Target End FY2009**
Treatment		382,011	117,989	500,000
End of Plan Goal	500,000			
11.4 - Number of individuals receiving antiretroviral therapy at the end of the reporting period	0	382,011	117,989	500,000
	National 2-7-10 (Focus Country Only)	**USG Downstream (Direct) Target End FY2009**	**USG Upstream (Indirect) Target End FY2009**	**USG Total Target End FY2009**
Human Resources for Health				
End of Plan Goal	0			

(1) Total Care represents number of OVC served by an OVC program during the reporting period and the number of individuals provided with facility-based, community-based and/or home-based HIV-related palliative care, including those HIV-infected individuals who received clinical prophylaxis and/or treatment for tuberculosis(TB).

Early Funding Activities

Program Area	Activity ID	Early Funding Narrative	Early Funding Request	Planned Funds
14-OHPS	8270.08	Early funding is requested because the CDC funding opportunity announcement (FOA) was not published in time to make the awards in FY 07. The FOA is currently out and the application deadline is October 5th. Early funds are needed to ensure that these organizations receive their FY 07 funding and can continue to implement activities.	$500,000	$500,000

Table 3.3: Program Planning Table of Contents

MTCT - PMTCT

Program Area:	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT
Program Area Code:	01

Total Planned Funding for Program Area: $35,365,719

Estimated PEPFAR contribution in dollars	$280,000
Estimated local PPP contribution in dollars	$396,500
Estimated PEPFAR dollars spent on food	$435,000
Estimation of other dollars leveraged in FY 2008 for food	$0

Program Area Context:

As of July 2007, there were 3,650 facilities offering PMTCT services in South Africa. PMTCT service delivery is available at 100% of hospitals and in more than 85% of clinics, community health centers and mobile clinics. Service delivery is accessible to all pregnant women, if not at the service point than via referral to a nearby facility. The PMTCT program is in its final stage of expansion. However, many of the challenges that existed in the pilot phase of implementation still plague the program.

Although coverage of PMTCT services is extensive, the number of women needing PMTCT is staggering. The latest Antenatal Survey indicates that the national HIV prevalence among pregnant women is 29.1%. Despite a slight decrease in the antenatal prevalence from 2005, approximately 290,000 babies are being born to HIV-infected women annually. Furthermore, this means that an estimated 290,000 women need PMTCT services annually. While quality data on PMTCT access from the National Department of Health (NDOH) is not readily available, all indications are that the need far outweighs availability. Thus supporting PMTCT is a priority for USG assistance. Since the beginning of PEPFAR, PMTCT funding has contributed to the rapid expansion of PMTCT services. The USG strategy has been to support the NDOH by supporting a range of PMTCT partners that work directly at the facility level to facilitate the implementation of the PMTCT program. In addition, technical assistance has been provided directly to the NDOH in the form of two Centers for Disease Control and Prevention (CDC) technical advisors. Technical assistance has been in the area of policy development and implementation, capacity-building, implementation of early infant diagnosis, and integration of PMTCT into existing Maternal Child and Women's Health services. Despite the large number of PMTCT partners and the large number of PEPFAR-supported PMTCT service points, the national trend indicates that at best, 50-55% of pregnant women agree to be tested, and of those that test positive only 35% receive nevirapine. Unfortunately, this means that the majority of women are being missed at entry into the program. In addition, the USG PMTCT strategy has been heavily focused on capacity building. To address this trend, and to ensure that there is greater geographical support for the national PMTCT program, the NDOH, together with CDC and UNICEF, is engaged in a stakeholder analysis. This analysis will map all PMTCT stakeholder activities, identify gaps and overlaps in technical assistance, and will provide recommendations to ensure better coordination between stakeholders. In addition, during early FY 2008, the PEPFAR PMTCT program will be reviewed and recommendations will be incorporated in implementation for the upcoming financial year. This will provide strategic direction to both the national PMTCT program and the PEPFAR PMTCT program.

In FY 2008, the PEPFAR PMTCT program will continue to support the national PMTCT program by addressing some of the inherent programmatic gaps in service delivery. These include ongoing support and supervision for health care providers and community health care workers; the promotion of provider-initiated counseling and testing, providing follow-up for mother-baby pairs post delivery, quality improvement, ensuring integration of PMTCT into maternal, child and women's health services, community outreach and referral into wellness and treatment programs for HIV-infected mothers and exposed infants, and scale-up of early infant diagnosis services. All PMTCT PEPFAR partners will meet with the NDOH quarterly to ensure that these objectives are being met. The quarterly meeting will provide an opportunity for partners to share lessons learned and to prevent the duplication of tool and curriculum development. In addition, the quarterly forum will ensure greater coordination between partners and government.

In July 2007, the NDOH announced the long-awaited policy shift from the provision of single dose nevirapine to dual therapy for all HIV-infected pregnant women. To this end, the primary objective for FY 2008 will be to ensure finalization of policy and guideline development, updating health care workers, and providing site specific support to ensure readiness and implementation of the new PMTCT policy. To date, a National PMTCT Policy Task Team, consisting of CDC, UNICEF, The Child Health Institute at the University of the Western Cape, and the NDOH has been working on the development and finalization of the policy guidelines, updating the national NDOH PMTCT and Infant Feeding Training Curriculum, and assisting provincial PMTCT managers in budgeting and planning for the implementation of dual therapy. Based on the progress of this task team, it is anticipated that the first 6 months of FY 2008 will be spent preparing for implementation, with a few facilities/partners per province implementing the dual therapy regimen. Rollout will begin during the second half of FY 2008. PEPFAR partners will play a key role in facilitating readiness for implementation by providing ongoing assistance to the provincial and local health structures to address operational challenges; ensuring all health care workers receive the necessary policy updates and training; and strengthening linkages between antenatal care and HIV service delivery as well as social services. Activities in FY 2008 will ensure better coordination with the NDOH, particularly around capacity building and training. A large number of partners are engaged in training activities, however, at the request of the NDOH, and in an attempt to standardize training initiatives; all partners will work with the NDOH curriculum. In addition, at the community level, the program will create increased awareness and demand for quality PMTCT service delivery. Activities targeting cultural attitudes to mixed feeding, male involvement in PMTCT and increasing uptake of services will also be supported.

The SAG is currently revising both the adult treatment and PMTCT guidelines with expected implementation in the second half of 2008. Both of these will provide for treatment initiation at a CD4 level <350. This would have significant impact on targets in both ARV services and PMTCT. However, until such time as these revised guidelines are officially launched, the targets remain as is. In the future, targets in these program areas may have to be revised.

In FY 2008, the USG PEPFAR team will work with the NDOH to strengthen monitoring and evaluation systems. Based on the new PMTCT policies (provider-initiated counseling and testing and dual therapy), the South African USG team is optimistic that there will be an increase in the uptake of PMTCT services and a decrease the rate of vertical transmission.

Program Area Downstream Targets:

1.1 Number of service outlets providing the minimum package of PMTCT services according to national and international standards	1072
1.2 Number of pregnant women who received HIV counseling and testing for PMTCT and received their test results	319341
1.3 Number of HIV-infected pregnant women who received antiretroviral prophylaxis for PMTCT in a PMTCT setting	77493

1.4 Number of health workers trained in the provision of PMTCT services according to national and international standards	6363

Custom Targets:

Activity Narrative: SUMMARY:

AED will use FY 2008 PEPFAR funding to continue to support integration of maternal nutrition and Infant and Young Child Feeding (IYCF) in the context of HIV policy into healthcare and community services through three components: training of healthcare providers and community health workers from all nine provinces; assistance for implementation of integrated IYCF and PMTCT model in two districts of KwaZulu-Natal and one district each in North West, Mpumalanga and Eastern Cape; and support to enhance public awareness of the importance of maternal nutrition and IYCF in PMTCT.

BACKGROUND:

This is an ongoing AED project, initiated in FY 2004 with PEPFAR funding. The first activity was development of guidelines on nutrition for pregnant and lactating women and IYCF in the context of HIV and AIDS. AED has been working in collaboration with the South African National Department of Health (NDOH) nutrition directorate and local NGOs to build health workers' capacity to integrate maternal nutrition and IYCF into existing healthcare and community services based on these guidelines. This will continue with FY 2008 funding. In addition, AED will continue to support efforts to enhance public awareness of the importance of improved nutrition for HIV-infected women in general and pregnant and lactating women in particular, as well as the importance of IYCF counseling as an aspect of PMTCT. Furthermore, AED will provide technical assistance to the National, Provincial and District Departments of Health and selected NGOs and FBOs to enhance male involvement to address gender issues in PMTCT. AED will also provide technical assistance to ensure sustainability through continuing support and monitoring of PMTCT data. AED will also provide technical assistance to provincial DOH staff to encourage expansion to other sub-districts in the provinces and promote greater sustainability.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Technical Assistance to NDOH, NGOs and FBOs

Building on the development of Maternal Nutrition Guidelines in collaboration with the NDOH, further technical assistance will be provided to National, Provincial and District Departments of Health and selected NGOs and FBOs. This technical assistance will increase Human Capacity Development (HCD) by training health workers to integrate counseling on maternal nutrition and IYCF in the context of HIV into existing healthcare and community services. AED will provide technical assistance to the targeted provincial Departments of Health in the implementation of the guidelines. In addition, following earlier successful training of lecturers from universities and schools of nursing in the integrated model, AED will provide technical assistance to develop capacity to include the integrated program into existing professional development curricula of nurses and dieticians' pre-service orientation. Additional trainers from these institutions in the nine provinces will be trained at the national level as well as provincial level in Gauteng, Limpopo, Northern Cape, Western Cape and Free State provinces. Healthcare providers from each of the five target provinces will be trained to provide direct integrated services to clients in their respective districts. Policies and guidelines on pregnant and lactating mothers and IYCF in the context of HIV will continue to be disseminated and implemented. Technical assistance will continue to be provided to Mpumalanga, Eastern Cape and North West provinces to conduct needs assessments at clinics and community services in three sub-districts, and will be followed by mentorship and supervision in view of implementing integrated PMTCT and nutrition for pregnant and lactating women and IYCF into service outlets. Facilities where AED is currently working will continue to receive support, mentorship and in-service training around issues not fully addressed during the initial implementation of the program, such as stigma and family planning. Program managers working with women and children (on integrated management of childhood illnesses, PMTCT, CT, Maternal, Child and Women's Health, and Health Promotion) will be mobilized on the promotion of the Baby Friendly Community Initiative in the context of HIV.

ACTIVITY 2: Quality Assurance

Building on the activities of FY 2006 and 2007 in the four sub-districts (Kagisano Molopo, North West; Qaukeni, Eastern Cape; Umzumbe, KwaZulu-Natal; and Kabokweni, Mpumalanga), AED will support existing facilities to increase the provision of quality care by supporting the provision of refresher courses for performance and quality improvement in the integration of nutrition to the basic PMTCT package. AED will provide technical assistance for the integration of safe-feeding practices in PMTCT into antenatal, labor and delivery practices, as well as post-natal care. Quality assurance and supervision will be provided using the trained Baby Friendly Hospital Initiative assessors to conduct internal and external assessments.

ACTIVITY 3: Family-Centered Community Care

Technical assistance will be provided to three sub-districts to implement the "Family-Centered Community Care" approach, with clear follow-up and referral system for mothers and infants. CBOs, NGOs and FBOs will contribute to community mobilization. Technical assistance will be provided to health care workers and community volunteers to address stigma and discrimination, including gender issues. In addition, key community members, leaders, and religious leaders will be trained to organize behavior change communication activities on male involvement and people living with HIV in each of the three target facilities. AED will support development of linkages and referrals to existing services such as family planning, TB treatment, and care and support for HIV-infected mothers and families. AED will strengthen linkages between facility interventions and community services for follow-up, couple counseling, family-based counseling and testing, specifically involving men in PMTCT activities, and will also encourage and facilitate public-private partnerships.

ACTIVITY 4: Integrated IYCF/PMTCT expansion to Northern Cape

With FY 2007 funding, AED expanded to the Northern Cape Province. FY 2008 funding will be used to continue activities with FHI and JPHEIGO to harmonize the PMTCT provincial guidelines and monitoring systems. FY 2008 funding will be used for expansion of the integrated IYCF/PMTCT model in the Western Cape, Gauteng, Limpopo and Free State provinces.

ACTIVITY 5: Expansion

Activity Narrative:

FY 2008 funds will continue to support the roll-out of and training on the new NDOH PMTCT guidelines with the integration of maternal nutrition and Infant and Young Child Feeding practices. This will include capacity development of non-governmental organizations and community health care workers in existing provinces so they will be able to play a key role in achieving project targets, strengthening referrals and linkages, and improving monitoring and evaluation to ensure program sustainability within the selected provinces. Funds also will be used to expand the program by providing onsite support to other service outlets within the existing districts. In the existing districts, FY 2008 activities will include emphasis/addition of HIV counseling and testing and ARV prophylaxis in the integrated training on maternal nutrition and IYCF in the context of PMTCT. This will be based on the national PMTCT guidelines, in line with the National HIV and AIDS Strategic Plan.

These activities will directly contribute to the seven million infections averted component of the 2-7-10 objective of PEPFAR by training additional health workers on safe infant feeding practices, hence reducing the risk of transmission via mixed feeding. AED will contribute to the PEPFAR vision outlined in the five-year strategy for South Africa by expanding access to PMTCT services and by improving PMTCT related counseling of mothers.

Targets

Target	Target Value	Not Applicable
Indirect Number of service outlets	N/A	True
Indirect number of women provided with a complete package of PMTCT services	N/A	True
Indirect number of women provided ARV prophylaxis for PMTCT	7,000	False
Indirect number of people trained for PMTCT services	N/A	True
Number of infants born to HIV positive mothers that receive a complete course of cotramoxizole (from 6 weeks - 1 year)	N/A	True
Indirect number of infants born to HIV positive mothers that receive a complete course of contramoxizole (from 6 weeks - 1 year)	N/A	True
Number of mother-baby pairs followed up over 12 month period	N/A	True
Indirect number of mother-baby pairs followed up over 12 month period	N/A	True
Indirect number of pregnant women who received HIV counseling and testing fo PMTCT and received their results	35,000	False
1.1 Number of service outlets providing the minimum package of PMTCT services according to national and international standards	332	False
1.2 Number of pregnant women who received HIV counseling and testing for PMTCT and received their test results	N/A	True
1.3 Number of HIV-infected pregnant women who received antiretroviral prophylaxis for PMTCT in a PMTCT setting	N/A	True
1.4 Number of health workers trained in the provision of PMTCT services according to national and international standards	600	False

Indirect Targets

Through the newly trained health care workers in FY 2008, AED will be able to provide support to about 1400 active carers in the field, therefore indirectly having an impact on PMTCT service delivery. The organization expects that each of these care providers will reach at least 25 pregnant and lactating women in their areas and encourage them to be counseled and tested for PMTCT and receive their results. The community health workers trained will actively refer clients to health facility providing PMTCT services.

Mechanism: N/A

Prime Partner: Africa Center for Health and Population Studies

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 7914.08

Planned Funds: $339,500

Activity System ID: 13367

Activity Narrative: SUMMARY:

The Africa Centre for Health and Population Studies, in partnership with the Hlabisa Department of Health (DOH), based in Hlabisa Health District in rural KwaZulu-Natal, operates the Hlabisa antiretroviral treatment (ART) program and aims to deliver safe, effective, efficient, equitable and sustainable ART to all who need it in Hlabisa district. The program emphasizes integration of the government Prevention of Mother-to-Child Transmission (PMTCT) Program and Antiretroviral Treatment (ART) Program. The target population for the integrated PMTCT and ART Program are people living with HIV and AIDS (of all ages), HIV-infected pregnant women and HIV-infected infants (0 to 5 years). The major emphasis area of this program is development of network/linkages/referral systems, and minor emphasis areas include information, education and communication, local organization development and training.

BACKGROUND:

The Africa Centre, a population research department of the University of KwaZulu-Natal, implements a PMTCT program in partnership with the KwaZulu-Natal Department of Health (DOH). The program is based in Hlabisa sub-District, a rural health district in northern KwaZulu-Natal that provides healthcare to 220,000 people through one government district hospital and 15 peripheral clinics. The ART Program is embedded in the DOH ART rollout whereby the Africa Centre and KwaZulu-Natal DOH work to complement each others abilities and resources in providing ART. The Africa Centre has expertise in infectious diseases and management that is not available at the district DOH. In addition to clinical staff, and infrastructure, the district DOH provides the necessary drugs and laboratory testing for effective ART rollout.

With FY 2008 funds, the Africa Centre will continue partnering with the district DOH to improve and expand PMTCT services by providing additional human resources and training. In addition, Africa Centre will integrate PMTCT services with its tuberculosis (TB)/HIV, palliative care, counseling and testing, and treatment programs. Increased attention will be given to addressing gender inequality (including increasing male involvement in PMTCT) and promoting HIV service delivery among men and children.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Partnership with South African Government (SAG)

All government clinics within Hlabisa District offer PMTCT services. However, many of these clinics are under-resourced and require additional human capacity to ensure that HIV-infected women are enrolled in the PMTCT program. Africa Centre provides training, supervision, mentoring, and systems strengthening in support of PMTCT services in Hlabisa district. The PMTCT program is the main referral base for assisting HIV-infected women with ART. Africa Centre aims to address the lack of human resources with the district DOH to recruit and place nurses and treatment counselors at government facilities to assist with pre and post-test counseling and appropriate infant feeding counseling. During pregnancy, if criteria are met, or during post delivery when women become eligible, nurses will provide HIV rapid testing, CD4 counts and referrals to trained ART counselors. Counselors will offer pre and post-test counseling and further facilitate enrollment into the ART program. In addition, counselors will offer pregnant women continued follow-up and support and facilitate testing of all exposed infants at 6 weeks of age, with referral to the ARV program if they are HIV-infected.

Africa Centre conducts workshops and meetings with DOH promoting linkages between PMTCT and ART programs and educates clinic staff about available services. Africa Centre will develop and distribute informational materials for wider circulation in the hospital and clinics and will target pregnant women.

ACTIVITY 2: PMTCT and Treatment

Africa Centre will provide clinics with clinical services (via the provision of doctors and other health workers) to initiate HIV pregnant women enrolled in the PMTCT program on ART. Africa Centre's assistance provides the full package of PMTCT services in line with the National Department of Health's PMTCT standards. Doctors will be present in clinics at appointed times, on a weekly or fortnightly basis, as appropriate, and will provide treatment management including work-up (complete medical history and medical examination), consultation, screening, symptom and pain management, and patient counseling (including maternal nutrition and family planning). PMTCT clients will be referred to Africa Centre-supported ART services. These services will also provide patients who experience adverse side effects or treatment failure with additional monitoring and support. Africa Centre-supported home-based care organizations will provide ongoing care and monitoring support to ensure treatment adherence. All patients transferred into the ART program from the PMTCT program will be tested for TB and receive TB treatment if necessary.

ACTIVITY 3: Counseling and Support

To reduce vertical transmission of HIV from mother-to-child, treatment counselors will provide counseling on appropriate infant feeding and support into routine PMTCT in line with the newly published WHO guidelines on infant feeding. The selection of counseling content and material will be informed by the results from a large local vertical transmission study conducted by the Africa Centre. All HIV-uninfected women will be counseled on exclusive breastfeeding from birth to six months, with continued breastfeeding to at least 2 years of age, and on safe sex. HIV-infected women will receive individual counseling and it is anticipated that most women will choose to breastfeed given the results of previous work in this area and the lack of resources to fulfill the AFASS criteria for replacement feeding (AFASS: acceptable, feasible, affordable, sustainable and safe). Women who do not wish to test and who, therefore, do not know their status will be counseled on infant feeding practices as per HIV-uninfected women (i.e. exclusive breastfeeding to six months) in line with WHO policy. Opportunities to counsel women and their partners on infant feeding will be taken at every visit, both antenatally and postnatally. HIV-infected women who choose to exclusively breastfeed, whatever their CD4 counts, will receive a monthly food parcel from the government, as do mothers who do not breastfeed. In addition, counseling on family planning will be offered. The program will address gender by attempting to increase gender equity by promoting the involvement of male partners in the PMTCT and family planning sessions. The PMTCT counselors will ask pregnant women and mothers to come with their male partners during follow-up visits. During road shows (a form of “edutainment,” which successfully disseminates information through entertainment since 2004) a special focus will be the

Activity Narrative: involvement of men. Men are still underrepresented in the clinics not only for being tested, but especially for getting treatment. The main objective will be to make men aware of their responsibility concerning the response to HIV. Male involvement will be strengthened using existing materials when appropriate. The possibility of family testing in the home will be investigated.

Finally, counselors will refer eligible patients to the government services that are available (for instance, for food aid or to a social worker if domestic violence is suspected).

ACTIVITY 4: Human Capacity Development

The South African DOH and Africa Centre counselors and nurses will be trained in the full PMTCT package according to government guidelines and standards. Refresher and on-the-job training will be provided as needed, keeping healthcare providers up to date in the delivery of PMTCT services. All healthcare providers will receive training on HIV and ART. A baseline course is based on the DOH curriculum and comprises four sessions of three hours each. The four sessions cover basics of HIV and ART, follow-up of patients, assimilation of follow-up and practical work with a patient (including blood taking for CD4 counts and viral loads).This training will be enhanced with clinic visits from training officers, during which the officers will monitor counseling and provide individual mentoring. In addition, nurses and treatment counselors will be offered the opportunity to participate in short courses covering the management of ART side effects, opportunistic infections, and pediatric ART. When necessary additional space may be renovated or park homes provided to increase facility capacity.

Due to the shortage of staff and to the increasing number of patients and increasing workload, additional staffing will be provided in close cooperation with the facility and wherever possible SAG positions will be created. It is estimated that one position for each of the 14 sites is necessary and all of these will be staffed by SAG employees as soon as they can be recruited.

ACTIVITY 5: Monitoring and Evaluation

Africa Centre's Vertical Transmission Study published in the Lancet in 2007 (369: 1107-16) had major impact on the guidelines of the WHO. It showed that exclusive breastfeeding reduces the risk of Mother-to-Child transmission compared to mixed feeding. With dedicated Health Workers in the clinics and a strong M&E system, PEPFAR funding will be used to continue monitoring and evaluation activities.

Africa Centre's integrated PMTCT and ART program contributes to PEPFAR's 2-7-10 goals for South Africa by improving capacity, access and demand for PMTCT and ART for pregnant women and mothers. These activities ensure that new infant infections are averted and the HIV-infected treatment-eligible women are referred and initiated on treatment in a timely matter.

Funding Source: GHCS (State)

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 13700.08

Planned Funds: $824,500

Activity System ID: 13700

Activity Narrative: SUMMARY:

BroadReach Healthcare (BRHC) supports integrated ARV services that include PMTCT, doctor consultations, lab testing, adherence support, patient counseling, remote decision support, quality assurance (QA), and data management. The main emphasis area is capacity building, with minor emphasis on strategic information and human capacity development (training). The primary target population is pregnant women.

BACKGROUND:

PEPFAR funds support BRHC initiatives that provide HIV and AIDS clinical management, care and support services to HIV-infected individuals in areas where the SAG rollout has not yet been implemented and assists ART rollout in the public sector. The BRHC PEPFAR program began in May 2005 and now operates across 5 provinces. BRHC is supporting approximately 5000 individuals directly with care and treatment and 15,000 indirectly. BRHC taps private sector health professionals to provide comprehensive care and treatment, fostering capacity-building initiatives within the public health system, and supporting community-based programs. BRHC leverages PLHIV support programs to identify and assist with treatment literacy, adherence support and ongoing community mobilization, prevention education activities, and positive living initiatives. BRHC also works to build capacity in public health facilities, focusing efforts on human capacity development (HCD) activities, including clinical didactic training, clinical mentorships, patient training and operational assistance training. BRHC is expanding its provision of staff and infrastructure support to SAG facilities. Finally, BRHC is expanding its involvement in the design of scaleable down referral models in partnership with faith-based organizations (FBOs), community-based organizations (CBOs), and public-private partnerships (PPPs).

ACTIVITIES AND EXPECTED RESULTS:

To ensure that patients are armed with accurate and practical HIV prevention strategies, BRHC will carry out the following activities:

ACTIVITY 1: Clinical Services

BRHC patients will be treated in accordance with national guidelines by ensuring that all elements for effective treatment are provided in a coordinated manner. Patients see doctors regularly, and will receive laboratory tests, HIV and AIDS education (complete with prevention messages), management of sexually transmitted infections (STIs), adherence support, counseling, cotrimoxazole prophylaxis and linkage to other support and wellness services. Pregnant women identified through the BRHC program and partner sites will be offered PMTCT services in line with SAG guidelines. PMTCT services include counseling and testing (see subsequent activity); counseling and support for maternal and infant nutrition; access to ARV treatment and safe infant feeding practices. Linkages will be made to pediatric treatment. At each facility a “tracer” will be employed full time to ensure that appointments are kept, opportunistic infections are treated, CD4 counts monitored and referrals completed.

ACTIVITY 2: Human Capacity Development (HCD)

BRHC will provide comprehensive HIV and AIDS training that includes PMTCT to its network of providers including doctors, nurses, pharmacists and other healthcare professionals through a variety of initiatives including remote decision support, telemedicine, web-based training, didactic training, and clinical mentoring from experienced clinicians. Comprehensive HIV and AIDS training for health professionals includes prevention and management of sexually transmitted infections, PMTC, ART management, tuberculosis (TB), adherence, management of complications and side-effects, and pediatric HIV management. BRHC will continue to train patients and support group facilitators on topics including prevention and PMTCT, HIV and AIDS, ART, adherence, living positively, and accessing psychosocial support in communities.

ACTIVITY 3: Counseling and Testing

BRHC will work with partner sites to ensure that pregnant women are counseled and tested for HIV, and offered access to PMTCT. This will be done by both private general practitioners who are in the BRHC network and at the government facilities where BRHC works.

ACTIVITY 4: Support to SAG

BRHC will conduct an initial needs assessment at each SAG partner facility. The assessments will identify problems that impact overall capacity and efficiency. Solutions for each institution include recruitment and salary support for doctors, nurses, and pharmacy staff. BRHC general practitioners provide part-time services at SAG facilities, and train SAG staff in HIV care and treatment and related management. Other support may include infrastructure, such as refurbishment, equipment and supplies procurement. This will also include strengthening linkages between essential HIV support services such as PMTCT to ensure clear referral procedures, patient tracking, and reporting of intervention results.

These activities directly contribute to the PEPFAR 2-7-10 goals by attempting to prevent new infections among infants.

Budget Code: MTCT

Program Area Code: 01

Activity ID: 8049.08

Planned Funds: $50,000

Activity System ID: 13822

Activity Narrative: SUMMARY:

The South African Department of Defense (SA DOD) Prevention of Mother-to-Child Transmission (PMTCT) program is an integral component of the SA Department of Defense Comprehensive Management, Prevention, Care and Treatment Program. It focuses on training military healthcare workers with standardized educational materials based on World Health Organization (WHO) and South African National PMTCT guidelines to ensure appropriate and uniform PMTCT services for HIV-infected mothers and their babies. Healthcare workers in all military hospital and clinic settings throughout all nine provinces will be trained. The program will include counseling and testing of mothers as part of antenatal care, the provision of antiretroviral treatment for PMTCT, in line with national policy, appropriate management of infant deliveries, follow-up support for infant feeding practices, and linkages with treatment, care and support for HIV-infected women. It is envisioned that PMTCT will serve as an entry point for male partners and other family members to access counseling, testing, care and treatment services. The major emphasis area is training, with minor emphasis on information, education, and communication, and policy and guidelines. Target populations include adults, pregnant women, HIV-infected pregnant women, people living with HIV, HIV-infected infants, doctors, nurses, laboratory workers, pharmacists, and other healthcare workers within the military.

BACKGROUND:

Since 2000, the SA DOD has provided a comprehensive care, management and treatment plan for HIV and AIDS to members of the military and their families that includes PMTCT as a mode of intervention. This PMTCT intervention has served as an entry point to treatment and care, thereby ensuring access to treatment for women. Although this intervention has already been integrated into the HIV and AIDS program, it has never received PEPFAR funding and is not standardized across all military units in all nine provinces. It is envisaged that future management of the SA DOD PMTCT project will include more vigorous PMTCT training for military healthcare workers and ensuring that healthcare workers are able to link PMTCT and antiretroviral treatment programs. In addition, healthcare workers will also be trained to see PMTCT as a HIV and AIDS service delivery entry point for the whole family, including mothers, fathers, infants and other children. This expansion requires standardization of protocols, more vigorous implementation of a comprehensive package of PMTCT services according to WHO and national guidelines, and monitoring and evaluation of the PMTCT program.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

SA DOD will modify PMTCT clinical practice guidelines to be implemented in PMTCT programs. Existing guidelines will be reviewed annually during a PMTCT workshop attended by SA DOD doctors and nurses. The goal of this workshop will be to ensure that current WHO PMTCT guidelines and NDOH PMTCT guidelines are being incorporated into all SA DOD communication tools and educational aids for practitioners and patients and that PMTCT services available for whole families (including mothers, fathers, and babies) are standardized across all military health units in all nine provinces. SA DOD will provide standardized PMTCT training to healthcare providers using these evidence-based clinical practice guidelines as part of a comprehensive package of PMTCT services. Dependent upon human resource capacity within SANDF, the Director of the SA DOD HIV and AIDS Program will decide whether the training will be centralized within SA DOD or will need to be outsourced to an accredited training institution. The PMTCT training program was included for FY 2007 into the ARV training program, which is outsourced to the University of Pretoria. One hundred eighty six healthcare workers have been trained since April 2005. It is expected that another 56 healthcare workers will attend this training in August 2007. Due to human resource shortage and capacity within the SAMHS, the FY 2007 PMTCT funding has not been utilized, yet this is still an unmet need.

ACTIVITY 2: Service Delivery

SA DOD will provide a comprehensive package of PMTCT services to every pregnant woman. A large component of this PMTCT package is counseling and testing. All pregnant women will be counseled and offered HIV testing using the opt-out testing approach. Women who test positive will be post-test counseled and antiretroviral treatment for PMTCT will be provided. An important component of the comprehensive package of PMTCT services includes the referral of HIV-infected women to treatment, care and support services. SA DOD will ensure that all women are fully supported once the HIV status has been established. This includes support on appropriate infant feeding practices The SA DOD PMTCT program will ensure that PMTCT does not stop at delivery and an infant follow-up system will be implemented to ensure that the HIV status of the HIV-exposed infant can be determined and the infant can be referred to treatment, care and support services. This follow-up system will also ensure that HIV-exposed infants are monitored for signs and symptoms of HIV infection and that cotrimoxazole prophylaxis is provided appropriately. The SA DOD program will support HIV-infected pregnant women such that they are in a position to disclose their HIV status to their families and can encourage their families to participate in the program. This will be done by providing ongoing counseling and support to these women. SA DOD will also offer counseling and testing to other family members, and family members who test positive will be referred to treatment facilities as well. Presently, procurement of antiretroviral drugs for this purpose will be funded by PEPFAR as managed by USAID.

The PMTCT package also includes micronutrient supplements (multivitamins, iron therapy, folic acid) and recommendations for a well-balanced nutritious diet for pregnant and lactating women. Nutritional supplements will be procured through the SA DOD budget. Guidelines will be given to all health units on the provision of PMTCT and the SA DOD Monitoring and Evaluation team will track women who receive this PMTCT package of services through the SA DOD health informatics system. It must be noted at this stage it is not possible to report on the numbers of pregnant women receiving PMTCT services as the SA DOD only reports on cumulative numbers of adult patients on treatment as agreed. This will be further explored with the US and SA DOD M&E teams for future reporting in this financial year.

These activities will directly contribute to the PEPFAR 2-7-10 goals by averting HIV infection in children, increasing access for people living with HIV to counseling, testing, care, treatment and support in the South

Activity ID:	9083.08	**Planned Funds:**	$750,000

Activity System ID: 13851

Activity Narrative: SUMMARY:

UKZN proposes to use PEPFAR funding to strengthen existing prevention of mother-to-child transmission (PMTCT) services, by continuing ongoing FY 2007 activities in the Eastern Cape province and providing technical support to KwaZulu-Natal to facilitate better PMTCT implementation and integration with treatment, care and support. Target populations for the project include pregnant women and infants born to HIV-infected mothers, all cadres of health care workers engaged in maternal and child health services and provincial PMTCT coordinators. Emphasis areas for the project include human capacity development, local organization capacity building, and the provision of technical assistance. The UKZN PMTCT project has 2 components viz. (i) Expansion of the FY 2007 funded Demonstration Project which aims to create linkages between health and social services in the EC; and (ii) Provision of technical assistance to 3 Health Districts in KwaZulu-Natal with the highest antenatal HIV seroprevalence.

BACKGROUND:

MTCT rates prior to implementation of the national PMTCT program ranged between 20% - 34%. Since 2002, South Africa has made significant progress in the rapid expansion of PMTCT services. Several national and provincial audits of the program have highlighted common gaps and challenges to implementation, and as a result MTCT rates remain high, 20.8% at six weeks as compared to the anticipated 12%-14%. Challenges to program implementation include: low uptake of CT, lack of ongoing support for both HIV-infected and uninfected women, poor administration of ARV prophylaxis (less than 25%), policy confusion around nevirapine, poor postnatal follow-up (retention < 15%) and erratic and unsafe infant feeding practices. In addition, with the implementation of ART programs, linkages between PMTCT and ART programs have not been established successfully. In view of the above challenges and using FY 2006 and FY 2007 funding; the UKZN PMTCT project was conceptualized to begin to address these deficiencies. Specific FY 2006 and FY 2007 activities included: establishing pilot sites in each province to begin implementation of repeat HIV testing for pregnant women who were missed or who tested negative at the first antenatal care visit. During FY 2006,, the project was completed in 12 primary health care clinics, three in each of the provinces with the highest HIV antenatal prevalence, namely MP, FS, EC and GP and using FY 2007 funds preparations for implementation in three primary health clinics in each of the remaining provinces, namely North West (NW), Limpopo (LP), Western Cape (WC) and Northern Cape (NC) have begun.

Using FY 2006 funding, a demonstration project aimed at improving follow-up and continuum of care of women (HIV infected and uninfected) and children in the PMTCT program by fostering a partnership between Health and Social Services in KwaZulu-Natal was implemented. This project serves as a demonstration site for a holistic PMTCT program that focuses on enrollment of women into PMTCT services, PMTCT service delivery and linking women and their infants to social welfare programs, treatment, care and support. This project has commenced in collaboration with management of both departments of Health and Social Development in KwaZulu-Natal and is due to be complete in July 2008. Using FY 2007 funding, a demonstration site for holistic PMTCT service delivery is being set up in Eastern Cape and expanded to two health facilities in KZN. Funding will ensure that each of the two provinces have a best practices model which can be rolled out by the provincial departments of health and social development. The project is supported by a trained team of clinicians, community health workers and social workers who would perform a situational assessment of health service utilization and the provision of comprehensive maternal and child health services among women and children, implement a comprehensive package of clinical care for HIV infected and uninfected women and their children through integrating HIV and PMTCT programs in routine maternal and child health services, establish a support program for HIV-infected and uninfected women antenatally and postnatally until 18 months post-delivery and facilitate and expedite access to social support services such as child support grants (CSG), child care grants (CCG), and disability grants through interdepartmental collaborations viz. health, social welfare and home affairs.

FY 2007 funding is also being used to provide ongoing technical assistance and support to four provinces, namely Eastern Cape, Gauteng, Free State and Mpumalanga. Technical assistance will be provided at the provincial level to ensure that provincial program managers develop skills to conduct program level evaluations and can use these evaluations to strengthen existing PMTCT services. Technical assistance will also be provided at the clinic level through the provision of a comprehensive training and capacity building program, and an onsite, mentorship and support program.

FY 2008 Specific activities include:

ACTIVITY 1: Expansion of Demonstration Project

This activity will be expanded in the Eastern Cape to all peripheral clinics associated with Motherwell Community Health Centre. UKZN will use PEPFAR funds to support the Department of Health in the EC in its effort to improve the follow-up and continuum of care of women (HIV-infected and uninfected) and children in the PMTCT program. To this end, UKZN will foster a partnership between Health and Social Services in the EC. This project is a holistic PMTCT program that focuses on enrolling women into PMTCT services, PMTCT service delivery, and linking women and their infants to social welfare programs, treatment, care and support. An assessment of current systems of the provision of social services in these communities will assist identification and networking of relevant stakeholders in the Departments of Health, Home Affairs and Social Development. We will develop a strategy of facilitating rapid access to identity documents and social grants for HIV infected women and children in consultation with the relevant role players.

ACTIVITY 2: Support and Technical Assistance to KwaZulu-Natal

The premise behind this activity is to improve knowledge of health workers to ensure successful implementation of a comprehensive HIV and AIDS plan at the primary health care facilities and to increase awareness among patients regarding the availability of HIV and AIDS related health services at the facility level. Technical assistance will ensure the facilitation of linkages between family planning, PMTCT, and treatment. The focus of this activity includes the development of an integrated training strategy which address operational and implementation issues for the delivery of a comprehensive package of care for

Activity Narrative: women and children affected by the HIV and AIDS pandemic. Technical assistance also target teams off service providers from each of the facilities and their associated ART sites to establish and strengthen referral mechanisms and a multidisciplinary team approach towards ensuring that women and children have easy access to ARV treatment and continuum of care.
Training will take place at the facility level and will be implemented over three days per month. In addition to on-site training and mentorship, audiovisual aids to promote education and communication at the health facilities will also be implemented. These aids include video recordings, pamphlets and posters.

The UKZN PMTCT project aims to increase uptake of CT, PMTCT, improve maternal and infant follow-up, better ART and medical adherence rates associated with reduction in maternal and child morbidity and mortality, improve health awareness and service delivery. This project contributes to PEPFAR 2-7-10 goals by preventing vertical transmission and linking women and infants to treatment programs.

Budget Code: MTCT

Program Area Code: 01

Activity ID: 13865.08

Planned Funds: $194,000

Activity System ID: 13865

Activity Narrative: SUMMARY:

The Desmond Tutu TB Centre project aims to improve access to prevention of mother-to-child-transmission (PMTCT) services, address comprehensive care of antenatal women and promote family centered postnatal care of mothers and babies at well baby clinics. The PMTCT program will be evaluated at facility level to identify gaps in services and quality improvement initiatives will be developed in response to these gaps. The emphasis areas include human capacity development through in-service training and ongoing supervision. The project aims to improve pre- and post-natal PMTCT care and to improve maternal and infant health outcomes. The primary target populations includes all women in their reproductive years, with a focus on those who are HIV-infected, and all HIV-exposed babies, whether registered with the PMTCT program or not.

BACKGROUND:

The Provincial Government initiated the PMTCT Program in the Western Cape in 1999 in the Khayelitsha Sub-District. The program offered HIV testing to women booking at antenatal services in Khayelitsha, dual therapy (AZT/NVP) in pregnancy and labor and advocated formula feeding of infants. The Provincial rollout of the program commenced in 2001 and was completed within two years. This rollout followed national protocols and offered nevirapine monotherapy. The Western Cape PMTCT protocol was modified in 2004 to include a dual therapy regimen. Emphasis was placed on exclusive feeding options and early infant diagnosis using PCR tests at 14 weeks. Reporting was simplified with single registers at antenatal sites, in labor wards and at well baby clinics with reporting done on a cohort basis. The Western Cape PMTCT program has been extremely successful and serves as a best practice model for the country. During 2006, 54,211 women accessed opt-out counseling at antenatal services in Cape Town with 93% accepting HIV testing. This is substantially higher than the rest of the country. However, a substantial number of pregnant women never access antenatal care and they and their babies thus fall outside the PMTCT program - these may be the women and babies with a high risk of being HIV infected. Of the 3389 HIV-exposed babies who came through the PMTCT program and were registered at well baby clinics in 2006, 79% had PCR tests done at 14 weeks and transmission rates were 5%. There are, however, several gaps in the program that make a thorough evaluation of PMTCT difficult. These include: inconsistent collection of booking data; fragmented TB and HIV care in antenatal settings; poor quality of labor ward data; loss of clients between obstetric units and well baby clinics; mixed infant feeding; delays in testing of infants; low index of suspicion of HIV among exposed babies whose mothers did not access the PMTCT intervention. This project aims to address these challenges and facilitate the implementation of quality PMTCT services. This project will be implemented in close collaboration with the Western Cape Department of Health, Cape Town City Health Department and non-governmental organizations (NGOs) and will be embedded within the services offered by these health departments. Project staff will work closely with line and program managers to support facility staff in implementing quality improvement initiatives that increase access to quality PMTCT interventions. Lessons learned will be used to inform the program throughout the province. This project will be implemented within existing health facilities. The integration of postnatal maternal and infant care will take place in the six clinics which form part of the Zamstar project and which are also associated with these flexi-hour VCT centers. The Zamstar project is part of the CREATE consortium and is funded by the Bill and Melinda Gates Foundation through a grant to the Johns Hopkins University. Zamstar works to reduce the prevalence of TB by improving integration of HIV and TB services. This project will complement Zamstar through insuring that PMTCT services are also fully integrated into TB and general HIV services.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Increase Access and Improve Quality PMTCT Services at Antenatal and Delivery sites through improvement of health systems

The PMTCT program is clouded by inconsistent information from antenatal and delivery sites. Inconsistent collection of antenatal booking data makes it impossible to assess the true reach and impact of the PMTCT program. Poor recording of information, high staff turnover and the use of untrained locum staff all present problems to the implementation of a quality program. Formal training courses are difficult to arrange due to staff shortages. Using FY 2008 PEPFAR funding, project staff will work on site at six Midwife Obstetric Units in Cape Town. Systems will be evaluated and the overall program will be improved by various interventions, including the collection of quality data to allow a better assessment of the PMTCT outcomes. Simple flow charts will be developed and made available to serve as prompts to locum staff that may be unfamiliar with the program protocols. Once good baseline data is available, quality improvement initiatives will be implemented to address deficits in the local program. The role of project staff will be to assist with program evaluation and to support the facility manager in implementing quality improvement initiatives. This will be done in a way that will ensure sustainability by building capacity within the health services.

ACTIVITY 2: Provision of Adequate HIV and TB Care Antenatally

The provision of antenatal services to women in Cape Town is fragmented: in general, women receive obstetric specific care at Midwife Obstetric Units, TB care at Local Authority Clinics and HAART at Provincial Community Health Centers. While it is outside of the scope of this project to address the structural issues contributing to this fragmentation, this project will ensure that women who access antenatal care are appropriately screened for STIs, TB and HIV and receive the necessary services through improving services at the Midwife Obstetric Units as well as referral links to other health facilities. Community health workers, PMTCT counselors and clinic nurses will be trained to do symptomatic screening for TB. Nurses at the six Midwife Obstetric Units will be trained on TB screening algorithms. Once clients are diagnosed with TB, they will be referred to the local clinic for treatment. Further antenatal visits will be used to reinforce key messages and to motivate TB clients to complete the full course of treatment. Staff will also be trained on the basic package of HIV care to enable them to deliver this at the Midwife Obstetric Units. The components of HIV care will include WHO staging, CD4 counts, PAP and RPR, cotrimoxazole prophylaxis, management of concurrent OIs, TB screening at every clinical visit, including the use of sputum culture in symptomatic clients who are smear negative and referral for HAART if required. The responsibility of project staff will be to train and supervise staff, to transfer skills and build capacity, and to conduct regular folder reviews to ensure that established protocols are being followed. Project staff will work with facility staff and managers to improve the quality of all aspects of PMTCT services as described above.

Activity Narrative:

ACTIVITY 3: Family-Centered Care to Mothers and Infants at Well Baby Clinics

At present, when mothers present with their infants at well baby clinic, the focus is on the care of the infant whose mother accessed PMTCT. Little effort is made to ensure that the mothers receive general HIV care at the same visit or that babies of mothers who did not access the PMTCT program are screened for HIV. There is also little reinforcement of exclusive feeding options. A significant number of babies are lost to follow-up by the time of the PCR test at 14 weeks. Systems will be established at the six clinics attached to the PEPFAR-funded flexi-hour VCT sites to ensure that the care of babies and mothers is linked. Staff will be trained on the basic package of HV care to be provided to mothers and infants and on simple algorithms to screen for HIV among infants not registered on the PMTCT program. Ongoing counseling of mothers will improve the retention of babies so that a higher percentage pf babies are tested at 14 weeks and retained on the program for the full six-month duration. The role of project staff will be to evaluate services, undertake in-service training, transfer skills, build capacity and plan quality improvements with facility staff and managers. Improvements will be evaluated through ongoing supervision on-site, audit of clinical folders and evaluation of routine program data.

These activities support an integrated approach for TB and HIV services in a PMTCT setting that is a key strategy for both PEPFAR South Africa and the South African Government. The project contributes to the 2-7-10 PEPFAR goals by ensuring early identification of HIV-infected pregnant women and ensuring that they are enrolled into the PMTCT program and reducing vertical transmission of HIV.

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID:	1201.08	**Mechanism:**	QAP
Prime Partner:	University Research Corporation, LLC	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	3111.08	**Planned Funds:**	$485,000
Activity System ID:	13871		

Activity Narrative: SUMMARY:

Through training, mentoring and the introduction of quality assurance (QA) tools and approaches, University Research Co., LLC/Quality Assurance Project (Health Care Improvement - URC/QAP/HCI) will assist South African Department of Health (DOH) facilities in five provinces to improve the quality of PMTCT and follow-up services. Facilities identified for support differ from those of other PEPFAR partners. Training and other activities are coordinated to avoid duplication and redundancy. URC/QAP will capacitate healthcare workers to ensure rapid identification and referral of HIV-infected pregnant women and their babies to appropriate services. The essential elements of QA include technical compliance with evidence-based norms and standards, interpersonal communication and counseling and increasing organizational efficiency. The major emphasis areas for this activity are QA and supportive supervision, with minor emphasis on development of networks, linkages, referral systems, training and needs assessment. The target populations include adults, people living with HIV, HIV-infected pregnant women, HIV and AIDS affected families, HIV-exposed infants, HIV-infected children, policy makers, public and private healthcare workers, community-based organizations (CBOs) and NGOs.

BACKGROUND:

Using FY 2007 funding, URC/QAP has been supporting PMTCT programs in 120 facilities in four provinces. URC/QAP also supported two home-based care organizations (HBOs) to improve the quality of their program targeting HIV-infected mothers and their babies. A collaborative model has been used to rapidly expand access to PMTCT services in a large number of antenatal care (ANC) facilities. In FY 2008, URC/QAP plans to expand the support to an additional 40 facilities and to assist health facilities to integrate PMTCT with ANC services. Loss to follow-up of infants is one of the major challenges to PMTCT as the majority of HIV-exposed babies do not receive appropriate follow-up care. URC/QAP will assist healthcare facilities in integrating follow-up strategies into postnatal/well-baby services. Changes will be made and monitored to ensure implementation and compliance with national guidelines in all supported URC/QAP facilities. URC/QAP coordinators will facilitate training in integrating clinical practices. URC/QAP will continue to provide support to additional CBOs to improve the quality of their services to peripartum women. Support will focus on improving infant feeding practices and follow-up care of HIV-infected infants. URC/QAP will work with district supervisors to ensure that they provide ongoing support and mentoring to healthcare workers. URC/QAP is collaborating with the National Department of Health (NDOH) and the provincial departments of health to ensure sustainability of the program.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Facility-level Quality Improvement Teams

URC/QAP will work with each facility to support teams representing various service delivery components such as ANC, and HIV care and treatment. Facility teams, with URC/QAP and DOH staff support, will be responsible for developing facility-based plans to increasing the uptake and quality of PMTCT services. Each facility team will conduct regular rapid assessments to identify factors affecting access to and quality of PMTCT services. Using standardized quality assurance (QA) tools, the assessments will measure/track changes in compliance with the NDOH PMTCT standards. URC/QAP will assist each facility team to develop a strategic plan for improving the uptake and quality of PMTCT and follow-up services. Interventions will include: (1) integration of ANC, intrapartum, postpartum with HIV and AIDS services; (2) re-design of clinical processes to improve patient flow and service times using QA/QI tools; and (3) promote facility teams to carryout ongoing monitoring by analyzing individual and facility level compliance with various standard indicators.

ACTIVITY 2: Training for ANC and other HIV and AIDS service providers in PMTCT

URC/QAP will build knowledge and skills of healthcare providers in PMTCT technical issues. This will be done through training workshops for healthcare workers as well as through on-the-job mentoring at facilities which only QAP supports. Training includes two days of formal training sessions, with ongoing monthly follow-up at each facility. QAP training compliments the NDOH PMTCT and Infant Feeding Curriculum as it has a specific focus on quality assurance methods and quality improvement techniques. The measurement of quality is also highlighted with emphasis placed on the indicators used to monitor clinical performance, such as the proportion of women attending antenatal services who were offered HIV counseling and testing case studies and data sheets are used and participants work in groups to identify quality gaps within the case study and make recommendations on possible solutions to improve the quality of service provision in PMTCT. Participants, either individually or as a group, are also required to analyze/interpret the data from the data sheets, graphically illustrate their analysis and make quality improvement plans based on this. Trainings are done by the URC/QAP staff and are scheduled to complement the district HAST/PMTCT trainings in each province.

ACTIVITY 3: Facility-Community Linkages

URC/QAP will assist participating facilities in building linkages with community-based groups to increase awareness about PMTCT as well as address issues of psychosocial support, stigma reduction and prevention of domestic violence for HIV-infected pregnant women. This will involve working with communities, community-based and home-based care organizations, specifically community-based workers/tracers who will work to improve the visibility of PMTCT activities; increasing voluntary counseling and testing (VCT) in communities by education (in facilities and door-to-door/household visits); and hosting open days for clinic staff and community members, to showcase improvement activities and encourage support for improvement initiatives.

ACTIVITY 4: Referrals and Linkages

URC/QAP staff members will identify and strengthen linkages between PMTCT and ARV treatment sites, by working with facility staff at different levels of care and advocating for the development of integrated referral and follow-up networks. PMTCT sites will be responsible for referring HIV-infected mothers and their newborns for onward care, treatment and support, while staff at ARV sites are responsible for care, treatment, support and follow-up of these patients. It is essential to ensure that all patients receive optimal

Activity Narrative: care and remain within the health care system, ensuring compliance / adherence with treatment and an improved quality of life. URC/QAP will strengthen the ability of healthcare workers to provide infant care follow-up, opportunistic infection (OI) prophylaxis, and basic preventive care to HIV-exposed infants identified in the PMTCT programs, as well as capacitating community-based tracers to identify and follow-up defaulters, including HIV-exposed babies who have been 'lost to follow-up'. URC/QAP will continue to promote improvements in counseling of mothers regarding infant follow-up and best practices, early infant diagnosis, ongoing training and onsite mentoring, and support for national initiatives. URC/QAP plans to strengthen linkages to Orphans and Vulnerable Children (OVC) programs and to routine maternal and child health services, including family planning. It is envisaged this will serve to identify and strengthen existing networks; highlight gaps in the quality of services provided; and provide information about the feasibility of incorporating relatively rapid QA approaches into ongoing OVC programs.

ACTIVITY 5: Strengthening Supervision

URC/QAP will visit each facility fortnightly to provide on-the-job support and mentoring to staff. In most cases, the visits will be conducted together with district staff. This will ensure that the district staff take ownership of the program and can sustain the program when URC/QAP support ends. The mentoring will focus on improving clinical skills of staff and ensuring that the improvement plans are implemented correctly. During these visits, URC/QAP and facility staff will compare performance data with expected results. URC/QAP will conduct quarterly assessments in each facility to assess whether the facility staff is in compliance with the national guidelines. Facility staff will be provided with feedback regarding compliance with national guidelines. All facilities exhibiting 100% compliance for all programs assessed for at least three consecutive quarters will be judged to be sustainable. Sample-based surveys will be done in a small number of QAP-assisted facilities annually to assess compliance with quality assurance standards and key performance indicators. Although the coverage area for the URC/QAP PMTCT project is primarily in four provinces, some activities are also directed at the national level. URC/QAP will actively participate in the training and development of the National NDOH PMTCT monitoring and evaluation framework, to ensure accountability and long-term sustainability of the program. URC/QAP will advocate for strategies to address male norms and behaviors (Key Legislative Area) specifically seeking their involvement in PMTCT and highlighting the importance of partner testing at all levels. In addition, the URC/QAP PMTCT program includes sensitizing staff to the importance of male testing and participation in PMTCT programs. Male counselors are being trained at some facilities, to enhance the current system. Promoting integration of services at the facility level ensures the development of links between services, promoting holistic care.

URC/QAP will contribute to 2-7-10 PEPFAR goals by ensuring a strengthened PMTCT program.

Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	3553.08	**Planned Funds:**	$1,649,000
Activity System ID:	13968		

Activity Narrative: SUMMARY:

The Human Sciences Research Council (HSRC) will provide technical support, including ongoing monitoring and evaluation (M&E) to prevention of mother-to-child transmission (PMTCT) activities in 50 antenatal care clinics (ANCs) and surrounding communities in the Eastern Cape and Mpumalanga. Once the PMTCT program in the Eastern Cape is running smoothly, HSRC will embark on similar activities in an underserved district in Mpumalanga. The District in Mpumalanga is still to be determined and will be determined in consultation with the provincial department of health. The major emphasis area will include quality assurance and supportive supervision, with community mobilization, local organization capacity development, strategic information, and training as minor emphases. The primary target populations include pregnant women, people living with HIV and AIDS (PLHIV), families affected by HIV and AIDS, public and private healthcare workers, community-based organizations (CBOs) and non-governmental organizations (NGOs).

BACKGROUND:

This project will contribute to the PEPFAR objective of preventing HIV infections in the PMTCT priority area. The project was in the FY 2006 and FY 2007 COPs, but is currently in the early stages of implementation because funding was awarded late. At the request of the provincial government, the district was changed and it took longer to establish partnerships with provincial and local health authorities than anticipated. HSRC will provide technical support for the implementation of PMTCT services according to national guidelines, and will seek to actively engage communities served by the specified ANCs. HSRC will also seek to establish partnerships with relevant CBOs and NGOs conducting HIV-related work in the area, develop reciprocal referral networks and strengthen peer support group systems to enhance family support (especially husbands, partners, mothers and mothers-in-law) and support from traditional birth attendants (TBAs) for the PMTCT program.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Rapid Assessment

Using FY 2006 funding, a baseline assessment is currently underway to identify gaps and challenges to PMTCT implementation in the district. The assessment will identify program elements that are in need of strengthening, and provide a baseline measure by which to assess the success of systems strengthening activities.

ACTIVITY 2: Systems Strengthening

Once the baseline assessment has been completed, program strengthening activities will commence.

HSRC will promote the use of health facilities for newborn delivery among pregnant women and their families. All pregnant women attending the 26 antenatal clinics in the Kouga Local Service Area (LSA) of the Eastern Cape will be encouraged to have confidential counseling and testing (CT) for HIV infection during pregnancy. Women who test HIV-positive will be referred to the nearest accredited ART site for clinical staging, a CD4 count, and initiation of ART, if indicated (according to the national ART guidelines). Women who do not meet the criteria for initiation of ART will be referred to a wellness program and/or relevant social support services. HIV-infected pregnant women will be counseled about disclosure, and encouraged to refer their partners for HIV testing. Women identified as HIV-infected during pregnancy (and who do not have long-term ART initiated prior to delivery), and their infants, will be given a short course of ART prophylaxis at delivery for PMTCT. This regimen will be adapted once the dual therapy protocol becomes policy in the Eastern Cape province. HIV exposed infants will be tested using PCR, and at 15 to 18 months using appropriate tests to determine their HIV infection status. Infants found to be infected will be referred to the local health services for follow-up, monitoring and initiation of treatment if eligible. Most of the programmatic work will be done by staff already employed by district health services, or by traditional birth attendants in the target communities. FY 2008 PEPFAR funds will be used to employ additional staff to strengthen PMTCT programs in the Kouga area. The Eastern Cape Department of Health has agreed to take over the funding of these positions after the initial phase of system strengthening.

ACTIVITY 3: Technical Assistance

HSRC will provide technical assistance to strengthen M&E systems and will seek to coordinate the M&E and PEPFAR-related reporting activities with routine district health M&E activities to minimize any unnecessary duplication of work. At the clinic level this will be paper-based. HSRC will employ a dedicated M&E specialist, a community engagement and outreach activity specialist, and a data manager. HSRC will mobilize community leaders, FBOs, CBOs, district councils, traditional leaders and traditional birth attendants in the region to support PMTCT interventions.

ACTIVITY 4: Expansion

Activities will be expanded with FY 2008 funding to include:

PMTCT program integration (wraparound) with family planning, reproductive health, and ART services, and positive prevention interventions for HIV-infected women in the Kouga Local Service Area (LSA). The impact of the project on the PMTCT delivery system in the Kouga LSA will be monitored, and when service delivery quality is satisfactory, support will gradually phase out (based on service delivery indicators and achievement of more than 80% PMTCT uptake in the district), and similar program implementation and support service activities will be initiated in a new geographic region in an underserved area of Mpumalanga province. The area will be selected in consultation with the provincial department of health and the CDC, and an analysis of key PMTCT indicators by district. The district with the most need will be selected. This activity will increase gender equity in HIV and AIDS programs by increasing women's access to HIV information, treatment, care and support.

The HSRC PMTCT Program contributes to the PEPFAR 2-7-10 goals and objectives by strengthening PMTCT service delivery, increasing uptake of PMTCT and decreasing the number of new infections.

Funding Source: GHCS (State)

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 3338.08

Planned Funds: $200,000

Activity System ID: 13985

Activity Narrative: SUMMARY:

At the request of the National Department of Health and CDC, Leonie Selvan Communications (LSC) will continue to use PEPFAR funding to broaden the current integrated prevention of mother-to-child transmission (PMTCT) strategy to ensure improved implementation and integration of PMTCT on national, provincial and facility levels. LSC are continuing to build on the integrated PMTCT strategies developed by Kagiso Communications using FY 2005 funding, while broadening the scope of the strategies to cut across the three levels of implementation. The primary emphasis area for the activity is local organization capacity development; with secondary emphasis on community mobilization/participation, training, development of network/linkages/referral systems, information, education and communication (IEC), quality assurance and supportive supervision. Target populations include South African Government workers, public healthcare workers, traditional leaders, traditional healers, traditional birth attendants, family planning clients, pregnant women, people living with HIV and AIDS (PLHIV), families of PLHIV, community-based organizations (CBOs) and non-government organizations (NGOs).

BACKGROUND:

Using FY 2005, FY 2006 and FY 2007 funding, LSC has facilitated the development and implementation of a national training curricula for professional healthcare workers and community healthcare workers. The focus of the South African National PMTCT curriculum is PMTCT and infant feeding. This is a five-day intensive curriculum that focuses on all aspects of maternal and child health in the context of HIV. Using FY 2007 funding, LSC conducted a stakeholder's analysis to identify all PMTCT activities around the country, identify overlaps in services, gaps and challenges. Results of the stakeholder's analysis will be presented at a PMTCT stakeholder's forum in November 2007. At this forum the National PMTCT Program Manager will encourage better collaboration between donors, stakeholders and ensure that PMTCT support reaches areas of greatest need. Using FY 2008 funding, and the results of the stakeholder analysis Leonie Selvan Communications will facilitate the development of one national PMTCT implementation plan and will convene two stakeholder forums to ensure stakeholder collaboration monitor progress on the national implementation plan. In addition, Leonie Selvan Communications will continue to work with PMTCT course directors and trainers facilitating the development of a mentoring system to support healthcare workers at the facility level. At the national and provincial level, the LSC will also focus on strengthening of linkages and networks between PMTCT and treatment programs, ensuring that pregnant women who test positive are staged and referred for monitoring. While much of the emphasis during 2007 has been on assessing and developing tools to meet the activities and strategies described above, the focus during 2008 will be on implementation and assessment of the success of these activities.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Identification of Gaps and Bottlenecks to PMTCT Implementation and strengthening collaboration between stakeholders and donors.

Although the PMTCT program is five years old, challenges to implementation are still inherent in the program. There are a substantial number of partners supporting the national PMTCT program, and a large number of donors working with provincial and national government. However, uptake remains at 55% and nevirapine only reaches about 30% of women who need it. This is partly due to a lack of collaboration by stakeholders and donors, and support not covering many of the high transmission areas. At the request of the national department of health, LSC will convene two stakeholder forums. At the first stakeholder forum, LSC will present the stakeholders analysis conducted in FY 2007 and, together with the national PMTCT program, identify geographical gaps in stakeholder support, gaps in service delivery and challenges to quality PMTCT implementation. LSC, together with the CDC's NDOH -laced technical advisor will work with the national program to develop one PMTCT operational plan. A second stakeholder forum will be conducted six months after the completion of the national operational plan. The purpose of the second stakeholder forum will be to monitor progress towards implementation of the plan. The stakeholder forum will bring together stakeholders from government, universities, implementing partners, NGOs, CBOs, donor organizations, traditional healers and traditional leaders. Expected results of this activity include the development and implementation of program-specific activities to address challenges to PMTCT uptake and ensure greater coverage of PMTCT service delivery.
.
ACTIVITY 2: Development of Mentorship Program

Using PEPFAR funding, Leonie Selvan Communications will continue to work with the NDOH, provincial PMTCT course directors and trainers. Provincial course directors and provincial trainers are responsible for the implementation of in-service PMTCT and Infant Feeding training for cadres of health care workers involved in maternal and child health service delivery. FY 2008 funding will be used to set up and maintain a mentoring system for healthcare workers and community healthcare workers. A core group of course directors and trainers from each province will be identified and trained as mentors to assist healthcare workers with implementation at the facility level after they have attended training. The role of the mentor will be to ensure that training translates into improved service delivery. In addition, funding will be used to facilitate a mentor network allowing the mentors to support and assist each other. The mentorship program will also ensure that individuals working at the National AIDS hotline are trained in PMTCT issues and that counselors answering the phones are able to answer questions appropriately. Expected results of this activity will be capacity building of healthcare workers and community healthcare workers.

ACTIVITY 3: Development of Tools to Strengthen Linkages between PMTCT and Treatment Programs.

One of the priority areas identified in order to improve PMTCT service delivery for FY 2008 is to strengthen linkages between PMTCT and treatment, care and treatment programs. One of the downfalls of the PMTCT program is that service delivery takes place away from the treatment program. HIV-infected pregnant women are identified during antenatal care, but in many cases do not receive a CD4 test, and referred to treatment programs if eligible. The national policy states that all pregnant women testing positive should be staged and referred to antiretroviral services. However, the reality is that most HIV-infected pregnant women are not given a CD4 test and are not referred to treatment programs for monitoring. As a result, after delivery, most of these women are lost to follow up and only show up at health facilities with advanced stages of AIDS. To address this challenge, PEPFAR funding will be used to work with the national and

Activity Narrative: provincial departments of health to develop strategies for healthcare workers to ensure better linkages between PMTCT and treatment programs. Since this activity is coordinated through the NDOH, all PEPFAR supported partners will participate in activities aimed at addressing these challenges. This will also ensure that all tools being used by PEPFAR partners are in line with the NDOH PMTCT messaging.

These activities contribute to the 2-7-10 PEPFAR goals by ensuring improved PMTCT implementation, identifying women eligible for antiretroviral treatment (ART) early and ensuring appropriate monitoring of HIV-infected pregnant women. This will result in a significant number of infections averted via vertical transmission and a great number of women enrolled in ART programs.

Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	2952.08	**Planned Funds:**	$194,000
Activity System ID:	13996		

Activity Narrative: SUMMARY:

Management Sciences for Health/Integrated Primary Health Care Project (IPHC) in collaboration with the National Department of Health (NDOH) will support the expansion of Prevention of Mother-to-Child Transmission (PMTCT) services at 80 public health facilities (hospitals and clinics) in eight districts in five provinces (Eastern Cape, Mpumalanga, KwaZulu-Natal, Limpopo and North West) by building human capacity of health workers to provide comprehensive PMTCT care. IPHC capacity building activities will include training, mentoring, coaching and supporting healthcare providers to provide quality PMTCT services to all antenatal care (ANC) clients in the facilities that are being supported. Providers' skills will be enhanced to strengthen infant feeding counseling and contribute to a reduction in HIV transmission from mother-to-infant in line with South African Government (SAG) guidelines. The target populations include adults, pregnant women, HIV-infected pregnant women, HIV-exposed infants (zero to five), nurses, other healthcare workers, community leaders and traditional healers. The major emphasis area is quality assurance and supportive supervision, with minor emphasis on community mobilization/participation and training.

BACKGROUND:

IPHC will work with the Department of Health (DOH) service providers at the facility level to increase the uptake for HIV counseling and testing during antenatal care visit; increase the number of HIV-infected mothers and infants on prophylactic treatment; and increase the support for infant feeding practices and referral for antiretroviral treatment (ART) when required. IPHC will improve the quality of the service by integrating PMTCT into routine Maternal, Children and Women's Health (MCWH) services. Through integrating maternal and women's health and family planning programs, IPHC will pay special attention to HIV-infected mothers who fall pregnant. These programs will ensure that HIV-infected women are aware of the risks associated with mother-to-child-transmission and are able to make informed choices about contraception. IPHC will strengthen the community support of HIV-infected mothers through post-test support groups and ensuring linkages with community home-based care organizations. Strengthening Pharmaceutical Systems (SPS) will partner with IPHC to provide support with PMTCT drug logistics.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

IPHC will train several hundred healthcare providers (both professional and non-professional) in eight districts in five provinces on comprehensive PMTCT service delivery using the South African NDOH national PMTCT training guidelines and curriculum. Training is usually on-the-job training, but is complemented by two-to-three day intensive sessions on topics such as PMTCT updates. The training will be a participatory activity with the district management teams to ensure that the training is fully integrated into the provincial PMTCT training plans and is sustainable. Health service providers will be trained to counsel and test pregnant women and their partners, promote exclusive infant feeding for prevention of HIV transmission from mother to child, conduct clinical staging of the HIV-infected pregnant mother, tuberculosis (TB) screening and treatment of opportunistic infections (OI). They will also receive training on appropriate client screening mechanisms and referrals for antiretroviral (ARV) triple therapy and provision of ARV prophylaxis to HIV-infected mothers who do not qualify for triple therapy. IPHC will train service providers from the eight districts in five provinces, increasing the number of health service providers with PMTCT skills and improving the quality of PMTCT care. IPHC will coordinate with provincial governments in each province to ensure the training is supportive of ongoing provincial PMTCT training efforts and may include co-funding workshops with DOH to ensure sustainability. The newly acquired skills of trainees will be strengthened through on-site mentoring and coaching by IPHC technical staff, who will visit each facility/CBO/FBO at least twice a month to provide on-the-job support to healthcare staff, and in-service training of facility staff on specific interventions for increasing PMTCT uptake. These may include provider-initiated counseling and testing (opt-out) to all ANC clients.

ACTIVITY 2: System Strengthening

The focus of this activity will be to improve the quality of counseling services, logistics and commodity management to ensure adequate supply of PMTCT-related commodities such as HIV test kits, nevirapine and infant formula at the facility level. In addition, since the South African Government has recently announced a policy shift from single dose nevirapine to dual therapy, this activity will also work with the facilities to ensure adequate supply for the rollout of the new regimen. Emphasis will be placed on record-keeping, reporting systems to improve data accuracy, quality of reports and data usage at facility level. In addition IPHC will integrate PMTCT services into routine maternal and child health services to broaden the use and availability of PMTCT services and will focus on improving mother-baby follow-up tools to track the infants born to HIV-infected mothers. This is in line with the South African Government (SAG) policy of testing babies born to HIV-infected mothers at specified intervals. DOH Program managers and supervisors will be supported to strengthen referral systems between the three healthcare levels (e.g. Primary Health Care, District, and Tertiary hospitals) and to ensure that ongoing support and mentoring is provided to facility staff. IPHC will provide technical assistance support, mentoring and coaching to the facility health service providers in the eight districts to standardize referrals and ensure that all referrals are followed up and monitored to ensure that the client has received the required service.

ACTIVITY 3: Building Community Networks

IPHC will support community groups to encourage and advocate for couples counseling and testing (CT) and to encourage more men to get tested. Traditional leader forums, community-based organizations, and NGOs will identify community sources of supportive encouragement and follow-up for HIV-infected mothers and their infants. Traditional leaders will be trained to increase and mobilize male/partner understanding of HIV and AIDS and the need for CT and PMTCT and so strengthen the support network for the mother. Community healthcare workers will be trained to promote and counsel for exclusive infant feeding practices among HIV-infected women, tracking infants to ensure follow-up and nutrition support for mothers. IPHC will assist districts to implement and strengthen counseling and support for HIV-infected pregnant women.

While activities from FY 2007 are still ongoing, FY 2008 COP activities will be expanded to include and

Activity Narrative: focus on increasing the number of pregnant mothers at IPHC supported facilities who are receiving clinical staging and appropriate referral to treatment, care and support services during pregnancy. This will be accomplished through in-service training and on-site mentoring. IPHC will work with other partners like Regional Training Centers in Eastern Cape and ECHO Project in Limpopo which focus on training pediatric doctors in /HIV and AIDS. PMTCT training will include coding mothers and babies, ensuring that mother receive nevirapine during labor, CD4 cell count, and following-up of babies at six weeks and advice on infant feeding. IPHC will work with the facilities to review the discharge plan and monitor for mother-baby pairs and identify quality assurance interventions that need to be implemented. In addition, IPHC will develop strategies to reduce the number of missed opportunities and ensure that the number of HIV-infected pregnant women receiving prophylaxis is increased by reviewing the PMTCT data in the clinics and coaching clinic staff on the importance of PMTCT and its related data management. Furthermore, IPHC will improve the current system to ensure that mothers understand and comply with infant feeding options through the community IMCI support groups and community home-based care groups. IPHC will also strengthen the management of babies born to HIV-infected mothers and/or of mothers with unknown status in order to refer the children for 6 weeks Polymerase Chain Reaction (PCR) testing, and increase family planning uptake among mothers who are HIV-infected to prevent unintended pregnancies.

The IPHC Project will help PEPFAR reach the vision outlined in the USG South Africa five-year strategy by increasing access to PMTCT services, improving the quality of PMTCT care services and increasing the awareness and demand for PMTCT services, thereby contributing to the 2-7-10 goal of seven million HIV infections averted. These prevention outcomes are in line with the USG goal of integrating maternal and child services into the primary healthcare system in South Africa.

Activity Narrative: SUMMARY:

mothers2mothers (m2m) will implement activities to improve the effectiveness of prevention of mother-to-child transmission (PMTCT) in HIV programs. Services are carried out through facility-based, peer education and psychosocial support programs for pregnant women, new mothers and caregivers, all living with HIV and AIDS. There are four components of the program: curriculum-based training and education programs; psychosocial support and empowerment services; programs to increase uptake for counseling and testing; and bridging services linking PMTCT treatment and care to antiretroviral treatment (ARV) and other health services. The primary emphasis areas are human capacity development (training) and local organizational capacity building. The target population is people living with HIV and pregnant women.

BACKGROUND:

m2m is a South African-based international NGO established in 2001 to help enhance and support publicly-funded PMTCT programs through peer education and psychosocial support for HIV-infected pregnant women and new mothers. With PEPFAR's support, m2m will increase the effectiveness of PMTCT services through a comprehensive program of facility-based, peer education and psychosocial support for pregnant women, new mothers and caregivers living with HIV and AIDS. m2m addresses issues of stigma through group counseling, support groups, and linkages to income generation. All activities have been and will continue to be coordinated with local PMTCT service providers and their partners, and will also be carried out in conjunction with provincial, district and municipal health authorities. The programs have the active support of the Departments of Health for KwaZulu-Natal, Mpumalanga and Western Cape provinces and will be integrated into their healthcare structures. Current m2m programs are located in over 90 healthcare facilities in four provinces in South Africa as well as in Lesotho. With funding from the PEPFAR New Partners Initiative, m2m will initiate service provision in Kenya, Rwanda and Zambia in 2007/2008. With FY 2008 funding, m2m will enhance the existing South African program sites and improve infrastructure, while adding significant numbers of facilities in these provinces. By the end of FY 2007 m2m will be active and will have launched sites in one of the following three provinces: Northwest, Limpopo, Gauteng. In the remaining two provinces, preparation during FY 2007 will have laid the ground work for implementation and site start-up so that these sites will be ready to launch as early as possible in the following year. With the work of FY 2007 as a foundation for expansion, in FY 2008, m2m will continue to build the program and increase service provision in new provinces and with new partners who offer antiretroviral care and treatment services. By the end of FY 2008, m2m will have established service in up to 200 sites throughout seven provinces in South Africa.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development and Training
PEPFAR funding will be used to support the delivery of a cascade of curriculum-based training for m2m mentors and education programs designed to improve PMTCT outcomes through education and training of pregnant women and new mothers with HIV and AIDS. The training curriculum that is given to m2m staff provides guidance about PMTCT and ARV treatment tied to maternal and infant health, with the objective of encouraging women living with HIV (PLHIV) to take responsibility for their own health, their child's health, and the health of their partners. Additional critical subjects covered in the training include disclosure, safer feeding options, family planning, nutrition, couples counseling, and prevention guidance for these PLHIV and their partners ("Prevention with Positives"). An intensive two week training course is given to all m2m Site Coordinators (SC) and Mentor Mothers (MM), all of whom are PLHIV. Training for Site Coordinators includes an additional week of management training (3 weeks of training total). m2m staff, in turn, provide curriculum-guided education and support (individual and group) to mothers in PMTCT programs during antenatal care, post-delivery recovery, and at their return to clinics after delivery. Annual training is given to all staff, inclusive of new staff and retraining for existing staff. m2m does not provide formal training on direct PMTCT service provision for healthcare providers, including doctors and nurses. With FY 2008 PEPFAR funding, m2m will add a complement of trained PMTCT care providers (SCs and MMs) to supplement the resources of frequently overburdened local healthcare providers in 3 new provinces. m2m will also use funding to continue to support existing sites and open new sites. Simultaneously, the program will also hone the skills and knowledge of existing healthcare staff in PMTCT related care and support. The lasting impact of these activities will make a significant contribution to the sustainable development of the capacity of local organizations. Through expanded partnerships with providers of ART, m2m will also be able to train the staff of these organizations and have an impact on ARV care and treatment service providers.

ACTIVITY 2: Service and Mentoring

PEPFAR funding will be used to provide individual and group psychosocial support and empowerment programs for pregnant women and new mothers with HIV and AIDS to help them with issues including stigma and discrimination, disclosure, reducing risky behavior ("Prevention with Positives") and pediatric support. Nutritional support and guidance is also part of the programs. A related activity focuses on providing specific support programs for the MMs and SCs ("Care for Caregivers"), contributing to their own physical and emotional well-being as well as that of their clients. One objective of both group and individual support is specific knowledge transfer around the many issues women living with HIV and AIDS faces in navigating the PMTCT process. Another outcome is empowering the women to focus on and take responsibility for the health of their babies, and their own health. By encouraging behaviors that can help mothers sustain their well-being, the programs aim to reduce the potential that their children could become Orphans and/or Vulnerable Children (OVC). While m2m does not provide formal referrals for healthcare, MMs are well informed about where services are available and they inform women about how to access both medical and social services. The program addresses the reality of the high rates of violence against women in the communities served, as well as the specific ties between HIV and domestic violence. They provide tactical as well as emotional support aimed at helping women confront this issue and reduce their likelihood of becoming targets and victims. Women who come to the program are also giving information about income generation projects in their area and are encouraged to participate in such programs.

ACTIVITY 3: Counseling and Testing

Working in close partnership with local health and government programs, m2m will facilitate the integration

Activity Narrative: of MMs and SCs into the antenatal intake process at both the community and facility levels. In this role, they will focus on increasing counseling and testing uptake by serving as committed advocates, working with women like themselves and drawing on their training and their own personal experience. Through this program, the MMs and SCs also provide significant support for Pediatric Counseling and Testing during home visits by advocating for pregnant women to return to clinics post-delivery to test their infants, supporting the women in the post-delivery period, and providing referrals of babies to testing and treatment programs.

ACTIVITY 4: Linkages and Referrals

This activity provides linkages and referrals in various forms including creating a bridge between PMTCT services and other health and empowerment services. In active collaboration with local and provincial health officials, PEPFAR funding is used to link ante/post natal women to programs providing wellness care for themselves and their infants, and to refer women and infants with AIDS-defining conditions to ARV therapy programs. With FY 2008 funding, m2m will expand partnerships with service providers of ARVs in order to become fully integrated into HIV and AIDS care and treatment programs throughout South Africa. Working at sites where ARV treatment is provided, m2m will be able to assist in the process of steering pregnant and post-delivery women in need of referral for ARV care and treatment to these services.

The above results contribute to the PEPFAR 2-7-10 goals by increasing the number of women cared for by PMTCT programs; by improving prevention (PMTCT) outcomes, thus reducing the number of infected children; and by increasing the number of pregnant women, new mothers, and infants receiving treatment by providing a referral system from PMTCT to ARV services.

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID:	4756.08	**Mechanism:**	N/A
Prime Partner:	PATH	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	8248.08	**Planned Funds:**	$3,104,000
Activity System ID:	14261		

Activity Narrative: SUMMARY:

The PATH prevention of mother-to-child transmission (PMTCT) project will improve the quality, availability, and uptake of comprehensive PMTCT services in Eastern Cape by strengthening systems that support the delivery of high-quality, comprehensive PMTCT services, building the capacity of health facilities and staff to provide comprehensive PMTCT services, and increasing community engagement and leadership in promoting, supporting, and utilizing PMTCT services. Emphasis areas include training and community mobilization/participation, with minor emphasis on quality assurance and supportive supervision. Primary target populations include people living with HIV (PLHIV), pregnant women, HIV-exposed and infected infants, South African-based volunteers and nurses, and provincial and district HIV and PMTCT coordinators.

BACKGROUND:

With FY 2007 funding, PATH in collaboration with the Eastern Cape Department of Health (ECDOH) initiated a PMTCT program in Amatole, OR Tambo and Cacadu districts. The PATH PMTCT program supports the South African Government's HIV/AIDS/STI Strategic Plan for 2007-2011, the Eastern Cape's Comprehensive HIV/AIDS/STI/TB Program, and the Strategic Plan for US-SA Cooperation. PATH, the prime partner, provides technical, programmatic, and financial leadership. The ECDOH, provides all the facilities, systems, and local personnel. Health Information Systems Program (HISP) is responsible for monitoring and evaluation. South African Partners, an NGO, leads the community support and mobilization interventions. There is also a small grants program for community-based organizations. PATH will address the root causes of gender inequity by examining values and norms. The project provides information and support for infant feeding choices and helps clients assess their needs, considering issues such as the risk of stigma and discrimination associated with not breastfeeding. The project provides holistic psychosocial support to HIV-infected women. Community mobilization is led by PLHIV leaders--the majority of whom are women, to increase knowledge about PMTCT, promote understanding of PMTCT as the equal responsibility of men and the community, and work toward transforming current norms, stigma and discrimination that hold women solely responsible for having HIV and transmitting HIV to children.

ACTIVITIES AND EXPECTED RESULTS:

This program will strengthen the ability of current PMTCT facilities to provide a minimum package of services, enable the ECDOH to expand PMTCT services by training and supporting providers such that they can provide comprehensive services, and raise awareness of and support for PMTCT service use within communities. The project is focused on the public sector and dependent communities only.

ACTIVITY 1: Systems strengthening

Building on FY 2007 activities, FY 2008 resources will be used to ensure continuity of system strengthening activities. One set of interventions will strengthen human resource capacity: training existing but untrained facility staff (e.g., nurses, midwives, lay counselors) to provide PMTCT services, reinforcing the skills of current PMTCT staff, and orienting other staff (e.g., child/wellness clinic nurses, community health workers) who help ensure a continuum of care. Training will focus on HIV counseling and testing, measuring CD4 cell counts, clinical staging, psychosocial support, antiretroviral treatment (ART), and follow up and care for the exposed child, including piloting polymerase chain reaction (PCR) testing. A second set of interventions will ensure that monitoring and supervision systems are fully operational at all levels (district, local service area, facility), providing on-site technical support as needed. A third set of interventions will strengthen ECDOH data and logistic systems, improving the quality of data recorded, collected, reported, and used at all levels. The project will also work with the ECDOH to address specific policy and guideline issues that directly affect PMTCT services. Finally, the project will improve referral systems, especially referral of pregnant or postpartum women and their children to antiretroviral (ARV) care and treatment sites and pediatric centers.

ACTIVITY 2: Capacity building

The project works at all levels of service delivery to strengthen the provision of high-quality, comprehensive PMTCT services. The project will focus on priority hospitals and select feeder-community health centers and clinics to ensure that women have access to the full continuum of PMTCT services, from the first antenatal care visit through follow-up of the mother and baby after birth. The package of interventions will be tailored to each facility's needs and may include training in essential PMTCT skills, monitoring and supervision to maintain high-quality services and/or upgrade staff skills, data management for ongoing corrections and decision-making, integration of services to give women and babies necessary care and treatment, and linkages to the community so that PMTCT is accepted and used widely.

ACTIVITY 3: Increasing community engagement and leadership

One of ECDOH's priorities is to broaden the role of the community in promoting, supporting, and utilizing PMTCT services. This includes providing health education, reducing stigma, generating demand for services, working with the partners and families of HIV-infected women to increase support for PMTCT, developing community networks for client follow-up, and strengthening tangible links between the community and the facility. Underlying these interventions is the need to build capacity of community networks and organizations to implement and monitor programs. Interventions will strengthen HIV prevention programs, provide PMTCT information, and reduce stigma in the community; strengthen peer support for HIV-infected pregnant women to increase demand for and adherence to PMTCT and ARV regimens; and improve community-facility collaboration to increase local ownership and utilization of services. The ECDOH is the driving force of this project and all of the investments in human capital will benefit their workers and the communities. Human capacity development is at the center of this project as described in the training and systems strengthening activities above.

ACTIVITY 4. Preparing for a transition to dual therapy for PMTCT

The new HIV & AIDS and STI Strategic Plan for South Africa calls for a new policy on the drug regimen used in PMTCT, suggesting that the policy should be updated according to the WHO Guidelines. The purpose of this activity is to conduct an assessment to assist ECDOH in planning for the implementation of

Activity Narrative: the policy change and to suggest a set of criteria to inform how and when the introduction of dual therapy should be introduced at the facility level. The assessment will look at the critical components of the health system including policy, financing, human resources, training, supply systems, service management and referrals, and information and monitoring systems to establish what will be needed to implement the pending policy. PATH will also establish a pilot project in six sites in the EC (upon ECDOH approval) and implement dual therapy services to establish a "better practice" model. This will be rolled out to other districts and facilities. In addition, PATH will work with the ECDOH to strengthen referral systems for HIV-infected pregnant women ensuring that all treatment eligible pregnant women are fast- tracked to treatment programs.

ACTIVITY 5: Maternal nutrition and infant feeding job aids and materials

In FY 2007 PATH developed a series of job aids and print materials for both health workers and mothers such as handouts on feeding options, flip charts and/counseling cards for infant feeding counselors on feeding options, AFASS, lactation and breastfeeding, etc., basic maternal nutrition guidance, a wall chart linking each antiretroviral drug with a statement on its implications for food intake at the time when it is taken, etc. FY 2008 activities will focus on dissemination and utilization of these materials.

FY 2008 COP activities will be expanded to include:

ACTIVITY 6. Creating Linkages between Reproductive Health (RH) and PMTCT

This activity will effectively link prevention of HIV and prevention of unintended pregnancies into PMTCT settings in the EC. The work will provide evidence-based information and recommendations for decision-makers and program managers to improve policy and practice for integrating RH services into PMTCT settings. Current integration policy and practices will be explored, as will client fertility intentions and desires. The community will be consulted on what services should be integrated and to strengthen community ownership of service delivery and to increase demand for RH services. The PMTCT continuum will be analyzed to determine when clients are most likely to want internalize information that could influence their uptake of services. Lay counselors and professional nurses will be trained and community mobilization will be expanded to improve access to and utilization of RH services.

ACTIVITY 7. Preparing nurse/midwives to expand their role in HIV and AIDS prevention and treatment

This activity targets professional nurses from maternity wards and expand their roles and responsibilities in terms of HIV prevention and treatment. The focus will be on hospitals where the need for task shifting is greatest. Activities will improve attitudes, motivation, knowledge and skills. Participatory training approaches will be used to work with this cadre to define the problems and to create solutions to ensure quality comprehensive services.

The PATH PMTCT project contributes to the PEPFAR 2- 7-10 goals by strengthening PMTCT services hence preventing vertical transmission of HIV.

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID:	1066.08	**Mechanism:**	PHRU
Prime Partner:	Wits Health Consortium, Perinatal HIV Research Unit	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	3103.08	**Planned Funds:**	$1,837,180
Activity System ID:	14262		

Activity Narrative: SUMMARY:

The approach taken by the Perinatal HIV Research Unit (PHRU) is one of comprehensive, high quality care and support for people living with HIV and AIDS (PLHIV). The PHRU will use PEPFAR funds to provide high quality coverage of prevention of mother-to-child transmission of HIV (PMTCT) in Soweto (Gauteng province) and Mpumalanga provinces. This will include support to pregnant women for pre- and post- test counseling and testing (CT), information on safe infant feeding choices, referral of women to appropriate HIV and AIDS treatment programs and support for early testing of infants exposed to HIV. The major emphasis area addressed is human resources; minor areas are information, education and communication, local organization capacity development and training. The target populations are adults, pregnant women, HIV-infected infants (0-5 years), PLHIV and their families.

BACKGROUND:

In partnership with the Gauteng Provincial Department of Health (DOH) the PHRU has been running the Soweto (Gauteng) PMTCT program since 2000. All pregnant women accessing public health antenatal clinics are reached, resulting in very high uptake rates. The PHRU offers post-partum counseling and testing (PPCT) in the maternity wards at the tertiary hospital (Chris Hani Baragwanath Hospital (Bara)) where most deliveries in Soweto take place, and provides post-exposure prophylaxis (PEP) to infants exposed to HIV. The PHRU has supported the Mpumalanga Provincial DOH by providing PMTCT service in the Bushbuckridge district since 2003. The PMTCT service is integrated into maternal and child health services. All activities are ongoing and are funded by PEPFAR. The close partnership with the DOH and emphasis on capacity building and training ensures sustainability of the programs. All PMTCT sites use rapid HIV tests with results given on the same day. Each day a group health talk is given, followed by individual pre-test counseling. After a pregnant woman voluntarily consents to testing, the test is conducted and the results given during individual post-test counseling session. Women testing HIV-infected are then provided with ARV prophylaxis following the South African Government (SAG) guidelines. The PMTCT program is an important entry point for HIV-infected women to access palliative care and antiretroviral treatment (ART) for themselves and their families. All women who test positive are referred for CD4 count tests, those with CD4 counts<200 cells/mm3 are referred for ART. Infants born to positive women are given nevirapine syrup in the labor wards and a PCR test is conducted at 4 to 6 weeks. Infants are given cotrimoxazole prophylaxis and other basic preventive care. Psychosocial support is provided through ongoing counseling and support groups. Information is provided on issues such as safe infant feeding practices, formula, nutrition, general healthcare, family planning, prevention for positives and disclosure. Negative women are provided with information on how to stay negative. Safe disclosure is encouraged to reduce stigma and violence. All women are encouraged to bring their partners for testing to increase male involvement in HIV and AIDS care and treatment programs and to improve male involvement in PMTCT and reduce stigma. Health workers and lay counselors are mentored, provided with debriefing and continuous in -service training on PMTCT and developments in the field.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: PMTCT, Gauteng (urban township)

The PMTCT program in Soweto is considered a best practice model for PMTCT in South Africa with greater than 96% uptake at each stage of the cascade. The program is ongoing and will continue operating in all Soweto public antenatal clinics with funding from PEPFAR and Gauteng DOH. Staff employed with PEPFAR funding offer PMTCT to around 30,000 pregnant women annually. Around 30% are HIV-infected and about 27,500 receive their results. Following SAG guidelines for PMTCT, positive women and their babies are provided with ARV prophylaxis. Support groups run at all clinics with emphasis on HIV information, prevention for positives, informed infant feeding choices, nutrition, safe disclosure to partners, etc. Partners are encouraged to come for testing and be involved in PMTCT. All HIV-infected women are referred for CD4 count tests and those with CD4<200 cells/mm3 are referred for ART. Currently over 60% of women accept the CD4 count test with half receiving their results. The introduction of PCR testing for infants by DOH provides the opportunity for early infant diagnosis of HIV and referral for appropriate treatment and care, currently more than 50% of babies are tested. During FY 2008, the program will become more closely integrated with ARV treatment and will improve gender equity in treatment programs.

ACTIVITY 2: Post-Partum Counseling and Testing (PPCT), Gauteng (urban township)

Each year, two thirds of births (around 20,000) in Soweto occur at Bara Hospital. Around 3,000 women at the time of delivery present with an unknown HIV status. In this ongoing activity, staff funded by PEPFAR work with DOH staff to provide PPCT. A PEP dose of nevirapine syrup is provided for HIV-infected mothers' infants to reduce the risk of transmission. It has been shown that a post-exposure prophylactic dose of nevirapine is effective if given to infants within 72 hours of birth. Approximately 2,500 women are offered PPCT, about 2,000 accept and receive their results. Around 30% of these test HIV-infected. Over 98% accept nevirapine for their infant. The uptake of the program is high and operates seven days a week to ensure access for all women giving birth. Women who tested negative early in pregnancy will be offered a follow-up test. Positive women identified at the time of delivery are provided with psychosocial support through counseling and groups, referred for CD4 count tests and early infant diagnosis.

ACTIVITY 3: PMTCT, Mpumalanga (rural facilities)

PMTCT in the Bushbuckridge District is run by the provincial DOH. The PHRU and HIVSA, support PMTCT at Tintswalo hospital with PEPFAR funding. Activities include mentoring the counselors, assisting with referrals and providing education and support to pregnant women. Each year, around 4,000 women deliver at the hospital; about 25% are HIV-infected. PHRU will liaise with the PMTCT service providers to ensure increased uptake of HIV counseling and testing. Following SAG guidelines, ARV prophylaxis is given to the mother and infant. Women testing positive are referred for CD4 count tests and to ART if CD4<200cells/mm3. All women are encouraged to bring their infants for testing at 6 weeks. Support groups and counseling are available with emphasis on informed safe infant feeding practices, nutrition, disclosure to partners, early infant testing, HIV information, etc. HIVSA provides support groups in the district primary care clinics assisted by a US-based volunteer.

Activity Narrative: These activities directly contribute to the PEPFAR 2-7-10 goals by improving access to and quality of PMTCT services, testing pregnant women, identifying HIV-infected persons, reducing transmission to infants and improving access to care and ARV treatment.

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 2971.08

Planned Funds: $291,000

Activity System ID: 14269

Activity Narrative: SUMMARY:

Population Council (PC) is using PEPFAR funding to provide technical assistance (TA) to the KwaZulu-Natal Department of Health (KZN DOH) in the development of a provincial antenatal (ANC) and postnatal (PNC) policy and evidence-based comprehensive guidelines. These will incorporate aspects of HIV prevention, counseling and testing (CT), prevention of mother-to-child transmission (PMTCT), antiretroviral (ARV) and male involvement, which are aimed at providing pregnant women, their partners and infants with quality comprehensive care during the ANC and PNC period. The target populations for this activity are people living with HIV and AIDS, HIV-infected pregnant women, and program managers. The emphasis areas for this activities are local organization capacity development (major), strategic information, and human capacity development (training and task shifting).

BACKGROUND:

PC currently provides TA using a participatory methodology aimed at ensuring that local, national and international evidence, and relevant guidance from the vertical HIV related programs (CT, PMTCT, and ARV) feed into the development of comprehensive and integrated provincial ANC and PNC policies and guidelines. This ongoing project, which commenced in 2004 with PEPFAR funding, is carried out in collaboration with the Reproductive Health and HIV Research Unit (PEPFAR funded) and two KwaZulu-Natal DOH directorates (Maternal Child and Women Health [MCWH]/PMTCT, Sexually Transmitted Infections [STI]). The KZN MCWH is the lead for the provincial "Core Team". The overall function of the Core Team is to steer the development of policy and guidelines. To date, multiple stakeholders and the Core Team have developed drafts of both the policy and guidelines. As part of the process to inform the development of the policy and guidelines, the Core Team conducted focus group discussions with pregnant women to identify their maternal health needs. Further resources, including monitoring and evaluation tools, a set of job aides and training materials had been developed to support the implementation of the policy and guidelines.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Continued technical assistance to the KZN DOH in support of the implementation of the policy and guidelines

PC will provide ongoing TA to the KwaZulu-Natal DOH as key drivers of the comprehensive and evidence-based policy and guideline development. The development of the policy and guidelines has been a provincial process which has mainly been driven by the MCWH/PMTCT program. As a way of strengthening integration at district and facility levels and for sustainability of the implementation of the guidelines, technical assistance will be expanded to other programs which are STI, HIV and AIDS, ART, VCT, TB and gender. Task teams representing these programs will be formed to assist in driving the implementation of the policy and guidelines. Specific support will include assistance with the development of district work plans for implementation, development of health delivery systems as well as continued training on M&E. Ongoing support will be provided to the relevant programs to identify any implementation issues and further training will be organized where necessary. PEPFAR funds will be utilized for conducting feedback/debriefing sessions, facilitating the development of health delivery systems, coordination of the development of district work plans and training. The target population for this activity involves program managers and health providers of the six programs listed above.

ACTIVITY 2: Supporting and evaluating the effectiveness of the implementation of the comprehensive policy and guidelines in improving maternity care at provincial level

In order to improve the implementation of the policy and guidelines, the evaluation will take several forms (testing the effectiveness of job aides and training materials, M&E tools, training of trainers, assessment of provider attitudes, as well as ANC and PNC client satisfaction assessment). Based on the outcome of this evaluation, identified gaps will be addressed and relevant adaptations will be made. PEPFAR funds will be used for the design of data collection methodology and tools, training of data collectors, collection of data, data entry, analysis and interpretation of the evaluation data at facility level.

This activity will contribute to the overall PEPFAR goals of preventing 7 million new infections by strengthening PMTCT programs with policy and guidelines and an implementation plan in the province most affected by the HIV and AIDS crisis.

Prime Partner: Absolute Return for Kids

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 13355.08

Planned Funds: $727,500

Activity System ID: 13355

Activity Narrative: SUMMARY:
Absolute Return for Kids' (ARK) focus is to provide a comprehensive care package for PMTCT services to HIV-infected mothers and their children through partnerships with local government health facilities. ARK's primary emphasis has been in areas of human capacity development, local organization capacity development, and construction/renovation at about ten facilities. The target population is HIV-infected pregnant women and their infants.
BACKGROUND:
ARK is a charity organization whose mission is to facilitate and support delivery of accessible, sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and poverty. In partnership with the KwaZulu-Natal Department of Health (KZNDOH), ARK, has established an antiretroviral treatment program in government primary health facilities and hospitals. Specifically, ARK works with the KZNDOH to identify sites and areas for capacity building, including human resources, modest infrastructure support, and organizational capacity development. PEPFAR funding has enabled ARK to successfully enroll over 15,000 patients in ART in KZN with about 12000 remaining in care at ARK supported sites.

FY 2008 funding will enable ARK to expand its established ARV treatment program to include a comprehensive range of PMTCT services. These services will be supported by improvements in the infrastructure of targeted sites, and the provision and training of human resources in partner health facilities to further strengthen their capacity to deliver quality counseling and testing, treatment, care and support for HIV-infected mothers and their children.
ACTIVITIES & EXPECTED RESULTS:
ACTIVITY 1: Support to KZNDOH
ARK works with the KZNDOH to develop the necessary processes and systems to manage the PMTCT program, to ensure that the model implemented is scaleable, sustainable and replicable elsewhere. ARK's PMTCT program works within KZNDOH selected districts and focuses on strengthening the existing networks of operating clinics; capacity-building is site specific. Upon identification of a site, ARK conducts an analysis to identify staffing, clinical equipment, and infrastructure needs. The program works with facility management to prioritize and promptly address gaps and develop plans for manageable scale-up. ARK also assesses hospital patient data management systems and will employ and train, where needed, data capturers. The data capturers support both providers and facility administrators to strengthen the management and use of patient records systems for improved service delivery.

ACTIVITY 2: Human Capacity Development
ARK will conduct a thorough needs analysis of human resource capacity prior to initiating support to the PMTCT program at each site and recruit all the necessary medical staff required for the successful rollout of services. The staff recruited varies from site to site but include doctors, nurses, pharmacists, pharmacy assistants, medical technologists, facility-based counselors, and patient advocates. For all key staff, ARK will provide two-week orientation training based on the National PMTCT and Infant Feeding Curriculum and Methodology. The training and follow-up refresher courses cover all aspects of ARK's PMTCT program including employee policies and procedures, onsite mentorship from experienced ARK staff, and an introduction to key performance areas. The specific topics covered include: counseling and testing, treatment guidelines for pregnant women, management of opportunistic and sexually transmitted infections, adherence support as well as the value of community access, prevention counseling and patient advocacy. Staff are invited and encouraged to attend formal training offered by external providers including other PEPFAR partners such as the Foundation for Professional Development (FPD).

ACTIVITY 3: Counseling and Testing
ARK will focus on provider driven opt-out testing to all pregnant mothers entering the antenatal clinics. To better ensure sustainability, where possible, ARK will use the counselors available through the District HIV program and existing trained community care workers to provide counseling. Where needed, ARK will employ and train additional counselors. Counseling and ongoing training will be in line with the National Department of Health (NDOH) Guidelines. ARK will provide mentorship and supportive supervision to lay counselors to ensure high quality standards for CT. In accordance with NDOH standards, all testing will be conducted by trained medical staff (primarily nurses). Pre-and post-test counseling for all clients will include information on HIV & AIDS, STIs, prevention education, risk reduction strategies, and partner testing. Post-test counseling will further include information and support on treatment, care and support services, and positive living.

Formal and informal training and onsite mentorship will be provided to all lay counselors in the program. ARK, in partnership with the Centre for Social Science Research at the University of Cape Town, will continue to develop and improve training modules for lay counselors. The areas covered in training include: basic and advanced counseling skills, positive living, disease progression, opportunistic infections, risk reduction for HIV transmission and safer sex.

ACTIVITY 4: Treatment for HIV-infected pregnant women
All pregnant women testing positive for HIV will have an immediate CD4 test and will have a clinical assessment for the present of opportunistic infections and for staging. Women will receive nutritional counseling as well as counseling around feeding options for their babies. Exclusive breast feeding will be encouraged in those women who do not satisfy the AFASS principles for formula feeding. A particular focus will be on triaging pregnant women who are treatment eligible into treatment programs, and ensuring that women who are not treatment eligible are provided with the appropriate dual-drug prophylaxis (new DOH guidelines.) The process and follow up of women on triple therapy will be dependant on the facility. In some facilities this site will be in the same place as the antenatal service, in others the ARV treatment site will be separate to the antenatal clinic.

Upon registration into the PMTCT program, a paid trained patient advocate is assigned to the patient. The patient advocate conducts a pre-treatment home visit and provides ongoing support to the patient and her family. The patient advocate will accompany the mother to her antenatal visits, provide adherence support and referrals and follow-up as needed. Should a patient be non-adherent or lost to follow-up, the patient advocate will investigate the reasons for this, acting as the link between the patient and the clinic. ARK facilitates the integration process for ART, TB, palliative care and OVC care and support services where appropriate.

Activity Narrative: ACTIVITY 5: Pediatrics
HIV-infected pregnant women will be educated and encouraged during pregnancy to undertake post delivery testing for their babies. All children born to HIV-infected mothers will be closely followed up for any evidence of early deterioration and will receive NVP and AZT as per PMTCT protocol. At the six week visit, all HIV exposed babies will have a PCR test done, will be given cotrimoxazole prophylaxis and multivitamins to await the PCR result. Mothers with a CD4>350 or between 250-350 with WHO STG 1&2 will stop HAART if babies are exclusively formula fed OR after weaning if exclusively breast fed. Formula fed babies that test negative will be offered an Elisa at 18 months. Breast fed babies if tested negative will be offered a PCR at 12 weeks after weaning and if still negative an Elisa at 18 months. HIV-infected babies will be immediately referred to ARK's ARV treatment program and will have access to cotrimoxazole prophylaxis, multivitamin supplements and general nutritional advice, and breastfeeding counseling and support for the mother. The patient advocates (PA) will ensure that all babies are brought back for their immunization and testing for HIV will be actively encouraged by the community workers.

ACTIVITY 6: Family-Centered Care and Support Services
In an effort to encourage adherence among mothers and ongoing care for their infants, ARK's program takes an integrated maternal and child health care approach and extends care and support (including treatment literacy and prevention education) to all members of a patient's household. Together, facility-based counselors and patient advocates counsel mothers and their partners on treatment literacy, nutrition, safe infant feeding practices, and safe sex. They offer services within homes and provide encouragement and support to male partners to serve as "adherence buddies" in the management of care during pregnancy and after delivery. Patient advocates are also trained to provide basic psychosocial support and link mothers to individual counseling services and/or support groups.

ACTIVITY 7: Quality Assurance/Improvement
ARK provides computers and employs data capturers at all sites. Data is captured from patient folders and transferred to ARK's data center, allowing for ongoing evaluation and outcome analysis. Adherence rates, death rates and loss to follow-up are closely monitored. Quarterly updates are provided to the KZNDOH and information is used within the clinics to strengthen service delivery. All ARK staff are provided onsite, on-the-job training, followed with regular onsite mentorship and evaluation by ARK's national executive and provincial management teams. Informal training sessions are conducted quarterly. Staff are encouraged to attend formal external training courses offered by FPD.

These activities contribute to PEPFAR's 2-7-10 goals by increasing the number of South Africans on treatment and possible new infections averted among infants and children.

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID: 4616.08

Mechanism: N/A

Prime Partner: CARE International

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 12243.08

Planned Funds: $73,510

Activity System ID: 13701

Activity Narrative: SUMMARY:

CARE serves as an umbrella grant making mechanism for the Centers of Disease Control. CARE has been an umbrella grants mechanism since FY 2006. CARE's primary responsibility is for the financial oversight of the grant which includes review of the financial reports and on-site assessment of the supporting documentation. CARE does not provide programmatic level technical assistance to the sub-grantees. Technical assistance and programmatic over-site is provided by CDC activity managers. The specific activities that CARE is responsible are listed below. The target area for PMTCT umbrella grants mechanism is local organization capacity building. The target population is pregnant women and children under the age of five. Currently CARE support three indigenous organizations who are implementing PMTCT activities, these include Wits Health Consortium – National Health Laboratory Services; Nozizwe Consulting; and Leonie Selvan Communications.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: Contractual Responsibilities

CARE is responsible for the contractual arrangements of the sub-grants with CDC South Africa. These arrangements include application for funding for implementation of activities by the sub-grantees that have been approved by CDC South Africa to meet the PEPFAR goals. CARE will prepare all supplemental and continuation application, and ensure that progress reports are received by the sub-grantees. CDC activity managers will be responsible for the technical review of the sub-grantees; thus targets met by the sub-grantees for the PMTCT program will not be assigned to CARE.

ACTIVITY 2: Financial Oversight

CARE is responsible for the financial oversight of the sub-grants. This activity includes the review of financial reports submitted by the grantees on quarterly/6-monthly basis; and on-site assessment of the supporting documents to ensure compliance with the contract. These on-site assessments will be conducted on a 6-monthly basis. CARE will also ensure progress reports are received from the sub-grantees and approved by the activity managers of CDC South Africa on a quarterly/6-monthly basis prior to the disbursement of continuation funding.

Although these activities do not directly contribute to the overall PEPFAR goals and objectives, the Umbrella Grants Mechanism ensure that PEPFAR support can be given to small and medium-sized organizations, enabling them to facilitate the achievement of the PEPFAR 2-7-10 goals.

Mechanism ID: 190.08

Mechanism: N/A

Prime Partner: Aurum Health Research

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 13689.08

Planned Funds: $242,500

Activity System ID: 13689

Activity Narrative: SUMMARY:

Aurum will provide PMTCT services to patients in South African government clinics, GP practices and non-governmental sites. Emphasis will include the implementation of the PMTCT diagnosis and treatment protocols at the service outlets, early counseling and testing of pregnant mothers, provision of antiretroviral prophylaxis to HIV infected mothers both during the pregnancy and during delivery. Emphasis will also include provision of ARV to infants born to HIV mothers according to protocols and PCR of infants born to HIV-infected mothers. Also included in this activity is counseling on safe infant feeding practices and prevention of STI and HIV infection during pregnancy and while breast feeding. The primary target populations are HIV-infected pregnant women and their infants.

BACKGROUND:

Aurum Institute for Health Research (Aurum) is a not-for-profit, public benefit organization that is committed to improving the health of disadvantaged individuals and communities through transformational research (the research programs are not PEPFAR-funded), management of TB and HIV programs and provision of HIV testing, treatment and care. Aurum has received PEPFAR funding since October 2004. The main focus of the Aurum program in the public, private and non-governmental sector is to provide HIV care and treatment to a large number of persons in a cost-effective standardized manner ensuring a high quality of counseling, patient care and patient monitoring. The model is centrally coordinated and designed to be implemented on a large scale in peripheral sites that are resource-constrained and lacking basic resources such as HIV specialists, information technology (IT) infrastructure, and laboratory and pharmacy capacity. Aurum has established a centralized system of support which includes the following: (1) training of all levels of healthcare workers to ensure capacity building of clinicians to manage patients in resource limited settings with remote HIV specialist support; (2) provision and maintenance of guidelines for HIV preventive therapy (including INH and cotrimoxazole), treatment of adults and children, prevention of mother-to-child transmission and VCT; (3) clinical and administrative support through site visits by staff involved in psychological support, training, clinical support and monitoring data management systems; and (4) centralized distribution of medication and laboratory testing. This program will supplement the South African government's ARV rollout and therefore the program adheres to national guidelines and protocols.

ACTIVITIES AND EXPECTED RESULTS:

Aurum will carry out five activities in this Program Area. All of the activities are aimed at the provision of quality PMTCT service delivery.

ACTIVITY 1. Establishing Capacity for PMTCT at Service Outlets

This activity will include the dissemination of information on the importance of PMTCT and the application of PMTCT protocols to all South African government clinics, GP and NGO sites funded supported through the Aurum grant. This is also linked to the training of health workers (activity 7 below).

ACTIVITY 2: Counseling and Testing of Pregnant women

Pregnant women will receive provider-initiated counseling and testing as soon as they present to the health care service outlet. Women who test negative during the initial testing will be encouraged to repeat testing during the pregnancy to detect early HIV infection and ensure proper clinical care for the mother and infant.

ACTIVITY 3: Provision of Prophylactic ART

Women who are HIV-infected and pregnant will be provided with prophylactic ARVs to prevent transmission of HIV from the mother to the unborn child. As part of the minimum service package, newborn infants will receive the recommended prophylactic ART. Following pregnancy women will be enrolled onto the HIV care program.

ACTIVITY 4: Early infant diagnosis using PCR

Training will be given to health care providers at South African government clinics, GP sites and NGO sites on the importance of early infant HIV diagnosis and the correct use of the PCR test. Data collection will include a compilation of results of all PCR tests performed.

ACTIVITY 5: Prevention of STI and HIV in pregnancy and during breast-feeding period

Counseling given to pregnant mothers will emphasize the risk of contracting STI and new HIV infections during pregnancy and how that increases the risk of transmission to the unborn child.

ACTIVITY 6: Promotion of safe infant feeding practices

Aurum will provide education and counseling to support mothers to make correct choices around infant feeding practices to ensure reduced risk of HIV transmission in the post-partum period while safeguarding the health of the infant.

ACTIVITY 7: Training of Health Care Workers to provide PMTCT

Aurum will incorporate training around the provision of PMTCT into its existing training curriculum for doctors and professional nurses and counselors. This training will include counseling of pregnant women to encourage them to test for HIV, the prophylactic antiretroviral therapy, the modification and continuation of antiretroviral therapy in mothers already receiving therapy the use of PCR for early infant diagnosis and counseling around other prevention methods for STI and HIV and safe infant feeding practices. Aurum's PMTCT activities contribute to the achievement of the PEPFAR 2-7-10 goals.

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID:	224.08	**Mechanism:**	CTR
Prime Partner:	Family Health International	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	2929.08	**Planned Funds:**	$436,500
Activity System ID:	13722		

Activity Narrative: This activity was approved in the FY 2007 COP, was funded with FY 2007 PEPFAR funds, and is included here to provide complete information for reviewers. The funding mechanism from field support to a local agreement for Family Health International (FHI) is changing in October 2008 therefore a COP entry is being made to reflect this change in mechanism and activity number only. FHI activities under MTCT are expected to continue under the FY 2008 COP and funds are being requested in the new COP entry.

SUMMARY:

Family Health International (FHI) will collaborate with PEPFAR-funded prevention of mother-to-child transmission (PMTCT) partners to strengthen PMTCT services in four provinces. FHI will provide a PMTCT Training of Trainers (TOT) course designed for program implementers. Auxiliary nurses and lay counselors will be equipped with appropriate knowledge and skills of PMTCT. With the provincial departments of health (DOH), FHI will design and provide technical assistance (TA) to PMTCT facilities to improve the quality of those services. This project will provide resources to other PEPFAR partners, including Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) and JHPIEGO. The target populations include men and women of reproductive age, pregnant women, and people living with HIV and AIDS. The emphasis areas are addressing male norms and behaviors, training and wraparound programs in family planning.

BACKGROUND:

Since FY 2004, with PEPFAR funding, FHI has provided TA to a number of South Africa provincial DOH PMTCT facilities. The goal of this TA is to improve overall performance of selected PMTCT sites, with an emphasis on promoting best practices including the provision of antiretroviral (ARV) prophylaxis and family planning (FP) counseling and referrals. Since FY 2004, FHI has supported the provincial DOH in Limpopo and Northern Cape provinces by providing training to over 211 PMTCT service providers, including nurses and lay counselors, and on-site TA to 50 PMTCT facilities. In FY 2006 FHI continued to work in Limpopo and Northern Cape provinces and extended TA to Free State. At the request of these provincial Departments of Health and with endorsement from the national DOH, FHI is assisting in the development and adoption of provincial PMTCT protocols. FY 2007 funding ensured that TA could continue to be provided to Free State, North West, Limpopo and Western Cape provinces. With FY 2008 funding, the project will build on the lessons learned from the two previous years of PEPFAR funding. FHI will develop and make available on CD-ROM an interactive tutorial that can be used by other PMTCT implementing agencies and the DOH. FHI will also continue to provide TA to improve overall PMTCT performance and strengthen the systems necessary to support PMTCT programs (e.g. supervision and data management). FHI, in conjunction with clinics, will also design strategies to improve outreach to male partners of women availing themselves of PMTCT services, hence increasing gender equity in HIV programs and addressing male norms and behaviors by providing training on couple counseling, and promoting male attendance at antenatal visits with women (based on women's consent).

ACTIVITIES AND EXPECTED RESULTS: ACTIVITY 1: Capacity Building

FHI's activities will build on the FY 2006 and FY 2007 program in which FHI developed human capacity by refining the current training course for auxiliary nurses and lay counselors and equipping them with the knowledge and skills necessary to strengthen PMTCT services, including: (1) counseling and testing; (2) provision of ARV prophylaxis; (3) counseling and support for safe infant feeding practices; and (4) counseling on FP. Focusing on transferring skills to trainers to train providers, as well as to providers directly, FHI will develop TOT training materials into a CD-ROM in FY 2007 and make it available as a resource to the DOH, all PEPFAR partners, and other PMTCT stakeholders. The CD-ROM will include the facilitator's guide and participant manual from the refresher course. Interactive in nature, the contents will focus on the main components of a comprehensive PMTCT program and will have an emphasis on increasing counselors' and nurses' knowledge of appropriate FP methods for women with HIV, including those women receiving ARV treatment, strengthening counselors' communication and counseling skills around FP for PMTCT clients, and providing referrals. In addition, FHI will continue to provide the TOT course to other agencies supporting or implementing PMTCT programs (e.g., EGPAF, NDOH, JHPIEGO) and work closely with them to provide additional TA to roll out the TOT curriculum through their programs.

ACTIVITY 2: Technical Assistance

FHI will continue to provide TA to the DOH in PMTCT facilities in four provinces (Free State, North West, Limpopo and Western Cape) to improve program performance. Specifically, the scope of work for the TA is: (a) conduct both pre-service and in-service training courses for auxiliary nurses and lay counselors to strengthen the four main components of the selected PMTCT programs; and design the TA with the DOH to ensure activities fit into the existing health system to help promote sustainability; (b) clarify performance expectations for newly trained staff and managers and strengthen supportive supervision processes; (c) strengthen referral systems to enhance continuity of care; (d) improve functional referrals from PMTCT to FP services in order to promote healthy spacing of pregnancies and prevent unintended pregnancies among post-partum PMTCT clients; (e) conduct training on couple counseling and create strategies to involve male partners in PMTCT visits, and; (f) draw on the results of FHI's research on optimal timing for FP counseling within PMTCT services to provide TA to facilities that will include the development of FP messages to be incorporated into points in the service delivery system that have shown to increase the likelihood of uptake of FP (e.g., pre-/post-test counseling, post-partum period, infant feeding counseling, infant testing, or child health services).

This project contributes to PEPFAR 2-7-10 goals by reducing the number of new infections among infants exposed to HIV and ensuring that HIV-infected pregnant women and infants are appropriately referred to treatment, care and support services. In addition, by strengthening the FP component of PMTCT programs FHI helps to prevent future unintended pregnancies in HIV-infected women.

1.4 Number of health workers trained in the provision of PMTCT services according to national and international standards	300	False

Indirect Targets

Through the TA that FHI will provide to the DOHs 60 sites, they will have an indirect impact on PMTCT service delivery in those four provinces. Five providers per site will be trained, for a total of 300 individuals trained.

Based on FHI's experience providing TA to PMTCT sites in the FY 2004 and FY 2005, approximately 100 women per site were counseled, tested and received test results and about 20 percent of women tested will test positive and 70 percent of those who test positive will receive ARV prophylaxis.

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID:	2797.08	**Mechanism:**	N/A
Prime Partner:	Columbia University Mailman School of Public Health	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	13736.08	**Planned Funds:**	$1,387,087
Activity System ID:	13736		

Activity Narrative: SUMMARY:

Columbia University (Columbia) will support implementation and expansion of comprehensive prevention of mother to child transmission and linkages with treatment, care and support. The emphasis areas include gender, human capacity development, and local organization capacity building. The target population includes infants, men and women, pregnant women, family planning clients, people living with HIV (PLHIV) and healthcare workers in the public and private sectors.

BACKGROUND:

Columbia has been a PEPFAR partner since FY 2004, and supports services to strengthen integration of PMTCT activities into HIV chronic care in all supported HIV care and treatment outlets. Columbia's geographical coverage includes the Eastern Cape (EC) and KwaZulu-Natal (KZN) provinces. FY 2008 funding will ensure expansion to the Free State (FS). Columbia's PMTCT component is designed to support the national scale-up of PMTCT programs by assisting the government in implementation of strategies and plans; capacity building and training, infrastructure support; monitoring and evaluation support; and development of key tools and standard operating practices (SOPs) for program implementation.

ACTIVITIES AND ANTICIPATED RESULTS:

Columbia's PMTCT comprehensive approach will focus on HIV counseling and testing (CT) to all pregnant women seeking care; ARV prophylaxis for PMTCT; and, counseling and support for infant feeding. The interventions will be underscored by treatment, care and support including maternal health for women living with HIV, their children and families. The planned activities will ensure that HIV-infected pregnant women are identified early and enrolled into treatment, care and support programs. This approach will ensure that prevention, care, treatment and support services cover pregnancy, delivery, neonatal, and infancy periods.

ACTIVITY 1: PMTCT at clinics and maternity obstetric units

Columbia will improve the quality of antenatal care and maternity services at the 14 sites and integrate key interventions to prevent MTCT. This will ensure that women have greater access to high-quality antenatal, labor, delivery and postpartum care, including counseling and support for infant feeding, and use existing services more frequently and earlier in pregnancy. CT will be the pivotal component of the PMTCT program. Expanding provision of PMTCT services to include both antenatal clinics and maternities at the sites will significantly increase access to both maternal and infant HIV prophylaxis regimens. The program will focus on:

1. Conducting readiness assessments for implementation of basic PMTCT services
2. Conducting infrastructure renovations/refurbishment to allow for PMTCT implementation
3. Providing supplies and additional equipment as needed
4. Hiring additional health workers to provide support to sites
5. Training staff in CT within ANC setting
6. Implementing routine rapid CT as an integral part of antenatal care
7. Providing simple/short course prophylaxis regimens for PMTCT, with access to more complex and effective regimens as capacity and national guidelines allow
8. Developing replicable models of PMTCT in the 14 sites of EC, KZN and FS
9. Provision of CT during labor and delivery for pregnant women of unknown HIV status
10. Promoting safer delivery practices
11. Devising referral mechanisms to ensure patient follow-up post-delivery
12. Improving activities for optimal obstetric care including development/adaptation of SOPs.

ACTIVITY 2: Provide HIV-related care, treatment and support

Columbia will ensure extension of services beyond the PMTCT to the treatment and care services for the HIV-infected women, their infants and family members. This will be done through the early identification and referral of HIV-infected pregnant women who are eligible for treatment, enhanced laboratory capacity to monitor and conduct CD4 and other recommended tests for HIV care and treatment; establishment of mechanisms for prioritization and fast tracking of HIV infected pregnant women for ART; providing screening, diagnosis and treatment of TB; providing screening, diagnosis and treatment of STIs; providing cotrimoxazole prophylaxis to eligible mothers according to national guidelines; establishing a family centered case management approach with particular attention to establishing continuity of care; enhancing referral systems to ensure continuum of care post-partum; providing counseling and care relating to maternal nutrition and psychosocial support; establishing appropriate linkages and referral for HIV negative mothers tested; develop best practice models in pediatric and maternal care which can be replicated at national level and other sites; support continuation of routine health care including VIA for cancer of the cervix screening; and testing other family and household members and enroll them into care and treatment programs within clinic setting.

ACTIVITY 3: Provide early diagnosis, care and support to infants and children who are HIV-exposed or infected

Columbia will institute regular infant follow-up care. This includes infants who have received ARV prophylaxis, because HIV exposure increases risk of illness and failure to thrive, whether or not the infant has HIV infection. In addition, the PMTCT interventions will only reduce, but not eliminate the risk of HIV transmission from the mother to the infant. The focus of interventions will be to ensure PCR testing at 6 weeks and enrollment in ART for eligible infants. In order to scale up PCR testing, health care workers will be trained to identify HIV exposed infants and to ensure follow-up, provide cotrimoxazole prophylaxis. In addition, health care workers will be trained to provide counseling and support for infant feeding options and to establish functional appointment systems for regular health assessment and promotion visits for HIV-exposed infants. Particular attention will be given to establish functional linkages between the MCH health care workers with the care and treatment sites for follow-up of HIV infected women and HIV-exposed infants. Technical laboratory assistance for early infant diagnosis that includes training and providing essential lab equipment in the EC and FS will be provided. Columbia hire a laboratory adviser and support staff for technical expertise and mentoring on early infant diagnosis. With FY 2008 reprogramming funding,

Activity Narrative: Columbia will strengthen support in Free State, including strengthening early infant diagnosis and additional space in some facilities.

ACTIVITY 4: Promote linkages to community-based services and psychosocial support for comprehensive family care

Columbia will establish formal links with community resources through Columbia's adherence and social support unit to provide the resources that can help women cope with the impacts of HIV diagnosis. The focus of interventions will be to: increase behavior change communication activities focusing on access to PMTCT and treatment literacy to mobilize community in PMTCT and to develop/adapt tools to improve the follow-up of HIV-infected mothers and tracking at community level.
ACTIVITY 5: Mentor Mothers Approach

Columbia proposes to expand the scope of services of the mothers to mothers program (m2m) - a PEPFAR prime partner since FY 2007 - through an existing sub-agreement. The mentor mothers will provide support to the PMTCT component. Based in the antenatal, delivery and post-natal units, the primary duties of these mentor mothers will include: promoting counseling and testing among the pregnant women; linking mothers who test positive to PMTCT services; providing psychosocial support and education (individual and group) to mothers in PMTCT programs; forming and facilitating support groups of HIV-infected mothers; linking PMTCT mothers with necessary HIV care and treatment.

ACTIVITY 6: Engaging Stakeholders

Columbia will engage stakeholders in the planning and management of the program through meetings, sensitization workshops and feedback reports. The stakeholders include: DOH officials, District Managers, Health Facility managers, Clinic supervisors, Laboratory personnel, Staff representatives (doctors, nurses etc) and community members. In addition, Columbia will engage any other PEPFAR partners engaged in PMTCT activities in the same provinces in the stakeholder planning and management.

ACTIVITY 7: Quality of Care

Columbia will focus attention on the quality of PMTCT services provided in each of the facilities, since the quality of the services will influence the program outcomes. Particular attention will be given to ensuring quality in service delivery during the site level operational planning, implementation and M&E of the program in order to support two overarching principles of quality assurance i.e. supporting clients' rights and addressing providers' needs. Clients' rights will be addressed by: ensuring provision of complete and accurate information to the mothers; facilitating access to all the PMTCT and ART services; ensuring safety of PMTCT service delivery; providing privacy and confidentiality; ensuring provisions that take into account patients dignity, comfort and expression of opinion and ensuring continuity of care from PMTCT, to treatment, care and support.

Systems and capacity will be developed to support the work of the providers which include: Establishing good quality management and supervisory support at all levels; provision of adequate information, competence-based training and skills development; and provision of adequate supplies, equipment and infrastructure

All the PMTCT activities are in line with the South Africa Government (SAG) National Strategic Plan 2007-2011 and PEPFAR program goals. The interventions will contribute to PEPFAR's country level goal of supporting at least 80% of pregnant women with PMTCT services, and reducing MTCT by 40%.

Mechanism ID:	6156.08	**Mechanism:**	N/A
Prime Partner:	Columbia University Mailman School of Public Health	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	12237.08	**Planned Funds:**	$550,000
Activity System ID:	13739		

Activity Narrative: SUMMARY:
Columbia University International Center for AIDS Care and Treatment Program (ICAP) will use FY 2008 funding to apply its PMTCT capacity building activities in 30 sites located in Limpopo, Northwest, Gauteng, Mpumalanga, Northern Cape, and Western Cape provinces. ICAP's capacity building model is based on its support of the South-to-South Partnership for Comprehensive Pediatric HIV and AIDS Care and Treatment Training Initiative (S2S) in the Western Cape, which emphasizes site level training; namely, continuous and supportive onsite presence, onsite dynamic skills-building events such as on-the-job training, clinical mentoring, modeling and site implementation workshops and case-based learning. The core activity for FY 2008 involves designing and implementing PMTCT performance action plans and establishing long-term monitoring systems so that increased quality of service delivery can be sustained over the long term. This activity will be implemented in collaboration with the Foundation for Professional Development (FPD), BroadReach Healthcare and Right to Care.

BACKGROUND:
A main focus of ICAP support on the site level is to build provider and system capacity with a focus on continuous quality improvement. Shortages of health care workers are exacerbated by the gap between the knowledge and skills required to provide HIV and AIDS services. Additionally, poor design of facility systems and services, lack of patient scheduling systems, inefficient provider placement and scheduling and irregular supervision by senior management continue to weaken already stressed HIV services. ICAP's site level support is dynamic and continuously customized to consider site attributes and existing resources. During FY 2008 this capacity building model will support the continuation and expansion of the S2S Partnership with Tygerberg Children's Hospital-Stellenbosch University in the Western Cape. The S2S program, experiences and materials will support the activities within this initiative aimed at supporting pediatric HIV and AIDS.

ACTIVITIES and EXPECTED RESULTS:

ACTIVITY 1: Basic Capacity Building Model

While the technical support and capacity building focus varies according to site attributes, all sites benefit from ICAP support to: (1) jointly develop or review/revise existing site specific work-plans (with clear benchmarks, targets, and activities) to outline action steps on how to achieve related goals, including setting site specific benchmarks and targets (in close collaboration with USAID-SA partners); (2) leverage and maximize efficiency of existing site and regional level human and commodity resources; (3) deliver a quality package of PMTCT-Plus and family-centered HIV services to clients; (4) implement active referrals and linkage systems; (5) efficiently operate with an integrated approach to caring for the HIV-infected pregnant woman/mother and her family; (6) facilitate and lead site level system improvements that improve quality of care, support optimal patient flow, and decrease patient wait time; and (7) initiate a multidisciplinary approach to service delivery.

ACTIVITY 2: Exposed Infant Follow-up/Care and Pediatric HIV Care and Treatment

ICAP will continue to support pediatric activities in close collaboration with the S2S program to rapidly expand access to HIV care and treatment for infants and children. Through its basic capacity building model ICAP will support the implementation of comprehensive care services for the HIV-exposed child at all sites, including growth monitoring, neuro-developmental screening, and cotrimoxazole prophylaxis. ICAP will capitalize on IMCI, EPI, and under-5 services to identify infants at peripheral sites that should be referred for HIV testing, and use aggressive pediatric case finding by supporting clinical/immunological presumptive diagnosis and/or early infant diagnosis services. The ICAP model will be used when appropriate to expand provider-initiated in-patient testing in pediatric wards, and to assist in the implementation of routine pediatric psychosocial assessments to appraise readiness and support needs prior to initiating treatment.

ACTIVITY 3: Expansion of Early Infant Diagnosis (EID)

The ICAP capacity building approach will support implementation and expansion of EID services. This includes the improvement of follow-up services, including improving counseling to ensure that caregivers understand the importance of returning for services and developing mechanisms to identify and trace caregivers who have not returned for follow-up and test results.

ACTIVITY 4: HIV-infected Women of Childbearing Age and their Partners

ICAP plans to strengthen the quality of the clinical and psychosocial services available to women of childbearing age and males (especially partners) enrolled in care and treatment services. This activity Includes supporting facilities to offer services and referrals to counsel HIV-infected women and partners, specifically on family planning.

By strengthening PMTCT services, these activities contribute to PEPFAR 2-7-10 goals, averting new infections among infants exposed to HIV as well as increasing access to treatment care and support for HIV -infected women and their infants.

Activity ID: 7969.08

Planned Funds: $2,925,000

Activity System ID: 13763

Activity Narrative: SUMMARY:

EGPAF will use FY 2008 PEPFAR funds to continue prevention of mother-to-child transmission (PMTCT) support for its existing partners which include National Department of Heath (NDOH) and provincial DOH KwaZulu-Natal and Gauteng. The Foundation will expand its geographic coverage during FY 2008 to include direct support to provincial and district health departments in the Free State and North West provinces. The key objective is to expand the coverage of PMTCT services, and thus ensure provision of quality PMTCT services, and increase the uptake of PMTCT services. The primary emphasis area is human capacity development and expansion of services through training and task-shifting, quality improvement, development of networks, linkages, referral systems and strengthening M&E and health systems, and strengthening of local organizations. Primary populations to be targeted include infants, men and women, pregnant women, HIV-infected pregnant women, people living with HIV (PLHIV), and public and private healthcare providers.

BACKGROUND:

The long-term goal of the EGPAF Project HEART PMTCT program in South Africa is to decrease transmission of HIV from mother-to-child. This is to be achieved through an intensive focus on increasing: the capacity of health facilities to deliver high quality PMTCT services in antenatal care (ANC), including screening and staging of HIV-infected pregnant women; the uptake of voluntary counseling and testing (VCT) through the implementation of the opt-out policy; and the referral of eligible HIV-infected pregnant women to care and treatment.

USG support for the PMTCT program was initiated in 2003. This support was provided to McCord Hospital in KwaZulu-Natal, Hlabisa sub-district through the Africa Centre in KwaZulu-Natal, mothers to mothers (m2m) in KwaZulu-Natal and Mpumalanga, and the Johannesburg Metro District through the Perinatal HIV Research Unit (PHRU) in Gauteng. The Africa Centre, M2M and PHRU programs have been transitioned to the KwaZulu-Natal Department of Health (KZNDOH) and to direct USAID support, respectively.

McCord Hospital implements best practices for PMTCT through highly active antiretroviral therapy (HAART) for prevention/treatment, AZT from 28 weeks and nevirapine in labor, nevirapine for pregnant women who first present in labor, as well as a stat dose of nevirapine and AZT seven days post delivery to the HIV-exposed infant. This is different from the national protocol. This resulted in a vertical transmission of 4.25% in 2006. McCord uses a family-centered approach for PMTCT.

New partnerships created at the end of FY 2006 and implemented in FY 2007 include working directly with the Tshwane-Metsweding Region in Gauteng, and the Free State, North West and KwaZulu-Natal provincial health departments. To improve quality of PMTCT service delivery, EGPAF will continue to support the national and provincial Departments of Health by providing technical support, human capacity development, and infrastructure rehabilitation, where applicable.

Priority areas for the South Africa program that are implemented through the activities include:
(a) Follow-up of HIV-exposed infants and referrals to care and treatment for HIV-infected infants.
(b) Develop referral and integration strategies for fast-tracking pregnant women to treatment services.
(c) Improve partner (i.e., couple) testing and increase male and mothers-in-law involvement in the PMTCT program.
(d) Work directly with government sites to strengthen PMTCT services.
(e) Strengthen monitoring and evaluation (M&E) activities.
(f) Encourage provider-initiated testing and counseling, counseling for HIV negative to stay negative, repeat HIV test at 36 weeks
(g) Tuberculosis (TB) screening, identification of eligible pregnant women for HAART and referral to care and treatment sites.
(h) Integrating PMTCT into existing maternal and child health and family planning services including pap smears.
(i) Infrastructure rehabilitation, e.g., renovations to existing structures, acquisition of park homes.
(j) Encourage support groups for pregnant women.
(k) Community and facility-based strategies to support infant feeding choices made.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: McCord PMTCT Program Activities

(a) Implement the family-centered model encouraging couple counseling, providing partner testing and testing of other siblings.

(b) Use the both provider-initiated and voluntary "opt-out" approach in the counseling and testing (CT) program

(c) Provide polymerase chain reaction (PCR) testing at six weeks for early infant diagnosis and thus improve HIV-exposed infant testing and follow-up.

(d) Strengthen the referral system between PMTCT and the wellness clinic or care and treatment services. This is achieved by offering routine CD4 testing to HIV-infected pregnant women and HIV-infected infants to identify those eligible for HAART.

(e) Provide TB screening for HIV-infected pregnant women.

(f) Offer complex ARV regimens depending on the clinical and immunological (CD4) staging.

(g) Provide HIV and AIDS training to local community-based organizations such as churches and youth organizations to raise community awareness.

(h) Provide cotrimoxazole prophylaxis for mothers and children.

Activity Narrative: ACTIVITY 2: Free State, Gauteng, KwaZulu-Natal and North West Provincial Departments of Health

(a) Conduct needs and site assessments to identify gaps and address the needs of human resources, infrastructure, training of healthcare workers (HCW), technical support, monitoring and evaluation, commodity, and ways to strengthen PMTCT services.

(b) Provide training in early infant diagnosis (PCR) to improve follow-up of HIV-exposed infants.

(c) Incorporate CD4 testing of HIV-infected pregnant women and HIV-infected infants in the PMTCT program, and fast-track those eligible to care and treatment sites or wellness clinics.

(d) Facilitate the provision of antiretroviral treatment for eligible HIV-infected women within the PMTCT program.

(e) Develop comprehensive referral systems to care and treatment sites.

(f) EGPAF respects Provincial Policy on Nutrition. The nutritional advice is provided through health education to all pregnant women (HIV-infected or not).

ACTIVITY 3: Support to National PMTCT Staff Capacity and Training; Participate in the National Pediatric AIDS Working Group

(a) Provide training to the nine provinces on early infant diagnosis, antiretrovirals in pregnancy, clinical and immunological staging of HIV and AIDS in infants and children, and clinical manifestations of HIV and AIDS in infants and children.

(b) Place a technical advisor within the National Department of Health.

(c) Participate in the National Pediatric Working Group to discuss and advise policy with regard to pediatric treatment guidelines and access to pediatric treatment services.

The EGPAF PMTCT activities contribute to the PEPFAR 2-7-10 goals by strengthening PMTCT at the provincial and national level.

With FY08 reprogramming funding, EGPAF will provide support to the national Department of Health and 3 provinces (KwaZulu-Natal, North West and Free State) in training and mentoring of health workers to implement the new (2008) PMTCT dual therapy guidelines. Tools to measure compliance to these new guidelines are being developed and will be rolled out to facilities in the three targeted provinces, and beyond.

Budget Code: MTCT

Activity ID: 12240.08

Activity System ID: 13831

Program Area Code: 01

Planned Funds: $388,000

Activity Narrative: SUMMARY:

St. Mary's Hospital in Durban, KwaZulu-Natal will aggressively address the need to prevent the transmission of HIV from mother-to-child. St. Mary's is ideally situated and offers a wide range of services to 'capture' the target group to ensure success. This will be achieved through the integration of maternal services at the primary health care facility. The activities will encompass human resources, laboratory tests and medical supplies. The emphasis area of this activity is to provide counseling and testing to the family unit and in particular there will be a focus on couple counseling. The ultimate aim is to reduce the number of new infections from mother-to-child and to refer the mother into treatment programs when required. The target groups for this activity are people living with HIV, pregnant women, and their infants.

BACKGROUND:

This is a new program activity funded in FY 2008, although St. Mary's has received previous PEPFAR funding as a sub-partner to Catholic Relief Services (CRS). This activity is linked in with the counseling and testing activity program. The program is supported by the South African Government as St. Mary's Hospital has a service level agreement with the KwaZulu-Natal Provincial Department of Health and the Hospital is in partnership with the District Office of the Department of Health to provide HIV and AIDS training to all clinical staff over the next two years.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Routine HIV testing and counseling

The PMTCT program is based in the primary health care (PHC) facility that has an antenatal clinic. This is the first point of entry for a pregnant mother (not in labor) to the hospital. It is at this point that the pregnant mother will be counseled and tested using same-day rapid test results to establish her status. Provider-initiated Testing and Counseling is currently the standard practice for testing in the entire facility. Women who initially test negative will be offered a repeat HIV test during the last trimester in the pregnancy, and if the mother is not tested at the PHC facility then the mother will be tested at the hospital when the mother is in labor. Linkages and referral to the PMTCT program will occur at the primary health care facility as well as from the midwifery and obstetrics unit in hospital. The overall objective of this activity is to routinely counsel and test as many pregnant mothers as possible so preventative prophylaxis will be offered to the women and their infants. Counseling and testing in hospital at labor and delivery will also be a focus as some mothers are referred from community clinics and have not attended the antenatal clinics sessions on site. Partner counseling and testing will also occur at the primary health care facility as well as in the hospital. In addition attention on TB screening will occur at all levels of health care for the mother. A group of six PMTCT counselors based at the PHC facility and in the hospital will be trained extensively in PMTCT and pediatric ART to ensure that the goals of this activity are achieved. Government counseling and testing protocols will be adhered to. The expected results of this activity are to: (a) create a culture in which all people regularly seek counseling and testing for HIV; (b) provide preventative treatment to mothers for their unborn child; and (c) the subsequent follow up and support for the family unit post-delivery.

ACTIVITY 2: The provision of ARV prophylaxis and post-delivery support

The provision of ARV prophylaxis dependent on the CD4 count of the mother will be in line with the South African Guidelines, which currently include single-dose nevirapine (SDNVP). However, when the guidelines change to include dual therapy, St. Mary's will change its protocols. Single-dose nevirapine will be provided to pregnant mothers that have a CD4 count of 200 and above and HAART to pregnant mothers that have a CD4 count of below 200. ARV prophylaxis will be provided to pregnant mothers who test positive during labor and who have not previously entered the PMTCT program at the PHC facility. PCR testing is conducted at 6 weeks post-delivery and if these infants are born positive to mothers who entered the PMTCT program, the children will be referred to the pediatric ARV program. This is an extension of the PMTCT program. Similarly, the mother and partner will be referred post-delivery if necessary. Subsequent PCR testing is conducted 6 weeks after cessation of exclusively breastfed babies, and formula fed infants will be re-tested at 18 months to determine HIV status. Home-based visits will occur through the counseling and testing activity program. St. Mary's Hospital is accredited as a baby-friendly hospital and the hospital promotes exclusive breast feeding; however, other feeding options are discussed in the extensive infant feeding counseling that is provided. A PMTCT therapeutic counselor will provide nutritional support and counseling to the mother, mother-in-law and father of the baby. Infant formula is available through the PHC facility on site as well as at the community clinic level. This is a service from the Department of Health. In addition, one of the treatment activity plans is for the dietician/nutritional expert to provide ongoing education to communities at clinic level. This educational support will be expanded to include pregnant mothers and mothers post-delivery. In addition, the therapeutic counselors will visit mothers in the home setting which is addressed as a counseling and testing activity program. Extensive counseling on feeding options will be provided in the home setting.

The expected results of this activity are: (1) Prevent the transmission of HIV from mother to child; (2) Effective referral and access to treatment programs if the child is born positive; (3) The referral and access to treatment programs for HIV or TB for the mother and partner if necessary; (4) Additional home-based support if required to the family unit to limit loss to follow-up, especially to those mothers that did not enter the PMTCT program at the PHC facility; (5) Address referral links for care and treatment to St. Mary's Hospital or other treatment centers.

ACTIVITY 3: Provision of support and guidance to referral clinics

The PMTCT program based at St. Mary's Hospital will work extensively with referral clinics in the area to ensure that pregnant mothers from referral clinics will be afforded the same service as if they had attended the PMTCT program at St. Mary's. The PMTCT training that will be afforded to the staff at St. Mary's Hospital will be extended to the referral clinics to the PHC facility on site. This will be included in the treatment activity plan.

These activities contribute directly to the overall PEPFAR 2-7-10 goals as HIV-infected pregnant mothers will be identified, appropriately treated, cared for and supported. Family members affected will benefit

Activity Narrative: directly from counseling and support within the hospital environment as well as within the community setting during home visits.

Activity ID:	13837.08	**Planned Funds:**	$125,000
Activity System ID:	13837		

Activity Narrative: SUMMARY:

TB Care Association's activities will be carried out to increase TB and HIV case finding and case holding through community peer supporters as well as to support facility-based integration of prevention of mother-to-child transmission (PMTCT) with TB/HIV and antiretroviral treatment (ART) services. The TB CARE Association PMTCT project emphasizes gender issues by increasing access to PMTCT, TB/HIV and ART services for women and their partners. A second emphasis area is in-service training. The target populations for this activity include children under the age of five years, pregnant women, discordant couples, people living with HIV and AIDS, families. The emphasis area for this program include gender, by addressing gender equity in HIV and AIDS programs, human capacity development by providing in-service training and local organization capacity building.

BACKGROUND

Although TB CARE Association is a new FY 2008 PMTCT partner, this is an ongoing activity. TB Care Association was founded in March 1929 as a social support group for TB sufferers in Cape Town. The core role of TB Care has remained largely unchanged in the intervening 70+ years. TB Care provides a comprehensive, developmental social support service to TB sufferers and their families in the City of Cape Town. TB care operates from the community health centres which patients to take their daily treatment on the street where they live under the supervision of specially trained community treatment supporters. In FY07, TB CARE Association partnered with the Medical Research Council in FY 2007 and was a sub-partner implementing these PMTCT activities. In FY 2008 PEPFAR funding will be coordinated by TB Care Association and the Medical Research Council will be a sub-partner. The activity will be coordinated with the provincial and district Departments of Health. TB CARE Association partnered with the Medical Research Council in FY 2007 and was a sub-partner implementing this activity. FY 2008 PEPFAR funding will be coordinated by TB Care Association and the Medical Research Council will be a sub-partner. The activity will be coordinated with the provincial and district Departments of Health.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: Community TB/HIV Case Finding and Case Holding Among Women Participating in PMTCT

The Good Start Community Intervention Project (PEPFAR-funded since FY 2005) has trained and employed community peer supporters to provide household-level support to improve postnatal care of mothers served by PMTCT programs. In the TB/HIV component of the Community Intervention Project, community peer supporters will identify suspected TB cases in the households of pregnant mothers and refer them to the health services for TB diagnosis. They will encourage pregnant women, their partners and HIV-exposed infants to be tested for HIV and to access health services for appropriate prophylaxis and antiretroviral therapy (ART). They will also provide adherence support for household members on prophylaxis or treatment related to TB or HIV.

ACTIVITY 2: Integration of PMTCT with TB/HIV and ART Services

This project will support a comprehensive best-practice approach to integrate PMTCT into TB/HIV care in Sisonke District in KwaZulu-Natal. The project will improve screening of pregnant women for TB and HIV as part of antenatal care. HIV-infected pregnant women will routinely have CD4 counts assessed and be screened for full antiretroviral treatment. HIV-infected mothers will also be screened for prophylaxis (isoniazid preventive therapy and cotrimoxazole prophylaxis). HIV-exposed infants will receive cotrimoxazole prophylaxis and will have a PCR test at their six week immunization visit. PCR-positive infants will have a CD4% test to determine their eligibility for ART. The project will establish a best practice approach to integrated TB/HIV prevention and care in PMTCT services and will provide training to PMTCT health care providers on integrated TB/HIV care. Project results and lessons learned will be shared with the national and provincial Departments of Health to inform existing policies and guidelines on TB/HIV care. TB patients and PLHIV are the principal target populations and include pregnant women (referred to PMTCT services) and children (receiving ARVs if indicated).

These activities will contribute to PEPFAR's 2-7-10 prevention goals by reducing mother-to-child HIV transmission. The prevention outcomes are also in line with the USG goal of integrating TB and HIV services within primary care systems in South Africa.

Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	13965.08	**Planned Funds:**	$970,000
Activity System ID:	13965		

Activity Narrative: SUMMARY:

Johns Hopkins University/Center for Communication Programs (JHU/CCP), coordinates the work of 20 South African partners, provides technical assistance and capacity building to prevent HIV and AIDS through a comprehensive HIV prevention program that addresses risky behaviors and the key drivers of the epidemic in the general population through mass media and social mobilization. The target populations are: youth, adults, people living with HIV (PLHIV), religious leaders, teachers, public health workers, and community, faith-based and non-governmental organizations. Eleven partners working across South Africa will support efforts to mobilize pregnant women and their male partners in support of PMTCT. Two mass media programs are utilized to highlight themes relating to PMTCT guided by the findings of the 2006 South African HIV/AIDS Communication Survey that found that 87% of all South Africans were reached with messages dedicated to HIV prevention and living with HIV and AIDS by means of television and radio programs.

BACKGROUND:

This is the first year that JHU/CCP is undertaking strategies using community-based mobilization and mass media in support of PMTCT programs. Our approach recognizes the need to educate pregnant women and their male partners (and discordant couples) concerning their right to PMTCT prior to delivery so that they can make the best decision regarding their own sexual behaviors, know their HIV status, have access to PMTCT services and understand the need for safe feeding practices that will reduce the risk of their newborn from getting HIV. Through ensuring that women are counseled in advance of their rights to access PMTCT services upholds the constitutional rights of women and their to access PMTCT services. The evidence-based strategic message design identifies key theoretical and practical factors that influence behavior, reinforcing the positive and minimizing the negative. Each activity below is designed to enhance critical and creative thinking, contribute to changes in social norms, create social networks that support individual change, build skills and improve decision-making. Eleven of the twenty South African partners will incorporate social mobilization for PMTCT into their community mobilization and mass media activities.

ACTVITIES AND EXPECTED RESULTS:

ACTIVITY1: Community Mobilization

DramAidE places Health Promoters (HPs) living with HIV in 23 of the country's higher learning institutions. The HPs use campus events to educate young female students and their male partners on PMTCT, to undergo voluntary counseling and testing, and referrals to appropriate services on or in the vicinity of tertiary institutions.

Mindset Health (MH), Health Workers Channel is located in more than 400 public clinics. It produces and disseminates training materials for Health Care Workers that is expanded upon through an interactive web-based training program. Its Public Health Channel sensitizes audiences through facilitated discussions within public health centers on issues relating to PMTCT and encourages pregnant women to be tested for HIV, obtain antiretrovirals for PMTCT and safe feeding practices. Mindset Health, a partnership between Mindset Network, the Department of Health and Sentech, operates under the umbrella body of Mindset Network, which is funded through a number of public-private partnerships, such as Standard Bank, Liberty Life as well the Nelson Mandela Foundation.

The Community Health Media Trust (CHMT) is increasing the number of Treatment Literacy and Prevention Practitioners (TLPPs) to 92 (72 funded by PEPFAR and 20 by the National Department of Health (NDOH)) who work in health centers serviced by MH in the Western Cape, Eastern Cape, KwaZulu-Natal, Free State and Gauteng, to facilitate discussions with patients in general waiting rooms, prevention of mother-to-child transmission (PMTCT), Antenatal (ANCs) and ART Clinics on PMTCT. In addition, these outreach workers work with CBOs and support groups of people living with HIV to increase awareness of PMTCT.

Lesedi Lechabile and Mothusimpilo, who work with mobile populations in the mining areas of the Free State and the North West, train their peer educators and clinical staff working in their mobile clinics to sensitize pregnant women, their male partners and women engaging in transactional sex and those engaging in sex work in areas surrounding the mines to be tested for HIV so that they can know their HIV status, access PMTCT services and receive education on safe feeding practices.

The Valley Trust, working in rural KwaZulu-Natal, trains its peer educators and clinical staff in their mobile clinics to encourage pregnant women to be tested for HIV, access PMTCT services and obtain information on safe feeding practices. It also utilizes community events and activities to mobilize pregnant women and their male partners around knowing their status, PMTCT and use safe feeding practices.

Lighthouse Foundation trains its peer educators and community facilitators to work in the 13 informal settlements in the Madibeng District of the North West province to incorporate PMTCT into their community outreach comprising door to door campaigns, HIV support group and men's support group in order to mobilize pregnant women and their male partners to know their HIV status, be referred to PMTCT services and educated on safe feeding practices.

LifeLine South Africa expands its innovative workplace approach from one informal settlement/rural area in Gauteng and Limpopo provinces to include an informal settlement in the Free State, Northern Cape, and Mpumalanga. This program works with management and employees in small and medium enterprises to develop a comprehensive program that trains peer educators (PEs). As part of its workplace-based program LifeLine provides pregnant women within these workplaces with counseling and testing so that they may be referred for PMTCT services, while sensitizing male workers on PMTCT so that they can support their partners. LifeLine works in partnership with the Small Business Associations and with the Farm Owners Associations in the areas that they operate in.

The Department of Correctional Services, a PEPFAR partner, trains master trainers from the Department that will train offenders within correctional facilities to provide peer education using the TshaTsha series to promote HIV prevention. In male and female correctional facilities knowledge of HIV status and PMTCT are addressed as key topics so that offenders can make appropriate decisions upon their release and

Activity Narrative: reintegration into society.

ACTIVITY 2: Mass media in support of Community Mobilization

ABC Ulwazi produces a radio talk show series tailored to 60 different community radio stations. Special emphasis is on male norms and behaviors, partner reduction, and on PMTCT. Each episode will end with a summary and clear messages on the topic discussed. Listeners' associations formed by local citizens have facilitators' guides to carry out community outreach interventions related to the series themes.

JHU in a public-private partnership with the South African Broadcasting Corporation co-funds two TV programs, nine local language radio programs and web support. Trailblazers, a community health show, broadcasts 13 episodes highlighting individuals that provide models of positive behaviors for others to emulate. A second season of the 26 episode TV drama (tentatively called Circles) deals with contextual issues relating to social and cultural norms that inhibit and/or support positive male norms and behaviors, including addressing the theme of male involvement in relation to PMTCT. Radio talk shows follow both programs, providing additional information and stimulating community participation.

JHU/CCP contributes towards meeting PEPFAR goals by building the capacity of individuals and the social networks through awareness, education and human support within the public health care system to support pregnant women to prevent mother-to-child transmission of HIV. The results expected include: (1) Contributing towards increasing the number of pregnant women accessing PMTCT services from the current 17%; (2) Ensuring that greater numbers of pregnant women are aware of their HIV status and enrolled into the national PMTCT program; (3) ART for treatment eligible pregnant women; (4) Essential care for women and children in need of PMTCT; and (5) Safe feeding and nutritional practices. This contributes to the goal of the National Strategic Plan for South Africa 2007 - 2011 by ensuring that 80% of people living with HIV and their families have access to an appropriate package of treatment, care and support services by 2011 through focusing on pregnant women and the wellness management of people before they become eligible for ART.

1.4 Number of health workers trained in the provision of PMTCT services according to national and international standards	2,000	False

Indirect Targets

JHU/CCP and its partners are engaged in mobilizing communities (women and men) around PMTCT through using interpersonal communication including community mobilization through activities such as household visits, structured community events and activities, discussions in clinics that form part of health centers and mobile clinics that visit hard to reach areas and underserved communities such as informal settlements and deep rural areas, tertiary campuses and workplaces. Through sensitizing women and men around PMTCT this activity mobilizes all women to undergo counseling and know their status so that they can access PMTCT services prior to delivery. As part of its efforts to strengthen the health delivery system a study will be undertaken examining the extent to which task shifting the care and support for people living with HIV (PLHIV), including pregnant women, within clinical settings and tertiary institutions contributes towards improved care and support for PLHIV, including pregnant women living with HIV. The indirect targets have been estimated in relation to the estimated number of people reached through community mobilization and the impact that task shifting from health care workers to TLPPs will have on improving the quality of care for women living with HIV.

Activity ID:	7944.08	**Planned Funds:**	$1,599,320

Activity System ID: 13980

Activity Narrative: SUMMARY:

The Kagiso Educational Television (Kagiso) PMTCT activity focuses on male involvement in the prevention of mother-to-child transmission (PMTCT) to increase uptake of PMTCT through the expansion of a grassroots campaign targeting community-based men's groups. The campaign aims to create male awareness of PMTCT ensuring that men understand the implications of mother-to-child transmission (MTCT) and can support and encourage their pregnant partners to uptake PMTCT services.

BACKGROUND:

Low uptake of PMTCT services remains a challenge to successful implementation. Although coverage of PMTCT exceeds 80%, PMTCT uptake still hovers around 50%, indicating that the majority of women who need PMTCT services are being missed. Reasons for low uptake vary from health systems issues to social issues. Cultural and social values are prime factors, with fear of violence and abandonment from male partners due to HIV disclosure often cited as the primary reason for choosing not to be tested during antenatal care. Furthermore, many women assume that because they are faithful to their male partners, they cannot be HIV-infected and choose not test for HIV during antenatal care. MTCT is also affected by the cultural perceptions that breastfeeding is a practice adopted by model mothers and wives. Many HIV-infected mothers report that they breastfeed in the presence of their husbands and mothers-in-law, but formula feed when they are absent. These mothers are not aware that mixed feeding practices increase the risk of vertical transmission.

Anecdotal evidence suggests that many men are afraid to undergo HIV testing and use their wives' HIV test results as a proxy for determining their negative status. Conversely, when their wives test positive, they often do not assume they are infected. These misconceptions contribute to vertical transmission of HIV, and led to a joint decision by the USG Inter-Agency Task Force and the National Department of Health (NDOH) to target the partners of pregnant women and to develop a PMTCT male involvement campaign targeting grassroots men's groups.

Using FY 2006 PEPFAR funding, the grassroots male campaign was initiated. This campaign works directly with non-governmental and community-based organizations, sports clubs, savings associations, faith-based organizations and other men's groups at the community level to ensure HIV, AIDS and PMTCT information transfer, and to address gender, stigma and masculinity in the context of South African culture and how it relates to PMTCT.

Partners of women attending antenatal care are targeted by the campaign. The campaign aims to sensitize men to issues relating to PMTCT, to create a platform from which to address cultural and gender issues that impede the uptake of PMTCT.

FY 2008 funding will ensure expansion of the campaign to rural communities and will continue to target male partners of women attending antenatal care and family planning clinics to facilitate their understanding of HIV and AIDS and PMTCT issues, and to encourage them to get tested, "know their HIV status" and to support their partners, even if their results are discordant. Efforts will be made to hold support groups for men whose partners are in the PMTCT program, with a specific focus on the development of skills to reduce stigma. In addition, Kagiso will link with the SAFPU (South African Football Players Union) to expand its reach training the Union's HIV and AIDS facilitators, where they exist, and supporting the Union to select and train facilitators where they do not exist. This project has a particular focus on the year 2010 when South Africa hosts the Soccer World Cup.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Conducting workshops

Using FY 2008 funding, Kagiso will train male facilitators. Refresher training will be offered periodically. Trained facilitators/community activists will be responsible for conducting ongoing workshops with different male groups in their community. In each workshop or identified community activity, men will be taken through a number of activities aimed at increasing awareness and understanding of PMTCT and then each group of men will identify a community-based action or activity illustrating male support for PMTCT and build on its outcomes. These actions may range from wearing T-shirts with emblems supporting PMTCT, holding community meetings to address myths around PMTCT or encouraging men to go with their partners to antenatal care and to be tested. With monitoring and ongoing support from the workshop facilitators, the men will implement the activity in their communities. These activities will be developed and implemented by the communities and will focus on creating support and awareness for PMTCT. Using FY 2008 funding, the training curriculum will be accredited by the national accreditation board. This will ensure continued support and sustainability. Capacity in the provincial departments of health will be built around health communication by identifying community workers, volunteers or community health workers that are already trained in PMTCT by offering the accredited community-based male involvement training as a way for these community workers to continue their work and earn additional resources. This will extend the partnership between USG and SA NDOH to a grassroots level. Using FY 2008 funding, Kagiso also seeks to deepen productive relationships with national and provincial department of health initiatives such as MIPAA (Men in Partnership Against AIDS) and WIPAA (Women in Partnership Against AIDS) identified in the previous year.

Having established public-private partnerships (PPPs) with appropriate companies as well as training existing facilitators in fundraising, Kagiso will concentrate on establishing sustainability of these organizations with FY 2008 funds. These activities will be done in collaboration with Soul City training and outreach and the Soul Buddyz clubs throughout the country. Soul City is also a recipient of PEPFAR funds.

ACTIVITY 2: Media campaign rollout

Building on the project’s success stories profiled in FY 2007, FY 2008 funding will be used to ensure scale up and rollout of a media campaign entitled "Real Men Talking to Real Men." This campaign will draw on successes of FY 2007 and will aim to reach a wider audience through broadcasting on both television and radio. It will also leverage the hosting of the Soccer World Cup in South Africa in 2010 drawing on the relationship with the South African Football Players Union. The media campaign will operate at two levels

Activity Narrative: with the mass media campaign being a targeted media burst. For example, in August, which is traditionally "women's month," the messages could be differentiated by running a series of smart campaign commercials on SABC radio stations and for one week on SABC TV; the second level could be community radio and newspapers with a more specific messages drawing on the idea of Fathers to Fathers encouraging men at a community level to support each other and their HIV-infected partners. This campaign will be linked with community outreach through community radio, newspapers and other civil society initiatives to ensure that communities, particularly men, have a platform to discuss issues raised by the campaign. In addition, Kagiso will investigate digital storytelling and website channels and opportunities to provide skills and work opportunities for young men and women.

ACTIVITY 3: Support groups.

In FY 2007, Kagiso targeted women attending antenatal care and pregnant HIV-infected women attending support groups and encouraged them to bring their male partners to a discussion group. At the outset of the partner discussion groups, all aspects of pregnancy, not just HIV and PMTCT, are discussed. Groups meet regularly. Men are encouraged to attend antenatal care clinics with their partners and accept couple counseling and testing. Men who want to be tested but who do not want to go to the clinic are referred to alternative sites. The aim of the group sessions is to ensure the development of support networks for men whose partners are enrolled in PMTCT programs, and to encourage improved support to their partners, ensuring better uptake and adherence of PMTCT service delivery. Using FY 2008 funding, these groups will be expanded geographically. The groups will be modeled on the highly successful mothers2mothers initiative, although a different approach is being used to reach men. Men's groups will take place outside of the health facility, at places where they are comfortable hanging out. These include sporting grounds, churches, (through faith-based organizations) and informal stokvels (gatherings) or tavern associations.

ACTIVITY 4: Expansion

Funding will be used to expand the workshops and media campaign by linking the campaign with the South African Football Players Association Union (SAFPU). By linking the male involvement in PMTCT campaign to SAFPU, Kagiso will be able to reach at least 80,000 men and create greater awareness around HIV, AIDS and PMTCT. In addition, this linkage will enable SAFPU the opportunity to strengthen the HIV prevention campaign and to incorporate messages around PMTCT, thereby creating greater awareness among their members.

This activity contributes to PEPFAR 2-7-10 goals by increasing awareness of HIV and AIDS, increasing uptake of PMTCT, and reducing vertical transmission. Targeting men and ensuring men identify and implement community-based activities in support of PMTCT will improve community-wide support for PMTCT services. This activity will begin a process by which men begin to understand PMTCT. Increased male involvement and community support for PMTCT will improve uptake of PMTCT service delivery, contributing to the PEPFAR target of averting 7 million new infections.

Funding Source: GHCS (State)
Program Area: Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code: MTCT
Program Area Code: 01
Activity ID: 7906.08
Planned Funds: $649,640
Activity System ID: 14006

Activity Narrative: SUMMARY:

The McCord Hospital/Zoe Life's overall activities relate to building capacity at four municipal clinics in the Outer West area of Durban (KwaZulu-Natal province) to provide a strengthened and integrated prevention of mother-to-child transmission (PMTCT) service which is linked with tuberculosis (TB) and HIV care and treatment. Activities that will strengthen services include provider-initiated (with the option to opt-out) counseling and testing of all pregnant women attending the antenatal clinics, testing of partners and children of the index patient where possible, TB screening of HIV-infected pregnant women with referral for treatment where needed, antiretroviral (ARV) prophylaxis for HIV-infected women and newborns, maternal nutrition and infant feeding counseling and infant follow-up. Emphasis areas include local organization capacity development, strengthening of referral networks between PMTCT and other vertical programs, including pediatric services; human resource development through training, mentorship and supervision of PMTCT staff, quality assurance and improvement through supportive supervision, technical assistance and mentoring during site visits and strategic information strengthening through development of a simple integrated monitoring and evaluation system. The primary target populations are pregnant women, HIV-infected pregnant women, and their infants.

McCord Hospital currently receives funding for PMTCT and ARV treatment through the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF). This program described here focuses on strengthening the capacity of public sector facilities, and it is distinct from the hospital-based program funded by EGPAF.

With FY2008 reprogramming funds, and as part of the optimization of services, the McCord PMTCT hospital -based program will be conducting a basic program evaluation which will feed directly back into the activities implemented by McCord Hospital and Zoë-Life. Up until now, the McCord PMTCT program focus has centred on whether HIV transmission occurs 6 weeks postpartum. However, there has been no assessment as to whether transmission is occurring later than 6 weeks postpartum and what the clinical and health outcomes of the PMTCT intervention are for mother and child. There has also been no way of determining whether infant feeding decisions made on discharge are, in fact, being correctly practiced. In addition, in an effort to address the high rates of postnatal lost to follow up that the Program had been experiencing, a follow up mother and baby wellness clinic, located within the PMTCT program, was recently established. This clinic offers primary health care services and HIV-related care and treatment to both mother and child. As such, an evaluation of this clinic will be conducted to determine whether it is proving successful in addressing the problem of lost to follow up. A concurrent evaluation of the long term clinical and health outcomes of the PMTCT program intervention will also be performed. These lessons will be used to strengthen both the hospital-based program and the clinic strengthening program.

BACKGROUND:

The South African Government (SAG) recently published results of the PMTCT program per province (2006 Antenatal HIV and Syphilis Prevalence Survey). Results of this survey show that KwaZulu-Natal continues to have the highest antenatal prevalence of HIV at 39.1%. This is 10% higher than the national prevalence of 29.1%. Current statistics at the four municipal clinics in the Outer West area of Durban show suboptimal uptake of PMTCT and poor follow-up of infants from the PMTCT program. There are currently no statistics to indicate the success of infant feeding interventions, infant follow-up rates or involvement of partners.

This is an ongoing activity designed to strengthen PMTCT services within the framework of a decentralization and integration of HIV care and treatment program. This project is supported by both municipal and provincial government. All protocols followed will be in line with the Provincial Treatment Guidelines, and outcomes of the program will be reported to the eThekwini (Durban) municipality as well as to the KwaZulu-Natal Department of Health. The implementing organizations, McCord Hospital and Zoe-Life, will strengthen capacity of staff employed by the municipal government (eThekwini Municipality) at the four clinics to optimize current PMTCT services.

ACTIVITES AND EXPECTED RESULTS:

An emphasis on gender equity in this program area will focus on optimizing the number of pregnant women who receive care, support and prophylaxis, as well as developing strategies to include partners of pregnant women in decision-making and issues relating to PMTCT. Partners will be encouraged to test for HIV, and infected partners or family members will be integrated into the HIV palliative care and antiretroviral treatment (ART) services program areas. Access to couple counseling will be increased, with focus areas around family planning, risk reduction, infant feeding choices and testing of family members included in the counseling and support.

ACTIVITY 1: Human Resources Strengthening

PEPFAR-funded staff with PMTCT expertise will provide onsite mentorship and supervision of staff of the PMTCT program at the four facilities to improve quality of PMTCT care; training and onsite mentorship of counselors and clinical staff at the four facilities to increase skills in couple counseling and integration of partners into PMTCT-related decision making; training of counselors and nurses in infant feeding choices and maternal nutrition; and training of nurses to draw blood from infants to increase access to infant testing.

ACTIVITY 2: Monitoring and Evaluation

This activity will focus on the development of a monitoring and evaluation (M&E) system that can integrate data from ART, TB, palliative care and PMTCT services. This M&E system will optimize the provincial PMTCT data protocols and ensure smooth referrals into other vertical programs.

ACTIVITY 3: Technical Support in Response to M&E Results

PEPFAR-funded staff will provide regular onsite technical support and training of staff to understand the outcomes of the M&E to improve quality of care and to highlight areas where necessary.

ACTIVITY 4: Follow-up of Infants

Activity Narrative: This activity will focus on the development of sustainable strategies to improve follow-up of infants using M&E tools and optimization of routine infant clinic visits (e.g., for immunizations, weighing, etc.).

NEW ACTIVITIES:
FY 2008 funding will go toward the following activities:

(1) Counseling services will be expanded to include pre-conception counseling, discordant couple counseling, extended family counseling and establishment of relevant and appropriate psychosocial support interventions including focused outcomes based support groups.

(2) Testing services will be expanded to include a second HIV test for all women at 36 weeks gestation who tested negative at first booking. This will ensure that all women who may have seroconverted during the pregnancy are able to participate in the PMTCT program.

(3) Care and Treatment services will be strengthened by improving early identification of women who require treatment, and by offering these women referral and fast tracking into established ARV treatment program.

(4) Follow up of infants will be strengthened by establishment of child-friendly spaces within the clinics and through sensitization of staff to improve case finding of all children attending the clinic and strengthening linkages with community-based health workers and birth attendants where possible.

(5) Linkages with the most common hospital-based delivery sites will be strengthened with the aim of improving perinatal management of the HIV-infected women through staff training, technical support and strengthening of case finding systems within the maternity unit.

(6) Linkages with schools and educational services will be formed and a program developed to sensitize young people to the realities of PMTCT and family planning. This activity will link with the provision of counseling and testing services at these centers, and will link schools with the clinics and NGOs that provide optimum PMTCT services.

Sustainability is addressed through the capacity building focus of this program area. PEPFAR-funded staff will not be permanently assigned to these clinics but will lend support and build capacity until South African Government-funded staff are able to sustain the program without assistance. The M&E system developed will be offered to the municipal and provincial government if it is useful within this context.

This program area expects to add quality and to increase uptake of PMTCT services in four municipal clinics. Uptake of PMTCT services is expected to increase by 30-50%. Zoe-Life and McCord Hospital expect to provide additional counseling services such as couple counseling, partner counseling and testing, and maternal nutrition testing. A follow-up system for infants will be developed which will capitalize on the routine immunization schedules, and an increase in infant and sibling testing is expected. HIV-infected infants or children will be supported according to the provincial pediatric treatment guidelines. Referral systems will be strengthened to ensure continuity of care. Infected infants will be referred for initiation of treatment and referred back to the ARV services program area for ongoing care once stabilized. This program area will thus increase access to treatment for infants and children.

The McCord Hospital/Zoe Life activities contribute to the 2-7-10 PEPFAR goals and the USG South Africa Five-Year Strategic Plan by integrating PMTCT and HIV services, strengthening the public sector and expanding access to care and treatment.

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID:	4624.08	**Mechanism:**	N/A
Prime Partner:	Medical Care Development International	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	7903.08	**Planned Funds:**	$224,000
Activity System ID:	14015		

Activity Narrative: SUMMARY:

Medical Care Development International - South Africa (MCDI-SA) is a US-based private voluntary organization (PVO) that is registered as a Section 21 company (NGO) in South Africa. MCDI-SA has been successfully implementing community public-health and social support projects in KwaZulu-Natal, South Africa, since 1995. Prior to PEPFAR funding, projects have incorporated activities focusing on traditional Child Survival (CS) interventions, reducing HIV and AIDS through prevention among youth and adolescents, assisting with CT/PMTCT site establishment, strengthening the government healthcare system's provision of services to and creating support groups for HIV-infected and TB-affected individuals, and supporting other health-supportive community-based initiatives. MCDI-SA seeks to prevent mother-to-child transmission (MTCT) through a comprehensive training and support program. Target populations include men and women of reproductive age, pregnant women, and people living with HIV and AIDS, and children under five. The major emphasis areas are all gender-related issues (addressing male norms and behaviors, increasing gender equity in HIV and AIDS programs, increasing women's access to income and productive resources, increasing women's legal rights, and reducing violence and coercion), Human Capacity Development (in-service training and retention strategy), Local Organization Capacity Building, and include Child Survival and Safe Motherhood Wraparound Programs.

BACKGROUND:

FY 2008 PEPFAR funding will be used to expand MCDI-SA's ongoing PMTCT initiatives in rural Ndwedwe sub-district to the three remaining sub-districts of Ilembe District Municipality in KwaZulu-Natal province. The MCDI-SA PMTCT program is part of the Ndwedwe Integrated TB and HIV and AIDS program (NITHAP), funded by the USAID Child Survival Program, as well as Ilembe District Child Survival Project and UNICEF. Proposed activities are consistent with the South African Government's mission of preventing the spread of HIV. The main partner in this activity area is Ilembe District Department of Health. Other partners include South African non-governmental organizations (NGO) such as The Valley Trust and National Association of People Living With HIV and AIDS (NAPWA) as well as the Campus Law Clinic at the University of KwaZulu-Natal (UKZN). Activities in this area will provide the means to empower women of reproductive age in general to protect the health and well-being of their children and themselves and will provide pregnant women and HIV-infected pregnant women and mothers expanded access to counseling and testing (CT), PMTCT and antiretroviral (ARV) services.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Capacity Building

MCDI-SA will continue to improve the capacity of local government-supported and volunteer-community health workers to provide quality CT, traditional VCT and PMTCT; services, and to educate the community on the importance of CT and PMTCT. Community Health Workers (CHWs), home-based care volunteers (HBCV), and other community influencers, such as traditional healers, religious and traditional leaders, will ensure that HIV-infected pregnant women and mothers adhere to PMTCT treatment and feeding protocols, i.e. taking nevirapine at the onset of labor, either on arrival at the health facility for delivery, or at home in a community setting (assisted by a birth companion) and adhering to exclusive infant feeding practices until appropriate weaning commences.

Training of health providers and community outreach workers will include the following: (1) Training of sub-district trainers, Community Health Facilitators (CHF) and health facility personnel on PMTCT/VCT and household and community integrated management of childhood illnesses (C/HH IMCI) by MCDI-SA and The Valley Trust; (2) CHFs will provide training to CHWs, HBCVs, Traditional Birth Attendants (TBAs), and Traditional Healers (THs) on C/HH-IMCI and Community PMTCT; (3) Households and communities as well as traditional healers and community and religious leaders will be reached by community workers and provided with information about Community and Household Integrated Management of Childhood Illnesses (C/HH-IMCI) and PMTCT. All training activities are based on the South African Government (SAG) PMTCT protocols. In addition, community workers will be provided with sound knowledge of C/HH-IMCI and community PMTCT and will serve as community advocates for CT and PMTCT to pregnant women in the area. Community awareness is a key to increasing access to PMTCT services and adherence to government healthcare and treatment protocols.

Training formats will be either small workshops held over one or more days or one-on-one mentoring and will be conducted by qualified nurses and/or South African Qualification Authority (SAQA)-accredited trainers. Training quality assurance will be measured through pre- and post-training evaluations as well as periodic follow up evaluations whenever feasible.

ACTIVITY 2: Pre- and Post-Natal Support Through HIV-infected Mothers Support Groups and Birth Companion Programs

MCDI-SA will continue its current efforts in providing HIV-infected women with psychosocial and other support as part of the PMTCT program. With FY 2008 funding, MCDI-SA will establish HIV-infected Mothers Support Groups in collaboration with the local National Association of People living With AIDS (NAPWA) affiliate. Locally recruited lay counselors trained by MCDI-SA and NAPWA will offer additional educational and psychological support to mothers support groups, and legal support will be provided through a partnership with the UKZN Campus Law Clinic. These support groups will: (1) guide new mothers on appropriate feeding practices; (2) assist new mothers in developing income generation and public awareness/anti-stigma projects; and (3) encourage information sharing on accessing and adhering to antiretroviral treatment (ART), childhood illness prevention, detection and treatment, accessing social grants, involving men in maternal and child care, and addressing and reducing domestic violence. HIV-infected mothers' support groups will be used as linkages between communities and health facility PMTCT/CT and ART services. Groups also will be mentored in how to register themselves as community-based organization who can receive funding for their own organized activities. Furthermore, birth companions will be identified and trained by MCDI-SA and NAPWA trainers to accompany pregnant women in all stages of the antenatal and postnatal periods. They will foster best practices in antenatal care, child bearing, and infant feeding and care, including ensuring that HIV-infected mothers adhere to PMTCT protocols related to self-administration of nevirapine in the home, when delivery does not take place in a

Activity Narrative: facility. In addition, Birth Companions will promote referral to the two ARV service centers in Ilembe sub-district. The Support Group Facilitators will work with the district Department of Health Community Health Facilitators, traditional birth attendants (TBAs), HBCVs and CHWs to identify Birth Companions among the community, family members or volunteers.

ACTIVITY 3: Facility PMTCT Service Quality Assessments

Using an assessment tool developed in conjunction with the Ilembe District DOH under the current TB-HIV service integration project, MCDI-SA will conduct annual assessments of PMTCT services at the facility level. This tool is similar in format to the District Rapid Assessment Tool (DRAT) that was developed to evaluate TB services in the Eastern Cape for the Equity Project, which has been adapted and expanded for use in Ndwedwe under our TB-HIV project, NITHAP. This tool, which provides a more in-depth understanding of service provision than current DoH data vehicles are able to collect and present, has proven to be effective for TB services, and will be adapted to address PMTCT service quality. Each assessment will evaluate the quality of PMTCT service provision in terms of number, training and tenure of personnel; adequacy of physical space, supplies and equipment; integration with ANC, VCT, and TB services; consistency of recording and reporting; and other key service points in compliance with NDOH PMTCT guidelines. Results and recommendations will be discussed on-site with the service providers as well as compiled and presented to the Ilembe District Health Management Team. DOH PMTCT program managers will be trained on use of the tool and provided with electronic copies of the tool for their ongoing use.

This project contributes to PEPFAR 2-7-10 goals by improving uptake and access of PMTCT services at public health facilities, facilitating the linkages between PMTCT and ART services, and providing psychosocial support to HIV-infected pregnant women and mothers, ensuring better adherence to PMTCT protocols and reducing the number of new infant infections.

1.4 Number of health workers trained in the provision of PMTCT services according to national and international standards	75	False

Indirect Targets

Although MCDI is directly reaching PMTCT clients, indirect support will be provided to the overall Ilembe District PTMCT program. Project activities planned to support ongoing South African NDOH services include the following: (1) training of all facility nurses on PMTCT protocols that will provide sustainable benefits to all pregnant community members; (2) implementation of PMTCT service quality assurance through thorough PMTCT facility service assessments and on-site mentoring of facility staff for improvement; and (3) provision of a PMTCT quality assurance tool to the DOH for continued use and of training on its use. Estimates for the indirect targets are based on KZN DOH District Health Information System (DHIS) statistics for the number of the first visit antenatal care (ANC) clients in a one-year period and the proportion who are HIV (approximately 30%).

Activity System ID:	14018		

Activity Narrative: SUMMARY:

This project is implemented by a consortium of organizations, including the Medical Research Council of South Africa (MRC), the Health Systems Trust, the University of the Western Cape (UWC) and Centre for AIDS Development, Research and Evaluation (CADRE). The project focuses on improving the outcomes of HIV-infected women and their infants through multiple approaches at the facility and the community level. The project will also include a targeted evaluation of PMTCT effectiveness. Emphasis areas include community mobilization/participation, needs assessment, quality assurance and supportive supervision, strategic information, and training. Target populations include infants, women, pregnant women, people living with HIV (PLHIV), HIV-affected families, nurses, and other healthcare workers.

BACKGROUND:
This ongoing project, started in FY 2005, builds on the PEPFAR-funded Good Start Cohort Study. The study results highlighted the need for greater community support for HIV-infected mothers in relation to infant feeding and postnatal care, and health systems weaknesses that have contributed to the poor performance of PMTCT programs.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Community Peer Support Project

With FY 2005 and FY 2006 PEPFAR funding, UWC developed training materials and trained 36 locally-identified peer supporters in basic child health skills. In FY 2007, the project focused on identifying pregnant women in 34 project clusters, followed by providing peer support to each of these households until the infants reached six months of age. The activity aimed to support exclusive infant feeding practices (either exclusive breastfeeding or formula feeding); encourage mothers to attend antenatal care and to be tested for HIV; support disclosure of HIV status; support access to child support grants; encourage women to attend clinics postnatally for immunizations; provide cotrimoxazole and access to antiretroviral (ARV) therapy if required; and support early cessation of breastfeeding for HIV-infected women choosing to breastfeed. In FY 2008, the project will focus more on the early neonatal period, with the peer supporter visits beginning within 24-48 hours after delivery. This change in focus is aimed at created greater linkages between communities and the facility-based PMTCT programs. During their initial visits, peer supporters will ensure that HIV-infected women's infants received nevirapine and that the women are aware of ongoing PMTCT-specific care during the postnatal period. Funding for this activity will be used to provide a stipend to the peer supporters, for supervision and mentoring of peer supporters and for transport to visit mothers in the clusters. The expected results from this activity include identifying HIV-infected women and providing community peer support to these women from the antenatal stage until the infants reach 10 weeks of age.

ACTIVITY 2: Monitoring and Evaluation:

Data collectors will be recruited to determine if the provision of peer support leads to increases in exclusive infant feeding practices, uptake of PMTCT-specific care (e.g. nevirapine CD4 testing, infant six week testing, cotrimoxazole) and improved infant HIV-free survival at 12 weeks. Data will be collected from mothers enrolled in the project when their infants reach 12 weeks. Information on infant feeding practices, morbidity, infant growth and health-seeking behavior of mothers will be collected. Dried blood spots will be taken to determine the rate of mother-to-child transmission of HIV at 12 weeks. This data will be used to determine the effectiveness of the peer supporter program on infant survival. The data will be reported to the provincial departments of health and based on the findings the provinces will determine how the peer supporter program should be scaled up.

ACTIVITY 3: Community Voluntary Counseling and Testing (VCT)

Using FY 2007 Funding, development of a pilot community-based VCT project for pregnant women is underway. FY 2008 funding will ensure continuation of this pilot project. This activity is being undertaken in the rural district of Sisonke in KwaZulu-Natal. It was designed in response to the finding that many pregnant women in this district do not know their HIV status and are not accessing facility-based antenatal VCT. FY 2008 funding will ensure employment of community VCT counselors who will go door to door in their communities identifying pregnant women and offering them home-based pre-test counseling. If women agree to be tested, a mobile testing team led by a nurse will visit the home to perform the testing and post-test counseling. Other household and family members will also be able to receive VCT. This project aims to assess the feasibility and acceptability of a home-based VCT model in a rural area in South Africa.

ACTIVITY 4: PMTCT Integration

During FY 2006, this project developed a baseline assessment tool to assess the integration of PMTCT within maternal and child health services. The assessments began in 2006/2007 in all facilities in two districts in KwaZulu-Natal and were undertaken as a participatory process with district management teams. During FY 2007, the results of the assessments were fed back to districts during workshops where district teams identified interventions aimed at improving PMTCT service delivery. Examples of interventions include provider-initiated opt-out antenatal HIV testing and an intervention to adapt the infant Road to Health Chart to improve the identification of HIV exposed infants. The main focus has been on providing technical assistance to district management teams to act on the identified bottlenecks to integration by developing action plans. During FY 2008, the project aims to implement the identified interventions in the two districts in KwaZulu-Natal and to monitor the effect of the interventions on key PMTCT indicators.

ACTIVITY 5: Facility-based Intervention

This project will involve various interventions to improve the quality of PMTCT care. Interventions would include training health workers on appropriate use of PMTCT and HIV registers and training on HIV/TB/PMTCT integration. During FY 2006 and 2007, two training workshops on TB/HIV/PMTCT registers were held in Sisonke district with 50 people trained. The revised registers have been introduced in the district. During FY 2008, the project plans to implement strategies to improve the linkages between the TB, HIV and PMTCT program through management training, information system support and operational research activities. This activity will be undertaken in Sisonke district, a rural part of KwaZulu-Natal.

Activity Narrative: These activities will contribute to PEPFAR's 2-7-10 goals by promoting exclusive infant feeding practices among HIV-infected women, increasing the number of pregnant women who are aware of their HIV status and who can access PMTCT, improving the quality of PMTCT services and providing strategic information regarding the operational effectiveness of PMTCT. Ensuring that more pregnant mothers are aware of their HIV status will empower more women to access PMTCT interventions, and a significant number of postnatal HIV infections will be averted by increasing the number of women who practice exclusive feeding during their infants' first year of life. These activities are in line with the USG goal of integrating maternal and child health services into primary care systems.

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID: 500.08

Mechanism: CDC Support - with CARE UGM

Prime Partner: National Department of Health, South Africa

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 3564.08

Planned Funds: $1,475,813

Activity System ID: 14057

Activity Narrative: In close collaboration with the National Department of Health (NDOH), CDC will provide overall HIV and AIDS programmatic support to the national and provincial prevention of mother-to-child transmission (PMTCT) program. In addition, NDOH relies on CDC to implement activities that address NDOH's emerging priorities, provide financial and technical support quicker than the NDOH systems allow. PEPFAR PMTCT-specific activities are represented on the NDOH operational plan, and contribute to the overall implementation of the national PMTCT program.

SUMMARY:

The aim of the "In Support of the NDOH PMTCT" project is to provide technical assistance to the NDOH and provincial health departments to ensure expansion and strengthening of PMTCT services in all nine provinces. The major emphasis area is training. Minor emphasis areas include development of network/linkages/referral systems, policy development, local organization capacity development, quality assurance, and strategic information. Target populations for these activities include policy makers, National AIDS Control Program staff, other NDOH staff, other healthcare workers, women, family planning clients, pregnant women, people living with HIV, HIV-infected pregnant women and their infants.

BACKGROUND:

The goal of the National PMTCT program is to reduce mother-to-child transmission of HIV by improving access to HIV counseling and testing in antenatal clinics, improving family planning services to HIV-infected women, and implementing clinical guidelines to reduce transmission during childbirth and labor. In addition, the National program is responsible for ensuring follow-up of infants born to HIV-infected mothers and ensuring that these infants are identified early and referred to treatment if necessary. The purpose of this project is to provide technical assistance to NDOH by funding two program assistants to work within the NDOH on all aspects of the program. The technical assistance focuses particularly on capacity building of healthcare workers and community healthcare workers, development and implementation of provincial PMTCT-specific operational plans, strengthening national and provincial reporting systems, coordinating the national PMTCT steering committee meeting, developing a monitoring and evaluation system for early infant diagnosis and strengthening service delivery by implementing systems strengthening activities.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Capacity Building

In FY 2005, PEPFAR and the NDOH finalized the PMTCT and Infant Feeding Curricula and PEPFAR funding produced a trainers' guide, participants' guide and course directors' guide. In FY 2006, course directors and trainers were updated on the finalized curriculum and provincial training coordinators were assisted in developing provincial training plans to implement the curriculum at the provincial level. FY 2007 funding was used to ensure expansion of the PMTCT training throughout the country. Particular support was given to expand training on PCR implementation and monitoring and evaluation of the PMTCT program. FY 2007 Plus up funding will be used to align the existing PMTCT and Infant Feeding Curricula with the important policy shift in the area of PMTCT ARV prophylaxis. As of FY 2008 the national PMTCT policy will no longer be single dose nevirapine, but the provision of dual therapy to all HIV-infected pregnant women. It is anticipated that the regimen will be AZT from 24-28 weeks and nevirapine at the onset of labor. FY 2008 PEPFAR funds will be used to assist the NDOH and provincial DOHs to develop strategies for the implementation of the new PMTCT policy, the development and printing of the new PMTCT guidelines, training and updating of all health care workers. Funds will be used to ensure that all healthcare workers offering antenatal care, postnatal and child health services receive training. These activities will contribute to the PEPFAR goal of averting seven million new infections, as healthcare workers will be trained to integrate PMTCT into routine service, and more pregnant women will receive PMTCT services.

ACTIVITY 2: Technical Assistance

In FY 2004 CDC placed a technical advisor at the NDOH to support the PMTCT program. For the last three years, this advisor has worked closely with the national PMTCT program and the national PMTCT steering committee to identify gaps and challenges to PMTCT implementation and develop strategies to strengthen PMTCT implementation. As the PMTCT policy will shift in FY 2008, it is necessary to bring an additional PMTCT advisor on board to assist the NDOH in the roll-out of the dual therapy PMTCT policy. This will mean that in FY 2008, CDC will support two PMTCT advisors at the NDOH. The one advisor will focus on the maternal aspects of the PMTCT program and integration of PMTCT into antenatal care services. This advisor will be tasked with assisting the NDOH increase PMTCT uptake, develop strategies and provincial operational plans for the roll-out of dual therapy, providing technical assistance to the provinces to address health systems challenges in PMTCT implementation. A second advisor will focus on ensuring rollout of early infant diagnosis, ensuring stronger linkages between PMTCT and treatment, care and support, addressing infant feeding issues and creating systems to improve follow-up of PMTCT enrolled mothers and their infants. These advisors will offer technical assistance for the implementation of policy, monitoring and evaluation and day-to-day programmatic support to the NDOH. The technical advisor will conduct provincial site visits to assess quality of PMTCT service delivery and will work directly with the provinces to strengthen and improve existing services.

ACTIVITY 3: Monitoring Early Infant Diagnosis

Using FY 2007 and FY 2008 funding a monitoring and evaluation system for early infant diagnosis is currently being developed and piloted at the coronation hospital complex in Gauteng province. FY 2008 funding will be used specifically to support the scale-up and rollout of early infant diagnosis services to other clinics and hospitals in Gauteng province. The monitoring and evaluation system is currently being developed as no national system to monitor early infant diagnosis exists. The district health information system (DHIS) which is responsible for the national data set only captures the number of infants tested at 12 months of age. The new system includes monitoring and evaluation training on the national early infant diagnosis testing protocol implementation, implementation itself and client adherence and follow-up. The activity is a logical follow-on from the formative/descriptive work conducted in FY 2006, and the results obtained from the formative work served as the basis for formulating monitoring and evaluation tools (both quantitative and qualitative, exploring both quality of care and service provision and client adherence and

Activity Narrative: psychosocial impact) that can be used for early infant testing rollout. Expected results include development of a draft monitoring and evaluation package to be tested in a number of facilities as the early infant testing training and protocol are progressively rolled out. The draft package will also include an assessment of the feasibility of implementing the package in different types of health facilities and how it can be adapted to facilities already offering the service. In addition, while the monitoring and evaluation package will be thorough and comprehensive, certain components may not be realistic for certain clinical settings. Therefore, part of the package will explore different levels of monitoring and evaluation (gold, silver, bronze standard) depending on the clinical environment. This will ensure exploration of quality of care issues in greater depth. This activity will contribute to PEPFAR goals by facilitating a process where HIV-infected infants can be identified early and referred to antiretroviral therapy facilities for monitoring and ensuring that they receive treatment at the appropriate time. In addition, the focus on quality of care will ensure sustainable implementation of early infant diagnosis.

ACTIVITY 4: Collaboration with Other Donors and Stakeholders

At the request of the NDOH, a stakeholders analysis of PMTCT activities is currently underway. This analysis will identify and map all existing PMTCT activities taking place around the country. It will facilitate the identification of gaps in PMTCT service delivery and highlight the different levels of support being given by various donors and stakeholder to the NDOH PMTCT program. FY 2008 funding will be used to hold a National PMTCT stakeholders workshop, where the results of this analysis will be presented. The NDOH, the donors and stakeholders will then decide how to scale up and strengthen PMTCT activities. The premise behind the stakeholders workshop is to ensure that there is no overlap in activities, all areas of the country are being provided with support and assistance and that stakeholders and donors are collaborating in the rollout of PMTCT services. The expected result of this activity will be the development of one national annual PMTCT operational plan for South Africa. The NDOH, with support from CDC, will take the lead on this activity.

The "In support of NDOH" activity plays a pivotal role in the implementation of the national PMTCT program as all activities assist the NDOH and provincial departments of health in the rollout of the New Strategic Plan (NSP) for HIV and AIDS, and the accelerated prevention strategy. Funding will ensure that the new PMTCT policy is disseminated throughout the country and that health care workers are trained in accordance with the NSP. This program will contribute to 2-7-10 goals by ensuring implementation of quality PMTCT services and by preventing vertical transmission.

Indirect number of mother-baby pairs followed up over 12 month period	N/A	True
Indirect number of pregnant women who received HIV counseling and testing fo PMTCT and received their results	750,000	False
1.1 Number of service outlets providing the minimum package of PMTCT services according to national and international standards	N/A	True
1.2 Number of pregnant women who received HIV counseling and testing for PMTCT and received their test results	N/A	True
1.3 Number of HIV-infected pregnant women who received antiretroviral prophylaxis for PMTCT in a PMTCT setting	N/A	True
1.4 Number of health workers trained in the provision of PMTCT services according to national and international standards	3,000	False

Indirect Targets

As provider initiated CT is rolled out over the next year, uptake of PMTCT will increase. Currently uptake is 55%, however the SAG aims to achieve 70% uptake of PMTCT service delivery by September 2009. In addition, as dual therapy is rolled out, it is anticipated that the number of pregnant women who complete a complete course of ARV prophylaxis will also increase.

USG staff work closely with the NDOH to improve PMTCT uptake and service delivery. Staff assisted with drafting the revised PMTCT protocol to include the introduction of dual therapy and provider-initiated CT. PEPFAR support to the National PMTCT Program includes: training of all facility nurses on PMTCT protocols that will provide sustainable benefits to all pregnant community members; implementation of PMTCT service quality assurance through thorough PMTCT facility service assessments and on-site mentoring of facility staff for improvement; and provision of a PMTCT quality assurance tool to the DOH for continued use and of training on its use.

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 7854.08

Planned Funds: $349,200

Activity System ID: 14002

Activity Narrative: SUMMARY:

Management Sciences for Health (MSH) has been awarded the RPM Plus follow-on: Strengthening Pharmaceutical Systems (SPS), therefore all RPM Plus activities for FY 2008 will be undertaken by SPS. SPS will strengthen the pharmaceutical component of the Prevention of Mother-to-Child Transmission (PMTCT) services at the facility level and the role of pharmacy personnel in promoting and supporting PMTCT services. Three activities have been identified: 1) strengthening health personnel capacity to support the PMTCT program, assisting with the review of National PMTCT standard treatment guidelines (STGs); 2) monitoring of PMTCT commodities; and 3) improving management of patients to support National Department of Health (NDOH) prevention efforts. The major emphasis area is needs assessment, and minor emphasis areas include human resources, linkages with other sectors, logistics and training. Target populations include women, infants, family planning clients, people living with HIV (PLHIV), policy makers, national program staff, and public doctors, nurses, pharmacists, and other healthcare workers.

BACKGROUND:

In South Africa, the implementation of PMTCT services is one of the key HIV and AIDS interventions, as prevention remains the cornerstone of the country's response to HIV and AIDS. PMTCT services are available through hospitals, midwife obstetric units, community health centers and primary healthcare clinics. In 2003, RPM Plus received funds from the USAID Child Survival program to assist in strengthening the "pharmaceutical component" of the PMTCT program. An in-depth analysis of existing policies and practices was conducted and is being applied in collaboration with the National and all nine provincial Departments of Health. SPS is also providing support to the NDOH Pharmaceutical Policy and Planning Cluster (NDOH-PPP), and the Medicines Control Council (MCC) with the selection and review of the drug(s) and regimen of choice for PMTCT.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthening health personnel capacity to support the PMTCT program

SPS will conduct provincial workshops for pharmacists, pharmacist's assistants and nurses to address issues identified during the assessment of PMTCT services and will include an update to health staff on recommended ART regimen(s) for pregnant women and the associated clinical pharmacology (i.e., drug of choice, adverse-drug-event while on ART). The focus of the provincial workshops will be on training primary healthcare (PHC) level workers, as PHC sites constitute one of the primary sites for prevention, and also diagnosis, staging, referral and routine follow-up of HIV-infected patients. Quantification of PMTCT related medicines and commodities will also be addressed during the training. Additional provincial workshops will be conducted during FY 2008. The expansion of the National ARV program to the PHC level is anticipated to take place during this period. A full comprehensive training program will be implemented in provinces and local government authorities.

ACTIVITY 2: Technical assistance

SPS will continue the ongoing support provided to the NDOH Essential Drugs List Committee in reviewing PMTCT drug(s) of choice and standard treatment guidelines (STGs), to the MCC on regulatory issues, and to the NDOH PMTCT Task Force in planning implementation of the strategy. This activity also includes the review and development of training modules to include new PMTCT STGs in the training conducted by SPS (e.g., HIV and AIDS management and Pharmaceutical and Therapeutic Committee training). The review of the National PHC EDL is underway and includes the review of PMTCT STGs. In FY 2008 SPS will continue to provide support in the implementation of the recommendations that arose from the PMTC assessment and National workshop.

ACTIVITY 3: Monitoring of PMTCT commodities and patient management

SPS will implement systems (manual and computerized) to monitor the use of PMTCT commodities and the management of patients at PHC level. This includes the monitoring of distribution and use of cotrimoxazole, nevirapine and/or AZT.

These activities contribute to the PEPFAR 2-7-10 goals by improving the quality of the PMTCT services provided at the facility level.

1.3 Number of HIV-infected pregnant women who received antiretroviral prophylaxis for PMTCT in a PMTCT setting	N/A	True
1.4 Number of health workers trained in the provision of PMTCT services according to national and international standards	450	False

Indirect Targets

By training 50 health workers (pharmacy personnel and nurses) to support PMTCT services; SPS will indirectly strengthen service delivery for the overall PMTCT program in the provinces. In addition, SPS will conduct focused provincial assessment of the pharmaceutical component of PMTCT services, as well as assist with the review of National PMTCT standard treatment guidelines. SPS will indirectly support 40 sites with an estimated number of 1000 PMTCT patients/site.

Activity Narrative: PMTCT National Public Health Evaluation (PHE)

Title of Study: Targeted National PMTCT Evaluation

Time and Money Summary: The Consortium (Medical Research Council of South Africa (MRC), the Health Systems Trust, the University of the Western Cape (UWC) and Centre for AIDS Development, Research and Evaluation (CADRE) is using FY 2007 funds to conduct an analysis of the cohort data described below and consultation with relevant experts and stakeholders to develop the research plan for the cross-sectional national PMTCT survey. The initial modeling analyses and research planning activities will be completed within one year of receipt of funds. The project started in July 2007 and the project is expected to run over three years. The activities described in the 2007 COP are expected to be completed in the first year of funding. There will be no funds leveraged from other sources.

Local Co-investigator: The Principal Investigator for the MRC CDC-PEPFAR award is Mickey Chopra. This project will be conducted through a consortium of research partners, including the following co-investigators: Debra Jackson from University of the Western Cape; Mark Colvin and Alan Matthews from CADRE (Dr. Matthews is also a SACEMA Fellow); Ameena Goga from University of the Witswatersrand; and Tanya Doherty and Wesley Solomons from the Medical Research Council.

Project Description: At the request of the National Department of Health (NDOH), MRC has been requested to evaluate the national PMTCT program. In FY 2007 the project focuses on analysis of cohort data, review of the literature and beginning modeling the transmission data from the previous PEPFAR funded PMTCT cohort study. This will provide estimates of postnatal HIV transmission across three sites with different infant feeding patterns. FY 2007 also focuses on the development of a cross-sectional study design and planning. As part of this planning process, during FY 2007 relevant national, provincial and local stakeholders are engaged to assure relevance of the cross-sectional survey for program policy and planning. During FY 2008 the project will undertake a nationally representative survey of facilities providing PMTCT in all nine provinces. This cross-sectional component will take place at immunization clinics where mothers who are bringing their infants for six week immunizations will be asked for consent to perform an ELISA test on their infants. A positive ELISA test indicates that the infant was exposed to HIV. In this event, a further blood spot will be tested with a DNA PCR to determine early transmission rates. Mothers will also be interviewed to determine their access to PMTCT during antenatal care. Finally, after completion of the cross-sectional survey, data from the cohort studies will be used to model late transmission of HIV, and this data will be taken from results obtained from the cross-sectional approach as six week testing is the recommended testing point in the national program and most infants are lost to follow up after this point. Data from the evaluation will be used by provincial and national departments of health to strengthen PMTCT service delivery.

Status of Study/Progress to Date: A study protocol has not yet been developed. A study protocol will have been developed and submitted to the MRC Research Ethics Committee and the CDC for review during FY 2007.

Lessons Learned: Not applicable. This project has only just started.

Information Dissemination Plan: Once the evaluation has been completed, presentation of data will be made to national and provincial stakeholders in PMTCT and HIV and AIDS Policy and Programs. In addition, the consortium will develop policy briefs for policymakers summarizing the key findings in simple language and making brief practical policy recommendations. Presentations will also be made at relevant scientific meetings and manuscripts prepared for submission to peer review journals in the field of public health and/or HIV and AIDS.

Activities: FY 2008 COP activities will be expanded to include: (1)Cross-sectional survey of a representative national sample of PMTCT sites throughout South Africa. (2) On-going development of models for postnatal transmission of HIV based on the previously conducted cohort study, national data and national and international literature in coordination with South African Centre for Epidemiologic Modeling Analysis (SACEMA). FY 2008 COP activities will be planned in greater detail once the initial planning phase (using FY 2007 funds) has been conducted.

Budget Justification for FY 2008 Monies (please use US dollars):
Salaries/fringe benefits: $150,000
Equipment: $10,000
Supplies: $5,000
Travel: $100,000
Participant Incentives: $10,000
Laboratory testing: $200,000
Other: $25,000
Total: $500,000

Table 3.3.01: Activities by Funding Mechansim

Mechanism ID:	7300.08	**Mechanism:**	N/A
Prime Partner:	Pathfinder International	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Prevention of Mother-to-Child Transmission (PMTCT)
Budget Code:	MTCT	**Program Area Code:**	01
Activity ID:	15942.08	**Planned Funds:**	$250,000
Activity System ID:	15942		

Activity Narrative: SUMMARY:

Pathfinder will implement activities aimed at equipping clinics to offer prevention of mother-to-child transmission (PMTCT) services, train nurses in the provision of PMTCT services and train peer educators in case finding and supporting groups. The emphasis areas for these activities are human capacity development and local organizational capacity development. The target population is women between the ages of 15-24 years.

BACKGROUND:

Pathfinder International is a new PEPFAR partner and all activities related to this project will be initiated in FY 2008. The objective under this program area is to improve access to youth-friendly PMTCT services, including the prevention of unwanted pregnancies and protection/treatment of the pregnant women. All activities will be implemented by Planned Parenthood Association of South Africa (PPASA) and services will be made available in PPASA youth-friendly service (YFS) clinics in KwaZulu-Natal, Gauteng, North West, and the Eastern Cape. Antenatal Care (ANC) comprises a large percentage of services delivered in YFS clinics. With demand for ANC among young people increasing, the YFS clinics are well positioned to offer the continuum of PMTCT services in the selected sites. The establishment of PMTCT services will have a two-pronged approach: increasing PMTCT services at YFS clinics and encouraging community support/mobilization for these services. The clinics will provide ANC, VCT, infant feeding and psychosocial counseling, ART, family planning in the context of HIV and referrals for optimal obstetric care, newborn care (including infant feeding options), and well-child/well-mother follow-ups. The community (through existing networks of peer educators and local NGOs) can be organized, trained and be supported to identify cases; support young women during pregnancy and home-birth; encourage facility delivery; provide information on PMTCT; and promote safer breastfeeding. These elements of service provision must be carefully linked and coordinated to guarantee the even flow along the continuum of care for the young woman and family at risk. A two-way referral system, training of facility-based providers and peer educators, and sensitization of facility-based staff and community leaders are all part of establishing this two-pronged approach. This effort to integrate PMTCT services into existing YFS clinics will utilize and strengthen the existing infrastructure and systems in the selected sites to ensure sustainability in preventing new infections.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: PMTCT Continuum of Services

PMTCT services for young people will go beyond the usual focus on pregnant women to engage partners, family members and the community in institutionalizing the services and reducing the stigma associated with them. VCT is an important entry point for PMTCT services, starting with primary prevention for couples intending to have children and then promoting VCT early in pregnancy to minimize chances of MTCT. VCT, as a routine part of ANC, is the cornerstone of PMTCT. Consistent and correct condom use after pregnancy, as well as early postpartum care will be encouraged through counseling on family planning. Family planning and dual protection for young mothers will be reinforced in PMTCT training of service providers. Nurses will also be trained in the provision of youth friendly PMTCT services. Pathfinder will also conduct monthly supervision and refresher training meetings with nurses providing PMTCT. The project will train peer educators to find young pregnant women in the community and encourage them to use youth-friendly PMTCT services. The project will also establish a two-way referral system between providers and peer educators. The peer educators will refer young pregnant women from the community to the YFS clinic and the nurses will refer the pregnant women who test positive to the peer educators for ongoing support during their pregnancy.

ACTIVITY 2: Guidelines for PMTCT

The project will follow the National PMTCT guidelines and will expand them by adding best practices and practical guidelines on PMTCT services for young people. Pathfinder will adapt these guidelines to be more youth-focused and use the national training curriculum on PMTCT, complemented by Pathfinder's PMTCT curriculum developed in Kenya, to train doctors and nurses specifically on issues relating to youth and PMTCT. It is also crucial that providers be trained in YFS and counseling for pre- and post-testing, as well as to provide support throughout the PMTCT continuum.

ACTIVITY 3: Behavior Change Communication (BCC) Interventions for PMTCT

The BCC campaign will increase knowledge about and motivation for the use of PMTCT services. Aside from gaps in service delivery that will be addressed through the project, cultural barriers to testing for pregnant women (such as stigma, denial, and lack of partner, familial or community support) will be addressed through a PMTCT BCC intervention. Because the PMTCT services will be offered through existing youth-friendly clinics providing an array of services, including ANC, the common stigma associated with seeking PMTCT services will be reduced and young women will be able to seek the services confidentially at the clinics. The project will benefit from lessons learned from Pathfinder's PEPFAR-funded PMTCT work in Botswana and in Kenya, as well as the Ndola demonstration project run by AED in Zambia. These successful BCC messages will be adapted to focus on youth for the South African setting. The first BCC priority will be to develop materials for young clinic clients and providers. Community outreach efforts to increase awareness of services will be coordinated with other HIV and AIDS awareness activities, especially those under this project on VCT and community home-based care (CHBC). BCC efforts will also encourage young expecting couples/partners to utilize services at YFS clinics to prevent MTCT. Finally, information campaigns on PMTCT will be carried out by peer educators in the waiting areas of clinics. Pregnant clients waiting for services will be informed that PMTCT services are available and will learn of the importance of protecting their own health and the health of their child.

These results contribute to the PEPFAR 2-7-10 goals by improving access to and quality of PMTCT services in order to identify HIV-infected pregnant women and increase the number of pregnant women receiving ARV services.

Activity Narrative: SUMMARY:

The Wits Pediatric HIV Clinics (WPHC) and National Health Laboratory Service (NHLS) will use PEPFAR funds to expand a demonstration project that was implemented with FY 2006 and FY 2007 funding. The project is aimed at increasing access to early HIV diagnosis for infants, and developing guidelines for rollout of the project on a national level. This project was specifically requested by the Gauteng provincial Department of Health (DOH), with strong support from the National Department of Health (NDOH) and its Prevention of Mother-to-Child Transmission (PMTCT) Early Diagnosis Committee. Local organization capacity building, in-service training and ongoing operational research validating suitable HIV assays will be the major emphasis areas for this program, with minor emphasis given to commodity procurement, development of networks, linkages, and referral systems (especially between immunization clinics, early infant diagnosis and treatment, care and support),and logistics. The primary target population will include HIV-exposed infants (birth to five years old) and infants who are not infected, and secondary target populations include lab workers, doctors, nurses and South African government policy makers.

BACKGROUND:

Early infant diagnosis of HIV is vital for monitoring PMTCT programs and identifying HIV-infected children to receive care. Diagnosing HIV in children is more complex than in adults because of the interference of maternal HIV antibodies during infancy and ongoing exposure to the virus during breastfeeding. To date, HIV diagnostic services for children in low resource settings have been neglected and healthcare workers are not familiar with its theory or practice. About five million people in the country are HIV-infected and it is estimated that about 500,000 of these, which include 60,000 children, are in urgent need of antiretroviral (ARV) therapy. One frequently cited reason for so few children accessing treatment is the fact that mechanisms to diagnose infants early are not in place. Although NDOH Guidelines have made provisions for early diagnosis with HIV DNA PCR, in most places this has not yet replaced the previous protocol of using HIV ELISA tests at 12-months of age. In reality, infants are not followed up either die before accessing care or only present once they are already ill with their first HIV-related illness. Lack of early diagnosis for exposed infants and the integration of PMTCT services with services providing ARV drugs have been identified as keys to improving access to care for HIV-affected children and their families, and thereby increasing the number of HIV-infected people receiving treatment.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Technical assistance and scale-up of early infant diagnosis

Using FY 2008 funding, this activity aims to assess the implementation challenges and develop guidelines to scale-up early infant diagnosis for infants born in PMTCT programs. Technical assistance will be provided to the provinces to help facilitate the rollout of early infant diagnosis services. This project was specifically requested by the Gauteng province DOH, with strong support from NDOH and its PMTCT Early Diagnosis Committee. Technical assistance will be provided to improve lab infrastructure to conduct early infant diagnosis and scale up these services around the province. Technical assistance will be provided to establish dried blood spot testing in all HIV DNA PCR laboratories; to make monthly PCR test statistics available, e.g., to "Concerned Pediatricians" to monitor progress; to optimize current and new HIV assays used; to update diagnostic algorithms for children in an evidence-based manner; and to establish a system for feedback from clinics for central monitoring, e.g., service issues, quality control, etc.

ACTIVITY 2: Capacity Building

In FY 2008, WPHC and NHLS will continue to facilitate training of clinic healthcare workers including nurses, doctors and lab technician in the area of early infant diagnosis and update training content as practice evolves. The training will ensure that infants exposed to HIV accessing immunization clinics at six weeks of age are offered PCR testing. Training will help facilitate an average increase in test volumes from 3,000 to 4,500 per month.

ACTIVITY 3: Linking the expanded program for immunizations (EPI) at primary healthcare clinics (PHC) with early infant diagnosis.

In FY 2008, WHPC and NHLS will continue to explore systems to ensure PHC clinics act as entry points for HIV-affected children by identifying HIV-infected children (and other family members) for comprehensive HIV medical care, including referral between PHC and hospital facilities.

The NHLS early infant diagnosis demonstration project directly contributes to PEPFAR's 2-7-10 goals by increasing the number of infants accessing treatment in Gauteng, and serving as a platform for expansion of early infant diagnosis programs throughout the country. These activities support the PEPFAR Five-Year Strategy for South Africa by supporting government efforts to improve quality of and access to care and treatment for HIV-infected children.

Activity ID: 15939.08

Planned Funds: $250,000

Activity System ID: 15939

Activity Narrative: SUMMARY:

Using FY 2006 and FY 2007 PEPFAR funding, an evaluation of existing program data was conducted to understand barriers to effective implementation of maternal syphilis screening and treatment in existing antenatal care (ANC) programs, including links between syphilis and HIV screening. Based on the evaluation results, a new activity is planned to promote integrated prevention of mother-to-child transmission (PMTCT) and syphilis screening in government-run primary healthcare facilities providing ANC services in two provinces, Gauteng and Northern Cape. These provinces were identified in consultation with the National Department of Health (NDOH). The primary emphasis area addressed by this project is policy and guidelines. Target populations are pregnant women, HIV-infected pregnant women and healthcare workers, including nurses, traditional birth attendants and pharmacists, working in antenatal care facilities.

BACKGROUND:

The evaluation described above is expected to be completed in August 2007, with summary results and a report provided shortly thereafter. FY 2008 funds will be used to implement improved service delivery activities based on the findings. The activity is planned to be conducted within existing primary care settings providing ANC to women in their locality, and thus is directly coordinated with and supported by both the South African national and provincial sexually transmitted infections (STI) program. The prime partner, CDC's Division of STD Prevention (DSTDP), provides technical expertise and oversight for the project. DSTDP works directly with the provinces of Northern Cape and Gauteng to conduct activities. DSTDP also sub-contracts with the National Institute of Communicable Diseases (NICD)/STI Reference Centre (STIRC), a South African parastatal, for hiring additional staff, laboratory quality assurance testing and other needed preventive services. Gender issues will be addressed indirectly (e.g., training will cover concerns about partner violence associated with HIV testing; pregnant women's access to ANC/PMTCT services will be encouraged and covered in training).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Dissemination of findings from the evaluation

A meeting of local/provincial health departments will be held to review results of the evaluation and develop a plan of action that (1) integrates HIV testing along with syphilis screening in ANC clinics; (2) integrates rapid identification and treatment of women who test positive for syphilis and/or HIV through support of lab capacity; (3) supports pregnant women who are not currently accessing ANC services to do so; and (4) considers uses of alternative models of integrating service and providing PMTCT. Results will also be presented at the National PMTCT Steering Committee meeting.

ACTIVITY 2: Setting up a demonstration project

The evaluation that was conducted highlighted a number of challenges to PMTCT implementation. In order to address these challenges and set up a best practice model for PMTCT implementation in Gauteng province and the Northern Cape province, two demonstration projects will be implemented. These demonstration projects will address challenges to implementation. Interventions will be implemented in the demonstration project to ensure high quality PMTCT services are rendered. Some of the proposed interventions include opt-out provider initiated counseling and testing, referral networks between PMTCT and treatment, care and support, dual therapy, mechanisms to follow-up HIV exposed infants in the community and reduce loss to follow-up and the implementation of a holistic service. The idea is to set up best practice models in the provinces that can serve as training sites, and a resource to the province for the implementation of interventions aimed at strengthening PMTCT service delivery.

ACTIVITY 3: Human Capacity Development

Human capacity will be developed through the training course and ongoing support to nurses providing ANC services for a high quality program. These activities will involve the revision of currently approved government training curricula (manuals, etc.) and training of primary healthcare nurses providing ANC services that focus on enhancing antenatal HIV and syphilis testing, treatment and services, and encouraging access to care for pregnant women. This project aims to improve access and quality of PMTCT services, to identify HIV-infected or syphilis serology positive pregnant women, and to increase the number of women receiving treatment for syphilis and antiretroviral (ARV) prophylaxis to prevent STI and HIV transmission to infants.

By addressing enhanced PMTCT through improving ANC systems for HIV and syphilis screening, it contributes to the PEPFAR prevention objective of 7 million infections averted. This project contribute to PEPFAR 2-7-10 goals by improving access to and quality of PMTCT services to identify HIV-infected pregnant women and increase the number of women receiving ARV prophylaxis to prevent HIV transmission to infants.

Budget Code: MTCT

Program Area Code: 01

Activity ID: 21086.08

Planned Funds: $491,750

Activity System ID: 21086

Activity Narrative: SUMMARY:

JHPIEGO will continue conducting monitoring and evaluation (M&E) training in PMTCT for staff from National Department of Health (NDOH) and provinces. In FY 2007, JHPIEGO would have implemented activities to strengthen PMTCT services in North West province. JHPIEGO will increase its geographic depth by expanding the model PMTCT facility that will link essential PMTCT services among six feeder primary healthcare clinics (PHC) and the district hospital in a targeted district in North West province. This program will be used as a model of best practice for the province, and will be expanded to other districts in FY 2008. JHPIEGO will also expand the Training Information Monitoring System (TIMS) to three additional provinces. Emphasis areas are training, human resources, quality assurance and supportive supervision, and strategic information. Target groups include adults, family planning clients, people living with HIV, HIV-infected infants, public health workers and policy makers.

BACKGROUND:

Using PEPFAR funding, JHPIEGO has provided M&E training to the NDOH since FY 2004. In FY 2007, JHPIEGO provided support and technical assistance to introduce an integrated model to adopt and support a PMTCT service delivery facility in North West province. JHPIEGO will continue this work in FY 2008, and will also expand this support to an additional district in the NWP. JHPIEGO proposes that the integrated PMTCT model combine antenatal care (ANC)/delivery services at the district hospital level inclusive of its feeder clinics, thereby increasing access and standardizing services. Currently, adequate referral systems between the PHC feeder sites and district hospital are lacking. This model will improve comprehensive PMTCT by addressing each pillar of the World Health Organization's (WHO) framework for PMTCT services, including (1) primary prevention of HIV infection, (2) prevention of unintended pregnancy among HIV-infected women, (3) prevention of transmission from HIV-infected women to their infants, and (4) care, treatment, and support for HIV-infected women and infants. JHPIEGO will work closely with the North West province Department of Health (NWDOH) HIV and AIDS directorate, and district health authorities to develop an implementation plan that will include eventual transition away from donor funding and to full support by the NWDOH. JHPIEGO may cover initial salaries of additional staff but will work with DOH authorities to ensure that required positions are created and budgeted for. This will ensure sustainability by permitting the NWDOH to eventually absorb these positions. JHPIEGO will work with the district hospital and the six feeder clinics to ensure adequate forecasting of required drugs and supplies.

As cross-cutting support to address sustainability, JHPIEGO will introduce standards-based management and recognition (SBM-R) for PMTCT that will encompass those interventions mentioned above as well as others. JHPIEGO will support the rollout of couple counseling in this model program in an attempt to increase men's role in PMTCT services. JHPIEGO will coordinate PMTCT activities with FHI, AED, and other PEPFAR partners working in the same geographical area. Family planning, infant and young feeding practices, and monitoring and evaluation topics are synthesized into the three respective training curriculums so that the topics are not repeated and to ensure that clinic staff are not pulled off of the clinic for redundant training.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Referrals & Linkages

The objective of this activity is to build strong linkages and referral systems between women's healthcare services and PMTCT programs, thus eliminating missed opportunities for women and their families to access PMTCT services. JHPIEGO will work to ensure that counseling and rapid testing services focusing on risk reduction will be available to all PHC clients and their partners. JHPIEGO will mentor and support personnel in PMTCT counseling and clinical interventions to reduce the risk of transmission during ANC, postnatal care, labor and delivery. JHPIEGO will link with the provincial and national departments of health to ensure that all providers who have not received adequate training are enrolled in the national PMTCT and Infant Feeding Training. After providers have attended training, JHPIEGO will offer supportive supervision and mentoring at the facility level and will facilitate the implementation of clinical staging for antiretroviral treatment (ART) so eligible HIV-infected pregnant women can be immediately referred to ART services. In accordance with South African Government PMTCT guidelines, JHPIEGO will ensure that all providers are equipped with adequate knowledge on ART prophylaxis for PMTCT. In addition, JHPIEGO will ensure that HIV-infected women and infants are not only referred for treatment but are tracked so they do not fall through the cracks after delivery. Services provided in the postpartum period will include ongoing monitoring for opportunistic infections, linkages with well-baby visits, HIV testing for infants and appropriate referrals to treatment, care and support. Finally, women will be referred back to family planning counseling. To increase men's role in PMTCT, JHPIEGO will work with facility staff to incorporate couple counseling, including prevention with positives. JHPIEGO will link with Kagiso Educational Television, which implements the "Grassroots Male Involvement in PMTCT" campaign, to include men in the catchment areas and to foster linkages between the CT, PMTCT, treatment and family planning aspects of these programs, JHPIEGO will work with community health workers, community-based organizations, and social services to strengthen linkages and referral systems, including referral for infant feeding programs and mother to mother-to-be support groups. JHPIEGO will work with facilities to measure performance, identify performance gaps and develop action plans to address challenges in implementation. JHPIEGO will work with staff and health authorities to use this tool as an internal and external supervision tool that can be used to improve quality and sustainability of services. JHPIEGO will use its PMTCT performance and quality improvement tool, which was developed to improve M&E from the service delivery level to the district level. This will serve to strengthen data capture, monitoring, and evaluation, allowing the NWDOH to use data to strengthen PMTCT services in the province.

By strengthening PMTCT services and building the capacity of healthcare workers, these activities contribute to PEPFAR 2-7-10 goals, averting new infections among infants exposed to HIV as well as increasing access to treatment care and support for HIV-infected women and their infants.

Activity ID:	21631.08	**Planned Funds:**	$200,000
Activity System ID:	21631		

Activity Narrative: TYPE OF STUDY: New.

TITLE OF STUDY: Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) Antiretroviral Pregnancy Register – A Multi-Country Surveillance Protocol.

TIME AND MONEY: Part A of the study is expected to begin in September 2007. Rollover into Part B will occur in April 2008. Inclusion of additional countries into the larger surveillance protocol will begin in October/November 2007 during the revision of the current protocol. Total project time is five to six years. Total projected budget for South Africa, with activities set to begin in 2008, is approximately $1 million for the five-year duration of the project. Funding requested will be $200,000 for each year.

LOCAL CO-INVESTIGATOR: EGPAF anticipates using one to two local clinical investigators, though the investigators have not yet been confirmed. They will work in collaboration with the other country clinical investigators as well as with the protocol team leader and principal investigator (PI). It is anticipated that only one to two sites will be included in this study.

PROJECT DESCRIPTION: Antiretroviral treatment (ART) delays disease progression and consequently HIV-infected pregnant women are increasingly being treated with highly active antiretroviral therapy (HAART) for the sake of their health and to reduce vertical transmission. Current guidelines in developed countries for the management of HIV-infected women include the use of HAART during pregnancy as this achieves complete plasma viral suppression prior to delivery. Although the use of HAART in pregnancy has significantly reduced rates of vertical transmission of HIV-1, some questions remain regarding the safety of these therapies and their potential impact on the uninfected infant. The scientific and medical communities in the western world in collaboration with drug manufacturers have established an Antiretroviral Pregnancy Registry (APR). In contrast, in most of the resource-poor countries that carry high burden of disease from HIV and where antiretroviral products are likely to be used, routine surveillance on birth defects is not documented. EGPAF is establishing such a registry within its Care and Treatment program. The goal of this registry is to conduct observational surveillance for HIV-infected pregnant women exposed to antiretroviral products during the prenatal period to evaluate the outcome of the pregnancy and safety of the products.

EVALUATION QUESTION: There are two evaluation questions. The primary question aims to to determine the frequency of adverse events including teratogenicity and adverse birth outcomes among infants or fetuses born to mothers exposed to antiretroviral treatment during pregnancy. The secondary question aims to (a) differentiate the frequency of adverse events including teratogenicity and adverse birth outcomes among infants born to mothers exposed to antiretroviral treatment during pregnancy by gestational age at exposure; and (b) differentiate the distribution of adverse events including teratogenicity and adverse birth outcomes by various drug regimens used in resource-limited countries.

Endpoints include:
(a) Number of major congenital defects documented at birth and at six months and in any fetus > 20 weeks gestation born to mothers exposed to combination antiretroviral therapy during pregnancy.
(b) Number of adverse pregnancy outcomes documented in mothers exposed to combination antiretroviral therapy during pregnancy.
(c) Number of maternal > Grade II toxicity events reported in pregnant women exposed to combination antiretroviral therapy during pregnancy.
(d) Number of toxicity episodes reported among infants born to mothers exposed to combination antiretroviral therapy during pregnancy.

PROGRAMMATIC IMPORTANCE/ANTICIPATED OUTCOMES: The purpose of this registry will be to track the effects of ART medications on pregnancy outcomes, infant and maternal health. Results will be used to supplement animal and human toxicology studies, in order to promote safe use of ART drugs within the prenatal period and assist clinicians in caring for their patients. The information acquired may also be made available to the existing international Antiretroviral Pregnancy Registry (APR).

Methods:
(1) This is an observational surveillance program of pregnant women on ART and follow-up of their infants to the age of six months to observe for major congenital deformities and serious adverse effects.
(2) Case Report Forms (CRFs) will be designed and provided to the study clinicians for completion. Data relating to the EGPAF APR will be recorded on the CRFs provided. The CRFs will reflect the latest observations on the EGPAF APR participants. During monitoring visits, an EGPAF representative will evaluate them for completeness, validity, legibility and consistency.
(3) No major ethical issues are foreseen. The surveillance program will be conducted in accordance with the (a) World Medical Association Declaration of Helsinki; and (b) the ICH harmonized tripartite guidelines for GCP, 1996.

POPULATION OF INTEREST:
(1) Sampling frame: The EGPAF APR will systematically sample and recruit from the women attending the ART clinic. These women range in age from 15-45 years.
(2) Sample size: An 'intent-to treat analysis' will be conducted for this protocol. This means all subjects who begin combination ART will be included in the analysis, even if they discontinue therapy for any reason or are designated as 'lost-to-follow-up'. All statistical tests will be interpreted at the 5% level of significance. Since Part A is an exploratory phase, the relative frequency of teratogenic effects of the ARVs will be described and the prevalence of these adverse effects including major congenital defects will be calculated. Comparisons between the groups on various treatment regimens will also be done in Part A. Adjustments for multiple comparisons will be done in the first phase e.g. teratogenic effects will be compared to gestational period at initiation of treatment by regimen. In order to do this, the adverse effects including teratogenicity will be tabulated per treatment group by type of adverse effect and timing of exposure to treatment. Special attention will be given to those subjects who have discontinued the pregnancy registry due to teratogenic effects, a severe adverse event of adverse pregnancy outcome.

INFORMATION DISSEMINATION PLAN: The results of this EGPAF APR will be published in a peer-reviewed journal. The paper should be submitted for publication within six months of EGPAF APR completion. Information from this peer-reviewed publication will be subsequently shared with South African government stakeholders and the pharmacovigilance division of the National Comprehensive Care,

Activity Narrative: Management and Treatment of HIV and AIDS (CCMT) program. The initial manuscript describing the multi-country results will be created by the principal investigator and distributed to study investigators and site staff for input and comments. Site specific data can be utilized by local investigators as deemed appropriate by human subject committees' approvals. A final EGPAF APR report will be prepared in collaboration with all clinical investigators. This report will be provided to all investigators who contributed to the EGPAF APR and the Independent Ethics Committee/Institutional Review Board if required. Presentation and publication of the results of this EGPAF APR will be governed by EGPAF policies.

BUDGET JUSTIFICATION FOR YEAR 1 BUDGET:

The following is based per site:

Salaries/fringe benefits: $87,200
Equipment: $5,700
Supplies: $0
Travel: $0
Participant Incentives: $0
Laboratory testing: $0
Other: $ 7,100
Subtotal: $100,000

Activity ID: 22313.08

Planned Funds: $470,000

Activity System ID: 22313

Activity Narrative: Summary
The University of Western Cape is implementing multiple activities aimed at improving human capacity development to address HIV and AIDS in South Africa.

BACKGROUND
The 2004 report of the Joint Learning Initiative on health human resources states that “after a century of most spectacular health advances in human history, Human survival gains are being lost because of feeble national health systems. The HIV and AIDS emergency has undoubtedly contributed to this problem, particularly in South Africa. The pressure on health care workers is immense and with the crisis of attrition and out-migration of personnel, systems in South Africa are challenged as never before. This has been placed in stark relief by the urgent need to respond to HIV and AIDS epidemic, and especially the current imperative to deliver antiretroviral therapy (ART) to large numbers of sick people who are often living in areas where health systems have been poorly developed. This project focuses on strengthening and expanding the development and implementation of comprehensive HIV and AIDS prevention in South Africa in order to mitigate the impact of the HIV and AIDS epidemic. The emphasis area for these activities is human capacity development, training, including pre-service and in-service training for nurse midwives. The primary target groups for these activities include nurse midwives and community healthcare workers in the public sector. Secondary target groups include HIV positive pregnant women and their infants.

ACTIVITIES AND EXPECTED RESULTS:
There are tw0 0eparate activities in the PMTCT program area.

ACTIVITY 1: Improving the quality of community health worker programs for the delivery
The use of community health workers, such as lay counselors to support the delivery of HIV and AIDS care in communities is becoming increasingly common in South Africa. The National Department of Health (NDOH) has introduced a national community health workers policy framework in 2003 which unifies and regulates initiatives in this regard. This project aims to develop an audit tool to assess the implementation of CHW programs in the country using PMTCT as an example. The tool will be piloted in one urban and one rural sub-district and feedback will be disseminated via a workshop to the NDOH and corresponding PDOHs where the piloting occurred. The project will begin with a series of workshops with policy makers and program implementers in two provinces, and national experts to define the scope and key components of the tool. This will be followed by the development of the tool, during which time further consultation with stakeholders will take place.

ACTIVITY 2: Training nurse mid-wives in community-based PMTCT
Nurses and midwives are a backbone to the health system and are major role players in the delivery of quality health services, especially in the context of maternal and child health services. With HIV and AIDS the most common primary cause of maternal ad child deaths in the country, this puts a challenge onto the already depleting MCH health services and to heath care providers, the midwives. The overall aim of this project is to build capacity through the training of midwives in the prevention, management and integration of PMTCT into maternal and child health services in a rural district in the Western Cape. The school of nursing, UWC, will develop a training program targeting midwives managers/supervisors at health facilities, qualified midwives at primary health care/community health centers and midwives trainees (within undergraduate and postgraduate studies). Midwives implementing PMTCT at primary health care will mentor the midwifery trainees. The midwives managers/supervisors will be responsible for conducting training and implementing the train-the-trainer skills education program for the MCH facility manager on integration of PMTCT into MCH services.

The above mentioned activities contribute to the PEPFAR 2-7-10 indicators by ensuring skills development for community health workers and nurse midwives implementing PMTCT services. The development of skills for this cadre of health care workers will insure implementation of quality PMTCT services, hence reducing vertical transmission and pediatric AIDS.

Funding Source: GHCS (State)

Program Area: Prevention of Mother-to-Child Transmission (PMTCT)

Budget Code: MTCT

Program Area Code: 01

Activity ID: 22314.08

Planned Funds: $150,000

Activity System ID: 22314

Activity Narrative: In close collaboration with the National Department of Health (NDOH), CDC will provide overall HIV and AIDS programmatic support to the national and provincial prevention of mother-to-child transmission (PMTCT) program. In addition, NDOH relies on CDC to implement activities that address NDOH-emerging priorities, provide financial and technical support quicker than the NDOH systems allow. PEPFAR PMTCT-specific activities are represented on the NDOH operational plan, and contribute to the overall implementation of the national PMTCT program.

SUMMARY:

At the request of the NDOH, CDC in collaboration with FXB has been asked to review the national PMTCT and Infant Feeding Curriculum for Health Care Workers, identify gaps and develop a revised PMTCT and Infant Feeding Curriculum that can be used by the province to ensure that all health care workers are adequately trained and can rollout quality PMTCT services. The major emphasis area is training. Minor emphasis areas include development of network/linkages/referral systems, policy development, local organization capacity development, quality assurance, and strategic information. Target populations for these activities include policy makers, National AIDS Control Program staff, other NDOH staff, other healthcare workers, women, family planning clients, pregnant women, people living with HIV, HIV-infected pregnant women and their infants.

BACKGROUND:

The goal of the National PMTCT program is to reduce mother-to-child transmission of HIV by improving access to HIV counseling and testing in antenatal clinics, improving family planning services to HIV-infected women, and implementing clinical guidelines to reduce transmission during childbirth and labor. In addition, the National program is responsible for ensuring follow-up of infants born to HIV-infected mothers and ensuring that these infants are identified early and referred to treatment if necessary. The purpose of this project is to build human capacity through the development of a quality PMTCT Training Curriculum.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Capacity Building

In FY 2005, PEPFAR and the NDOH finalized the PMTCT and Infant Feeding Curricula and PEPFAR funding produced a trainers_uide, participants_uide and course directors_uide. In FY 2006, course directors and trainers were updated on the finalized curriculum and provincial training coordinators were assisted in developing provincial training plans to implement the curriculum at the provincial level. FY 2007 funding was used to ensure expansion of the PMTCT training throughout the country. Particular support was given to expand training on PCR implementation and monitoring and evaluation of the PMTCT program. FY 2007 Plus up funding will be used to align the existing PMTCT and Infant Feeding Curricula with the important policy shift in the area of PMTCT ARV prophylaxis. As of FY 2008 the national PMTCT policy will no longer be single dose nevirapine, but the provision of dual therapy to all HIV-infected pregnant women. It is anticipated that the regimen will be AZT from 24-28 weeks and nevirapine at the onset of labor. FY 2008 PEPFAR funds will be used to work with the National PMTCT Technical Task team to update the current PMTCT and Infant Feeding Training Curriculum. These activities will contribute to the PEPFAR goal of averting seven million new infections, as healthcare workers will be trained to integrate PMTCT into routine service, and more pregnant women will receive PMTCT services.

ACTIVITY 2: Development of job-aids
At the request of the NDOH, FXB will use FY 2008 PEPAR funding to develop specific job-aids for health care providers and community health workers. The purpose of the job-aids will be to ensure that health care providers and community health workers/lay counselors have pocket-sized resource materials that they can refer to when working with HIV positive pregnant women. This will ensure improved PMTCT service delivery.

The updating of the PMTCT and Infant Feeding Training Curriculum and the development of specific job-aids plays a pivotal role in the implementation of the national PMTCT program. By ensuring that the training curriculum is updated, these activities will assist the NDOH and provincial departments of health in the rollout of the updated PMTCT policy guidelines. Funding will ensure that the new PMTCT policy is disseminated throughout the country and that health care workers are trained in accordance with the NSP. This program will contribute to 2-7-10 goals by ensuring implementation of quality PMTCT services and by preventing vertical transmission.

Program Area Code: 01

Activity ID: 22309.08

Planned Funds: $281,957

Activity System ID: 22309

Activity Narrative: In close collaboration with the Gauteng Provincial Department of Health (GPDOH), Nozizwe Consulting will pilot a monitoring and evaluation of early infant diagnosis program at Coronation Hospital.

SUMMARY:

In late FY2007, the National Department of Health (NDOH), began implementing early infant diagnosis of HIV at two sites per province. AT that time, it became evident, that a monitoring and evaluation system for early infant diagnosis was needed. Nozizwe Consulting, in collaboration with Coronation Hospital and Wits Health Consortium- National Health Laboratory Services began implementing activities to develop and strengthen early infant diagnosis. The major emphasis area is strategic information. Target populations for these activities include policy makers, National AIDS Control Program staff, other NDOH staff, other healthcare workers, and infants born to HIV positive mothers.

BACKGROUND:
In South Africa, lack of early diagnosis of HIV-exposed infants and integration of early testing protocols into existing public health services has been identified as key to improving access to care for HIV affected children and their families. In FY 2007 funding was used to conduct formative work aimed at identifying psychosocial issues and implementation challenges relating to early infant HIV diagnosis. As a follow on to this activity, FY 2008 funding will be used to create a draft monitoring and evaluation system for early infant HIV diagnosis in South Africa. This project focuses on creating a pilot monitoring and evaluation system or package that will include assessment of four specific interest areas: 1) training on the national protocol implementation; 2) implementation itself, 3) quality of care and psycho-social well-being (of both clients and providers) and 4) client adherence/follow-up. This activity is a logical follow-on from the formative/descriptive work conducted in FY 2007; and the results obtained from the formative work will serve as the basis for formulating M&E tools (both quantitative and qualitative; exploring both quality of care/service provision AND client adherence and psycho-social impact) that can be used for early infant testing roll-out in South Africa and elsewhere. The project will explore different levels or standards of monitoring and evaluation (gold, silver, bronze standard) for early infant HIV diagnosis. As a result, part of the M&E package will contain recommendations on how to adapt monitoring and evaluation activities to differing local (clinical and community) contexts.

Expected results include the development of a draft M&E package that will be tested in a number of facilities and geographic locales as the early infant testing training and protocol are progressively rolled out throughout the country. The draft package will contain a log frame, indicators, data collection tools, and a protocol or plan containing guidelines for data collection, management and analysis plan. It will also include an assessment of the feasibility of implementing the package in different clinical and community settings (i.e. types of health facilities, geographic locales, stages of protocol training and implementation, etc.), how it can be adapted to sites that are already offering the protocol/service, and guidelines for using gold, silver or bronze standards/levels of evaluation.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Monitoring Early Infant Diagnosis

Using FY 2007 and FY 2008 funding a monitoring and evaluation system for early infant diagnosis is currently being developed and piloted at the coronation hospital complex in Gauteng province. FY 2008 funding will be used specifically to support the scale-up and rollout of early infant diagnosis services to other clinics and hospitals in Gauteng province. The monitoring and evaluation system is currently being developed as no national system to monitor early infant diagnosis exists. The district health information system (DHIS) which is responsible for the national data set only captures the number of infants tested at 12 months of age. The new system includes monitoring and evaluation training on the national early infant diagnosis testing protocol implementation, implementation itself and client adherence and follow-up. The activity is a logical follow-on from the formative/descriptive work conducted in FY 2006, and the results obtained from the formative work served as the basis for formulating monitoring and evaluation tools (both quantitative and qualitative, exploring both quality of care and service provision and client adherence and psychosocial impact) that can be used for early infant testing rollout. Expected results include development of a draft monitoring and evaluation package to be tested in a number of facilities as the early infant testing training and protocol are progressively rolled out. The draft package will also include an assessment of the feasibility of implementing the package in different types of health facilities and how it can be adapted to facilities already offering the service. In addition, while the monitoring and evaluation package will be thorough and comprehensive, certain components may not be realistic for certain clinical settings. Therefore, part of the package will explore different levels of monitoring and evaluation (gold, silver, bronze standard) depending on the clinical environment. This will ensure exploration of quality of care issues in greater depth. This activity will contribute to PEPFAR goals by facilitating a process where HIV-infected infants can be identified early and referred to antiretroviral therapy facilities for monitoring and ensuring that they receive treatment at the appropriate time. In addition, the focus on quality of care will ensure sustainable implementation of early infant diagnosis.

ACTIVITY 2: Development of an Advisory Panel
Nozizwe Consulting will convene an advisory panel for the project. Individuals will be selected who can provide input on all aspects of the project including; training, implementation, psycho-social support, and adherence. Together with the advisory team Nozizwe Consulting will identify potential study sites for testing of the draft M&E package; and will create a draft version of the M&E package itself.

This project will help strengthen early infant HIV diagnosis efforts in South Africa by facilitating a process where HIV positive infants can be identified early and referred to ARV sites for monitoring and ensuring that they receive treatment at the appropriate time. In addition, the focus on quality of care will ensure that implementation of early infant diagnosis is sustainable. This program will contribute to 2-7-10 goals by ensuring implementation of early infant diagnosis activities such that HIV positive infants are identified early and enrolled into treatment, care and support programs.

Planned Funds: $600,000

Activity System ID: 22374

Activity Narrative:

SUMMARY:
The KZN 20,000 project aims to significantly reduce perinatal HIV transmission within 2 years and improve overall child survival within 5 years in three districts of KwaZulu-Natal (KZN) through health system support interventions that would increase the effectiveness of current Prevention of mother-to-child transmission (PMTCT) services.

BACKGROUND:
HIV infection in children is preventable. In Europe and the United States mother-to-child transmission rates have been reduced to less than 2% and few HIV-infected babies are born in these countries. This has been achieved through active screening and thereby identification of HIV-infected women attending antenatal clinics, the early initiation of highly active antiretroviral treatment (HAART) whilst women are pregnant, delivery of infants by cesarean section and the avoidance of all breast milk.
Implementing the same interventions and achieving the same low transmission rates has not been realized in most resource-poor settings. Whilst the relatively restricted PMTCT protocols that have been applied in most South African provinces cannot be expected to produce the results seen in developed nations (where perinatal HIV transmission is the exception) there is an unacceptable gap in performance of the existing PMTCT programs. Numerous obstacles have contributed to the failure of national and district health systems to successfully operationalize international PMTCT recommendations. While in some cases there are genuine deficiencies in human and physical resources, as well as incomplete training, experience in rural and urban South African PMTCT program points to a widespread failure to reliably deliver the sequence of simple processes of care (e.g. determining a mother_HIV status, reliable dispensing of prophylactic drugs). Additional transmissions occur due to inappropriate infant feeding choices by HIV-infected mothers either because of poor antenatal counseling or/or lack of support from health workers. Target population for the project includes pregnant women, their infants, and health care workers at the district health facilities. The emphasis areas are training, strategic information and local organization capacity building.

ACTIVITIES AND EXPECTED RESULTS:
The KZN Department of Health (DOH) and University of KwaZulu Natal agreed that the project, now known as KZN 20,000 , would proceed in three phases. Phase I comprises of a situational analysis and planning exercise (currently underway) to determine the level of health system intervention required to effect large scale improvement of the PMTCT program. Phase II will focus on rapid scale up of system strengthening and priority activities to improve effectiveness of PMTCT. Phase III will focus on infant feeding strategies and community mobilization. FY 2008 funding will be used to implement phase II activities. Subsequent years of funding will ensure the implementation of Phase III.

Activity 1: Implementation of KZN 20,000
KZN 20,000 will operate across three districts that were chosen by the KZN DoH, namely Ethekwini (Durban and immediate surroundings), Ugu and Umgungundlovu. Ugu district is a Presidential nodal site, meaning that it has been designated as a district that is exceptionally poor and under-resourced. Umgungundlovu contains Pietermaritzburg, the second largest city in KZN. Durban and Pietermaritzburg both have large areas of informal housing and peri-urban areas with extremely poor communities. The 3 districts contain more than half (~5m) of the entire population of KZN (~9m) and suffer high antenatal HIV prevalence rates - Ethekwini 41.6%, Ugu 38.9% and Umgungundlovu 44.4%. Between the three districts there are over 260 PHC clinics and 16 state hospitals delivering 82,000 babies per year. The project is designed to reduce the number of infant infections in the three districts by 4,800 per year and improve the health of HIV-infected mothers through strengthening of the existing health system and capacity development at district and local level. Emphasis will be given to careful documentation of process and monitoring of outcomes so that best practices and lessons can be rapidly extended to the other 8 districts within the Province. The KZN DoH is committed to the project and is using it as a way of improving overall health care management and service delivery. The health system support intervention (Phase II) will also create a platform from which to introduce interventions to improve infant feeding practices that are critical for preventing infant HIV infection and reducing infant mortality.

Activity 2: Health System Improvement Intervention:
KZN 20,000 will introduce health systems improvement intervention designed to improve the quality of PMTCT services across 3 districts. The project team will train and mentor mid-level Primary Health Care (PHC) supervisors in quality improvement methodologies and management skills that will be supported through a data collection and monitoring system specifically designed and supported by the project. Implementation of PMTCT services will remain the primary responsibility of health staff in clinics and hospitals. Routine PMTCT performance indicators will be tracked as well as 3 outcome indicators namely a) infant HIV prevalence rates at immunization clinics, b) population-based infant mortality rates and c) in-patient child mortality.

Activity 3: Development of a Data System:
A robust system that allows for timely and accurate collection, transmission (to central data assembly points), collation, translation and feedback of data is a critical component of an effective improvement intervention. An IT system is in development that will install a local MS Access database on computers that will be placed in each District Information Office. All applications will work independently but data will be automatically uploaded to an SQL database on a remote server each day. Data security can be assured by use of digital certificates such that data is only accepted from pre-specified machines which have valid certificates installed. A dedicated data assistant will be located in each district office to capture and manage data from each clinic and to produce reports for the PHC supervisors. This will initially be a system that runs parallel to, and will derive data from the current provincial data collection system. There will be no duplication of data collection since all data will flow to the provincial office. It is anticipated that the systems will be merged at the end of the funding period if the potential benefits of the proposed system are realized. The main output of the data system will be to run system performance data reports for program leadership and site specific process performance reports (line charts and histograms) to guide activities of the nursing supervisors and clinics staff.

Activity 4: Development of Learning Networks:
Prior experience with large scale improvement interventions indicates that change is accelerated when successful ideas are transmitted from peer-to-peer, and when a culture of peer support can be developed. In a traditional quality assurance environment, the front-line staff receive instructions to improve across a

Activity Narrative: broad array of indicators in what is often a pejorative context. The purpose of the learning network is to bring together small teams (e.g. facility manager, nurse, counselor) from each health care site to set common project aims, learn together how to map care processes, identify obstacles and solutions, learn how to test innovations and how to collect data to track improvement. Additional support will be given to poor performing clinics. At Learning Sessions, sites that are struggling will also be exposed to participants from high performing sites who will share their experience and strategies for success. Between these Learning Sessions, quality mentors will visit the hospitals and together with PHC supervisors will visit the clinics regularly (1-2 times/month) to support the teams, and sustain the improvement process through planning new tests of change. The concept of learning networks will apply also to the mentoring of the PHC supervisors themselves who will be brought together each month for training, transparent review of team progress, and peer support for successes and challenges in the field.

Activity 5: Monitoring of Infant HIV transmission rates, Infant and Child Mortality:
Perinatal transmission rates will be routinely monitored at sentinel sites in each district through surveillance of all infants attending 6 week immunisation clinics. Dried blood samples will be collected from all infants following informed consent from the mother or legal guardian regardless of whether the mother was part of the PMTCT programme or not. Maternal, infant HIV prevalence rates can be determined as well as vertical transmission rates.

The goals of project 20,000 are directly aligned with the goals and objectives of the US President_Emergency Plan for AIDS Relief (PEPFAR). These goals include achieving primary prevention of new HIV infections through expanding VCT programs and building programs to reduce mother-to-child transmission. KZN 20 000 aims to improve the overall performance of PMTCT and thus reduce the incidence of new perinatal HIV infections. Improvement of PMTCT has other desirable indirect outcomes which include early diagnosis of HIV that leads to increased access to HAART, decrease in infant mortality rates and overall improvement in child survival.

HVAB - Abstinence/Be Faithful

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Total Planned Funding for Program Area: $38,599,589

Estimated PEPFAR contribution in dollars	$876,000
Estimated local PPP contribution in dollars	$1,544,080

Program Area Context:

South Africa, with a population of 47.3 million, has a highly generalized AIDS epidemic: a 2005 population-based survey found overall HIV prevalence of 16% for the 15-49 age group. Transmission is primarily heterosexual, followed by mother-to-child transmission. HIV prevalence among pregnant women attending antenatal clinics was 29.1% in 2006, reflecting the first small decline after rising steadily since the early 1990s.

HIV infection rates vary greatly by age, sex, and geographic region. Young adults have the highest infection rates; prevalence peaks at 33% for women aged 25-29 and at 23% for men in their thirties. Almost twice as many women as men are infected. In the 15-24 age group, the ratio of infected females to males is four to one. Young women aged 20-29 also have extremely high HIV incidence at 5.6%; incidence in pregnant women is also high at 5.2%. Although incidence rates are higher in 15-24 year olds, adults over age 25 account for two-thirds of new infections, owing to their larger numbers. Among provinces, Mpumalanga has the highest adult prevalence (23%), while KwaZulu-Natal and Gauteng together contribute almost half of all recent infections. Eleven high-prevalence districts in three provinces contribute disproportionately to the epidemic. Urban informal settlements, which are a magnet for migrants, also have very high HIV rates; in a recent study, migrant men had HIV prevalence double that of non-migrants.

Factors associated with high HIV transmission include multiple and concurrent partners and age-mixing in sexual partnerships. Alcohol and substance abuse also contribute to risky sexual behavior. The Mean age at first sex, currently about 17 years, is declining. Levels of sexual violence in South Africa are among the highest in the world. High labor mobility, low marriage rates, and low rates of male circumcision further contribute to HIV transmission.

Basic knowledge and awareness of HIV and AIDS is almost universal and exposure to communications and interpersonal sources of information is high. Yet personal risk perception is astonishingly low. Sixty-six percent of South Africans do not see themselves at risk of HIV, often because they are faithful to, and do not recognize their potential exposure through, a trusted partner. Moreover, there is limited understanding of the protective benefits of mutual fidelity and partner limitation.

In 2007, the South African Government (SAG) issued The HIV and AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP). The plan seeks to involve all sectors of society in HIV prevention, with an emphasis on maintaining the HIV-negative status of those currently uninfected and strengthening social mobilization and poverty reduction. The NSP builds on national programs to address gender-based violence and mainstream HIV and AIDS interventions, with priority given to the rural poor, urban informal settlements, and marginalized groups. NSP priorities include: strengthening behavior change programs; scaling up interventions for youth, especially for young women; engaging parents and children in open discussion; and implementing workplace programs.

Consistent with the SAG strategy, the USG supports a comprehensive, multi-sectoral, “ABC” approach to prevention. The USG Five-Year Strategy emphasizes abstinence and faithfulness (AB) for youth, expansion of media as well as community outreach through FBOs and CBOs; links to other preventive services, and HIV testing and care. As of September 2006, outreach efforts had reached over 6.5 million people with AB messages, including 550,000 with A-only messages. The FY 2008 COP increased funding for AB prevention to $37,463,363 million but the targets were slightly reduced from last year due to the change in the OGAC community outreach definition that large events are no longer included.

USG assistance for HIV prevention complements support from other international donors that support youth prevention activities, including the Global Fund, Japanese, British, Irish governments, and the European Union. The recent Global Fund Round 6 grant provides support to several current USG partners to further expand their programs.

Earlier in 2007, an assessment of the USG South Africa prevention program highlighted the need to strengthen current efforts, in particular, to sharpen risk perception regarding multiple partners and concurrency, and to address important populations that are not being reached. With FY 2008 funding, the USG will address the weaknesses and gaps identified by the assessment, while building on existing strengths of the portfolio. Within the AB prevention program area, the USG will maintain a major focus on youth. The USG will support the Department of Education and a diverse array of indigenous faith-based and other non-governmental partners to deliver intensive, curriculum-based and peer HIV prevention education to youth through schools, churches and other community fora. USG partners will help adolescents internalize the message that abstaining from and delaying sexual activity is the only certain way to prevent HIV, and that a long-term committed relationship with a mutually monogamous, HIV-negative partner is the next best strategy for prevention. Partners will address gender issues, for example by tailoring curricula for girls and young women to enhance their self-esteem and to address the risks of transactional sex with older men. Use of interactive teaching methods will help youth personalize information and develop the skills they need to abstain. The Harvard School of Public Health and the GoLD Peer Education Agency will work to strengthen the quality of peer education implemented by other USG partners. Several partners are working in tertiary institutions; the USG will work with these partners to ensure that there is no overlap and that there is a strategy developed for addressing this population.

With FY 2008 funding, the USG will adapt “Families Matter,” an evidence-based intervention to engage adult family members in communicating with youth about prevention, and to create safer contexts for young women. Linkages between AB and OVC programs will ensure that orphans and other at-risk youth receive HIV prevention education. Several partners other partners will work with higher risk youth in disadvantaged areas. Soul City will target younger youth aged 8-12 through its Soul Buddyz mass media series, print materials and clubs. A new TBD activity will support follow-on activities when the centrally-funded Track 1.0 youth prevention program ends.

At the same time, the USG will initiate new prevention activities targeting key adult populations. The lynchpin of these efforts will be a high visibility, multi-level, multi-media campaign to increase understanding of the risks associated with multiple and concurrent partners. This will be the thematic focus of a new television drama series and a series highlighting real-life individual success stories in adopting abstinence and fidelity. The TV series will be supported by radio, outdoor media advertising, and a cellular phone text messaging campaign. Campaign messages will draw on recent qualitative research on the drivers underlying multiple partnerships. The campaign will give special emphasis to the role that male attitudes, norms and behavior play in sustaining sexual networks, cross-generational sex, and high rates of concurrency and partner turnover. In the lead up to the 2010 World Cup in South Africa, the campaign will feature prominent South African soccer players delivering messages about male responsibility, personal risk perception, and community action to support healthy behaviors. The campaign will also engage in a parallel effort to target the young women who are at highest risk.

Media activities will be complemented by an expansion of outreach to adult populations, especially men. A new initiative will seek to promote partner reduction through high visibility advocacy by the leadership of national faith-based networks and non-governmental organizations (NGOs). This will be linked to grass roots social mobilization to shape new community norms of responsible sexual behavior through local FBOs and CBOs. Other new activities will target migrants and mobile populations with comprehensive prevention education, as well as young women in their twenties in high transmission areas. In addition, new workplace programs will target small and medium enterprises and selected government departments. These new initiatives will deepen understanding of the risks associated with multiple overlapping partners and cross-generational sex, the potential for exposure to HIV through regular partners, and the benefits of mutual monogamy in the context of knowing both one’s own and one’s partner’s HIV status. Women of reproductive age and their partners will also be educated about the risks of HIV in pregnancy. The role of alcohol and substance abuse in risky behavior will be integrated into prevention education for all audiences.

Ongoing prevention activities will reinforce normative change and responsible sexual behavior through networks of CBOs, FBOs, traditional leaders and healers. AB activities targeting adults will receive complementary funding for Condoms and Other Prevention activities, in order to provide comprehensive prevention education for individuals who continue to engage in risky behavior. Strong linkages will be established to counseling and testing, and for those who test positive, to positive prevention, PMTCT, care and treatment.

In FY 2008, the USG team will add two new senior prevention experts who will promote the adoption of evidence-based, best practice intervention models; a common set of clear, actionable, behavioral messages; and coordination and synergy across partners.

Program Area Downstream Targets:

2.1 Number of individuals reached through community outreach that promotes HIV/AIDS prevention through abstinence and/or being faithful	6732379
*** 2.1.A Number of individuals reached through community outreach that promotes HIV/AIDS prevention through abstinence (a subset of total reached with AB)	1304860
2.2 Number of individuals trained to promote HIV/AIDS prevention programs through abstinence and/or being faithful	57016

Activity ID:	22496.08	**Planned Funds:**	$200,000
Activity System ID:	22496		

Activity Narrative: The Solidarity Center, in cooperation with a consortium of partners, proposes to implement a five-year HIV prevention initiative in South Africa called “Be Faithful, Be Tested, Be Union.” The Solidarity Center’s project partners are Engender Health and four of South Africa’s largest and most influential unions. These unions are the National Union of Metalworkers of South Africa (NUMSA), the Police and Prisons Civil Rights Union (POPCRU), Health and Other Service Personnel Trade Union of South Africa (HOSPERSA), and the Congress of South African Trade Unions–Western Cape (COSATU-Western Cape). Over five years, activities will be implemented in five provinces—Gauteng, Limpopo, and KwaZulu-Natal, Western Cape and Eastern Cape.
This project focuses on prevention, concentrates on workplaces, and enlists unions, businesses, and communities. The project will assist four large and influential South African unions, and the workplaces and communities in which their members labor and live, to achieve wide-reaching HIV prevention outcomes.
The project will address four critical HIV-related areas: counseling and testing, gender norm transformation, workplace policy development and implementation, and increased institutional HIV-related capacity through targeted technical assistance.
The main objective of this activity is to prevent HIV transmission using AB methods through safe and healthy sexual behavior in HIV-infected and uninfected individuals, with emphasis on gender norm changes.

Funding Source: GHCS (State)

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 22508.08

Planned Funds: $250,000

Activity System ID: 22508

Activity Narrative: Activities conducted at identified sites include HIV counseling & testing and concurrent HIV prevention and marketing activities. Trend Setters* will undertake the HIV prevention & marketing activities include placing banners, canvassing the area on foot, distributing pamphlets and invoking discussion with pedestrians, conducting information education sessions on HIV&AIDS, projecting culturally appropriate abstinence and be faithful messages, performing HIV&AIDS-related dramas and performances, establishing "post test clubs" and condom demonstrations/distribution. Post Test clubs (PTC) is a model used in Uganda which helps PLWHA's cope with infection and both HIV positive and negative members adopt and maintain an effective prevention behavior. Formation of PTC can assist in changing the social norms in support of HIV risk reduction. (UNAIDS pub.20 1999).

HIV prevention activities especially emphasize fidelity, though are balanced with abstinence messages, especially targeted towards youth, and condom promotion (i.e. correct and consistent use of male or female condom) in order to reach as many people in the target audience as possible. Management will ensure PEPFAR regulations are strictly followed.

Education and marketing is essentially to dispel myths and ensure the right information is out there. These activities enable people, who may have been unable to overcome fear or stigma to encourage knowing their HIV status, which ultimately can prolong or save their lives and possibly the lives of others.

Teenager programmes (13 -18) will focus mainly on abstinence or delayed sexual encounter and encourage those who are sexually active to pledge abstinence once again. Programmes will include prevention and living positively programmes to promote maintaining a negative HIV status and living positively to ensure quality of life.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 22495.08

Planned Funds: $112,000

Activity System ID: 22495

Activity Narrative: The Montefiore Medical Center aims to eliminate missed opportunities to test youth by building the capacity of youth-serving clinics and STI clinics to more routinely provide CT using the ACTS model. ACTS (Assess, Consent, Test and Support) is a program of rapid, simplified counseling and testing (CT) that effectively scales up provider-initiated counseling and testing (PICT). In addition, will implementing a youth-based PICT, Montefiore Medical Center will work with rural districts to target non-government organizations (NGOs) working with youth to provide HIV prevention activities.

BACKGROUND:

Engaging young people in HIV counseling and testing, prevention and care is one of the most important strategies for reducing the burden of HIV and AIDS in South Africa. Unfortunately, thousands of opportunities to achieve these goals are missed every day when vulnerable South African youth seek a variety of health care services but are not offered HIV counseling and testing (CT) or provided with HIV prevention information. By reducing pre-test counseling sessions to five minutes or less, ACTS allows nurses to incorporate CT into the other clinical services they provide, such as sexually transmitted infection (STI) care and family planning and promotes immediate follow-up and linkage to care. In addition, youth can then be linked with NGO proving HIV prevention services to ensure behavior change. The target population for this activity is youth between the ages of 10-25 in hard to reach parts of the country. The major emphasis area for these activities includes building local capacity and creating linkages, networks and referrals between youth-based prevention services
and the ACTS CT model.

ACTIVITES AND EXPECTED RESULTS:
Using ACTS, this program will focus initially on maximizing the linkages between youth based NGOs working in the area of HIVE and AIDS prevention and CT services in high-prevalence youth clinics, starting with STI clients and expanding to family planning clients. The linkage with the NGOs will ensure that ACTS services can be implemented in conjunction with AB targeted messaging and with other NGO activities. ACTS will link with youth-based NGOs in and around the clinics where services are being implemented. This will ensure that youth get both CT services and AB prevention messages. Simalarily to its approach with working with health facilities, the ACTS team will engage each new NGO, develop an implementation and monitoring plan and train all relevant providers HIV and AIDS prevention, in the importance of CT, collection PEPFAR indicators, provide quality assurance monitoring and initial HIV care. During the five year cooperative agreement, this model will be continuously refined and successively implemented in high prevalence communities and sites throughout South Africa starting in the Western Cape and Mpumalanga. The yout-based NGO project will expand services to Waterberg district in Limpopo province and the North West Province.

In FY2008, the team will continue to refine the ACTS services in two youth clinics in Khayelitsha . A monitoring and evaluation plan will be developed that includes PEPFAR indicators. A quality assurance plan will evaluate linkage to prevention among HIV negative youth as well as ensure that newly diagnosed HI-infected youth also receive information on positive prevention. A Project Director will be hired and trained and locations in Mpumalanga or other Province will be chosen as well as additional clinical and community sites in the Western Cape. The goal is for this partner to test 20,000 youth for HIV and link them to prevention.

These activities will contribute towards meeting PEPFAR's 2-7-10 goals by targeting youth between the ages of 15-25 and ensuring that they receive AB messages. In linking prevention services with CT services, this activity will ensure that youth understand how to stay negative after undergoing a HIV test.

Activity Narrative: BACKGROUND:

PCI: Project Concern International (PCI), along with two implementing partners in South Africa, proposes a program with the goal to reduce HIV transmission by changing social norms related to sexual and other gender-based violence against women. The objective of the program is to reduce the prevalence of sexual and other gender-based violence in both urban and rural areas. This will be achieved through a large scale social mobilization program that will: 1) mobilize public and private sector partners to combat gender-based violence; 2) create an enabling environment for changing social norms related to gender-based violence; and 3) develop and support the implementation of multi-sectoral activities which will achieve and maintain significant reductions in gender-based violence.

Activities leading to these results include: a) assuring that key sector partners in government, civil society, media, the private sector and education understand the impact of and are committed to ending all forms of gender-based violence; b) developing and implementing a communications strategy that will unite individual organizationsâ€™ efforts into one unified, branded campaign reaching all sectors of society; and c) empowering sector partners with resources and training to implement a range of local activities to end gender-based violence. The Western Cape and KwaZulu Natal Networks on Violence Against Women (WCN and KZN), with over 700 member organizations, will provide the technical know-how, experience, commitment and leadership to end violence against women

Activity ID: 22316.08

Planned Funds: $1,000,000

Activity System ID: 22316

Activity Narrative: SUMMARY:

The Programme Goal is to develop indigenous capacity to provide young learners with HIV prevention training and appropriate life skills to affect lasting moral and behavioural change.
PROGRAMME OBJECTIVES
1.Increase the capacity of the 6,631 Life Orientation teachers to promote HIV prevention through abstinence and faithfulness.
2.Reach 1,000,052 total learners with a message that promotes HIV prevention through abstinence and being faithful including 150,000 orphans and vulnerable children (OVC).
3.Develop the capacity of the Department of Education at the provincial and district level.
4.Develop the administrative, logistic and academic capacity of RaG and Hope Education to sustain quality HIV prevention education.

BACKGROUND:

Schools, particularly Life Orientation classes which are designed to prepare children for life, provide an ideal setting to address topics related to HIV prevention. Because Life Orientation classes have only recently become mandatory, the teachers have yet not received proper training nor do they have sufficient materials and resources In response to these needs, Reaching a Generation (RaG), a community-based South African organization, in cooperation with Hope Education (HE), a US NGO, developed a training programme for Life Orientation (LO) teachers focusing on HIV prevention and the development of skills necessary for teaching LO. Along with teacher training RaG/HE has developed an age appropriate, child-centred curriculum called iMatter to equip Life Orientation teachers with the materials they need for LO/HIV prevention education. These programmes have been developed in cooperation with the Department of Education and have the Department's full support. The LO/HIV prevention teacher training is based on a learner centred model and focuses on practical and interactive activities that engage the teachers. Begun as a pilot programme in the Free State province in August 2006, teacher training was tested, revised, improved and expanded. To date, more than 3,000 teachers have been trained. The process uses Master Trainers working in cooperation with Department of Education LO Educators to provide direct LO teacher training in the provinces.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Teacher training
The LO/HIV prevention training typically takes place during daylong workshops held for groups of 50 to 100 teachers. This is accomplished in close cooperation with the Department of Education. Such cooperation increases efficiency by utilizing the personnel, communication channels and infrastructure that is already in place. For example, the Department of Education handles communication with the schools and individual teachers and manages the majority of the follow up.The teacher training was been designed to have every LO teacher from each district attend. Unfortunately, limited resources made this impossible at times. In the past it has been necessary for one teacher from certain schools to attend and then return to the schools and provide the training and resources to other teachers. Because the trained teachers taught other teachers there was a high ratio of teachers to learners trained: 3,000 teachers for 2.5 million learners impacted. In a scaled up version, every LO teacher will be able to attend and directly participate in the training. Thus by training all LO teachers directly, we will see over 6,000 teachers impact over 1,000,000 learners in a year.

ACTIVITY 2: Curriculum materials
In addition to the training manual, each teacher will also receive age-appropriate HIV prevention materials for each of his or her learners in the Foundation and Intermediate Phases. This book called "iMatter" is complimented by a corresponding iMatter Teacher's Guide (see Appendix B for sample lessons). Each lesson of iMatter indicates which learning outcomes and assessment standards from the National Curriculum Statement are being taught. Teachers are required to keep a file of their work as well as a learner's portfolio. Both the iMatter Teacher's Guide and learner books indicate the specific dimensions of HIV prevention teaching that can be included in both the learners' portfolios and teacher's file.
As required by the Critical and Developmental Outcomes of the National Curriculum Statement each iMatter lesson is age appropriate in terms of language and cultural approach. The National Policy states: "Education should ensure that learners and students acquire age- and context-appropriate knowledge and skills in order that they may adopt and maintain behaviour that will protect them from HIV infection." The policy furthermore states: "A continuing life skills and HIV and AIDS education programme must be implemented at all schools and institutions for all learners, students, educators and other staff members." During the teacher training session, a district official from the Department of Education responsible for LO assists the teachers in understanding the correlation between the iMatter training and the National Curriculum Statement and articulates how the content learned will be used for performance appraisals in the future. Depending on the province, this person is called either a Learning Facilitator or a Curriculum Specialist. They also explain how to apply Outcomes Based assessment in compliance with the National Policy of Assessment.
The iMatter curriculum was specifically developed for Sub-Saharan Africa in Swaziland. Before the development began, Hope Education conducted due diligence and research to determine what the content should include and to ensure that no duplication was taking place. Both in Swaziland and South Africa, the iMatter materials are found to complement existing materials. The Foundation Phase book is for Grade 2 - Grade 3 and the Intermediate Phase book is for Grade 4 - Grade 7. Since the experience in Swaziland, iMatter has been modified for the South African context. Education specialists in South Africa identified the grade-appropriate National Curriculum Standard learning outcomes contained in each iMatter lesson in order to better integrate with the South African school curriculum. Practical teaching tips and activities to equip the LO teachers were also added. While the LO/HIV prevention teacher training has been designed to include an iMatter book for every child, current financial support allows for each teacher to receive only one copy of the iMatter material to utilize as a resource for teaching the Life Orientation and HIV prevention programme. In a fully funded programme, teachers will receive a copy for each of his or her learners. Recent changes within the requirements of the Department of Education along with the experience of the past two years provide additional content that would be helpful if included in the iMatter materials. A second edition of iMatter will be designed in order to align it even more fully into the requirements of the Department of Education. The project will be completed between September and December 2008. The second half of the programme being proposed here will use the second edition of iMatter.
ACTIVITY 3: Partnership and certification activities

Activity Narrative: Since the pilot teacher training programme, RaG has secured agreements with the provincial education departments to provide HIV/AIDS prevention/awareness training to the LO teachers in the provinces of Eastern Cape, Free State, North West, Mpumalanga, Northern Cape, and portions of Gauteng and Kwazulu Natal. Experience has shown that the Department of Education becomes increasingly supportive the more involved they become in the RaG/Hope Education training. Initially the involvement is primarily limited to sending the teachers. But as the programme continues and positive results are seen and feedback is heard, they become increasingly involved in providing venues, logistical support, and meals for the teachers. In addition, the district officials within the provinces are providing monitoring and evaluation to ensure the materials are being used and implemented in the schools. This is done on a continuous basis. At times RaG staff members accompany the district officials in order to capture this part of the process on video.
The HIV prevention/LO teacher training course has been registered with UMALUSI and the South African Qualifications Authority (SAQA). UMALUSI is a monitoring and moderating organization responsible for general education and training as well as further education and training. SAQA is responsible for the development and implementation of the National Qualification Framework established in 1995 to create a single and integrated qualification system for the education sector. Through a partnership with Worldwide Education Providers, RaG will be able to offer up to 5 credits to the teachers who participate in the training. The Department of Education in their draft proposal requires that each of their teachers complete 120 credits of continuing education every 3 years.
Feedback from education leaders who have been involved with the training has been very positive. Mrs. Hariette Speckmeier, Provincial Coordinator: Life Skills and HIV and AIDS for the Department of Education in the Free State Province, states: "We value your contributions and input into our current programmes in the province. The resources help our educators as there is a big need in this part of the programme. The training is well received and helps us to build capacity in our educators in the field of Life Orientation. It is my pleasure to confirm on behalf of the Department of Education that the Life Orientation Department is in agreement with Reaching a Generation (RaG) to continue to present Life Orientation (LO) training to all the teachers in the Free State.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 21164.08

Planned Funds: $250,000

Activity System ID: 21164

Activity Narrative: Organization Name: Medical Care Development International (MCDI)

Duration of Projects in years: 3 years

Prevention AB & OP:Objective 1: To prevent HIV/AIDS and other STIs and pregnancy among in and out-of-school youth through tested peer education behavior change communication (BCC) activities and using creative drama and film methods

MCDI undertakes to expand on and enhance its already successful activities in this area. IDCYSP activities are in line with the PEPFAR objective of preventing HIV transmission through the promotion of safe and healthy sexual behavior among HIV infected and uninfected individuals. Proposed activities are also consistent with the South African Government's AIDS Programme mission of preventing the spread of HIV. These proposed activities recognize the important role that community education, outreach and advocacy can play in educating youth and preventing HIV/AIDS. Specifically, the youth activities will address increased risk to youth and the disproportionately high risk among girls and young women. The Mobile Education Unit will reach underserved rural communities. The education of community influencers in a behavior change and communication approach will emphasize the particular vulnerabilities all of these vulnerable groups, while creating a more supportive environment for PLWHA and youth.

OVC: Objective 2: To provide quality comprehensive and compassionate care for AIDS orphans and other vulnerable children by expanding the model crèche to other areas, including access to essential health, social, psychosocial and legal services for OVC and their households.

IDCYSP will encourage enrollment of OVC, specifically targeting those children in child- or sibling-headed households, to crèches who are often excluded because of tuition fees through MCDI's previously successful approach of fee waivers for orphans. In the Mavela crèche, enrollment increased from 40 to 100 through using this approach. OVC will be identified through MCDI PMTCT activities. They will also be identified by home-based caregivers (HBCs), who are local community residents that have completed secondary school and an MCDI 21-day training course to deliver palliative care. MCDI is currently transitioning the supervision of HBCs to CBOs who have funding to support their income. IDCYSP will provide legal support to OVC and their caretakers, which will have a significant impact on their current and future economic well-being. Protecting and promoting the inheritance rights of OVC and fighting against disinheritance is crucial to comprehensive care and support of these children.

Planned Funds: $350,000

Activity System ID: 19441

Activity Narrative: SUMMARY:

The South African Democratic Teachers Union (SADTU) project aims to reduce the impact of HIV and AIDS by focusing on preventing transmission of HIV for teachers, their workplace community, and caring for orphans and vulnerable children in the workplace. SADTU has existing national and provincial partnerships with the Department of Education and was a member of the team that developed the National Strategic plan with the Department of Health. SADTU has also established relationships with other HIV and AIDS organizations around the country. This will ensure sustainability of program after PEPFAR funding. The target population for these activities is teachers, their workplace community and primary and secondary school learners.

BACKGROUND:

The HIV pandemic has created workplace environments that are not conducive to quality teaching and learning for both educators and learners alike. Many schools have orphans and vulnerable children who lack basic needs and therefore cannot perform optimally at school. Teachers often have to take care of these situations themselves. Although some schools do have soup kitchens and food parcels for these children, this does not address the learners psychosocial needs.
The school as a workplace is often plagued by high levels of stigma. This often results in educators suffering silently and becoming victims of the pandemic despite high perceptions of knowledge of HIV and AIDS. As a result many educators do not have the courage and support in the workplace to go for voluntary counseling and testing, since knowing your status is not publicly encouraged. Consequently most educators discover they are HIV positive when they start showing symptomatic illnesses that do not respond to medications. By this time their CD4 counts are usually low and they can no longer function optimally at their schools with compromised health. SADTU aims to address this by creating an caring workplace environment for both learners and educators alike and focusing on HIV prevention and increasing access to care and treatment services.

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Training union leaders as peer educators in the workplace

The SADTU workplace program will seek to sustain peer education for teachers using union leaders, who already have positive influence and recognition amongst educators and good standing with senior management. IEC materials focusing on prevention, knowledge of HIV and AIDS, PMTCT and human rights will be used to ensure that the peer educators can implement activities after the initial training. The focus of the prevention messages will be a comprehensive ABC approach with a focus on the be faithful message. SADTU will work, through the trained peer educators to increase community involvement, and increase male involvement and awareness around HIV prevention, PMTCT, the role of male norms and behaviors in HIV transmission. In addition, through community involvement activities, SADTU will ensure the distribution of IEC materials to educators and communities.

Activity 2: Increase access in local languages to HIV and AIDS prevention knowledge

The SADTU workplace teachers program will target educators and learners through age and gender appropriate group activities and community mobilization to increase knowledge around HIV and AIDS prevention. The program will focus on addressing gender by reducing violence and coercion, and addressing male norms and behaviors. In addition community mobilization activities will focus on the reduction of stigma and discrimination by increasing knowledge around HIV and running community activities that focus on stigma reduction.

Activity 3: Implement HIV prevention activities for learners

As part of their OVC program, SADTU will integrate HIV prevention messages building on the existing school life skills program. The focus of these messages will be on AB. These messages will be carried out by both youth peer educators and teachers.

These activities contribute to the PEPFAR 2-7-10 goals and objectives by increasing knowledge of HIV transmission and the prevention of new infections.

Activity ID:	19442.08	**Planned Funds:**	$550,000
Activity System ID:	19442		

Activity Narrative: SUMMARY:

This activity is a component of a comprehensive prevention education, care and treatment program for small to medium enterprises (SMEs) with 20-200 employees and other workplaces in South Africa. It includes activities in CT, Policy Analysis and Systems Strengthening, and Condoms and Other Prevention.

With an estimate of 12.3 million learners in South Africa, served by 386,600 teachers and more than 26,000 schools managing a response to HIV and AIDS across the education sector requires a comprehensive and substantial effort. Efforts must include a focus on both learners and educators if the impact of HIV is to be mitigated; and it must be recognized that any efforts focused on learners via the education sector cannot succeed without educators also being addressed. The Education Labour Relations Council (ELRC) will implement a comprehensive HIV and AIDS workplace program for the education sector of South Africa.

BACKGROUND:

ELRC is a statutory council which serves the South African education sector nationwide and is comprised of the public sector, the national and provincial departments of education, the private sector and teacher unions representing all primary and secondary public school educators. The ELRC works as an interface between the Department of Education (DOE) and labor organizations for labor peace and a vision of contributing towards the transformation and development of a quality South African public education system. A 2005 Health of Our Educators Report found that 50% of all teacher attrition is linked to complications of HIV and AIDS, resulting in 4000 teachers being lost each year due to AIDS. The general prevalence rate among educators was found to closely parallel that of the national population with an estimate of 12.7% of all DOE employed educators living with HIV. Based on the findings of this report and with FY 2007 and FY 2008 PEPFAR funding ELRC will implement a country-wide project to educators living with and affected by HIV and AIDS. The target group for this project is teachers, including those living with HIV or those who have family members living with HIV. This is a workplace intervention with minor emphasis areas in information, education and communication, community mobilization, and the development of linkages and networks. A particular focus of this project is the greater involvement of people with AIDS. ELRC will work with HIV positive teachers to ensure they can serve as role models to fellow teachers and to learners.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Development of Workplace Prevention Education

PEPFAR funds will be used to support the development of a comprehensive education sector prevention program targeting teachers and education sector union members. Funds will also be used to support workplace prevention education programs targeting the health and education sector. With funding from PEPFAR, these workplace programs will conduct training sessions for employers, senior management, senior union leadership and employees on the basic facts of HIV transmission, prevention, and impact of HIV and AIDS on the industry. Peer educators for unions in the education sector will receive ongoing training on prevention (especially abstinence and being faithful), PMTCT, stigma and discrimination, counseling and testing, palliative care, and access to treatment. The goal of the peer education is to increase workers' knowledge about HIV and AIDS prevention, care and treatment with the purpose of changing their attitudes and practices and modifying behavior to prevent HIV infections and reduce violence and coercion (key legislative issue).

Activity 2: Training of peer educators for teachers unions

Working in nine provinces, peer educators from four teachers' unions will be identified and trained peer educators. Training will focus on prevention, particularly AB messages. A structure will be set up to support the peer educators and ensure quality assurance for the one-on-one interactions and community mobilization activities that they will be expected to participate in.

Activity 2: Community Mobilization

The newly trained peer educators will reach teachers in their unions with AB prevention messages. The focus of the AB messaging for teachers already involved in relationships will be the B component. The peer educators will distribute IEC materials, organize mobilization events, campaign messages and conduct one-on-one interactions with teachers and/or their families.

This activity will directly contribute to PEPFAR's goal of preventing 7 million new infections. These activities support the USG Five-Year Strategy for South Africa by expanding and improving quality AB prevention programs.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 16484.08

Planned Funds: $150,000

Activity System ID: 16484

Activity Narrative: SUMMARY:

The Greater Mpumalanga Rape Intervention Program (GRIP) provides holistic services which include prevention and care for survivors of sexual assaults and domestic violence and for people infected and affected by HIV and AIDS. GRIP is involved in Abstinence and Being Faithful (AB) activities through community outreach programs. The emphasis areas are gender and human capacity development. The target populations are school children (boys and girls), teachers, and the community at large.

BACKGROUND:

GRIP was initiated by volunteers and established in 2000. GRIP started by offering services to all rape and sexual assault survivors. GRIP started empowering women, men, and children through the process of preventative education, counseling and testing, post traumatic care, and community outreach. Realizing the importance of HIV prevention and the need to address sexual assault and domestic violence in the community, GRIP is involved in two direct prevention services: peer education and teacher training. The prevention strategies include creating awareness on HIV and AIDS with special emphasis in addressing the plight of sexual assault and domestic violence survivors. This program will protect children, teachers, communities, and will uphold the rights and dignity of sexual assault survivors.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Peer Education

The aim of the peer education intervention is to encourage abstinence and to delay sexual initiation for youth aged 10 -14, before they start sexual activity. The program will target boys and girls in schools between 10 and 18 years old, who come from disadvantaged backgrounds, vulnerable to crime and experiencing socio-economic challenges within their communities. These children will be identified in targeted schools by teachers, principals and peers. For the Be faithful component of the AB program, older youth aged 15 -24 engaging in sexual activity, will be encouraged to adopt secondary abstinence and reduce number of sexual partners. Full information is provided on correct and consistent condom use for youth who are already sexually active.

At the beginning of the activities, individual sessions for boys and girls will be conducted separately for period of three months to identify their needs. After the three months, group sessions for boys and girls will be conducted separately for a period of six months. At the end of six months, both groups of boys and girls will be brought together to share what they have learned. GRIP will link this activity to an ongoing community-based support program and provide guidance to all the children. The children will also participate in camps, where boys and girls will take part in life skills.

The program is expected to empower children with information, problem-solving techniques, and life skills, which will lead to enhanced self esteem, and responsible behavior regardless of peer pressure or social problems. Through role modeling, participants in the program will with others pupils in the school who have not been through the program with a view to transference of knowledge gained. A monitoring and evaluation system will be in place for pre and post test of children who have participated in the program.

ACTIVITY 2: Training of Teachers

The goal of the GRIP program is to promote effective, accountable, and sustainable support systems in the schools and the surrounding communities. GRIP has realized that teachers and school management are usually reluctant to get involved in sexual assault issues that affect their pupils hence limited support is given to the victims of sexual assault in schools and the community. FY 2008 funding will therefore address HIV prevention, sexual assault, cross-generational sex, multiple concurrent relationships and domestic violence information. Training will equip teachers with the skills to identify, support and conduct referrals for the affected children. The program will enhance community support as all children and youth will be linked to a support mechanism through community-based forums to ensure that HIV prevention and support is sustained. Additionally this program will be linked to community and government stakeholders to ensure ownership and collaboration.

Through this program GRIP aims at improving teachers' abilities to communicate their values and expectations regarding their pupils' behavior and individual social problems. This will increase awareness and sensitivity regarding sexual violence and HIV among teachers, pupils, and community. The program will reinforce the adoption and modeling of prevention behaviors among adults, and engender social sanctions against risky practices such as cross-generational sex, multiple concurrent partnerships and sexual assault.

GRIP will train teachers selected from identified schools in Mpumalanga. Training will enable them to identify vulnerable and abused children within their environment, and empower them to report such cases. GRIP has found that during past trainings, teachers were committed to referring children to GRIP's intervention. Apart from caregivers, teachers are the most constant adults within the school child's sphere of reference. Expected results from this program are teachers who are better equipped to identify, support, and refer affected pupils a community-based support system. This includes providing parents with continued support and counseling to minimize post-traumatic effects of abuse and to ensure complete recovery. This activity will be closely monitored and continuously assessed to ensure quality assurance in the effort to achieve intended results.

These activities, through the variety of approaches will all contribute to the overall PEPFAR goal of averting seven million new infections.

PROJECT TITLE: Feasibility and Effectiveness of a Comprehensive School-Based Life Skills Curriculum based on HIV and AIDS Prevention Messages Focused on Abstinence and Being Faithful

NAME OF LOCAL CO-INVESTIGATOR: Mpumalanga Province Department of Education

PROJECT DESCRIPTION: This public health evaluation (PHE) will adapt the existing abstinence and being faithful (AB) Life Skills curriculum by monitoring and evaluating its implementation in the 8th and 9th grade classrooms, and then implement the adapted curriculum in nine primary/secondary schools in Mpumalanga. Process data that relate to dosage and fidelity of implementation in the selected classrooms will be collected and monitored; the PHE will ensure age appropriateness of materials, and their adherence to Department of Education (DOE) Learning Outcomes and Assessment Standards. Population Council will follow the 4,600 learners and 102 teachers who will have received the adapted AB curriculum in the 6th and 7th grade. Follow-up observations focus on sexual behavior outcomes and knowledge, and attitudinal outcomes around abstinence and faithfulness.

EVALUATION QUESTION: Currently there is little available knowledge on the feasibility and effectiveness of embedding HIV and AIDS prevention AB messages into a comprehensive life skills school-based curriculum that begins with the 6th grade learners. This PHE seeks to answer the following research questions:
(1) Will rigorous process evaluation generate information that leads to an appropriately adapted AB prevention curriculum?
(2) Will the adapted curriculum be the main causal factor in changed sexual attitudes and behaviors among the selected learners?

PROGRAMMATIC IMPORTANCE/ANTICIPATED OUTCOMES: For the FY 2007 COP, Population Council worked on expanding the Life Skills curriculum to 30 schools in Mpumalanga. Population Council developed this curriculum as a replacement for the current Mpumalanga Department of Education's Life Orientation Program curriculum. The comprehensive curriculum addresses the Department of Education's Life Orientation Learning Outcomes and Assessment Standards through the lens of HIV prevention, particularly focusing on AB. In addition, the curriculum builds negotiation, decision-making, and problem-solving skills around HIV prevention. This comprehensive curriculum is designed to be seamlessly incorporated into all 6th - 7th grade (11-12 year old learners) Life Orientation Program classrooms across South Africa. These elements of school-based learning are critical for instilling effective HIV prevention awareness among young people, especially awareness of a balanced AB approach to preventative sexual behavior.

The particular programmatic importance of this PHE builds on the work done in the previous year by adapting the AB life skills curriculum for use in 8th and 9th grade (13-14 year old learners) classrooms. As the Life Orientation Learning Outcomes and Assessment Standards vary by grade, the curriculum that has been developed for the 6th and 7th grades must adapt to reflect the requirements for the 8th and 9th grade DOE Life Orientation program. The PHE will measure the success of this adaptation process through rigorous process evaluation of actual classroom implementation and through the panel study that follows the learners over time with multiple observations of sexual prevention outcomes.

Overall this PHE will contribute to the PEPFAR global 2-7-10 goals by providing an important set of data needed to assess the effectiveness of school-based AB prevention curricula.

TIMELINE AND FUNDING: The total project timeframe is two years. This entry describes activities during the second year of the project, which mainly include development of protocols; training of study team; implementation of process evaluation; adaptation of the curricula; collection of panel data on sexual prevention outcomes; analysis of data; and dissemination of findings. The budget requested for the second year of study is $400,000.

METHODS:

Training: A total of 80 Life Skills educators and 10 Peer Educators from the 30 selected schools will be trained using the "Dare to be Different AB Life Skills Curriculum." (The total number of individuals trained in AB prevention for this PHE is 90.) This training component enhances the capacity of both peer educators and teachers to promote AB messages among learners in schools and the community level. Through parent -teacher meetings, parents will also be exposed to the Life Skills program so that they can assist in creating an enabling environment for their children to participate in this program.

Process Evaluation: Population Council will monitor and evaluate implementation of the adapted curriculum in the 8th and 9th grade classrooms to ensure that (a) the material is age appropriate, (b) material meets the DOE Learning Outcomes and Assessment Standards, and (c) teachers adhere to the curriculum in terms dosage and fidelity. This component will reach more than 1,500 learners in two districts in Mpumalanga province.

Panel Study: The study team will follow an additional 1,562 learners (9 schools) who received the AB curriculum as part of their schools' Life Orientation Program in the 6th and 7th grades in 2007. The panel study will focus on sexual behavior outcomes but will also examine knowledge and attitudinal outcomes around abstinence and faithfulness. As the Life Orientation Learning Outcomes and Assessment Standards vary by grade, the curriculum that has been developed for the 6th and 7th grades will be adapted to reflect the requirements for the 8th and 9th grade DOE Life Orientation Program. In total, 3,062 (1,500 + 1,562) learners will be reached. A subset of this total (approximately 1,000) will receive AB prevention messages that are predominately abstinence-only.

POPULATION OF INTEREST/GEOGRAPHIC AREA: The population of interest is grades 6 to 9 learners in South African schools. The geographical area covered in South Africa is Mpumalanga Province.

INFORMATION DISSEMINATION PLAN: The results of this PHE will be disseminated as widely as possible in South Africa and other resource-constrained African countries, most of which are struggling with the

Activity Narrative: problem of identifying a rigorously tested and successfully implemented school-based AB prevention program for young learners. Results will be presented to local, provincial, and national government officials and made available online through the Population Council and other websites. Findings will be presented to USAID/South Africa at the appropriate time, as well as at national and international conferences.

BUDGET JUSTIFICATION FOR YEAR 2 (USD):
Salaries/ fringe benefits: $320,000
Equipment:$15,000
Supplies: $5,000
Travel: $20,000
Participant Incentives: $ -
Laboratory Testing: $ -
Other: (communications): $ 40,000
Total: $400,000

The majority of funds (80% of the total) will be used for salaries and benefits for study staff, including the principal investigators/lead behavioral scientists, field directors, data managers, statistical analyst, trainers, and data collectors. Approximately seven laptop computers and related support (IT) equipment will be purchased for field data entry and analysis (equipment, 4%). Supplies will include general office supplies, computer supplies, and photocopying of data collection instruments (1%). Travel (5% of the total) will include local transport for the study team and limited international travel for Pop Council New York/Washington based technical expertise visits to South Africa. Finally, communications, office space, and other expenses will account for 10% of the total.

Table 3.3.02: Activities by Funding Mechansim

Mechanism ID:	8683.08	**Mechanism:**	N/A
Prime Partner:	South African Business Coalition on HIV and AIDS	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Abstinence and Be Faithful Programs
Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	19443.08	**Planned Funds:**	$275,000
Activity System ID:	19443		

Activity Narrative: SUMMARY:
This activity is a component of a comprehensive prevention education, care and treatment program for small to medium enterprises (SMEs) with 20-200 employees and other workplaces in South Africa. It includes activities in CT, ARV Drugs, ARV Services, Policy Analysis and Systems Strengthening, and Condoms and Other Prevention.

Background:

The South African Business Coalition (SABCOHA) will implement through the Vender Chain Management and BizAids sub-partnerships. The major emphasis for this program will be the development of a workplace program, with minor emphasis given to community mobilization and participation; training and linkages with other sectors and initiatives and development of information, education and communication materials. The target population will include adults (men and women of reproductive age), truck drivers, factory workers, the business community and HIV/AIDS affected families. The project will focus on gender by addressing male norms and behaviors, issues associated with violence and coercion and stigma and discrimination (all key US legislative issues).

ACTIVITIES AND EXPECTED RESULTS:
Activity 1: Vendor Chain
Vendor Chain Management will make use of the SABCOHA HIV/AIDS Toolkit methodology which has a component on workplace prevention programmes. During the capacity building of companies, there will be training of managers, steering committees and HIV Coordinators on prevention. It will be one of the major components of the program as it will cut across at all levels of the company. The approach used will include the education in terms of workshops, information in terms of materials which will be provided during the various sessions as well as various communication channels include audio-visuals. In addition, an assessment to determine needs and risk profile of company(gender, age, socio-cultural aspects) will be conducted. This will assist in determining how prevention programs can be tailored to meet companies' needs. Companies will also be linked to external service agencies for continuous support after the direct capacity building intervention. A particular focus of the company workshops will be on the B component of the AB messaging.

Activity 2: Project Promote
Through Project Promote the current private sector partners in the cleaning and hygiene sectors will receive support on IEC material and programme messages to be included in in-house HIV/ AIDS company training that focuses on issues such as the be faithful messages highlighting the significant risk of having concurrent partners as well as issues of stigma and discrimination within the workplace. The contract cleaning industry is almost 60% female and as such gender issues will also be covered in the materials provided to companies for dissemination. Current private sector partners of Project Promote combined employ over 30 000 cleaners. Through internal company trainers and as part of the partners ongoing workplace programs, Project Promote aims that its private partners will reach at least half of these employees over a 5 year period. During FY 2008 Project Promote aims to facilitate the training of 3800 cleaners.

Activity 3: BizAIDS
The Micro Enterprise sector in South Africa is enormous. Developed by the International Executive Services Corps (IESC) BizAIDS mainstreams HIV and AIDS issues within broader operational and strategic issues for micro enterprises. BizAIDS is a tested strategy in mitigating the economic impact of HIV and AIDS and other unplanned risks on micro-enterprises.
In a 15 hour programme, at minimal cost to the business owner, they will acquire business management; health (HIV) and legal knowledge in managing their business better, thereby reducing risk and to ensure that to continue to operate in the face of risk and to generate income. The aim of the SABCOHA response will be to expand on BizAIDS Project as a core strategic initiative and to include VCT as well as treatment and care to the core projects and through the BizAIDS project, the aim is to train 2500 people over the next 5 years. As the BizAIDS progamme links to with the vendor chain programme the same treatment and care model will be used. While numbers are based on an average of 500 micro-enterprises per year to be serviced each year over 5 years, it is possible that the treatment and care components can be extended to include spouses and dependents should funds allow. The BizAIDS programme will have access to 500 Microenterprises per annum. On Average these enterprises have approximately 5 employees each with an additional 5 family members being influenced by the enterprise itself.

This activity will directly contribute to PEPFAR's goal of preventing 7 million new infections. These activities support the USG Five-Year Strategy for South Africa by expanding and improving quality AB prevention programs.

Table 3.3.02: Activities by Funding Mechansim

Mechanism ID:	190.08	**Mechanism:**	N/A
Prime Partner:	Aurum Health Research	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Abstinence and Be Faithful Programs
Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	19444.08	**Planned Funds:**	$100,000
Activity System ID:	19444		

Activity Narrative: SUMMARY: The Aurum SME Project commenced in September 2007. The project seeks to extend access of HIV related services such as prevention, counseling, testing and treatment to people that currently are not accessing services through the existing health care system. The project specifically targets employees of small, micro and medium sized (SME) companies as well as their partners and dependents. In the second year of this project, the focus will be on strengthening service provision at the existing service points as well as extending the service offering to four additional fixed sites in Mpumalanga, Limpopo and Gauteng provinces.

BACKGROUND: Aurum provides services to SMEs at the workplace, through the use of mobile vehicles and through a fixed testing site at the Bree Street Taxi Rank which is the busiest taxi rank in Johannesburg, catering for an estimated 400,000 commuters a day in addition to 500 traders and 2000 taxi drivers.

ACTIVITIES AND EXPECTED RESULTS: Prevention activities will comprise prevention messaging targeting youth and young adults that utilize the fixed Bree centre as well as a campaign that will involve the use of counselors visiting educational institutions, sports facilities and entertainment venues within the targeted areas. In FY 2008 these activities will be expanded through the employment and training of additional counselors. It is anticipated that 7000 people will be reached with specific abstinence and be faithful messaging. Messaging that specifically targets the young men and young women will encourage abstinence, delayed sexual debut, avoidance of risk taking behavior and reduction in the number of sexual partners. All the messaging will be provided in languages understood by the targeted group and the project will involve an ongoing conversation with the community as opposed to short-term information blitzes. In addition 300 individuals from the targeted companies and communities will be trained as peer educators to use A/B focused materials.

ACTIVITY 1: Recruitment and training of youth community mobilization counselors.
Aurum intends to recruit additional youth counselors who will be trained and then tasked with the provision of youth focused messaging and education to students at educational institutions within the targeted areas, mainly high schools and tertiary educational colleges. Young commuters that frequent the taxi ranks will also be targeted with the specific A/B message. The training provided to the youth counselors will include basic counseling skills, sexuality, modes of HIV transmission, gender as related to the HIV epidemic, prevention methods, counseling for behavioral change, group and individual counseling.

ACTIVITY 2: Delivery of specific AB message to targeted youth.
An ongoing activity under this grant will be the delivery of targeted messaging to youth, attending educational institutions in the targeted areas. Youth will also be targeted at sports venues and other entertainment venues and the abstinence, be faithful and delay in sexual début will be delivered in one on one and small group information and education sessions. Messaging will specifically targets young men and young women and will encourage abstinence, delayed sexual debut, avoidance of risk taking behavior and reduction in the number of sexual partners. All the messaging will be provided in languages understood by the targeted group and the project will involve an ongoing conversation with the targeted communities.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 16087.08

Planned Funds: $485,000

Activity System ID: 16087

Activity Narrative: SUMMARY:

USAID/South Africa (SA) supports institutional capacity building of indigenous organizations that implement PEPFAR programs, including abstinence and fidelity focused prevention programs, through three competitively-selected Umbrella Grants Mechanism (UGM) partners: Pact, the Academy for Educational Development (AED) and Family Health International (FHI).The main purposes of these UGM projects are to: (1) facilitate further scale-up of HIV and AIDS prevention services through local and international implementing partners in the short-term; and (2) develop indigenous capability thus creating a more sustainable program. The major emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs) and community-based organizations (CBOs). The current UGM with FHI will support five sub-partners who have transitioned over from Pact and five new sub-partners. The activity described below refers only to the USAID/SA UGM project managed by FHI.

BACKGROUND:

Currently, USAID/ SA's Health and HIV and AIDS strategy responds to the overwhelming challenges posed by the HIV and AIDS epidemic on individuals, families, communities and society in South Africa. Through this UGM, FHI is responsible for managing sub-grants to ten of USAID's partners (all of whom submit their own COPs directly to USAID). As USAID's prime partner and the managing umbrella organization, FHI will not directly implement program activities, but rather act as a grants management partner to manage and mentor its ten sub-recipients who, in turn, will carry out the assistance programs. Thus, FHI functions primarily as a sub-grant making entity and a relatively small percentage of overall funds are used for administrative purposes. Given that grant recipients require significant technical assistance and management support, FHI will devote a reasonable percentage of overall funding to providing this support.

USAID closely collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grant mechanism. Although some of the partners work closely with various SAG Departments at national and/or local (i.e. provincial and district) levels, the umbrella grant's primary interface with the SAG is through the Senior Management Team (SMT), which includes key staff from USAID, the National Departments of Health and Social Development (NDOH, DOSD), and representatives from the provincial departments.

Under this UGM with FHI, USAID is supporting four indigenous and international FBOs and NGOs providing abstinence and be faithful-focused (AB) prevention services to communities in the provinces. These are: GoLD Peer Education Agency; Humana People to People; LifeLine; and Mpilonhle. Grants to prevention partners support the delivery of AB programs in a variety of settings including schools, churches, and outreach to communities. Services are delivered in accordance with the PEPFAR ABC guidance. Approaches include capacitating community volunteers to conduct age-appropriate youth activities, working with religious leaders to reach congregations with value-based prevention for men and women, conducting participatory personal risk assessments, and promoting VCT and use of other HIV services.

ACTIVITIES AND EXPECTED RESULTS:

In the FY 2008, USAID will continue to support AB prevention activities through this UGM with FHI. Funds budgeted under this narrative will support costs for administering and managing these AB prevention sub-partners of FHI. The subpartners conducting Prevention activities are: GoLD Peer Education Agency; Humana People to People; LifeLine; and Mpilonhle. Separate COP entries describe the prevention activities implemented by each sub-partner under FHI. Institutional capacity building of indigenous organizations is a key feature of the umbrella grant mechanism and an important strategy for achieving prevention, care, and treatment goals of PEPFAR to ensure long-term sustainability of programs and organizations.

ACTIVITY 1: Grant Management

Through this UGM, FHI will award and administer grants to partners selected through the PEPFAR APS competitive process to implement HIV and AIDS AB prevention activities. This involves an array of related activities including award and administration of grants, monitoring of grant progress, meeting reporting requirements, and grant closeout. FHI will continue to monitor prevention program implementation and adherence to financial regulations, both within FHI itself and by its sub-partners (e.g., USAID's partners). This involves provision of extensive technical assistance to partners on project development and implementation, financial management, and reporting. All these functions provide key support to organizations so they better implement AB activities.

ACTIVITY 2: Capacity Building

This umbrella mechanism will support institutional and technical capacity building of indigenous organizations, a key strategy for PEPFAR prevention goal, thus promoting more sustainable programs and organizations. (Capacity building activities are defined as activities that strengthen the skills of indigenous organizations to implement HIV and AIDS programs efficiently, with diminishing reliance on external technical assistance and support). FHI will support activities to improve the financial management, program management, quality assurance, strategic information and reporting (including monitoring and evaluation), and leadership and coordination of its sub-partner organizations implementing prevention activities. FHI will also provide technical assistance to the USAID partners, as needed, to improve the technical approaches used for AB prevention activities and to enable quality assurance/quality improvement (QA/QI) of activities falling within this technical area. All these functions provide key support to organizations so they better implement AB activities.

ACTIVITY 3: Monitoring and Evaluation (M&E) and Reporting

The UGM will ensure that support is provided to USAID's prevention partners in M&E, in order to strengthen measurement of the implementation and impact of program activities, an eventual achievement of PEPFAR goals. FY 2007 featured an initial intensive training workshop with the partners to address data collection, data analysis, and data use and to develop their annual M&E Plans and data collection tools. Training and technical assistance will continue to be systematically provided to all of FHI's sub-partners under the UGM

Activity Narrative: during FY 2008, as well. M&E support of prevention partners will include revision/updates to data collection tools, as needed; measurement of program progress; provision of feedback for accountability and quality; and implementation of information management systems. In addition, the UGM will provide supportive supervision including guidance, monitoring, mentoring and oversight through site visits, virtual and direct technical assistance, and QA/QI initiatives. All these functions provide key support to organizations so they better implement AB activities.

The FHI UGM will contribute to the PEPFAR goals of providing treatment to two million HIV-infected people; prevent seven million HIV infections; and provide care to ten million people infected by HIV and AIDS, including orphans and vulnerable children (OVC).

Budget Code: HVAB

Program Area Code: 02

Activity ID: 16849.08

Planned Funds: $0

Activity System ID: 16849

Activity Narrative: SUMMARY:

The education and awareness outreach programs are implemented in nine communities, two schools, and six factories. The emphasis areas are education, gender and workplace programs. The program includes activities that address societal and community norms to reduce stigma. Workplace programs engage private businesses to provide HIV and AIDS care, treatment and prevention for their employees. Gender is addressed through efforts to increase gender equity in HIV and AIDS programs by encouraging couple counseling and testing. Education programs use the existing school system as a means to address HIV prevention with children. The school program also addresses the emphasis area of addressing male norms and behaviors by encouraging young men to be responsible in their sexual behavior and child rearing and to respect women- including the reduction of sexual violence and coercion, number of sexual partners and cross-generational and transactional sex. The primary target populations are youth and adults, many of whom fall into most-at-risk populations, namely mobile populations, persons who exchange sex for money and /or other goods with one or multiple or concurrent sexual partners but who do not identify as persons in prostitution.

BACKGROUND:

Project Positive Ray (PPR), is one of the Ugu AIDS Alliance (UAA) implementing partners. PPR's activities are not directly supported by the South African Government (SAG) but are in line with the SAG priority areas. PPR uses government-facilitated training for the community-based volunteers.

Young people are South Africa's most important asset and protecting them from contracting HIV is one of the most important objectives shared by the Ugu AIDS Alliance (UAA) and PEPFAR. UGU AIDS Alliance addresses OCAG's priority intervention of 'Abstinence and Behavior Change for Youth' through school programs and the priority intervention: 'Promoting Healthy Norms and Behaviors' through our community and workplace programs. The project also addresses the South African HIV and AIDS and STI Strategic Plan for 2007-2011 the following key priority areas: (1) Create an enabling environment for HIV testing; (2) Implement interventions targeted at increasing behavior change and subsequent HIV infection in young people, focusing on young women; (3) Increase open discussion of HIV and sexuality between parents and children; and (4) Increase roll out of workplace HIV prevention programs.

The volunteers reach large numbers of people, operating on the premise that the more individuals who receive the message, the higher number who may make behavioral change as a result of being able to make informed choices. This is done by working with families and small group and not large community awareness events. People are also educated on factors that drive HIV transmission such as cross generational sex and having concurrent partners. People are actively encouraged to know their HIV status. HIV negative people are encouraged to stay negative through the various messages from the awareness education program.

Abstinence and being faithful is promoted as the most important means of reducing sexual transmission of HIV. The programs encourage unmarried individuals especially the youth, to delay sexual activity until marriage. The education and awareness program conducted in schools highlights to adolescents aged 10-19 the benefits of undertaking early HIV counseling and testing. In all the education programs people are strongly encouraged to know their HIV status. They are referred to go for testing at government accredited sites.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Education and Awareness programs

To reduce the risk of HIV infection by educating our communities on the importance of abstinence, being faithful and delaying sexual debut. The training will be used to do education and awareness interventions in schools, factories, and communities. Topics covered include: What is HIV and AIDS? How people are infected and affected? What causes AIDS? Can AIDS be cured? What happens to a person infected with Aids? Voluntary Counseling and Testing? Treatment and adherence to antiretroviral treatment.

The organization will conduct education and awareness programs in six factories, two schools, and nine communities, and will reach 15,300 people. Thirteen volunteers each do 20 education and outreach activities visits to families in their homes each per month, each family averaging five members. Therefore, per month, 1300 people are reached, and in 11 months, 14,300 people. In addition, work in factories reaches 500 people per year and work in schools reaches 500 youth per year.

ACTIVITY 2: Skills Training in HIV Prevention Education

Thirty community members will be trained to provide HIV prevention education. Training on quality assurance is done through monitoring and evaluating the work the volunteers do and through study of the reporting forms which are submitted to the project office on a monthly basis.

Current staff will be sent on refresher training to update their skills and community members will be afforded the opportunity of receiving training. GT's role is to coordinate the attendance of peer educators at government run training programs. The results of these activities will contribute to the PEPFAR 2-7-10 goals to reduce new HIV infections among youth by facilitating the HIV prevention programs through abstinence and/or being faithful activities encouraging behavior change.

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 16316.08

Planned Funds: $350,000

Activity System ID: 16316

Activity Narrative: SUMMARY:

This activity involves the Population Council (PC) working closely with the South African Council of Churches (SACC), the Eastern Cape Provincial Council of Churches and the Mpumalanga Provincial Council of Churches to pilot and scale up a community-based HIV and AIDS prevention program focused on abstinence and being faithful messages that are delivered to out-of-school youth in two provinces of Mpumalanga and Eastern Cape in South Africa.

These organizations have a wealth of experience in youth interventions, and have conducted relevant activities in the two provinces selected. The program should be highlighted for its intended contribution toward strengthening social mobilization and community involvement in prevention initiatives for out-of-school and vulnerable youth in particular. Emphasis areas include training and gender, and target populations are adolescents, adults, people living with HIV and AIDS, orphans and vulnerable children, street youth, pregnant teenagers, and religious leaders will also be targeted through community outreach programs.

BACKGROUND:

Based on their comprehensive and complementary experience working with young people, during FY 2008 the Population Council, the Eastern Cape Provincial Council of Churches and the Mpumalanga Provincial Council of Churches intend to design, implement and evaluate HIV prevention AB activities among out-of-school and other vulnerable youth who are not well reached by programs in largely rural and peri-urban areas in the EC and Mpumalanga. The program will deliver tailored AB interventions and messages to reach youth based on their age, sex and needs. It will work through youth clubs, churches and community groups. The program will draw extensively from the work of two partners in South Africa that formerly collaborated with the Population Council/Horizons Project and in Zambia where PC/Horizons worked with hundreds of out-of-school youth to implement a three-year program, which trained young people to provide care and support for people living with AIDS and OVC and to engage in prevention activities. The FY 2008 program will strengthen social mobilization and community capacity and involvement to participate in prevention initiatives for out-of-school and other vulnerable youth.

This AB prevention program emphasizes strategic information: processes and progress will be systematically documented at all stages. Routine programmatic routine data will be collected and analyzed on a small-scale operations research basis. Routine data will be tracked on a monthly basis to obtain program outputs such as the number, age and gender of the beneficiaries reached. The field support staff will receive training on strategic information, and will be responsible for collecting the required information.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Pilot and Scale-up

For FY 2008, this program will initially be piloted in two rural communities in one district in the Eastern Cape (Amathole) and also in a district in Mpumalanga (Nelspruit). The pilot will be refined within six months and expanded to four additional communities in these districts by the latter six months of the year. In year two, a second district will be identified in each of the two provinces (Mqanduli in the EC, Mpumalanga will be determined) for further expansion and scale-up. This strategy will allow for a phased-out scale-up approach, giving the partners the opportunity to develop and test relevant interventions, apply lessons and program results in the new sites, while strengthening activities in pilot sites. It will also provide the opportunity for the different communities and stakeholders to share lessons facilitate and support activities.

The AB Prevention component will include messages to delay sexual debut, reduce number of partners, channel youth interest to include healthy activities such as sports, drama and other community activities, and promote counseling and testing.

ACTIVITY 2: Implementation and Assessment of Prevention Messages and Interventions Through Community Outreach

The focus of this activity is implementing and evaluating a relatively broad set of prevention outreach to the out-of-school youth. While the clear focus is on HIV and AIDS prevention, an underlying objective is encouraging the out-of-school youth who had failed to complete school (e.g., due to pregnancy) to re-enroll and complete their education. Youth will be encouraged to explore training opportunities that will assist them to participate in income generating activities within their communities. Peer educators, youth mentors, community leaders and stakeholders will also be trained to promote HIV prevention messages. Male participation will be enhanced through targeted initiatives such as male forums that discuss gender norms and dynamics in the communities.

The individuals targeted for exposure to predominately AB prevention messages are not the same individuals targeted for exposure to messages that are predominately Other Prevention.

Other activities will include the promotion of secondary abstinence, channeling youth interest to include healthy activities such as sports, drama and other community activities, messages and support around abstinence, being faithful messages for youth with partners and partner reduction and including promoting access to counseling and testing, messages on cross-generational and transactional sex, and finally, messages on gender norms aimed at reducing violence and coercion. The prevention strategies and interventions that are deemed feasible, acceptable and successful will be assessed and documented and the results shared widely to enhance expansion activities in year two.

During FY 2008, the program will contribute to key targets highlighted in the National HIV and AIDS and STI Strategic Plan (2007-2011), which includes the need to promote healthy lifestyles.

The project will address the 2-7-10 PEPFAR goals by increasing the number of individuals reached through community outreach strategies that promote a balanced strategy centered on messages of abstinence and being faithful among out-of-school youth.

Program Area Code: 02

Activity ID: 15937.08

Planned Funds: $220,000

Activity System ID: 15937

Activity Narrative: SUMMARY:

Muslim AIDS Program (MAP) is a faith-based organization (FBO) working with families holistically through its youth to promote abstinence-based norms and behavior within communities. The project is implemented in close collaboration with either the provincial health departments the Department of Social Development in each of the four target provinces. MAP is currently operating in the four of the nine provinces: Western Cape, KwaZulu-Natal, Gauteng and Mpumalanga. The organization recruits and trains young adults to work in the programs as peer group trainers and facilitators. The emphasis areas for this project are gender through addressing male norms and behaviors, human capacity building and local organization capacity building. The target population for this project are youth both in- and out-of-school, community and religious leaders, and street youth.

BACKGROUND:

MAP life skills program is an initiative of the Islamic Careline, Jamiatul-Ulama and the Islamic Medical Association. One of the key objectives is to assist children and youth to become responsible members of the community. MAP has developed a series of life skills programs and continues to provide facilitation training for the programs. MAP has been receiving PEPFAR funding through the CDC-National Department of Health cooperative agreement since FY 2005. In FY 2007 MAP became a sub-partner of CARE international and now receives funding through the CARE international/CDC cooperative agreement.

In FY 2008 MAP will expand services geographically in the provinces where it is operating. There will be an expansion of accelerated prevention programs targeting youth, especially girls. These programs will include discussions on promoting and strengthening primary and secondary abstinence; promoting post-exposure prophylaxis (PEP) after sexual assault, discussion on gender issues, delayed sexual debut, encouraging positive prevention for infected people and integrating reproductive health to HIV programs. These topics shall also be taught to young women as they are the most vulnerable.

ACTIVITY 1: Abstinence and Being Faithful Program

MAP's abstinence and being faithful (AB) life skills program will target secular and religious schools and educational institutions. The abstinence-based messages are designed to assist youth in- and out-of-school aged 10 to 21, and to encourage them to delay sexual debut until marriage. The organization visits a school for a six week period. During that time, bi-weekly two hour sessions are conducted with the same group. Topics covered include delaying sexual onset, adoption of community norms that denounce cross-generational sex, HIV and AIDS, and stigma and discrimination.

The organization also promote behavior change by endorsing social and community norms that support refraining from sex outside marriage and partner reduction.

The "No Apologies" program will be implemented with youth from Grades 7-12, and with out-of–school youth. The program is a character-based abstinence until marriage program. Topics covered include: healthy relationships, media literacy, pre-marital sex has consequences, why abstinence works, and drugs and alcohol as it relates to abstinence.

The "Free Teens" program is also abstinence-based and encourages young people to make informed choices about their future through interactive discussion on pertinent topics. The program covers HIV and AIDS, STI's and as well as a comprehensive pregnancy prevention program for unmarried people.

Gender equity is achieved by encouraging a consistent number of both male and female learners to attend the program. Male/female norms and behaviors are widely discussed during school programs. Stereotypes of male/ female dominance and subservience exist in families and there is a need for the youth to engage in and interact with these issues.

ACTIVITY 2: Training and Peer Education in Schools

MAP will train young university students and available unemployed youth to render a service to the organization. Trained youth attend workshops for both self development and as volunteer facilitators for the organization. MAP conducts the ladies' life skills and parenting skills programs which promotes constructive communication between youth and parents who are primary caregivers.

The Rutanang Peer Education concept will be implemented within the existing program with the training of peer educators as well as the incorporation of various appropriate experiential exercises. Peer Educators will be trained to effectively communicate the AB messages which include abstinence to the 10-14 years, encourage them to delay sexual debut and secondary abstinence to those who have started sexual activities and for the youth at-risk to reduce the number of sexual partners.

ACTIVITY 3: Creative Education

The organization incorporates entertainment in the form of role plays, drama, indigenous games, dancing and singing to reinforce the AB and the life skills message. In the Orphan and Vulnerable Children program, life skills are simplified to suit the needs of this special group of learners. Some of the topics that will be added will include road safety, basic entrepreneurial skills, peer communication skills as well as arts and culture. The program is translated into different languages for the benefit of the learners in some schools.

Evaluations of these programs have proven that the use of creative arts is well received by the learners and this will therefore be expanded. The use of holiday camps as well as mother/daughter and father/son projects are rapidly becoming a means of intervention whereby parent-child interaction is enhanced and promoted.

ACTIVITY 4: Capacity Building

MAP provincial offices mentor eight community-based organizations (CBOs) in order to develop capacity in AB programs and to strengthen peer education. Specific training for CBOs includes workshops on program

Activity Narrative: management, basic information on HIV and AIDS, and "NO Apologies" "Free Teen" and Rutanang Peer Education. Interns and volunteers are recruited to facilitate the implementation of the program in informal settlements and previously disadvantaged communities. The volunteers are capacitated with additional training opportunities to improve skills for effective service delivery.

These activities will contribute to the PEPFAR 2-7-10 goals by promoting knowledge and skills to prevent HIV infection in youth population that may have an increased risk to HIV exposure.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 3014.08

Planned Funds: $944,750

Activity System ID: 15073

Activity Narrative: SUMMARY:

HPI TO1 is follow-on to the POLICY Project funded by USAID. HPI TO1 will support the implementation of policies and programs to integrate gender, stigma and discrimination into HIV prevention programs. The project will work with faith-based organizations (FBOs), traditional leaders (TLs), and community-based organizations (CBOs) to develop and implement Abstinence and Be faithful (AB) prevention messages and programs. HPI TO1 will assist FBOs and CBOs to systematically identify program gaps and barriers to uptake or dissemination. Activities will focus on improving knowledge about HIV, behavior change to reduce risk, community mobilization and participation in HIV prevention programs.

Over the years, HPI TO1 has worked with the FBOs and TLs as a key target group. The organization aims to respond to the needs of the groups in prevention. These needs have evolved variously from the need to sensitize the leadership and membership on the necessity of including a prevention focus in their programs, to helping groups set up prevention programs for their diocese and communities. Currently, HPI TO1is targeting behavior change and emphasizing what needs to happen at the personal level. HPI TO1 will be utililizing approaches that influence individual behavior as it relates to HIV prevention, using proven approaches that reinforce person-to-person influences and decision making, and which will ultimately lead to behavior change at the personal level.

Emphasis areas are training in AB, with special focus on behavior change; community mobilization and participation; gender which will address male norms and behaviors, reduce gender-based violence and coercion; and human capacity building for partners at the national, provincial and community levels. Capacity building aims to identify and address the operational barriers that impede the expansion of HIV programs. The target population is adolescents, adults, people living with HIV, and religious leaders.

BACKGROUND:

HPI TO1 empowers new partners to participate in the policy making process. The initiative helps organizations translate policies, strategic plans, and operational guidelines into effective programs and services. The project will work with FBOs, TLs, and CBOs to develop and implement AB prevention messages and programs and to assist these organizations in systematically identifying program gaps and barriers to uptake or dissemination. HPI TO1 will continue to build and strengthen the capacity of organizations and institutions across all sectors to design, implement, and evaluate comprehensive HIV prevention, care, and support programs and policies. Project assistance focuses on improving multi-sectoral capacity and involvement in the country's national HIV and AIDS program by assisting different role players in developing and implementing effective advocacy strategies for HIV and AIDS; facilitating effective planning for HIV and AIDS programs; increasing the information used for policy and program development; and strengthening collaboration between government and civil society organizations (CSOs) and institutions working in HIV and AIDS. The activities proposed under HPI TO1 will (1) focus on the devolution of capacity building and training in AB programs to district level for TLs and to FBOs; (2) provide technical assistance to TLs and faith-leaders to ensure their training skills are used and appropriate prevention messages are being disseminated in communities; and (3) build the capacity of traditional and faith leaders to identify barriers to uptake or expansion of prevention programs. In this period HPI TO1 will also work in partnership with the South African National AIDS Council (SANAC) and the National House of Traditional Leaders. HPI TO1 will partner with SANAC to provide direct technical assistance to TL structures in South Africa.

Traditional Leaders: It is estimated that over 16 million people live in the rural areas that are under the jurisdiction of TLs. These TLs command respect and have significant influence on the day-to-day running of many rural/ peri-urban communities. They are also key players in the governance structures of South Africa, particularly at the local level, and are therefore well placed to mobilize communities to access and use services. In 2001, a partnership between the National Department of Health (NDOH) and the Nelson Mandela Foundation (NMF) supported the formation of the National TLs' HIV and AIDS Forum and the development of a national strategy by TLs to address the challenges of HIV and AIDS. Previously, the activities in this program area focused mostly on Traditional Leaders at the provincial level and were implemented in partnership with a small non statutory Traditional Leaders forum. In this period HPI TO1 will be implementing this activity in support of the National House of Traditional Leaders. This is the biggest body of Traditional Leaders in South Africa and is also a statutory body represented in the national parliament and the South African National AIDS Council. The National House of Traditional Leaders is key in assisting HPI reach as many Traditional Leaders in their various forms, kings, indunas, chiefs, traditional councilors and will be implemented at the district level. Further in this period HPI will be implementing activities in the Northern Cape which did not receive any interventions previously.

Faith-Based Organizations: South Africa is a multi-faith country. FBOs are rooted in the community and are in a strong position to mobilize communities to address the challenge of HIV and AIDS. They can promote prevention strategies, mobilize communities against stigma and discrimination, and provide community-based care and support to people infected or affected by HIV and AIDS. The capacity of many FBOs to develop appropriate training materials or to design and implement effective programs varies considerably. In the previous interventions HPI TO1 worked with FBO’s such as the National Baptist Church of Southern Africa, the Southern African Catholic Bishops Conference and the Church of the Provinces of Southern Africa. In this period HPI will be working with the mostly Africa traditional faiths such as the Zion Christian Church and Shembe.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1. Traditional Leaders

HPI TO1 will conduct six provincial, three-day training workshops; each workshop will host 40 participants. Each of 240 people trained will then conduct at least five activities to reach community members with A/B messages within one year of receiving the training. These workshops will be focusing on encouraging TLs to promote prevention messages in particular, the reduction of concurrent sexual partners being faithful to one sexual partner, especially in older youth and adults engaged in sexual relationships, abstinence or delaying sexual debut for young people aged 10-14 before they start engage in sexual activity, the role of gender and gender based violence in prevention and prevention for positive individuals. This activity will be implemented in KwaZulu-Natal, Eastern Cape, Mpumalanga, Free State, Limpopo, North West and

Activity Narrative: Northern Cape provinces. The training will focus on the design, planning, and dissemination of successful AB prevention messages and will include strategies to reduce community level stigma and discrimination and raise awareness of the impact of gender-based violence on women's access to prevention programs including discussion of issues of the role of men in society. HPI TO1 will look at individual behavior and how to reinforce positive behaviors in the community. We will look at addressing both individual and larger community issues that are barriers to behavior change. Trainees who are TLs will include AB prevention messages into one TL's council meetings once a month. As more TL's take the lead in addressing HIV and AIDS, this would have more impact in behavior change of men in their different constituencies, because most Traditional Leaders are men. The training materials used throughout this activity will be developed by HPI TO1. HPI TO1 will follow up with a subset of trainees to (1) assess the activities carried out; (2) identify the challenges and opportunities TLs are experiencing in disseminating AB messages; and (3) provide technical assistance to the TLs to strengthen their skills in order to address implementation challenges.

ACTIVITY 2. Faith-Based Organizations

HPI TO1 will facilitate nine provincial workshops on integrating AB messages into the church activities of a selected church group. Thirty participants will be reached in each provincial workshop. These workshops will focus on encouraging FBOs to promote prevention messages, such as the reduction of concurrent sexual partners, the delay of sexual debut for young people, being faithful to one sexual partner, the role of gender and gender-based violence against women and girl children in prevention and prevention for positive individuals. A total of 315 people will be trained. Each of the 315 people trained will then conduct at least one activity to reach community members with A/B messages within one year of receiving the training. Trainees will develop action plans to disseminate AB prevention messages and conduct prevention outreach activities within the church communities. HPI TO1 will follow up with a subset of those who participated in training to assess: (1) the degree to which participants were able to implement their action plans; (2) the challenges and opportunities trainees encounter in their community; and (3) to reinforce skills learned in the provincial training workshops in order to build a sustainable cadre of trainers. The trainees for FBOs will be comprised of faith-based HIV and AIDS committee members and other members of the broader church community. Technical assistance will be included in the training curriculum.

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 12257.08

Planned Funds: $582,000

Activity System ID: 14252

Activity Narrative: SUMMARY:

Pact's Rapid Response for HIV and AIDS in South Africa is an umbrella grant mechanism for USAID PEPFAR grants identified through a USG interagency competitive (APS) process. Pact's primary goal is to build sustainable institutional capacity and increase the effectiveness of local partners to achieve expanded and quality services. Pact conducts initial assessments (identifying key organizational strengths and weaknesses) and works with each partner to develop and implement a tailored, phased capacity building agenda.

BACKGROUND:

Since FY 2004, Pact has facilitated the efficient flow of grant funds during the rapid scale-up of the PEPFAR South Africa program. Pact provides PEPFAR funding and assistance to over 30 total PEPFAR partners and sub partners in South Africa playing valuable roles in the fight against HIV and AIDS. Primary target organizations include non-governmental, private voluntary and faith-based organizations. Pact's major emphasis is the enhancement of local organizational capacity building through the development and implementation of documented organizational systems and procedures and human capacity development at management and operational levels. Prevention activities have to date resulted in Pact partners reaching over 200,000 people with Abstinence and Being Faithful (AB)-focused messages. Grants to prevention partners support the delivery of AB programs in a variety of settings including schools, churches and through household visits. Services are delivered in accordance with the President's Emergency Plan for AIDS Relief (PEPFAR) policy guidelines and in line with the South African Government's Department of Health strategy. Approaches include capacitating community volunteers to conduct age-appropriate youth activities, working with religious leaders to reach congregations with values-based prevention for men and women, conducting participatory personal risk assessments and promoting Counseling and Testing (CT) and use of other preventive services.

ACTIVITY 1 - Grant Management

Pact conducts a participatory assessment of each partner organization and collaboratively develops an organizational capacity building strategy that details planned interventions. These assessment results also inform Pact of what type of assistance must be provided urgently in order to ensure that the organizations comply with USAID rules and regulations. Prior to the signing of grant agreements, Pact provides extensive assistance to organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact assists partners in developing realistic cost share levels and emphasizes the sustainability aspect of this requirement. After the signing of the agreement, Pact works with each partner in developing a very detailed annual work plan that includes specific activities to be implemented, timelines, budgeted amounts, target beneficiaries and projected reach. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of partner organizations to diversify their funding base and ensure sustainability.

ACTIVITY 2 - Human Capacity and NGO Development

Pact has developed a customized training series to orient new partners and their sub partners. The training series includes basic and advanced grants and sub grant management which addresses USAID rules and regulations, good governance and minimum financial management standards. Monitoring and evaluation courses cover basic principles of monitoring and evaluation and PEPFAR data requirements as well as internal data quality assurance. Refresher courses are also offered throughout program implementation. Pact ensures that ongoing, intensive on-site training and mentoring is provided to partners and sub partners. On a quarterly basis, Pact assesses the level and type of assistance required by each organization and develops a site visit plan that ensures that the necessary support is delivered to each partner and sub partner. Pact organizes and supports technical consultation meetings for the sharing of best practices and lessons learned among PEPFAR and non-PEPFAR partners. As required, technical assistance from select regional and international providers is sourced to assist partners in improving their technical capacity.

ACTIVITY 3 - Monitoring and Evaluation (M&E)

Pact SA assists each grantee in developing a results framework that tracks success against both PEPFAR program and organizational indicators. Pact further assists partners and sub partners in the development of monitoring, evaluation and reporting (MER) plans and systems. Participation in a five day M&E training is mandatory for all partners prior to full implementation. Pact provides additional M&E assistance to all partners in the following areas: review and development of effective data collection, analysis and reporting tools; setting realistic and achievable targets; establishing and strengthening data quality management systems, conducting internal data quality audits and verifying and validating partner and sub partner data submissions

ACTIVITY 4 - Program and Financial Monitoring

Pact recognizes the importance of monitoring partner and sub partner program progress and early identification and resolution of implementation issues. Pact has frequent and regular contact with partners and if technical/programmatic gaps or problems are identified, ensures that issues are promptly addressed and resolved. In addition to monitoring program progress, Pact closely monitors partner financial management and ensures that grants funds are utilized only for activities approved by USAID under PEPFAR funding. All partners submit monthly financial reports that that detail and document expenditures. Once Pact has ascertained that the partner has implemented and/or strengthened financial management systems which fully comply with USAID regulations, the documentation requirement is removed and only the monthly reporting requirement remains in effect. Pact finance staff visit partners every quarter to audit program expenses and accompanying documentation, compliance with USAID rules (including branding requirements) and cost share.

ACTIVITY 5 - Technical Assistance

Activity Narrative:

Pact will provide and manage direct technical assistance in prevention, care and support strategies for all sub-grantees. Pact technical staff will conduct assessments and provide consultation and training on the development and implementation of programs and services (in line with best practice models, donor and SAG recommended methodologies and standards). In addition, sub-grantees will be supported with guidance and ongoing assistance on the design and delivery of partner HIV and AIDS curricula, training modules and publications. Pact will also work closely with partners to ensure the effective incorporation and strengthening of nutrition and food security, protection services, gender mainstreaming, and human capacity development in existing programs.

Pact has contributed to the 2-7-10 PEPFAR goals through support to five indigenous and international FBOs providing prevention services to communities in all nine provinces.

Table 3.3.02: Activities by Funding Mechansim

Mechanism ID: 500.08

Mechanism: CDC Support - with CARE UGM

Prime Partner: National Department of Health, South Africa

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 7966.08

Planned Funds: $1,036,000

Activity System ID: 14058

Activity Narrative: SUMMARY:

PEPFAR funds will be used to continue to support the National Department of Health (NDOH) Youth and HIV directorate. Since FY 2005, PEPFAR funds have been used to place a Youth HIV advisor at the NDOH. This advisor has provided programmatic support to the NDOH in terms of growing the youth program and ensuring support for non-governmental organizations (NGOs), faith-based organizations (FBOs), and other organizations working in the area of youth and HIV. The emphasis will be on human and local organization capacity development, and training. The target populations will include host country government workers, implementing organizations and youth between the ages of 10 -18. Activities will also focus on young adults, between the ages of 18 and 24, especially women. The focus for this group, particularly those women that are sexually active, will be on the B component of the AB program

BACKGROUND:

Four NGOs will be supported to carry out AB prevention activities for youth through the NDOH cooperative agreement. The funds requested under this COP entry "In-Support of the NDOH" will continue to support a youth specialist that provides technical assistance to the NDOH on youth activities including the provision of technical oversight to the four NGOs. The "In-support of the NDOH" funds are also allotted to small-scale activities at the request of the NDOH for AB prevention activities.

ACTIVITIES AND EXPECTED RESULTS:

Three activities will be carried out in this Program Area.

ACTIVITY 1: Technical Assistance

FY 2008 funding will ensure continued support for a locally employed staff to provide technical and programmatic assistance to the NDOH in the area of youth and HIV. The youth advisor will continue to work closely with NDOH in the design and delivery of their youth interventions. In addition, the youth advisor will ensure collaboration between youth-based NGOs funded through the CDC-NDOH cooperative agreement.

ACTIVITY 2: Expansion of the Peer Educator Program

Providing coordination and oversight for Rutanang peer education trainings (particularly addressing abstinence and be faithful, youth-friendly services, HIV prevention initiatives and strategies, male norms and behavior and violence, cohesion, stigma and discrimination) offered for the NDOH, the South African Department of Education (DOE), and other South African Government partners in collaboration with Harvard University.

ACTIVITY 3: Capacity Building

FY 2008 funding will be used to build the capacity of local organizations that are working with Youth. Capacity building will be achieved through the provision of training on HIV and on the promotion of AB messages. This will be done in collaboration with the NDOH and DOE and in line with their priorities.

ACTIVITY 4: Families Matter!

FY 2008 funds will be used to begin to adapt and implement the Families Matter! Program (FMP). FMP is an evidence-based, parent focused intervention designed to promote positive parenting and effective parent -child communication about sexuality and sexual risk reduction for parents of 9-12 year olds, with the prospect of expanding to parents of teenagers at a later stage. FMP recognizes that many parents and guardians may need support to effectively convey values and expectations about sexual behavior and communicate important HIV, sexually transmitted infection, and pregnancy prevention messages to their children. The ultimate goal of FMP is to reduce sexual risk behaviors among adolescents, including delayed onset of sexual debut, by giving parents tools to deliver primary prevention to their children. Families Matter! is delivered over five consecutive sessions where each lasts for three hours. Each session builds upon the foundation laid in the previous session. Activities will be implemented in accordance with the NDOH

These activities support the PEPFAR 2-7-10 goals and the USG five-year strategy by ensuring close collaboration with the NDOH in the area of AB and youth HIV related activities. This support strengthens NGO and FBO activities and contributes to seven million new infections averted.

Prime Partner: National Department of Education

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 4784.08

Planned Funds: $1,746,000

Activity System ID: 14041

Activity Narrative: SUMMARY:

Abstinence and be faithful (AB) activities will target students at different levels of the education system. Activities will support the Department of Education (DOE), in the prevention of HIV in schools, colleges and universities. The focus of this activity will be on training, care and support for students, and promote positive healthy behavior. Primary areas of emphasis are training students as peer educators to develop skills to practice healthy behaviors, training to reduce gender based violence, and skills training to develop the capacity of students and teachers. Abstinence and be faithful (AB) activities will be integrated with other prevention activities in support of the DOE. The target populations are students aged 14–19 in schools; college students aged 18–25; university students aged 18–25; and teachers aged 20 plus enrolled for training at university.

BACKGROUND:

DOE's Health Promotion Directorate develops policies and provides inputs to legislative frameworks to address health and HIV and AIDS issues across the education system, in collaboration with other government departments. The nine provincial education departments are responsible for implementing programs in schools and colleges. Life skills programs offering age-appropriate AB messages are part of the school curriculum. The PEPFAR-funded peer education program complements these efforts. DOE is harmonizing the PEPFAR-supported peer education program with life skills activities to provide training on HIV prevention, gender based violence, sexual harassment and to fight abuse. Current DOE PEPFAR-supported activities are in KwaZulu-Natal, Free State, Mpumalanga and North West schools.

Colleges offer vocational education and training programs to improve skills. The DOE revamped college courses to ensure that they respond to the country skills' needs, and are accessible to students in all areas. PEPFAR funds will support AB and other prevention activities while economic growth funds will support wraparound workforce training in health and science related fields.

Universities have identified HIV and AIDS as a key challenge and they are supporting targeted peer education programs focusing on AB prevention messages. With respect to HIV, universities are involved in research, teacher training, support to feeder schools and integration of HIV into the curricula. PEPFAR and education funds will support wraparound activities at the Universities of Zululand and the Western Cape to strengthen AB programs started through previous USAID support.

ACTIVITY 1: Expansion of Peer Education Program:

This PEPFAR activity will expand the current AB program to an additional 250 schools in the four focus provinces of KwaZulu-Natal, Free State, Mpumalanga and North West. Funds will strengthen the focus in new schools in target districts, and develop training programs to address HIV prevention. Activities will encourage self-worth, the importance of HIV counseling and testing, reduction of stigma and discrimination, responsible sexual behavior, and knowledge about HIV prevention. Programs will target 36,000 students in the four districts. Complementary education resources will provide technical assistance to the DOE to support program management and build host country capacity. Implementation will be through a local NGO.

ACTIVITY 2: Support at the University of Western Cape (UWC):

Support to UWC will extend programs to the Western Cape province and target first year and post graduate students, trainee teachers and students in feeder high schools. Activities will focus on AB messages and will be integrated with more comprehensive prevention messaging. Activities will address gender by targeting male students and teachers and challenging traditional male norms and behaviors that contribute to the continued spread of the HIV epidemic. Interventions for first year students will encourage attitude and behavior change as they enter university. Fifty peer educators will encourage 700 first year students to participate in HIV and AIDS prevention programs as part of their work study programs. Peer educators receive a stipend, and gain facilitation and training skills. Training will be on AB messages and activities will be organized through student leadership structures, academic, sporting, and house committees at residences.

UWC will also work with 1000 high school students from feeder schools located in the Cape Flats communities which are affected by high levels of gang violence, drug, substance and alcohol abuse. Trained UWC peer educators will work with high school students to address sexuality issues, and HIV prevention. Peer educators will provide training to high school students through motivational talks and small focus group discussions.

Other activities to be supported with education resources will target 100 teachers in the same feeder schools through teacher training programs to build capacity in HIV education. The UWC HIV and AIDS unit will adapt teacher training modules used in Southern Africa for accreditation as UWC short-term courses. Teachers will be trained in life skills courses, enabling them to teach AB programs in schools to address HIV prevention, sexuality, gender, and abuse issues.

ACTIVITY 3: Support at the University of Zululand (UniZul):

UniZul operates multiple programs to fight HIV and AIDS. Support will focus on AB activities and will be integrated with other prevention activities targeting students. Activities will strengthen student peer education programs and address gender-based violence (GBV), particularly related to rape by empowering young girls with negotiation skills to delay sexual activities. Activities will promote awareness of women's legal rights and provide guidance on how to access GBV and legal services. UniZul will collaborate with DramAIDE to stage communication campaigns through drama, art, and poetry, and encourage strategies to abstain from sex. UniZul will hold quarterly communication campaigns and encourage active participation from students and staff. Assistance to local schools will strengthen life skills programs. PEPFAR AB activities will target 2,500 new students, some whom have not yet initiated sexual activity and many of whom do not yet have current partner on campus.

ACTIVITY 4: Support at Vocational Training Colleges:

Activity Narrative: Support for college students will target youth over age 18 with AB activities. Training will emphasize strategies to abstain from sexual activities, delay sex until later in life and teach measures to change behavior targeting 1000 students. AB programs will be integrated with more comprehensive prevention messages. Funds will be used to train students in skills they may need to abstain and to encourage delaying sex until marriage. Young people will also be encouraged to adopt social and community norms that support delaying sex until later in life and skills to avoid cross-generational sex, transactional sex, rape and other gender-based violence.

The results of these activities will contribute to the PEPFAR 2-7-10 goal of seven million infections prevented and will directly support the USG/SA strategy in AB by improving A/B preventive behaviors among youth.

Activity Narrative: This activity was approved in the FY 2007 COP, is funded with FY 2007 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2008 funding is requested for this activity.

FY 2007 PEPFAR funds were allocated to the National Department of Health (NDOH) to fund community and faith-based organizations for implementing HIV prevention activities. However, these sub-agreements have been delayed for various reasons so the funds that were awarded last year will be carried over and no new FY 2008 funds are requested.

Mechanism ID: 4749.08
Mechanism: N/A
Prime Partner: Ingwavuma Orphan Care
USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)
Program Area: Abstinence and Be Faithful Programs
Budget Code: HVAB
Program Area Code: 02
Activity ID: 13987.08
Planned Funds: $125,000
Activity System ID: 13987

Activity Narrative: SUMMARY:

Ingwavuma Orphan Care will continue to strengthen and, in some cases, formalize new prevention work, training its staff and volunteers to effectively advocate for and promote prevention, abstinence and faithfulness among all its beneficiaries. The emphasis areas include gender and human capacity building. The church congregations and families of clients in our programs for home-based care will be the entry point to access the target populations which are adolescents, adults, religious leaders and orphans and vulnerable children.

BACKGROUND:

This project is part of the work of two organizations, Ingwavuma Orphan Care (IOC) and their partner Lulisandla Kumntwana (LK), which began their work in 2000 and 2002, respectively. The organizations work in adjacent districts in Northern KwaZulu-Natal, covering an area of around 4,000 square kilometers between them. The organizations have been networking with each other since 2002 and benefit from this partnership through sharing ideas, information and resources, and occasionally loaning each other staff with particular expertise. Both organizations were new to PEPFAR in FY 2007, and are registered as welfare organizations with the South African Department of Social Development (DOSD). IOC and LK work closely with the Department of Health, which refers orphans and vulnerable children (OVC) to LK and helps facilitate psychosocial workshops that train boys and girls in life skills, gender issues, and sexual education. LK also has an Memorandum of Understanding with the local Department of Welfare to ensure that there is no duplication of services and to facilitate sharing of information, skills, and resources. These projects address gender by reducing the burden on girls and women of caring for OVC and reducing the need for teenage girls and young women to use sex to get food. The youth clubs and psychosocial workshops described below provide a forum for young people to discuss gender issues and for young girls to boost self -esteem and build self-confidence. These youth clubs will be actively involved with prevention messaging and counseling as well as all the other programs of IOC and LK. Prevention has always been a part of the activities of IOC and LK and the need has been identified to further ensure its quality and scope through direct project management, support and monitoring; and also through new specific prevention programs.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Behavior Change Outreach

Family Support Teams, comprised of volunteers recruited from local churches, provide intensive care to OVC living in their immediate vicinity. The teams are supervised by Orphan Care Coordinators and both conduct regular home visits to OVC. Home-based carers visit the homes of people living with HIV and nurses, chaplains, youth pastors, social workers, and paralegals, facilitators of youth clubs and support groups for HIV-infected people all have a strong opportunity to educate on behavior change which includes encouraging youth aged 10-14 to abstain or delay sexual debut whenever they visit. For older youth aged 15-24, secondary abstinence is encouraged while information on correct and consistent condom use is provided for youth at risk and those who are sexually active. Education and counseling is done with both HIV negative and positive people, through support groups for HIVinfected people and counseling home-based care patients. IOC and LK will ensure all staff and volunteers are trained to do this effectively through their normal process of line-management supervision and will document and monitor the interventions using an innovative intervention monitoring database, described below.

ACTIVITY 2: Mobilizing Pastors to Counsel for HIV prevention:

In FY 2007 Ingwavuma Orphan Care meticulously built up relationships with many of the 800 pastors in the area, and a group of pastors, of all denominations, requested that Ingwavuma Orphan Care provide them with training on HIV and AIDS and prevention. IOC leadership training for pastors will be conducted in FY 2007/8, using Zulu source material from Dr. John C. Maxwell. Training will be conducted over 5 months in 20 sessions and will be followed up by the training of pastors to give prevention messages to their congregations along traditionally faith-based lines, including fidelity and mutual monogamy. This messaging will encourage reduction of the number of sexual partners and discouraging cross generational and multiple concurrent partnerships. Pastors, as trusted members of the community, will also conduct abstinence workshops for youth. The pastors have built a good relationship with the community members. They will first participate in HIV awareness workshops and then prevention and abstinence workshops. Pastors will then in turn conduct these workshops; targeting youth aged 10-14 before they initiate sexual activity. The workshops will be held at churches, and will include health presentations from the IOC nurse. Using FY 2008 funding, this activity will be scaled up significantly beyond the scope of the small pilot project that was implemented in FY 2007.

ACTIVITY 3: Family Counseling:

Ingwavuma Orphan Care holds workshops for couples once a month for a period of six months, rotating around the different IOC areas, to strengthen marriages and families. A program of oral and video presentations is given by locally-respected men and pastors, followed up by individual family counseling initially with the parents and then with the whole family. Counselors will receive additional training in marriage counseling and counseling in general by an external training provider. The training includes a series on "How to Have a Successful Marriage" and opportunities will be sought to reach mobile populations, specifically when husbands are home from the mines. Because its ethos is like a traditional community meeting profile, with respected elders sharing the secrets of having strong marriages and individual counseling to individual circumstances, this program has been highly popular since May 2007. Using FY 2008 funding, IOC will expand the couple’s workshops throughout the municipal district, reaching larger numbers of people with a very high quality and personalized intervention. The workshops and counseling promote reduction of number of sexual partners and HIV testing with referrals to IOC's testing program. The expected behavioral changes are strong and monogamous marriages; giving children the family security they need to be successful and abstinent. The workshops specifically address male norms and behaviors and address discrimination, abuse and coercion amongst women and girl children.

ACTIVITY 4: Training of Staff and Volunteers:

Activity Narrative: An inter-disciplinary team of nurses, social workers, chaplains, and orphan care coordinators, as well as a consultant with proven motivational skills will train Family Support Teams. Training of IOC staff to provide prevention messages will occur every month at one of the three staff team days. Training for pastors, including prevention messages for AB and methods of disseminating this information to the community will occur once per month over three months.

ACTIVITY 5: Monitoring and Evaluation:

IOC's sophisticated M&E system operates on a MySQL/ PHP/ Javascript platform covering both home-based care and orphan care beneficiaries and field workers. Every contact with a beneficiary by a field worker and every intervention are recorded by timesheet. Each intervention is categorized according to the PEPFAR SASI indicators so that reporting is extremely simple. A Data Quality Officer audits the data and verifies the interventions with home-visits on a rolling three-month audit program. The Quality Improvement Manager and staff undertake regular client satisfaction interviews on visits to the clients' homes after three or four months subsequent to the intervention and establish what IOC staff and volunteers have done in practice and whether the client feels their behavior has changed.

This activity will enable IOC to reach hundreds of youth and adults with the abstinence and faithfulness messages. This activity will contribute to the PEPFAR 2-7-10 goals of averting seven million infections by helping adults and youth reduce risky sexual behaviors.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 13986.08

Planned Funds: $350,000

Activity System ID: 13986

Activity Narrative: SUMMARY:

At the request of the National Department of Health (NDOH) and CDC, Leonie Selvan Communications (LSC) will use PEPFAR funding to review the existing Youth Friendly Training Manual for Nurse Youth Health Providers, as well as other material pertaining to this target group. The material will be updated and reworked to ensure that it is user friendly and accessible. Prior to revising the material, focus groups will be held with nurse youth health providers to determine their perceptions of the existing material and to identify any specific needs or areas of improvement, if necessary. The updated manual will be piloted at provincial level before being finalized. Train the trainer forums will be held at the launch of the new Youth Friendly Training Manual for Nurse Youth Health Providers so that facilitators are familiar and comfortable working with the revised manual. In addition, Leonie Selvan Communication will work with the NDOH to develop a tool kit for school-based peer educators. The emphasis area for this activity is in-service training as health workers and peer educators on youth friendly services and building capacity of local organizations. This will be done by providing tool kits to school-based peer educators from different non-government organizations to ensure the delivery of quality peer education messages. Target populations for this activity are adolescents aged 10-24 and adults which includes all health care workers.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Review and Consolidation of Existing Materials

There are currently a number of different curricula being used by the NDOH to train nurses and other health care workers on the specific needs of youth in the context of HIV and AIDS. In addition, there is a number of different curricula that focus on the establishment and implementation of youth-friendly services. At the request of the NDOH, Leonie Selvan Communications will review the curriculum and make recommendations for a single curriculum that encompasses aspects from the multiple sources. The new materials will focus on ensuring that all youth between the ages of 10- 18 receive HIV prevention messages when they visit health services. The primary focus of this activity is abstinence. However, for youth that are already sexually active the focus will be on the B component of the AB program and will be linked with other prevention activities of the NDOH to ensure the provision of condoms and clear and consistent messaging around condom usage.

ACTIVITY 2: Focus Groups with Youth Nurses

In order to ensure that the specific needs of youth are addressed and incorporated into the curriculum and materials to be developed, Leonie Selvan Communications will conduct nine focus group discussions with nurses from youth friendly clinics. All nine provinces will be represented in the focus groups to ensure that provincial youth issues can also be address in the materials and curriculum. The results of the focus group will be presented to the NDOH youth directorate with the curriculum review outlined in activity Both activity one and activity two will culminate in the development of a youth friendly training manual for nurse providers. The national youth program will ensure that all youth nurse providers are trained in the curriculum ensuring the provision of youth friendly service delivery in the context of HIV.
`

ACTIVITY 3: Materials for Peer Educators

At the request of the National Department of Health and CDC, Leonie Selvan Communications (LSC) will use PEPFAR funding to identify, source and develop a range of suitable promotional material for peer educators. This material will include bags to carry their manuals and hand-outs when they visit schools. Marketing material in the form of leaflets, posters and brochures will be designed and developed to assist peer educators market the peer education program. In addition, a Resource Pack/tool kit will be developed to ensure that they have all the necessary materials, handouts and resources to conduct quality peer education workshops. Prior to developing material focus groups will be held with a cross-section of peer educators to identify what marketing and training material works best for them. New material will be designed/ developed based on the outcomes of the focus groups.

This activity contributes to the PEPFAR 2-7-10 goals by ensuring access to youth friendly services in the context of HIV and AIDS. In addition, this project will assist in ensuring the sustainability of the national peer educator program by providing the peer educators with a standard set of resources to conduct quality peer education activities.

Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	8271.08	**Planned Funds:**	$200,000
Activity System ID:	13989		

Activity Narrative: SUMMARY:

The PEPFAR-funded Abstinence and Being Faithful activity described in this FY 2008 COP harnesses the activities and work of other ongoing projects, namely, the Community Counselor Project, especially with respect to community mobilization and outreach. It also benefits from contributions from other donors such as Anglo Platinum Mines, which has committed to three-years of cost-sharing. In particular, Anglo Platinum Mines are funding a vehicle to be used in the mining areas and covering traveling costs and stipends for a nurse and driver. Relationships formed with local government and municipal departments will assist to ensure the continuity of the project. The two major components of the Abstinence and Being Faithful (AB) program area include community outreach and mobilization around the designated hot spots and throughout Bojanala District and the LifeLine centre in Rustenburg.

The AB messages and HIV prevention activities address gender issues and gender dynamics directly, encouraging target populations to examine gender roles in society. Emphasis areas include gender addressing male norms and behaviors, and reducing violence and coercion as well as human capacity development. Target populations include boys and girls (aged 10-14); adolescents; and adult men and women, especially of reproductive age. In a generalized epidemic such as the one in South Africa, the project targets the general population; thus the project will also reach groups such as persons who engage in transactional sex, but who do not identify as persons in sex work, discordant couples, people living with HIV, and orphans and vulnerable children.

BACKGROUND:

LifeLine Rustenburg is a non-governmental, non-profit, community-based organization affiliated to LifeLine Southern Africa which in turn is affiliated to LifeLine International. Affiliation is awarded annually based on maintenance of standards, adherence to policy and procedures and acceptable performance in areas of service. Operational since 1991, LifeLine focuses on counseling and crisis intervention services; provision of life skills training; capacity building for community-based organizations; voluntary counseling and testing (VCT) and HIV prevention activities. To date LifeLine has implemented a community counselor project (CCP) that provided counselors to 150 health facilities in Bojanala; established a non-medical VCT site; provided 24-hour counseling service via a national counseling line; and provided training to numerous other organizations. FY 2008 plans for the project include placing counselors at all health facilities in the Bojanala District; supplying mobile VCT; conducting referrals for care to HIV persons; and promoting HIV prevention throughout the Bojanala District of the North West Province.

The South African Government, specifically the Bojanala District Department of Health in the North West province, supports and contributes to a sustained and broad-based community mobilization and outreach effort in public health facilities, schools, other government outlets, and through media. Informal partners include local businesses, Radio Mafisa, local taxi associations, mining corporations and others, who provide support for our community mobilization and outreach efforts. In particular, Mafisa Radio Station provides an hour timeslot weekly for Lifeline to discuss and debate on topics related to HIV and AIDS education. The local taxi associations agreed, in FY 2006, to paste Lifeline stickers on their vehicles and to participate in prevention campaigns.

Many prevention modules require male and female participants to be separated in order to delve into specific issues. This is the approach LifeLine will continue to use during education and training sessions in the FY 2008 period. The program activities also emphasize changing male norms and behaviors, promoting one-partner relationships and altering the norm of violence against women in society. A hot spot is defined as an area that has a high rate of traffic of vulnerable persons; for example, taxi ranks and the mining hostels. The LifeLine hot spots are currently located in the Bojanala region, with one hot spot identified in each sub-district. In COP FY 2007, PEPFAR enabled LifeLine to work in eight such hot spots, with the target for COP FY 2008 being 12 hot spots.

ACTIVITIES AND EXPECTED RESULTS:

Four activities will be covered in this program area. For youth, particular emphasis is placed on abstinence and delayed sexual debut based activities. Contact is made during school hours with education sessions and at the end of the school day when leaving the premises. After school activities (i.e. sports, youth and church clubs, etc.) are utilized especially to reach the out-of-school youth. Men and women, especially of reproductive age, are initially reached at the hot spots, and thereafter encouraged to join more intensive education sessions. They are also contacted at evening and weekend activities such as men's and/or women's clubs/groups, church groups, "stokvel" meetings, etc. In a generalized epidemic such as the one in South Africa, the project targets the general population. This will also include encouraging sexually active youth to consider secondary abstinence. Messages for the older youth and adult population will focus mostly on reduction of number of sexual partners and will discourage multiple and concurrent sexual relationships as well as cross-generational sex. LifeLine will also work with the traditional leaders and community to transform male norms and behaviors in order to reduce violence and sexual coercion, which is rife in the community.

ACTIVITY 1: Community Mobilization

The community mobilization and outreach efforts seek to ensure that the general public receives the necessary information targeted towards behavior change. Eight community outreach volunteers and four trainers will conduct the HIV prevention activities in areas surrounding the hot spots, which are visited bi-monthly. Education is provided in plenary sessions, as well as focus group education and discussion. Education topics highlight behavior change; attitudes; cultural, legal, gender, alcohol and substance in young people as a risk factor, and other issues; multiple partners; same sex partners; and cross-generational sexual partners. The pros and cons of abstinence, benefits of later sexual debut, and one partner relationships will be highlighted to people who are not yet sexually active. For persons already sexually active emphasis will be on faithfulness, one partner relationships and secondary abstinence where relevant. All prevention activities are target and language group sensitive i.e. each target group receives relevant information and education specific to the age, culture or other dynamic of the group. Some of the LifeLine activities are conducted at the lifeline offices while others take place within the communities.

Activity Narrative: ACTIVITY 2. Capacity Building

Human capacity development requires ongoing trainings throughout the project for the community outreach volunteers in order to ensure their motivation, competency and proficiency in carrying out the activities. Peace Corps volunteers help with training where required. Bi-annual training as an incentive that ensures retention of staff in the service. Training is conducted on monthly basis as an in-service kind of training. Workshops of five-days duration aimed at behavior change will be conducted for community members. These are presented three times per annum per hot spot. Workshops will be held one day a week over a five week period, with the same participants in groups of 10-20 persons. An evaluation session will be held three months after completion of each workshop to measure behavior change. A variety of techniques and participatory methodologies are used. Topics cover basic life skills, behavior patterns, sexuality, reproductive health, morals and values, choices, consequences and responsibilities, substance abuse, multiple, concurrent, same sex and cross generation partners, and HIV topics. These activities strive to influence behavior change in the form of increased abstinence and delayed sexual debut, commitment to one partner at one time, and general social norm transformation related to gender issues. The workshops are facilitated by LifeLine trainers.

These activities will contribute to PEPFAR 2-7-10 goals of averting HIV infections through promoting Abstinence and Be Faithful prevention activities among the general population and youth.

Activity Narrative: SUMMARY:

HOPE worldwide South Africa (HWSA) will continue to support the expansion of a comprehensive HIV prevention program through a skills-based, gender-focused program for young boys and men, and the promotion of abstinence and being faithful (AB) messages for young people in four provinces, namely Western Cape (WC), Eastern Cape (EC), Gauteng (GP), and KwaZulu-Natal (KZN). This activity targets primary and secondary school children and youth (both in- and out-of-school), adults, teachers and religious and community leaders, community-based, faith-based and non-governmental organizations. The emphasis areas for the project are gender and human capacity development, which includes training. The target population is adolescents, teachers, religious leaders and adults as well as orphans and vulnerable children.

BACKGROUND:

The activities described below are part of an ongoing HIV prevention program of HWSA, funded by PEPFAR since FY 2006. Using FY 2008 funding, HWSA will promote and strengthen its AB prevention program, implement a gender-sensitizing component carried out by HWSA's Men as Partners (MAP) program, and work with parents, caregivers and guardians to promote consistent, positive and proactive parenting and a constructive family environment.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: Promote AB Behaviors

HWSA will continue its programs in GP, KZN, WC, and EC provinces to promote and strengthen AB prevention messages within its community outreach efforts that include faith-based communities. HWSA will expand to new areas within the current sites, and in particular to peri-urban and rural areas in KZN in response to the geographic development of the HIV pandemic in South Africa. HWSA will establish an abstinence-based program in four provinces, for youth 10 - 14 years who have not initiated sexual activity. HWSA will use PEPFAR funding to support a program that prioritizes abstinence activities, HIV prevention information, workshops and learning materials required for the HIV prevention intervention. HWSA will also target the 15-24 year old age group and will establish an AB approach for this target population. This will focus on reducing the number of sexual partners, mutual faithfulness with an uninfected partner and the importance of correct and consistent condom use. HWSA's AB program, for all age groups, follows a standard peer educator model of training small groups of change agents to influence their immediate and broader communities. HWSA's AB program for youth aged 10-14 provides age-appropriate messages that promote the importance of abstinence in reducing HIV transmission and encourages delay in sexual debut. This program educates children/youth on the basic facts about HIV prevention and AIDS, the skills for practicing abstinence, stigma and discrimination and avoiding and reporting violence and abuse. The HWSA program involves five contact sessions spread over 10-12 hours. HWSA's AB program for older youth aged 15 -24 consists of sessions that are age and culturally appropriate with sessions on the benefits of abstinence in reducing HIV transmission. Where appropriate focus is on secondary abstinence, personal self-esteem, healthy relationships, the delay of sexual activity until marriage, the importance of reducing the number of casual sex partners, mutual faithfulness to an uninfected partner, the importance of HIV counseling and testing and full information on the correct and consistent use of condoms is encouraged as a way to reduce the risk of HIV for those youth who are already sexually active. The program involves ten contact sessions spread over 14-20 hours. The program is interactive and fun, and sessions mix limited teaching by HWSA facilitators with youth-led group discussions, role plays and debates. Relevant games are used. The program includes a component that targets out-of-school youth through youth clubs, community-based organizations and sports groups. HWSA will continue to work closely with the national and provincial health departments. The activity will build on FY 2006's success of reaching 57,000 individuals with A and AB messages through 100 FBOs and 50 schools.

ACTIVITY 2: Men as Partners (MAP)

A follow-up activity to Activity 1 will be a gender-sensitizing component carried out by HWSA's MAP program. This activity will address both the prevention needs of girls and young women and the promotion of positive gender-sensitive attitudes, practices and behavior for young boys and youth. Alcohol and substance abuse information will be integrated into the curriculum to reduce the risk behavior. The MAP program will be modified to be age-appropriate and will attempt to change social norms related to male socialization, coercive sex, cross-generational sex, and/or transactional sex. This activity will create community commitment and involvement in reduction of violence against women and children, support HIV counseling and testing, peer education and community interventions with messages to challenge norms about masculinity, early sexual activity and multiple sexual partners for boys and men, cross generational and transactional sex. This program will promote the benefits of abstinence in reducing HIV transmission, encourage the delay of sexual debut until marriage for the 10 -14 age groups and for the older youth MAP will also encourage the reduction in number of casual sexual partnerships, mutual faithfulness to an uninfected partner and will stress the importance of HIV counseling and testing and provide full information on the correct and consistent use of condoms to reduce the risk of HIV for those who engage in risky sexual behavior.

ACTIVITY 3: Parent Empowerment

This activity will work with parents, caregivers and guardians to promote consistent, positive and proactive parenting and a constructive family environment. This activity will build on research that shows that strong family bonds have a major influence on children's achievements in school and through life and also that youth report a preference of having parents/guardians educate them about sexuality and related issues. The program will empower and capacitate parents with skills to interact with children and youth about abstinence, sexuality, HIV prevention messages and create an enabling environment for AB messages. There is research evidence that good relationships between parents and teens and adequate supervision of teens reduce risky behavior among youth. HWSA will partner with the Parenting Centre and faith-based networks (e.g. South African Council of Churches, African Federation of Churches and the International Churches of Christ) to develop and implement this program. The program will include sessions on personal growth; enhance self-awareness, personal values, parenting skills, building children's self-esteem, discipline

Activity Narrative: and problem-solving. The activity will be linked to the HWSA OVC program which will focus on empowering parents and guardians in vulnerable households and working with granny-headed households.

These HWSA activities will contribute to the PEPFAR goal of averting seven million infections, and support the USG Five-Year Strategy for South Africa by improving AB preventive behaviors among youth and adults.

Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	2988.08	**Planned Funds:**	$5,639,250
Activity System ID:	13952		

Activity Narrative: SUMMARY:
Over the next four years Johns Hopkins University/Center for Communication Programs (JHU/CCP) and its 20 South African (SA) partners will combine mass media with interpersonal community mobilization to bring about heightened awareness of risk of HIV infection among general population to address sexual partnerships and behaviors placing them at risk of HIV infection. With young people under 14, emphasis will be on abstinence ("A") and delaying sexual debut (DSD). With people over 14 main focus will be on younger girls and women aged 15–24 and men aged 25–49 and emphasis will be on faithfulness ("B"). "B" messages focus on heightening perceptions of risk to HIV infection owing to sexual partnerships and behaviors people engage in placing them at risk of HIV infection, namely: multiple and concurrent partners (MCP), intergenerational/transactional sex (ITS), casual sex, violence and coercion, linkage between alcohol and substance abuse and HIV, stigma and discrimination (SD). The target populations are youth, people living with HIV (PLHIV), religious leaders, teachers and adults which will include the public health workers, and community, faith-based and non-governmental organizations. The emphasis areas are gender, human capacity development, strategic information, work place programs and wrap around programs such as family planning and TB.

BACKGROUND:
JHU/CCP AB prevention initiatives are in their fifth year. Over the next four years all partners will prioritize interventions to focus on men aged 25–49 and young girls and women aged 15–24, while addressing social norms and values among youth below age 15. Interventions will impact on key drivers of the epidemic and perception of risk in relation to sexual partnerships and behaviors including MCP, ITS and incorrect and inconsistent condom use. Interventions are informed by qualitative research intervention undertaken by JHU/CCP and its partner CADRE. The study found high-risk behaviors driving epidemic are determined by social norms and values that include male attitudes and behaviors, alcohol and substance abuse; population mobility and gender dynamics including gender-based violence (GBV). In hyper-endemic situations where HIV prevalence exceeds 15% there is need to engage people to heighten perception of risk while providing them with tools to enable them to manage risk of HIV infection by taking necessary actions to address risk behaviors. JHU/CCP uses a social-ecology approach to communication that combines power of interpersonal communication with mass media to engage and mobilize individuals around sexual behavior and risk perception to HIV infection and influence social networks, communities and societies to create enabling environment that allows them to reduce risk of HIV infection. Each activity is designed to contribute towards change in social norms, create social networks that support individual change, build skills, and improve decision making leading to safer sexual behavior.

ACTVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Young People 12–14
The Valley Trust (TVT) and Lighthouse Foundation (LF) will work with youth under 14 in primary and secondary schools to encourage DSD and provide them with life skills to help reduce their risk to HIV infection.

ACTIVITY 2: Mobilizing In- and Out-of-School Youth 15-24
Dance4Life (D4L), DramAIDE, TVT, Lesedi Lechabile (LL), LF and Community Health Media Trust (CHMT) will work with youth in secondary schools using variety of approaches to train peer educators who will establish HIV prevention, care and support clubs to act as entree to in-school youth. Among youth under 14, the primary focus will be on DSD. Among youth over 14, the focus will be on messages relating to MCP, ITS; correct and consistent condom use, male norms and behaviors, substance and alcohol abuse, gender-based violence (GBV), risk perception and SD.

TVT, LF and LL will undertake interpersonal discussions, workshops and community events with out-of-school youth to heighten perceptions of risk in relation to sexual partnerships and behaviors.

DramAidE's Health Promoters work in 23 tertiary institutions and use group meetings, individual consultations, dorm visits, classroom instruction and community events to increase perceptions of risk in relation to MCP, ITS, GBV, condom negotiation skills, STIs, male norms and behaviors, SD, sexual and reproductive health (SRH) and risks of substance and alcohol abuse.

ACTIVITY 3: Mobilizing Adult Men and Women 15-49
Sonke Gender Justice (SGJ) supports partners to integrate Men as Partners approach to mobilize men on responsible male behavior, substance and alcohol abuse and reduction of GBV. SGJ, LF, LL and TVT will expand the number of men's clubs and health services to mobilize men, communities and traditional structures around MCP, responsible male behavior, substance and alcohol abuse and reduction of GBV.

TVT, LF and Matchboxology (MB) will mobilize adult men and women using door-to-door campaigns, taverns and taxi ranks, around MCP, ITS, male norms and behaviors, SD, and risks of substance and alcohol abuse.

LifeLine SA and TVT will support workplace interventions and train PEs within small and medium enterprises and on farms. MB will work with professional footballers and fan clubs. All workplace based interventions will increase perceptions of risk in relation to MCP and ITS, GBV, SD, male norms and behaviors and alcohol consumption and sexual behavior.

TVT and LF will engage with traditional leaders and healers to mobilize them to address cultural dimensions of MCP, GBV, SD, male norms and behaviors and alcohol consumption.

TVT, LifeLine SA and LF will work with FBOs through activities to promote partner limitation, GBV and SRH. Religious leaders will be trained and provided with appropriate communication materials to guide them.

Mindset Health Channel (MHC) has a Healthcare Worker Channel (HCWs) and a Patient Channel in more than 400 public clinics. The HCW Channel trains health workers and its public health channel sensitizes audiences on partner reduction, GBV, substance and alcohol abuse.

CHMT, will increase number of Treatment Literacy and Prevention Practitioners to 92 (72 funded by PEPFAR and 20 by National Department of Health (NDOH) and facilitate discussion among patients in

Activity Narrative: general waiting rooms in MHC on topics relating to correct and consistent condom use, GBV, substance and alcohol abuse, STIs and SRH. LF, TVT and Mothusimpilo will work with CHMT and MHC to facilitate dialogues in clinics surrounding their areas.

LL and Mothusimpilo use PE and HCW in mining districts of North West and Free State to reach young women at risk, including sex workers, through clinics, schools and community events to heighten risk perceptions on sexual partnerships and behaviors that place them at risk of HIV infection including MCP, ITS, GBV, SD, male norms and behaviors and risks of alcohol and substance abuse. Their programs are linked to local mining companies who generally focus on male employees.

Department of Correctional Services (DCS) will expand their correctional facilities program from Limpopo and North West to include Gauteng and Northern Cape. DCS uses TshaTsha TV drama series to train PEs to heighten awareness of risks pertaining to sexual partnerships and behaviors that place them at risk of HIV infection.

ACTIVITY 4: Mass Media Support for Community Mobilization
The 2006 national communications survey found that 76.7% of people had at least one television (TV) in their households. 60% watch TV every day and 60% listen to radio every day. TshaTsha reached about 48% of population, while the treatment literacy program Siyanqoba – Beat It reached 27% and community radio program Mind, Body Soul reached 6% of the population. TshaTsha is used to facilitate discussions with people in schools, correctional facilities and community meetings around issues of risk of HIV infection, ITS and MCP. However 16% of population was not reached by any media interventions partly due to fragmentation of media environment in relation to audience preferences influenced by socio-economic status and language. To address this, JHU/CCP will expand mass media program to include new platforms such as cellular and internet technology and outdoor media that will complement radio and TV outreach. All platforms will heighten awareness of risk among men aged 25–49 and young girls and women aged 15–24 in relation to sexual partnerships and behaviors including MCP, ITS and male attitudes and behavior.

ABC Ulwazi will produce a community radio talk show for 60 community radio stations using local languages that are facilitated through listener associations. JHU has a public-private partnership with SA Broadcasting Corporation to fund two TV programs supported by nine regional SABC language radio programs and internet. A second season of TV drama Circles heighten perception of risk to HIV infection through highlighting sexual partnerships and behaviors that place them at risk of HIV infection including MCP and ITS. Trailblazers provide positive models.

MB in partnership with SA Professional Football Union and the Professional Soccer League will mobilize prominent SA football players to provide messages through different mass media platforms to raise awareness of risk concerning MCP, ITS, male behavior, GBV, alcohol and substance abuse, treatment of STIs, as part of build up to 2010 Football World Cup.

A TBD outdoor media partner will work with JHU to develop messages for outdoor media to heighten perceptions of risk in relation to sexual partnerships and behaviors that place people at risk of HIV infection including MCP with low and inconsistent condom use. A TBD cellular telephone partner will use short message services technology to address MCP, ITS, correct and consistent condom use, male norms and behaviors and the risks of alcohol and substance abuse.

Table 3.3.02: Activities by Funding Mechansim

Mechanism ID: 4644.08 **Mechanism:** N/A

Prime Partner: Youth for Christ South Africa (YfC)

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 7948.08

Planned Funds: $500,000

Activity System ID: 13912

Activity Narrative: SUMMARY:

Youth for Christ South Africa (YFC) will promote HIV risk reduction through abstinence and being faithful (AB) activities among youth 10 to 18 years of age. The activities will take place in at least 250 schools in five provinces, namely Eastern Cape, Gauteng, Mpumalanga, North West and the Western Cape. The organization will recruit and train young adults to work in the programs as youth workers and peer group trainers. The emphasis area for this program will be gender and human capacity building and training. The target population will include children and youth, adult, teachers and religious leaders.

BACKGROUND:

YFC is a youth development organization that directly addresses problems and needs of youth. YFC South Africa has established several training centers and local offices in five provinces of South Africa. YFC runs a number of programs aimed at preparing youth for the future. YFC has been funded by the National Department of Health (NDOH) since 1995 and received PEPFAR funds through the CDC cooperative agreement with the NDOH starting in 2005. As of FY 2007, YFC will become PEPFAR prime partner and will no longer receive PEPFAR funds through the CDC cooperative agreement with the NDOH.

ACTIVITIES AND EXPECTED RESULTS:

Many YFC activities promote behavior change through promotion of AB messages and activities. YFC will continue to empower young women through counseling and education, in an effort to improve general life and sexual decision-making skills. The abstinence-focused messages are geared towards children ages 10-14 in primary schools; messages to high school students ages 14-19, out-of-school youth and young adults focus on abstinence, delayed sexual debut and faithfulness. Full information on correct and consistent condom use is provided and referral to relevant service sites, but the focus is more geared towards AB messages. This is consistent with the PEPFAR ABC guidance.

ACTIVITY 1: Peer Education in Schools

Building on activities of FY 2007, YFC will continue to train a network of unemployed young adult volunteers from faith-based organizations to provide peer education in the form of training, support and referral services for students. YFC has developed effective models of working with, and empowering, youth who will be trained to share AB information and correct decision-making skills with their peers. YFC will work with the provincial Department of Education (DOE) to identify appropriate schools in which to implement these activities. YFC will also collaborate with school principals and the local communities. The young volunteers will be placed in schools to serve as coaches and mentors for peer groups, and these volunteers will encourage students to form support groups and clubs both in- and out-of-school. The volunteers will also be trained to run informative workshops and community events in their schools on a host of issues relating to HIV and AIDS, peer pressure, self-esteem, and goal setting.

ACTIVITY 2: Life Skills Training

Young volunteers will be trained to conduct life skills sessions at schools and in camps to educate youth on making informed decisions about life and sexuality. YFC will use the Rutanang curriculum, which has been endorsed by NDOH. Rutanang's peer education model highlights the importance of delaying first sex secondary abstinence and consistent and correct use of condoms, as well as respect for others. YFC has developed holistic prevention programs that incorporate key players from all levels of a community to bring about a positive school environment. It is the responsibility of each local office of YFC to maintain and sustain the work that they initiate in their localities. YFC will use drama, music and dance to effectively communicate the life skills and AB messages. Topics to be covered will include male norms and behaviors as well as gender roles and equity to discourage discrimination, violence, coercion and abuse against women and girl children YFC will also work with the DOE to implement this activity.

ACTIVITY 3: Creative Educational Teams

YFC will set up and use edutainment for support of the prevention program for both in- and out-of-school youth. This will be done by using drama, dance and discussion groups to educate youth on HIV and AIDS, and to promote AB life styles. YFC will recruit, train and deploy five itinerant teams to work and support work done in schools and communities to educate youth on these issues. YFC itinerant teams will present HIV and AIDS productions in high schools, youth centers, churches and prisons. These teams will spend three to five days in each school, giving assembly and classroom presentations, and creating informal discussion times. YFC will work in partnership with the NDOH and the DOE to reach the target audience. The provision of community programs will help to de-stigmatize HIV and AIDS in communities. YFC aims to have teams set up in each region.

ACTIVITY 4: Capacity Building

During FY 2007 YFC has established and is implementing an Internship Program. This program targets unemployed youth volunteers, active in faith-based organizations, and placed them in the various YFC offices. The purpose of the year-long internship is to provide the interns with on-the-job training in a program or project linked to the organization. Examples of activities that interns participated in include: life skills programs; leadership training; training camps; HIV and AIDS workshops. The Internship Program is based on the great emphasis on training and capacity development of the YFC management. Using FY 2008 funding, YFC South Africa intends to increase the number of Interns and Youth Workers placed in schools.

ACTIVITY 5: Gender-Based Camps

Using FY 2008 funding a new activity that will be implemented is that of gender-based youth camps that aim at tackling issues of gender stereotyping. YFC will run camps for boys and for girls. The purpose of the camp will be to create a space for youth to dialogue about sexuality, gender, and gender stereotypes in the context of HIV and AIDS.

Activity Narrative: ACTIVITY 6: Parent/Child School-based Seminars

In addition to the activities listed above, YFC understands that it is important to focus on building relationships between youth and their parents. YFC will establish school run, school based seminars to facilitate dialogue and increase awareness and understanding between youth and their parents, to foster good relationships and bridge the gap of misunderstanding created by lack of communication. Talking about sex, sexuality and boy/girl relationships continues to be taboo in many families and communities. This increases the risk factor of young people with regard to HIV and AIDS as they seek information from peers and other sources, unguided by relationship and communication with their parents, families and/or significant adults in their lives.

These activities will contribute to PEPFAR's goal of averting seven million new HIV infections. In addition, the activities support the USG Five-Year Strategy for South Africa by increasing effective faith-based activities and creating support for positive gender norms.

Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	3797.08	**Planned Funds:**	$290,000
Activity System ID:	13925		

Activity Narrative: SUMMARY:

Peace Corps Volunteers (PCVs) work in civil society organizations (CSOs) that focus on HIV and AIDS relief under the Community HIV/AIDS Outreach Project (CHOP) and in the education system at the primary school and district levels under the Schools and Community Resources Project (SCRP). All CHOP and SCRP PCVs will be encouraged to work with both in-school and out-of-school youth in delivering Abstinence/Be Faithful (AB) messages through life skills and peer education sessions delivered in classrooms or in association with extracurricular school activities and through community events organized by youth and adult volunteers. Activities in this program area aim to encourage positive life styles and health -seeking behaviors among youth and to help them develop positive gender norms and expectations. SCRP PCVs will specialize in training teachers and mobilizing in-school youth while CHOP PCVs will focus more on training out-of-school peer educators, community citizen volunteers, and CSO employees and mobilizing traditional, business and religious leaders in supporting community- and school-based prevention activities. CHOP and SCRP PCVs and their counterparts will be encouraged to work together in designing and delivering comprehensive HIV prevention training and outreach programs in their rural communities. Prevention training and outreach activities will be conducted in the KwaZulu-Natal, Limpopo, North West, Northern Cape and Mpumalanga provinces.

BACKGROUND:

To date, the program in South Africa has relied primarily on PEPFAR-funded PCVs assigned to the (previous) NGO Capacity Building Project. Although the FY 2007 program still utilizes PEPFAR-funded PCVs, the Schools and Community Resources Project (SCRP) and the (now) Community HIV/AIDS Outreach Project (CHOP) were significantly revised in FY 2007 so that all CHOP and SCRP PCVs and their counterparts can be involved in prevention AB activities. In FY 2008 the program will not place PEPFAR-funded PCVs and instead use PEPFAR funds to enable all PCVs to train service providers in HIV prevention and to conduct HIV prevention outreach to various youth groups.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: HIV Prevention Training

In FY 2008, approximately 100 PCVs (key legislative issue) and 100 counterparts will receive training in HIV and AIDS prevention (key legislative issue), using the Peace Corps' Life Skills Manual (an internationally recognized best practice model) and other peer education materials. The peer education and life skills training will focus on building skills among youth in communication, decision-making, thinking, managing emotions, assertiveness, self-esteem building, resisting peer pressure and building relationships.

ACTIVITY 2: Project Design and Management Training

Approximately 100 PCVs and 100 counterparts will attend Peace Corps' Project Design and Management training to develop skills in participatory development and implementation of HIV and AIDS activities with target groups. This training will take place in the context of the AB prevention training and will find application across all program areas.

ACTIVITY 3: Organizational Capacity Building Training

Approximately 60 CHOP PCVs and 60 CHOP counterparts will attend Organizational Capacity Building training to enable them to develop or strengthen policies, systems and practices that will enable CSOs to deliver quality and sustainable HIV and AIDS programs. This training will take place in the context of the AB prevention training and will find application across all program areas.

ACTIVITY 4: Grant Proposal Writing and Monitoring and Evaluation Training

Approximately 100 PCVs and 100 counterparts will attend Grant Proposal Writing and Monitoring and Evaluation training to enable them to prepare Peace Corps PEPFAR Volunteer Activity Support and Training (VAST) proposals and U.S. Embassy PEPFAR Small Grant proposals. The training will also support the development and use of appropriate monitoring, reporting and evaluation tools with their host schools and CSOs. This training will take place in the context of the AB prevention training and will find application across all program areas.

ACTIVITY 5: Delivery of Life Skills Sessions

Approximately 100 PCVs and 100 counterparts will deliver life skills sessions in schools and communities, using and developing peer educators in the process. Teachers in the schools and supportive adults and business, traditional and religious leaders in the communities also will be used to champion HIV and AIDS activities. Male behaviors and gender equity (key legislative issue), reducing violence and coercion and stigma/discrimination are directly addressed in the prevention activities. PCVs work with counterparts in the schools and communities to ensure that, on completion of their service, their initiatives continue with school and community support. 3000 individuals will be reached through community outreach that promotes HIV prevention and 120 peer educators and other service providers will be trained to promote HIV prevention.

Both CHOP and SCRP PCVs contribute to the US Mission's country emphasis on prevention by uniquely providing American citizen assistance in rural communities. Their activities are also closely aligned to the South African government strategies in each of the provinces in which PCVs work.

Activity Narrative: SUMMARY:

Siyafundisa is an Anglican-based Abstinence and Be Faithful (AB) HIV prevention program that focuses on providing information and education to young people and adults within the Anglican churches. Siyafundisa has established a partnership with the Harvard School of Public Health to develop and roll out a peer education program. This program will be implemented by young people at different parishes across the country. Emphasis areas consist of building local organization capacity to deliver prevention activities; and training trainers/facilitators to reach other youth. Siyafundisa addresses gender by focusing on increasing gender equity in HIV and AIDS programs, addressing male norms and behaviors; reducing violence and coercion and stigma/discrimination; mobilizing and reaching communities; developing linkages with partners to sustain and enhance the program; as well as providing information, education and communication. Siyafundisa targets children and youth, especially orphans and vulnerable children, with AB messages through information and education. The AB prevention program is designed to develop skills that promote abstinence for youth aged 10-14, secondary abstinence for older youth aged 15 -24 and provide correct and consistent condom use for youth at risk and those in long-term sexual relationships. Adults, especially parents, are also targeted with information and education to support youth as well as information that encourages mutual monogamy, partner reduction and HIV risk perception. Special populations include community and religious organizations that can help promote AB prevention, volunteers who can implement AB activities, religious leaders who can impact individuals and families through outreach, and individuals and families who are affected by HIV, AIDS and stigma, and especially people living with HIV.

BACKGROUND:

Siyafundisa is implemented in parishes, communities, schools, and tertiary institutions through clergy networks, children, youth, and family ministries. Using FY 2006 funding, this program has been piloted in five cioceses in the Eastern Cape, Gauteng and KwaZulu-Natal. FY 2007 funding was used to roll out this program to all dioceses in South Africa. The church plays a significant role in building the capacity and training members and volunteers from women’s movements such as Mothers’ Union and Anglican Women Fellowship. In addition, community facilitators are trained to be able to provide psychosocial and material support as caregivers. A strong focus is given to the training of youth as peer educators and facilitators of life skills programs. Prevention activities target men with a core objective of changing male norms and reducing violence and coercion and young women to ensure equal access to HIV and AIDS information and related training. Men both young and old are also educated on issues of cross-generational and multiple concurrent partnerships which are the risk behaviors that fuel the epidemic.

ACTIVITIES AND EXPECTED RESULTS:

FY 2008 funding will ensure that the project can continue and expand into all 19 of the dioceses in South Africa. Initially peer education will be introduced into ten parishes each within nine dioceses and Life Skills into ten parishes in each of the remaining ten dioceses. Once this expansion is completed, then the project will introduce peer education into the remaining 10 dioceses (10 parishes each) and additional parishes within the initial nine dioceses. Complementary to and co-located with the training, the project plans to partner with a testing organization using mobile VCT services to extend testing to those being trained and others in their communities.

ACTIVITY 1: Training Clergy and Adults

Adults and clergy will be trained to facilitate workshops around the issues of HIV and AIDS through structured outreach programs. Training will be conducted for the Mothers' Union - the women's group in the church responsible for prayer and family ministries, teaching of Sunday school and mentoring youth organizations; and the Bernard Mizeki members - the men's organization in the church that plays an influential role in mentoring young people and assisting them in spiritual formation.

ACTIVITY 2: Workshops

Workshops will include parent-child communication skills training and AB prevention. Young women and girls will be empowered with knowledge and skills to protect themselves against sexual abuse and violence. Men perpetuate most of gender-related violence, so emphasis and attention will be given to men, helping them to understand the role they play in HIV prevention. Men will be encouraged to reduce the number of sexual partners and to remain faithful to their partners. Life skills programs will be presented for both boys and girls to address the challenges and pressures of growing up as well as helping youth to refrain from harmful risky behaviors.

ACTIVITY 3: Human Capacity Development

The program will also focus on the expansion of internal capacity within the Anglican Church. More staff and HIV youth workers will be recruited to form the support team in the different Anglican dioceses and archdeaconries. Diocesan coordinators will provide additional support. Training for staff and volunteers will include HIV and AIDS, peer-to-peer outreach, parental involvement and participation, male involvement, community mobilization, and gender sensitization.

ACTIVITY 4: Peer Education

The Anglican Church is utilizing Rutanang, a peer education curriculum for children and youth (age 10-14, 15 -19, 20 -24), developed by the Harvard School of Public Health. It is being piloted in three provinces (Eastern Cape, KwaZulu-Natal and Gauteng), which cover five dioceses (Port Elizabeth, Grahamstown, Zululand, Highveld and Christ the King). Through the peer education program, each parish will have one supervisor and 15 peer educators. Members of the Anglican Students' Federation will also be trained as supervisors and mentors for the parishes located close to their universities, colleges, and technical colleges. Typically, a team of three peer educators will be assigned a group of up to 20 young people to deliver six lessons, over a period of four months, from the Rutanang manual. The program will be gradually rolled out, reaching full scale covering all dioceses and provinces. The trainings will be replicated with different groups of youth in each parish. Topics covered in the curriculum include; self worth and self esteem, relationships, communication, assertiveness, peer pressure, alcohol and substance abuse, refusal, asking for help,

Activity Narrative: gender, media influences, personal safety, and helping others.

ACTIVITY 5: Large-scale Dissemination of AB Messages Through Nationwide Church Campaigns

Important commemoration and celebration dates have been identified to disseminate HIV prevention messages and to increase awareness and involvement of the community in the response to the HIV pandemic. These include development of sermon notes focusing on themes that build self-esteem for young people and avoidance of harmful behaviors, faithfulness, reduction of sexual partners and healthy relationships. The sermon notes are distributed to all dioceses. Different parishes and dioceses hold commemoration services and rallies and during these events, reach hundreds of people. Nothing the Church does is "one off." Messages are continuously reinforced in the church, Sunday School, Confirmation Classes and more. Church media will also be used to reach people with messages commemorating Women's Day, youth month campaigns and encouraging more boys and young men to get involved in outreach and education. The program will continue to address stigma across all dioceses, reaching people of different cultures and backgrounds, ethnic groups, races, and standard of living in rural and urban areas nationwide.

In FY 2007 the project increased the number of field workers to implement and support (assistance and quality control) the extension of training by peer educators and life skills facilitators. Further expansion is planned for FY 2008. The project will continue to emphasize preparation and dissemination of materials to parish priests throughout all nineteen dioceses to inform sermons, lessons, and more.

These activities, through the variety of approaches will all contribute to the overall PEPFAR goal of averting seven million new infections.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 3292.08

Planned Funds: $500,000

Activity System ID: 13758

Activity Narrative: SUMMARY:

By training faith and community-based leaders, as well as youth leaders in “Choose Life", a value-based Abstinence and Be Faithful (AB) prevention program, CompreCare and its prevention partner, HospiVision, will empower these leaders to implement AB programs in their various constituencies. The emphasis area for this intervention is training as well as community mobilization. Primary target populations include faith-based organizations (FBOs), non-governmental organizations (NGOs) and community leaders, volunteers, caregivers of people living with HIV and AIDS, people living with HIV (PLHIV), children and youth, orphans and vulnerable children.

BACKGROUND:

CompreCare is a South African NGO, undertaking HIV prevention and care activities under a multi-partner initiative called the CHAMPs Initiative. CompreCare's partner in this program is HospiVision, a FBO involved in spiritual care, counseling and training. HospiVision is part of a network of FBOs involved in the prevention of HIV by involving churches in the Tshwane (Greater Pretoria) metropolitan area in Gauteng. The prevention program will strengthen value-based AB messages in faith-based and community networks, with the goal of changing individual, social and community norms. This will lead to reduced risk behaviors and strengthen stable family relationships thereby reducing the HIV infection rate in the target communities.

The program is accredited by the Powell Centre at the University of South Africa (UNISA) and Transforming Tshwane, an ecumenical faith-based initiative focusing on networking and community mobilization in Tshwane. This program is conducted in support of the Tshwane local government's HIV and AIDS strategy which is in line with the National Department of Health (NDOH). HospiVision is also accredited by the NDOH. The Christian AIDS Bureau for Southern Africa has cooperated in the development of the training program and has provided support in the Western Cape. These partnerships and linkages will contribute largely to the sustainability of the program.

This activity builds on the successes achieved with PEPFAR FY 2005, FY 2006 and FY 2007 funding. During the first 18 months of the implementation of the AB program 700 leaders were trained, 57,596 people were reached and an estimated 540,000 people have already been reached through the mass media program by Radio Pulpit. In addition, at no cost to CompreCare or to PEPFAR, the Northwest University is conducting an evaluation and analysis of the impact of the personal and community impact of the Choose Life Program. The results of this study will be made available, annually, in November and will be used to improve and strengthen the program.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

The "Choose life" program is a value-based AB training program for faith, NGO, community and youth leaders who are targeted and identified through existing networks. "Choose Life" is an experiential basic (three days) and advanced (five days) accredited training program. The program focuses on two value frameworks ("the golden rule" and Ubuntu "being through community") as well as six central spiritual values (respect, responsibility, integrity, fairness, love and service) and enhancing decision-making, assertiveness and negotiation skills. A trained facilitator conducts workshops with a group of (maximum) 20 participants. Facilitator capacity building is conducted through a master trainer and mentor training program. By increasing the number of master trainers, and faith, community, youth and NGO leaders trained, the number of people reached will increase considerably. "Choose Life (Youth)" has adapted the program for the youth context. The outcome of this program is to empower participants with knowledge, skills and attitudes to live powerful, spiritual, self-confident lives by making wise ethical decisions. There will be a particular emphasis on the role of FBOs in reducing stigma, addressing gender issues and empowering youth and unmarried people to make abstinence and "be faithful" choices, and for active couples to make "be faithful" choices that are based on values and supported by life skills. FY 2008 PEPFAR funding will ensure continued support for fund trainers, workshops, adapt training manuals and handbooks. FY 2008 funding will ensure geographic expansion of these activities to Free state, Western Cape, Limpopo and Mpumalanga and expanding into new areas in Gauteng. Ongoing review and adaptation of the program will be based on lessons learned from the previous year of implementation. This program will in turn reduce stigma and discrimination on HIV and AIDS. The participants are identified in various faith-based communities and they get nominated to attend the course. At the end of each course participants are given evaluation forms and assignments which they have to perform and bring after six months. This is a train the trainer program, where trainers are nominated from existing community structures. Once the training is completed, trainers go back into the community to implement what they have learned and come back after six months for a review.

ACTIVITY 2: Community Outreach

Leaders trained will form action teams that will initiate the community mobilization activities. The value-based prevention approach, incorporating "Choose Life" program, includes raising awareness about HIV and AIDS in faith communities, workshops for community members and youth as well as activities like church services and catechism for children and youth. Apart from the "Choose Life" program implemented by CompreCare's prevention partner HospiVision, other prevention activities will be implemented using several modalities in cooperation with Kurima, a NGO, by means of the Know Your Neighborhood (KYN) program. Prevention communication will be implemented via a network of trained KYN community facilitators who are responsible for spreading AB messages within designated areas at the grassroots level in target communities.

ACTIVITY 3: Mentoring and Implementation Support

Trained community, faith and youth leaders will receive ongoing support through trained mentors and during follow-up workshops. Mentors will assist participants in the completion of assignments for certification as well as in the implementation of the program in their communities. This will significantly increase the numbers of people reached through continuous implementation by trained leaders. HospiVision will continue to train the KYN Facilitators and Child Care Workers from the OVC program in value-based

Activity Narrative: prevention as well as provide counseling and debriefing services on a regular basis. The mentoring and implementation support will form an essential part of a quality assurance and monitoring and evaluation program. Through the monitoring and evaluation process, the impact and effectiveness of the value-based prevention approach will be assessed. FY 2008 PEPFAR funds will support mentors and mentor workshops.

ACTIVITY 4: Information, Education and Communication

Via the medium of Radio Pulpit, a national Christian radio station, and other community radio stations, a media program will emphasize the value-based prevention approach, incorporating the messages of the "Choose life" program about AB lifestyle choices and life skills based on value frameworks and value-based behavior change principles. This will be done through interviews, discussion forums and listener-driven programming. In addition, “Choose life: A value-based response to HIV and AIDS”, a handbook will be published on annually by the Powell Bible Centre. This will be linked with series of AB value-based leaflets published by “The Christian Literature Fund” specifically aimed at targeting community members, pastors and leaders of FBOs.

CompreCare and its prevention partner, HospiVision, will contribute towards meeting the vision outlined in the USG Five-Year Strategy for South Africa (PEPFAR goal of seven million infections averted) by improving AB preventive behaviors among the youth and adults and increasing effective CBO/FBO prevention activities.

Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	2926.08	**Planned Funds:**	$145,500
Activity System ID:	13723		

Activity Narrative: This activity was approved in the FY 2007 COP, was funded with FY 2007 PEPFAR funds, and is included here to provide complete information for reviewers. The funding mechanism from field support to a local agreement for Family Health International (FHI) is changing in October 2008; therefore, a COP entry is being made to reflect this change in mechanism and activity number only. FHI activities under AB are expected to continue under the FY 2008 COP and funds are being requested in the new COP entry.

SUMMARY:

Family Health International (FHI) will provide technical assistance (TA) to three universities' peer education programs to continue integration of abstinence and be faithful messages (AB) as well as life skills into the ongoing activities of the peer education programs on university campuses. Using the curriculum developed in FY 2005, the AB and life skills training will be extended to a cadre of peer educators (PEs) on each of the campuses participating in this project. The PEs will then pass these skills on to other students on campus primarily through interaction in ongoing, small behavior change groups. Emphasis areas are gender which includes addressing male norms and behaviors, cross-generational sex and multiple sexual partnerships, reducing violence and coercion, training, local organization capacity building, and wraparound programs in family planning and education. Main target populations addressed are men and women of reproductive age and people living with HIV.

BACKGROUND:

Currently, most efforts addressing sexuality and reproductive health needs for young people are focused on out-of-school youth and those in secondary school in South Africa. Youth at institutions of higher learning represent a special group at risk as they are often left unsupervised by both parents and teachers, who are under the assumption that they are mature enough to protect their sexual and reproductive health. Available evidence suggests that these young men and women have high sexually transmitted infection (STI) and unintended pregnancy rates, an indication that they are not yet equipped with the knowledge and skills required to protect themselves from these adverse outcomes.

In FY 2005, in consultation with the South African Universities Vice Chancellors' Association (SAUVCA) and the Department of Education, FHI implemented a project that took place on three university campuses in South Africa: University of the Western Cape, University of the Free State, Qwaqwa campus and University of Limpopo, Medunsa campus. Each campus contributed to the development of the AB/life skills curriculum which was subsequently implemented among 26 PEs from each of the three campuses. After the training, PEs recruited six students each to take part in ongoing behavior change communication (BCC) groups on their campus, reaching in total 468 students.

Life skills aim to enhance the students' ability to make responsible sexual health decisions and adopt behaviors that will keep them free of STI and HIV infection, as well as avoid unintended pregnancies. The curriculum included sessions on “Abstinence”; which promotes delaying sexual debut for youth under 14, as well as secondary abstinence for older youth and “Be Faithful” for youth and adults in long-term relationship, discouraging them to engage in multiple and concurrent sexual relationships which are the drivers of the HIV epidemic. The AB prevention messaging will address secondary abstinence, values clarification, self-esteem, communication, decision making and negotiation, and utilized participatory learning techniques. Another key component of the AB/life skills training was a session on gender equity. The curriculum complemented the universities' existing peer education curricula, which provides basic information about prevention of HIV and AIDS. The BCC groups provided a safe place to explore strategies for adopting and strengthening the AB life skills in their personal lives. Students were able to support each others' behavior change process, including seeking counseling and testing (CT). Through one-on-one and group interaction, the PEs took advantage of a variety of regularly scheduled campus events-such as orientation week, condom week, and STI awareness week-to reach additional students with basic information on STIs, HIV and unintended pregnancies and how to protect oneself and maintain a healthy lifestyle. The program also promoted referrals between the PEs and student health or community health services for CT as well as family planning (FP).

Major accomplishments to date include development of the AB life skills curricula and successful training of the PEs. The program has gone beyond the university campuses and PE groups to be conducted in high schools in communities near the campuses. A radio series was produced and launched on campus and community stations throughout South Africa, reaching approximately 6,000,000 listeners. The show addressed issues related to risk-reduction behaviors for STIs, HIV and unintended pregnancies that are relevant for university students. The curriculum was also used by University of Nairobi for a similar intervention.

The universities did not receive PEPFAR funding for FY 2006, however the universities were committed to continue the BCC groups and supervision activities. While the activities are expected to continue with the respective university funding, additional resources are needed to strengthen the longer-term institutionalization of the life skills program.

ACTIVITIES AND EXPECTED RESULTS:

In collaboration with the Department of Education, in FY 2008 FHI will continue to work with the three universities, University of the Western Cape, University of the Free State, Qwaqwa campus and University of Limpopo, Medunsa campus, and explore opportunities to expand activities to tertiary institutions. FHI will work in collaboration with JHU at the University of Western Cape and the University of Free State, Qwaqwa campus to ensure that all PE programs are harmonized. To align the goals of the program with the government goals, FHI will work closely with the Department of Education staff to further refine the program and improve outreach. Further integrating AB life skills into their peer outreach program work plans, each university will recruit new PEs for the AB life skills project, who will then recruit other students to participate in small, ongoing BCC groups. TA will also be provided to strengthen supervision skills to ensure the quality of the peer interactions, modeling problem solving skills, and shaping perceived peer/social norms on sexual behaviors. The “Be Faithful” messages will also promote mutual monogamy, partner reduction and full information on correct and consistent condom use will be provided.

Specific activities include:

Activity Narrative:

(1) Incorporating AB life skills program into existing peer education work plans in a cost-effective manner;
(2) Conducting AB life skills training for all PEs participating in the program;
(3) Providing refresher trainings to strengthen basic peer education/facilitation skills;
(4) Standardizing job aids and tools for PEs to use in small groups;
(5) Conducting supervision skills training for and provide TA to supervisors to help support PEs and the BCC group process;
(6) Building and strengthening relationships between PEs and student health services, and formalize referral links to health services;
(7) Integrating alcohol and substance abuse risk behaviors in the life skills program; and
(8) Monitoring AB, life skills and BCC group processes.

The project will help decrease the number of new infections by achieving the expected results which will ultimately lead to a delay in sexual debut, a reduction in sex acts, fewer partners or a reduction in unprotected sex.The activities contribute to the 2-7-10 PEPFAR's goals of averting of seven million new infections.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 12253.08

Planned Funds: $28,226

Activity System ID: 13702

Activity Narrative: SUMMARY:

CARE serves as an umbrella grant-making mechanism for the Centers of Disease Control and Prevention (CDC). Specific responsibilities of include the financial oversight of the grant which includes review the financial reports and on-site assessment of the supporting documentation.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Contractual Arrangements

CARE is responsible for the contractual arrangements of the sub-grants with CDC Atlanta. These arrangements include application for funding for implementation of activities by the sub-grantees that have been approved by CDC South Africa to meet the PEPFAR goals. Care will prepare all supplemental and continuation application, and ensure progress reports are received by the sub grantees. CDC activity managers will be responsible for the technical review of the sub-grantees, thus targets met by the sub grantees for the HVAB program will not be assigned to CARE.

ACTIVITY 2: Financial Oversight

CARE is responsible for the financial oversight of the sub grants. This activity entails the review of financial reports submitted by the grantees on quarterly/6 month basis; and on-site assessment of the supporting documents to ensure compliance to contract. These on-site assessments will be conducted on a six month basis. CARE will also ensure progress reports are received from the sub grantees and approved by the activity managers of CDC South Africa on a quarterly/6 month basis prior to the disbursement of continuation funding.

CARE is contributing to the 2-7-10 PEPFAR goals through support to indigenous and international FBOs and NGOs providing AB and Youth focused services to communities in all nine provinces.

Activity ID: 3835.08

Activity System ID: 13384

Program Area: Abstinence and Be Faithful Programs

Program Area Code: 02

Planned Funds: $600,000

Activity Narrative: SUMMARY:

Harvard School of Public Health (HSPH) contributes to PEPFAR prevention (AB and Other Prevention), orphans and vulnerable children (OVC), and system/capacity building goals by providing training, technical assistance, and materials development to government, non-governmental organizations (NGO), faith-based organizations (FBO), corporate, and other organizations using peer education strategies through the Center for the Support of Peer Education (CSPE). CSPE is the first academic center devoted to development and continuing improvement of a sustainable national inter-sectoral peer education system. The emphasis area will be gender, local organization capacity, development and training. The target population will be children, youth, adults, HIV-affected families, teachers and religious leaders.

BACKGROUND:

This project is an expansion and institutionalization of peer education. Rutanang peer education is consistently defined and implemented as including, among other characteristics, multiple-dose small-group structured and facilitated discussions; informal influence; recognition and referral of those with further needs (e.g., VCT, treatment, OVC); and advocacy.

ACTIVITIES AND EXPECTED RESULTS:

CSPE provides PEPFAR and non-PEPFAR partners with training and ongoing technical assistance and assists with the development and adaptation of peer education materials and tools specifically focused on the AB prevention in multiple settings. The Center will prepare and coordinate trainers (with accreditation process initiated) from a variety of sectors and geographic areas. Partners will use evolving standardized monitoring and evaluation tools to collect and share comparable data on program activities and outcomes. All CSPE peer education AB activities and materials explicitly and intensively address the following areas of interest: male norms and behaviors, sexual violence and coercion, stigma reduction, risk behaviors like alcohol and substance abuse, across generational sex, multiple concurrent partnerships and maintaining infected and affected children in school. Peer education focuses on Abstinence and Be Faithful prevention messages for adolescents and adults. Prevention messaging will focus on abstinence for the youth aged 10 -14, delaying sexual debut and secondary abstinence for youth older than 14 years and reduction in multiple and concurrent partners for youth at risk and those sexually active. Peer education having primary AB prevention goals is also a means for early identification and referral to services of vulnerable children and youth, and HSPH is pursuing strategies that enhance peer education as an advocacy tool to make environments safer. Each of the foregoing content themes is explicitly addressed in the design of peer education support systems, training of peer educators, and the content peer educators are trained to deliver. AB activities are conducted through partners.

ACTIVITY 1: KwaZulu-Natal Department of Education

CSPE will train and support regional and district-level trainers and administrators in three of six districts to provide supervision and oversight for high school-based peer education. More than 50 personnel from NGOs, CBOs and FBOs serving KwaZulu-Natal will be trained and equipped to organize and supervise peer education programs in 120 KwaZulu-Natal schools, working with teams of 15 peer educators per school.

ACTIVITY 2: Catholic Institute of Education (CIE)

Three Catholic Institute of Education schools in KwaZulu-Natal will be assisted to develop integrated models including primary prevention, services for OVC, workplace peer education for educators, and use of school-trained peer educators in community settings. Integrated work in KwaZulu-Natal will promote an intersectoral advocacy process involving policymakers and leaders from government departments and public and private sector stakeholders. CSPE will support the expansion of peer education within the national CIE network to an additional five schools in FY 2008. Maintenance of the current intervention in six schools is a continued activity.

ACTIVITY 3: Eastern Cape Department of Education

Schools are receiving Rutanang-based peer education through Eastern Cape Department of Health (ECDOE) tenders with Youth for Christ (YFC). This initiative predated YFC funding by Department of Health/PEPFAR, uses ECDOE conditional grant funds, and specified the use of Rutanang in the tender. CSPE maintains an ongoing consultative (at least two meetings/year) and monitoring and evaluation training relationship with YFC.

ACTIVITY 4: Western Cape Education Department (WCED)

CSPE will support the implementation of peer education to a total of 100 high schools reaching 6,600 learners. A range of service providers working under the DOE umbrella receive at least two consultations per year with CSPE staff, and additional trainings and consultations, including one for principals, are planned.

ACTIVITY 5: Free State Education Department (FSED)

Strengthening the peer education called 'Radically Different Species' (RADS), the FSED adaptation of Rutanang, CSPE will promote the integration of peer education into the scheduled curriculum, reaching approximately 40 high schools and 2,000 learners. FY 2008 funding will ensure strengthen of monitoring and evaluation ,for Department of Education provincial and district officials.

ACTIVITY 6: Mpumalanga Department of Education

In 2005, the Mpumalanga Department of Education (MPDOE) began using the RADS adaptation, and HSPH training and technical assistance, to develop a province-wide peer education strategy. CSPE will provide training and technical assistance to 30 MPDOE supervisory and M&E personnel, supporting rigorous peer education programs in 30 schools reaching 1500 learners through training 6 PEs per school.

Activity Narrative:

ACTIVITY 7: Anglican Church of the Province of Southern Africa (ACSA)

CSPE is working with the Anglican Church of the Province of Southern Africa to tailor T&TA and materials for AB activities in churches, religious schools, and FBO community outreach projects. Five diocese and 25 parishes with 5 coordinators; 50 supervisors and 150 peer educators reaching 50 youth per parish.

ACTIVITY 8: Faith-based Organizations

CSPE is also developing memoranda of understanding with three FBOs that provide school-based peer education under PEPFAR funding to the Department of Health: Youth for Christ, with whom HSPH has a long and productive relationship in the EC, the Muslim AIDS Program, and Scripture Union. HSPH will also provide consultation to other large NGOS working in various parts of the country, including Hope Worldwide.

ACTIVITY 9: Parent support

CSPE has identified the need to help and support parents to prevent high-risk behavior in their children. Working through existing partnerships with organizations and structures capable of reaching parents (schools and faith-based organizations); CSPE will develop, disseminate, and train on the use of parenting workshop materials designed for low-literacy parents. In FY 2007 HSPH designed, piloted, evaluated, and refined this package. In FY 2008 HSPH will begin a gradual, controlled rollout of this package to selected partners.

ACTIVITY 10: CPSE Expansion

CSPE will divide its efforts between responding to specific partners and carrying proactive strategies to improve peer education as a systems approach in a variety of settings and partners. CSPE will expand and embark on a program to provide materials and advanced and targeted training to various audiences and settings. Direct invitations to current partners make it easier for government employees to secure support and budget to attend. CSPE will offer workshops at the University of the Witwatersrand and at provincial sites. Training courses will be designed towards SAQA accreditation and contribute to improved rigor and quality. This activity addresses both capacity building and systems strengthening goals. Training focus areas include: (a) advanced peer educator training for a graduated system: supervisors and advocates; (b) advanced communication skills for us in natural group encounters; (c) peer education for HIV and AIDS in sport and recreation settings; and (d) peer educators as lay counselors: potential and limits.

In addition to contributing to PEPFAR annual and cumulative targets, long-term results of the HSPH project will be the establishment of a sustainable integrated system supporting rigorous, measurable peer education that increases the amount and quality of social interactions and skills acquisition concerning norms, traditions, and behaviors that will help reduce the transmission of HIV.

Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	3804.08	**Planned Funds:**	$376,000

Activity System ID: 14270

Activity Narrative: SUMMARY:

Prevention efforts are key to reducing sexual transmission of HIV. In South Africa, the Population Council (PC) has implemented several prevention programs targeting young people, learners, as well as men and couples to delay sexual debut, promote faithfulness and mutual monogamy, and to reduce risk behaviors. With PEPFAR FY 2008 funds, PC intends to strengthen and expand these activities. The proposed activities are in response to requests from various government departments (provincial and national), and will draw upon exiting partnerships with South African institutions and organizations such as the Departments of Health and Education and the South African Council of Churches.

BACKGROUND:

Over the past few years, the PC has developed an expertise in developing strategies and interventions that more specifically focus on the role of men in HIV prevention. The first activity has been to work with the Department of Education, South African Council of Churches and local FBO piloting interventions on AB in primary schools and mutual monogamy in churches in Mpumalanga Province and the Eastern Cape Province, respectively. These community interventions have reached couples, church members, youths, teachers, learners, parents/guardians and other stakeholders. However, reaching an adequate number of men through churches is a major challenge because fewer men than women participate in church activities. This year's activities will continue to increase male involvement through specific strategies such as strengthening couples interventions and educating learners. The emphasis area include: human capacity development public health evaluations / targeted evaluations. Interventions will target program managers, program implementers, NGOs and other stakeholders.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: AB Life Skills

AB Life Skills: Adapting a comprehensive school-based AB Life Skills Curriculum for 8th and 9th grade learners. The AB Life Skills curriculum, Dare to be Different (D2BD) is a Horizons developed comprehensive ABC prevention curriculum specifically designed for South African schools. D2BD is unique to the life skills curricula currently being implemented in South African schools as it is an outcomes-based curriculum that utilizes a learner-centered approach that promotes a balanced ABC prevention strategy by emphasizing abstinence (A) and faithfulness (B) and building upon the existing condom knowledge of in school learners. D2BD has been designed to meet all the learning outcomes and assessment standards set forth by the South African DOE and the National Curriculum Statement for the national Life Orientation/life skills program in schools. D2BD promotes a balanced ABC strategy through a comprehensive curriculum that addresses/promotes goal setting, character building, messages and activities that promote the advantages of abstinence and the consequences of sexual engagements, activities around risk assessment, and skills building, including: decision making, critical thinking, problem solving, resisting peer pressure and communication skills. D2BD features two additional components: (1) Hometalk: homework activities fostering parent/child communication, and (2) Peer Support: supplemental activities to be implemented by trained learners. The current Life Orientation curricula being implemented in South African schools do not address any of the above mentioned messaging or skills building and this is what makes the D2BD curriculum unique.

D2BD has been piloted in nine primary schools in Mpumalanga District among 1,562 learners and 25 teachers. Data from the pilot suggests that the curriculum differs from what is currently being implemented, provides more comprehensive information on HIV prevention, encourages parent-child communication around HIV prevention and pregnancy and is well received by learners and teachers.

In FY 2008, Population Council will build on the findings of the pilot and implementation of the curriculum in 6th and 7th grades in 2006 and 2007 and adapt the AB life skills curriculum D2BD for use in 8th and 9th grade (13-14 year old learners) classrooms in South African schools in Mpumalanga Province. The D2BD curriculum that has been developed for the 6th and 7th grades, and as the Life Orientation learning outcomes and assessment standards vary by grade, D2BD will need to be adapted to reflect the requirements for the 8th and 9th grade DOE Life Orientation Program.

Population Council will monitor and evaluate the implementation of the adapted curriculum in the 8th and 9th grade classrooms. Some formative research, and a pre-test and pilot will need to be conducted to be sure that the material is age appropriate, that it meets the DOE Learning Outcomes and Assessment Standards and that teacher's are comfortable with the curriculum. For this evaluation Population Council is interested in following the same cohort of students who participated in the program in 2007. As this study will be a cohort study Population Council will also need to continue monitoring and evaluating the implementation of the AB life skills curriculum in the 7th grade classrooms. The 2008 cohort study will follow the 1,562 learners who received the AB curriculum as part of their schools Life Orientation Program in the 6th and 7th grades in 2007. The cohort study evaluation will focus on sexual behavior outcomes but will also examine knowledge and attitudinal outcomes around abstinence and faithfulness.

ACTIVITY 2: Strengthening FBO Prevention Activities

Kindly note that the program area for the FBO Mutual Monogamy Study has been changed to Counseling and Testing. For FY 2008, this program focuses on promoting Couple's HIV Testing and Counseling through faith-based organizations

The program will continue to focus on couples in churches with the goal of mutual monogamy among these couples. Couples will continue to receive messages and skills to enable them to establish and/or maintain mutual monogamy in their partnerships. Indeed, mutual monogamy messages are still important for this population as baseline data collected April 2007 among church members in Butterworth and Alice indicated that approximately one-third of church-goers in stable relationships suspected their primary partner to be having sex with someone else, and 17 percent of those in stable relationships indicated they had sex with someone else outside of their primary relationship. Given the potential for exposure to HIV through non-monogamous relationships, HIV testing among couples becomes crucial, particularly in light of the high level of HIV serodiscordance among couples that have been reported in Sub-Saharan Africa.

Activity Narrative:

An integral part of the FBO program on mutual monogamy has been the promotion of HIV counseling and testing, particularly as a couple, so that they can know their HIV status and plan accordingly as a couple. In the current program, individuals and couples have been referred for HIV counseling and testing, however, the quality of the service of couples counseling and testing is likely to be poor. Therefore, by adding on the couple counseling and testing component to this program, the program becomes more comprehensive.

This activity contributes to the PEPFAR goal of averting seven million infections.

Activity ID:	8238.08	**Planned Funds:**	$300,000
Activity System ID:	14026		

Activity Narrative: SUMMARY:

Mpilonhle is a new South African community-based organization registered in 2007 with the South African Directorate for Non Profit Organisations (NPOs). It is dedicated to improving the health and well-being of adolescents in high schools in Umkhanyakude District Municipality, KwaZulu-Natal (KZN) through its "Mpilonhle Mobile Health and Education Project". Mpilonhle will become operational in late 2007 with a single mobile unit funded with support from Oprah's Angel Network, and expand with two further mobile units funded by PEPFAR. Mpilonhle expects to recruit and hire 40 staff members who will be based at Mpilonhle offices in Mtubatuba, KZN.

Mpilonhle's Abstinence and Be Faithful (AB) prevention activities include school-based provision of (1) health screening, (2) health education, and (3) computer-assisted learning, delivered through mobile clinic and computer laboratory facilities to 12 secondary schools in the rural KwaZulu-Natal province. Emphasis areas are gender, human capacity development, and education wraparound programs. Targeted populations are adolescent males and females aged 10-24 and teachers.

BACKGROUND:

This is a new PEFPAR funded activity to be implemented under the FHI Umbrella Grants Mechanism (UGM). Mpilonhle has the broad support from district and provincial South African Government (SAG) leadership. AB prevention activities will be implemented in Umkhanyakude District Municipality, the poorest and most rural district in KwaZulu-Natal that has extremely high HIV prevalence rates. Services will be delivered using mobile units traveling to rural secondary schools. Students in these schools suffer from physical remoteness, scarcity of health services and generally inadequate resources. Partners include the Department of Education (DOE), the South African Democratic Teachers' Union (SADTU), District Health Services, district and municipal leadership, including the Traditional Authorities. The local Department of Education officials, school principals, district and municipal mayors, teachers and students have expressed the acceptability of school-based voluntary counseling and testing (VCT).

ACTIVITIES AND EXPECTED RESULTS:

The AB prevention activities will be provided through mobile facilities beginning in January 2008. There will be a cost sharing of resources through the Oprah Winfrey Angels funding. Each mobile health unit will have four counseling rooms, a nurse room, and two group education areas - one for HIV and health education, and one for computer training. Each mobile unit will be staffed by a primary health care nurse, four health counselors, a health educator, and a computer educator. Each unit will serve four participating secondary schools, staying at each school for one week per month during the eight-month school year. The project will have three mobile facilities, allowing it to serve 12 secondary schools in total. Each participating secondary school has an average of 800 students. Six of the 12 schools have been initially selected by identifying principals who expressed interest in participation. With greater knowledge of the proposed project there has been a greater expression of interest and the remaining six schools will be determined through deliberations with the Mayors of Umkhanyakude District Municipality, Mtubatuba Municipality, and Hlabisa Municipality, and with local officers of the Department of Education and the Traditional Authority.

Mpilonhle will conduct three main activities in the AB Program Area, as described below.

ACTIVITY 1: School-Based Health Screening

The health counselor will provide students with an annual individualized health screening that is comprehensive, integrated, and appropriate; however the emphasis is on HIV prevention and promotion of risk perception. It includes voluntary counseling and testing (VCT) and individualized AB counseling. Through this activity, young people will be screened for tuberculosis (TB), sexually transmitted infections (STIs) and other common health problems. Those who are HIV-infected will be referred for CD4 count and further management at the nearest appropriate health facilities. The premise behind the health screening is to ensure that young persons are reached before they begin having sex. The main messages will focus on abstinence, delay of sexual debut for young people (10 -14years). For older youth (15 -19 years) who are sexually active they will be encouraged to revert to secondary abstinence. For those most at risk sexually active (20 -24 years) information on correct and consistent use of condoms will be given and encouraged to limit number of sexual partners (i.e. be faithful). VCT will be an entry point to prevention programs, especially for sexually active students, including in-school OVC.

ACTIVITY 2: School-Based Health Education

The health educator will provide students with four 90-minute small-group HIV, general health and life skills education sessions per year that will discuss the basic facts about: HIV and STIs; VCT; TB; anti-retroviral therapy (ART); prevention of mother-to-child transmission of HIV (PMTCT); a balanced Abstinence-Be Faithful-Condoms (ABC) approach to HIV prevention; reducing stigma and discrimination against people living with HIV and AIDS (PLHIV); promoting healthy lifestyles including the avoidance of substance abuse and the promotion of exercise and good nutrition; and promoting mutual respect between men and women. An age-appropriate curriculum on these topics has been developed by the Educational Development Center (EDC) and the South African Democratic Teacher's Union (SADTU). Existing material developed by the EDC and SADTU, and the World Health Organization (WHO), the summarized WHO publication "Teachers' Exercise Book for HIV Prevention", will be used because it conforms to the SA DOE's Life Skills curriculum. This curriculum will also be submitted to the SA DOE for approval, and for certification of conformity with the Life Skills curriculum. The curriculum will also be sent to UNICEF for their inputs. This curriculum emphasizes the traditional three-part public health theory of improving Knowledge, Attitudes and Practice (KAP) skill-building methods in topics such as risk reduction, decision-making, and social responsibility, as a way of preventing HIV infection, providing support to those infected and affected by HIV, fighting stigma and discrimination, and dealing effectively with the challenges of everyday life. The skill-based HIV education will provide focused messages about the benefits of delaying sexual debut and other safe sexual behaviors. Activities will aim to develop students' self-esteem to build their resilience, assist them to make informed choices and develop communication skills.

ACTIVITY 3: School-Based Computer-Assisted Learning

Activity Narrative:

The computer educator will provide students in participating schools with four 90-minute small-group computer education sessions per year. This training will focus on how to use computers, basic software, the internet; and computer-assisted learning for improved school performance, HIV prevention, and general health promotion. The computer-based health education lessons are packaged to address the life skills needs of youth and are consistent with SAG guidelines. The AB messages are internationally recognized, appropriately researched messages. This activity is intended to improve student learning, raise number of pupils who graduate (graduation rates), and augment employability. These outcomes can in turn increase women's socio-economic status, and reduces their vulnerability to coercive, cross-generational, and transactional sex.

Sustainability will be achieved through (1) political commitment from district and municipal governments, and the local Department of Education; (2) the relatively low-tech and easily replicable nature of many core program features; (3) minimal dependence on scarce health professional such as doctors and nurses; (4) the ability of rugged mobile facilities to reduce the need for additional investments in fixed physical infrastructure; (5) the possibility of adapting the VCT service delivery model to workplaces as well as schools; (6) the multi-dimensionality of program activities, which includes HIV and AIDS, general health, and education related activities, and which broadens the scope of donors interested in funding continuation and scale-up of activities.

Building human capacity in remote rural areas will occur by maximizing the capacities and skills of relatively abundant lay health workers to enable them to perform critical yet scarce services such as VCT, health screening and personalized risk assessment, and health education. This will help shift the burden of these activities away from relatively scarce professional health workers such as nurses and doctors. The organization will build the technical expertise and capacities of lay health workers through rigorous training and regular refresher courses, and through the technological support provided by the Information Technology components of the program.

This activity addresses gender issues through (1) the provision of AB education to large numbers of adolescent males and females encouraging males to respect females, abandon gender stereotypes, and by discouraging multiple sex partners; (2) computer education which promotes female educational attainment, self-confidence and self-reliance, and employability, which in turn reduce vulnerability to HIV, in particular coercive, cross-generational and transactional sex; and (3) health education that promotes safer behavior and gender-sensitive attitudes among men and yield benefits to women when making informed choices with regard to their sexual health.

These activities will contribute to 2-7-10 PEPFAR goals of preventing seven million new HIV infections.

Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	3024.08	**Planned Funds:**	$400,000
Activity System ID:	13993		

Activity Narrative: SUMMARY:

Living Hope (LH) provides a comprehensive HIV and AIDS awareness and prevention education program with an emphasis on abstinence and fidelity in schools, churches, workplaces, and community centers. The program is values-based and targets vulnerable and impoverished groups residing in the Western Cape peninsula, including migrants from the Eastern Cape into the Ocean View, Masiphumelele, Capricorn and Red Hill areas of the Western Cape. The program's emphasis is gender and human capacity development through life skills education for children and youth on HIV prevention.

BACKGROUND:

LH Community Center is an indigenous South African faith-based organization (FBO) formed in 1999 in direct response to the HIV and AIDS epidemic. LH's response to HIV has grown to include a comprehensive approach to the pandemic including HIV prevention programs for children, youth and adults, a 22-bed Hospice for HIV care, home-based care, and pre- and post-test counseling. The LH network includes five branches in different communities, with partnerships through local churches, local Department of Health (DOH), hospitals, schools, as well as DOH clinics.

The prevention program curriculum utilizes the Scripture Union's "Jika" and "Reach for Life" program and Family Impact's 'Positive Parenting' course. The success of LH's program is due, in part, to the development of partnerships with other community stakeholders and service providers. LH works with over eight primary schools, seven churches, and several private organizations including Homestead, All Nations, OIL, Desmond Tutu Foundation, Vrygrond Development Trust, New World Foundation, and Next Generation. LH's PEPFAR-funded activities are a continuation and expansion of some of the first programs conducted by LH such as after school life skills programs and community interventions held in the clinic in Masiphumelele. FY 2008 funding will be used to expand geographical focus to include new areas in the Western Cape such as Muizenberg, Red Hill, Fish Hoek, Simon's Town, Ocean View and False Bay.

FY 2008 funding will be used to provide life skills education, youth clubs for children and teens, outreach activities to increase risk perception and behavior change for adults, and training and mentorship for local churches. Other community-based organizations (CBOs) will be supported to undertake HIV prevention activities.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

LH's life skills educators are recruited from local communities and attend a life skills workshop with a local CBO called Think Twice as well as Scripture Union. Each life skills educator also attends the AIDS Training, Information and Communication, Basic HIV and AIDS information course. Several other short courses are conducted to sharpen the skills of life skill educators, such that they are able to communicate effectively with children and to be creative in their presentation of the prevention program.

The life skills educators will be educated on the needs of diverse audiences including children, youth and adults. The educators address abstinence for pre-teens and youth as well as delayed sexual debut. The life skills educators will be provided with ongoing follow-up support and supervision from LH's Prevention Coordinator. Regular meetings to evaluate progress and monitor activities will be held.

As LH continues to build relationships with community and religious leaders, it will conduct HIV prevention education at LH facilities and partner churches, workplaces, schools, and community centers with a focus on behavior change. The behavior change communication (BCC) focus on abstinence for youth aged 10-14 before they start sexual activity and AB for youth aged 15–24 to encourage them to adopt secondary abstinence and reduction of number of sexual partners. Adult men will be educated on male norms and values to discourage cross-generational sex and multiple concurrent partnerships. Youth at risk due to their sexual behavior and adults will be provided with full information on correct and consistent condom use and referred to condom service outlets. HIV outreach activities aim to prevent youth at risk and adults from becoming HIV-infected by (1) increasing understanding about the nature of the disease; (2) increasing understanding about how HIV can be prevented through abstinence, or delaying sexual debut, being faithful and partner reduction; (3) increasing personal risk perception about HIV infection; and (4) reducing stigmatization and discrimination against people living with HIV.

LH is aware of the influence of community leaders and encourages community leaders to become advocates for HIV prevention through ongoing outreach activities and training. LH equips community and religious leaders with teaching materials and encourages them to teach others about male norms and behaviors as well as gender roles and equity to discourage discrimination, violence, coercion and abuse against women and girl children. LH provides ongoing support as requested by various community leaders and will be available for further awareness and education in local churches, businesses or community centers upon request.

LH's prevention activities aim to provide comprehensive health-related courses with an emphasis on HIV and AIDS risk perception and behavior change. This activity is designed to increase HIV risk perception and knowledge of HIV and AIDS, with an emphasis on AB as the best means of preventing transmission. Within the Be Faithful messages, there is a strong emphasis on sexual partner reduction, discouragement of cross-generational sex and multiple concurrent sexual partnerships.

ACTIVITY 2: Outreach and Education

FY 2008 funds will be used to provide in-depth education and training in life skills and basic health topics with an emphasis on HIV prevention. The adolescents under 14 years are targeted before they start engaging in sexual behavior through the outreach and education designed to change behaviors and attitudes to prevent HIV. This activity will be conducted through a partnership with local government, in public schools as well as community churches in underprivileged communities such Masiphumelele, Vrygrond Ocean View and Red Hill.

Activity Narrative: The HIV prevention messages will be disseminated in various places where youth congregate. Prevention messages and structured curricula will be delivered through church sermons, public school assemblies in underprivileged communities, youth and after-school kids clubs in these communities, and holiday clubs during school holidays.

LH has implemented a life skills development program for children and youth-based on an abstinence value system. Specific activities will include weekly children's and teen's clubs that incorporate life skills training to encourage healthy life choices, including delaying sexual debut, abstinence until marriage for children before they start to engage in sexual activity and faithfulness once married, and to enable youth to resist sexual pressures. Women and girls will be empowered through these workshops to say no to premarital, extramarital, and unprotected sex.

ACTIVITY 3: Referrals and Linkages

Adults and youth at risk and those who are sexually active will be encouraged to test for HIV and will be provided with referrals for counseling and testing at clinics in Masiphumelele, Red Hill, Ocean View, Fish Hoek, Simon's Town, Muizenberg, Seawinds and False Bay. LH's lay counselors will offer a comprehensive basket of services to people based on their HIV status. These services include South African government ARV treatment programs, clinical services, LH and other home-based care, hospice care and support groups. If an adult or youth know their status to be HIV negative they will likely be more empowered to protect their negative status through AB and partner reduction if already sexually active.

LH has developed a partnership with the City of Cape Town Clinic in Masiphumelele, Red Hill, Ocean View, Fish Hoek, Simon's Town, Muizenberg, Seawinds and at False Bay Hospital where LH's lay counselors conduct pre- and post-test counseling for CT clients with clinic staff conducting the rapid-tests. The client is also offered a comprehensive list of services for follow-up care or support. Full information on correct and consistent condom use will be provided to youth at risk and adults. For individuals who test positive, the program will provide referrals to support groups to encourage positive living and will ensure treatment access.

FY 2008 funds will be used to expand the HIV prevention programs by using social workers to help needy children and their families. The communities where the prevention program is active have high rates of unemployment and drug and alcohol abuse coupled with little or no access to social assistance. LH will seek to fill this social service gap by providing at least one social worker for the prevention program to help link needy families with appropriate government or non-government social services. The social worker will also help in conflict resolution and linking vulnerable or abused children with the appropriate authorities. The prevention program will also network with other area service providers in the area to help coordinate needs with service delivery which will help reduce overlap and redundancy.

Integrating social services into the prevention program will help to strengthen LH's family-centered approach and enable LH to work with all family members and referring them to the basket of services available to them in the community in terms of HIV prevention and care.

Activity ID:	7930.08	**Planned Funds:**	$1,300,000
Activity System ID:	13807		

Activity Narrative: SUMMARY:

The Scripture Union (SU) Life Skills Program implements education and training activities focusing on abstinence and being faithful (AB) HIV prevention for both in- and out-of-school youth. It is values-based, volunteer driven and aims to assist in the development of sexual and life decision-making skills by youth in order to prevent HIV exposure and infection. Community church members are trained to deliver prevention messages to local youth and provide small group discussions around prevention issues. The emphasis will be on gender through discouraging violence, coercion and abuse against women and the girl child as well as respect shown for one another, regardless of gender, and human capacity building. The target populations are children, youth teachers and religious leaders. SU targets youth and children in school aged 10 - 18 years drawn from disadvantaged communities.

BACKGROUND:

SU has worked with youth in South Africa since 1924. The Sakhulutsha, SU's HIV and AIDS Life Skills Program, started in 1992 and is ongoing. The South African National Department of Health (NDOH) and Department of Education have funded SU's program for the past ten years, and since 2005, PEPFAR co – funded SU through a NDOH cooperative agreement. In FY 2007 SU became a prime PEPFAR partner. Using PEPFR funding SU has established youth programs in five South African provinces (Gauteng, Eastern Cape, KwaZulu-Natal, Mpumalanga and Western Cape). In FY 2008, SU will expand geographically to the Northern Cape Province to fill a need in one of South Africa's underserved areas.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Small Groups in School

SU will implement a peer education program to target youth in their formative years and equip them with skills to help them learn more about each other and discuss issues of love, respect and equality. These skills will help youth to make informed decisions about sexual activity and avoid HIV infection. The HIV prevention programs are run with in- and out-of-school youth, and consist of 12 modules presented over 12 weeks. The program uses a small group model, and trained volunteers from the community will run these programs. The ratio of 10:1, the ideal small group model, is maintained.

ACTIVITY 2: Breakaway Workshops

SU believes that societal norms and behavior change must be examined in order to address the challenges of HIV and AIDS in a proper way. SU uses single gender camps and discussions in classrooms (through the participation of school principals) to help young people to view each other as equals and to develop respect for one another, regardless of gender. Life skills training and a holistic learning experience which enhances HIV and AIDS education programs will also be implemented. Topics to be covered will include male norms and behaviors as well as gender roles and equity to discourage discrimination, violence, coercion and abuse against women and the girl child. SU will also run activities at eight camp-sites using the same small group model, but the full course in these programs will be completed over a period of three to five days. Trust is built up between group leaders and participants and this ensures open and effective dialogue. The single sex approach allows SU staff to focus on gender specific issues -- particularly those relating to girls - and topics include abstinence skills and the power to say no. Participants will be encouraged to access voluntary counseling and testing (VCT) sites so that they can know their status and plan for their future.

ACTIVITY 3: Youth Development Programs

SU Youth Development Programs (holiday clubs) are run during school holidays when youth are most likely to be bored, and this may lead to vulnerability and engagement in unsafe sexual behavior. The holiday clubs will be run in community centers and in church and school halls. Life skills activities will be presented to youth to facilitate sustained HIV prevention and to encourage youth to learn their HIV status by getting tested so that they can plan for their future. SU encourages youth to be compassionate and also to volunteer in their communities and be involved in the response to the HIV epidemic. Programs will be run by trained community members who are familiar with local customs and social norms, and so will be ideally placed to gain the trust of the members of the community.

ACTIVITY 4: HIV Prevention Programs

SU will conduct and expand leadership training for community leaders, and in particular, for pastors, so that they can support and lead HIV prevention programs for both in- and out-of-school youth. Volunteers will be trained using an HIV and AIDS education program that has been tested for effectiveness by SU using qualitative methods. Using the 12-module life skills program, volunteers will be equipped to lead small group discussions with youth about AB-based prevention of HIV which includes abstinence for 10-14 year olds, encourage delayed sexual debut and secondary abstinence for those who have started sexual activity and reduction of sexual partners and CT for youth at risk. This project will establish sustained relationships between the community leaders/pastors and the youth because the leaders and volunteers are community-based. Community workers will also focus on empowering and training female leaders to run youth development programs, and development of more female leaders will ensure that the needs of girls within the community are met.

ACTIVITY 5: Course/Camp Combination Intervention

In FY 2008, SU will introduce a new type of activity, namely a course/camp combination. This will allow the benefits of both types of venues to be combined for excellent synergy. SU will be running l 78 course/camps to maximize the impact of prevention messages and reinforce healthy behavior. The course/camp combo is a hybrid of six modules run over six weeks at schools with the balance of the modules run over two days at a camp site. Sustainability is achieved through development of well-trained youth leaders and peer educators. Scripture Union will continue to develop their funding base to expand AB prevention programs to disadvantaged communities in South Africa.

SU will reach a significant number of youth and children with behavior changing messages. The results will

Activity Narrative: contribute towards PEPFAR goal of preventing seven million infections by 2010. These results will also contribute to the South African response to preventing HIV infection among young people especially young girls.

Activity Narrative: SUMMARY:

Humana People to People (Humana) implements a comprehensive, integrated ABC HIV prevention program called Total Control of the Epidemic (TCE).TCE trains community members as Field Officers (FOs) to utilize a person-to-person campaign to reach every single household within target areas with AB messages, with the objective of changing community norms and individual behaviors. The emphasis of the prevention program is gender, human capacity building and a TB wraparound. Target populations are adolescents and adults and teachers.

BACKGROUND:

TCE was launched by Humana in 2000 in Zimbabwe. The program has been implemented in eight countries in Southern Africa reaching a population of five million people. Humana has received PEPFAR since July 2005. By August 2007, Humana had implemented five TCE areas in the Mpumalanga and Limpopo provinces. Humana works in partnership with the South African Government (SAG) and local municipalities. In the first year of implementation, 200 community members were trained as Field Officers (FOs) and prevention services had been provided to about 60% of the targeted community members. During FY 2006, follow-up visits were made to develop individual risk management plans with household members. FOs mobilized whole communities to address stigma and discrimination associated with HIV and AIDS and raised awareness related to HIV preventive behaviors. TCE tracks service provision by gender and has developed strategies to reach men over and above those already reached with AB messages. FOs also promotes gender equity during their home-visits, by empowering both males and females with gender-specific knowledge about protecting themselves and their families. TCE has trained community volunteers called Passionates that are responsible for establishing vegetable gardens, running children and youth clubs, and offering care and support to orphans and people living with HIV (PLHIV). Since FY 2005, the Mopani and Ehlanzeni District Municipalities have been major partners, contributing over $140,000 per year to the program. The program has received several awards, including the 2003 Stars of Africa Award (in partnership with Johnson & Johnson) for best Corporate Social Investment Program in Health and HIV and AIDS in South Africa. TCE also expects to scale up its coverage with funding from Global Fund via the South African National AIDS Council (SANAC) in 2008.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Household-based Person-by-Person Campaign

The TCE program uses a person-to-person campaign over three years to reach every household with information about HIV and AIDS within the targeted areas. Each FO is allocated a field of 2,000 people (approximately 485 households). Households are visited at least three times over a three-year period and receive targeted prevention messages emphasizing age-appropriate abstinence and faithfulness (AB) with the objective of changing community sexual norms and addressing issues of multiple concurrent partnership and cross-generational sex. FOs visit households and engage individuals in discussions about HIV and AIDS and preventive behavior. FOs also provide information about government services such as counseling and testing (CT), prevention of mother-to-child transmission (PMTCT), TB and sexually transmitted infections (STI) services, social grants and home-based care and refer those in need. FOs also refer people with symptoms of AIDS-related conditions directly to public health clinics for CD4 testing, HIV clinical staging, and treatment of opportunistic infections. A tool called Perpendicular Estimate System (PES), has been developed and tailored to measure the impact of the program in the target areas. PES consists of a set of questions and demands to the individual in order to be TCE-compliant, which means being in control of HIV and AIDS in one's life. During the second and third year of the program, community members interact with their TCE FOs on an individual basis to make a PES-plan, which minimizes their risk of being infected and makes them live responsibly and positively if infected. Further, the program has a series of targeted interventions to reach schools, including teachers, youth in after school clubs, and health workers on HIV and AIDS awareness and AB prevention. TCE organizes workshops for local leaders, traditional healers, and community-based organizations, to explain TCE and promote HIV awareness and prevention. In FY 2008, six new TCE areas will be started (including four TCE areas completed in 2007 that will be replaced and an additional two TCE areas) bringing the total number of areas under PEPFAR to 10. These areas are selected with regard to relationships that Humana already has with certain communities, relationships with the health districts involved, the reach of other NGOs in the areas, and the need presented by the communities. Some of the lessons learned in the previous years will be used to strengthen the program including the refinement of PES, improved counseling for behavior change, and the intensification of in-service training of the FOs. The continuation of the counseling and testing (started in FY 2005) and palliative care programs (started in FY 2007) are expected to have an influence on the effectiveness of the AB campaign. The counseling, antiretroviral (ARV) adherence program, and the direct observed therapy (TRIO) under palliative care will support the ARV program of the South African Government (SAG).

ACTIVITY 2: Human Capacity Building:

Using FY 2008 funding FOs will receive training on promoting AB messages through the implementation of door-to-door campaigns and other targeted interventions. FOs will receive ongoing in-training, through weekly meetings. FOs will be trained as lay-counselors in year one and graduate to educators in the subsequent year. The training is based on experiences gathered in the field. TCE makes use of its own material, and educational material developed by other organizations and the SAG. All programming is in line with the SAG national prevention strategy. Passionates are trained in HIV and AIDS and in communication and facilitation skills, such as running youth clubs.

ACTIVITY 3: Linkages and Networking

TCE's activities ensure that individuals receive appropriate care. The establishment of linkages and networking activity was initiated in FY 2006 and will continue in FY 2008. A key strategy of the prevention program is the promotion of counseling and testing (CT). TCE works in partnership with South African organizations like LoveLife, to provide CT services to the sites. All households receive messages on the benefits of CT. Referrals to CT are provided during home visits. TCE also collaborates with other PEPFAR partners and SAG hospitals, to ensure that referrals to treatment, care and support services are made. TCE

Activity Narrative: maintains a strong partnership with the TB sub-directorate in the Ehlanzeni and Mopani districts. FOs are trained to raise awareness about TB in the context of HIV, make referrals to clinics and collect sputum. TCE works with public clinics to ensure that pregnant women have access to antenatal services and PMTCT. TCE also ensures cooperation with SAG including the Department of Social Development to ensure that OVC and PLHIV identified through household visits are able to access social security and with the Department of Education to ensure children and youth access education and receive HIV and AIDS information and education on importance of abstinence and delaying sexual debut for the youth aged 10-14, who have not started with sexual activity; and secondary abstinence and reduction on the number of sexual partners using the be faithful prevention component.

ACTIVITY 4: Monitoring and Evaluation

TCE has developed a range of systems to measure the impact of the program. Before starting in a new area, TCE carries out a baseline survey collecting information about knowledge, attitudes and practices in the area. After implementation, each FO maintains a household register, which keeps basic information about the household and provides a continuous source of data to evaluate the progress of the program. Specific information that is collected includes number of people tested, number of OVC, and pregnant women referred to PMTCT and STI services. The PES tool described under Activity 1 provides data that is used to track community behavior change. This data provides information on individual behavior change in the target area. Throughout the program, the FOs and TCE Management meet on a weekly and monthly basis to evaluate the progress of the program. The meetings monitor progress in achieving targets and deliberate on the challenges faced in the field. Quarterly, TCE management meet with staff at the TCE Regional Headquarters in Zimbabwe to further evaluate the progress of the program and develop activities in order to increase impact in people reached with prevention messages within the community.

These activities will contribute to the 2-7-10 PEPFAR goals of averting seven million new infections by increased knowledge and skills among community members in HIV prevention; reduced stigma; improved gender equity in access to information and services; increased knowledge about services (PMTCT and CT); strengthened linkages between other organizations in the area and government services; increased number of people knowing their HIV status; and increased mobilization and capacity among community members and local leaders to deliver prevention messages and offer care and support.

Planned Funds: $1,455,000

Activity System ID: 13959

Activity Narrative: SUMMARY:

HOPE worldwide South Africa (HWSA) will continue activities in abstinence and being faithful (AB) to support the expansion of a comprehensive HIV prevention program through a skills-based, gender-focused program for young boys and men and the promotion of AB messages for young people within designated communities.

The activity targets children and youth (both in- and out-of-school), adults, parents, teachers, religious and community leaders, mobile populations and non-governmental organizations (NGOs). The emphasis areas for the project are gender addressing male norms and behaviors, reducing violence and coercion and human capacity development. The target populations are adolescents and adults.

BACKGROUND:

The FY 2008 funded activities are part of an ongoing HIV prevention program of HWSA, funded by PEPFAR since 2003. HWSA will continue its programs in Gauteng, KwaZulu-Natal, Western Cape and Eastern Cape provinces to promote and strengthen abstinence and faithfulness prevention behaviors within its community outreach efforts that include communities of faith. With FY 2008 funding, HWSA will expand to new areas, and in particular to peri-urban and rural areas in South Africa, where the HIV prevalence is high. HWSA has reached 300,000 individuals with A and AB messages through 32 faith-based organizations (FBOs) and 73 schools, and other community-based awareness campaigns in 26 clinics and hospitals through support groups. The HWSA prevention program is aligned to the South African Government's (SAG) prevention strategy in its promotion of abstinence, fidelity and the correct and consistent use of condoms (ABC) for sexually active youth at risk and older youth.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: AB Community Outreach

HWSA's AB program follows a standard Peer Educator model of training small groups of change agents, through age-appropriate activities, to impact their immediate and broader communities. The first part of the activity entails the establishment of an abstinence-based program for youth aged 10-14 years who have not initiated sexual activity. The program educates children on the basic facts about HIV prevention and AIDS, addresses stigma and discrimination and how to avoid and report abuse. The second part of the activity will be targeted at the 15-24 year old age group and will establish an abstinence and fidelity-based approach (AB) focusing on HIV prevention messages and AIDS awareness, the importance of abstinence in reducing the transmission of HIV, the importance of delaying sexual activity until marriage, the development of skills for practicing abstinence, and where appropriate secondary abstinence, personal self-esteem, the reduction in the number of sexual partners, the importance of mutual faithfulness in reducing HIV transmission, dangers of alcohol and substance abuse and the importance of HIV counseling and testing. The activity will reach youth through school programs, faith-based organizations, recreational activities, health care services and the workplace. HWSA will expand its services to new areas and focus on improving the quality of the services offered based on lessons learned using PEPFAR funding. Key areas to be addressed include the need to incorporate components on culture and personal leadership into the AB program

The HWSA program will also target out-of-school youth through youth clubs, community-based organizations and sports groups. HWSA will provide full information regarding the correct and consistent use of condoms and refer youth at risk of HIV infection to condom outlets and health facilities where necessary as a way to reduce the risk of HIV infection for those who engage in risky behaviors. This element of the program will be closely linked to HWSA's OP activity.

ACTIVITY 2: Men as Partners (MAP)

HWSA's MAP program is part of the national Men as Partners network initiated by Engender Health. The MAP program creates community commitment and involvement in the reduction of violence against women and children, community interventions that will challenge male norms and behavior about masculinity, early sexual activity, multiple sexual partners and transactional sex for boys and men and will establish new norms. FY 2008 funding will support school-based violence prevention programs, promote abstinence and the development of skills for practicing abstinence and skills training for peer educators to promote HIV counseling and testing. The MAP program will continue to build its public-private partnerships (with Coca Cola, South African Airways and the National Department of Arts and Culture), which provide corporate funding for workplace MAP workshops and awareness activities in the communities adjacent to these companies. The MAP program will be modified to be age-appropriate for school children and older youth reached by the school-based program. MAP project will focus on educating both young and older men to respect and protect the rights of women and girl children. Lessons learned through program implementation indicate the need for as a greater emphasis on gender issues in particular the vulnerability of girls and young women and discourage sexual abuse, violence and coercion of women and girl children.

The activity will target young men aged 15-24 years and their communities. PEPFAR funding will be used to maintain current staff of three coordinators, and eight peer educators.

ACTIVITY 3: Parent Empowerment

HWSA will scale up its Parent Empowerment program with FY 2008 funding. This activity started in FY 2006 and has been progressively scaled up in FY 2007. The need to scale up this activity and to empower and capacitate parents, caregivers and guardians with skills to interact with children and youth about sexuality and to create an enabling environment for AB messages has become increasingly evident over the last program year. The scaling up of this activity will involve more sessions on personal growth; enhance self awareness, personal values, and parenting skills. In addition much of the focus will be placed on creating spaces where both youth and parents/caregivers are able to interact. Camps, child-parent days and joint campaigns of youth Community Action Teams (CATs) and parent CATs will form a key part of this component of the activity. Target audiences for this activity include parents of youth involved in the A activities, members of FBOs and adults from the communities at large. The activity will also be linked to the OVC program with a focus on empowering parents and guardians in vulnerable households and working

Activity Narrative: with granny-headed households. The practice and role-modeling of fidelity or partner reduction that forms a part of the parenting activity will contribute to the number of beneficiaries reached through the indicator for number reached with community outreach HIV prevention promoting AB. This activity will build on work done with FBO networks and school governing bodies in FY 2007.

ACTIVITY 4: Sub-grant to Gateway for AB Prevention for In-school Youth

HWSA's new partnership with Gateway, an NGO working in rural communities of South Africa, will assist in scaling up AB activities in areas where HWSA does not currently operate. As Gateway works predominantly in schools with in-school youth, these activities will focus on including AB peer education, AB MAP activities and the mobilization of Community Action Teams. The program will be expanded to new areas in Limpopo Province (Musina, Duiwelskloof, Makhado, Lephalale, Modimolle, Bela-Bela, Vaalwater), North West (Klerksdorp), Free State (Riebeekstad, Kroonstad, Welkom, Odendaalsrus, Ventersburg), KwaZulu-Natal (Utrecht, Newcastle), Mpumalanga (Volksrust) and Northern Cape (Kimberly and Douglas). These provinces have a high HIV prevalence according to the Human Sciences Research Council (HSRC) research study. This strategic partnership will enable HWSA to expand its capacity to work in additional areas through providing human resources and utilizing Gateway's established links and track record in the new communities. HWSA will train Gateway staff on its Peer Education, AB and MAP curricula and provide mentoring and coaching on a regular basis. This partnership will build on Gateway's success for 2006 in which 338,464 individuals were reached. Gateway's work with youth has been funded by SAG grants and other corporate sponsors.

These HWSA activities will contribute to the PEPFAR objectives of averting 7 million infections, and support the USG PEPFAR Five-Year Strategy for South Africa by improving AB HIV prevention behaviors among youth and adults.

Activity ID: 2919.08

Planned Funds: $690,000

Activity System ID: 13775

Activity Narrative: SUMMARY:

EngenderHealth's Men as Partners (MAP) Program works to reduce the spread and impact of HIV and gender-based violence by challenging unhealthy gender-related beliefs and attitudes, such as equating masculinity with dominance over women, pursuing multiple sexual partners, and participating in other risk behaviors. The MAP program utilizes a range of strategies with focus on human and organizational capacity building through skills-building workshops, community mobilization, health service provider training, media advocacy, and public policy advocacy. The target population includes men and boys, in- and out-of-school youth, university students, adults, people living with HIV, caregivers, immigrants/migrants, community and religious leaders, program managers, public healthcare providers, CBOs, FBOs and NGOs.

BACKGROUND:

Since 1998, EngenderHealth received USG funding to support CBOs, FBOs and the South African government to implement the MAP program. EngenderHealth conducts skills-building workshops on gender norm transformation. Through these workshops, MAP develops "transformation agents" (peer educators) who then spread AB messages and skills to others in their communities. These workshops aim at motivating men to know their HIV status and take action if they test positive. MAP encourages men to participate in their communities and to challenge other men who are practicing high-risk behaviors and gender-based violence. MAP recognizes that this transformation will assist men and women in achieving low-risk behaviors such as sexual abstinence, being faithful to one partner, and treating women as equals. MAP works with individual men and boys, their partners, as well as community structures to influence culture and transform lives. Working through various community-based partners, MAP also mobilizes communities to take action via community education events and the formation of "community action teams" (CATs). EngenderHealth MAP also produces information, education and communication (IEC) materials that motivate men and boys to confront harmful gender norms. Currently, EngenderHealth is running the "I am a Partner campaign" focusing on defining what men can do to take action and be more gender equitable to reduce the spread and impact of HIV (www.iamapartner.org). Finally, EngenderHealth staff coordinates provincial MAP Networks, creating a space for gender activists to share best practices and formulating a platform to participate in the development and adoption of the HIV and AIDS and STI Strategic Plan for South Africa, 2007-2011. In response to demand, EngenderHealth developed additional programming linked to palliative care, and voluntary counseling and testing.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Tertiary Institution Programs

EngenderHealth will continue to build the capacity of tertiary institution's peer education programs to integrate AB messages into gender norm transformation programming on HIV. EngenderHealth will work with five institutions in the Western Cape (UCT, CPUT/Bellville, CPUT/Cape Town, UWC, and Stellenbosch University) and with least three institutions outside of the Western Cape. At least five staff and student "transformation agents" from each of the institutions will be trained on a quarterly basis. The communications skills of the "transformation agents" will be developed so that they are able to reach students on campus and learners in local communities with AB messages. Issues such as gender norms, multiple partnerships, cross-generational sex, communication issues, and alcohol abuse, as well as consistent and correct use of condoms and referral to condom service sites will be addressed. EngenderHealth staff will provide ongoing on-site and telephonic assistance on a range of management and content issues. EngenderHealth recognizes the power of working with such institutions and the sustainable benefits of building such capacity.

ACTIVITY 2: School/Community Action for Gender Equality (S-CAGE) based Program

EngenderHealth will continue to capacitate at least four NGOs working in school-based settings by focusing on the integration of AB messages into MAP programming on gender norm transformation and HIV. This programming will take place in communities where the drivers of the epidemic have been identified, i.e. in Gauteng (Diepsloot, Vaal, Hillbrow/Yeoville/Berea and Soweto), North West, and KwaZulu-Natal (KZN). EngenderHealth will work with another PEPFAR partner, Mpilonhle, in KZN –to build a gender component to their pre-existing work in schools and communities. EngenderHealth will work directly with school personnel and student leaders to develop their capacity to link AB-related MAP messaging and programming into the school curriculum via life orientation programs. Similar trainings will be conducted each quarter and course content will be tailored to meet the needs of each community-based partner. Typically, 20 to 30 participants will be trained over a period of four to five days. In addition, capacity-building assistance, in the the form of individual on-site and telephonic sessions will be offered to all partners. EngenderHealth will solicit funds from other development partners, and private sector entities to assist with this program. Potential and existing public-private partnerships include those with the Ford Foundation (secured for North West province); De Beers Mining Company (secured for KZN); and Anglo American Mining Company (pending for KZN).

ACTIVITY 3: Community Capacity-building Program

EngenderHealth will continue building the capacity of at least four NGOs, CBOs, FBOs, and private sector partners on AB messages and gender norms. EngenderHealth will partner with groups based in strategic communities within Gauteng (Diepsloot, Vaal, Hillbrow, Yeoville, Berea, and Soweto), North West, KwaZulu -Natal, and Western Cape provinces. In addition, private sector organizations will be approached for cost sharing options. Trainings will be conducted each quarter and course content will be tailored to meet the needs of each community-based partner. Typically, 20 to 30 participants will be trained over a period of four to five days. EngenderHealth will be available to provide individual support to partners via on-site and telephonic sessions.

ACTIVITY 4: Government/Other Key Stakeholder Program

EngenderHealth will continue building sustainable partnerships with national and provincial government agencies. In FY 2008, these institutions may include South African Police Services (SAPS), Department of Correctional Services, Department of Social Development and Department of Health. EngenderHealth plans

Activity Narrative: to work with the SAPS, building capacity of individual precincts youth desks to implement MAP programming in their communities, maintaining community action teams (CATs) to mobilize men (including policemen). Cost sharing options will be explored to gain financial support from government institutions. Training and support, as described above, will be offered on a quarterly basis to partners.

ACTIVITY 5: Clinical/Community Outreach Program

EngenderHealth will continue to reach out to men in various settings, including street outreach and in clinical settings. Typically, this program will reach over 250 men (and their partners) per month via formal and informal talks at clinics and on the streets/parks nearby. These talks will focus on helping men recognize the importance of having only one partner. EngenderHealth will target services in Gauteng, specifically in Diepsloot, Vaal, Hillbrow, Yeoville, Berea, and Soweto. In the Western Cape, EngenderHealth will work with its partners at tertiary institutions to conduct talks in clinics. Programs will also reach out to youth in surrounding communities. This will focus on abstinence messaging for learners aged 10-14 and on encouraging secondary abstinence for older youth aged 15-24 years old.

ACTIVITY 6: MAP Network:

EngenderHealth will continue to support the MAP Network on information exchange and advocacy. EngenderHealth will host monthly meetings bringing together prime partners (typically about 20-30 members), to exchange experiences and to enhance programming. On a quarterly basis, additional key stakeholders representing other NGOs, CBOs, government and general activists will gather to discuss issues, exchange information and develop an advocacy platform on public policies relating to gender-norm transformation, HIV and AB messages. EngenderHealth's advocacy program will then take these issues forward at the national and local levels.

ACTIVITY 7: National Campaigns:

EngenderHealth will continue to promote AB messages through gender norm transformation via national campaigns. Priorities will be placed on implementing the annual National MAP Week (held in March/April), which motivate EngenderHealth partners to host community events which raise the profile of MAP's AB messages. Working through national campaigns, such as annual MAP Week, EngenderHealth engages private sector, media and government partners to increase the effectiveness of MAP. Activities may include community marches and rallies, sports days, men's meetings, intergenerational dialogues to address cross-generational sexual relationships, school debates, and mass media appearances. In addition, EngenderHealth MAP staff will collaborate with other NGOs and government institutions to assist in organizing and promoting additional campaigns, including 16 Days of Activism on Violence against Women, Youth Month, and Men's Health Month. BCC materials (based on EngenderHealth's “I am a Partner Campaign”) will be used to motivate men to rethink gender equality and challenge other men to do so as well. Finally, throughout the year, EngenderHealth will collaborate with various media partners to spread MAP-AB messages via mass media channels.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 3067.08

Planned Funds: $100,000

Activity System ID: 13852

Activity Narrative: SUMMARY:

The University of KwaZulu-Natal (UKZN) Nelson Mandela School of Medicine (NMSM) uses PEPFAR funds to work closely with the KwaZulu-Natal (KZN) and Ethekwini Traditional Health Practitioner Councils, to tease-out, refine and outline culturally appropriate and effective behavior change messages focused on preventing the spread of HIV through abstinence and being faithful in relationships. The emphasis areas local and human capacity building. The target population is the general population which includes children, youth and adults.

BACKGROUND:

UKZN has an ongoing collaboration with associations of traditional health practitioners (THPs) in urban, peri -urban and rural areas of Ethekwini District, KZN. THPs are influential and are a largely untapped resource in HIV prevention and mitigation on the community level. THPs ascribe to and uphold traditional African cultural values, including conservative attitudes toward sexual practices and abstinence that make them natural partners in this effort. These values are a set of social and community norms that support delaying sex until marriage and that denounce coerced sexual activity among married and unmarried individuals and promote mutual monogamy. This THP cultural perspective has not been reinforced, nor has it been included in public abstinence and being faithful (AB) campaigns in KZN. THP is often the first counselor sought for married couples who wish to discuss issues related to marital relationships and couples counseling on HIV and AIDS. Given the position the THPs hold in their social networks, working with the THPs holds great promise for enhancing the uptake of a culturally appropriate version of the AB message. These activities began in August 2005 with the arrival of FY 2005 PEPFAR funding. NMSM is implementing the project in collaboration with the KZN and Ethekwini Traditional Health Practitioner Councils, with the eThekwini Health Unit, and the eThekwini District Health Office of the KZN Department of Health.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Promotion of AB Messages

It is widely acknowledged among health professionals in KZN that the Abstinence, Be Faithful and correct and consistent use of Condoms (ABC) messages are not having enough effect in this local cultural context. This project trains and mobilizes THPs in KZN so that they will be effective promoters of HIV prevention messages and strategies, including AB-focused behavior change messages. NMSM is adapting Abstinence/Be Faithful messages to the cultural and healing contexts in KZN to inform and communicate effective behavior change messages. NMSM is also developing prevention messages together with the THPs and incorporating these messages into training workshops on an ongoing basis. NNSM is also developing new prevention message formats for posters, pamphlets, instructional medical comic books, and medical animations for training and for distribution to the THPs to use with their patients. These messages are developed in Zulu and English, though they will be distributed primarily in Zulu. This project has also been developing dramatic presentations that are used in the training workshops to deliver prevention messages. These have been designed by the senior THPs on the project team and are embedded in Zulu cultural practice. The prevention messages are developed jointly with the THP team members so that they are culturally embedded and effective. Discussions with senior traditional healers on the PEPFAR-funded team indicate they have a variety of interesting, potentially effective suggestions for ways to deliver modified and improved prevention messages to the community that go beyond the confines of the traditional healer practice sites. Using FY 2008 funding the following activities will take place:

(1) NMSM will call ongoing assessment workshops (usually one day) with the THPs to discuss the program and assess the effectiveness of the prevention messages and materials for use in their practice.

(2) NMSM will continually assess the level of absorption and understanding (among the THPs) of the basic scientific information underlying the rationale of the need for prevention activities, particularly in the value of abstinence in preventing infection.

(3) The School will continually investigate and assess the value of partner reduction and faithfulness to one partner, and the effectiveness of faithfulness if the other partner is not also being faithful (particularly relevant in marriage situations).

(4) NMSM will facilitate meeting with indunas and amakhosi: these are headman and chiefs of the tribal areas. Traditional healers meet with these leaders who command some authority in their communities, and work together to speak to their constituents about prevention. Target communities include townships and urban areas.

(5) The project will engaging parents. Modern mothers have often lost the knowledge of the traditional ways of protecting their daughters and helping them to be abstinent. Traditional healers trained during this program visit women's clubs and work with mothers to reintroduce these practices.

Formally integrating traditional healers into the public healthcare system is a stated objective of the National Department of Health and the prevention objectives in the South African Strategic Plan for HIV and AIDS. By expanding access to culturally and scientifically appropriate prevention messages, the Nelson Mandela School of Medicine will directly contribute to the PEPFAR goal of preventing seven million new infections. These activities also support the prevention objectives outlined in the USG Five-Year Strategy for South Africa.

Budget Code: HVAB

Program Area Code: 02

Activity ID: 8261.08

Planned Funds: $200,000

Activity System ID: 13846

Activity Narrative: SUMMARY:

Ubuntu Education Fund's (Ubuntu) health educators provide life skills education to vulnerable children and adolescents in the townships of Port Elizabeth, a city in the Eastern Cape Province of South Africa. Ubuntu's life skills classes focus on the development of knowledge, attitudes, values and skills needed to make and act on the most appropriate and positive health-related decisions. The major emphasis areas for this activity are addressing male norms and behaviors, increasing gender equity in HIV and AIDS programs. Specific target populations include adolescents (10-14) and (15-24).

BACKGROUND:

For the past six years, Ubuntu has provided life skills classes in over 20 primary and high schools in the Ibhayi townships of Port Elizabeth. The vast majority of the children in these schools are from high-poverty areas including informal settlements. There are high rates of sexual abuse and rape in the target area. Ubuntu has established partners with the Department of Education (DOE) and operates under Memoranda of Agreement with each school partner. Ubuntu works in close coordination with the Life Orientation Coordinator at each school and the Curriculum Development Specialist at the Nelson Mandela Bay Metropolitan Municipality's Department of Education to ensure that the life skills curriculum meets the learning and assessment objectives of the national curriculum for life orientation.

Ubuntu became a PEPFAR partner in FY 2007 and has only recently received funds.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Life Skills Education

Health educators will provide life skills education classes in primary and secondary schools reaching 8,000 children in high-poverty, high-density township communities in Port Elizabeth. Learners in grades four through eleven receive lessons from a comprehensive life skills curriculum once every five to ten days (two lessons every five days depending on school size). Discussions and role-playing promote crucial skill development, such as decision-making, withstanding peer pressure, interpersonal communication, value clarification, negotiation, goal-setting, self-assertion and accessing health services. Age-appropriate lessons focus on the development of positive attitudes related to gender equity and relationships, delaying sexual onset, delaying pregnancy, and challenging myths about HIV and AIDS. Older youth are engaged in discussions about correct and consistent condom usage, the risks of concurrent sexual partners, the risks of transactional sexual relationships, the role of substance abuse in exposure to HIV, the need to treat STIs, and the importance of knowing one's personal and partner's HIV status as an essential part of committed relationships. Ubuntu will integrate a 'Men as Partners' approach in the life skills curriculum to engage children and youth at an early age in establishing norms that reject gender-based violence.

ACTIVITY 2: Peer Education

Ubuntu’s peer education training uses a curriculum that is accredited by the Department of Education and the Sector Education and Training Authority (SETA). Semi-annually Ubuntu conducts four-day trainings targeting youth age 16-18, who are in grades ten through twelve. The training is geared to mobilize youth to facilitate support groups on basic counseling and problem solving skills, the causes and prevention of HIV, delaying the onset of sexual activity, the dangers of alcohol and drugs, sexual orientation, living positively with HIV and prevention of teen pregnancy. Ubuntu provides one training every six months and ongoing in-service trainings every fortnight. Ubuntu is currently creating baselines and follow up surveys which will be administered every six months.

ACTIVITY 3: Mobilizing Youth

Ubuntu’s peer education training is geared to mobilize youth to facilitate support groups on basic counseling and problem solving skills, the causes and prevention of HIV, delaying the onset of sexual activity, the dangers of alcohol and drugs, sexual orientation, living positively with AIDS and prevention of teen pregnancy. Ubuntu provides one training every six months and ongoing in-service trainings every fortnight. Using FY 2008 funding, Ubuntu will ensure that peer educators are trained and that they are working in their communities to mobilize youth on issues around AB messaging.

These results contribute to 2-7-10 goals by promoting knowledge and skills to prevent HIV infection in youth populations that may have an increased risk of HIV exposure.

Table 3.3.02: Activities by Funding Mechansim

Mechanism ID: 274.08

Mechanism: Masibambisane 1

Prime Partner: South African Military Health Service

USG Agency: Department of Defense

Funding Source: GHCS (State)

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 2977.08

Planned Funds: $100,000

Activity System ID: 13823

Activity Narrative: SUMMARY:

The South African Department of Defence's (SADOD) activities are complementary to the other prevention and care components within the Masibambisane program (the HIV Prevention and Awareness Program of the SADOD). The focus of this abstinence and being faithful (AB) activity is the training of chaplains as trainers in the moral, values and ethics-based program, which addresses gender equity, the role of men as partners, and violence and coercion. This activity will facilitate transferring the value and ethics-based program to members of the SADOD, training chaplains in pastoral care and counseling, and providing pastoral care and counseling to HIV-infected and affected members. In addition, workshops are conducted with unit commanders to ensure buy in and to address stigma and discrimination. Mass awareness and targeted intervention programs will also address AB components of prevention. The activity has been expanded to include training of Southern African Development Community (SADC) chaplains. Specific target populations include HIV-infected pregnant women, people living with HIV (PLHIV), religious leaders and health workers as well as all other personnel within the military.

BACKGROUND:

The AB component of the Masibambisane program is an integral part of the Chaplaincy HIV program of the Department of Defence. This ensures more focused prevention messages in terms of abstinence and/or faithfulness. The program was developed with FY 2004 funding to expose all members of the SADOD to the training. In order to achieve this objective, all regular Defence Force chaplains as well as a number of Reserve Force chaplains were trained. The training was reviewed and redesigned in a three-day training program. This training will continue in order to reach the optimal number of Defence Force members.

Since 2005, all chaplains are trained in the pastoral, care and support program to enable them to render the appropriate care and support services to HIV-infected and affected individuals and families. This activity will continue to be implemented by the chaplaincy of the SADOD.

All these activities are monitored through the monitoring and evaluation (M&E) plan for Masibambisane. The M&E plan includes a focused program evaluation of the training courses. The chaplaincy will also involve Reserve Force chaplains and liaise with the broader religious community to market the training programs to civilian communities to mobilize faith-based organizations.

The chaplaincy developed both courses and trained the majority of chaplains within the SADOD. They have also trained a group of chaplains from Southern African Development Community (SADC) countries and those chaplains attended the North Atlantic Treaty Organization (NATO) chaplains' conference for the last three years. Training of Reserve Force Chaplains has resulted in the expansion of the program to civilian faith-based organizations.

The AB Program will continue with specific focus on highly vulnerable target groups such as the Military Skills Development (basic training) intake of young recruits between the age of 18 and 25 years.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

This activity will provide training to chaplains of the SADOD, SADC, and the NATO in the values- and ethics -based intervention program to empower them to facilitate HIV prevention through abstinence and being faithful. This requires updating and customization of the training curriculum and the printing of training material.

ACTIVITY 2:

The activity aims to execute the values- and ethics-based program within the SADOD as part of unit workplace programs to members of the SADOD, focusing on activities that promote abstinence; for instance, development of skills in unmarried individuals for practicing abstinence and adoption of norms that supports delaying sex until marriage and that denounce forced sexual activity among unmarried individuals. This requires the development and printing of facilitation manuals.

ACTIVITY 3:

The SADOD will support the establishment of unit workplace programs through workshops with commanders on the AB programs to ensure targeted abstinence and faithfulness interventions within units. The commanders are the chiefs of the units, they have much influence on the military personnel in their units, therefore their buy in is critical for the success of the program. The workplace program will also address stigma and discrimination.

ACTIVITY 4:

The SADOD will provide ongoing pastoral care and counseling to HIV-infected and affected individuals and families within the SADOD with the secondary aim to prevent HIV infection through interventions that focus on abstinence and faithfulness. This will ensure that the spread of HIV within the SA DOD is contained.

ACTIVITY 5:

SA DOD will conduct community outreach campaigns to address abstinence and faithfulness through media and awareness activities which includes the development and printing of information and educational material. Awareness activities are an important component of the SA DOD Abstinence and Be faithful Prevention Program targeting new recruits who are vulnerable group aged 18 – 25 years.

ACTIVITY 6:

SA DOD will assimilate innovative ways of spreading AB information through attending PEPFAR prevention partner meetings, publications in military and peer-reviewed magazines and journals and oral and poster

Activity Narrative: presentations on effective and innovative programs at conferences and seminars.

These activities will contribute to the prevention of HIV infection through increased pastoral care and counseling in the SA DOD for PLHIV and increased support to healthcare providers thus contributing to the PEPFAR goal of preventing seven million new infections.

Activity Narrative: SUMMARY:

The Training Institute for Primary Health Care (TIPHC) prevention program provides HIV and AIDS information and education to underserved populations in townships, informal settlements, rural areas and mining communities. The program emphasis areas are training workshops, community mobilization and participation and capacity building of local organizations to promote HIV prevention and behavior change. The target populations are in-school youth, out-of-school young people, adult men and women, mineworkers, people living with HIV and local community leaders like school teachers, religious leaders, traditional healers and ward councilors. PEPFAR funding is used for abstinence messages for youth and young people and for AB messages targeting sexually-active populations.

BACKGROUND:

TIPHC is a South African registered non-profit organization which has been in operation since April 1994. It has a long history of implementing HIV and AIDS information, education, home care and support programs in Emalahleni Municipality, a local authority of Mpumalanga Province. TIPHC is a key partner to the national and provincial government's HIV and AIDS AB initiative which is a component of the South African AIDS Prevention, Management and Treatment framework. The prevention program is aligned with the South African Government (SAG) policy of promoting equitable access to HIV and AIDS health services particularly for vulnerable groups such as women and youth. Since inception, TIPHC has grown and gained the confidence of both the provincial and national Departments of Health who have funded the bulk of its prevention and care activities. Through PEPFAR partnership, TIPHC intends to intensify and expand its community outreach with HIV prevention messages in partnership with two sub-partners. The outreach initiative will target teachers and learners in senior primary and high schools. Teachers and class leaders will be trained as peer educators and counselors for learners. Community target groups will include out-of-school youth (in sports clubs, music and drama groups and church choir) and members of women's groups, stokvels (savings clubs), burial societies and shop stewards of mineworkers unions.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training Leaders on HIV and AIDS

Training workshops will be held with leaders of selected schools, churches and community groups. TIPHC will train the leaders of these groups and support them in organizing and facilitating HIV education information and life skills workshops for their group members. In this aspect, TIPHC will coordinate the workshops for leaders. Accredited service providers will be contracted to deliver workshops. Trained leaders will in turn deliver information and skills workshops to learners and community groups. TIPHC will assist the leaders with workshop organization and supply of approved curriculum materials. The main program objective is to influence behavior change of encouraging abstinence, delaying the first encounter of sexual intercourse and promoting faithfulness among sexual partners. Messages are age specific according to the PEPFAR guidance on AB. The curricula will incorporate gender bias issues like cultural norms of women's and men's behaviors and inequalities between men and women that increase the vulnerability to and impact of HIV and AIDS. Encouraging gender equity and reducing gender-based violence coercion, stigma and discrimination will be integral to the key outputs. More importantly, focus will be on enhancing life skills for instilling a value system of respect, integrity, responsibility, fairness, and constructive decision making. As part of the sustainability plan, TIPHC trains trainers from among the leadership groups such as teachers, church pastors, traditional healers, youth peer educators and counselors and union leaders. This is a strategy for scaling-up HIV and AIDS outreach to a broader target population. These leaders command substantial influence in the community and have the ability to reach large audiences easily. Leaders to be trained as trainers will be identified and selected during training workshops and sent for train the trainer courses.

ACTIVITY 2: Training of Other Community Groups

Among the adult population, there are mine workers and taxi drivers that require particular strategies for reaching them with AB messages. This is a critical group because they also engage in cross-generational sex. Traditional healers are also a target group. Educational workshops for these target groups will address issues of gender equity, cultural norms and behavior change.

ACTIVITY 3: Community Mobilization and Participation

A door-to-door campaign whereby caregivers talk to families about HIV and AIDS and distribute leaflets is another strategic approach for wider coverage in prevention outreach to communities. TIPHC will produce and distribute leaflets about the PEPFAR program and HIV and AIDS information materials from the national and provincial Departments of Health. In addition, all target groups will be encouraged to tune-in to monthly community radio topical discussions by two people living with HIV who will be supported with PEPFAR funding. They will also be supplied with TIPHC PEPFAR news articles printed in the local papers. These two activities do not have direct targets but they contribute towards community information and education about HIV prevention. All formal training to community leaders, trainers, peer educators and counselors will be coordinated by TIPHC but delivered by accredited service providers. TIPHC has not yet received full accreditation for its training program. It currently possesses a confirmation number for its application for accreditation by the South African Qualifications Authority (SAQA) through the Health and Welfare Sector Education and Training Authority (HWSETA). Therefore, TIPHC will liaise with accredited institutions on Health and Welfare Sector Education and Training Authority (HWSETA) database and outsource the activity. TIPHC will work closely with service providers and ensure that their curricula cover essential skills of, communication, development facilitation, leadership roles and qualities, promoting gender equity, human rights, needs assessment, activity organization and management, report writing, fund-raising, knowledge about HIV prevention. Essential training for leaders, trainers and peer educators is a five-day course followed by a two-day refresher course annually. TIPHC will in turn assist these trained facilitators with the organization and facilitation of planned training and information sessions with their group members. Support with provision of training and information materials and adaptation of curriculum will be provided. The sessions will be monthly one-day activities covering specific topics on HIV prevention. TIPHC will be responsible for quality assurance and will ensure that accredited assessors are used to evaluate the learning. A monitoring system will be instituted to capture information that will profile training participants

Activity Narrative: and record what is covered in all training activities to enable proper and accurate reporting.

This activity contributes to the PEPFAR goal of averting seven million infections.

Activity System ID:	13760		

Activity Narrative: SUMMARY:

GOLD Peer Education Development Agency (GOLD) was awarded first place in the Commonwealth Good Practice awards 2006. GOLD became a new PEPFAR partner FY 2007. FY 2008 PEPFAR funds will support the expansion of comprehensive youth prevention services to facilitate the roll-out of the GOLD Peer Education (PE) model through three components: (1) development and dissemination of PE best practice methods and materials; (2) capacity building and training of PE participants; and (3) quality assurance of implementation of the GOLD Model. The primary emphasis areas for these activities are Gender, Human Capacity Development, and Local Organization Capacity development. Specific target populations include adolescents (10-14), adolescents (15-24), adults (25 and over), orphans and vulnerable children and teachers.

BACKGROUND:

This project is part of a larger initiative which began in FY 2004. The described activities are ongoing and will be scaled-up in FY 2008. GOLD developed the GOLD PE Model. GOLD partners work with suitable community organizations to implement its model using the secondary school system and other community youth servicing sites. GOLD works in conjunction with the relevant South African Provincial Government structures. GOLD manages and provides quality assurance of the implementation of GOLD PE of its sub-partners. GOLD assists its partners to align the PE programs with the South African Government (SAG) guidelines on prevention of HIV with a focus on youth as a priority population group. The GOLD model is implemented within Western Cape (WC), KwaZulu-Natal and Mpumalanga provinces of South Africa. GOLD is being implemented in collaboration with provincial education departments (DOE) and the National Department of Health (NDOH). GOLD's sub-partners in the Western Cape (WC) are partly funded by the Global Fund via the WC DOH and the conditional grant via WC Department of Education. In other provinces sub-partners are partly funded by HopeHIV. Two of the three activities will be implemented directly by GOLD. One activity, capacity building and training of PE participants, will be implemented in collaboration with 24 youth-focused community organizations that implement the GOLD model in various sites and train the youth peer educators (PEs). These organizations are: Youth for Christ (YFC, George, Knysna, Pietermaritzburg and Nelspruit), Masoyi Home-Based Care, Wagon of Hope, Planned Parenthood Association of South Africa (PPASA), MaAfrika Tikkun, Ukuthwasa, and Institute for Social Concerns, Christian Assemblies Welfare Organization, Club Coffee Bar Community Centre, Uniting Christian Students Association, OIL Reach Out, NOAH and Sethani. Nine additional organizations will be assessed in July 2008 and selected and trained in September 2008 to recruit peer educators. Recruitment will take place in January 2009. Between 2007 and 2008, another batch of thirteen additional organizations will be selected to become GOLD implementing partners. The issues facing South African youth in HIV prevention are firmly entrenched in the social constructions of behaviors and identities and include unequal power in sexual relationships, gender-based violence and intergenerational sex. GOLD messaging is designed to look beyond awareness and reflect the complex social dynamics of HIV transmission. By reflecting these dynamics that youth face daily, the model is intelligible to youth and fosters critical awareness, transformation and long-term behavior change that increases gender equity, challenges male norms and behaviors and supports activities to strengthen sanctions against sexual violence and coercion. PEs are equipped to challenge stigma around HIV and to promote the reduction of discrimination faced by HIV affected and infected individuals. The GOLD curriculum emphasizes the message giver as a role model. Peer Educators are equipped and supported to role-model lifestyles that promote, in order: abstinence; delayed, faithful sexual debut and reduction of sexual partners amongst youth.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Development and dissemination of PE best practice abstinence and be faithful methods and materials.

GOLD will refine and disseminate an interactive and context-specific resource base of GOLD PE curricula and good practice methods for use by: GOLD staff; trainers and master facilitators who use this to train peer education facilitators and program managers; PE facilitators who use this to train adolescent peer educators; Adolescent peer educators who use this to empower their peers; and program managers implementing the GOLD PE Program within secondary schools and communities who use this to help them in the implementation and management of their peer education program. The curricula focuses on social dynamics informing conceptions of gender, covering sexuality and the feminization of AIDS, to reduce the inequalities between men and women that have led to the increase of HIV and AIDS as well as challenging stigma around HIV and AIDS and addressing substance abuse and risk behavior. Ongoing refinement and development of curricula will involve human capacity development of representatives of implementing partners to provide constructive feedback on experiences and share their findings together.

ACTIVITY 2: Capacity building and training of PE participants

GOLD will train program managers and community leaders from 24 implementing organizations, as well as 660 teachers, to implement the structured three-year GOLD Model in 132 secondary schools and communities through equipping and supporting adolescent PEs. PEs are supported by implementing organizations through a structured skills training and mentoring program. GOLD will assess and provide implementing organizations with intensive capacity building to deliver the GOLD model in schools where access is given by the provincial Department of Education within youth high risk behavior sites. GOLD will equip staff of the organizations through a structured capacity building program including modular training sessions, mentorship and provision of PE resources and best practice methods. GOLD will provide training to teachers to enhance the quality and ownership of the program for long-term sustainability. Twenty four implementing organizations will train 8008 adolescent PEs within 132 secondary school sites to fulfill specific PE roles and outputs over a three year period in which they positively impact their peers. It is anticipated that gender will be impacted through both the implementation of curriculum and the GOLD program environment. Youth in the PE program will work through gender issues within a safe and enabling environment (the GOLD program) and are given room to critically analyze and challenge gender norms, working together towards gender equality. These youth will in turn support each other as they work among their peers and communities. New GOLD trainers and facilitators will be recruited based on criteria that ensure their character and skills reflect the values and practices imparted through the curriculum and program design. A planned selection of both male and female facilitators and PEs will be aligned to the

Activity Narrative: GOLD facilitator and peer educator recruitment guidelines.

ACTIVITY 3: Quality assurance around implementation of the GOLD PE Model

This activity provides quality assurance around the implementation of the GOLD Model in secondary schools via implementing organizations, PE facilitators, and adolescent PEs. This will involve: ongoing development and use of a robust information and communication technology infrastructure to (1) enable effective roll-out of the program in a way that enables ongoing monitoring and evaluation; (2) conduct bi-annual assessments of all implementing organizations; and (3) implement a comprehensive monitoring and evaluation system within all implementation sites.

The GOLD program contributes to the PEPFAR 2-7-10 goals to reduce new HIV infections among youth through: facilitating the structured promotion of safe and healthy behavior of HIV-infected and uninfected youth; improving access to services for affected youth and increasing positive youth role-modeling and advocacy.

Activity Narrative: SUMMARY:

Life Choices is one of the implementing organizations that run the Western Cape Peer Education Program for the Departments of Education and Health. Life Choices was the first organization integrated in this program that was not funded by the Global Fund or Conditional Grants. Life Choices is also a founding member of the Western Cape Youth Peer Education Association. This association aims to provide quality standards and ensure sustainability of the provincial peer education program. The Life Choices Program aims to reach young people with a powerful abstinence and be faithful (AB) message early in their lives, and to change social norms (gender roles, violence, discrimination, etc.). The intent of the program is to reach 56,000 young people in a period of four years. Life Choices believes in providing a quality Life Skills Program combined with a structured Peer Education Program to youth that will help them to maintain or change behaviors. In order to create a supportive environment around youth, Life Choices also run programs with the stakeholders in their lives - teachers and parents. Each year Life Choices chooses different themes in order to ensure that youth aged 10 -14 delay sexual debut, older youth 15 -24 practice secondary abstinence and those who are sexually active stay faithful to one partner, know their HIV status and are given full information on consistent and correct use of condoms. Some of the themes that Life Choices uses are - 'True Love Waits,' 'Spread Love not Gossip,' 'NO, I value LIFE,' 'I am the choices I make,' among others. The emphasis area for this activity is gender and human capacity building. The target population is adolescents, teachers, religious leaders and most at risk population which will include the street youth, persons who engage in transactional sex, but who do not identify as persons in sex work and incarcerated populations.

BACKGROUND:

The Life Choices Program was launched in FY 2005 in the Western Cape with the support of PEPFAR. Three main communities were selected by the Western Cape Department of Education: Athlone, Delft and Mannenberg. The schools within these three communities are the main target for the Life Choices Program and became the base for program activities. Life Choices brought a comprehensive program that aimed to change social norms (with components on HIV and AIDS, self-worth, gender, violence, and substance abuse) to 11 high schools and 10 primary schools. Besides these three communities, Life Choices also reaches youth around Cape Town in 'Street Youth' Shelters, churches and in one correctional center. The Western Cape Departments of Health and Education coordinate the Life Choices school activities. Once a month Life Choices meets with the Government and reports back about the monthly activities and quarterly written reports are also submitted.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training of Trainers - Human Capacity Development

In FY 2008, 18 trainers (nine women and nine men) will be trained on an ongoing basis in order to increase the quality of their service delivery. Four major trainings will be organized during the year. These activities will build on last year's success in counseling, and parental and facilitation training skills.

ACTIVITY 2: Development of Behavior Change Communication Materials

Behavior Change Communication (BCC) materials on Abstinence, Be faithful and gender issues will be finalized and field tested in FY 2007. These materials will include pamphlets and other media, and will comprise topics related to Life Choices messages (self-worth, reproductive health, relationships, gender, violence, coercion, teen pregnancy, substance abuse, etc.). Furthermore, these materials will also need to be approved by the Western Cape Government, and teachers' and parents' associations. Once the approval has been obtained, the BCC materials will be used to reinforce the message around changing of social norms which discourages gender violence and coercion of young women and girl children and address issues of cross generational sex and multiple concurrent partnerships in an interactive way during the delivery of the program. Some of the AB and gender materials will be given to the youth for free and they will be distributed by Life Choices facilitators, Peer Educators, teachers and church leaders.

ACTIVITY 3: Delivery of the Program to the Salesian -Based Centers

The Life Choices program will continue to implement Life Skills in the Correctional Center targeting high risk groups with behavior change activities. The work with Parish Youth Groups will also be maintained. Unfortunately last year, Life Choices did not achieve its goal of training 30 parish youth leaders. In FY 2008, Life Choices continue training youth leaders. These youth leaders will work in male-female pairs to reinforce and enhance their status as role models to their peers. They will also receive additional training to ensure that they are well informed to reinforce the AB message. Each pair of youth leaders will reach 50 youth in their respective parishes.

ACTIVITY 4: School-Based Program

In FY 2008, Life Choices will continue to work in the 12 high schools where service are already established and will expand to an additional two high school. The program will also continue in the ten primary schools. FY 2008 expansion activities in primary schools will include targeting youth in the lower grades (Grades 4, 5, 6 and 7) and providing them with abstinence messages. In addition, a Health Promotion Program will be initiated in high schools and primary schools where health services will be made available to school learners. These include comprehensive health screening like TB screening, voluntary counseling and testing, reproductive health services to provide an integrated prevention package.

Youth will be trained on an ongoing basis to become role models, to educate their peers in informal and formal ways, to identify and refer peers with problems, and to advocate for change. Youth camps will be organized to ensure the value, accuracy and consistency of the message given by the peer educators to their peers. All the target schools will also continue with the Life Skills program that will reach learners. In FY 2008 the Life Choices program will continue working with teachers by conducting quarterly workshops. Expansion activities for FY 2008 include the implementation of a parent program. Both programs will aim to improve teacher/parent-teen communication and to create a safe environment for positive behaviors among youth.

Activity Narrative:

ACTIVITY 5: Youth-Friendly VCT

The Life Choices Program, in agreement with New Start (a PEPFAR partner), will continue providing youth-friendly VCT at designated schools via voluntary counseling and testing (VCT) mobile centers. The program will continue organizing VCT campaigns in high schools where youth above 14 years of age will be encouraged to test for HIV. These campaigns are used as powerful prevention tools. In a country where very few HIV-infected people know their status, it is essential that ongoing VCT campaigns are organized in the communities targeted by the program. New Start and Life Choices will continue establishing referral networking systems for youth who need further support, including those who are HIV-infected, have been abused, or are sexually active.

This Salesian Mission activity will contribute to PEPFAR achieving the overall goal of averting seven million new HIV infections.

Table 3.3.02: Activities by Funding Mechansim

Mechanism ID:	335.08	**Mechanism:**	N/A
Prime Partner:	Salvation Army	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Abstinence and Be Faithful Programs
Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	2992.08	**Planned Funds:**	$200,000
Activity System ID:	13803		

Activity Narrative: SUMMARY:

The message of Abstinence and Be Faithful (AB) is promoted through two interventions: (1) youth mentors are equipped to deliver a values-based AB curriculum to youth in a school context or as part of a peer education group; and (2) pastors are equipped to promote AB to their congregations through integrating messages into standard church activities (sermons, funerals, groups of women, men, and youth.). The major emphasis area of this activity is information, education and communication of AB messages; and the minor area will be training and community mobilization in promoting AB as a lifestyle.

BACKGROUND:

The Salvation Army is an international Christian denomination with specific community programs to address all aspects of HIV and AIDS through community-based care and prevention programming: home-based care, provision of OVC psychosocial support, individual pre- and post-test counseling, clinical care of opportunistic infections, community counseling, and youth mobilization. Matsoho A Thuso is a care and prevention project that has received PEPFAR funding since FY 2004. Prevention activities focus on capacitating Salvation Army churches to address HIV prevention through training pastors and church volunteers to conduct outreach in churches, schools and the wider community. The project currently operates in 58 sites with Youth Mentors going to different schools to promote AB during the Life Orientation classes. This is done in conjunction with the Department of Education on local levels. Salvation Army also operates in 33 sites with pastors promoting the message in churches and surrounding communities, in eight of South Africa's nine provinces, many of which are in rural and underserved areas.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training of Youth Mentors

Salvation Army will train South African volunteers as youth mentors. These youth mentors will be equipped to assist in the facilitation of life orientation lessons, conduct school assemblies, and lead peer support groups for youth who wish to commit to a lifestyle of abstinence before marriage. The curriculum used for this purpose contains 30 lesson plans complete with student activities that will assist youth in building the skills they need to pursue abstinence before marriage. These include development of the ability to attach consequences to actions, assertiveness and the ability to withstand peer pressure. The curriculum also challenges misperceptions about male norms and behaviors in order to assist in addressing issues related to gender. The learners are challenged to see that boys and girls have the same responsibility with regards to reducing the spread of HIV. Girls are empowered with the necessary information and skills to delay their sexual debut even when they are pressured by their male counterparts. These lessons are planned to suit learners from higher primary to secondary school levels. Youth mentors will be expected to represent the values of the program and act as role models to in-school youth. As of FY 2006, 95 youth mentors have been trained to implement A and AB outreach activities in the school setting. FY 2007 funding will be used to train additional Youth Mentors and to increase the support and supervision provided to program volunteers to ensure the intensification of services. Refer to explanation of training activities section for FY 2008 plans.

ACTIVITY 2: AB Outreach in Schools/Peer settings

Youth mentors will promote abstinence before marriage for children aged 14 and below, and abstinence before marriage and faithfulness within marriage to youth aged 15 and above in a school or peer group setting. The program will support the South African Government (SAG) life skills program in schools through providing AB prevention services throughout the country. Youth mentors will be assigned to schools identified in collaboration with the SAG Department of Education for two terms. Each youth mentor will conduct 30 lessons for each class. Lessons also include development of character and promotion of abstinence as a way of life. The curriculum also challenges misperceptions about male norms and behaviors. This has been a useful tool to address issues of gender equality and gender equity among the youth and the prevention programs are made accessible for both boys and girls. Initially it was planned that youth mentors would visit schools twice a week, however most schools have requested that youth mentors provide services daily. Youth mentors will ensure that all OVC identified in schools are referred to the OVC program. As of June 2006, this activity has reached over 16,000 youth with A and AB messages. Refer to explanation of training activities section for FY 2008 plans.

ACTIVITY 3: Mobilization and Training of Church Leadership

The third activity is to mobilize church leaders (pastors) to engage their congregations on issues of abstinence and faithfulness. The Salvation Army will capacitate pastors to find positive language that extols the benefits of abstaining before marriage and being faithful within marriage, and to aid them in giving their congregations tools that will further reinforce the message. Pastors will be trained using a field-tested curriculum to introduce abstinence, fidelity and related topics of character building into sermons and Bible Studies curricula. In the period ending June 2006, a total of 62 pastors were trained from 62 churches. In FY 2007 the project will train an additional cadre of pastors to intensify and expand service delivery. Project staff will provide supervision and support to pastors to ensure that prevention activities are being implemented in each church. Pastors will also be encouraged to take a leadership role supporting the care and support and OVC programs run by the Salvation Army. This will ensure that linkages are made between the different components of the project and will provide mentorship to the volunteers. Refer to explanation of training activities section for FY 2008 plans.

ACTIVITY 4: Outreach activities for congregation members

Pastors will exercise their influential status in communities to address the prevention of HIV through encouraging the adoption of A and B behaviors. Pastors will discuss the reduction of multiple and/or concurrent partners as a methodology to mitigate the spread of HIV in their communities. Anecdotal reports indicate that the corps/churches that are implementing the program demonstrated an increased awareness to the fact that benefits of prevention will be attained through Abstinence and Being Faithful. Pastors will disseminate values-based information and education in church and community gathering settings including at sermons, funerals, and during women's, men's and youth group activities.

Activity Narrative: Salvation Army's prevention activities will contribute to PEPFAR's goal of averting seven million HIV infections among adults and youth. Refer to explanation of training activities section for FY 2008 plans.

Table 3.3.02: Activities by Funding Mechansim

Mechanism ID: 510.08

Mechanism: N/A

Prime Partner: Soul City

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 3055.08

Planned Funds: $5,090,000

Activity System ID: 13810

Activity Narrative: SUMMARY:

Soul City has received PEPFAR funding since FY 2005 to implement a media and community-driven program to strengthen prevention, and increase awareness of and demand for HIV care and treatment services. The major emphasis area is community mobilization/participation. Other emphasis areas include: information, education and communication; local organization capacity development; and training. There are five activities. Three activities target adults and children nationally using multimedia, and two activities build on this through training and community mobilization of adults and children.

BACKGROUND:

The activities are ongoing. Soul City has a long history of partnership with the South African Government, collaborating with the National Departments of Health (NDOH), Education (DOE), Social Development (DOSD), Transport, and Public Service and Administration, which includes financial support from NDOH, and potentially DOSD in the future. In addition, Soul City partners with 18 non-governmental organizations (NGOs) to implement the community mobilization program. All Soul City interventions address gender issues, particularly those associated with driving the epidemic (e.g., power relations and cross generational sex). In September 2007 Soul City and its sub-partners are planning a major planning retreat to design its five year prevention strategy, and the USG will be important contributors to this process. Violence and partner reduction will be a focus over the next five years as will the issues that promote violence, like substance abuse.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: The Soul City Series

The Soul City TV series,13 episodes for a family audience, broadcast during primetime in October 2008; 30 radio drama episodes in nine languages in November 2008; and a 36-page color booklet for adults printed in four languages, with one million copies distributed through newspapers, health facilities, partners and community organizations. The booklet will focus on HIV and relationships, particularly concurrent partners. Other issues addressed are HIV prevention that promotes abstinence and faithfulness, and decreasing stigma. The series will cover gender in HIV prevention, violence reduction and substance abuse. PEPFAR funds will be used for 30% of this activity, with other donors funding the remaining 70%.

ACTIVITY 2: Soul Buddyz

Soul Buddyz is aimed at children, 8 to 12 years of age and comprises: (1) 13 TV drama episodes for children and their parents, broadcast in primetime October 2008; (2) development, printing and distribution of one million copies of a 42-page color parenting book in four languages from April 2008; (3) development of a 116-page grade 7 life skills book distributed to pupils in April 2008; and (4) marketing to promote and link these materials. This activity contributes to PEPFAR objectives by averting new infections through behavior change. The topics the Soul Buddyz series will cover are HIV prevention, in particular the promotion of abstinence and faithfulness, and youth sexuality. The Soul Buddyz intervention deals with a range of developmental topics relevant to children's lives and not only to HIV and AIDS. It will also deal with violence reduction, reduction in substance abuse, gender and building self esteem. PEPFAR funds will be used to support 30% of this activity, with other donors funding the remaining 70%.

The following two activities depend on the media activities for their credibility and impact at a community level.

ACTIVITY 3: Community Mobilization

Based on the Soul Buddyz intervention, Soul Buddyz Club is a community mobilization intervention aimed at children, largely at schools and facilitated voluntarily by teachers. Children in the clubs learn about life skills covered in the Soul Buddyz series (that stress abstinence and being faithful (AB) messages) and are encouraged to do outreach work in their schools, families and communities. Nationwide, 3000 clubs already exist, and in FY 2008 Soul City will establish another 1000 clubs. To achieve this, it will conduct 20 training sessions for facilitators; develop, print and distribute 6000 annual club guides; hold a national congress for clubs and their facilitators; develop, print and distribute 80,000 magazines to each club member bi-annually; and run Buddyz club competitions. The clubs will focus on preventing HIV infection, AIDS and its impact on schools; youth sexuality focusing on skills development; and violence reduction, reduction in substance abuse, gender and building self esteem. PEPFAR funds will be used to support approximately 80 percent of this activity, with other donors funding the remaining 20%. Soul City emphasizes building the capacity of facilitators so they can support clubs into the future. This will be done in partnership with the DOE at both national and provincial levels. This activity contributes towards PEPFAR objectives by averting new infections through increasing self esteem and behavior change.

ACTIVITY 4: Material Development

Soul City develops flexible training materials in five local languages to use in facilitated learning settings, and in the general public, with a focus on parents. They will build parenting skills and equip them to educate their own and other children about prevention using an AB approach. They also deal with all other aspects of the epidemic, including, antiretroviral therapy support, and support for home-based care and orphans and vulnerable children. These materials will also be used to train school governing bodies to create schools as nodes of care for vulnerable children. These materials are also used by businesses and workplace programs. These materials are used by 18 partner NGO's in a cascade training model. Trainees are given the support and skills with which to become mobilizers in their community. More than 200 training sessions will be conducted in FY 2008 with an average of 30 people per session. In addition, materials are made available to a wide range of institutions that make use of the materials in their work. A minimum of one million copies of materials will be made available. PEPFAR funds will be used to support approximately 70 percent of this activity, with other donors funding the remaining 30%.

ACTIVITY 5: Heartlines

Activity Narrative: Heartlines is a sub-partner of Soul City: IHDC uses a values-based approach to HIV prevention. It is fully described in Other Prevention A children's book aimed at children 5-8 years old was produced in FY 2007. FY 2008 funding will be used to translate the book into 11 languages and 100,000 copies will be distributed to 17,000 primary schools. In partnership with DOE, teachers will also be trained to use the materials.

The long-term sustainability of Soul City is addressed by diversifying its funding sources and by establishing a broad-based empowerment company which can take ownership of shares and whose dividends will accrue to Soul City. An empowerment company is one that aims to strengthen small businesses and expand them in order to encourage investments from outside investors.

To determine the impact of the activities, Soul City and another PEPFAR partner, Johns Hopkins University Center for Communication Programs, will implement a nationally representative longitudinal panel design evaluation, which, together with propensity score analysis, enables one to attribute change to the intervention with a high degree of certainty, as the change is clearly measured in a time sequence, and the "control" is controlled for demographics, other interventions, other attitudes and behaviors. This allows a high degree of certainty about what the cause of the change is. (This activity is funded under the Johns Hopkins University PEPFAR program and described in that COP entry.) Soul City has reached over 6 million children and 22 million adults with AB prevention messages. A further study (not PEPFAR-funded) is planned in partnership with the University of the Witwatersrand which will be a randomized intervention study comparing the impact of the school based intervention on child resiliency

These activities will contribute to the PEPFAR 2-7-10 goals, focusing on prevention (specifically abstinence and being faithful) and care and treatment awareness.

Table 3.3.02: Activities by Funding Mechansim

Mechanism ID:	6084.08	**Mechanism:**	SANBS country buy-in
Prime Partner:	South Africa National Blood Service	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Abstinence and Be Faithful Programs
Budget Code:	HVAB	**Program Area Code:**	02
Activity ID:	12252.08	**Planned Funds:**	$242,500
Activity System ID:	13814		

Activity Narrative: SUMMARY:

The South African National Blood Service (SANBS) has expanded and its donor base more representatives of the demographics of the country by establishing four new donor clinics in geographical areas previously not serviced by the organization. The recruitment and educational programs aimed at new donors will focus on the relationship between safe lifestyle and utilize abstinence and be faithful (AB) messages. The outcome of the program will be measured by donor recruitment and retention, and HIV prevalence in donors.

ACTIVITIES AND EXPECTED RESULTS:

Four new clinics in FY 2007 will be established in primarily black communities. In July 2007 a donor clinic was opened in Umlazi, KwaZulu-Natal, and a site for a clinic found in Soweto. Four nurses, one for each of the pilot clinics, will be trained as donor educators and counselors. They will have appropriate information/education packs with suitable materials that have been developed in FY 2007. The material will be evaluated and refined in FY 2008 and incorporate AB and prevention messages that will support the prospective donor interview, education and selection process. Prospective donors will be issued with education materials and encouraged to spread these messages to their family, friends and peers, thereby making the blood donors ambassadors of the program. Ten thousand new donors will be exposed to these educational and selection programs and the extension of the program to the family and friends of the donors will have a significant impact on HIV prevention in the community at large. The donor education and recruitment program is strengthened by the one-on-one interview that is part of the donor selection and self-exclusion procedure. This ensures that prospective donors fully understand the impact of the AB component of blood safety. The message is reinforced because this interview is repeated at every donation. Another facet of the program is the one-on-one interview that is part of the follow-up strategy for HIV-infected prospective donors. This program is used to evaluate the effectiveness of the educational program and is used for counseling HIV-infected people and referring them to an appropriate counseling and treatment center. This program, which will be piloted at the four new clinics, will in FY 2008 and FY 2009, be institutionalized in all the clinics across SANBS and the Western Province Blood Transfusion Service.

Mechanism ID: 167.08

Mechanism: N/A

Prime Partner: Africare

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Abstinence and Be Faithful Programs

Budget Code: HVAB

Program Area Code: 02

Activity ID: 2911.08

Planned Funds: $936,500

Activity System ID: 13374

Activity Narrative: SUMMARY:

Africare's Injongo Yethu Project will continue to work through several foci of influence throughout Lukhanji communities to disseminate information and influence behavior change to prevent new HIV infections and to encourage testing. In FY 2008, an additional focus on interactive, prevention skills programs (especially focused on youth and men) will be employed to sustaining messages throughout the community. Further expansion will be made to catchment areas of other approved care and support sites. Major emphasis is on human capacity development, local organization capacity building, and gender. Gender activities will focus on addressing male norms and behaviors, reducing violence and coercion, and increasing women's access to productive resources. The target populations for this activity include the general population above the age of ten, teachers and religious leaders.

BACKGROUND:

This is an ongoing activity, expanding the number of peer educators (PEs) and expanding the geographic reach to include more villages throughout the Lukhanji Local Service Area and into initiate activity in a new LSA. Prevention activities are supported and encouraged by the ECDOH. The House of Traditional Leaders supports the project, and is an important behavior change agent in the community. Lukhanji Local Municipality expresses support for the integration of ward councilors in community mobilization efforts. Efforts to empower young women are included in the in-school youth peer education/life skills activities, out-of-school youth peer education and livelihood activities supporting young women to be materially independent of older men. Shaping how young men see and behave toward women is included in the out-of-school youth peer education activities, the traditional initiation schools, faith-based youth activities, and in-school youth.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthen the Quality and Intensity of Existing Community-based Activities

In FY 2008, human capacity development will remain a key activity, building on the training of traditional leaders and healers, community leaders and in and out-of-school youth. Africare will continue to provide further training and mentorship for traditional initiation (circumcision) surgeons/nurses on how to integrate HIV prevention, gender awareness and behavior change education for young males during initiation into manhood (traditional practice). In-school youth will continue to be developed, along with their coaches and teachers. Rural youth with little education will be given continued support to internalize messages with regard to gender and behavior change and to better develop facilitation, counseling, and activity management skills. Practical skills for youth development and life skills will also be provided to the out-of-school youth peer educators. Summer and spring youth camps for existing PEs will continue to focus on personal empowerment and build their capacity to promote abstinence and delayed sexual debut for in- and out-of-school youth in collaboration with church Sunday Schools. In FY 2008, program depth and quality will be enhanced for youth to provide skills needed to prevent cross-generational sex and substance abuse through modular life skills programs. Partnering with Soul Buddyz for youngsters will provide a sustainable, long-term program and partnership with Girl Guides or similar programs will be explored to give girls the skills and perspective to focus on their futures.

Funds will be used to recruit additional peer education and advocate supervisors to support community-based peer education and advocacy in new communities. Additional training in peer education and behavior change approaches will be provided to the supervisors to enhance their ability to provide technical guidance in communities. Community-based PEs and advocates from all participating groups will be provided with in-service education on interpersonal communication for behavior change.
Teachers from participating schools (20 current and 20 new) will continue to receive professional development in life skills education for grades 4-7 and support of PEs. Linked with the care and support components, the Service Corps Volunteers and community-based caregivers will have their HIV prevention communication skills further developed to improve the frequency, intensity and quality of their communications in the clinics and in the homes of clients.

Training of the various community groups will be done using the Harvard School of Public Health curriculum. The curriculum is flexible based on assessment of skills, norms and attitudes of each group.

ACTIVITY 2: Reach the Community with Consistent Abstinence and Be Faithful Messages

Funding will support quarterly HIV prevention-focused educational events for each target group. These events are intended to stimulate discussion of intergenerational sex, transactional sex, stigma, discrimination, denial and other related issues, to reduce high-risk behavior and to create a supportive environment for HIV testing. The forums for these events include youth debates, drama, and sensitization meetings to highlight these issues. Through these open forums, Africare aims to stimulate discussion on issues and guide the community to identify HIV risk and appropriate steps to reduce such risks. The project will facilitate the dissemination of relevant IEC materials and enlist the support of PEPFAR partners such as Soul City to adapt materials. In addition, Africare will continue to work with faith-based leaders to disseminate information about HIV and AIDS with a focus on promoting risk reduction through AB messages. In FY 2008, Africare will continue to expand the number of pastors in the program, creating a supportive environment for testing by fostering care and support of families affected by HIV in addition to prevention. Pastors link with palliative care activities in providing pastoral care for PLHIV in need of spiritual counseling.

ACTIVITY 3: Expand to New Community Groups and New Localities within this Site

In collaboration with the law enforcement agents, the project will continue to strengthen and expand the gender- and child-based violence task working group by supporting quarterly meetings/activities to promote case identification, effective support and intervention (including PEP) and prevention. For in-school youth peer education, new schools in the Queenstown area (10) will be added to the existing group of schools. Additional groups of youth and faith-based organizations in Queenstown areas of Ezibeleni, Mlungisi, Ilinge and Lesseyton will be engaged and trained for prevention as well as stigma reduction and care and support. Chiefs' wives will be engaged through the Chris Hani District AIDS Council to reach girls and female youth.

Activity Narrative: As the new care and support sites are finalized, community entry with key stakeholders will begin. FY 2008 will also include jointly developing an adult male-focused strategy (with the House of Traditional Leaders, Department of Health and male involvement programs) to engage men in reducing sexual partners, reducing cross-generational sex and increasing utilization of services.

ACTIVITY 4: Vocational Skills Training and Microfinance

Appropriate vocational skills will be linked to youth prevention activities especially for young women in order to ensure that they are economically empowered, and can avoid intergenerational/transactional sex and avoid conflict with the law. Training institutions will provide vocational and skills training, and support learnerships and apprenticeships for youth. FY 2008 COP activities will limit micro-financing to linking individuals and groups to other financing resources through government small-medium enterprises funding programs. Support to local information technology centers in collaboration with Microsoft will aim to ensure that rural women, youth, and community-based organizations have access to information about HIV and AIDS, entitlements and income-generation funding resources, along with the means to write and send applications and reports.

Total Planned Funding for Program Area: **$2,742,500**

Estimated PEPFAR contribution in dollars	$0
Estimated local PPP contribution in dollars	$0

Program Area Context:

Blood transfusion in South Africa is recognized as an essential part of the healthcare system. South Africa has a strong blood safety program that is directed by the South African National Blood Service (SANBS), a Track 1 partner. SANBS actively recruits voluntary blood donors and educates the public about blood safety. Blood donors are voluntary and not remunerated. Blood is collected at fixed donor clinics and mobile clinics that visit schools, factories, and businesses. All blood is routinely screened for HIV-1 and 2, hepatitis B and C, and syphilis.

SANBS operates in eight of the nine provinces in South Africa and is responsible for the delivery of transfusion services to 87% of patients in the country. The Western Province Blood Transfusion Service (WPBTS) provides blood to patients in the Western Cape. The National Health Act requires a single national blood transfusion service. SANBS, WPBTS and the National Department of Health (NDOH) are discussing the way forward to comply with the provision of the National Health Act. FY 2008 funding to SANBS will be used to support processes in support of this merger.

In 2005, SANBS was confronted with a major challenge to implement a new blood safety risk management policy. The previous policy which was based on using race as a major indicator of blood safety was unacceptable to the NDOH. SANBS developed a new blood safety policy, the Donor Status Risk Management Model. This policy is based on the knowledge that repeat, regular blood donors are less likely than first-time donors to donate blood in the infectious window period. The model is supported by the introduction of individual donation nucleic acid test (ID-NAT) screening of all donations for HIV, HBV and HCV and an extensive structured donor education, selection and exclusion program. The new risk model was successfully implemented in October 2005. New operational systems, training programs for staff, standard operation procedures, adaptation of the operational IT system, and the inclusion of measurement systems for monitoring and evaluation have been implemented and refined since then. This was a very significant achievement that has been supported by the SANBS PEPFAR program.

The success of the Donor Status Risk Management Model can be judged from the findings for the period October 2005 to March 2006. During this period a total of 277,920 units of blood were procured. Of these donations 56% were from regular, repeat donors who provide very low-risk donations that were used for the manufacture of components. Red cells were issued from donations of repeat donors; these donors provided 29% of the blood supply. The higher risk blood, used primarily for the preparation of fresh frozen plasma, made up the balance. The prevalence of HIV in the donor groups differed significantly: component donations 0.011%; red cell donations 0.057%; and the plasma donations 0.53%. Estimating the number of undetected HIV positive units in the blood supply by a window period incidence model calculated that about three HIV window period donations may have entered the blood supply during this period. This indicates that the Donor Status Risk Management Model is equivalent in terms of blood safety to the race indicator model used in the past. The outcomes of the risk model, however, have to be monitored carefully, will need refinement and must be adjusted appropriately. The impact of the Donor Status Risk Management Model on blood safety, the measurement of outcomes and the optimization of the model will be a major component of the SANBS PEPFAR program.

In 2007, SANBS has spent considerable effort in planning and implementing strategies to expand the donor pool in light of the revised risk model. SANBS has coordinated with the NDOH and the Department of Education to provide prevention education to potential young donors that will assist them in protecting themselves from infection and will result in their being “certified” as committed safe regular donors. PEPFAR resources will also be used to develop cultural and language-specific donor recruitment and HIV educational materials.

In 2008, SANBS will utilize PEPFAR funds to expand and make its donor base more representative of the demographics of the country. This will be achieved by establishing four new donor clinics in geographical areas previously not serviced by the organization. Recruitment and educational materials that are language and culture specific and appropriate for the target donor population will support the program. Through this effort, prevention messages will be developed focusing on the relationship between lifestyle and safe blood, the need for blood by patients and the importance of societal involvement in this “gift of life” relationship between donor and patient. The outcome of the program will be measured by donor recruitment and retention, and HIV prevalence in donors. PEPFAR resources, leveraged with existing SANBS infrastructure and collaborative funding, will continue to strengthen SANBS information technology systems and training of donor recruiters, HIV counselors, technicians, quality officers, and internal and external healthcare providers. In the future, SANBS plans to link with other PEPFAR partners specifically working in ARV services to improve the referral network for persons who test positive.

The American Association of Blood Banks (AABB), another Track 1 partner, provides technical assistance (TA) to SANBS. SANBS has reported that the TA provided by AABB has been of high quality and AABB has especially played an important role in the development of the new risk model in South Africa. In FY 2008, AABB will focus on establishing an accreditation program for SANBS, improving training activities, strengthening the IT system, and providing TA on policies and guidelines.

The blood safety activities represent an integrated program which contributes to objectives delineated in the USG Five-Year Strategy. PEPFAR will support incorporation of messages regarding prevention, treatment and care into blood donor programs, and blood safety issues will be addressed in HIV and AIDS communication programs.

No other major donors are working directly in blood safety at this time.

Program Area Downstream Targets:

3.1 Number of service outlets carrying out blood safety activities	4203
3.2 Number of individuals trained in blood safety	2420

Activity Narrative: SUMMARY:

The South African National Blood Service (SANBS) program aims to ensure an adequate supply of safe blood. This includes expanding the Safe Blood Donor Base by donor education and selection, training donor and technical staff, logistics management, and appropriate information systems. The major areas of activity are donor and blood user education and strengthening the technical and information systems infrastructure. The target population is potential blood donors.

BACKGROUND:

SANBS collects 750,000 units of blood per annum providing blood to eight of the nine provinces. The other service, Western Province Blood Transfusion Service (WPBTS) collects 120,000 units per year serving the Western Cape Province. SANBS is a leader of blood transfusion in Africa and supports by training and technically the blood services of the Southern African Development Community (SADC). The National Health Act requires a single national blood transfusion service. SANBS, WPBTS and the Department of Health are discussing how best to comply with legislation. SANBS, utilizing PEPFAR, has shared educational material with WPBTS, standardized the self-exclusion donor questionnaire, supported the continuing professional development of staff and developed the PEPFAR indicator tool as a national measuring system. FY 2008 funding to SANBS will support the merger by strengthening the bonds between the services in the fields of blood safety, staff training and donor education.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Expanding the Donor Base

The focus of this activity is to expand the donor base by including younger and more demographically representative population groups. Blood safety is achieved by donor education and self-exclusion of those at risk of HIV exposure. This activity will consist of several sections: (a) The donor education and communication materials have been revised and included in the donor educator and recruiter training materials. These materials will be made culture-specific and translated into the indigenous languages to facilitate the expansion and demographic diversity of the donor base. (b) A donor education guideline for the Muslim community has been approved by an Islamic fatwa. This will be implemented in FY 2008. (c) A key program focuses on educating and recruiting young donors. Prospective donors will be exposed to a special scholar donor education program approved and in harmony with those of the Departments of Education and Health, and the HIV and AIDS Directorate. Scholars at selected pilot schools will be educated on lifestyle and HIV transmission, including the role of Abstinence and Be Faithful (AB), and the impact of lifestyle on blood safety. Education also addresses the importance of blood donation, and the use and need of safe blood. The Club 25 project was started in FY 2006 and is continually being refined and evaluated. In FY 2007 the program was expanded to other African countries. The model is based on education of particularly scholars and their commitment to remaining regular safe blood donors (donate 20 units before the age of 25). The results of laboratory screening tests will be disclosed to them and the message of safe lifestyle, and the benefits of being a donor reinforced. This is optimized by one-on-one interviews by trained nursing sister counselors. Trained donor educators offer course by lectures supported by pamphlets, information leaflets and booklets. In FY 2008 the program will be institutionalized in as many schools as possible. A further 50,000 scholars in FY 2008 will be exposed to the Club 25 program. (d) A donor deferral guideline has been developed for training of and use by the 100 tele-recruiters allowing them to professionally inform blood donors. (e) A pilot project to expand the SANBS donor base aims at entering into partnerships with private companies. SANBS has formed a successful partnership with Daimler Chrysler SA. This initiative will be expanded and new partnerships fostered in FY 2008. (f) SANBS will continue to refer HIV-infected donors to PEPFAR-supported ARV sites. SANBS will link with PEPFAR AB partners to optimize the education of the youth on safe lifestyles. (g) FY 2008 activities will include donor recruitment and educational programs at the four clinics established in 2007 in black communities. The donor programs will focus on safe lifestyle and the relationship to safe blood, and the need for blood donors. The results of laboratory screening tests will be used to reinforce the message of safe lifestyle, the role of AB in avoiding sexually transmitted infections, and the importance of blood and donors.

ACTIVITY 2: Training

This program focuses on developing training courses and materials for SANBS and WPBTS staff. These materials will be offered in the seven operational zones of SANBS, and WPBTS. Training focuses on human capacity development and addressing skills shortages. The 40 technicians enrolled in the program to qualify as technologists at a tertiary institution will continue in FY 2008. Training programs for technicians, technologists, and donor education and recruitment staff will be continued. Sixty trainee phlebotomists will be trained and registered with the Health Professionals Council of SA as Phlebotomy Technicians. Fifteen trainers from all provinces will be trained in the train-the-trainer program The distance learning material developed in FY2005-2007 will facilitate in FY 2008 the training of SANBS and WPBTS staff. The distance learning program is strengthened by the videoconferencing equipment purchased in FY 2007. The national and regional Training Center commenced in FY 2007 will be fully established in FY 2008 and all aspects of the program assessed and overseen by a professional educator. SANBS and WPBTS staff will continue to host seminars, workshops, symposia and lectures in the discipline of transfusion to internal staff and external health practitioners. As part of the AABB PEPFAR Technical Assistance program, two SANBS staff members, one each from the donor and technical areas will attend a specialist high-level training course at Emory University. SANBS in FY 2007 assisted in the development of a certified course in clinical transfusion medicine at the University of the Free State. SANBS will in FY 2008 participate in the delivery of the theoretical and practical course material. The course content is suitable for students of other African countries. Central to staff development is job satisfaction leading to better retention of staff. The staff development program is complemented by performance management and reward with clear career paths.

ACTIVITY 3: Regional Reference Center and Plasma Repository

SANBS annually screens more than 700,000 blood donations for HIV, HCV and HBV. In FY 2007 a plasma repository of viral positive plasma has been established in a facility funded by SANBS. This will in FY 2008/9 be expanded to a regional reference laboratory. This facility will satisfy the needs of the Southern African region for an external quality assessment program. The plasma repository will be fully characterized,

Activity Narrative: and aliquots distributed to participants in an African External Quality Assurance System. Analysis of performance of blood services will enhance national blood safety. The plasma repository is a unique resource for African transfusion services and could be used to assess blood screening systems, investigate the sensitivity and specificity of tests and their impact on the window period, and the identification of new infectious agents. The technologist who will lead this program in August-October 2007 will be trained at the Blood Research Institute in San Francisco.

ACTIVITY 4: Data Warehouse

The SANBS data warehouse will be fully operational by end FY 2008. It is an essential component of the information system and will be used for the management and evaluation of all components of the blood system. In FY 2008 the data warehouse will include the data of WPBTS. This will make it possible to utilize the PEPFAR indicator tool to assess and improve the blood system of South Africa.

ACTIVITY 5: Western Province Blood Transfusion Service (WPBTS)

FY 2008 COP activities will be expanded to focus on the merger of SANBS and the WPBTS. Activities will be implemented for a step-wise incorporation of WPBTS into the SANBS PEPFAR program focusing on training and personnel development, establishment of a training centre, and by developing appropriate information technology systems for the collection of national data as an indicator of the status of blood transfusion in South Africa. WPBTS will also utilize PEPFAR funding to expand their base of safe donors by establishing more mobile clinics. This will be facilitated by acquiring a specially fitted vehicle. WPBTS will play a key role in the development of the web-based training system and the WPBTS will be incorporated into the SANBS staff capacity building, on-site training and continuing professional development programs.

Funding Source:	Central GHCS (State)	**Program Area:**	Medical Transmission/Blood Safety
Budget Code:	HMBL	**Program Area Code:**	03
Activity ID:	7926.08	**Planned Funds:**	$500,000
Activity System ID:	13381		

Activity Narrative: SUMMARY:

The American Association of Blood Banks (AABB) has been awarded Track 1 funding to continue providing technical assistance to the South African National Blood Service (SANBS) for purposes of strengthening the blood supply in South Africa. The focus of this activity is to achieve substantial improvement in the affected transfusion services and their infrastructure, and to improve transfusion safety. The ultimate goal is to effect significant change in the incidence of transfusion-transmitted HIV.

BACKGROUND:

The AABB cooperative agreement funds technical assistance for 5 of the 15 PEPFAR target countries. AABB has provided technical assistance to SANBS for the past three years.

ACTIVITES AND EXPECTED RESULTS:

ACTIVITY 1: Training

Training activities will focus on building human capacity and addressing the skills shortage in SANBS. AABB will assist in quality improvements in training of trainers, training delivery, and documentation of training, as well as operational activities to improve performance and knowledge of SANBS staff. In order to facilitate knowledge and skills transfer, AABB will provide SANBS with AABB membership and facilitate key personnel to attend the AABB Annual Meeting.

ACTIVITY 2: Incorporation of Western Province Blood Transfusion Service (WPBTS)

AABB will assist SANBS in the incorporation of the WPBTS into the SANBS PEPFAR program. This will be accomplished by focusing on training and personnel development, and through the development of appropriate information technology systems for the collection of national data as an indicator of the status of blood transfusion in South Africa.

ACTIVITY 3: Establishment of Training Center

AABB will assist SANBS in establishing an international training center for blood center operations and transfusion services. Following a comprehensive evaluation of the current process of training throughout SANBS, AABB will assist in implementation of recommendations to improve the overall training process throughout SANBS. Once this is established, AABB will assist SANBS in expanding the training center to provide training opportunities to other African countries.

ACTIVITY 4: Policy and System Strengthening

Currently SANBS is self-regulated but they would like to move towards developing an external accreditation program. AABB will assist with the establishment of the accreditation program to provide more objectivity on the operations of SANBS. AABB will also participate in the development of South African national blood policies, especially regarding notification of blood donor test results.

ACTIVITY 5: Information Technology Systems

SANBS rolled out the Meditech operational (information) system with technical assistance from AABB. This will allow the management of the blood donor base, analysis of the effectiveness of donor education and selection programs, risk management and the optimal management of the blood inventory. AABB will continue to provide technical assistance as it is rolled out to all regions. AABB will also assist with the development of M&E systems and Quality Management Systems data reporting for purposes of monitoring improvement to blood safety and blood services operations. By providing technical assistance to SANBS, AABB will help to ensure that the blood supply is safe and meets the blood supply needs in South Africa. Building local capacity will also ensure the sustainability of SANBS programs.

HMIN - Injection Safety

Program Area: Medical Transmission/Injection Safety

Budget Code: HMIN

Program Area Code: 04

Total Planned Funding for Program Area: **$2,223,732**

Estimated PEPFAR contribution in dollars	$0
Estimated local PPP contribution in dollars	$0

Program Area Context:

Statistics indicate that the average number of medical injections per person per year in South Africa is 1.5. In addition, all South African facilities that use syringes for patient care use single use and sterile syringes, that is, those observed to come from a new and unopened package. The PEPFAR program in South Africa aims to address issues of medical transmission of HIV through the Track 1 Making Medical Injections Safer (MMIS) project led by the John Snow Research and Training Institute, Inc. The goals of this project are to:

(1) Improve injection safety practices through training and capacity building;
(2) Ensure the safe management of sharps and waste; and,
(3) Reduce unnecessary injections through the development and implementation of targeted advocacy and behavior change strategies.

The project's three main programmatic areas are logistics, waste management, and behavior change communication. Training on these issues, its core activity, is provided to professional and non-professional staff. The project works at national, provincial and district government levels and is present in all nine provinces of South Africa. Buy-in from the South African Government (SAG), partnerships with local organizations as well as synergies with other PEPFAR projects have been used to ensure sustainability and rapid scale-up. A multi-pronged approach is used in training and consists of providing in-service and on-the-job training to three different levels of workers: senior management, middle managers and clinical personnel, as well as waste handlers, as a short-term approach. JSI/MMIS is planning to conduct pre-service training with the incorporation of injection safety content in the curricula for nurses, doctors and other professionals.

The National Department of Health (NDOH) with input from MMIS has developed national policy guidelines on Infection Control and Prevention. In addition, the project is working with the NDOH on an agreed set of norms and standards for injection safety. An accreditation process to assess compliance to these has been planned with the Council for Health Service Accreditation of Southern Africa. These processes will comply with evaluation activities conducted by the first national injection safety survey.

The NDOH Quality Assurance and Environmental Health units will institutionalize the adapted version of the "DO NO HARM" manual as the country's primary reference manual for training in injection safety. Sustainability is achieved by leveraging support from local partners. To date, MMIS has garnered support from the Democratic Nurses Organization of South Africa; Khomanani (the South African Government's HIV and AIDS Information, Education and Communication (IEC) Campaign); Excellence Trends (a private firm consulting in waste management); and the Basel Convention for the completion of a number of deliverables such as training, and printing and disseminating of IEC material. In addition, MMIS works with South African provinces and municipalities to plan allocations for current JSI-related costs through the SAG Medium-Term Expenditure Framework.

The MMIS South Africa team has made significant progress since its inception. The team provided input to the National Policy on Infection Control, specifically the chapters on Injection Safety and Waste Management. Secondly, systems are being implemented to procure personal protective equipment for waste handlers in two provinces, the Eastern Cape and Western Cape. Thirdly, MMIS South Africa and MINDSET Health Channel have collaborated to relay injection safety information to over 200 facilities (public hospitals and clinics) across South Africa, using a computer-based multi-media platform. An external evaluation has established that this technology significantly increases knowledge levels among users. Lastly, MMIS has recently conducted a national baseline assessment of injection safety in hospitals.

Improving injection safety and proper waste disposal practices are vital systems-strengthening activities for the over-burdened health system. These activities further the USG Five-Year Strategy by supporting both an increase in health system capacity and quality of care.

No other major donors are working directly in injection safety at this time.

Program Area Downstream Targets:

4.1 Number of individuals trained in medical injection safety	7950

Custom Targets:

Table 3.3.04: Activities by Funding Mechansim

Mechanism: Safe Medical Practices

Prime Partner: John Snow, Inc.

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: Central GHCS (State)

Program Area: Medical Transmission/Injection Safety

Budget Code: HMIN

Program Area Code: 04

Activity ID: 2945.08

Planned Funds: $2,223,732

Activity System ID: 13951

Activity Narrative: SUMMARY:

The Making Medical Injections Safer (MMIS) project conducted by John Snow Research and Training, Inc. (JSI) aims to bring about an environment where patients, healthcare workers and the community are better protected from the transmission of HIV and other blood-borne pathogens through medical practices. The project targets healthcare workers and the population at large. Emphasis areas include training and human resources, development of policy and guidelines as well as commodity procurement.

BACKGROUND:

The project's initial stages have moved from a pilot to a full geographical scale implementation by its mid-term. The review conducted in 2007 and its findings will guide implementation of priority interventions towards the second half of the funding cycle building up to September 2009. To this effect the fiscal year FY 2008 will focus on ensuring that the remaining resources allocated to this project are used to maximize the opportunities to lower risks of transmission. To this end a particular focus will be placed on linking current injection safety activities to phlebotomy. Discussions to this effect have been embarked upon with the NDOH unit responsible for the coordination and implementation of the country's Comprehensive Plan for HIV and AIDS Care, Management and Treatment as well as the South African National Blood Services (SANBS), a South African organization partially funded by PEPFAR. Such a focus will also strengthen the MMIS project's ability to support the effective implementation of the newly launched HIV & AIDS and STI National Strategic Plan, 2007-2011 in its chapter on Accelerated Prevention.

MMIS in collaboration with the National Department of Health (NDOH) completed the first national injection safety and infection control survey in public facilities in South Africa in 2007. The results indicated that there were gaps in training in the areas of waste management and injection safety. During 2007 MMIS addressed recommendations emanating from this survey through training and ongoing behavior change communication (BCC) activities. The BBC activities address issues such as safe phlebotomy procedures, the appropriate use of multi-dose vials, reducing the current rate of recapping of needles after injections, the overflowing of sharps containers and other survey findings requiring attention and action. The NDOH and the KwaZulu-Natal Department of Health have retractable syringes available on the national and provincial tenders, adopting them for use and making sustainable financial allocations from the fiscus to cover related costs in their Mid-Term Expenditure Framework spanning 2007-2009.

A similar approach remains an option for the other provinces as far as the national tender is concerned and MMIS will continue to play an advocacy role towards such policy decisions to be considered in the interest of self-sustainability.

ACTIVITES AND EXPECTED RESULTS:

ACTIVITY 1: Healthcare Workers' Training

More healthcare workers will be trained in FY 2008 to reach the target of 3,975 set for the said fiscal year. Senior and middle managers, clinical staff as well as waste handlers will be trained to increase the public health sector's capacity in injection safety and infection control. This will continue to be done in partnership with organizations such as MINDSET Health, BroadReach Health Care and the Democratic Nurses' Organisation of South Africa. Following discussions initiated in FY 2007, MMIS will together with other PEPFAR funded projects continue to work towards the improvement of monitoring tools aimed at measuring the use and effectiveness of its tele-education through the MINDSET Health Channel. The project is not intending to provide additional support towards the expansion of the said channel but will benefit from such expansion (as made possible by the South African Government as well as other PEPFAR partners) as these will increase the reach and accessibility of MMIS Injection Safety content to additional health facilities in the country. The current reach of the Mindset Health Channel covers 300 facilities, 79 of which were connected by JSI through its MMIS project. The rest of the facilities networked with PEPFAR partners as well with individual provincial departments of health. In addition, the project will continue to work closely with the NDOH's Quality Assurance and Environmental Health Directorates to have trainers trained during past fiscal years cascade the training in their districts and facilities. Training of trainers will also take place together with an increased focus on phlebotomy. MMIS trained more than 2,000 healthcare workers in FY 2007.

ACTIVITY 2: Behavior Change Communication

FY 2008 funds will be used to continue to disseminate educational materials to healthcare workers and the communities they serve. The community outreach program will form part of the South African government's Khomanani campaign whereby community outreach workers visit 100,000 persons each month to disseminate health information. From FY 2008, MMIS content will officially become part and parcel of this campaign, at no additional cost from JSI. The visits will not only serve to educate and inform community members, but safety boxes for disposing of used medical injections at home will also be distributed where necessary.

ACTIVITY 3: Logistics and Procurement.

MMIS finalized a national Logistics and Procurement strategy in 2007. The key focus of the strategy is to increase sustainability in provinces and local government efforts to acquire commodities such as safety syringes that are now available on national and provincial tenders. Where needed, JSI will use PEPFAR funds as bridging funds to ensure transition to this effect. In Ethekwini such funding will be provided until March 2008 while the municipality goes on tender for sustained procurement beyond this period. In the Free State information from a 2007 analysis will be used to procure protective equipment for healthcare workers in FY 2008 to ensure an uninterrupted supply. In addition, special courses for logisticians and senior managers will be run to address weaknesses related to ensuring the uninterrupted supply of commodities such as sharps containers. Such courses will aim to increase skills and competencies for effective and efficient stock management for the first target group. They will also be aimed at improving contract management skills for the latter.

ACTIVITY 4: Norms and Standards.

Activity Narrative:

MMIS will work with the NDOH and the Council for Health Service Accreditation of South Africa to implement norms and standards on injection safety policy and waste management. A supervision check list will be developed to allow the structuring of mentoring and supervision of activities related to injection safety and infection control in healthcare facilities.

The Making Medical Injections Safer activity contributes to meeting the vision outlined in the USG Five-Year Strategy for South Africa by strengthening the health sector's capacity to provide safe medical injections and thereby represents an important prevention activity. It is a sustainable program that it is building human capacity and working closely with the South African government to implement long-lasting policies for injection safety. It also supports PEPFAR's goals of preventing seven million new infections.

HVOP - Condoms and Other Prevention

Program Area:	Condoms and Other Prevention Activities
Budget Code:	HVOP
Program Area Code:	05

Total Planned Funding for Program Area: $22,427,539

Amount of total Other Prevention funding which is used to work with IDUs	$200,000
Estimated PEPFAR contribution in dollars	$0
Estimated local PPP contribution in dollars	$1,134,500

Program Area Context:

With an HIV prevalence of 16% in the population aged 15-49, most new HIV infections in South Africa occur in the general population, outside those groups usually considered to be most-at-risk populations (MARPs). Even in such a generalized epidemic, however, prevention for MARPs remains a key priority, especially interventions targeting commercial sex workers (CSWs) and their clients, men who have sex with men (MSM), injecting drug users (IDUs), the uniformed services and incarcerated individuals. A recent study documented very high HIV infection rates among drug-using CSWs and MSM, and among IDUs in major cities. Limited available data suggest that infection rates among some sex work populations exceed 65%.

At the same time, in the South African context, there are many subgroups within the general population that are at significantly elevated risk of acquiring or transmitting HIV. Among these are migrant and mobile populations, including miners, farm workers, informal traders and persons who live and work along transport corridors. In a recent study, migrant men had HIV prevalence rates double that of non-migrants. Over five million people living with HIV, many of them likely to have discordant partners, are a priority for secondary prevention.

Young women represent one of the highest priorities and greatest challenges for HIV prevention in South Africa. Not only is HIV incidence and prevalence extremely high among young women, recent research also indicates that their probability of acquiring HIV from exposure to a single infected partner is incredibly high. A recent study reports high levels of sex partner turnover for both young adult men and women. Coerced sex, especially involving young girls, has been associated elsewhere with increased risk of HIV, and is a widespread problem in South Africa. Many men and women abuse alcohol, which contributes to behavioral disinhibition, sexual violence, and HIV risk.

Certain geographic settings are also associated with higher risk behavior. Formal sex work is concentrated in inner cities, mining and border areas, and along major truck routes. Urban informal settlements have the highest HIV prevalence and incidence of any geographic setting. Eleven districts in three provinces have exceptionally high rates of HIV and appear to contribute disproportionately to the national epidemic.

While male circumcision can provide significant protection against HIV for both circumcised men and their female partners, rates of circumcision in South Africa—about 30%—appear too low to provide population-level protection from HIV.

Recently, the South African Government (SAG) launched the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP), with the goal of reducing new HIV infections by 50% by 2011. The NSP emphasizes improved access to male and female condoms, especially for 15-25 year olds, and to services for sexually transmitted infections (STIs), post-exposure prophylaxis (PEP), and counseling and testing. Other priorities are to address gender-based violence and prevention for MARPs (see important text on gender in comments box). The SAG makes male and female condoms widely available free of charge, and provides broad-based public education about condoms. The trucking industry, major transportation corridors and other migrant labor are also priorities for the SAG. The SAG is also giving consideration to providing safe circumcision services.

The USG Five-Year Strategy mirrors the SAG strategy in calling for expansion of prevention programs focusing on high-transmission areas, most-at-risk populations, and workplace efforts. Consistent with the SAG, the USG supports a comprehensive ABC approach, with linkages to HIV testing and care.

USG funding complements assistance from other donors. The USG and many donors co-fund Soul City's mass media and outreach activities. The Global Fund also co-funds several USG community outreach partners, and supports condom distribution and workplace programs through several NGOs. DFID/United Kingdom supports the SAG's free distribution of condoms and STI management. Sweden co-funds a comprehensive regional prevention program in the transport sector, together with the International Organization for Migration, the European Union, and the private road freight industry.

A review of the USG South Africa prevention program in 2007 highlighted the need for a more comprehensive and strategic approach, together with increased coverage and intensity of interventions for key at-risk populations. In particular, the review highlighted unmet needs for prevention among MARPs, young women in their twenties—especially those engaged in informal transactional sex, migrants and other mobile populations.

The FY 2008 COP budgets $24.7 million for 39 activities in the Condoms and Other Prevention program area. This includes significant resources, including additional FY 2008 funding, to expand existing programs and initiate new activities in response to the recommendations discussed above. With FY 2008 funding, the USG will significantly expand coverage of key MARPs, with an emphasis on formal and informal sex work and MSM. The USG will significantly increase support to NGO consortia in three major cities that provide linked drug treatment and comprehensive prevention and other HIV services for drug-using MARPs, and will broaden this activity to include non-drug using MARPs. In addition, a new activity will support development of a systematic framework for MARPS programming, and expand such programming to other "hot spots" utilizing formative research, mapping, and size estimation for different MARPs. These activities will emphasize targeted outreach and prevention education, linked to MARP-friendly STI, HIV counseling and testing, care and treatment services. The USG will continue to support ongoing prevention efforts in correctional facilities, and with sex workers and clients in inner city Johannesburg and selected mining communities. The USG will also continue to assist the South African Department of Defense in providing comprehensive coverage of the armed forces, with special attention to the role of alcohol in sexual risk-taking.

The USG will also expand programming for alcohol abuse. The new MARPs activity will include development of interventions to promote responsible drinking and adoption of HIV preventive behaviors, with a focus on bars, taverns and shebeens that are venues for meeting casual sex partners. Education on the role of alcohol in risky behavior will also be integrated into many of the initiatives described below.

A second major new activity will intensify prevention for migrant and mobile populations. The design of this initiative will be based on an assessment of priority needs in informal settlements, commercial farms, mining, transportation and border areas, recognizing that each of these localities and populations involve sector-specific risks and vulnerabilities and require distinct approaches. The USG will also seek opportunities to partner with the private mining, farming, and trucking sectors.

Another major new initiative will target the 11 “high transmission” districts, with a focus on adult male behaviors and the vulnerability of young women. Intervention design will draw on recent qualitative research on the drivers underlying multiple partnerships. Behavioral messages will emphasize partner limitation and consistent and correct use of condoms as key strategies for risk reduction. The USG will explore economic empowerment approaches to address the contextual factors that make it difficult for young women to adopt safer behaviors. Parallel activities will target the male attitudes, norms and behaviors that sustain sexual networks and drive concurrency and high partner turnover.

The USG’s overall approach to prevention with positives will be to integrate behavior change counseling into a comprehensive preventive package provided to all HIV-infected individuals through facility, community, and home-based care and treatment programs. To advance positive prevention, FY 2008 Other Prevention funds will support formulation of policy and guidelines by the SAG, and piloting of various community and facility-based intervention models.

PEPFAR will continue to scale up and improve PEP services for rape survivors through the network of Thuthuzela Care Centers and other appropriate networks, in partnership with the Presidential Women’s Justice and Empowerment Initiative. The USG will build on a previously developed best practice model that provides multi-sectoral, comprehensive care by linking the health, social service, police and justice departments, and expanding community education about PEP.

PEPFAR is in ongoing consultations with the SAG and UNAIDS on male circumcision (MC). FY 2008 funds are budgeted for an MC technical advisor at the National Department of Health, development of policies and guidelines, provision of safe clinical male circumcision, and creating and disseminating prevention messages in the context of MC. Training and service delivery activities will not be launched unless the SAG provides official approval.

Several partners are working in tertiary institutions; the USG will work with these partners to ensure that there is no overlap and that there is a strategy developed for addressing this population.

The USG will continue to complement abstinence and faithfulness-focused prevention efforts with education about consistent and correct condom use, delivered through both community outreach and mass media programs. USG-supported HIV and AIDS workplace and community-based programs will adopt this comprehensive approach to address risk-taking by adults and older adolescents in the general population. The USG will also continue to build SAG capacity to better manage condom procurement and distribution.

Program Area Downstream Targets:

5.1 Number of targeted condom service outlets	2877
5.2 Number of individuals reached through community outreach that promotes HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful	6014877
5.3 Number of individuals trained to promote HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful	48828

Custom Targets:

Table 3.3.05: Activities by Funding Mechansim

Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	3552.08	**Planned Funds:**	$824,500
Activity System ID:	13970		

Activity Narrative: SUMMARY:

The HSRC is using PEPFAR funds to implement and determine the effectiveness of two prevention-with-positives interventions to reduce HIV transmission risks for their partners.

The prevention-with-positives (PwP) activity will adapt and pilot an existing CDC intervention for promoting HIV status disclosure and behavioral risk-reduction strategies among people living with HIV (PLHIV). This intervention is known as Healthy Relationships. It is a support-group-based intervention designed to reduce HIV transmission risks for people living with HIV (PLHIV) and their partners using an interactive approach that includes educational, motivational, and behavioral skill building components. Once this intervention has been piloted, a second individualized intervention will be developed and pilot-tested for effectiveness. Both interventions will include messages on condom use for PLHIV. The major emphasis area for the activity is gender and human capacity development. Target populations include men and women of childbearing age, National AIDS Control Program staff, HIV-infected pregnant women and health care workers, doctors, nurses, community-based organizations (CBOs), faith-based organizations (FBOs) and non-governmental organizations (NGOs).

BACKGROUND:

Among adults, the predominant mode of HIV transmission in South Africa is through heterosexual intercourse. PLHIV are an important group to target for HIV prevention activities (both to prevent re-infection with other HIV strains, and to prevent transmission to others), but to date prevention in this group has received little attention. Behavioral risk-reduction interventions targeting PLHIV will reduce new HIV infections and will complement behavior change prevention, including condom usage, efforts currently targeting uninfected people. Until now, people who knew they were infected with HIV had been largely ignored by HIV risk-reduction strategies in South Africa. There is an urgent need to develop behavioral and other supportive interventions to assist PLHIV to manage sexual situations, avoid acquiring new sexually transmitted infections, and to prevent the transmission of HIV to uninfected sexual partners. For behavioral risk-reduction to be successful among PLHIV, de-stigmatization must be an integral part of the intervention. Although there is also a need for broad-based stigma-reduction interventions at a community/population level, interventions for PLHIV can assist in managing the adverse effects of HIV-related stigma, including the hazards of disclosure of their HIV-infected status. The Healthy Relationships intervention is a small (support) group-based intervention which has been packaged and disseminated as part of CDC's Replication Project (REP). It has been implemented successfully in several U.S. states as part of an initiative by the CDC to provide HIV prevention interventions for PLHIV. This intervention has been adapted for local conditions and materials have been translated into isiXhosa, the predominant local language in the Eastern Cape. A second individualized intervention is being considered as many PLHIV have not yet reached a point when they are willing to disclose their status to others (including other PLHIV). The second intervention will focus on individual (one-on-one) positive prevention activities.

ACTIVITIES AND EXPECTED RESULTS:

This activity was in the FY 2006 COP and FY 2007 COP, but implementation has been delayed due to late receipt of funds. The HSRC will use PEPFAR funding to adapt and implement the Healthy Relationships Program in the area around Mthatha in South Africa's Eastern Cape province. Funds will be used to employ ten support group facilitators and an administrative staff person to undertake formative evaluations at baseline and at one, three and six months after enrollment, and to develop or purchase training materials and videos. Each group of ten PLHIV participating in the Healthy Relationships intervention will attend five sessions of two hours each over a one to two month period. The effects of the intervention will be evaluated using before and after comparisons, and by comparisons to PLHIV who have not yet taken part in the intervention. A process evaluation will also be conducted.

The project will establish how well these interventions work in a rural under-resourced South African setting and will also determine the feasibility of scaling-up these interventions in other rural areas with a high HIV prevalence. The interventions will be framed by the challenges PLHIV face in establishing and maintaining satisfying relationships, with special emphasis on strategies for disclosing HIV-positive status to a sex partner. Skills for making effective HIV disclosure decisions will be taught for disclosing HIV status to non-sex partners, particularly family members, friends, and employers. The interventions will also address building skills for reducing HIV transmission risk through behavior change with a particular focus on male norms and behavior. Risk-reduction strategies arise naturally in the context of disclosing HIV status, with different implications for practicing protected and unprotected sex with HIV-infected partners, HIV-negative partners, and partners of unknown HIV status. An advocacy component will be incorporated to train participants to advocate for HIV testing and risk behavior reduction among partners, family members, and friends. In this way, the impact of the intervention will be spread among their social and sexual networks. Participants in both field tests will be assessed at baseline, immediately post-intervention, and at one, three and six months after completion of the intervention. Once the evaluation of these two interventions has been completed, they will be further adapted if necessary and expanded to other parts of the Eastern Cape, including the Kouga LSA. The HSRC will train additional lay counselors and other healthcare workers working in the public sector or for local NGOs, community-based organizations or faith-based organizations, in the delivery of positive prevention interventions, and will undertake monitoring and evaluation of the program.

FY 2008 COP activities will be expanded to include:

The development and adaptation of another PwP intervention, to be delivered as an individual intervention by community health workers. Individual PwP interventions are needed because issues of stigma and fear to disclose one's HIV serostatus may serve as barriers to participation in group-based PwP interventions. The one-on-one intervention will be based on the Options for Health PwP intervention developed by Fisher et al. This intervention will be adapted for use in a rural South African setting, and adapted for delivery by community health workers instead of clinicians (task-shifting). Following a formative phase to adapt the existing intervention in consultation with service providers and PLHIV in Region E of the Eastern Cape, training materials will be modified and translated into the local language (isiXhosa). This new intervention will be implemented and evaluated among 400 PLHIV participating in ART programs or wellness programs in Region E of the Eastern Cape. This individual intervention is likely to consist of 3 one-hour individual

Activity Narrative: sessions with a lay counselor delivered over a 1-month period. Both process and outcome evaluations will be conducted. Participants will be interviewed at baseline, at the end of the intervention, and at three and six months from the start of the intervention to assess the impact of the intervention on risk behavior, and disclosure.

In addition, the Healthy Relationships PwP intervention will be expanded to another geographic region in the Eastern Cape, most likely the Kouga LSA ensuring linkages with the HSRC PMTCT program activities being implemented in that same geographic region. HIV-infected pregnant women will be targeted for this PwP activity. The main purpose of these new activities is to increase the range of evaluated PwP interventions available to accommodate the varying needs of PLHIV and to expand the types of settings for providing PwP interventions, and to scale-up the coverage of PwP programs in South Africa.

These activities will contribute to the PEPFAR goals by developing prevention strategies for PLHIV and their partners, thus having an impact on prevention of new infections. This activity will also contribute to the National Strategic Plan (NSP) goal of halving the incidence of new HIV infections by 2011.

Table 3.3.05: Activities by Funding Mechansim

Mechanism ID:	2803.08	**Mechanism:**	N/A
Prime Partner:	Hope Worldwide South Africa	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Condoms and Other Prevention Activities
Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	12323.08	**Planned Funds:**	$48,500
Activity System ID:	13960		

Activity Narrative: SUMMARY:

HOPE worldwide South Africa (HWSA) will continue to scale up its activities in the other prevention program area to support the expansion of a comprehensive HIV prevention program through a targeted program for people living with HIV (PLHIV) and for most at risk populations. This activity targets people living with HIV and AIDS, adults and mobile populations. The emphasis area for the project is gender, with a focus on addressing male norms and behaviors and human capacity development through in-service and pre-service training.

BACKGROUND:

The FY 2008 funded activities are part of an ongoing HIV prevention program of HWSA, funded by PEPFAR since 2003. HWSA will continue its Other Prevention program activities in Gauteng, KwaZulu-Natal, Western Cape and Eastern Cape provinces to promote and strengthen prevention with positive interventions and prevention messages within its community outreach efforts. With FY 2008 funding, HWSA will expand to new areas, and in particular to peri-urban and rural areas in South Africa. The HWSA prevention program is aligned to the South African Government's (SAG) prevention strategy in its promotion of abstinence, fidelity and the correct and consistent use of condoms (ABC).

ACTIVITY 1: Prevention with Positives

HWSA's Prevention with Positives (PwP) program is an integral part of HWSA's comprehensive approach to care and support counseling and testing (CT) and prevention for vulnerable and at-risk populations. The PwP program aims to provide HIV-infected individuals with supportive services, through group counseling, that will assist participants to minimize the risk of infecting their sexual partners and re-infecting themselves. The PwP activity has been run as part of HWSA's care and support program for a number of years but became a priority for HWSA in FY 2007. Key interventions include educational counseling sessions on disclosure and partner notification, partner reduction and fidelity, consistent and correct condom use, family planning and treatment adherence. In addition, the program links with HWSA's CT services that offer both partner testing and couple counseling. A key target group with this component of the activity will be the identification of, interaction with, and support of discordant couples. The 75 established HWSA support groups, with 15 to 20 members each, are located in five provincial sites in Gauteng, Mthatha, Port Elizabeth, Durban and Cape Town. HWSA counselors co-facilitate group counseling and educational sessions (with trained group members) and provide one-on-one support and referral services. The program will pilot a new training for select support group members that enable them to become PwP mentors. These mentors will serve as "buddies" for newly diagnosed support group members and their families, providing them with intensive one-on-one counseling support and follow-up support. HWSA conducts all services in consultation with the National Department of Health (NDOH), the National Association for People Living with AIDS (NAPWA) and other PLHIV groups.

ACTIVITY 2: Condom Education and Distribution

HWSA prevention facilitators are posted at 45 partner clinics nationwide. These facilitators conduct weekly educational sessions on basic HIV and AIDS information, prevention including, appropriate, correct and consistent condom use. HWSA’s partner clinics typically service a range of individuals including adolescents aged 15-24. Adolescents will also be accessed through work done specifically with a youth clinic in the Western Cape and with youth focused CBOs across the different program sites. This activity also targets mobile populations in informal settlements through work done from the clinics situated in these areas. This activity draws on HWSA's experience in its Men as Partners (MAP) programs and includes sessions which address male norms and behaviors. The program also conducts educational sessions with mobile populations at taxi ranks, bars (shebeens), and shopping centers and other targeted public areas. During these sessions, counseling and testing for HIV and STIs is promoted, demonstrations are conducted and condoms and informational materials are distributed. Condoms are accessed free from the South African Department of Health. Prevention facilitators also provide counseling, referrals to counseling and testing facilities, treatment, post-exposure prophylaxis and gender-based violence services. With PEPFAR funding, facilitators and PwP mentors will receive new and refresher training on general HIV prevention, condom promotion and usage and distribution.

With FY 2008 funding HWSA will seek to expand its OP activities and work towards creating best practice models in both PwP and the promotion of the correct and consistent use of condoms. HWSA will also build into its OP program lessons learnt from the abstinence and be faithful (AB), MAP and parenting empowerment programs and to ensure linkages between these programs.

These HWSA activities will contribute to the PEPFAR objectives of averting 7 million infections, and support the USG PEPFAR Five-Year Strategy for South Africa by improving OP HIV prevention behaviors among youth and adults.

Planned Funds: $520,000

Activity System ID: 13776

Activity Narrative: SUMMARY:
EngenderHealth's Men as Partners (MAP) Program works to reduce the spread and impact of HIV and AIDS and gender-based violence (GBV) by challenging unhealthy gender-related beliefs and attitudes, such as equating masculinity with dominance over women and pursuing multiple sexual partners. The MAP program uses various strategies, including skills workshops, community mobilization, health service provider training, media advocacy and public policy advocacy efforts to achieve its goal of gender norm transformation to reduce the spread of HIV and AIDS and GBV. This transformation will assist men and women to achieve behaviors such as abstinence, being faithful to one partner, correct and consistent condom use (CCC), reducing the numbers of sexual partners, treating women as equals, and circumcision. MAP targets adults, people living with HIV, religious leaders, refugees, teachers, CBOs, FBOs, and NGOs.
BACKGROUND:
Since 1998, EngenderHealth has received USG funding to support CBOs, FBOs and the South African Government to implement MAP. EngenderHealth's core strategy is conducting skills-building workshops on gender norm transformation. Through these workshops, (over 100), MAP develops "transformation agents" (TAs), peer educators who spread MAP messages and skills from the workshops to others in the communities. MAP encourages men to take action in their communities, challenging other men who are practicing behaviors that put them and their partners at risk for HIV and AIDS and GBV. MAP sponsors community education events and the formation of "community action teams" (CATs). MAP produces behavior change communication (BCC) materials which motivate males to address these harmful gender norms. EngenderHealth runs the "I am a Partner" campaign, focusing on defining what men can do be more gender equitable to reduce the spread and impact of HIV and AIDS. Through national campaigns, EngenderHealth engages national private sector, media and government partners to increase the effectiveness of MAP. EngenderHealth coordinates provincial MAP networks, creating a space for lessons among gender activists to be shared, and formulating a platform for national advocacy efforts, such as participating in the development of the South African National Strategic Plan in HIV/AIDS.
ACTIVITIES AND EXPECTED RESULTS
ACTIVITY 1: Tertiary Institutions
EngenderHealth will continue to build the capacity of tertiary institution peer education programs (with partners such as JHU/DrameAidE) to integrate gender norm transformation messages into HIV and AIDS programs of tertiary institutions peer education programs - specially with five institutions in the Western Cape, as well as at least three additional institutions in Gauteng province. These trainings will be offered on a quarterly basis, and at least five staff and TAs will be trained. Emphasis will be placed on skills-building of TAs to reach students on campus, as well as learners in local communities, with messages about CCC, the reduction of sexual coercion, reducing the number of sexual partners, and the prevention issues related to male circumcision. Beyond the training, EngenderHealth will assist in providing ongoing capacity-building assistance on a one-on-one basis, offering on-site and telephonic assistance on a range of management and content issues linked to gender norm transformation and HIV and AIDS.
ACTIVITY 2: School Community Action for Gender Equality
EngenderHealth will continue to capacitate at least four NGOs working with teachers and learners in school-based settings, focusing on the integration of gender norm transformation messages into HIV and AIDS programs. This program will work in priority communities in Gauteng, and KwaZulu-Natal (KZN) Provinces (in KZN, working with PEPFAR partner Mpilonhle). As well, EngenderHealth will work with school-personnel and student leaders to develop their capacity to link MAP messaging into the school curriculum. Similar trainings will be offered on a quarterly basis to staff and volunteers from about 20 selected NGO partners, tailoring specific knowledge and skills to the community-based partner. Typically, these trainings will have 20-30 participants and be 4-5 days. Similarly, more tailored capacity-building assistance will be offered to all the partners in person and telephonically. To help sustain this initiative, major support will also come from other development partners, including private sector entities. Currently, public-private partnerships opportunities are being investigated with the Ford Foundation (secured for NW province); De Beers Mining Company (secured for KZN province); Anglo American Mining Company (pending for KZN province), among others.
ACTIVITY 3: Capacity-building
EngenderHealth will continue building the capacity of at least four NGOs, CBOs, FBOs and private sector partners to integrate gender norm transformation activities related to HIV and AIDS. EngenderHealth will partner with groups based in strategic communities within Gauteng, KZN, and Western Cape Provinces. In addition, private sector partners will be engaged for such educational activities, with cost sharing options being examined. These organizations will be selected based on needs identified by public health indicators, capacity to reach community members, linkages to government funding sources, as well as willingness to integrate gender norm transformative approaches into their current efforts. Specific focus on EngenderHealth’s efforts in Johannesburg will focus on working with refugees. Tailored capacity-building assistance will be offered to all the partners via one-on-one, on-site, and telephonic sessions.
ACTIVITY 4: Government/ Key Stakeholders
EngenderHealth will continue building sustainable partnerships with government institutions at the national and local levels to build capacity related to integrating gender norm transformation and HIV and AIDS activities. In FY 2008, these institutions may include Department of Education, South African Police Services (SAPS), Department of Correctional Services, Department of Social Development and Department of Health. In addition, cost sharing options will be ensured to gain financial support from government institutions. The partnerships will include capacity building of specific units to carry out community mobilization activities linked to male gender norm transformation and HIV and AIDS. Similar trainings will be offered on a quarterly basis from all partners NGOs, tailoring specific knowledge and skills to the content of the community-based partner.
ACTIVITY 5: Clinical/Community Outreach
EngenderHealth will continue to provide direct prevention services on comprehensive HIV messages to men in various settings, including street outreach and in clinical settings. Typically, this program will reach over 250 men and their partners per month via formal and informal talks at clinics and on the streets/parks nearby. EngenderHealth will target specific services in Gauteng. In the Western Cape, EngenderHealth will work with its partners at the tertiary institutions to conduct such talks in the clinics, as well as community outreach programming they are doing in surrounding communities, targeting students in higher education institutions and unemployed men.
ACTIVITY 6: MAP Network
EngenderHealth continues to support the MAP network for information exchange and advocacy efforts. In both the Gauteng and Western Cape Provinces, EngenderHealth will host monthly meetings of its prime partners to exchange experiences and enhance programs. On a quarterly basis, additional key stakeholders representing other NGOs, CBOs, government agencies and general activists will gather to discuss issues,

Activity Narrative: exchange information and develop an advocacy platform on public policies relating to gender-norm transformation, HIV and AIDS and comprehensive HIV messages, including male circumcision, for EngenderHealth's advocacy program to take forward at the national and local levels. EngenderHealth will disseminate male circumcision messaging at the community level and within the MAP network.
ACTIVITY 7: National Campaigns
EngenderHealth will continue to promote comprehensive HIV messages through gender norm transformation via national campaigns. Priorities will be placed in implementing the annual National MAP Week, which motivates EngenderHealth partners to take action and host various community events raising the profile of MAP's messages. Working through national campaigns, EngenderHealth engages national private sector, media and government partners to increase the effectiveness of MAP. Example activities during the week may include community marches and rallies, sports days, men's meetings, school debates and mass media appearances. EngenderHealth MAP staff will collaborate with other NGOs and government institutions to organize additional campaigns related to MAP messages, including 16 Days of Activism on Violence against Women; Youth Month, and Men's Health Month. BCC will be developed to motivate men to transform themselves for gender equality and challenge others men to do so as well. EngenderHealth will also collaborate with various media partners to spread MAP messages via mass media channels.
ACTIVITY 8: M&E
EngenderHealth staff will also continue to conduct monitoring and evaluation activities through process and impact assessments. Each event is documented, as well as knowledge and attitudinal assessments conducted of participants. In FY 2008, EngenderHealth will also finish an impact evaluation study being done in collaboration with Mpilonhle, measuring the effectiveness of MAP strategies in a rural KZN community.

This program contributes to the 2-7-10 goals by increasing the number of men accessing HIV services; increasing the number of men using condoms and reducing their number of sexual partners; and reducing women's vulnerability to HIV by preventing GBV.

Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	7933.08	**Planned Funds:**	$125,000
Activity System ID:	13818		

Activity Narrative: SUMMARY:

The Southern African Clothing and Textile Workers Union (SACTWU) project has received PEPFAR funding in previous years through a sub-agreement with the Solidarity Center, but in FY 2007, SACTWU received direct PEPFAR funding. SACTWU has a well-structured training program, initiated in 1999, that has evolved within the dynamics of the industry and includes basic facts on HIV, AIDS, abstinence, being faithful and condom use. The major emphasis area of the activity is training. Target populations include factory workers and people affected by HIV, HIV-infected adults, especially women, and the business community.

BACKGROUND:

The Southern African Clothing and Textile Workers Union is South Africa's largest trade union organizing textile and clothing workers. It also organizes footwear, leather and retail workers. Hence, SACTWU members form part of the economically active population that has been identified as being the hardest hit by the HIV and AIDS epidemic. Further, around 66% of SACTWU's membership is female, mostly between 20 and 60. The prevention program is a three-level training program that starts with a foundation phase on the basic facts of HIV and AIDS, abstinence, being faithful and consistent and correct condom use (ABC). In FY 2008 the training will focus specifically on the issues of multiple concurrent partnerships, and intergenerational sex. These facts are reinforced and strengthened with the intermediate and advanced modules of training. The intermediate module deals with legal aspects and workplace policy development. In the advanced module, delegates are trained to become trainers, lay counselors and home-based carers. SACTWU also has an HIV and AIDS awareness workplace program where trainers take the training to floor level in 30-minute sessions in the factories. The major emphasis of the workplace program is on prevention. A particular focus of the SACTWU AIDS Program is to create greater gender equity in HIV and AIDS programs and address male norms and behaviors.

SACTWU has a membership of approximately 110,000 members nationally. The SACTWU AIDS Project is a national program that provides prevention and care services in five provinces: KwaZulu-Natal, Western Cape, Gauteng, Eastern Cape and Free State. The SACTWU AIDS Project was initiated in 1998 and developed a national comprehensive program, with an initial focus on prevention. It has matured over the years to the point where it now has a well-structured comprehensive training program, provides "in house" voluntary testing and counseling (VCT) services, access to a social worker in KwaZulu-Natal, runs income generating workshops, provides a primary package of care through the VCT service, and provides home-based care through its regional nurses and a home-based care network in KwaZulu-Natal. The nurses provide some level of support in the home through home visits, but this activity is mainly implemented by the home-based care network of 19 home-based carers who provide ongoing home-level support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

The training program serves as an education program and addresses stigma and discrimination associated with HIV status for all workers, shop-stewards, managers and healthcare staff within the industry nationally. It also serves as an instigator for the demand for the care and treatment services offered through the SACTWU AIDS Project, including counseling and testing, and antiretroviral treatment. With PEPFAR funding SACTWU employs two trainers and a training coordinator fulltime to deliver all prevention programs in-house and achieve set targets. This activity will aim to educate shop-stewards and workers within the industry in the five provinces where the program is active and to address issues of HIV prevention, stigma and discrimination by empowering the delegates and repeatedly reinforcing the facts on HIV. The basic module emphasizes the ABC message of the South African government and aims to prevent new infections. SACTWU also has an intermediate module that deals with the worker's rights and HIV as well as development of workplace policies. Empowering individuals on their rights directly addresses the issue of stigma and discrimination. Workplace training is done throughout the year, but with additional focus in April and December. This training will be expanded in FY 2008 to cover additional sites and services added to the program, including a focus on the issues of children (pediatric HIV care and treatment), and TB.

ACTIVITY 2: Condom Distribution:

The SACTWU AIDS program will distribute male and female condoms. One of the reasons why the epidemic is more prevalent among women is the lack of power of women in the relationship, which impacts on negotiating condom use. By making available the female condom SACTWU allows women additional protection if the male partner refuses to wear a condom. The prevention training is complemented by activities like the condom man campaign as well as using drama to reinforce the prevention message--this helps to get HIV "out of the closet" and make it an interactive and informal discussion. The training focuses on the correct and consistent use of condoms, as per Department of Health training guidelines.

PEPFAR funding will be used for human resources costs related to the prevention program. These activities support the overall PEPFAR objectives of 7 million infections averted.

Table 3.3.05: Activities by Funding Mechansim

Mechanism ID:	274.08	**Mechanism:**	Masibambisane 1
Prime Partner:	South African Military Health Service	**USG Agency:**	Department of Defense
Funding Source:	GHCS (State)	**Program Area:**	Condoms and Other Prevention Activities
Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	2978.08	**Planned Funds:**	$275,000
Activity System ID:	13824		

Activity Narrative: SUMMARY:

This prevention activity mainly addresses workplace programs and includes a spectrum of activities such as mass awareness; peer education on HIV prevention and gender equity through experiential learning and theories of behavior change in adults; substance abuse prevention; training of South African Department of Defense (DOD) members to develop and conduct prevention programs; and reducing stigma and discrimination through guided introspection about participants' sexuality, case studies about people living with HIV (PLHIV) fact sheets addressing myths, and confronting topics such as fear, stigma, isolation, discrimination and marginalization. The primary emphasis area for this activity is training, while minor emphasis will be given to information, education and communication (IEC), strategic information, workplace programs policy guidance, quality assurance and community mobilization/participation. Due to new evidence, safe male circumcision practices will be integrated as part of the HIV prevention program. Target populations include military health workers, doctors, laboratory workers, adults, people living with HIV and AIDS, and out-of-school youth within the military.

BACKGROUND:

Masibambisane is an integrated prevention, care and treatment program in the SA DOD, addressing the management of HIV and AIDS within the Department by interventions that target SA DOD personnel and their dependants. The prevention programs include mass awareness; workplace programs with condom distribution through condom containers in military units and sickbays (container supplies monitored by workplace managers); information, education and training; gender equity and substance abuse programs delivered by social workers, psychologists, occupational therapists, peers and peer educators. The program uses communication and education through a wide range of media such as pamphlets, posters, industrial theater (dramatic plays that address coping with stigma and discrimination in the workplace) and videos.

The overall activities are ongoing and in FY 2008. the activities will be continued and expanded upon by broadening the curriculum and reaching more SA DOD members. The activities are implemented in a decentralized manner in military units throughout South Africa by various role players and coordinated on a regional level by Regional HIV and AIDS Coordinators in the Masibambisane Program. A Knowledge, Attitudes and Practices (KAP) survey (SA DOD, 2006) indicates that there is an overall increase in knowledge about prevention; however work still remains on preventing risk behavior practices related to HIV infection. Community awareness and education programs include celebrations of World AIDS Day and other HIV-related international and national days, exhibitions and displays, sport and recreation activities that focus on HIV prevention and healthy living and unit competitions with HIV prevention as a focus. All HIV training packages are centrally-developed by the SA DOD HIV Advisory Committee and the Social Work Research and Development Department. Training aims are tailored to target groups (i.e. - healthcare workers, peer educators, or occupational therapists).

ACTIVITIES AND EXPECTED RESULTS:

Due to the scope of the program area, the SA DOD will carry out nine separate activities.

ACTIVITY 1: Workplace Programs

Workplace programs will be established through the training of unit commanding officers, workplace program managers and military community development committees. Workplace programs include discussions of safer sex practices with demonstrations of the correct use of male and female condoms and the distribution of condoms via workplace-manager monitoring of condom containers placed in each military unit and military sick bay. Condoms are obtained through the National Department of Health (NDOH) via their distribution mechanism. This activity will be linked with the values and ethics-based intervention in the Abstinence and Being Faithful program area and the gender equity training discussed under Activity 4 in this narrative.

ACTIVITY 2: Peer Education

This activity will focus on peer educator training and training of peers. This includes training during mobilization and preparation for mission readiness as well as training in the operational area. Other components of this program are: knowledge and attitudes about HIV, skills required to act as peer educators, and how to run HIV peer group training. This is accomplished through adult learning. Activities include information about sexuality and occupational exposure to HIV.

ACTIVITY 3: Medical Transmission and Injection Safety

SA DOD will focus on the prevention and management of occupational exposure to HIV infection, including medical transmission and injection safety through the placement of first aid kits in all workplaces, provision of personal protective equipment, training of healthcare workers and cleaning staff on occupational health and safety, and the development and publication of relevant IEC material.

ACTIVITY 4: Gender Equity

This activity will address gender equity and HIV through gender equity training, women empowerment and men as partner projects, workshops, seminars and awareness campaigns on gender equity as well as the development and printing of IEC material in this regard. This activity will be linked with the values and ethics -based intervention in the Abstinence and Being Faithful program area and the peer education and training discussed earlier in this narrative.

ACTIVITY 5: Substance Abuse Prevention

The development of a model and strategy and implementation of a substance abuse prevention program will be the focus of this activity. This will consist of training of line commanders on the link between HIV and substance abuse and a substance abuse summit for services and divisions.

ACTIVITY 6: Brief Motivational Interviewing

Activity Narrative:

Expansion of the pilot study on the use of brief motivational interviewing as a prevention strategy with a particular focus on the prevention of HIV transmission from HIV-infected individuals.

ACTIVITY 7: Information Sharing

Diffusion of innovation through attendance of PEPFAR prevention partner meetings, publications in military and peer reviewed magazines and journals and oral and poster presentations on effective and innovative programs at conferences and seminars.

ACTIVITY 8: Awareness Campaigns

SA DOD will conduct mass awareness activities at the regional level that focus on celebrations of World AIDS day and other HIV-related international and national days, exhibitions and displays, sport and recreation activities that focus on HIV prevention and healthy living and unit competitions with HIV prevention as a focus.

ACTIVITY 9: Male Circumcision

No male circumcision training or service delivery will take place without the express consent of the National Department of Health. In the absence of such approval and based on discussions with the PEPFAR South Africa team, funds could fully or partially be reprogrammed. Should the approval for safe clinical male circumcision activities be given, the following male activities are proposed:

The demand for circumcision must be matched by provision of adequate equipment and training of personnel to conduct safe, voluntary and affordable male circumcision. Increased provision of accessible safe adult male circumcision services should increase opportunities to educate men in areas of high HIV prevalence about a variety of reproductive and sexual health topics, including hygiene, sexuality, gender relations and the need for ongoing combination prevention strategies to further decrease risk of HIV acquisition and transmission.

Four main sub-activities will be included in the HIV prevention program:

-Review of policy on male circumcision in the SA DOD;
- Development of clear, consistent and accurate mass awareness messages that promote safe male circumcision within the context of broader approaches promoting male sexual and reproductive health and responsible sexual behavior;
- Capacity building of health care professionals to provide safe male circumcision services; and,
- Increasing access for the provision of safe male circumcision service delivery.

Training and messaging would be coordinated with the NDOH and with JHPIEGO, EngenderHealth, and the NDOH TBD program on male circumcision.

Program implementation will be supported and supervised through staff visits to the regions and monitoring and evaluation through the HIV and AIDS Monitoring and Evaluation Program of the SA DOD to ensure performance. Most of the activities and interventions are well established and the challenge in this regard is to expand interventions to reach an optimal number of members in the SA DOD. The activities will be scaled-up to reach more dependants; including children of military members.

Activity System ID:	13847		

Activity Narrative: SUMMARY:

Ubuntu Education Fund (Ubuntu) aims to prevent HIV transmission by promoting safe and healthy sexual behavior, and conducting community outreach activities among at-risk youth and adults in high-density, high -poverty areas including informal settlements in the townships of Port Elizabeth, a city in the province of the Eastern Cape, South Africa. Emphasis areas are addressing male norms and behaviors, reducing violence and coercion. Specific target populations are male and female adolescents (ages 15-24), men and women 25 and over, discordant couples, people living with HIV and AIDS, men having sex with men, persons who engage in transactional sex but do not identify as persons in sex work, and street youth.

BACKGROUND:

For the past six years, Ubuntu has provided targeted HIV prevention community outreach activities in the townships of Port Elizabeth. Outreach strategies focus on preventing HIV infection by building skills and promoting health-seeking behavior such as accessing voluntary counseling and testing (VCT) and antiretroviral treatment (ART) and other health services. Ubuntu works with the National Department of Health (NDOH) and the Nelson Mandela Bay Metropolitan Municipality's AIDS Training, Information and Counseling Centre (ATICC) to distribute condoms and promote uptake of health services. Outreach facilitators engage ward councilors in community outreach activities in their areas.

Ubuntu became a PEPFAR partner in FY 2007 and has only recently received funds.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Outreach Messaging

Based on current HIV prevalence rates among people accessing voluntary counseling and testing (VCT) services at clinics in the operational area, the targeted communities are at extremely high -risk for HIV infection, consistently above the already high average prevalence rate of 34.5% for the Nelson Mandela Bay Metropolitan Municipality. Outreach messaging focuses on increasing awareness of personal risk, making knowledge of personal and partner HIV status a relationship norm, increasing knowledge of sero-discordancy in couples, promoting consistent and correct usage of male and female condoms, and improving awareness and uptake of HIV clinical and community support services. With PEPFAR support, Ubuntu will scale up the outreach program with additional outreach workers in FY 2008 to fully reach target communities and increase outreach activities in partner clinics linked to immediate access to VCT. Outreach activity will focus on risk perception around multiple and concurrent partner and as part of incorporating a stronger gender perspective into outreach activities, Ubuntu is partnering with Engender Health to incorporate a 'Men as Partners' (MAP) approach in the community outreach program. MAP outreach will engage boys and men in addressing gender-based violence, reproductive health and encourage their participation as caregivers. Ubuntu will work with other community-based organizations (CBOs) to hold interactive workshops that challenge gender roles impinging on girls and women's rights and exposing them to gender-based discrimination, violence and loss of power. Workshops also break taboos by educating community members about same sex relationships.

The outreach team and volunteers reach 25,000 people per year in KwaZakhele, Zwide, Soweto, Veeplaas and New Brighton. The outreach team maps each target area for clinics, taxi ranks, markets, taverns, and networks with CBOs, support groups, neighborhood structures and community leaders. The program uses a variety of outreach activities to build knowledge and skills, to promote care-seeking behavior and to provide information on how to access local VCT and treatment services. Every week outreach facilitators plan a route through their area that involves (1) door to door campaigns, (2) street outreach, (3) clinic outreach, (4) networking with community peer educators, (5) conducting community workshops, (6) community events, and (7) supplying condom service outlets.

Door-to-door campaigns are conducted by outreach facilitators in identified high-risk, high-poverty areas. Facilitators introduce Ubuntu Education Fund services and engage adults and youth in discussions surrounding HIV and AIDS topics and identify health issues within the household. On-the-spot referrals are common, allowing Ubuntu to access difficult to reach populations.

Street outreach involves meeting individuals and small groups on the street in high-poverty, high-density areas to introduce Ubuntu services and initiate a discussion on HIV prevention issues. Very often these discussions turn into impromptu workshops and discussion groups as people gather. Outreach facilitators are able to ascertain barriers to accessing care, identify areas in the community where information is scarce and utilize this information on an ongoing basis to refine and improve messages. The outreach workers distribute isiXhosa information, education and communication (IEC) material including Ubuntu brochures detailing services, STI and HIV material from Khomanani (the South African government's mass media campaign) and Soul City, referral cards detailing locally available STI/VCT/TB/ART services, and male and female condoms (supplied by the SAG).

ACTIVITY 2: Education Sessions

Every morning facilitators conduct outreach education sessions at primary health clinics; conduct clinic outreach with a focus on VCT, treatment literacy, and living positively. These outreach sessions occur at the following clinics in the target area: Soweto Clinic, Veeplaas Clinic, Zwide Clinic, KwaNdokwenza Clinic, KwaZakhele Clinic, and KwaZakhele Day Hospital. Outreach facilitators conduct outreach in clinic waiting rooms on HIV topics while encouraging people to take advantage of VCT. Uptake of VCT is measured on these days to assess impact.

In each target area the team has cultivated relationships with community opinion leaders and enlisted their support to provide ongoing education to their peers and community members as point people on HIV and AIDS issues in their communities. Community volunteers are community leaders such as ward councilors, heads of neighborhood structures, clients, CBO leaders, and other community stalwarts who have offered to help others access resources and support. Community volunteers are trained in HIV and AIDS topics including transmission, prevention, VCT, and accessing care services. They assist in the identification of vulnerable families for referral into care and support services, and supply condoms with education within

Activity Narrative: their area.

ACTIVITY 3: Prevention Workshops

Every week Ubuntu conducts four to five HIV prevention workshops of 15-20 people each for established community groups, CBOs, (groups, or through networking in specific areas to gather community members. With formal groups there are workshop series over 3-4 weeks on HIV prevention and care.
Topics range from general HIV and AIDS information; STIs, TB and other opportunistic infections; stigma; living positively; and substance abuse, and HIV prevention. The organization focuses on young women in their twenties and adult men who engage in risky behaviors with emphasis on partner reduction. Ubuntu strives to increase involvement of PLHIV; in the workshops, Ubuntu integrates education about the role of alcohol in increasing risk behaviors into programs for adults; youth and high-risk population; and Ubuntu supports a comprehensive ABC approach. Ubuntu also conducts Men As Partners workshops twice every week reaching about 50 men per week.

ACTIVITY 4: Community Events

Every month Ubuntu holds a community event in a different area focusing on VCT uptake and HIV prevention skills. These informal events are late Friday afternoon open-air community gatherings where a DJ gathers a crowd and staff delivers a short presentation on specific HIV prevention topics. Up to 30 Ubuntu staff and volunteers then spread out into the crowd to lead discussions on HIV prevention and available services with small groups, while distributing condoms and IEC materials. Ubuntu holds high impact community events to coincide with national events such as World AIDS Day; Condom Day and an AIDS Candlelight memorial.

Outreach facilitators and community volunteers supply condom distribution points throughout target areas every week. Locations for condom distribution include taverns and restaurants as well as a number of condom service outlets with trained peer volunteers who distribute condoms from their venues or homes with education on correct usage. Ubuntu is a direct distributor of male and female condoms provided by the South African government.

These results contribute to the PEPFAR 2-7-10 goals by improving awareness of the need to know personal HIV status in the target community, improving awareness of VCT services in target area, increasing demand for VCT services, especially among men, increasing consistent and correct condom usage among men and women, reducing gender-based violence among target populations and increasing participation of men and boys in community HIV prevention initiatives.

Table 3.3.05: Activities by Funding Mechansim

Mechanism ID:	519.08	**Mechanism:**	N/A
Prime Partner:	University of KwaZulu-Natal, Nelson Mandela School of Medicine	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Condoms and Other Prevention Activities
Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	3068.08	**Planned Funds:**	$200,000
Activity System ID:	13853		

Activity Narrative: SUMMARY:

The University of KwaZulu-Natal (UKZN) Nelson Mandela School of Medicine (NMSM) is using PEPFAR funds to support the development and implementation of innovative prevention messages specifically adapted to the cultural practices of traditional healers (izangoma and izinyanga) in KwaZulu-Natal (KZN). The major emphasis area for this program is information, education and communication, with minor emphasis placed on community mobilization and participation, human resources, policy and guidelines, quality assurance and supportive supervision, and strategic information. The target population includes traditional health practitioners (THPs) in the private and public sector who are members of the KwaZulu-Natal KZN and Ethekwini Traditional Health Practitioner Councils, and THPs in Ilembe and Umgungundlovu Districts (to the North and West of eThekwini respectively) who are also members of the KZN THP Council.

BACKGROUND:

The University of KwaZulu-Natal (UKZN) has an ongoing collaboration with associations of traditional healers in Ethekwini District, and the larger KwaZulu-Natal (KZN) province. Traditional Healers are extremely influential in KwaZulu-Natal, and are a resource in HIV and AIDS prevention and mitigation at the community level. They are also generally considered to hold conservative attitudes towards sexual practices and abstinence that make them natural partners in HIV prevention efforts. This project provides THPs with the necessary tools and training to act as effective HIV prevention agents. The message of Abstinence, Be Faithful, and Condoms (ABC) has not been entirely successful in the Zulu cultural context. These issues are continuously explored with the THPs in this program and UKZN is constantly developing more effective ways of communicating prevention messages that resonate in the Zulu cultural context. Project training, prevention message delivery and follow-up with the THPs emphasize a clear understanding of the facts of viral transmission in sexual practices and the necessity of barrier methods to prevent viral transmission during sex. THPs work with their patients and the community to change cultural practices (non-sexual) that can contribute to viral transmission, such as blood-letting, scarification (use of razor blades to make incisions for rubbing herbs directly into the bloodstream), and skin puncturing using porcupine quills that are frequently used in an African type of acupuncture. Prevention messages delivered in training courses and follow-up work with THPs emphasize the biomedical facts of viral transmission and the vital necessity of safety precautions to prevent viral transmission in these cultural practices. In FY 2005, with the arrival of PEPFAR funding, NMSM trained 224 traditional healers to deliver HIV prevention messages to their clients and communities. NMSM will implement the project in collaboration with the KZN and Ethekwini Traditional Healer Councils, with the eThekwini Health Unit, and the eThekwini District Health Office of the KZN Department of Health.

ACTIVITIES AND EXPECTED RESULTS:
NMSM will build on English and Zulu language prevention messages developed with the traditional healers by the KZN Provincial Department of Health. This project will also promote the understanding of infectious disease in the traditional healer culture. Engagement with THPs through this project both in training workshops and follow-up work have made it clear that the majority of THPs were previously uncertain about what HIV is, that there is a "virus" that is transmitted, how this virus is transmitted both sexually and through cultural healing practices, and how to prevent this transmission. Similarly most THPs were unclear about what the virus does inside the body, how the activity of the virus leads eventually to AIDS, and what steps could be taken to slow this progression. It was also unclear to most THPs what the relationship was between HIV transmission and other sexually transmitted infection (STI) transmission, and why it was so important to treat and clear up other STI pathologies. In KZN, HIV and AIDS are a heterosexual pandemic, and largely a behavior-driven epidemic. The following activities will be achieved:

ACTIVITY 1: Increasing Uptake of Prevention Messages

NMSM will work to increase uptake of HIV prevention messages from the healers by both genders (increasing gender equity in HIV and AIDS programs), specifically looking into novel ways to instill behavior change ideas into their patients through counseling on the need for prevention. In addition, Traditional Healers have specific practices that include use of scarification to introduce herbs directly into the bloodstream, and use of porcupine quills to introduce herbs through the skin. Both of these practices are discussed in prevention training sessions and modification of these practices to ensure there is no blood to blood transmission of the virus by the razor blades, porcupine quills, or fingers of the THPs is ensured.

ACTIVITY 2: Community Mobilization

THPs will organize Imbizos (community gatherings) with their traditional leaders and or village chiefs in the community. These gatherings will be used to discuss a number of topics including male norms and behavior, including domestic violence in the context of the Zulu culture. Community mobilization/participation will be used to enhance the capacity of traditional healers to deliver prevention messages as they work with their patients and their families. A small number of medical school faculty, support staff and traditional healers will receive salaries in order to facilitate this project. Specifically, they will be responsible for monitoring and evaluation and training.

ACTIVITY 3: Monitoring and Evaluation

Monitoring and evaluation activities will measure the effectiveness of these interventions. Supervision and monitoring will be achieved through regular site visits. Data from these activities will contribute to the development of policies and guidelines for working with traditional healers.

ACTIVITY 4. Building Local Organization Capacity

Local organization capacity development will expand the capacity of the School of Medicine, the Ethekwini and KZN Traditional Health Practitioner Councils. Through regular staff site visits, quality assurance and supportive supervision, the development and implementation of prevention messages will be carried out.

Expected results of this initiative for FY 2008 include the development of new, innovative prevention messages in English and Zulu, including messages to change cultural practices (non-sexual) that can contribute to viral transmission; the development of better understanding of cultural perceptions, leading to

Activity Narrative: better prevention messages;–training of THPs and improving their prevention message delivery capacity as they work with their patients and the patient families. In addition, increased correct and consistent condom usage among sexually active community members who are not amenable to abstinence/be faithful prevention messages; the assessment of the effectiveness of Other Prevention approaches within the Zulu cultural context in Ethekwini will also be achieved.

By expanding culturally and scientifically appropriate prevention messages to communities that receive much of their healthcare from traditional healers, the Nelson Mandela School of Medicine will directly contribute to the realization of PEPFAR's goal of preventing 7 million new infections. These activities will also support efforts to meet the prevention objectives outlined in the USG Five-Year Strategy for South Africa.

Funding Source:	GHCS (State)	**Program Area:**	Condoms and Other Prevention Activities
Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	6567.08	**Planned Funds:**	$1,700,000
Activity System ID:	13811		

Activity Narrative: SUMMARY:

"Heartlines" is a values-based, media-led intervention that aims to mobilize the faith-based community in Southern Africa to prevent the spread of HIV by promoting abstinence and faithfulness, as well as decreasing stigma and increasing care for those infected or affected by HIV and AIDS. The major emphasis area is information, education, and communication. Minor emphasis areas include community mobilization/participation and linkages with other sectors and initiatives. Target populations include children and adults, people living with HIV and AIDS, communities, teachers and faith- and community-based organizations.

BACKGROUND:

This is an ongoing activity and was first funded by PEPFAR in FY 2006. This intervention complements Soul City's existing activities; targeting faith-based organizations (FBOs) nationally using prevention messages that will best resonate with this group. It also complements the AB Soul City activities described elsewhere in the COP. Mass Media Project (MMP), a Soul City sub-partner, is implementing the project. It is an NGO set up in 2001 with seed financing and with technical support from Soul City. The MMP works with the Government Communications and Information Services as well as the Department of Education. Decreasing gender disparity especially in an FBO context is a key focus.

ACTIVITIES AND EXPECTED RESULTS:

"Heartlines" aims to revive in South and Southern Africans the positive value system that traditionally prevailed. In so doing, it will lead to the re-examination of people's norms and values. It aims to lead to the prevention of new infections, decreased stigma and increased levels of care for those already infected with HIV. It aims to mobilize at least 50 percent of all FBOs in South Africa in support of this objective. Implementation started in July 2006. All major FBO leadership have actively supported "Heartlines" to date and have pledged support for the future. FBOs will be mobilized through the provision of training materials and training. Committees in each province have been established to coordinate FBO activities and to facilitate the dissemination of materials and training. In order to create focus for mobilization a concerted period of action of 6 weeks annually has been identified. This intervention is a partnership with the Nelson Mandela Foundation, a major South African Bank and the Public Broadcaster, along with four other smaller donors. Between them, they have already contributed over $6 million to this intervention to date.

In September 2007 Soul City and its sub-partners are planning a major planning retreat to design its 5-year prevention strategy, and the USG will be important contributors to this process.

ACTIVITY 1:Distribution of eight TV drama films and a story book for use in multiple FBO settings

The eight films and the book were produced in FY 2006 with other donor funding. They were aired at primetime across all public broadcast TV stations and were hugely popular. Each film focused on a different value: abstinence and delayed gratification, self-control, perseverance, tolerance and acceptance of difference (stigma reduction), positive parenting with an emphasis on men, forgiveness and integrity and grace (second chances), as well as fidelity and partner reduction. A spiritual dimension was introduced in the dramas, which is, for most Africans, the highest source of moral authority. Multiple other media platforms in radio, TV and print media were used in the period of broadcast to integrate the values raised, in particular in relation to HIV and AIDS and other contributing social issues such as violence against women and so stimulate a national debate. These films were complemented by a book for parents on teaching values to children. The book includes ten stories to be read to 3-6 year olds, focusing on the same values as the films. Adult components are described here and in other sections of the COP. Both the children's book and films were adapted in the course of FY 2007 for use in FBOs; and a facilitator guide will be produced. They will be duplicated and distributed in the course of FY 2008 to at least 30,000 FBOs. Further training materials will be produced which are focused on assisting FBOs to organize for action around these values. They will enable the FBOs to review and respond to needs both within their congregations as well as in their communities. Through ongoing mass media programming these actions will be reported on so as to encourage others to also take action. The materials will be adapted for different settings, thus it is likely that the resource for a rural FBO will differ to that of an urban one, although the objectives will be the same. At least 26 training/mobilization events will be held nationally with FBOs in support of the materials and their messages PEPFAR funding will contribute 80 percent of this budget, with other donors funding the remaining 20%.

ACTIVITY 2: Adaptation of the films for use in workplace programs and prisons

Considerable interest has been forthcoming for the use of these films in workplace management and HIV and AIDS programs as well as from the Department of Correctional Services. Consequently an adaptation of the films will be made with support training materials for this purpose. PEPFAR funding will contribute to the development of the materials. The major emphasis area is information, education, and communication.

ACTIVITY 3: Adaptation of the films for use in schools

These films were adapted in FY 2006 for use in grade 10 classes and an accompanying facilitator manual was produced. In FY 2008 30,000 copies of the DVD and manual will be distributed to 6000 high schools for use in grade 10. In partnership with DOE, teachers will also be trained to use the materials.

ACTIVITY 4: Out of school youth

Based on the positive reception to "Heartlines" by youth, an initiative will, in the course of FY 2008, be rolled out that will target at risk and out of school youth. The initiative will mobilize youth using hip hop music through a series of competitions across the country, which will get youth to use hip hop to challenge their peers to live positive values. Radio and TV will cover these events. These events and the media coverage will be used to select youth ambassadors who "walk the talk". They will be trained in leadership, enterprise development and will be trained to be peer educators in their communities. FY 2008 funding will be used to establish this initiative but by FY 2009,"Heartlines" will be working with at least 500 youth across the country.

Activity Narrative:

ACTIVITY 5: Soul City training

Training is conducted by 18 partner NGOs in a cascade-training model. Trainees are given the support and skills with which to become mobilizers in their community. More than 200 training sessions will be conducted in FY 2008 with an average of 30 people per session. Although trainees will be equipped to teach parenting skills and AB prevention to parents in particular they themselves will be trained in ABC prevention as well .In the course of FY 2008 further values-based media programs will be developed under the “Heartlines” brand as an HIV intervention. They may include an initiative targeting preschool children and one aimed at teenagers. These will initially not require PEPFAR funding and will be funded by other donors. These materials will first have impact in South Africa and then be available for use across the region through Soul City's regional program. A major public-private partnership has been forged by the MMP, which sees approximately 50 percent of project funding provided by a South African bank, with a commitment to funding till 2010. Further funding will be forthcoming from the national public broadcaster as well. As the MMP is a relatively new organization, work will be done on career development and other organizational development.

These activities contribute to the PEPFAR goal of averting 7 million new HIV infections.

Activity Narrative: SUMMARY:

GoLD Peer Education Development Agency (GoLD) was awarded first place in the Commonwealth Good Practice awards 2006. GoLD became a new partner to PEPFAR in FY 2007. The FY 2008 COP PEPFAR funds will support the expansion of comprehensive youth prevention services to facilitate the roll-out of the GoLD Peer Education (PE) model through three components: 1) development and dissemination of PE best practice methods and materials; 2) capacity building and training of PE participants; and 3) quality assurance of implementation of the GoLD Model. The primary emphasis areas for these activities are gender, human capacity development, and local organization capacity development. Specific target populations include adolescents (15-24), adults (25 and over), and teachers.

BACKGROUND:

This project is part of a larger initiative begun in 2004. The described activities are ongoing and will be scaled up in FY 2008 with the help of PEPFAR funding. GoLD partners work with suitable community organizations to implement its model using the secondary school system and other community youth servicing sites. GoLD works in conjunction with the relevant South African Provincial Government structures. GoLD manages and provides quality assurance of the implementation of GoLD PE of its sub-partners. GoLD assists its partners to align the PE programs with the South African Government (SAG) guidelines on prevention of HIV with a focus on youth as a priority population group. The GoLD model is implemented within Western Cape (WC), KwaZulu-Natal and Mpumalanga provinces of South Africa. GoLD is being implemented in collaboration with Provincial Departments of Education (DOE) and the National Department of Health (DOH). GoLD's sub-partners in WC are partly funded by the Global Fund via the WC DOH and the conditional grant via WC DOE. In other provinces, sub-partners are partly funded by HopeHIV. Two of the three activities will be implemented directly by GoLD. One activity, capacity building and training of PE participants, will be implemented in collaboration with 24 youth-focused community organizations that implement the GoLD model in various sites and train the youth peer educators (PEs). These organizations are: Youth for Christ (YFC, George, Knysna, Pietermaritzburg and Nelspruit), Masoyi Home-Based Care, Wagon of Hope, Planned Parenthood Association of South Africa (PPASA), MaAfrika Tikkun, Ukuthasa, Institute for Social Concerns, Christian Assemblies Welfare Organization, Club Coffee Bar Community Centre, Uniting Christian Students Association, OIL Reach Out, NOAH and Sethani. Nine additional organizations will be assessed in July 2008 and selected and trained in September 2008 to recruit peer educators from January 2009. Between 2007 and 2008, another batch of thirteen additional organizations will be selected to become GoLD implementing partners. The issues facing South African youth in HIV prevention are firmly entrenched in the social constructions of behaviors and identities and include unequal power in sexual relationships, gender-based violence and intergenerational sex. GoLD messaging is designed to look beyond awareness and reflect the complex social dynamics of HIV transmission. By reflecting these dynamics that youth face daily, the model is intelligible to youth and fosters critical awareness, transformation and long-term behavior change that increases gender equity, challenges male norms and behaviors and supports activities to strengthen sanctions against sexual violence and coercion. PEs are equipped to challenge stigma around HIV and to promote the reduction of discrimination faced by HIV affected and infected individuals. The GoLD curriculum emphasizes the message-giver as a role model. Peer Educators are equipped and supported to role-model lifestyles that promote, in order: abstinence; delayed sexual debut, faithfulness, reduction of sexual partners among youth and correct and consistent condom use.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Development and dissemination of PE best practice prevention methods and materials

GoLD will refine and disseminate an interactive and context-specific resource base of GoLD PE curricula and best practice implementation methods for use by GoLD staff; trainers and master facilitators; PE facilitators; PEs; and program managers implementing the GoLD PE Program within secondary schools and communities. Along with implementation guides, this also includes curricula that focus on social dynamics informing conceptions of gender, covering sexuality and the feminization of AIDS, to reduce the inequalities between men and women that have led to the increase of HIV and AIDS as well as challenging stigma around HIV and AIDS. Ongoing refinement and development of curricula and the implementation guides will involve human capacity development of representatives of implementing partners to provide constructive feedback on experiences and share their findings together.

ACTIVITY 2: Capacity building and training of PE participants

GoLD will train program managers and community leaders from 24 implementing organizations, as well as teachers, to implement the structured three-year GoLD Model in 132 secondary schools and communities through equipping and supporting adolescent PEs. PEs are supported by implementing organizations through a structured skills training and mentoring program. GoLD will assess and provide implementing organizations with intensive capacity building to deliver the GoLD model in schools where access is given by the provincial Department of Education within youth high risk behavior sites. GoLD will equip staff of the organizations through a structured capacity building program including modular training sessions, mentorship and provision of PE resources and best practice methods. GoLD will provide training to teachers to enhance the quality and ownership of the program for long-term sustainability. The implementing organizations will train adolescent PEs within the secondary school sites to fulfill specific PE roles and outputs over a three-year period in which they positively impact their peers.

It is anticipated that gender will be impacted through both the implementation of curriculum and the GoLD program environment. Youth in the PE program will work through gender issues within a safe and enabling environment (the GoLD program) and are given room to critically analyze and challenge gender norms, working together towards gender equality. The sessions in the Gender, Relationships and Rights module aim to raise awareness of rights in relationships among youth. Special attention is paid to sexual relationships, the rights of both boys and girls in these relationships, and gender violence that youth may experience in those relationships. The PE’s will in turn support each other as they work among their peers and communities. New GoLD trainers and facilitators will be recruited based on criteria that ensure their character and skills reflect the values and practices imparted through the curriculum and program design. A planned selection of both male and female facilitators and PEs will be aligned to the GoLD facilitator and

Activity Narrative: peer educator recruitment guidelines.

ACTIVITY 3: Quality assurance around implementation of the GoLD PE Model

This activity provides quality assurance around the implementation of the GoLD Model in secondary schools via implementing organizations, PE facilitators, and adolescent PEs. This will involve ongoing development and use of a robust information and communication technology infrastructure to 1) enable effective roll-out of the program in a way that enables ongoing monitoring and evaluation; 2) conduct bi-annual assessments of all implementing organizations; and 3) implement a comprehensive monitoring and evaluation system within all implementation sites.

The activities in the GoLD program contribute to the PEPFAR 2-7-10 goals to reduce new HIV infections among youth through: facilitating the structured promotion of safe and healthy behavior of HIV-infected and uninfected youth; improving access to services for affected youth and increasing positive youth role-modeling and advocacy.

Table 3.3.05: Activities by Funding Mechansim

Mechanism ID:	5191.08	**Mechanism:**	N/A
Prime Partner:	Reproductive Health Research Unit, South Africa	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Condoms and Other Prevention Activities
Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	9449.08	**Planned Funds:**	$339,500
Activity System ID:	13788		

Activity Narrative: SUMMARY:

Reproductive Health and Research Unit (RHRU), as part of an outreach project in deprived inner city areas, will implement four Other Prevention projects: Firstly, the provision of outreach prevention, clinical and support services to commercial sex workers at an inner city primary health care clinic as well as prevention information and condoms in the many brothels in Hillbrow, Johannesburg. Secondly, RHRU's sub-partner, CARE, will offer home-based information, support and referral, and capacity building activities to improve local faith-based organizations (FBOs), community-based organizations (CBOs) and non-governmental organizations (NGOs). Prevention measures will be used as the entry point to household-based work. Thirdly, RHRU will continue to provide a new program of prevention work for HIV-infected individuals, using "motivational interviewing" techniques to reduce risky behavior. Lastly, RHRU will promote the uptake of male circumcision through integration with existing services. Activities will include training, workshops and other outreach covering condom usage and negotiation. Concurrent partner/partner reduction strategies and HIV risk reduction will be integrated into all Other Prevention activities. The primary emphasis area for these prevention activities is human development. The primary target populations for these interventions are women, men, adolescents, people living with HIV, HIV-infected women including pregnant women, commercial sex workers and their partners/clients, brothel owners, community-based and non-governmental organizations (CBOs/NGOs). The sex worker component will be expanded in FY 2008 to an additional neighborhood in Johannesburg. Prevention with Positives (PwP) will also be continued in all CT and treatment programs.

BACKGROUND:

RHRU, a unit of the University of the Witwatersrand in Johannesburg, currently provides technical support to the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa, which includes the national ARV roll-out. Under PEPFAR funding since FY 2004, RHRU has provided regular on-site support, direct treatment, training and quality improvement to Department of Health sites in three provinces. RHRU will continue these activities, and will continue both an inner city program (Johannesburg) and a district-wide program (Durban), focusing on providing support to complete up and down treatment referral networks. In addition, RHRU will continue the provision of counseling and testing (CT), palliative care and prevention services. RHRU will seek to develop models of service delivery that can be replicated and expanded, and produces findings from lessons learned and targeted evaluations to disseminate and share with others. It should be noted that the success of antiretroviral treatment (ART) scale-up depends on the comprehensive approach detailed in other program areas. In particular, the strengthening of referral from other primary healthcare programs such as tuberculosis (TB), family planning, antenatal/postnatal and STI services is critical. Prevention is an integral part of this system, and RHRU will focus its condoms and other prevention program on high-risk groups such as commercial sex workers and their clients, people infected with HIV, and also on building capacity of the CBOs and NGOs with which it works. RHRU will also continue to develop strategies to address underserved communities affected by HIV, such as couples (both concordant and discordant), high risk groups such as young people, and gender-based interventions with women at risk, including pregnant women and commercial sex workers, and men.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: HIV Prevention for Women At Risk

RHRU will continue to target a large community of commercial sex workers with prevention and care services, as well as treatment referral. The project is located in the deprived Johannesburg inner city, which is densely populated, transitory and poor, with high HIV and unemployment rates. All women will be referred for CT, and those with appropriate CD4 counts will be referred for ARV treatment. New treatment sites will be identified in needy areas of the city, and the organization will work with local public sector clinics in the area to sensitize staff to the special needs of this difficult-to-reach group and to provide outreach clinics in local brothels, which are the hub of commercial sex workers in Hillbrow and Berea Johannesburg. RHRU will also work with brothel owners, and clients and partners of commercial sex workers to increase their awareness and affect a change in their norms and behaviors regarding HIV and AIDS. A specific focus will be on changing gender norms through workshops and trainings, which will include such topics as alternatives to risky behavior, women's rights, and reduction of gender-based violence. The project will provide prevention outreach services including management of sexually transmitted infection (STI), provision of condoms together with messages regarding correct and consistent use of condoms, contraception and HIV prevention education including cross-generation and transactional sex, as well as support for those who wish to leave sex work. The project will play a critical role in raising awareness of HIV services and prevention through workshops and event days, and by distributing IEC materials. Furthermore, this gender-related project will conduct HIV counseling and testing on high risk and difficult-to-access groups, and will relate to the development of health networks and linkages by providing referral to HIV and TB care and treatment services where necessary. To aid the expansion and sustainability of this program, the local health authority will also contribute to this project. In addition, a manual has been developed to provide a toolbox for other health authorities seeking to replicate this program, and technical consultation will be provided. RHRU will share this with the Medical Research Council and others involved with high risk populations.

ACTIVITY 2: Prevention with Positives

There is very little focus on prevention in South Africa among people already infected with HIV. Prevention work to encourage safe-sex behaviors and limit infection and re-infection for those already positive is currently being developed by some South African organizations. Innovative prevention methods, the development of which will draw on models that have proven successful in other settings, will be introduced in South Africa. Clinicians will be trained in this specific focus area, and the program will be monitored and evaluated for efficacy. Programs that are proven successful will be expanded into other areas and used as examples for other organizations. In addition, RHRU is currently adapting a flipchart on contraception for HIV-infected clients for use by South African health care providers. This will be piloted in FY 2007-2008 and will contribute to improved prevention for positive clients and will be integrated into care and treatment programs.

ACTIVITY 3: Community-Based Prevention

Activity Narrative:

RHRU will extend care and support services further into inner city areas, and incorporate prevention and behavior change into their activities. With a combination of private sector and PEPFAR funding, RHRU runs an information and support center in a high-risk area. A team of counselors and caregivers will be launched from this center into the surrounding community. Team members will link with 30 households a week, with the primary purpose of educating them on HIV prevention and understanding risk. Using prevention messages as the entry to the household they will also assist them as needed with home-based care, reaching orphans and vulnerable children, men and women, as well as contributing to the destigmatization of HIV and AIDS.

ACTIVITY 4: Male Circumcision

No male circumcision training or service delivery will take place without the express consent of the National Department of Health. In the absence of such approval and based on discussions with the PEPFAR South Africa team, funds could fully or partially be reprogrammed. Should the approval for safe clinical male circumcision activities be given, RHRU is proposing the following male activities:

Male circumcision has been identified as an important biological intervention that protects men from HIV infection. It also creates opportunities to engage with men over a variety of reproductive health and risk-taking issues. Men are grossly under-represented in terms of access to counseling and testing, as well as HIV clinical services, including ART. Circumcision programs may allow expanded access to all forms of care, including HIV testing. However, while the biological protection against HIV transmission has been demonstrated beyond doubt, issues such as acceptability, operationalization, disinhibition and programmatic integration, still remain. RHRU will explore the acceptability of integrating male circumcision into existing services to broaden uptake. This will include piloting "opt out" circumcision for neonates, and developing methods of raising awareness raising and counseling that address target groups including males and young people. All activities will be conducted in accordance with the South African Government's new Strategic Plan.

In FY 2007- FY 2008, RHRU will continue to undertake M&E activities to inform and develop quality HIV care. RHRU will be in a position to conduct targeted evaluations (TE) and Public Health Evaluations (PHE) of some of its prevention related projects in FY 2008-09. For each PHE, a detailed proposal will be developed and submitted to PEPFAR for review and funding approval.

RHRU will contribute to PEPFAR 2-7-10 goals by providing prevention services to a most-at-risk population in a densely populated, poor, and highly transient inner city community.

Budget Code: HVOP

Program Area Code: 05

Activity ID: 7920.08

Planned Funds: $145,500

Activity System ID: 13375

Activity Narrative: SUMMARY:

In addition to interventions promoting abstinence and being faithful, the Africare's Injongo Yethu Project approach is working through several community constituencies to promote other preventive behaviors. Activities will address target groups such as those frequenting taverns and using them for access to those engaged in transactional sex, and prisoners will be reached with messages emphasizing correct and consistent condom use and getting tested for HIV, as well as partner reduction in preparation for their release. Traditional healers will strengthen their activities across Lukhanji to promote counseling and testing (CT), prevent transmission during medical procedures, and provide messages on correct and consistent condom use, along with being faithful and partner reduction messages during their cultural dancing. Activities carried out by traditional healers also aim to reduce stigma. A follow-up survey on the effects of the community interventions will be considered for FY 2008. Emphasis will be on human capacity development through training and gender. Target populations include men, women, incarcerated populations and persons engaged in transactional sex.

BACKGROUND:

This is an ongoing activity, extending from the Abstinence and Being Faithful (AB) messages initiated with these groups. Traditional healers have been very active in combining messages into their cultural dancing, and have begun to refer clients for counseling and testing (CT). Two local associations of tavern owners have been trained and plan to encourage discussion as well as to share IEC materials in their establishments and keep condoms available. While there is not a formal sex worker trade in this community, informal transactional sex does occur and is frequently initiated at taverns. Monthly discussion sessions have been carried out in the male prison around HIV transmission and AB prevention. The local minimum security prisons have small populations (about 70 inmates) with short-term sentences and will return to their communities in a short time. Prisoners have expressed the need for prevention work, including condoms and condom information.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Prevention Messaging in Taverns

Largely through consistent and frequent messages using video and print materials and backed by trained tavern owners, correct and consistent condom use, along with reducing the number of concurrent sexual partners, will be encouraged. Tavern owners from the Whittlesea and Romanslaagte Community Policing Forums will continue to be coached in using IEC materials that can be used in their establishments. Included in their program will be an orientation to the local HIV services for testing and care (including treatment). Project support will also be used to provide videos and Xhosa print materials on condom use and reducing the number of partners. To reduce cross-generational sex, specific messages targeting the behavior of older men will be included. Gender issues, particularly prevention of violence against women and children will be addressed. VCRs and televisions will be made available on a rotational basis where they are not available on premises. Discussions once per quarter in each establishment facilitated by project volunteers will reinforce messages in addition to the informal discussions that will be generated by the videos and supported by the tavern owners.

ACTIVITY 2: Prevention Activities with Prisoners

Prisoners in the Sada prison for men and the Queenstown prison for women will continue to be reached with monthly discussion sessions. Videos will be used to trigger discussions and Xhosa print material on condom use, partner reduction and AB messages will be provided. Where condoms are not institutionally available, they will be provided, given permission from the authorities. In addition to affecting behavior while in prison, it is anticipated that significant information coupled with discussion while in prison will positively influence behavior after release into the community, including gender-based violence, gender relationships and at-risk social behaviors.

ACTIVITY 3: Prevention Activities with Traditional Healers

Traditional healers trained in the Hewu and Ilinge areas will be refreshed, updated and supported in their ongoing activities. Traditional healers in new project areas will be trained. Reinforcement of messages around limiting sexual networks through partner reduction and consistent condom use will be provided. Increased focus will be added on cross-generational sex and gender-based violence. Additional practice to build confidence in answering questions will be continued to be provided to promote independence from project staff. Information level messages from a wide variety of spheres of influence in the community has indeed been an initial focus (diffuse). While traditional healers continue to include sharing their advice on being faithful and condom use during the weekend dances (with clients and trainees), it is the role modeling and interpersonal skills development that will help traditional leaders to be more effective in prevention. A focus this year is on designing local interventions for effecting changes on male behavior in particular, and deploying approaches to youth that support protective choices.

ACTIVITY 4: Male Norms and Behavior

Violence reduction is addressed through several activities in the community. Traditional caretakers/ educators (amakankhatha) who educate male youth during traditional circumcision and initiation "school" are beginning to include emphasis on traditional norms and values that mandate respect and caring for women and children. This is to counter anecdotes of bullying behavior of young men toward women (even their mothers) when they come out of the school. Traditional leaders will include similar discussions with adult men with regard to violent behavior toward women and children. Peer Educators for out-of-school youth will continue to receive capacity building to lead youth discussions around gender issues and relationships. In-school youth (intermediate phase) will be introduced to issues of gender, how the other sex is seen, bullying, and consideration for others. Pastors and church leaders discuss mutual respect with couples. Youth both in- and out-of-school will be made aware of sexual abuse, prevention, and what to do if it happens. FY 2008 will include a continuation of the above activities, along with expansion into new communities.

Activity Narrative: By focusing on prevention among people at risk, Africare contributes to the PEPFAR goal of preventing 7 million new HIV infections.

Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	13690.08	**Planned Funds:**	$447,000
Activity System ID:	13690		

Activity Narrative: SUMMARY:
This activity will building on the existing program components (care, treatment and TB-HIV) to include a prevention activity, integrated into existing services. Aurum currently provides services in three sectors: public, private and NGO. This funding will allow Aurum to address prevention awareness and promote behavior change among the target populations, many of whom are at high risk (prisoners, refugees, miners and other mobile populations), including prevention messaging for people in the care and treatment program.

As per the South African Government ABC strategy, Aurum will address all these aspects, including messaging and training that promotes the correct and consistent use of condoms at South African government clinics, GP clinics and NGO sites. Aurum will continue to develop messaging for specific target groups such as young males, young women, pregnant women, mobile populations, and other target groups identified as being at risk in conjunction with other expert organizations. Aurum will emphasize messages that promote healthy choices regarding sexual behaviors and avoiding risky behaviors, especially concurrent multiple partnerships. Emphasis will be placed on avoidance of drug and alcohol abuse, delaying sexual debut and addressing transactional sex. One of the focus areas of this program is gender with a particular focus on addressing male norms and behaviors. Male circumcision will be encouraged within the context of local policy and guidelines. Aurum is working with one corrections facility and aim to be working with approximately four additional prison facilities in the next year. In one of the supported NGO facilities, based in central Hillbrow, Aurum is targeting homeless populations and street youth. The primary target populations are men, women, youth, prisoners and other most at risk populations (MARPs). For patients currently enrolled on the program (HIV-infected patients) messages about HIV prevention are continuously emphasized.

FY 2008 represents the second year of activity of the SME project which has a significant focus on prevention activities. The partnership with City of Johannesburg has enabled the establishment of a fixed site within the Bree Street Taxi Rank. In FY 2008, Aurum plans to undertake targeted prevention activities involving taxi drivers at a number of taxi ranks in the three targeted provinces. Attention will be paid to intensifying prevention activities in these groups through the syndromic management of STIs, peer education and active screening and counseling for substance use/abuse. This will include venue-based interventions aimed at targeting substance abuse and other risk behavior.

BACKGROUND:

Aurum supports activities which reduce the transmission of HIV through engaging target populations to provide messaging that encourages positive choices around sexual behaviors. The target population currently services with HIV care and treatment services are poor, underserved, and mobile. In partnership with ReAction! Consulting, another PEPFAR partner, community messaging is delivered to communities in the vicinity of NGO clinics in Mpumalanga through door-to-door campaigns. Utilizing the experience and tools from this facility, Aurum will expand its prevention activities in the other settings currently supported by Aurum. Health care workers that work in government clinics, GP clinics and NGOs will receive training from ReAction! Consulting in order to provide support in these activities.

The mining sector is a key platform to reach men. Stepping Stones is a workshop series designed to promote sexual and reproductive health. It addresses questions of gender, sexual health, HIV and AIDS, gender violence, communication and relationship skills. Stepping Stones has been shown to reduce high risk behavior and HIV incidence in a program in Africa. Aurum intends using this program in both the mining setting and in the prison population.

The SME Project targets workers in small, micro and medium sized companies, including market traders and taxi drivers who previously did not have access to HIV prevention, counseling and testing and treatment services due to incompatibility of their working hours with the operating hours of the public health facilities and the fact that the majority of SME employees do not have private health insurance. In placing services within taxi ranks and markets, partners and dependents of SME employees will also have access to these services.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Targeted Training to Specific Groups
Men will be targeted, especially the large prison populations supported by Aurum, and in mining settings. Messages to men will be developed and training provided promoting behavior change, and addressing cultural norms of manhood and masculinity. This will be done in partnership with other PEPFAR partners. This includes messages to young men encouraging them to use condoms, reduce the number of sexual partners and avoid risky behavior. Messaging to young women, who make up the bulk of the current population served with Aurum's care and treatment services, will empower them to be involved in decision-making regarding sexual choices, requiring their partners to use condoms, empowering them to use female condoms, delaying sexual debut and avoiding gender violence. Young women will be encouraged to develop a positive self-image.

Aurum currently offers a number of courses that cover positive living and information on HIV prevention. The training, provided by Aurum social workers and a psychologist, will be offered to incarcerated communities, nurses, lay counselors and peers. The trainees will become implementers and peer educators. The training curriculum includes understanding the challenges of disclosure, how to help clients disclose safely, and how to address HIV and AIDS stigma, and is offered twice a year. In addition a module on Prevention with Positives will be included in the training provided to the counselors in the SME fixed and mobile sites as well as the health care workers and peer educators.

ACTIVITY 2: Promotion of Male Circumcision as a Method of Reducing Transmission
Based on existing evidence, male circumcision has been show to have an effect on the rate of HIV transmission. Aurum plans to undertake a situational analysis to understand the beliefs, attitudes and practices of male circumcision to understand the barriers for widespread circumcision implementation in limited a number of industrial and community sites. In settings where it is possible to provide circumcision, Aurum will provide training to ensure safe methods and encourage males to opt for this procedure. Activities will not be conducted without consent from the National Department of Health.

Activity Narrative:

ACTIVITY 3: Prevention and Treatment of Sexually Transmitted Infections (STIs)
Aurum will continue to provide training to health care workers on the syndromic management of STIs as a means of preventing the transmission of HIV, as many of the populations currently served with HIV care and treatment services are at high risk. Aurum will encourage the use of male and female condoms to prevent the spread of STIs. In FY08 the SME Project will focus on the issue of identification and treatment of STIs in taxi drivers and will provide these services within the Bree Street taxi rank.

ACTIVITY 4: Education to Prisoners and Miners on Gender
Various organizations that are involved in gender issues and a framework will be established to provide education and programs to males based at the corrections facility and a company within the mining industry. One of these is the Stepping Stones workshops to be implemented with peer groups. The 14 sessions for the separate peer groups cover the following topics: introduction for the group and development of group skills; Images of Men and Women: Exploration of Ideals and Realities; Images of Sex and Sexual Health Problems; Exploration of Love: What We Look for and Expect to Give; Exploring our Sexuality: Problems and Concerns about Sex and Reproductive Health; Conception and Contraception; STDs and HIV; Safer Sex; Gender-based Violence; Let's Look Deeper: Why we Behave in the Ways We Do; Assertiveness Skills: Part 1; Assertiveness Skills: Part 2; Dealing with Loss; Let's Prepare for the Future: Future Decisions and Changes.

Activity 5: Prevention with Positives
People that are identified as being HIV positive through counseling or testing will be rapidly assessed for additional risk behaviors. Once these have been identified the counselor will negotiate with the HIV positive client around methods of reducing the risk of transmitting the infection to other people or of becoming infected with additional strains of the virus. The session will end with the client either being referred for additional support or arranging a follow-up session with the counselor. This service will be provided at all fixed and mobile sites as well as within the workplace and in occupational clinics within the SME project.

Activity 6: Venue-based Interventions targeted at reducing substance abuse and other risky behavior.
In FY 2008, Aurum will commence venue-based interventions that will target nightclubs, shebeens, taxi ranks and sports venues and will involve one on one encounters where a rapid assessment will be made of an individuals risk behavior such as substance and alcohol abuse. The counseling session will aim to identify the risk that that behavior places the individual in terms for transmission of HIV and other STIs and will involve referral of the individual for further assistance.

Activity System ID:	13385		

Activity Narrative: SUMMARY:

Through the Center for the Support of Peer Education (CSPE), the Harvard School of Public Health (HSPH) contributes to PEPFAR abstinence and be faithful (AB) and other prevention activities, support for orphans and vulnerable children (OVC), and system/capacity building goals by providing training, technical assistance, and materials development to government, non-governmental (NGOs), faith-based organizations (FBOs), corporate and other organizations using peer education strategies. CSPE is the first academic center devoted to developing and continuing improvement of a sustainable national inter-sectoral peer education system. The major emphasis will be training with minor emphasis on policy and guidelines and linkages with other sector and initiatives. Target populations include university students, adults, teachers, HIV-affected families, out of school youth, business community/private sector, community and religious leaders, program managers, South Africa-based volunteers, NGOs FBOs and CBOs.

BACKGROUND:

This project is an expansion and institutionalization of a five-year national consultative process developing consensus on goals, essential elements and standards of practice for peer education programs, and materials and tools (Rutanang) in wide circulation to improve how peer education is conducted in settings including schools, FBOs, sport and recreation, clinics, and worksites. Rutanang peer education is consistently defined and implemented as including, among other characteristics, multiple-dose small-group structured and facilitated discussions; informal influence; recognition and referral of those with further needs (e.g., voluntary counseling and testing (VCT), treatment, OVC); and advocacy. The first HSPH initiative in workplace prevention activities was launched in 2005 with the South African Police Services and expanded through collaboration with the South African Business Coalition on HIV/AIDS (SABCOHA) and the Wits Business School (WBS). The latter is funded through the private sector, but adds to the expertise and influence of CSPE and provides trained peer educators who are deployed in other settings in the community.

ACTIVITIES AND EXPECTED RESULTS:

CSPE provides PEPFAR and non-PEPFAR partners with training and ongoing technical assistance and assists with the development and adaptation of educational materials, tools, policy guidelines, linkages and community mobilization, and strategic information focused on Other Prevention in multiple settings. All CSPE activities and materials explicitly and intensively address the following issues: male norms and behaviors, sexual violence and coercion, stigma reduction, and maintaining infected and affected children in school. Peer education with adolescents and adults emphasizes delaying sexual debut, secondary abstinence, and reduction in concurrent partners. Peer education, having primary Other Prevention goals, is also a means for early identification and referral to services of vulnerable children and youth, and CSPE is pursuing strategies that enhance peer education as an advocacy tool to make environments safer. Each of the foregoing content themes is explicitly addressed in the design of peer education support systems, training of peer educators, and the content peer educators are trained to deliver.

While CSPE's peer education focuses on teenagers and older youth, young adults, workers and families through worksite programs and FBOs, it continues to emphasize the benefits and rewards of primary and secondary abstinence, delay of sexual onset, and fidelity. However, for many populations (out-of-school youth, some high school learners, university students, and adults) it is also necessary to address information, attitudes and skills concerning reduction in number of concurrent partners, condom use for those who are not abstinent, improved diagnosis and treatment of sexually transmitted infections (STIs), and promotion of voluntary counseling and testing (VCT). Through CSPE’s partners, target groups include urban informal settlements, a focus on young women in their twenties and adult men who engage in risky behaviors, an emphasis on partner reduction and delay in consecutive sexual partners. Through certain partners there will be an increased involvement of people living with HIV (PLHIV). All of CSPE’s activities will enhance the integration on the role of alcohol in increasing risk behavior into programs for adults; youth and high risk populations and continue to support a comprehensive ABC program.

In all settings, a persistent reconsideration of male roles and behavior, reductions in gender violence and discrimination, and encouragement of participation in organizational governance are critical CSPE peer education prevention strategies. Peer education activities at worksites also emphasize the roles audiences play as parents, grandparents and guardians, and prepare them to promote abstinence and sexual safety for their children.

ACTIVITY 1: Eastern Cape, Mpumalanga and Limpopo Department of Health

CSPE will conduct other prevention training for clinic-based staff at provincial and district level and provides Training and Technical Assistance (T&TA), planning, M&E for peer education programs. The clinic-based peer education program involves the selection and training of peer educators to reach youth from the community through time-limited structured sessions. Clinic staff are selected and trained as supervisors who will support and manage the peer educators.

ACTIVITY 2: South African Police Services (SAPS)

CSPE will develop materials and tools, provide ongoing T&TA, and assist with M&E as SAPS reconsiders its original workplace program. Sixty peer educator supervisors and trainers from nine provinces will be supported; each supervisor is responsible for an average of eight peer educators, and the number of SAPS personnel expected to be reached by these peer educators is 9,600.

ACTIVITY 3: Eastern Cape, Free State and Western Cape Departments of Education - FET Sector

Peer education addresses other prevention in the Further Education and Training, Colleges sub-sector. CSPE will work with management and education staff from selected campuses to develop and strategic plan for the sectors HIV and AIDS response. This response includes peer education as a strategic intervention. Educators and student counseling staff will manage and supervise the peer educators’ work with other students to implement a structured and rigorous intervention. CSPE will investigate providing possible support for HIV and AIDS education for students (youth and adults) in Further Education and

Activity Narrative: Training (FET) institutions in the EC and WC province. Included in the above target explanation is expansion of T&TA to the FET sector in Free State to selected multi-campus colleges and include situation analysis, strategic planning and program design contributing to the sector response. This expansion phase will include implementation of peer education as a workplace intervention and peer education as a prevention strategy for students.

ACTIVITY 4: Worksite Programs

CSPE will provide planning, T&TA, materials development and M&E support to four public sector departments or corporate entities. The project will target supervisors from selected sites and trainers for this support; their work will involve prevention and promote the uptake of VCT as will as delay or consecutive partners. A work place program will deploy educator teams to conduct other prevention activities throughout the selected sites as well as some selected community outreach as part of workplace social responsibility initiatives.

ACTIVITY 5: Sport and Recreation

In FY 2006 HSPH began articulating how peer education might be used to take advantage of the natural appeal and access to youth of sports programs. HSPH has been working with GrassRoots Soccer and Peace Players International (PPI) in Durban. Work involves the development of a sports oriented peer education intervention that uses both the appeal of playing sport and the use of sports analogies to promote prevention and behavior change. Sports NGOs are well placed in their linkages to schools as well as community-based sports initiatives to embark on a peer education intervention where the coaches are identified as supervisors in the program.

ACTIVITY 6: CPSE Expansion

As a Center CSPE will divide its efforts between responding to specific partners and carrying proactive strategies to improve peer education as a systems approach in a variety of settings and partners. From current efforts CSPE will expand and embark on a program to provide materials and advanced and targeted training to various audiences and settings. Direct invitations to current partners make it easier for government employees to secure support and budget to attend. These partners include DOE, DOH, HE and FBOs among others. CSPE will offer workshops at Wits and at provincial sites. Training courses will be designed towards SAQA accreditation and contribute to improved rigor and quality. This activity addresses both capacity building and systems strengthening goals. Training focus areas include: Advanced PE Training for a Graduated System: Supervisors and Advocates; Advanced communication skills for us in natural group encounters; Peer education for HIV and AIDS in sport and recreation settings; and Peer educators as lay counselors: Potential and limits.

In addition to contributing to PEPFAR goal of averting 7 million new HIV infections, long-term results of the HSPH project will be the establishment of a sustainable integrated system supporting rigorous, measurable peer education that increases the amount and quality of social interactions and skills acquisition concerning norms, traditions, and behaviors that will help reduce the transmission of HIV.

Program Area: Condoms and Other Prevention Activities

Budget Code: HVOP

Program Area Code: 05

Activity ID: 2968.08

Planned Funds: $582,000

Activity System ID: 14271

Activity Narrative: BACKGROUND:

There has been growing alarm regarding the high levels of rape reported in South Africa. Sexual violence and violence against women have become one of considerable political importance and the Department of Justice (DOJ) has launched a major initiative to address the needs of rape victims in a comprehensive manner. Meeting the immediate healthcare needs of rape survivors (including HIV, sexually transmitted infections, treatment of injuries, and counseling) is a priority. Guidelines exist for the provision of PEP, along with these other key services; however, evidence shows that these are not often followed. In addition, there is a poor link between medical post-rape services and the necessary legal and police procedures.

SUMMARY:

Population Council (PC) and Rural Aids and Development Action Research (RADAR) have been working in Limpopo to implement and evaluate a rural, multi-sectoral model for post-rape care. A number of obstacles in providing comprehensive post-rape care at the project site were identified, including uptake of service by community, institutional and provider capacity, quality of service delivery, and inter-sectoral linkages. An intervention strategy was developed to address these key challenges. A Project Advisory Committee (PAC) was formed and a hospital rape management policy was developed.

Healthcare workers and other providers were trained on multi-sectoral approaches to rape management, centralization and co-ordination of post rape care, strengthening of inter-sectoral linkages with local police and community awareness. Following the interventions, a repeat evaluation at the hospital and police station indicated that the flow of patient care has been streamlined, necessitating fewer providers, fewer steps, and fewer delays in treatment. Nurses are taking a more active role in management of rape cases, using formal protocols and policies, and referral rates to other providers appears to be increasing. With support from hospital management, the hospital pharmacist has begun to dispense a full 28-day regiment of PEP on the initial visit. Community awareness campaigns have reached over 14,000 individuals in the hospital catchment area, with information about post-rape services, including PEP. Whether due to increased awareness and/or other factors, there has been an observed increase in the uptake of services at the hospital. The project is also working with national and provincial (Limpopo and Mpumalanga) Departments of Health to train healthcare workers and health managers regarding management of sexual assault, and to share policies and management tools. Although these activities have strengthened the health sector response to violence, they have also revealed weaknesses in addressing the legal needs of rape survivors. Nurses and doctors have been trained in collecting forensic evidence, but few cases are actually brought to court, and even fewer successfully prosecuted. Lack of confidence in legal proceedings discourages survivors from seeking medical care or reporting to police.

In FY 2008 the activity outlined above will be replicated and scaled-up in collaboration with the Tshwaranang Legal Advocacy Centre (TLAC) in Limpopo and Mpumalanga. The aim of the activity is to add a strengthened legal and mental health component to an existing model for post-rape care and HIV post-exposure prophylaxis in rural South Africa, and to begin to explore questions concerning the uptake and feasibility of the model. Emphasis areas of this activity will be: increasing women's legal rights, reducing violence and coercion, human capacity development, local organization capacity building and strategic information.

ACTIVITIES AND EXPECTED RESULTS:

PC will implement continued monitoring of VCT and PEP services at the hospital and strengthening the referral system between the health sector and the criminal justice sector.

ACTIVITY 1: Ongoing Monitoring of VCT/PEP Services at the Hospital

During the first phase of the project called Refentse Project, a number of monitoring and evaluation tools were developed and introduced at the hospital to follow uptake and provision of VCT and PEP. This included establishing a confidential hospital rape register completed by outpatient nurses, and an interview with clients to determine PEP adherence at 4-weeks following the incident. During the second project phase, the use of these tools will continue to be supported and adapted as needed, with the aim of monitoring the provision of VCT and PEP, as well as adherence to the 28-day ARV regimen among clients. FY 2008 additional funds will be used to expand existing TA to provincial DOH to expand services and job aids on comprehensive post-rape care and HIV PEP

ACTIVITY 2: Project Advisory Committee Meetings

The previously established multi-sectoral Project Advisory Committee (PAC) will continue to meet at regular intervals. The PAC will continue to play an important role during this phase of the project, bringing together key stakeholders to share information and experiences, identify systemic problems and strengthen the linkages between the health system and the criminal justice system.

ACTIVITY 3: Strengthening the Referral System between Health and Justice Sectors

A system will be developed for referring all domestic violence and rape survivors for further legal and psychosocial support. This will entail training outpatient nurses, and developing a communication and monitoring system between the hospital's outpatient department (where such cases present) and the service providers responsible for ongoing paralegal and psychosocial support.

ACTIVITY 4: Introducing direct legal services and psychosocial counseling

A trained, community-based paralegal officer will provide day to day legal advice to clients at the project site. To facilitate access to the service, the paralegal will operate from the Victim Empowerment Unit, situated behind the local police station and will also conduct a weekly legal clinic at Tintswalo Hospital. It is envisaged that by physically locating the service at these premises, it will ensure greater access for women, as it will be immediately available to women who seek medical treatment and care and those that seek the intervention of the criminal justice system.

Activity Narrative: ACTIVITY 5: Case Management and Data Collection

The paralegal will be managed as part of TLAC's legal services unit and TLAC's current case management system will be used to track progress of and manage cases. Cases will be entered into a database and TLAC's attorney will have remote access to the database. TLAC's attorney will hold regular supervision meetings with the paralegal and will provide ongoing feedback on casework. A set of indicators has been developed to monitor both the progress and the impact of individual cases. The cases will be routinely tracked to identify systemic problems faced by women and these will be fed into various fora, including the already established Project Advisory Committee.

ACTIVITY 6: Paralegal Training

This activity is described in the Explanation of Training Activities text box below.

Expected Results: these are embedded in the descriptions of each activity, above, and are further quantified in the targets section of this COP.

This activity (and the sub-activities described above) will contribute to PEPFAR's overall project goals by increasing the legal and other institutional support systems available for rape victims in South Africa and specifically strengthening the HIV-related health care available to rape victims.

Activity ID:	13699.08	**Planned Funds:**	$776,000
Activity System ID:	13699		

Activity Narrative: SUMMARY:

BroadReach Healthcare (BRHC) supports integrated ARV services that include doctor consultations, lab testing, adherence support, patient counseling, prevention, remote decision support, quality assurance (QA), and data management. BRHC's emphasis areas are capacity building (major); with minor emphasis on strategic information and human capacity development (training). Primary target populations include adolescents, adults, and people living with HIV.

BACKGROUND:

The BRHC PEPFAR program began in May 2005 and now operates across five provinces. BRHC is currently supporting approximately 5000 individuals directly with care and treatment and 15,000 indirectly. Prevention is a new activity area for BRHC. BRHC will endeavor to understand SAG priorities around prevention, including those articulated in the new National Strategic Plan (NSP), and formulate site-specific prevention plans that reflect SAG priorities and facility needs. BRHC prevention activities will take two forms: first, as stand alone prevention interventions; and second, as integrated interventions within BRHC treatment program activities. In response to site specific needs, BRHC prevention activities will support ongoing prevention activities within SAG facilities, as well as support new initiatives that fill gaps in prevention priorities identified by the site and SAG guidelines.

ACTIVITIES AND EXPECTED RESULTS:

To ensure that patients are armed with accurate and practical HIV prevention strategies, BRHC will carry out the following activities:

ACTIVITY 1: Prevention Training (HCD)

BRHC will provide HIV and AIDS prevention training to its network of healthcare providers including doctors, nurses, pharmacists and other healthcare professionals, as well as public sector health professionals at its partner sites through a variety of initiatives including remote clinical decision support, telemedicine, web-based training, didactic training, and clinical mentoring from experienced clinicians. More specifically, the topic of HIV prevention is covered in the three day training for Nurses and Lay Counselors; in the five day University of KwaZulu-Natal training for Professional Nurses; the 10 module HIV/AIDS Clinical Training online course for Doctors; and the 1-3 day HIV Treatment Literacy training for ARV Coordinators and Counselors. In addition BRHC will integrate a prevention module into the one day quarterly Adherence Training for BRHC patients.

ACTIVITY 2: Strategic Prevention Partnerships (Outreach)

BRHC will form strategic partnerships with local CBOs and FBOs and companies that are actively engaged in prevention activities in the BRHC catchment area in order to support existing activities that are aligned with SAG policy, and to help create new programs should any gaps exist. Support to CBOs/FBOs may include provision of resources to support approved prevention activities (human resources, funds, equipment). BRHC will also leverage these strategic partnerships for condom distribution and educational materials on the proper use of condoms.

ACTIVITY 3: Condom Distribution

BRHC will distribute condoms and materials on proper condom use through a variety of channels. Distribution channels will include GP offices (~50 outlets); public sector hospitals and affiliated clinics (~100 sites); and through the BRHC IEC program to patient support groups (~10). As stated previously, BRHC will also provide condoms to partner CBOs/FBOs that are active in prevention activities in the community. The BRHC IEC team will run prevention outreach campaigns to local companies and engage them in prevention activities such as the distribution of condoms and prevention messages to employees.

ACTIVITY 4: Prevention Integration

BRHC will integrate prevention activities and messages into its treatment program activities. This will be accomplished in two principle areas: 1) Prevention with Positives (PwP) in the Clinical Setting; and 2) Prevention in the Counseling Setting. PwP activities will be coordinated through BRHC public sector sites and GP offices, and will involve the distribution of targeted prevention messages [printed materials] for HIV infected individuals by the BRHC IEC team; prevention education sessions for patients, buddies and family members conducted by the BRHC IEC team; and condom distribution at all clinical service outlets. Second, BRHC will also utilize the CT setting to distribute targeted prevention materials [printed materials] and will review counseling guidelines to ensure that prevention messages are delivered during counseling sessions. This will be made available at all sites where BRHC supported CT services are offered. Condoms will also be supplied and made available to individuals undergoing counseling and testing services.

These activities directly contribute to the PEPFAR 2-7-10 goals by attempting to prevent new infections.

Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	14260.08	**Planned Funds:**	$0
Activity System ID:	14260		

Activity Narrative: PEPFAR funds were allocated to the Supply Chain Management Systems (SCMS) Project to build upon JSI's successful development and implementation of a package of technical solutions to two critical weaknesses in the South African Government's (SAG) HIV prevention program relating to condom procurement and distribution: the poor quality of condoms that were distributed in South Africa and the frequent and prolonged shortages and stock-outs in the provinces - both problems which resulted in negative media towards, and an erosion of public confidence in, the SAG HIV prevention program. This activity will continue in FY 2008, but since SCMS funding is still available in the Working Capital Fund, this activity will now be a TBD SCMS. In this way, PEPFAR SA will be able to spend down the unspent FY 2007 SCMS funds first, and then allocate funding to SCMS as needed through the reprogramming process.

Therefore there is no need to fund this activity with FY 2008 COP funds at this time, but TBD SCMS funds may be used at a later date.

Activity ID: 7884.08

Planned Funds: $430,500

Activity System ID: 13977

Activity Narrative: SUMMARY:

Humana People to People (Humana) implements a comprehensive, integrated abstinence, be faithful and condom (ABC) HIV and AIDS prevention program called Total Control of the Epidemic (TCE). TCE trains community members as field officers (FOs). FOs utilize a person-to-person campaign approach to reach every household within the target area with prevention messages including the correct and consistent use of condoms and on prevention of mother-to-child transmission (PMTCT). The major emphasis area is community mobilization/participation, while minor emphasis areas are development of network/linkages/referral systems, information, education and communication (IEC), and training. Key target populations are men, women, pregnant women, discordant couples, migrant workers, out-of-school youth, community leaders and traditional healers.

BACKGROUND:

TCE was launched by Humana in 2000 in Zimbabwe. The program has been implemented in eight countries in Southern Africa, reaching a population of five million. Humana received its first PEPFAR funding in July 2005. As of August 2007, Humana had implemented its project in five PEPFAR funded TCE areas in the provinces of Mpumalanga and Limpopo. FY 2008 will ensure expansion in the number of TCEs in these provinces. In the first two years of implementation 400 community members were trained as FOs and prevention services have been provided to 60% of the targeted community members. FOs mobilize communities to address stigma and discrimination associated with HIV and AIDS and to raise awareness of HIV preventive behaviors. TCE tracks service provision by gender, and develops strategies to reach men with condoms and other prevention messages. FOs promote gender equity during their home-visits by empowering both sexes with information and education and tailoring the information given to address gender-specific vulnerabilities. TCE trains community volunteers - known as Passionates -- to establish vegetable gardens, run children and youth clubs, and to offer care and support to orphans and people living with HIV (PLHIV). Humana works in partnership with the Mopani and Ehlanzeni district municipalities, major partners contributing over $140,000 per year to the program until the end of 2007. TCE has received a number of awards, including the 2003 Stars of Africa Award (in partnership with Johnson and Johnson) for best Corporate Social Investment Program within Health/HIV and AIDS in South Africa. TCE also expects to scale up its coverage with funding from Global Fund via South African National AIDS Council (SANAC) in 2008.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Household-Based Person to Person Campaign

The TCE Program uses a person-to-person campaign to reach every single household with information about HIV and AIDS within the targeted areas. Each FO is allocated a field of 2,000 people (350-485 households). Households are visited at least three times over a three-year period and receive targeted IEC messages emphasizing age-appropriate prevention messages focusing on the use of condoms with the objective of changing community sexual norms. FOs visit households and engage individuals in discussions on preventive behavior and promote counseling and testing (CT) and PMTCT. FOs explain about government services such as CT, prevention of mother-to-child transmission (PMTCT), TB programs, STI screening, social grants and home-based care, and refer those in need. FOs also refer people with symptoms of AIDS-related conditions directly to public health clinics for CD4 testing, HIV clinical staging, and treatment of opportunistic infections. Although the TCE program focuses on AB messages, it also provides sexually active and at-risk community members with prevention messages on the use of condoms and PMTCT. TCE carries out a series of targeted interventions to reach people at workplaces, bars and shebeens, armed forces, at-risk youth and vulnerable population groups, such as taxi drivers, sex-workers and young men, with information on the use of condoms. During campaigns, the FOs assess the needs of the individual, tailoring their messages to address the different needs of specific populations. FOs address issues such as the increased risk of HIV transmission when engaging in casual sex encounters, in commercial sex, cross-generational sex, transactional sex, having sex with an HIV-infected partner or one whose status is unknown.

TCE has also developed a tool called Perpendicular Estimate System (PES), which is tailored to measure the impact of the program in the target areas; PES consists of a set of questions and demands to the individual in order to be TCE-compliant, which means being in control of HIV and AIDS in one's life. During the second and third year of the program, community members interact with their TCE FOs on an individual basis to make a PES-plan, which minimizes their risk of being infected and makes them live responsibly and positively if infected.

TCE organizes workshops for key players in the community, such as local leaders, traditional healers and community-based organizations to promote the use of condoms and CT. TCE also establishes condom outlets in the homes of FOs and Passionates. The FOs educate pregnant women on PMTCT and refer them to antenatal clinics. In the one-to-one counseling, FOs also address issues of domestic violence, child abuse, alcohol abuse and use of drugs.

ACTIVITY 2: Human Capacity Building

Through weekly meetings, the FOs receive continuous internal training, in the first year as lay-counselors, and during the second year as educators. The training is based on experiences gathered in the field. TCE makes use of both its own materials, which are continuously tested and updated and educational materials developed by other organizations and the government. TCE often makes use of guest speakers from government and other organizations for training purposes. Passionates are trained in HIV and AIDS and in communication and facilitation skills (such as running youth clubs), and some are trained to distribute and demonstrate the use of condoms.

ACTIVITY 3: Linkages with Sectors and Initiatives

TCE works in close collaboration with other stakeholders in the region. For example, the Department of Health provides all the condoms that are distributed by TCE and FOs mobilize and refer pregnant women to public sector antenatal clinics for PMTCT. Furthermore, TCE has a strong partnership with the tuberculosis

Activity Narrative: (TB) sub-directorate in the Ehlanzeni and Mopani districts, where FOs are trained to raise awareness about TB, make referrals to clinics and collect sputum. TCE also cooperates with SAG departments including the Department of Social Development to ensure that OVC and PLHIV, who are identified through household visits, are able to access social security. Through the door-to-door campaign, FOs identify patients in need of palliative care and refer them to services provided under the TCE program or to other services.

ACTIVITY 4: Monitoring and Evaluation

TCE has developed a range of systems to measure the results of the program. Before starting in a new area, TCE carries out a baseline survey collecting information about knowledge, attitudes and practices of community members. After implementation, each FO has a household register and maintains basic information about each household and is a continuous source of data to evaluate the progress of the program, such as number of people tested, number of OVC and pregnant women referred to PMTCT and STI services. Data from the PES campaign is used to track community behavior change. This data provides information on individual behavior change in the target area. Throughout the program, the FOs and TCE Management meet on a weekly and monthly basis to evaluate the progress of the program. The meetings monitor the progress of achieving targets and deliberate on the challenges faced in the field. Quarterly, TCE management meet with staff at the TCE Regional Headquarters in Zimbabwe to further evaluate the progress of the program and develop activities in order to increase impact.

Special Forces and Development Instructors (international volunteers) monitor services and ensure quality control through periodic spot check visits to households.

These activities will contribute to the 2-7-10 goals of averting 7 million new infections by increased knowledge and skills among community members in HIV and AIDS prevention; reduced stigma; higher gender equity; increased knowledge about services (PMTCT and CT); increased use of condoms; strengthened linkages between other organizations in the area and government services; increased number of people knowing their HIV status; and higher mobilization and capacity

Program Area: Condoms and Other Prevention Activities

Budget Code: HVOP

Program Area Code: 05

Activity ID: 8241.08

Planned Funds: $250,000

Activity System ID: 14027

Activity Narrative: SUMMARY:

Mpilonhle is a new South African community-based organization registered in 2007 with the South African Directorate of NGOs. It is dedicated to improving the health and well-being of adolescents attending high schools in Umkhanyakude District Municipality, KwaZulu-Natal (KZN) through its "Mpilonhle Mobile Health and Education Project" whose key activities are described below. It will begin operations in late 2007 with a single mobile unit funded with support from Oprah's Angel Network, and expand with two further mobile units funded by PEPFAR funds. It is currently building up its staff, which is expected to be 40 persons targeting 12 high schools with approximately 800 students, totaling 9,600. These activities will be based in the Mpilonhle office in Mtubatuba, KZN.

Mpilonhle activities consists of community-based health screenings, which will be conducted by health counselors at 24 community-based (non-school) sites, and will consist of a core of HIV preventive services including individualized voluntary counseling and testing (VCT); personalized abstinence, Be Faithful and correct and consistent condom use (ABC) counseling, and condom provision to sexually active youth and adults; and group HIV and health education sessions. These services will be delivered through mobile clinic and mobile computer laboratory facilities to 24 community (non-school) sites in rural KwaZulu-Natal. Emphasis areas are: gender, human capacity development and strategic information. Target populations are adolescents aged 15-24 and adults.

BACKGROUND:

This is a new PEFPAR activity. Mpilonhle works with broad support from district and provincial South African Government (SAG) leadership. The Condom/Other Prevention activities will be implemented in Umkhanyakude District Municipality, the poorest and most rural district in KwaZulu-Natal, and one that has extremely high HIV prevalence rates. Services will be delivered using mobile units traveling to rural secondary schools. These schools and their students suffer from physical remoteness, scarcity of health services and generally inadequate resources. Partners include the Department of Education, the South African Democratic Teachers' Union (SADTU), District Health Services and district and municipal leadership, including that of Traditional Authorities. School principals, local Department of Education officials, district and municipal mayors and focus groups of teachers and students have expressed the community acceptability of school-based VCT.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Community-Based Health Screening

Mobile community-based and community-focused health screenings will be conducted by HIV and AIDS counselors at 12 school locations. Each mobile facility consists of a paired-up mobile clinic and mobile computer laboratory, staffed by one primary care nurse, four health counselors, one health educator, and one computer educator. Each mobile facility will rotate across four school locations, allowing three mobile facilities to serve 12 sites in total. These community sites will be determined in collaboration with the mayors of Umkhanyakude, Mtubatuba, and Hlabisa Municipalities. The OP activity will consist of correct and consistent condom use programs which support the provision of accurate information about condom use to reduce risks for HIV infection and support access for those most at risk populations.

Provision and promotion of information on correct and consistent condom use will be coupled with information about abstinence and behavior change; the importance of HIV counseling and testing (CT), knowing one's HIV status, partner reduction and mutual faithfulness as risk reduction methods. The HIV preventive services include personalized ABC messaging, behavior change, HIV and AIDS counseling, group computer trainings that include health messaging, and group HIV and health education sessions. In addition to these services, Mpilonhle provides referrals to other community-based services for prevention of mother-to-child transmission (PMTCT), antiretroviral treatment (ART), tuberculosis (TB) and psychosocial support; referrals to a social worker for assistance with accessing government grants and support for orphans and vulnerable children (OVC) or people living with HIV (PLHIV); general health screening and referral for care and other services as required. These preventive services will be offered within the context of a health screening service that provides other health services besides HIV prevention. The broadness of these services, and the fact that it addresses other health concerns beyond HIV, is likely to attract a larger number of students with non-HIV-related health concerns to Mpilonhle’s services, thereby raising the number of people they reach with HIV prevention.

ACTIVITY 2: School-Based Health Education

Mpilonhle health educators will provide students with four small-group HIV, health and life skills education sessions per year that will discuss the basic facts about: HIV and STIs; CT; TB; anti-retroviral therapy (ART); prevention of mother-to-child transmission of HIV (PMTCT); a balanced Abstinence-Be Faithful-Condoms (ABC) approach to HIV prevention; reducing stigma and discrimination against people living with HIV and AIDS (PLHIV); and promoting respect between men and women. The HIV preventive outreach is not limited to the four health education sessions, but is supplemented by the health screening session described in Activity 1 and the health messages in the computer-assisted learning. An age-appropriate curriculum on these topics has been developed by the Educational Development Center (EDC) and the South African Democratic Teacher's Union (SADTU), drawing on existing material developed by the EDC and SADTU, and the World Health Organization (WHO) summarized in the WHO publication "Teachers' Exercise Book for HIV Prevention", and in conformity with the SA DOE's Life Skills curriculum. This curriculum will also be submitted to the SA DOE for approval, and for certification of conformity with the Life Skills curriculum. This curriculum emphasizes the traditional three-part public health theory of improving Knowledge, Attitudes and Practice (KAP) skill-building methods in topics such as risk reduction, decision-making, and social responsibility, as a way of preventing HIV infection, providing support to those infected and affected by HIV, fighting stigma and discrimination, and dealing effectively with the challenges of everyday life. The skill-based HIV education will provide focused messages about the benefits of delaying sexual debut and other safe sexual behaviors. Activities will aim to develop students' self-esteem to build their resilience, assist them to make informed choices and develop communication skills.

ACTIVITY 3: School-Based Computer-Assisted Learning

Activity Narrative:

An Mpilonhle computer educator will provide students in participating schools with four 90-minute small-group computer education sessions per year. This training will focus on how to use computers, basic software, the internet; and computer-assisted learning for improved school performance, HIV prevention, and general health promotion. The computer-based health education lessons are packaged to address the life skills needs of youth and are consistent with SAG guidelines. The AB messages are internationally recognized, appropriately researched messages. This activity is intended to improve student learning, raise number of pupils who graduate (graduation rates), and augment employability. These outcomes can in turn increase women's socio-economic status, and reduces their vulnerability to coercive, cross-generational, and transactional sex.

Sustainability of activities is facilitated by political commitment from district and municipal governments, and the local Department of Education to scale-up and to fund-raise in support of such scale-up; the relatively low-tech and easily replicable nature of many core program features, minimal dependence on scarce health professional such as doctors and nurses; the ability of rugged mobile facilities to reduce the need for additional investments in fixed physical infrastructure; declining prices over time for the program's information technology (IT) requirements, the possibility of adapting the service delivery model to workplaces as well as schools, the multi-dimensionality of program activities, which includes HIV and AIDS, general health, and education related activities, and which broadens the scope of donors interested in funding continuation and scale-up of activities.

Building human capacity in remote rural areas contributes to future sustainability of the program. Mpilonhle will respond to this challenge by maximizing the capacities and skills of relatively abundant lay health workers through rigorous training and regular refresher courses to enable them to perform critical yet currently scarce services such as VCT, health screening and personalized risk assessment, and health education, shifting the burden of these activities away from relatively scarce professional health workers like nurses and doctors.

This activity will contribute to PEPFAR 2-7-10 goals of preventing 7 million new HIV infections, and providing care and support to PLHIV. This activity addresses gender issues through the provision of ABC education and services to large numbers of females in the general population; computer education which promotes female educational attainment and employability, which in turn reduce their vulnerability to HIV, and in particular to coercive, cross-generational and transactional sex; health education that promotes safer behavior and gender-sensitive attitudes among men and yield benefits to women who become their sexual partners. This activity will also promote consistent use of condoms and behavior change through the reduction of sexual partners.

Activity Narrative: SUMMARY:

The approach taken by the Perinatal HIV Research Unit (PHRU) is one of comprehensive, high quality care and support for PLHIV. Building on their 2006 workshop on the feasibility of scaling-up doctor-based male circumcision, the PHRU are using FY 2007 funds to organize and facilitate a stakeholders workshop on the feasibility, acceptability, and resource requirements of alternative models of delivering circumcision as a part of a comprehensive HIV prevention program. The workshop compares three models of male circumcision: the use of traditional healers (where they are culturally appropriate) as circumcisers; use of trained doctors; and a nurse-based approach to circumcision. The workshop draws upon the work of Human Sciences Research Council (HSRC) and PHRU's non-PEPFAR funded study of the feasibility and acceptability of nurse-based male circumcision. This activity will be used by the Health Policy Initiative in their policy analysis of the impact of pending South African legislation restricting male circumcision to doctor -based programs and will be coordinated with JHPIEGO and the NDOH TBD support to the NDOH. FY 2008 funds will be used to conduct an additional symposium, similar to that held with FY 2007 funds, which will continue to involve major stakeholders in the policy analysis, brainstorming, and other major issues surrounding male circumcision. The major emphasis area addressed in this activity is human capacity development. Healthcare workers, program managers, and local health officials are the target group for this activity.

BACKGROUND:

Although not widespread, prevalence rates for male circumcision in South Africa ranges from about 30% national average to nearly universal among some ethnic groups. Male circumcision is a procedure that is usually done for cultural or religious reasons rather than for health benefits. This is seen among certain ethnic groups such as the Xhosa who routinely practice male circumcision as part of boys' initiation to the transition to manhood. In such cases the circumcision is done by traditional healers rather than by medically trained staff in a health facility. A recent study conducted in South Africa showed that male circumcision reduces the risk of becoming HIV-infected. UNAIDS and WHO have stated that these results should be confirmed prior to recommendations being issued regarding policy and program development. Two further large scale studies of circumcision for HIV prevention are in progress in Uganda and Kenya, with results anticipated later in 2007. Scaling-up male circumcision in South Africa may soon become a priority, as a component of comprehensive HIV prevention programs. In anticipation of this development, the PHRU held workshops in 2006 and 2007 on issues related to the feasibility of scaling-up male circumcision. Contributions to this workshop were made by researchers who conducted the South African trial, academics, surgeons, and included input on diverse aspects of possible interventions including training requirements, legal and ethical concerns, traditional methods, anesthesia, cultural concerns, and potential target groups. An important conclusion from this preliminary consultation was that there is little circumcision being carried out by trained surgeons. A medical model with circumcision delivered by trained nurses could also be considered. PHRU is currently conducting research, with non-PEPFAR funding, on the feasibility and acceptability of a nurse-based approach to circumcision. Through non-PEPFAR funding, male circumcision would be performed by trained nurses under the supervision of a surgeon in sterile operating rooms at primary and tertiary health facilities. It is expected that this activity would impact male norms and increasing equity in treatment programs.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: Male Circumcision Using Nursing Staff

No male circumcision training or service delivery will take place without the express consent of the National Department of Health. In the absence of such approval and based on discussions with the PEPFAR South Africa team, funds could fully or partially be reprogrammed. Should the approval for safe clinical male circumcision activities be given, PHRU is proposing the following male activities:

This activity assumes that the South African Government will change legislation to allow male circumcision to take place on a large scale in South Africa. Recognizing that specialized surgical and other staff are in short supply, this activity will look at alternative models to scale-up male circumcision. This will include training nurses to do male circumcision, paying staff to perform circumcisions and paying for materials required to perform male circumcision. Training, mentoring and implementation will be the main areas of emphasis and developed in consultation with NDOH and JHPIEGO. It is likely that this activity will take place initially in Gauteng, but may be expanded to other provinces on request of the National Department of Health.

These activities will contribute to the PEPFAR goal of preventing 7 million new infections by exploring innovative prevention possibilities, which will result in a lower transmission rate.

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Condoms and Other Prevention Activities

Program Area Code: 05

Planned Funds: $250,000

Activity Narrative: SUMMARY:

Youth for Christ (YFC) will promote HIV risk reduction and prevention activities by conducting life skills programs, awareness campaigns, and distributing and promoting correct and consistent use of condoms among school leavers, and young adults 18 years and older. YFC will recruit and train unemployed young adults as youth workers. After training, the youth workers will be placed in Youth Clubs where they will assist in expanding YFC's HIV prevention campaign by distributing condoms to communities and the youth. Gender is an emphasis area for this program as it addresses the extreme vulnerability of young South African women to HIV, and male norms and behaviors. While the target population is youths aged 15-24 years, adults aged 25-30 will not be excluded from these prevention activities.

BACKGROUND:

YFC has been involved with prevention programs in schools for several years. The National Department of Health (NDOH) has funded YFC activities since 1995. The organization was PEPFAR-funded from 2005 through the NDOH cooperative agreement, and is now a PEPFAR prime partner. YFC's prevention activities will focus on distribution and correct and consistent use of condoms, and on gender issues, which will be addressed through life skills programs. The life skills programs will focus on empowering young women, and challenging young men to question gender stereotypes. In addition, this program forms part of YFC's comprehensive prevention strategy and is linked to activities in the AB program area. A particular focus of this linkage for this the "B" (be faithful) activities.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Condom Distribution

YFC's prevention program will ensure condom distribution that is coupled with clear and consistent and correct messaging around condom use. The condom distribution and condom use program will be aimed at school leavers and out of school youth, as these young adults are likely to be sexually active, and have a higher risk of exposure to HIV. YFC will distribute government-provided condoms at community-based sites and public health facilities. This activity aims to empower and positively influence men to practice safe sex and to use preventative methods, while empowering young with condom negotiation skills. YFC peer educators and interns will interact with their peers and challenge gender stereotypes, and at the same time, serve as mentors and positive role models.

ACTIVITY 2: Behavior Change Campaigns

This activity will focus on the development and implementation of behavior change campaigns around HIV and AIDS. Information, education, and communication (IEC) publications developed by Khomanani, a South African communications company, will be distributed along with the condoms. These materials address key communication issues around issues of prevention, care and treatment of HIV & AIDS. Peer educators and interns will encourage discussion around condoms and HIV and AIDS, and this activity will help to alleviate stigma and discrimination in the communities in which YFC is working.

Interns and peer educators will be recruited from school leavers who are unemployed and who actively participate in faith-based organizations. These youth will be trained using the YFC peer educator programs including the Rutanang peer education manuals by the Department of Health and life skills manuals by the Department of Education section. In addition, peer educators will be trained in community mobilization and will play a role in informing their peers about local healthcare services, including counseling and testing. The peer educators will educate their peers on the benefits of HIV counseling and testing and will refer their peers to counseling and testing services in their communities. Parents will be targeted and provided with information on raising responsible and informed children. Community awareness programs will aim to destigmatize HIV and AIDS in communities and YFC will develop infrastructures to provide community support for HIV-affected families.

ACTIVITY 3: Life Skills and Leadership Camps

In FY 2008, two kinds of camps will be run for school leavers. Outdoor-based camps aimed at training and developing resilience and Leadership Skills. Young people will also be equipped with critical personal and inter-personal skills to enable them to dialogue with and impact their peers, friends and those they relate to. Important aspects of these camps shall be team building, leadership and communication with activities such as abseiling, hiking, canoeing, swimming, etc. Conference/Seminar-Based Camps will also be organized as "Youth, HIV & AIDS Seminars" to empower youth on current developments on the pandemic as they relates to youth specifically and to allow youth to understand the latest trends and developments in the fight against it. In all the activities, it shall be a general requirement that there be a gender ratio of at least 40% male and 60% female.

ACTIVITY 4: Intensifying Education about Responsible Sexuality

Condom promotion will not be done indiscriminately but by educating young persons and encouraging abstinence as the best and only completely safe option, within a mentoring and peer counseling context. However, since the majority of youth targeted in this component of the prevention strategy are already sexually active, activities will focus on the B component of the AB messaging and linking the being faithful to correct and consistent condom use. Efforts to engage youth shall aim to educate them in the correct and consistent use of condoms whilst also educating them on the risks involved in sexual activity. With FY 2008 funding, condom distribution, and efforts to ensure condom accessibility and availability will be accompanied by strategies that encourage youth to be responsible and accountable in decisions regarding their sexual behavior. With older, out of school youth, YFC will also tackle critical issues such as gender-based violence and cross generational and transactional sex, which the aim of fostering and encouraging behavior change among this group.

Through the distribution of 15,000 male and 5,000 female condoms and through behavior changing messages, YFC will support prevention goals as outlined in the USG Five-Year Strategy for South Africa to avert 7 million new infections.

Activity System ID:	13953		

Activity Narrative:

SUMMARY:
Johns Hopkins University/Center for Communication Programs (JHU/CCP) and its 20 South African (SA) partners are undertaking a concerted effort that utilizes a variety of communication channels, including mass media and interpersonal community mobilization (CM). It aims at bringing about heightened urgency of risk perception to HIV infection among the general population about sexual partnerships and behaviors that place them at risk including multiple concurrent partners (MCP); intergenerational/transactional sex (ITS); inconsistent and incorrect condom use; alcohol and substance abuse; and gender and gender-based violence (GBV). The condom and other HIV prevention strategy is guided by qualitative studies that investigated underlying behavioral causes of MCP and the 2006 SA HIV/AIDS Communication Survey that investigated reach and impact of 19 mass media interventions on HIV prevention.

BACKGROUND:
Over the next four years partners will prioritize interventions focusing on men aged 25–49 and women aged 15–24. Interventions will impact on key drivers of the epidemic and people's risk perception about sexual partnerships and behaviors including prevalence of MCP; ITS and incorrect and inconsistent condom use. All interventions are informed through study which found that high risk behaviors driving epidemic are determined through social norms and values that include male attitudes and behaviors, alcohol and substance abuse; population mobility and gender dynamics including GBV. JHU/CCP and its partners combines a social-ecology approach to communication with power of interpersonal communication with mass media (including radio, television (TV), outdoor and cellular technology) to engage and mobilize individuals around sexual behavior and perception of risk to HIV infection and influence social networks and communities to create an enabling environment that allows them to reduce risk to HIV infection. Activities will contribute towards changes in social norms, create social networks that support individual change, build skills, and improve decision making leading to safer sexual behavior (SB).

ACTIVITIES AND EXPECTED RESULTS
ACTIVITY 1: Mobilizing In- and Out-of-School Youth 15-24
Dance4Life (D4L), DramAidE, The Valley Trust (TVT), Lesedi Lechabile (LL), Lighthouse Foundation (LF) and Community Health Media Trust (CHMT) will work with young people in secondary schools using variety of approaches to train peer educators (PEs) to establish HIV prevention, care and support clubs to act as entree to in-school youth. With youth over 14 messages relating to MCP, ITS, correct and consistent condom use, male norms and behaviors, substance and alcohol abuse, GBV, risk perception, stigma and discrimination (SD) will be given.
TVT, LF and LL will use interpersonal discussions, workshops and community events with out-of-school youth to heighten their perceptions of risk about sexual partnerships and behavior including MCP, ITS, correct and consistent condom use, male norms and behaviors, substance and alcohol abuse and GBV.
DramAidE's Health Promoters (HPs) work in 23 tertiary institutions. They use group meetings, individual consultations, dorm visits, classroom instruction and community events to increase risk perceptions about MCP, ITS, GBV, condom negotiation skills, sexually transmitted infections (STIs), male norms and behaviors, SD, sexual and reproductive health (SRH) and risks of substance and alcohol abuse.

ACTIVITY 2: Mobilizing Adults 15-49
Sonke Gender Justice (SGJ) supports partners to integrate Men as Partners approach into their work to mobilize men around responsible male behavior, correct and consistent condom use, substance and alcohol abuse and reduction of GBV.
Sonke Gender Justice, LF, LL and TVT will expand number of men's clubs and men's health services to mobilize men, communities and traditional structures around responsible male behavior, correct and consistent condom use, substance and alcohol abuse and reduction of GBV. They will expand number of men's clubs in Mpumalanga, NW and NC provinces to mobilize men, their communities and traditional structures.
TVT, LF and Matchboxology (MB) will undertake CM interventions to mobilize adult men and women through door-to-door campaigns, taverns and taxi ranks, around MCP, ITS, correct and consistent condom usage, prevention with positives (PwP), GBV, male norms and behaviors, SD, and risks of substance and alcohol abuse.
LifeLine SA and TVT will support workplace interventions by training PEs within small and medium enterprises and on farms to mobilize employers and employees. MB will work with professional footballers and fan clubs. All workplace-based interventions will increase perceptions of risk about MCP and ITS, correct and consistent condom use, GBV, SD, male norms and behaviors and alcohol consumption.
TVT and LF will undertake community conversations with traditional leaders and healers s to mobilize them in addressing cultural dimensions of MCP, inconsistent and incorrect condom usage, PwP, GBV, SD, male norms and behaviors and alcohol consumption.
TVT, LifeLine SA and LF will work with faith-based organizations (FBOs) through activities to promote partner limitation, correct and consistent condom usage, GBV and SRH. Religious leaders will be trained and provided with appropriate communication materials to guide them.
Mindset Health Channel (MHC) has a Healthcare Worker Channel (HCWs) and a Patient Channel in more than 400 public clinics. Its HCW Channel trains health workers and its public health channel sensitizes audiences on partner reduction, correct and consistent condom usage, GBV, substance and alcohol abuse, STIs, and SRH.
Community Health Media Trust (CHMT), will increase number of Treatment Literacy and Prevention Practitioners (TLPPs) to 92 (72 funded by PEPFAR and 20 by National Department of Health (NDOH) and facilitate discussion among patients in general waiting rooms in MHC on topics relating to correct and consistent condom usage, GBV, substance and alcohol abuse, STIs and SRH. LF, TVT and Mothusimpilo will work with CHMT and Mindset to facilitate dialogues in clinics surrounding their areas.
DramAidE, CHMT and LF will mobilize support groups and community-based organizations of people living with HIV, in areas where they are working around PwP and in particular addressing correct and consistent condom use; MCP, alcohol and substance abuse, STIs. LL and Mothusimpilo use PE and HCW in mining districts of North West (NW) and Free State (FS) to reach young women at risk, including sex workers, in clinics, schools and communities to address correct and consistent condom use, risk perceptions, ITS, GBV, stigma and discrimination, male norms and behaviors and risks of alcohol and substance abuse. Their programs are linked to local mining companies who focus on male employees.
Department of Correctional Services (DCS) will expand its correctional facilities program from Limpopo and North West Province to include Gauteng and Northern Cape. DCS uses Tsha Tsha TV drama series, to train its PEs to promote correct and consistent condom usage, GBV, SRH including that relating to same sex SB.

Activity Narrative:

ACTIVITY 3: Mass Media Support for CM
2006 JHU/CCP national communications survey found that 76.7% of people had at least one television (TV) in their households. 60% watch TV everyday and 60% listen to radio everyday. JHU/CCP supported drama, Tsha Tsha reached 48% of population, treatment literacy program Siyanqoba – Beat It reached 27% and community radio program Mind, Body Soul reached 6% of population. Tsha Tsha has been used to facilitate discussions with people in schools, correctional facilities and community meetings around issues relating to risk of HIV infection, ITS and multiple and concurrent partnerships. However 44% of population was not reached by any of these due partly to fragmentation of media environment about audience preferences influenced by socio-economic status and language. To address this issue, JHUCCP will expand its mass media program to include new platforms such as cellular and internet technology and outdoor media that complements radio and TV outreach work. All platforms will heighten awareness of risk among men aged 25–49 and young girls and women aged 15–24 about their sexual partnerships and behaviors including MCP, low and inconsistent condom use and need for regular testing.
ABC Ulwazi will produce community radio talk show for 60 community radio stations using local languages facilitated through listener associations.
JHU CCP has a public private partnership with SA Broadcasting Corporation (SABC) to fund two TV-programs supported by nine regional SABC language radio programs and internet. A second season of TV drama Circles will heighten peoples perception of risk to HIV infection by highlighting sexual partnerships and behaviors that place people at risk of infection including MCP, and ITS.
MB in partnership with SA Professional Football Union and Professional Soccer League will mobilize prominent SA football players to provide messages through different mass media platforms that emphasize responsible male behavior including consistent and correct condom use, GBV, alcohol and substance abuse, treatment of STIs, as part of build up to 2010 Football World Cup in SA.
A TBD outdoor media partner will work with JHU to develop messages for outdoor media to heighten perceptions of risk about sexual partnerships and behaviors that place people at risk of HIV infection including MCP with low and inconsistent condom use.
A TBD cell phone partner will use SMS technology to address MCP, ITS, correct and consistent condom use, male norms and behaviors and risks of alcohol and substance abuse.
This activity contributes to reaching the 2-7-10 goals by training individuals to promote condom use and other prevention messages and preventing 7 million new infections.

Budget Code: HVOP

Program Area Code: 05

Activity ID: 6545.08

Planned Funds: $388,000

Activity System ID: 13946

Activity Narrative: PEPFAR funds were allocated to the Research Triangle Institute (RTI) in FY 2007 to improve care provided to victims of rape, through the establishment of seven new Thuthuzela Care Centers (TCCs). These multi-disciplinary centers provide comprehensive care services to women and children rape survivors, including post-exposure prophylaxis (PEP), HIV and AIDS counseling and testing, and referral to HIV care and treatment services. These centers also assist men and boys, who are increasingly becoming victims of rape. In FY 2008, funds will no longer be provided to RTI as the ceiling of this contract can not be increased. This activity will be re-competed and the RFP will be issued by December 2007.

This activity was approved in the FY 2007 COP, was funded with FY 2007 PEPFAR funds, and is included here to provide complete information for reviewers. Therefore there is no need to continue funding this activity with FY 2008 COP funds.

SUMMARY:

The goal of this project is to prevent the acquisition of HIV and AIDS among victims of rape and sexual violence through the establishment and operations of nine new Thuthuzela Care Centers (TCCs).These multi-disciplinary centers provide comprehensive services to women and children rape or assault survivors, including in this case a primary emphasis on post-exposure prophylaxis (PEP), with secondary emphases on HIV and AIDS counseling and testing, and referral to HIV care and treatment services. These centers also assist girls and boys who are increasingly becoming victims or perpetrators of rape. The major emphasis area will be on training and technical assistance with minor emphasis on commodity procurement. Target populations will include infants, girls, boys, men, women, doctors, nurses and pharmacist as well as the TCC core team. Commodities to be procured include rape kits, medical equipment, and comfort kits.

BACKGROUND:

This project is a continuation of work supported through PEPFAR funds in FYs 2006 and 2007 that were used to evaluate and upgrade existing TCCs in keeping with the National Department of Health's (NDOH) National Management Guidelines for the Care of Rape Victims. In FY 2008, this project will focus on maintaining established TCCs (20 total) in provinces where they do not currently exist and in other locations where need is identified. This activity is linked to the USAID Governing Justly and Democratically (GJD) office's program to support the Sexual Offences and Community Affairs (SOCA) Unit of the National Prosecuting Authority (NPA) of the Department of Justice and Constitutional Development (DoJCD) in its endeavor to eradicate all forms of gender-based and sexual violence against women and children, especially the crime of rape. The DoJCD/NPA/SOCA Unit has responded to the ongoing problem of sexual offences, and specifically rape, in the country by seeking to upgrade and expand the TCC network from 10 to 80 TCCs nationwide. The TCCs are a bold approach to rape prevention, care and treatment for victims of sexual violence and assault involving the health, justice, and civil society sectors in this endeavor. This project will advance the Women's Justice and Empowerment Presidential Initiative (WJEI) which seeks to establish a total of 30 TCCs to help the SAG achieve its goal of 80 TCCs nationwide. For victims of rape, the benefit of being assisted through a TCC is that the rape survivor can obtain all of the services needed at a single location, including medical assistance, access to justice by working with the local police and prosecutors, and access to counselors and emergency support services. Most TCCs are located within hospitals or near health care facilities, where there is a growing recognition of the links between violence against women or children and HIV and AIDS. The risk of HIV infection as a result of rape is significant in South Africa. Perpetrators seldom use condoms, placing the majority of women and children who are victims of this crime at risk. PEP represents an important intervention that can make a substantial contribution toward preventing HIV acquisition in particular and improving the healthcare of rape victims in general.

The TCC Model: According to the TCC model, when rape victims arrive at the police station to report a rape, they are removed from the crowds to a quiet room to take a statement. They are then transported to the nearest TCC where they are welcomed by a site coordinator. A dedicated nurse or doctor is then summoned to conduct the forensic medical exam. The Victim Assistance Officer (VAO) and the doctor or nurse explains to the victim what procedures need to be performed and help the victim understand why she must sign consent forms. The police detective on call to the centre is summoned and assigned to the case. Case managers are responsible for coordinating sexual offense cases and assisting the victim to understand what information the police investigator needs to investigate the crime. If the victim decides to pursue charges, the case manager opens a file and tracks the status of the victim's case. The victim is then referred to a local NGO or CBO to provide follow-on care and treatment services and support, as appropriate, throughout the legal process. This is the model. However, an audit conducted by RTI using FY 2006 PEPFAR funds found that TCCs are not always 100% compliant with this model (the highest score was 87.5% compliance). Upgrading current TCCs as well as operationalizing new ones consequently became an integral part of the program.

ACTIVITIES:

Using FY 2008 PEPFAR funds, a partner TBD will continue to support DOJCD/NPA/SOCA efforts to upgrade and expand the TCC model targeting nine additional TCCs. Part of this funding will continue to go towards the training of the medical officers (doctors, nurses and pharmacists) on how to provide PEP as well as to site coordinators and VAOs on how to educate victims on compliance with PEP as well as training and technical assistance to site coordinators who manage the multidisciplinary team and administer each TCC. Each rape victim will be encouraged to test for HIV. If the rape is reported within 72 hours, the rape survivors who test negative will be provided with PEP. They will be placed on PEP for 28 days and tested again for sero-conversion at three months and again at six months. They will be supported by TCC staff or affiliated CBOs and NGOs to ensure compliance with medication as well overall well-being.

EXPECTED RESULTS:

Rape victims who test positive for HIV will be given appropriate counseling and will be referred to the nearest government treatment site for further counseling, care and Antiretroviral Treatment (ART) when necessary. This project will be sustainable beyond the provision of PEPFAR funds, as the government will continue to support the TCC system and incorporate operating funds for the TCCs system in the national

Activity Narrative: budget.

This project will assist PEPFAR to meet its goal of averting 7 million new infections by playing a critical role in increasing access to and improving quality of vital post-rape services, including the provision of PEP.

Activity ID: 8252.08

Planned Funds: $100,000

Activity System ID: 13990

Activity Narrative: SUMMARY:

LifeLine's OP activity harnesses the activities and work of its other ongoing projects, such as the Community Counselor Project, especially with respect to community mobilization and outreach. It also benefits from contributions from other donors such as Anglo Platinum Mines, which has committed to three years of cost-sharing. In particular, they are funding a vehicle to be used in the mining areas and covering traveling costs and stipends for a nurse and driver. Relationships formed with local government and municipal departments will help ensure the continuity of the project. Salaries and other costs can be sustained through increased corporate training and workplace programs bringing in substantial revenue for LifeLine. The two major components of the program area include condom provision with education at specified sites as well as community outreach and mobilization. Emphasis is on information, education, dialogue, and HIV prevention activities carried out around the designated hot spots, throughout Bojanala District and the LifeLine centre in Rustenburg. The OP messages and activities address gender issues and gender dynamics directly, encouraging target populations to examine gender roles in society. Emphasis areas for this activity focus on gender by addressing male norms and behaviors and reducing violence and coercion around the designated hot spots and throughout Bojanala District and the LifeLine centre in Rustenburg. A "hotspot" is defined as an area that has a high rate of traffic of vulnerable persons; for example, taxi ranks and the mining hostels. The target groups for the OP messages are males and females from 15 years and older, including people living with HIV (PLHIV), discordant couples, pregnant women, persons who engage in transactional sex but who do not identify as persons in sex work, and mobile populations. Target groups are located in the identified hotspot areas. The LifeLine hot spots are currently located in the Bojanala region, with two hot spots identified in each sub-district. In FY 2007, LifeLine operated eight such hot spots. With FY 2008 PEPFAR support, LifeLine will expand its reach by an additional 4 hot spots, yielding support given to a total of 12 hot spots in the North West Province.

BACKGROUND:

LifeLine Rustenburg is a non-governmental, non-profit, community-based organization, affiliated to LifeLine Southern Africa and LifeLine International. Affiliation is awarded annually based on maintenance of standards, adherence to policy and procedures and acceptable performance in areas of service. LifeLine Rustenburg has been operational since 1991, and serves an area of approximately 200 square kilometers. LifeLine Rustenberg has a close working relationship with the National Office, which is informed about projects and services run by LifeLine Rustenburg. Bi-annual consultative meetings are held and quarterly reports are submitted to the main office by LifeLine Rustenburg.

LifeLine focuses on counseling and crisis intervention services, provision of life skills and personal development training, capacity building for less established community-based organizations (CBOs), counseling and testing (CT) and prevention activities. To date, LifeLine has implemented a community counselor project (CCP) which, in partnership with the provincial department of health, provides counselors to 150 health facilities in Bojanala, has established a non-medical CT site, provides 24 hour counseling service via a national counseling line, and has provided training to numerous other organizations. Future plans for the project are to place counselors at all health facilities, supply mobile CT, support and care to HIV-infected and affected persons and HIV and AIDS prevention services to rural and other under-serviced communities throughout the Bojanala District. Care and support activities will be provided through ongoing partnerships with other CBOs and FBOs (faith-based organizations) with expertise in these areas.

The South African Government, specifically the Bojanala District Department of Health, supports and contributes to a sustained and broad-based community mobilization and outreach effort in public health facilities, schools, other government outlets, and through media. Informal partners include local businesses, Radio Mafisa, local taxi associations, mining corporations and others, who provide support for LifeLine's community mobilization and outreach efforts. In particular, Mafisa Radio Station provides an hour timeslot weekly for LifeLine to discuss and debate on topics related to HIV and AIDS education, and the local taxi associations agreed, in 2006, to paste LifeLine stickers on their vehicles and to participate in condom-use campaigns.

In LifeLine's community outreach and education, many prevention modules require male and female participants to be separated in order to delve into specific issues. LifeLine will continue to use this approach during education and training sessions in FY 2008. The program activities also emphasize changing male norms and behaviors, discouraging cross-generational partners, promoting one-partner relationships and altering the norm of violence against women in society.

ACTIVITIES AND EXPECTED RESULTS:

Four activities will be covered in this program area. Messages for younger audiences will focus mostly on abstinence or delayed sexual debut. This will also include encouraging sexually active youth to consider secondary abstinence. Messages for the older youth and adult population will focus mostly on reduction in the number of sexual partners and will encourage non-concurrent sexual relationships. LifeLine will also promote the consistent and correct condom use. LifeLine will also work with the traditional leaders and community to transform male norms and behaviors in order to reduce violence and sexual coercion, and discourage cross-generational sex, which is rife in the community.

ACTIVITY 1: Mobile Counseling and Testing and Health Education Services

LifeLine uses two mobile units to reach high numbers of adolescents and adults in the community. The staff within each mobile unit consists of: two Counselors, two Community Outreach officials, and one Nurse. Currently the mobile covers five sub districts in the Bojanala region, and each of these five sub-districts features a minimum of two hot spots. The mobile unit services each hotspot for approximately seven hours a day, and a hotspot is revisited on a bi-monthly basis. The main aim of the mobile service is to increase accessibility, create awareness, and provide education and training on issues relating to HIV and AIDS prevention within the community. The mobile units provide Counseling and Testing (CT) services, offering a full range of CT services as well as prevention interventions. During the mobile visits, communities are educated on correct and consistent use of condoms, as part of a comprehensive ABC prevention program. Community members who test positive at the mobile unit are referred to the nearest hospital so that they can be enrolled in treatment, care and support programs.

Activity Narrative:

ACTIVITY 2: Community Mobilization

The community mobilization and outreach efforts seek to ensure that the general public receives the necessary information targeted towards behavior change. The HIV prevention activities, conducted in the area surrounding the hot spots, will be conducted by eight LifeLine community outreach volunteers and trainers. Education is provided in plenary sessions, as well as focus group education and discussion. Education topics highlight behavior and attitudes concerning: cultural, legal, gender, alcohol and substance abuse in young people as a risk factors, and other related social issues; multiple partners and cross-generational partnerships; and, for persons over 15, correct and consistent condom use. All prevention activities are target and language group sensitive (i.e. each target group receives relevant information and education specific to the age, culture or other dynamic of the group). Some activities are also conducted at the LifeLine offices. Individuals who live close to the LifeLine offices can access services at the LifeLine center. Activities at the LifeLine center are conducted by LifeLine community outreach volunteers and four trainers.

ACTIVITY 3: Capacity Building

Human capacity development requires ongoing trainings throughout the project. In-service training will be provided for the community outreach volunteers. This will ensure sustained motivation, competency and proficiency in carrying out LifeLine's HIV prevention activities. Peace Corps volunteers often assist with training, as needed. Bi-annual training for new personnel ensures project retention while monthly in-service training promotes staff retention. Workshops aimed at community members will also be conducted. These workshops are 2-days in duration, and are aimed at achieving behavior change with respect of safer sex practices. FY 2008 funding will ensure that these workshops will be conducted once a month per hotspot. The workshops will be held one day a week over a two week period, with the same participants. Each workshop will accommodate groups of 10-20 persons. A variety of techniques and participatory methodologies will be used. Topics cover basic life skills, HIV and AIDS general and prevention education, correct and consistent use of condoms, concurrent, same sex and cross general partners. The workshops will be facilitated by LifeLine trainers. In order to access behavior change and retention of information, a follow-up evaluation session will be held three months after completion of each workshop.

These activities will contribute to PEPFAR 2-7-10 goals of averting HIV infections through promoting Condom and Other Prevention behaviors among the general population and youth.

Activity System ID:	14019		

Activity Narrative: SUMMARY:

There are these separate programs being implemented by the Medical Research Council (MRC) in this program narrative. The first focuses on vulnerable populations, the second on gender-based violence and HIV, and the third on male circumcision. MRC's FY 2008 activities in the area of vulnerable populations build on FY 2005, 2006 and 2007 PEPFAR investments to strengthen programs serving IDUs, sex workers and MSM by developing the capacity of organizations to deliver services that enable these populations to reduce risk of HIV infection. Activities will focus on creating multi-sectoral and multi-disciplinary consortia of substance abuse and HIV organizations and developing organizational capacity to implement targeted community-based outreach interventions, linking outreach efforts to risk reduction counseling related to drugs and HIV, and access and referral to substance abuse, HIV care, treatment, and support services. In addition, the MRC will design and implement a behavioral HIV prevention intervention to reduce sexual risk behavior associated with alcohol use in bars in Tshwane. The major emphasis areas are the development of networks, linkages, and referral systems; and information, education and communication. Emphasis areas include local organization capacity building; quality assurance and supportive supervision; and training. Target populations are men, women, pregnant women, youth at risk, high-risk vulnerable populations and support organizations for IDUs, sex workers, other healthcare workers, community-based organizations (CBOs), non-governmental organizations (NGOs) and MSM.

BACKGROUND:

Findings from the South African-conducted International Rapid Assessment Response and Evaluation (I-RARE) of drug use and HIV risk behaviors among vulnerable drug using populations (injecting drug users (IDUs), sex workers and men who have sex with men (MSM) point to: high prevalence of overlapping drug and sexual risk behaviors; high prevalence of HIV in these populations; high levels of alcohol use and sexual risk behaviors and barriers to access and utilization of risk reduction, substance abuse and HIV services.

In FY 2005, PEPFAR supported MRC to conduct a rapid assessment of drug use and HIV risk among IDUs, sex workers and MSM in Cape Town, Durban, and Pretoria. In FY 2006, PEPFAR supported the convening of public and private partners, stakeholders, and organizations serving the target populations to develop recommendations, based on the findings of the rapid assessment. In FY 2007 and FY 2008, the MRC, in collaboration with a consortium of organizations and provincial governments is in the process of implementing interventions to reduce high-risk drug use and sexual behaviors and increase access to and utilization of services.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Linking and Coordination of Drug Abuse Treatment and HIV
Finding of the rapid assessment indicate lack of linkages and coordination of drug abuse treatment and HIV services. This activity focuses ondeveloping the capacity of Non government organizations (NGOs) and community-based organizations (CBOs) and other HIV and drug service organizations serving IDUs, sex workers and MSM to implement interventions targeting high-risk drug use and sexual behaviors and increase their access to and utilization of services. This activity will support the formalization of consortia linking drug abuse treatment and HIV service delivery organizations and the development of capacity among the consortia for the provision of comprehensive HIV and AIDS programs tailored for drug using vulnerable populations and adapted to the local epidemic. Components will include community-based outreach, risk reduction counseling, access and referral to HIV counseling and testing, substance abuse, and other HIV care and treatment services, including STI services. Community workers will be trained to access hidden populations and provide risk reduction related to violence, drug use, injecting and safer sex. Existing training manuals will be adapted to train outreach workers to implement community-based outreach. FY 2008 activities will be expanded to include underserved areas outside of the Durban, Cape Town, Tshwane metropolitan areas and in Mpumalanga province.

ACTIVITY 2: Design and Implement an HIV Intervention to Reduce Sexual Risk Behavior Associated with Alcohol use in Tshwane Bars

Using FY 2006 funding, MRC conducted formative research to identify a range of intervention methods that may be effective in reducing HIV sexual risk behavior associated with alcohol consumption. FY 2007 funding was used to develop specific bar-based intervention using methods proven to be effective in prior research. Future plans for this project build on FY 2006 and FY 2007 PEPFAR investments. In FY 2008, the MRC will continue to refine the interventions and make recommendations for implementation in other provinces and locations. FY 2008 COP activities will involve completing the pilot; collecting three-month follow-up data; making recommendations for adapting and scaling up the intervention to diverse socio-cultural settings.

ACTIVITY 3: Design and Implement an HIV Intervention to Reduce Sexual Risk Behavior Associated with Alcohol Use in Cape Town

Formative work related to (1) the design of a behavioral intervention aimed at reducing alcohol-related sexual HIV risk and gender-related violence for women in Cape Town, (2) designing behavioral interventions aimed at reducing drug abuse during pregnancy and associated HIV risk behavior, (3) designing behavioral interventions aimed at reducing drug-related HIV risk behavior among first time juvenile offenders and (4) better understanding the pathways through which alcohol affects HIV transmission and quantifying this association.

ACTIVITY 4: Effective delivery of PEP after rape: challenge of compliance

Monitoring and support of patients on anti-retroviral therapy (ART) is an important aspect of AIDS treatment and the daily support to patients to facilitate medication adherence during the initial stage is seen as an essential aspect of care (NDOH National Antiretroviral treatment Guidelines, 2004). Many lessons on how to support patients receiving post-exposure prophylaxis after a sexual assault can be gained from the ART program, and include extensive pre-treatment information and education, encouraging use of tools such as adherence diaries and motivational interviews during the initial period of pill-taking. The MRC is currently

Activity Narrative: engaged in a small proof of concept study that will lead to the development and testing of an information leaflet for patient education and adherence diary and of a model of providing nurse-led telephonic support in sites in the Western Cape and Eastern Cape with funds from Irish Aid. MRC will build on this work by developing two components of health service delivery and undertake an evaluation to determine impact of these on compliance with 28 day PEP courses. The first model of service delivery would be a model of nurse-led counseling for rape survivors that could be provided during the routinely scheduled weekly follow up visits to which patients are currently invited in services. The counseling would include adherence counseling, but would mostly focus on providing general psychological support for rape victim/survivors. The second model would be of follow up contact with victim/survivors on intermittent occasions during the 28 day period over which PEP is recommended. The model would seek to establish contact on days 2, 5, 13 and 20 after rape either by cell phone (~70% of South Africans have these) or home visit with the aim of providing support and encouraging adherence. The counseling model would build on existing good practice in the services. MRC will identify examples, study the approach and content of counseling in these settings, and develop a short training intervention that would train staff to follow the counseling model. The telephonic intervention would build on the MRC research in progress, but would in addition develop a model of home visitation that would be feasible and affordable for health services, building again on current good practice. The interventions will be implemented in the Western Cape, Eastern Cape and Gauteng Provinces in 24 sites providing care to sexual assault victim/survivor. Target population includes all victim/survivors of gender-based violence, including men, women and children of all ages. Victim/survivors would be given a leaflet about rape and HIV with an adherence diary. Staff at the sites will be trained to provide counselling during weekly follow up visits.

Activity 5: A rapid appraisal of traditional male circumcision (mc) and initiation processes
At the request of the NDOH, MRC will implement a rapid appraisal of traditional mc practices in 7 provinces of South Africa. The purpose of the activity is to gain an in-depth understanding of the processes, practices and meaning of initiation for boys and to gain an in-depth understanding of the community's response to the finding that mc plays in the role of HIV prevention. The rapid appraisal will be conducted through the implementation of focus groups, in-depth interviews and key informant interviews. The findings will be presented to the ministry of health together with a policy brief highlighting how HIV prevention messages and behavior change can be integrated into traditional male circumcision processes.

Results contribute to PEPFAR 2-7-10 goals by preventing infections among vulnerable drug using populations, and encouraging them to know their status and be appropriately referred to treatment services. The gender-based violence component will ensure prevention of transmission to survivors of sexual assault, and the rapid appraisal will help formulate policy around the incorporation of HIV prevention into traditional initiation processes

Budget Code: HVOP
Program Area Code: 05
Activity ID: 3029.08
Planned Funds: $436,500
Activity System ID: 14035

Activity Narrative: SUMMARY:

PEPFAR funds will support the Department of Correctional Services (DCS) to raise awareness about the prevention of HIV and progression to AIDS through the procurement of posters, pamphlets, videos/DVDs and booklets. CDC South Africa (SA) will review posters prior to printing and distribution. The appointment of six HIV and AIDS Management Area Coordinators (MACs) for the HIV and AIDS Offender Program, six Regional Coordinators and six Management Area Coordinators for the HIV and AIDS Workplace (members) Program as well as dieticians, on a contract basis of one year, will enhance the program implementation. The HIV and AIDS coordinators will coordinate, monitor and evaluate all HIV and AIDS programs. The emphasis areas for this program are workplace programs and reduction of violence and coercion. The target population will include male and female offenders and people living with HIV (PLHIV).

BACKGROUND:

The Department of Correctional Services has two distinct HIV and AIDS programs that are currently being implemented. It has a comprehensive HIV and AIDS Program for offenders for which a separate directorate was established in 2004. It also has a separate HIV and AIDS workplace program for personnel. Correctional officials are deployed in Correctional Centers, Community Corrections Offices, Management Areas, Regional Offices, and the National Head Offices. The HIV and AIDS workplace program currently resides under the Directorate for Human Resources Support and forms part of the Employee Wellness Program. Raising awareness and the role of behavioral change including safe sex practices in prevention among offenders and correctional officials forms a critical element of the comprehensive HIV and AIDS Program in the Department of Correctional Services. The utilization of educational posters, pamphlets, booklets, videos/DVDs, group activities, celebration of commemoration days raise awareness and encourages safe practices by empowering participants with knowledge and distributing condoms. Educational posters for offenders have previously been procured and distributed to the regions. Feedback received from the regions with regard to the utilization of these posters was positive and encouraged procurement of more educational material by Department of Correctional Services from accredited and registered service providers. The educational material was utilized by the master peer educators and HIV and AIDS coordinators during training and awareness raising sessions in Correctional Centers. The appointment of HIV and AIDS MACs for offenders, whose function is to coordinate HIV and AIDS comprehensive programs on contract basis, with funding received in 2004/2005 has proven to be successful and has enhanced the implementation of HIV and AIDS programs and services at management area level as well as at a correctional center level. It furthermore contributed to the fact that the human resource capacity in at least five management areas was extended by converting the contract post to a permanent post. Due to the shortage of human resources in the regions and at Management Area level, and to ensure the implementation and management of HIV and AIDS programs and services for staff, it is envisaged that the advertising of one year contract posts as indicated will add value to enhance and broaden the involvement of staff in HIV and AIDS activities and services in the workplace.

ACTIVITIES AND EXPECTED RESULTS:

There are approximately 162,000 offenders (both sentenced and un-sentenced) incarcerated in 241 Correctional Centers managed by the DCS, and 36,879 offenders in community corrections programs. The average offender population of a correctional center is approximately 4,000. In addition, DCS currently employs approximately 41,000 persons. This program is designed so that every offender and every correctional official will be exposed to ongoing information sessions and be involved in programs on HIV and AIDS through awareness-raising sessions and behavioral change programs, and training of professionals as well as offenders, and the changing of perceptions and behavior among correctional officials and offenders.

ACTIVITY 1: Procurement and Distribution of Educational Material and Procurement of Relevant Behavioral Programs

DCS will procure HIV and AIDS educational material that will be utilized during didactic training sessions, small group sessions, bigger projects and behavioral programs and for both offenders and correctional officials. These materials will be obtained through the Departmental procurement process. Offenders who are trained as HIV and AIDS peer educators, social workers, health care professionals, psychologists, chaplains and Employee Assistance Professionals provide prevention messages. The basic approach to HIV prevention is through group or individual sessions with all offenders in the Correctional Centers where information on abstinence, faithfulness and condom use is provided. The educational material will be distributed to all Correctional Centers and the utilization thereof will be monitored by the management area and correctional center coordinators. This activity is expected to reach individuals with relevant prevention messages. An urgent need has been expressed by the HIV and AIDS Workplace program for members to procure educational material. As explained in the background, the HIV and AIDS Workplace program focuses on custodial officials in the Correctional Centers as well as staff employed in the National, Regional and Management offices. JHU/CCP's Tsha Tsha materials are also used in some Correctional Centers to supplement what has been produced by DCS.

ACTIVITY 2: Appointment of HIV and AIDS Management Area Coordinators and Regional Coordinators

PEPFAR funds will also support the appointment of six HIV and AIDS Management Area Coordinators. These posts are intended to oversee the implementation of project activities. HIV and AIDS MACs are responsible for monitoring and evaluation of all HIV and AIDS programs. They will coordinate with other stakeholders, procure materials, and facilitate in-service and other training of staff and offenders as peer educators and on awareness. Posts will also facilitate HIV and AIDS work sessions, coordinate meetings, assist in gathering and tabulating required HIV and AIDS data and ensure that necessary reports and documents are submitted to the Regional HIV and AIDS coordinators. PEPFAR funds will also now support the appointment of six Regional HIV and AIDS Coordinators to assist with the management of HIV and AIDS programs and services for staff. It is furthermore envisaged that six additional MACs, especially for the bigger Management Areas, will be appointed to manage the HIV and AIDS program for staff. This has not been covered in the FY 2007 COP.

ACTIVITY 3: Behavioral Change Programs

Activity Narrative:

It is important to ensure that correctional officials and offenders in correctional centers engage in responsible behavior to mitigate the impact of HIV and AIDS and promote healthy living, abstinence, faithfulness and condom use. It is envisaged that six behavior change campaigns for offenders (one in every region) will be held. Behavior change programs will be developed on a scientific base through researching and the utilization of external experts. Funds will be allocated to the regions to ensure the implementation of these behavioral change programs, emphasizing responsible behavior. All the Correctional Centers (including correctional officials and offenders) in a Management Area will be included during the behavior change events and involved in more therapeutic programs or projects focusing on responsible behavior. In order to ensure that international calendar events are commemorated in the Department, such as Candle Light Ceremony and World AIDS Day, it is important to support the regions financially to conduct behavior change activities as well as programs aimed at developing responsible behavior around these special days for both staff and offenders. The awareness-raising sessions and behavior change programs, as well as the development of behavioral programs, will be conducted by external service providers who will be invited through the Departmental procurement processes. Offenders will be capacitated with the necessary skills and knowledge on HIV and AIDS during these sessions.

ACTIVITY 4: Addressing Violence and Coercion

All offenders will be exposed to at least two group sessions led by the peer educators discussing gender violence in the family. Social workers and Psychologists in the correctional centers will also provide one- on-one counseling to inmates who are abusive. This activity will specifically target those inmates who are in the pre-release centers or on parole.

The HIV prevention activities described in this section support the 2-7-10 PEPFAR goals by targeting a key high risk population in South Africa, promoting HIV-awareness and preventive behaviors, responsible sexual behavior and encouraging inmates and correctional officials to take a more active role in promoting HIV prevention.

Table 3.3.05: Activities by Funding Mechansim

Mechanism ID: 500.08

Mechanism: CDC Support - with CARE UGM

Prime Partner: National Department of Health, South Africa

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Condoms and Other Prevention Activities

Budget Code: HVOP

Program Area Code: 05

Activity ID: 14063.08

Planned Funds: $200,000

Activity System ID: 14063

Activity Narrative: SUMMARY:

In close collaboration with the National Department of Health (NDOH), CDC will provide overall HIV and AIDS programmatic support to the national and provincial Departments of Health. In addition, NDOH relies on CDC to implement activities that address NDOH's emerging priorities, providing financial and technical support more quickly than the systems of NDOH allow. PEPFAR other prevention-specific activities are represented on the NDOH operational plan, and contribute to the overall implementation of the national HIV and AIDS program. During FY 2007, CDC participated in the development of the Accelerated HIV and AIDS Prevention Strategy. During this process, a number of activities where identified and prioritized by the NDOH. These include activities focusing on prevention with positives (PwP); activities targeting parents, and activities focused around young women between the ages of 20 and 30. The PwP activities will complement the PwP activities within the CARE portfolio.

BACKGROUND:

The aim of the "In Support of the NDOH other prevention" project is to provide technical assistance to the NDOH and provincial health departments to ensure expansion of existing prevention efforts in all nine provinces of South Africa. In addition this project provides ensures technical assistance and implementation of new and innovative projects in the prevention arena. Two new prevention initiatives will be piloted in South Africa using FY 2008 PEPFAR funding. These include "Families Matter!" and a clinic-based prevention with positives initiative. The major emphasis area is training with a particular focus on in-service training. Other emphasis areas include development of network/linkages/referral systems and local organization capacity development. Target populations for these activities include healthcare workers, community-based and non-governmental organization, the general population, including children aged 10-18 years, youth, parents, people living with HIV (PLHIV) and discordant couples. A particular focus of this activity is prevention with positives. Addressing prevention with HIV-infected patients is an important part of a comprehensive prevention strategy. Through healthy living and reduction of risk behaviors, these prevention interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals. The rapid scale-up of HIV care and treatment has created an opportunity to reach many HIV-infected individuals with prevention interventions on a regular basis.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Capacity Building

FY 2008 funding will be used to building the capacity of local organizations supported by the NDOH that are working with in the area of other prevention. Capacity building will be achieved through the provision of training on HIV and on the promotion of prevention messages. This will be done in collaboration with the NDOH and in line with their priorities. Prevention messages and activities will target the general population and will focus on reducing concurrent partners, correct and consistent condom use, and behavior change messaging.

ACTIVITY 2: Families Matter!

FY 2008 PEPFAR funding will be used to begin to adapt and implement the Families Matter! Program (FMP). FMP is an evidence-based, parent-focused intervention designed to promote positive parenting and effective parent-child communication about sexuality and sexual risk reduction for parents of 9-12 year olds. FMP recognizes that many parents and guardians may need support to effectively convey values and expectations about sexual behavior and communicate important HIV, STD, and pregnancy prevention messages to their children. The ultimate goal of FMP is to reduce sexual risk behaviors among adolescents, including delayed onset of sexual debut, by giving parents tools to deliver primary prevention to their children. Families Matter! is delivered over five consecutive sessions where each lasts for three hours. Each session builds upon the foundation laid in the previous session. Activities will be implemented in accordance with the NDOH.

ACTIVITY 3: Prevention with Positives

HIV clinics and hospitals will be supported to adapt and implement a comprehensive package of prevention interventions for HIV infected individuals in care and treatment settings. Two provinces will be selected to pilot the intervention, namely Free State and Mpumalanga. The prevention interventions include provider- and counselor-delivered prevention messages, family planning counseling and services to HIV infected women and their partners, STI management and treatment, and testing of partners and children. Specifically, health care providers will be trained to deliver targeted behavioral messages to patients on disclosure, partner testing, and sexual risk reduction (abstaining or being faithful and using condoms consistently) during all routine clinic visits. Providers will be trained to deliver family planning counseling and services (funded through wrap around funds) to HIV infected women and their partners in the HIV clinic settings and these services will be integrated into the HIV clinic. In addition, providers will be trained to manage and treat STIs in the HIV care and treatment setting. Lay counselors will be placed in these settings for more in-depth prevention counseling beyond what health care providers have the time to address. They will counsel persons living with HIV on several key prevention issues, including sexual risk reduction, disclosure, adherence, reduction of alcohol consumption, and testing of sex partners and children in the HIV clinic setting. These interventions will be implemented using the CDC's HIV Prevention in Care and Treatment Settings Prevention Package, which includes several training packages and job aids. Other prevention is addressed by all providers in all components of the intervention. Medical providers will promote consistent condom use with all patients during each clinic visit. Mid-level providers and lay counselors will routinely recommend consistent condom use through tailored prevention messages. In addition, condom use is promoted in the Family Planning intervention as a method of dual protection. Condom use is also promoted as part of STI management as a method for reducing STI transmission and acquisition. In addition to recommending condoms and providing educational materials on condoms, clinics will stock an adequate supply of male condoms to distribute to each HIV-infected patient at every clinic visit.

ACTIVITY 4: Women 20-30

Activity Narrative: FY 2008 funding will be used to work with the NDOH to refine its prevention strategy targeting young women between the ages of 20-30. Funding will be used to assist the NDOH in integrating HIV prevention activities within the family planning setting. Activities will be aimed at the Provincial Maternal Child and Women's Health Coordinators. These provincial coordinators meet quarterly to discuss pertinent issues affecting women and children in their provinces and develop strategies to address these challenges. FY 2008 funding will be used to facilitate two quarterly meetings that address integration of HIV prevention into family planning services. At the first quarterly meeting, the facilitator will ensure that an implemental integration strategy specific to each province is developed. Thereafter, at the subsequent meeting, provincial coordinators will be required to report on progress, and challenges relating to the integration of HIV prevention and family planning services.

Activity ID:	6427.08	**Planned Funds:**	$388,000
Activity System ID:	15074		

Activity Narrative: SUMMARY:

While more coordinated strategies to improve women's reproductive health have been developed in South Africa, comprehensive national guidelines and policies to improve men's reproductive health are still sorely lacking. Gender norms play a crucial role in fuelling the HIV and AIDS epidemic, in terms of condoning men's violence against women, granting men the power to initiate and dictate the terms of sex, and making it extremely difficult for women to protect themselves from either HIV or violence or to access critical health and education services. By equating masculinity with sexual conquest, gender roles also contribute to what research suggests is the most significant factor driving the spread of HIV across sub-Saharan Africa - multiple concurrent sexual partnerships. Studies by Dworkin SL & Ehrhardt AA, Going beyond "ABC" to include "GEM": Critical reflections on progress in the HIV and AIDS epidemic and Noar, S.M. & Morokoff, P.J. (2001), The Relationship between Masculinity Ideology, Condom Attitudes, and Condom Use, show that traditional gender roles lead to men's "more negative condom attitudes and less consistent condom use" and promote "beliefs that sexual relationships are adversarial. Men are also far more likely to drink more heavily than women and more likely to be habitual heavy drinkers according to the 2002 World Health Report. Alcohol consumption is a risk factor for gender-based violence and for the sexual disinhibition that contributes to the spread of HIV and AIDS. Further research reveals that men are significantly less likely than women to utilize voluntary counseling and testing (VCT) services. Recent national studies in South Africa found that men accounted for only 21% of all clients receiving VCT and they also reflect the fact that many reproductive health services do not address men's HIV, STI and other sexual and reproductive health related needs. The National Strategic Plan recognizes the prevention role MC can play as part of a prevention strategy.

The above evidence calls for more concerted efforts to improve men's opportunities to realize their sexual and reproductive health and rights. In 2006 and 2007, HPI TO1 conducted a analysis to provide an overview of the status of men’s sexual and reproductive health and rights, especially as it relates to HIV, in South Africa as well as the impact this has on women’s health, an overview of current research that addresses the needs of men in preventing the spread of HIV and AIDS, an overview of evidence-based HIV and AIDS prevention interventions for men, currently being carried out by civil society and an overview of policies and guidelines that currently exist in South Africa, which address the sexual and reproductive health needs and rights of men including MC.

HPI TO1 will bring into the dialogue the myriad of key stakeholders, such as traditional leaders, community groups, provincial authorities, and the medical establishment and in collaboration with NDOH, WHO, UNAIDS, they will undertake to draft a national set of men’s reproductive health and rights guidelines which give strategic direction for improving male reproductive health and reducing men’s vulnerability to HIV and AIDS.

In support to the NDOH, HPI TO1 will conduct four day trainings for representatives from government, the public and private sectors to implement the final national set of men's reproductive health guidelines which give strategic direction for improving male reproductive health and reducing men's vulnerability to HIV and AIDS.

BACKGROUND:

National reproductive health and rights guidelines for men would not only provide an opportunity to build the capacity of programs and policy makers, but would also facilitate better cohesion and collaboration across government and civil society in their work with men. An important component of these guidelines would be to ensure that the reproductive health of more marginalized groups of men gain greater attention: migrant workers, men who have sex with men, male sex workers, refugees and prisoners, for example. Providing strategies which incorporate the needs of these vulnerable groups would facilitate the development of better designed programs, particularly those which address issues such as high turnover of sexual partners, high risk of sexually transmitted infections, non-use/inconsistent/incorrect condom use, lack of knowledge of HIV status and alcohol and other substance abuse. The guidelines will become a vital resource for training government and civil society on the different approaches outlined. As a result, more comprehensive and cohesive programs will be rolled out which address the reproductive health needs and rights of different groups of men in South Africa. HPI TO1 was a key partner involved in the development of the National Reproductive Health Guidelines for Men in 2007. As a follow up on the COP FY 2006 and FY 2007 work, HPI TO1 will be developing and implementing training programs that will address men's reproductive health needs and reducing men's vulnerability. These programs will also assist in ensuring the increase in men's utilization of reproductive services - especially with STI treatment, HIV testing, ARV uptake and circumcision (MC).

ACTIVITY 1: Prevention Workshops

HPI TO1 will conduct workshops for nine provinces. A minimum of 15 participants per workshop per province (135) will be trained. The workshop will target both the NDOH service providers as well as policy makers at different workshops accordingly. The training will be in the form of four day workshops. HPI TO1 in collaboration with Sonke GenderJustice, a short term contractor developed training materials based on the desktop review and the National Reproductive Health Guidelines for Men of 2007. The workshops will focus on the guidelines themselves and will guide managers on how to develop programs that address gender issues, that promote the increase in the uptake of health services by men, and that promote community awareness on men’s reproductive health issues and needs. The trainings will also be mechanisms of fostering coalitions and networks among stakeholders. This will also be a form of mobilization and advocacy. Through this training individual knowledge, skills and leadership capacity will be strengthened and there will be influence/change in organizational practices. The trainings will not be accredited. This training activity will strengthen the capacity and collaboration of National Department of Health (NDOH), and civil society groups in their work with men to ensure implementation of the National Reproductive Guidelines for Men.

ACTIVITY 2: Male Circumcision

No male circumcision training or service delivery will take place without the express consent of the National Department of Health. In the absence of such approval and based on discussions with the PEPFAR South

Activity Narrative: Africa team, funds could fully or partially be reprogrammed. Should the approval for safe clinical male circumcision activities be given, HPI TO1 is proposing the following male activities:

HPI TO1 will work closely with JHPIEGO and the NDOH TBD program to jointly develop prevention messaging for traditional leaders, tradition healers and traditional surgeons that can be incorporated in to existing traditional male circumcision activities.

ACTIVITY 3: Traditional Leaders and Healers

Using tools and messaging from Activity 2 above, HPI TO1 will work with traditional leaders, traditional healers and traditional surgeons to build capacity in the delivery of appropriate, accurate prevention messaging in the context of male circumcision. Activities will include trainings on prevention messaging piloting and testing the impact of the messaging and monitoring and follow up to ensure that prevention messaging is accurately delivered.

This activity contributes to the PEPFAR 2-7-10 goals by creating greater awareness of men's reproductive needs thus reducing men's vulnerability to HIV and AIDS through addressing issues like MC, increasing correct and consistent condom usage and preventing new infections, and by training individuals to promote HIV and AIDS prevention through other behavior change beyond abstinence and/or being faithful.

Activity System ID: 14045

USG Agency: U.S. Agency for International Development

Program Area: Condoms and Other Prevention Activities

Program Area Code: 05

Planned Funds: $242,500

Activity Narrative: SUMMARY:

Activities to provide other prevention strategies will be carried out by two local universities and two vocational colleges and will be integrated with the abstinence and be faithful (AB) activities to support the Department of Education (DOE). Activities will be focused at the Universities of the Western Cape (UWC) and University of Zululand (UniZul). FY 2008 PEPFAR funds will support existing programs to provide training in other prevention to prevent the spread of sexually transmitted infections (STIs), and HIV and AIDS. Activities will target university students and will promote healthy behavior. Primary areas of emphasis will be gender, participation, and training students as peer educators to develop skills to practice healthy behaviors. The program will target students aged 15-35, both males and females.

BACKGROUND:

UWC and UniZul have identified HIV and AIDS as a key challenge on their campuses and surrounding areas. The institutions have identified qualified senior university personnel to manage and direct HIV and AIDS policies and programs. UWC has 15,000 students and the majority of the students and staff are black South Africans. Women comprise 57 percent of the student body. UWC is located in the Cape Flats area, where high incidences of drugs, alcohol and gang violence have been reported. UWC's HIV and AIDS program was established in 2001 and it includes a focus on peer education, counseling and testing (CT), integration into the curriculum, and outreach to local communities where youth are at risk. UniZul is situated in northern rural KZN close to the major industrial and growth center of Richards Bay. This area is growing phenomenally due to the amalgamation of adjacent peri-urban, low cost housing, rural and informal housing areas. UniZul student enrollment is 8,000. Students are mainly from historically disadvantaged communities and are aged from 18 to 35 years. UniZul operates multiple programs on campus to fight HIV and AIDS, conducts peer education prevention programs, provides CT, and offers ARV treatment. The university offers outreach peer education programs to local high school students and interacts with local communities and hospitals. Vocational colleges will offer other prevention programs integrated with activities encouraging students to be faithful to their partners. The DOE recently revamped the colleges to offer courses that respond to emerging skills needs. Colleges will train students to qualify in priority skill areas and engage in the economy as productive artisans to strengthen the workforce. Some of the colleges have embarked on their own HIV and AIDS programs, offering prevention services to students and training students to be health care workers.

ACTIVITY 1: Other Prevention at UWC

FY 2008 PEPFAR funds will support other prevention programs at UWC targeting all students on campus, particularly first year students. Activities will address gender issues by directly targeting male norms and behaviors and challenging the way in which practices based on traditional masculine identity encourage the continued spread of HIV. Training will focus on partner communication skills. USG resources will increase the involvement of people living with HIV (PLHIV) by supporting two health promoters. Health promoters will provide individual counseling, initiate and run support groups, offer advice on nutritional support, and treatment of opportunistic infections, staging of the disease and information on healthy living. Training in risk reduction communication skills aimed at first year students will encourage attitude and behavior change. Fifty peer educators will encourage 1,000 first year students to participate in HIV and AIDS prevention programs as part of their work study programs. Students will receive a stipend, and will be mentored to become peer educators during their second and third year of study at UWC, gaining facilitation and training skills. Training will be on safe sexual practices including proper and consistent use of condoms and issues on cross-generational and transactional sex. UWC has a fully equipped Student Health Services facility on campus managed by qualified personnel. It offers free CT to students, and those students who test positive for HIV are referred for further consultation and treatment at the local hospital. UWC has 80 condom dispensing machines on campus and extra machines at all student residences, and condoms are offered free of charge from the Department of Health.

ACTIVITY 2: Other Prevention at UniZul

Programs at UniZul include peer education, treatment and CT. UniZul has a partnership with the local hospital where students who test positive for HIV are referred for further consultation and treatment. The university has an established CT site within the campus clinic, operated by qualified personnel although under resourced to meet the student needs. Education funds will support a counselor to address gender-based violence related to rape on campus and negotiation skills to empower young girls to delay sexual activities and promote correct and consistent use of condoms. According to the UniZul, 90% of diseases treated at the campus clinic are STIs, and focus will be on support to the campus clinic to develop and offer programs to manage STIs. (However, USG funds will not finance treatment of STIs). PEPFAR funds will train 50 peer educators to reach out to 3,000 additional students who are already engaging in sexual activity. Training will be on the use of condoms and discourage students from engaging in risky sexual behavior, cross generational sex and having multiple sexual partners. UniZul will collaborate with DramAidE to stage communication campaigns through drama, art, and poetry, and develop a coordinated media plan to increase risk perception relating to multiple and concurrent partners. Activities will target students through religious, cultural and traditional societies. The USG will mobilize additional support from other PEPFAR-financed activities to install reliable condo-cans in residences. Although female condoms are available at the campus clinic, their use has not been widely demonstrated.

ACTIVITY 3: Other Prevention at Vocational Colleges

Focus will be on training 50 peer educators aged from 15 plus to reach out to 1,000 additional students to encourage consistent use of condoms to prevent HIV and STI infection. Students will be educated on safe sex measures which include correct and consistent condom use, cross-generation and transactional sex male norms and behaviors and gender related issues aimed at reducing violence and coercion.
Training will also address the prevention of risky behavior among students due to drug and alcohol abuse.

The results of this activity will contribute to the PEPFAR 2-7-10 goal of 7 million infections prevented and will directly support the USG/SA strategy in the area of preventive behaviors among youth.

Budget Code: HVOP

Program Area Code: 05

Activity ID: 16317.08

Planned Funds: $350,000

Activity System ID: 16317

Activity Narrative: SUMMARY:

This section of prevention is focused on strengthening community-based approaches to deliver balanced AB and C interventions for out-of-school youth in the Eastern Cape and Mpumalanga Provinces. Specifically, the Population Council (PC), the Eastern Cape Provincial Council of Churches and the Mpumalanga Provincial Council of Churches will pilot and scale-up a community-based prevention program geared mainly for out-of-school youth in two provinces of Eastern Cape and Mpumalanga in South Africa. These organizations have a wealth of experience in youth interventions, and have conducted relevant activities in this area in South Africa. The proposed program will contribute to key targets highlighted in the National Department of Health's Strategic Plan (2006/7-2008), which include the need to promote healthy lifestyles. The program should be highlighted for its intended contribution toward strengthening social mobilization and community involvement in prevention initiatives for out-of-school and vulnerable youth in particular. Emphasis areas include gender, human capacity development, and strategic information. Groups such as adults, people living with HIV and AIDS, out-of-school-youth, pregnant teenagers, and religious leaders will be targeted through community outreach programs.

BACKGROUND:

Based on their comprehensive and complementary experience working with young people, during FY 2008 the Population Council, the Eastern Cape Provincial Council of Churches and the Mpumalanga Provincial Council of Churches intend to design, implement and evaluate HIV prevention activities among out-of-school and other vulnerable youth who are not well reached by programs in largely rural and peri-urban areas in the EC and Mpumalanga. The program will deliver tailored Other Prevention interventions and messages to reach youth based on their age, sex and needs. It will work through youth clubs, churches and community groups. The program will draw extensively from the work of two partners in South Africa that formerly collaborated with the Population Council/Horizons Project and in Zambia where PC/Horizons worked with hundreds of out-of-school youth to implement a three-year program, which trained young people to provide care and support for people living with AIDS and OVC and to engage in prevention activities. As mentioned, the FY 2008 program will strengthen social mobilization and community capacity and involvement to participate in prevention initiatives for out-of-school and other vulnerable youth.

This section contains a strong dimension of strategic information so that processes and progress are systematically documented at all stages. Monitoring and evaluation activities will be based on collecting routine data and evaluating key program outcomes. Routine data will be tracked on a monthly basis to obtain program outputs such as the number, age and gender of the beneficiaries reached. The field support staff will receive training on strategic information, and will be responsible for collecting the required information.
ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Pilot and Scale-up

For FY 2008, this program will initially be piloted in two rural communities in one district in the Eastern Cape (Amathole) and also in a district in Mpumalanga (Nelspruit). The pilot will be refined within six months and expanded to four additional communities in these districts by the latter six months of the year. In year two, a second district will be identified in each of the two provinces (Mqanduli in the EC, Mpumalanga will be determined) for further expansion and scale-up. This strategy will allow for a phased-out scale-up approach, giving the partners the opportunity to develop and test relevant interventions, apply lessons and program results in the new sites, while strengthening activities in pilot sites. It will also provide the opportunity for the different communities and stakeholders to share best practices and lessons learned.

The program will reach at least 8,000 people with training, prevention and other services. The Other Prevention component will include: messages to delay sexual debut, channeling youth interest to include healthy activities such as sports, drama and other community activities; partner reduction, condom use for youth at risk of HIV infection and promotion of counseling and testing.

ACTIVITY 2: Implementation and Assessment of Prevention Messages and Interventions through Community Outreach

The focus of this activity is implementing and evaluating a relatively broad set of prevention outreach to the out-of-school youth. While the clear focus is on HIV prevention, an underlying objective is encouraging the out-of-school youth who have failed to complete school (e.g., due to pregnancy) to re-enroll and complete their education. Youth will be encouraged to explore training opportunities that will assist them to participate in income-generating activities within their communities. Peer educators, youth mentors, community leaders and stakeholders will also be trained. Male participation will be enhanced through targeted initiatives such as male forums that discuss gender norms and dynamics in the communities.

Other activities will include the promotion of correct and consistent use of condoms for sexually active youth; promotion of secondary abstinence; channeling youth interest to include healthy activities such as sports; drama and other community activities; messages and support around abstinence, being faithful messages for youth with partners and partner reduction and including promoting access to counseling and testing; and also messages on cross-generational and transactional sex; and finally, messages on gender norms aimed at reducing violence and coercion.

All of these activities will be geared toward understanding current local prevention activities; defining the prevention needs of out-of-school and other vulnerable youth; mobilizing stakeholders; designing and testing interventions that focus on correct and consistent use of condoms for sexually active, at-risk youth. The prevention strategies and interventions that are deemed feasible, acceptable and successful will be assessed and documented and the results shared widely to enhance expansion activities in year two.

During FY 2008 the program will contribute to key targets highlighted in the National HIV and AIDS and STI Strategic Plan (2007-2011), which includes the need to promote healthy lifestyles. The project will address the 2-7-10 PEPFAR goals by increasing the number of individuals reached through community outreach strategies that promote correct and consistent condom use for sexually active youth.

Budget Code: HVOP
Program Area Code: 05
Activity ID: 15938.08
Planned Funds: $250,000
Activity System ID: 15938

Activity Narrative: SUMMARY:

Two activities will be implemented with FY 2008 funds. The first is conducting a health promotion campaign to raise awareness and increase service uptake for sexually transmitted infections (STIs) and HIV care and treatment among men in townships in Gauteng. The second activity is a continuing activity and involves the development (using results of 2007 provider survey) and dissemination of training intervention(s) aimed at improved healthcare provider management of genital ulcer disease (GUD) and other STIs in order to prevent new HIV infections. Both of these activities will be conducted by the STI Research Centre (STIRC) in the National Institute for Communicable Diseases (NICD) with the guidance of local Department of Health officials and CDC staff in South Africa, and in collaboration with local NGOs and CBOs as appropriate. They will work closely with CDC/Division of STD Prevention staff with prior experience and expertise in this area.

BACKGROUND:

Recently available data indicate that knowledge of STIs including HIV and availability of effective HIV and STI treatment is low among men living in townships in Gauteng. Additionally, men living in South Africa are less likely than women to be tested for HIV.

STIs represent episodes of behavioral and biologic risk for HIV, and the STI clinical encounter is a critical entry point for HIV prevention activities. HIV and other STIs, including GUD (a strong HIV co-factor) continue to have high prevalence in South Africa despite current prevention efforts. New HIV infections could be prevented with stronger clinical management of GUD and other STIs, particularly around prompt, improved case recognition and treatment, HIV testing and provision of other prevention modalities. STI/GUD management can be strengthened by systematically evaluating health provider barriers and needs, and providing them improved training and support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Community Health Promotion

This activity is an adaptation of a proven-effective community health promotion model using lay health advisors that has been used in other nations with high HIV prevalence. The lay health advisors deliver HIV/STI education and work with local health clinics to encourage men to use STI clinical services, HIV testing and treatment. The activity will be conducted in Gauteng province, specifically in townships near Johannesburg where government provided HIV/STI services are available. The target population is men living in townships with high HIV prevalence and thus often represents Most At Risk Populations (MARPS) including people living with HIV and AIDS, partners/clients of commercial sex workers, migrant populations of all types, and other high risk individuals. Specific activities for which PEPFAR funding will be used are: 1) Identify key community members who are known and trusted within the community (e.g., lay ministers, employees of trusted organizations, traditional healers or “lay” healers); 2) Assess the already existing training curricula in the Province; 3) Adapt an existing HIV/STI training curricula for lay health advisors; 4) Assess community norms, knowledge and attitudes toward STIs/HIV; 5) Develop appropriate educational materials (e.g., brochures) about STIs/HIV and ART for dissemination by lay health advisors; 6) Solicit feedback on educational materials from community members; 7) Translate materials into local languages as appropriate; 8) Train 30 lay health advisors in STD/HIV awareness and prevention; 9) Collaboration with local NGOs and CBOS to conduct activities. STIRC will hire needed staff, commodities, and other services to conduct the activity. The activity is anticipated to contribute directly to PEPFAR 2-7-10 goals in prevention, by preventing transmission of HIV among infected persons, and preventing acquisition of HIV among HIV-negative persons.

ACTIVITY 2: Health Care Provider Training in STI Management

To develop new (or as applicable, enhance existing) training and other interventions aimed at improved provider management of STIs -- particularly GUD -- results from a 2007 health provider survey identifying knowledge gaps, infrastructure challenges and training needs for STI/GUD care will be used, in consultation with local and national health officials. Training/dissemination activities will be coordinated with already existing district, provincial, and national Departments of Health tools and curricula.
Activities include: 1) Reviewing existing local and national STI training programs; identifying gaps and challenges to quality STI (e.g., GUD) management; 2) Using survey results to build new (or enhance existing) provider training and educational models using a variety of approaches deemed appropriate by local and national collaborators, 3) Ensuring integration of HIV testing and preventive services into the STI clinical encounter, 4) As possible, addressing structural barriers to quality STI/GUD care, 5) Disseminating provider intervention(s) through direct training of providers (and possibly other approaches).

Budget Code:	HVOP	**Program Area Code:**	05
Activity ID:	19445.08	**Planned Funds:**	$215,000
Activity System ID:	19445		

Activity Narrative: SUMMARY:
This activity is a component of a comprehensive prevention education, care and treatment program for small to medium enterprises (SMEs) with 20-200 employees and other workplaces in South Africa.

Activities and Expected Results:
Activity 1: Project Promote
Project Promote is a public private partnership established in 2006, between the South African Department of Health (NDOH), SABCOHA and the cleaning industry through Prestige Group, Fidelity Supercare, Steiner Group and BidAIR to as part of broader prevention programmes to provide an efficient and effective mechanism for condom distribution. Project Promote directly supports the NDOH in terms of extending condom distribution services through non traditional outlets. There is a national task team made up of representatives from each of the partners managed by SABCOHA, through a consulting organization Genlem projects that has worked in HIV and AIDS programmes within the cleaning industry for over 3 years. Currently Private sector infrastructure including personnel (trainers, supervisors and cleaners) are provided at no cost to the project, where SABCOHA funds the progamme management and the department of health procures, quality assures and delivers the condoms to the primary distribution sites free of charge. Primary distribution sites are actual Private Sector regional offices of each of the partners. Project Promote reports directly into the provincial and national departments of health using department of health approved M&E systems based largely on the Logistics Information System supported by USAID including LMIS sheets and Bin card. The interest in Project Promote shown by government and Private sector partners has lead to a far greater demand than originally envisaged and Project promote plans to have 43 operational Primary distribution sites in year one. Distribution mechanisms varying according to Private sector partner infrastructure, but the broad range of models enable project promote to access SME's otherwise difficult to reach over large geographical regions. In addition to this the project has begun supporting a community distribution programme whereby cleaners themselves are used as community distributors. Operationally over 5 years, Project Promote needs to be maintained and grow by at least 10 new primary distribution sites per year from year 2. Currently 8 of the 9 provinces are fully operational with Limpopo to be brought on in year 1 as part of the SABCOHA SME programme. This component of the programme will feed directly into the supply chain strategy and micro-enterprise strategy encouraging condom distribution through those mechanisms as well. It is anticipated that the SMME's reached through the Vendor-Chain Programme and the BizAIDS Programme will also be serviced by Project Promote. In addition to this as part of year one Project Promote will, based on systems currently used by the Department of Health streamline its operations through the development of and investment in greater IT technology and systems which will allow the programme to more effectively monitor the 43 sites in year one. On average the 43 sites are expected to distribute an accumulated total of 600 000 male condoms per month. These additional 10 sites for year 2 will bring the total number of sites to 53, with an additional 600 000 condoms distributed per month.

Activity 2: BizAids
BizAIDS through a network of small business associations and training providers will facilitate the transfer of skills to the informal sector. Skilled facilitators lead workshops of 18 – 20 business owners through topics ranging from: 1) understanding and identifying risks of HIV and other health risks; 2) protecting employees who are both HIV positive and negative; 3) providing HIV/AIDS legal/community resource directory; 4) increasing HIV/AIDS awareness through messages of abstinence, being faithful and using a condom; 5) ysing tools such as a SWOT (Strengths, Weaknesses, Opportunities, Threats in mitigating risk posed by unforeseen events.

By providing education on key strategies for preventing HIV infection and promoting healthy behavior change among workforce populations, including appropriate use of condoms, and by distributing condoms to a large population of workers the SABCOHA workplace program will directly contribute to PEPFAR's goal of preventing seven million new infections. Through education on prevention messages and the distribution of male and female condoms, this program will also support the prevention goals outlined in the USG Five-Year Strategy for South Africa.

Budget Code: HVOP
Program Area Code: 05
Activity ID: 19446.08
Planned Funds: $550,000
Activity System ID: 19446

Activity Narrative: SUMMARY:

This activity is a component of a comprehensive prevention education, care and treatment program for small to medium enterprises (SMEs) with 20-200 employees and other workplaces in South Africa. It includes activities in CT, Policy Analysis and Systems Strengthening, and Abstinence and Be Faithful. With an estimate of 12.3 million learners in South Africa, served by 386,600 teachers and more than 26,000 schools managing a response to HIV and AIDS across the education sector requires a comprehensive and substantial effort. Efforts must include a focus on both learners and educators if the impact of HIV is to be mitigated; and it must be recognized that any efforts focused on learners via the education sector cannot succeed without educators also being addressed. The Education Labour Relations Council (ELRC) will implement a comprehensive HIV and AIDS workplace program for the education sector of South Africa.

BACKGROUND:

ELRC is a statutory council which serves the South African education sector nationwide and is comprised of the public sector, the national and provincial departments of education, the private sector and teacher unions representing all primary and secondary public school educators. The ELRC works as an interface between the Department of Education (DOE) and labor organizations for labor peace and a vision of contributing towards the transformation and development of a quality South African public education system. A 2005 Health of Our Educators Report found that 50% of all teacher attrition is linked to complications of HIV and AIDS, resulting in 4000 teachers being lost each year due to AIDS. The general prevalence rate among educators was found to closely parallel that of the national population with an estimate of 12.7% of all DOE employed educators living with HIV. Based on the findings of this report and with FY 2007and FY 2008 PEPFAR funding ELRC will implement a country-wide project in all 9 South African provinces to educators living with and affected by HIV and AIDS. The target group for this project is teachers, including those living with HIV or those who have family members living with HIV. This is a workplace intervention with minor emphasis areas in information, education and communication, community mobilization, and the development of linkages and networks. A particular focus of this project is the greater involvement of people with AIDS. ELRC will work with HIV positive teachers to ensure they can serve as role models to fellow teachers and to learners.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Distribution of male and female condoms

ELRC will work with its four sub partners to ensure that 150 physical sites in the education sector are established to distribute male and female condoms. This will ensure that male and female teachers can assess condoms in their workplace. In addition to condom distribution points, IEC materials will be distributed focusing on correct and consistent condom usage and condoms as a HIV prevention strategy.

ACTIVITY 2: Development of Workplace Prevention Education

PEPFAR funds will be used to support the development of a comprehensive education sector prevention program targeting teachers and education sector union members. Funds will also be used to support workplace prevention education programs targeting the health and education sector. With funding from PEPFAR, these workplace programs will conduct training sessions for employers, senior management, senior union leadership and employees on the basic facts of HIV transmission, prevention, and impact of HIV and AIDS on the industry. Peer educators for unions in the education sector will receive ongoing training on prevention, condoms as an HIV prevention strategy, PMTCT, stigma and discrimination (a key legislative issue), counseling and testing, palliative care, and access to treatment. The goal of the peer education is to increase workers' knowledge about HIV and AIDS prevention, care and treatment with the purpose of changing their attitudes and practices and modifying behavior to prevent HIV infections and reduce violence and coercion (key legislative issue).

ACTIVITY 3: Training of peer educators for teachers unions

Peer educators from 3 teachers' unions will be identified and trained peer educators. Training will focus on all aspects of HIV prevention. A structure will be set up to support the peer educators and ensure quality assurance for the one-on-one interactions and community mobilization activities that they will be expected to participate in.

ACTIVITY 4: Community Mobilization

The newly trained peer educators will reach teachers in their unions with prevention messages. The peer educators will distribute IEC materials, organize mobilization events, campaign messages and conduct one-on-one interactions with teachers and/or their families.

Note that for targets, the numbers of people reached with prevention messages are counted under AB rather than OP.

This activity will directly contribute to PEPFAR's goal of preventing 7 million new infections. These activities support the USG Five-Year Strategy for South Africa by expanding and improving quality AB prevention programs.

Activity ID:	19447.08	**Planned Funds:**	$450,000
Activity System ID:	19447		

Activity Narrative: SUMMARY:

The South African Democratic Teachers Union (SADTU) project aims to reduce the impact of HIV and AIDS by focusing on preventing transmission of HIV for teachers and, their workplace community. This includes both a comprehensive ABC prevention program through peer education but also improve condom distribution at SADTU regional and branch offices.

BACKGROUND:

The HIV and AIDS pandemic has created workplace environments that are not conducive to quality teaching and learning for both educators and learners alike. The school as a workplace is plagued by high levels of stigma. This often results in educators suffering silently and becoming victims of the pandemic despite high perceptions of knowledge of HIV and AIDS. As a result many educators do not have the courage and support in the workplace to go for voluntary counseling and testing, since knowing your status is not publicly encouraged. Consequently most educators discover they are HIV positive when they start showing symptomatic illnesses that do not respond to medications. By this time their CD4 counts are usually low and they can no longer function optimally at their schools with compromised health. The SADTU project aims to reduce the impact of HIV and AIDS by creating an caring workplace environment for both learners and educators alike and focusing on preventing transmission of HIV for teachers and caring for orphans and vulnerable children in the workplace. The target group for these activities is teachers.

ACTIVITIES and EXPECTED RESULTS:

Activity 1: Condom distribution

The SADTU workplace project will distribute male and female condoms to at least 500 regional and branch offices. In addition as functioning as condom distribution points, each of the sites will provide educational materials on HIV prevention including correct and consistent condom usage. The sites are easily accessible and are frequently visited by teachers. IEC materials on correct and consistent condom usage will be available in all relevant languages. SADTU will work with relevant government departments to obtain free condoms.

Activity 2: Community Involvement

SADTU will work with trained peer educators to increase community involvement, and increase male involvement and awareness around HIV prevention, PMTCT, the role of male norms and behaviours in HIV transmission. In addition, through community involvement activities, such as sports and culture events, municipal imbizos, Department of Education campaigns, youth conferences, road shows in schools and community etc. SADTU will ensure the distribution of IEC materials to educators and communities.

The targets for the number of people reached through the comprehensive peer education program are counted under AB.

This project contributes to PEPFAR 2-7-10 goals and objectives by ensuring access to male and female condoms hence preventing new HIV infections.

Activity ID: 21081.08
Planned Funds: $48,500
Activity System ID: 21081

Activity Narrative: SUMMARY:

Family Health International (FHI) will provide technical assistance (TA) to three universities' peer education programs to continue integration of abstinence and be faithful messages (AB), condom and life skills into the ongoing activities of the peer education programs on campus. Using the curriculum developed in FY 2005, the AB and life skills training will be expanded to include other prevention strategies, including condom use. A cadre of peer educators (PEs) on each of the campuses participating in this project will be trained. The PEs will then pass these skills on to other students on campus primarily through interaction in ongoing, small behavior change groups. Emphasis areas include addressing male norms and behaviors, reducing violence and coercion, training, local organization capacity building, and wraparound programs in family planning and education. Main target populations addressed are men and women of reproductive age and people living with HIV and AIDS.

BACKGROUND:

Currently, most efforts addressing sexuality and reproductive health needs for young people are focused on out-of-school youth and those in secondary schools in South Africa. Youth at institutions of higher learning represent a special group at risk as they are often left unsupervised by both parents and teachers, who are under the assumption that they are mature enough to protect their sexual and reproductive health. Available evidence suggests that these young men and women have high STI and unintended pregnancy rates, an indication that they are not yet equipped with the knowledge and skills required to protect themselves from these adverse outcomes. In FY 2005, in consultation with the South African Universities Vice Chancellors' Association (SAUVCA) and the Department of Education, FHI implemented a project that took place on three university campuses in South Africa: University of the Western Cape, University of the Free State, Qwa-Qwa campus and University of Limpopo, Medunsa campus. Each campus contributed to the development of the AB/life skills curriculum which was subsequently implemented among 26 PEs from each of the three campuses. After the training, PEs recruited six students each to take part in ongoing behavior change communication (BCC) groups on their campus, reaching in total 468 students. Life skills programs aim to enhance the students' ability to make responsible sexual health decisions and adopt behaviors that will keep them free of STI and HIV infection, as well as avoid unintended pregnancies. The curriculum included sessions on AB, secondary abstinence, values clarification, self-esteem, communication, decision making and negotiation, and utilized participatory learning techniques. Another key component of the AB/life skills training was a session on gender equity. In FY 2008, the training will be expanded to include other prevention messages beyond AB, including messages on condom use and safe sex. The curriculum complemented the universities' existing peer education curricula, which provides basic information about prevention of HIV and AIDS. The BCC groups provided a safe place to explore strategies for adopting and strengthening the ABC life skills in their personal lives. Students were able to support each others' behavior change process, including seeking counseling and testing (CT). Through one-on-one and group interaction, the PEs took advantage of a variety of regularly scheduled campus events-such as orientation week, condom week, and STI awareness week-to reach additional students with basic information on STIs, HIV and unintended pregnancies and how to protect oneself and maintain a healthy lifestyle. The program also promoted referrals between the PEs and student health or community health services for CT as well as family planning (FP). Major accomplishments to date include development of the AB life skills curricula and successful training of the PEs. The program has gone beyond the university campuses and PE groups to be conducted in high schools in communities near the campuses. A radio series was produced and launched on campus and community stations throughout South Africa, reaching approximately 6,000,000 listeners. The show addressed issues related to risk-reduction behaviors for STIs, HIV and unintended pregnancies that are relevant for university students. The curriculum was also used by University of Nairobi for a similar intervention.

Although there was no FY 2006 funding, the universities were committed to continue the BCC groups and supervision activities. While the activities are expected to continue with the respective university funding, additional resources are needed to strengthen the longer-term institutionalization of the life skills program.

ACTIVITIES AND EXPECTED RESULTS:

In collaboration with the Department of Education, in FY 2008 FHI will continue to work with the three universities: University of the Western Cape, University of the Free State, Qwa-Qwa campus and University of Limpopo, Medunsa campus, and explore opportunities to expand activities to Technikons. FHI will work in collaboration with John Hopkins University (JHU) and the Department of Education at the University of Western Cape and the University of Free State, Qwaqwa campus to ensure that all PE programs are harmonized and do not overlap. To align the goals of the program with the government goals, FHI will work closely with the Department of Education to further refine the program and improve outreach. Further integrating ABC life skills into their peer outreach program work plans, each university will recruit new PEs for the life skills project, who will then recruit other students to participate in small, ongoing BCC groups. TA will also be provided to strengthen supervision skills to ensure the quality of the peer interactions, modeling problem solving skills, and shaping perceived peer/social norms on sexual behaviors.

Specific FY 2008 activities include: 1) Continue to incorporate ABC life skills program into existing peer education work plans in a cost-effective manner; 2) Conduct ABC life skills training for all PEs participating in the program; 3) Provide refresher trainings to strengthen basic peer education/facilitation skills; 4) Standardize job aids and tools for PEs to use in small groups; 5) Conduct supervision skills training for and provide TA to supervisors to help support PEs and the BCC group process; 6) Build and strengthen relationships between PEs and student health services, and formalize referral links to health services; and 7) Monitor ABC, life skills and BCC group processes.

The project contributes to the prevention of 7 million new infections as per PEPFAR 2-7-10 goals. The project will help decrease the number of new infections by achieving the expected results which will ultimately lead to a delay in sexual debut, a reduction in sex acts, fewer partners or a reduction in unprotected sex.

Mechanism ID: 242.08

Mechanism: ACCESS

Prime Partner: JHPIEGO

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Condoms and Other Prevention Activities

Budget Code: HVOP

Program Area Code: 05

Activity ID: 21095.08

Planned Funds: $485,000

Activity System ID: 21095

Activity Narrative: SUMMARY:

JHPIEGO, with approval from the South African National Department of Health (NDOH) will implement male circumcision (MC) activities by supporting a male circumcision technical advisor to the NDOH to help spearhead and coordinate MC within the NDOH, and to continue piloting modules of the WHO MC tool-kit.

BACKGROUND:

For nearly two decades, researchers have been interested in the preventive effect that male circumcision has on the risk of STIs, particularly chancroid and syphilis, as well as penile and cervical cancers. Increasing attention and research has been devoted to the potential preventive effect MC has on HIV transmission. From the interim results of three clinical trials that were conducted in South Africa, Kenya and Uganda, it has been concluded that MC reduces HIV transmission from women to men, by 60% on average. All three trials were interrupted before planned completion for ethical reasons once it was established that a clear protective effect existed between circumcision and contracting HIV, so that the men in the control groups could access this potentially life-saving intervention. Male circumcision is now accepted by the global normative bodies as one aspect of an effective HIV prevention strategy. Modeling studies estimate that making MC universal in Africa would prevent 5.7 million new infections and 3 million deaths over the next 20 years.

JHPIEGO has been supporting MC/Male Reproductive Health services in Zambia since 2003. The work in Zambia informed the WHO/UNAIDS programs and the WHO toolkit. JHPIEGO is a co-author with WHO and UNAIDS of the Training Manual for Male Circumcision under Local Anesthesia. In Mozambique, JHPIEGO, through the FORTE Saúde Consortium led by Chemonics and funded by USAID, has been recently asked to be the technical leader in the implementation of initial MC activities in Mozambique

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

It is expected that during FY 2007, JHPIEGO and the South African Government will reach agreement on the placement of a male circumcision technical advisor within the NDOH. FY 2008 funds will be used to continue JHPIEGOâ€™s technical assistance work with the NDOH. It is expected that the advisor will assist the NDOH with coordinating MC activities among the various relevant portfolios within the NDOH and will assist in the development of policies and guidelines that can be rolled out nationally. The technical advisor will work closely with the NDOH TBD activities supported by CDC on the development of linkages between traditional healers/surgeons and safe clinical male circumcision.

ACTIVITY 2:

It is expected in FY 2007 that JHPIEGO will be engaged in field testing various modules of the WHO MC toolkit and implementing capacity building activities that take into account political and cultural sensitivities of MC. The testing of these modules is based on ongoing consultation with the NDOH and UNAIDS. FY 2008 funds will be used to continue these activities in coordination with the NDOH and other relevant stakeholders

ACTIVITY 3:

Development of a standard MC training curriculum. Only with the express consent of the NDOH will training and service delivery of MC activities be undertaken. In preparation, and in consultation with the NDOH, a training course will be designed for clinical service providers (physicians, nurses, nurse-midwives) and aimed at producing individuals qualified to provide male circumcision and reproductive health counseling services. The course will consist of classroom and practical sessions focusing on Male Circumcision and reproductive health. Qualification will be based on participantsâ€™ achievement in two areas: Knowledge - score of at least 80% in the end of course knowledge assessment and Skills - satisfactory performance of recommended procedures during simulated clinical practice and with clients. The course is designed for five days but could be extended to 10 days in low-volume circumcision clinics so that the participants can acquire adequate guided clinical practice. Topics will include anatomy and physiology, male reproductive health needs, health education, counseling, male circumcision methods, management of adverse events resulting from MC, infection prevention and organizing and managing a male reproductive health clinic. The training will be provided by qualified MC clinical trainers.

These activities will contribute to the 2-7-10 goals of PEPFAR by creating policies and guidelines that will lead to increased prevention within South Africa.

Table 3.3.05: Activities by Funding Mechansim

Mechanism ID: 9227.08

Mechanism: N/A

Prime Partner: AgriAIDS

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Condoms and Other Prevention Activities

Budget Code: HVOP

Program Area Code: 05

Activity ID: 21167.08

Planned Funds: $100,000

Activity System ID: 21167

Activity Narrative: The purpose of AgriAids is to address the practical & manageable aspects of HIV/AIDS on farm level, both emerging farmers as well as commercial farmers: improving access to VCT, care – and treatment for farm workers through innovative new partnerships and existing health care facilities. AgriAids has built up an expanding network within the agricultural sector over the last 3 years, building up a "skills bank" and knowledge base on issues such as awareness, stigma, treatment, advocacy, etc. The rationale of AgriAids is to address the micro-level impact of HIV/AIDS on farm workers, which in turn will prevent the macro-level impacts from taking effect. AgriAids acts as the "spider in the web" which connects farms in need of services with supplying organisations. In this sense AgriAids will act as a "broker" between farms and service providers, using its existing network but also through identifying and setting up new partnerships.

In 2004, AgriAids came into life in order to address this regional problem: reducing the direct effects of HIV/AIDS on farm workers. This requires intervention on two levels (as explained in this proposal):
- Direct: facilitating rapid access to information, VCT, medical care – and ART for farm workers
- Indirect: lobbying the commercial agricultural sector to start viewing HIV/AIDS as an "occupational health threat" and encourage CSR spending on care – an treatment programmes on farm level

A great deal of interaction is also called for with Government (notably Dept of Health & Agriculture), since the plight of the farm worker is not high enough on the policy agenda.

The key strategy of AgriAids is to identify relevant medical service providers which can be linked to farms in need. AgriAids will act as a "broker" between farms and service providers, using its existing network but also through identifying and setting up new partnerships. This will result in an increase of farm workers accessing VCT, care – and treatment. This approach has proven its viability recently: AgriAids partnered with FPD since 2007 and several farm workers in the Brits area (North West) is now enrolled in the project and the demand is already growing from other farms. FPD will be a key partner, since they support a large number of public ART sites. AgriAids will therefore support the SA Government's National Strategic HIV/AIDS plan, since it will create a demand for ART services in rural areas, but also facilitate access on behalf of those who have traditionally been "sidestepped" by the healthcare system.

Some key outcomes of this project will be:
? Increase in farm workers accessing IEC campaigns on HIV/AIDS
? Increase in farm owners implementing HIV/Aids workplace policies, prevention and management plans on farms
? Increase in health-seeking behaviour of farm workers
? Increase in NGO's making farm workers target groups
? Increase intervention from Dept of Health & Agriculture to mitigate the impact of the disease
? Increase in condom distribution and usage on farms
? Increase in female condom distribution and usage on farms
? Decrease in multiple concurrent sexual partners on farms
? Decrease in new infections
? Increase in number of farm workers/managers/owners doing VCT, starting ART and receiving care & support
? Increase in organisations (public, private, NGO's, commercial, etc) adopting a common strategy, with specific focus on Dept of Agriculture
? Creation of a replicable model for decentralized rural healthcare in a workplace setting

These indicators point towards the fact that the project activities will look at HIV/AIDS holistically, and that activities will include workplace interventions, gender training, AIDS awareness, VCT, care – and ART.

Activity System ID: 21173

Activity Narrative: CI: Project Concern International (PCI), along with two implementing partners in South Africa, proposes a program with the goal to reduce HIV transmission by changing social norms related to sexual and other gender-based violence against women. The objective of the program is to reduce the prevalence of sexual and other gender-based violence in both urban and rural areas. This will be achieved through a large scale social mobilization program that will: 1) mobilize public and private sector partners to combat gender-based violence; 2) create an enabling environment for changing social norms related to gender-based violence; and 3) develop and support the implementation of multi-sectoral activities which will achieve and maintain significant reductions in gender-based violence.

Activities leading to these results include: a) assuring that key sector partners in government, civil society, media, the private sector and education understand the impact of and are committed to ending all forms of gender-based violence; b) developing and implementing a communications strategy that will unite individual organizations' efforts into one unified, branded campaign reaching all sectors of society; and c) empowering sector partners with resources and training to implement a range of local activities to end gender-based violence. The Western Cape and KwaZulu Natal Networks on Violence Against Women (WCN and KZN), with over 700 member organizations, will provide the technical know-how, experience, commitment and leadership to end violence against women

Activity Narrative: UMMARY:

The overall objective of the Ripfumelo project is to reduce HIV vulnerability of farm workers in various districts of South Africa by implementing a coordinated, evidenced-based and focused HIV and AIDS prevention and care program. Building on experiences and lessons learnt from IOM pilot projects in the southern Africa, the Ripfumelo project aims to provide sustainable prevention and care services to farm workers by building the technical capacity of local implementing partners (IPs); strengthening partnerships among and with local, provincial, and national governmental agencies; promoting public/private partnerships; and developing a network of stakeholders working specifically on HIV-related issues within the commercial agriculture sector.

The overall anticipated results of the project are a reduction in the HIV incidence in the targeted areas, and a mitigation of the impact of AIDS on farm workers and their families and communities. The project will build particularly on experiences and lessons learned from the ongoing IOM prevention and care project which has been implemented in Hoedspruit, Mopani District, Limpopo Province since 2005. The Ripfumelo project will strengthen the existing intervention in Hoedspruit and target additional seasonal, temporary, and permanent farm workers, whether South African or foreign, documented or undocumented, in the commercial agricultural areas of Hectorspruit/Malelane (Lowveld, Mpumalanga), Makhado/Musina (Vhembe, Limpopo), and Tzaneen (Mopani, Limpopo). The project will initially target approximately 20,000 farm workers on about 120 commercial farms.

Program Area Code: 05
Activity ID: 21163.08
Planned Funds: $250,000
Activity System ID: 21163

Activity Narrative: Organization Name: Medical Care Development International (MCDI)

Duration of Projects in years: 3 years

Prevention AB & OP:Objective 1: To prevent HIV/AIDS and other STIs and pregnancy among in and out-of-school youth through tested peer education behavior change communication (BCC) activities and using creative drama and film methods

MCDI undertakes to expand on and enhance its already successful activities in this area. IDCYSP activities are in line with the PEPFAR objective of preventing HIV transmission through the promotion of safe and healthy sexual behavior among HIV infected and uninfected individuals. Proposed activities are also consistent with the South African Government's AIDS Programme mission of preventing the spread of HIV. These proposed activities recognize the important role that community education, outreach and advocacy can play in educating youth and preventing HIV/AIDS. Specifically, the youth activities will address increased risk to youth and the disproportionately high risk among girls and young women. The Mobile Education Unit will reach underserved rural communities. The education of community influencers in a behavior change and communication approach will emphasize the particular vulnerabilities all of these vulnerable groups, while creating a more supportive environment for PLWHA and youth.

OVC: Objective 2: To provide quality comprehensive and compassionate care for AIDS orphans and other vulnerable children by expanding the model crèche to other areas, including access to essential health, social, psychosocial and legal services for OVC and their households.

IDCYSP will encourage enrollment of OVC, specifically targeting those children in child- or sibling-headed households, to crèches who are often excluded because of tuition fees through MCDI's previously successful approach of fee waivers for orphans. In the Mavela crèche, enrollment increased from 40 to 100 through using this approach. OVC will be identified through MCDI PMTCT activities. They will also be identified by home-based caregivers (HBCs), who are local community residents that have completed secondary school and an MCDI 21-day training course to deliver palliative care. MCDI is currently transitioning the supervision of HBCs to CBOs who have funding to support their income. IDCYSP will provide legal support to OVC and their caretakers, which will have a significant impact on their current and future economic well-being. Protecting and promoting the inheritance rights of OVC and fighting against disinheritance is crucial to comprehensive care and support of these children.

Activity Narrative: The Solidarity Center, in cooperation with a consortium of partners, proposes to implement a five-year HIV prevention initiative in South Africa called “Be Faithful, Be Tested, Be Union.” The Solidarity Center’s project partners are Engender Health and four of South Africa’s largest and most influential unions. These unions are the National Union of Metalworkers of South Africa (NUMSA), the Police and Prisons Civil Rights Union (POPCRU), Health and Other Service Personnel Trade Union of South Africa (HOSPERSA), and the Congress of South African Trade Unions–Western Cape (COSATU-Western Cape). Over five years, activities will be implemented in five provinces—Gauteng, Limpopo, and KwaZulu-Natal, Western Cape and Eastern Cape.
This project focuses on prevention, concentrates on workplaces, and enlists unions, businesses, and communities. The project will assist four large and influential South African unions, and the workplaces and communities in which their members labor and live, to achieve wide-reaching HIV prevention outcomes.
The project will address four critical HIV-related areas: counseling and testing, gender norm transformation, workplace policy development and implementation, and increased institutional HIV-related capacity through targeted technical assistance.
The main objective of this activity is to prevent HIV transmission using OP methods through safe and healthy sexual behavior in HIV-infected and uninfected individuals, with emphasis on gender norm changes.

Activity Narrative: Summary
The University of Western Cape is implementing multiple activities aimed at improving human capacity development to address HIV and AIDS in South Africa.

BACKGROUND
The 2004 report of the Joint Learning Initiative on health human resources states that "after a century of most spectacular health advances in human history, Human survival gains are being lost because of feeble national health systems. The HIV and AIDS emergency has undoubtedly contributed to this problem, particularly in South Africa. The pressure on health care workers is immense and with the crisis of attrition and out-migration of personnel, systems in South Africa are challenged as never before. This has been placed in stark relief by the urgent need to respond to HIV and AIDS epidemic, and especially the current imperative to deliver antiretroviral therapy (ART) to large numbers of sick people who are often living in areas where health systems have been poorly developed. This project focuses on strengthening and expanding the development and implementation of comprehensive HIV and AIDS prevention in South Africa in order to mitigate the impact of the HIV and AIDS epidemic. The emphasis area for these activities is human capacity development, training, including pre-service and in-service training. The primary target groups for these activities includes youth participating in sports, coaches, sports programs, traditional healers and health care workers.

ACTIVITIES AND EXPECTED RESULTS:
There are 2 separate activities in the other prevention program area. The first activity focuses on the HIV and AIDS prevention through sports participation, and the second activity focuses building capacity of health care providers and traditional health practitioners on collaboration for HIV and AIDS prevention.

Activity 1: AIDS prevention through sports participation
Research indicates that sports participation by youth has multiple health benefits. In particular, sports participation has been associated with lowered multiple risk behaviors and substance abuse. Youth participate in sports activities through the formal schooling organizations and sports associations. Research has also indicated that the central role of influence that sports coaches, managers, organizers and mentors have in the lives of young people engaged in sports. In addition sports are an extremely powerful way for reaching otherwise marginalized and at risk youth, through engaging them in organizational sports association and activities. As such, sports are natural points for inclusion of HIV information as a vital add onto sports programming. This project proposes to develop a workshop manual on Preventing AIDS through Sports Participation that will use sports metaphors and sports messages interwoven with established scientific knowledge of HIV and AIDS prevention to constitute unique messages that can be integrated into sports programs. Sports coaches, mentors, administrators and organizers within designated regions in the Western Cape Province will be trained to use the curriculum with youth. The curriculum will equip them to incorporate HIV and AIDS messages into their coaching practices and sports programming. The manual will effectively be a toolkit that will equip sports teachers, coaches and programs to reach young people in a language that appeals to the latter and is consistent with a passionate engagement in sports. Sports coaches and administrators will be identified from the West Coast/Wineland region of the Western Cape Province. The manual will be piloted with a group of sports coaches in this district. Thereafter it will be delivered more widely through workshops for coaches, trainers, managers and programs wider than the West Coast Region.

Activity 2: Training health care providers and traditional health care practitioners:
Traditional healers form the major informal sector of health care providers in South Africa. They have been formally recognized as part of the primary health care system through the promulgation of the Traditional Health Practitioners Bill and the establishment of the Interim Traditional Health Practitioners Council and the Directoate of Traditional Medicine within the National Department of Health (NDOH). Yet in formal health care planning, traditional health practitioners are generally overlooked. Currently the issue of training in HIV and AIDS is approached sectorally with the formal and traditional health care setting having little interaction with each other. Efforts at collaboration between formal health care providers and traditional healers in relation to cultural meanings and practices related to HIV and AIDS usually view the local healing system as cultural and the biomedical system as somehow culturally neutral. Furthermore, with the exception of the African Health Care Systems Research Network and the Nelson Mandela School of Medicine at the University of Kwa Zulu Natal, collaboration is done on a small scale, and falls outside of the national policy structure. This activity will draw on already existing collaborations with the South African Herbal Sciences and Medicines Institute (TICIPS) concerning the anthropology of pharmaceuticals and medicinal plants and focus in the Western Cape. It will organize workshops and develop training which will combine understanding of traditional healers and health care workers concerning HIV and AIDS prevention and highlight the sometimes oppositional cultural perspectives of biomedicine and indigenous healing. The workshop and training will focus on enhancing closer collaboration, improving health education, counseling and care. This will enhance the ability of health care workers at national, provincial and district levels to communicate with and utilize traditional healers and herbalists, who thus will have biomedical and indigenous knowledge of HIV and AIDS to assist with health education and counseling concerning HIV and AIDS prevention, and care and support ARV use.

These activities contribute to the PEPFAR 2-7-10 objectives by working with sports coaches and programs ensure integration of HIV prevention messages wit sports activities and reduce new infections. Furthermore, by ensuring collaboration between the traditional and biomedical health sectors, communities will receive the same HIV prevention messages from both sectors. This will ensure that greater numbers of individuals are reached with HIV prevention messages.

Table 3.3.05: Activities by Funding Mechansim

Mechanism ID: 8709.08 **Mechanism:** N/A

Prime Partner: Montefiore Hospital **USG Agency:** HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State) **Program Area:** Condoms and Other Prevention Activities

Budget Code: HVOP **Program Area Code:** 05

Activity ID: 22498.08 **Planned Funds:** $388,000

Activity System ID: 22498

Activity Narrative: The Montefiore Medical Center aims to eliminate missed opportunities to test youth by building the capacity of youth-serving clinics and STI clinics to more routinely provide CT using the ACTS model. ACTS (Assess, Consent, Test and Support) is a program of rapid, simplified counseling and testing (CT) that effectively scales up provider-initiated counseling and testing (PICT). In addition, will implementing a youth-based PICT, Montefiore Medical Center will work with rural districts to target non-government organizations (NGOs) working with youth to provide HIV prevention activities.

BACKGROUND:

Engaging young people in HIV counseling and testing, prevention and care is one of the most important strategies for reducing the burden of HIV and AIDS in South Africa. Unfortunately, thousands of opportunities to achieve these goals are missed every day when vulnerable South African youth seek a variety of health care services but are not offered HIV counseling and testing (CT) or provided with HIV prevention information. By reducing pre-test counseling sessions to five minutes or less, ACTS allows nurses to incorporate CT into the other clinical services they provide, such as sexually transmitted infection (STI) care and family planning and promotes immediate follow-up and linkage to care. In addition, youth can then be linked with NGO proving HIV prevention services to ensure behavior change. The target population for this activity is youth between the ages of 10-25 in hard to reach parts of the country. The major emphasis area for these activities includes building local capacity and creating linkages, networks and referrals between youth-based prevention services
and the ACTS CT model.

ACTIVITES AND EXPECTED RESULTS:
Using ACTS, this program will focus initially on maximizing the linkages between youth based NGOs working in the area of HIV and AIDS prevention and CT services in high-prevalence youth clinics, starting with STI clients and expanding to family planning clients. The linkage with the NGOs will ensure that ACTS services can be implemented in conjunction with HIV prevention activities that targeted messaging and with other NGO activities. ACTS will link with youth-based NGOs in and around the clinics where services are being implemented. This will ensure that youth get both CT services and HIV prevention messages. Similarly to its approach with working with health facilities, the ACTS team will engage each new NGO, develop an implementation and monitoring plan and train all relevant providers HIV and AIDS prevention, in the importance of CT, collection PEPFAR indicators, provide quality assurance monitoring and initial HIV care. During the five year cooperative agreement, this model will be continuously refined and successively implemented in high prevalence communities and sites throughout South Africa starting in the Western Cape and Mpumalanga. The youth-based NGO project will expand services to Waterberg district in Limpopo province and the North West Province.

In FY2008, the team will continue to refine the ACTS services in two youth clinics in Khayelitsha . A monitoring and evaluation plan will be developed that includes PEPFAR indicators. A quality assurance plan will evaluate linkage to prevention among HIV negative youth as well as ensure that newly diagnosed HI-infected youth also receive information on positive prevention. A Project Director will be hired and trained and locations in Mpumalanga or other Province will be chosen as well as additional clinical and community sites in the Western Cape. The goal is for this partner to test 20,000 youth for HIV and link them to prevention.

These activities will contribute towards meeting PEPFAR's 2-7-10 goals by targeting youth between the ages of 15-25 and ensuring that they receive HIV prevention messages. In linking prevention services with CT services, this activity will ensure that youth understand how to stay negative after undergoing a HIV test.

Prime Partner: Lifeline Mafikeng

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Condoms and Other Prevention Activities

Budget Code: HVOP **Program Area Code:** 05

Activity ID: 22500.08 **Planned Funds:** $250,000

Activity System ID: 22500

Activity Narrative: Summary of Proposed Activities:

LifeLine North West Mafikeng Centre seeks to implement a mobile HIV counseling & testing unit, in the Central and Bophirima districts of the North West Province, building on the experience of our Rustenburg affiliate that operates in the Bojanala District of the North West Province. LifeLine Rustenburg is currently funded by PEPFAR (2007) to implement the mobile VCT service in the Bojanala District.

The project addresses U.S.Government's HIV/AIDS objectives in South Africa by:

1) Improving access to and providing HIV counseling & testing services, 2) Implementing HIV prevention activities by promoting the ABCs of prevention, abstinence, being faithful, sexual behavioral change within the context of cultural norms, and correct and consistent male or female condom use, and 3) Improving the quality of life of those infected and affected by HIV & AIDS..

Geographic Reach: Central & Bophirima Districts

The administration and management of the project is based at the LifeLine centre in Mafikeng while the mobile units will service ten identified sites in the Central and Bophirima Districts, five in each Districts.Bophirima is rural while Central is a mixture of urban and rural communities, 20% of the provincial population (3.8M) reside in Central while 18% live in Bophirima however, Bophirima is the largest district and the population is very dispersed.

Target Populations

The identified sites will be locations which are not adequately served by clinics and in which high barriers to individuals' learning their HIV status remain. The sites identified are villages and farming communities that are far from clinics and/or are generally serviced by mobile clinics intermittently. Population will everyone, however more specifically farm workers, youth and the overall rural population.

Proposed Contribution to the HIV and AIDS and STI Strategic Plan for South Africa (2007 -2011) and Operational Plan for Comprehensive HIV and AIDS Care, Treatment and Management for South Africa

The project contributes the strategic and operational plans through promotion of ; HIV Counseling and Testing; care and support for HIV infected individuals and their families.

The project activities fall into three categories that are strongly interconnected in their implementation and objectives. Firstly, a wide array of HIV prevention & marketing activities are designed to increase the uptake of services, disseminate factual, comprehensive information on HIV&AIDS, and encourage behavior that prevents HIV transmission. Secondly, the work of the mobile unit includes conducting HIV testing & counseling at designated identified sites in the two districts, five per district. Lastly, LifeLine activities involve intensive human & organizational capacity development, both within LifeLine and through activities with six CBOs/FBOs with an additional two to be added in the second year.

HBHC - Basic Health Care and Support

Program Area: Palliative Care: Basic Health Care and Support

Budget Code: HBHC

Program Area Code: 06

Total Planned Funding for Program Area: $50,045,025

Estimated PEPFAR contribution in dollars	$1,310,000
Estimated local PPP contribution in dollars	$1,291,995
Estimated PEPFAR dollars spent on food	$442,919
Estimation of other dollars leveraged in FY 2008 for food	$4,369,848

Program Area Context:

It is estimated that South Africa has 5.5 million people living with HIV (PLHIV) who currently need varying levels of quality palliative care. Working in all nine provinces, the USG will support the South African Government (SAG) to increase the number of

PLHIV and their family members receiving quality care services in communities through NGOs, CBOs, FBOs, and at public and private health facilities.

In FY 2008, PEPFAR will continue to focus on improved direct service delivery of quality palliative care. At the end of September FY 2009, USG support will result in the delivery of quality HIV and AIDS care services for 1,235,086 PLHIV and their families at 2,662 service outlets which include hospitals, clinics, workplaces, hospices and home-based programs in communities. In addition, an estimated 547,344 HIV-infected persons will be reached with indirect support for a total of 1,782,430 targeted to be reached with palliative care through PEPFAR support (These figures include TB treatment as a subset). Other contributing donors include AusAid, CIDA, Ireland DCI, DFID, EU, Global Fund, The Elton John Foundation and several public-private partnerships.

The USG supports a holistic, family-centered approach to HIV and AIDS care which begins from the onset of HIV diagnosis, throughout the course of chronic illness, and end-of-life care. In order to ensure that all HIV-infected clients have access to basic care services and to minimize loss to follow-up (currently at about 70%), PEPFAR partners will provide a basic package of services for all HIV-infected individuals. This package will include: acceptance of status, disclosure, partner counseling and testing, prevention with positives (PwP), psychosocial support, nutrition counseling, pain assessment and referral, treatment literacy and adherence counseling, and outreach services to trace clients who have defaulted from the program. Emphasis will be placed on ensuring that HIV-infected individuals receive cotrimoxazole for those who are eligible as per national guidelines. This package of services will be offered at community level through support groups. These support groups (primarily run by PLHIV) will serve as a link between the health facilities and the community to ensure a continuum of care. Counseling and testing sites will refer all clients testing positive for HIV to the support group in their area. Human capacity in the health care system is under strain, and coordination between public and private sectors, and facility and community-based care remains fragmented. FY 2008 investments will result in an improved continuum of clinical, psychological, spiritual and social care and prevention services for PLHIV. The National Department of Health (NDOH) leads and coordinates national efforts to advance palliative care. Partnering with the NDOH at all levels, the PEPFAR partners will continue to support to the integration of standardized quality palliative care services into primary healthcare and build HIV-related care services into CT, TB, ART, PMTCT, and prevention programs and reproductive health services, STI sites, workplaces and community and home-based care (CHBC) sites, including for OVC. This will build on previous investments in supportive care to improve access to preventive care and basic clinical care services for PLHIV at the community level. The average cost per beneficiary is $87.66.

In FY 2008, PEPFAR partners will direct greater attention to strengthening quality HIV and AIDS palliative care service delivery and implementing standards of care. PEPFAR will support this effort by: (1) strengthening the integration of the basic care package and family-centered services across all care and treatment programs for adults and children living with HIV; (2) increasing the number of trained formal and informal healthcare providers, building multidisciplinary teams to deliver quality care with pain and symptom control and improving human resource strategies; (3) building active referral systems between CHBC and facility services; (4) developing quality assurance mechanisms, including integration of supervision systems and standardization of services and training; and, (5) translating national policy, quality standards and guidelines into action, particularly national adoption of the basic care package. For example, previous USG support to the Hospice Palliative Care Association of South Africa and its 143 member hospices and affiliates resulted in the development of national palliative care standards, quality improvement and accreditation programs, hospice management programs; and the development of national training centers for palliative learning across South Africa. In collaboration with National and provincial Departments of Health, FY 2008 funds will scale up direct delivery of quality palliative care services.

For FY 2008 reporting, the USG will continue to use a minimum requirement for someone having received palliative care which reflects a minimum standard of HIV-related services, aligning the program more closely to the definition of palliative as holistic service delivery. An HIV-infected individual must have received at least one form of clinical care and one other type of non-clinical care. The clinical service requirement addresses the critical importance of early identification of HIV status and HIV-related clinical problems which may compromise an individual's immune status and physical wellbeing. For HIV-affected family members, the minimum requirement would be that the individual receive services in at least two of the five categories of clinical, psychological, social and spiritual care and prevention services. While quality is very difficult to measure through routine indicators, this reinforces the message that PEPFAR is not simply interested in counting the number of people reached, but trying to reach individuals with appropriate and quality care.

PEPFAR partners will assure that a minimum standard of HIV-related services be adapted and implemented at facility and community-based sites for HIV-infected adults and children. Many facility-based services are integrated into comprehensive ART programs, providing wellness care for HIV-infected people prior to their eligibility for ARV therapy. The minimum care standard for facilities includes the following elements of the preventive care package and other essential care interventions:

-prophylaxis and treatment for OI, given according to national guidelines: cotrimoxazole prophylaxis for stage III-IV disease or CD4<200 or for HIV-exposed/infected children, TB screening and management, isoniazid preventive therapy in select sites and candidiasis screening and management where the Diflucan partnership exists;
-counseling and testing of partners and family members;
-nutrition counseling, clinical measurement and monitoring, micronutrient support according to WHO guidelines, and wrap-around nutrition support;
-STI care;
-routine screening and management of pain and symptoms;
-child survival interventions for HIV-infected children (immunizations, growth monitoring and safe infant/young child nutrition);
-integrated PwP strategies that include messaging, condoms, support for disclosure of status, referral for family planning and PMTCT services and ART adherence education, leading to healthy living, reduction of risk behaviors and reduced rates of HIV transmission;
-provision of at least one element of psychological, social, or spiritual care, or prevention services (emphasizing the holistic approach); and
-referrals for other services.

Support for malaria prevention (which is seasonal and in few geographic parts of South Africa) is leveraged with other donors. In

addition, cotrimoxazole is purchased by the SAG and obtained through the national supply chain, and thus available at all facilities, including primary health care centers.

The minimum standard for services at CHBC levels includes messaging, mobilization and referral (with follow-up) for the above mentioned services plus routine screening of all PLHIV and their family members (including OVC) for OI, TB, symptoms and pain; prevention messaging and condom provision; personal hygiene strategies to reduce diarrheal disease, and distribution of ITNs where appropriate. Provision of at least one element of psychological, social, or spiritual care or prevention services is also required at community level, however, home and community settings often facilitate delivery of a more comprehensive response including the provision of bereavement care, household support, community support group meetings, etc. PEPFAR partners adhere to national standards developed for hospice care which are inclusive of the comprehensive care elements addressed above with emphasis on relief of pain and symptoms and the provision of culturally-appropriate end-of-life care. The package of services at facility and community levels also includes medication adherence support for ART, TB and OI. At all levels, attention will be given to increasing gender equity in accessing HIV and AIDS programs, increasing male involvement in community programs, reaching pediatric patients, addressing stigma and discrimination, and building partnerships with local NGOs, FBOs and CBOs.

Program Area Downstream Targets:

6.4 Total number of service outlets providing HIV-related palliative care (excluding TB/HIV)	2662
6.5 Total number of individuals provided with HIV-related palliative care (excluding TB/HIV)	1235086
6.6 Total number of individuals trained to provide HIV-related palliative care (excluding TB/HIV)	28390

Custom Targets:

Activity System ID:	22491		

Activity Narrative: SUMMARY:
This activity is a component of a comprehensive prevention education, care and treatment program for small to medium enterprises (SMEs) with 20-200 employees and other workplaces in South Africa.

BACKGROUND:
SABCOHA program PEPFAR funds will be used to identify HIV-infected individuals as noted in the Vendor Chain and BizAIDS programs below. The major area of emphasis is Workplace Programs. Minor areas of emphasis include Community Mobilization/Participation, and Information, Education and communication. Specific target populations include Male and Female adults, Truckers, and the Business Community. The care component of this SABCOHA initiative will initially be implemented in at least three provinces namely: Gauteng, Mpumalanga and KwaZulu Natal. The SABCOHA Vendor Chain and BizAIDS counseling and testing (CT) programs will identify HIV-infected individuals will be referred into pre- ARV treatment (ART) services.

The Vendor Chain and BizAIDS components of the existing SABCOHA program will begin a CT and CARE component that will identify HIV-positive individuals and ensure that they are enrolled in care services until eligible for treatment. Through its program, SABCOHA will work with the existing infrastructure, and ensure that newly identified HIV-positive individuals will take advantage of the holistic education, testing, and treatment program for the employed sector.

Once an HIV-positive individual has been identified, it is the aim of the Vendor chain program to ensure adequate transition to care. Most of the HIV-positive individuals will be referred to one of the 440 established South African Department of Health (DoH) comprehensive care management and treatment sites as well as any other sites identified throughout the country. It is critical however that adequate referral is undertaken. To enable the referral, a specific referral path to a treatment site, adequate and close to the testing site is identified before testing. Patients tested HIV-positive are referred with the DoH or any other identified site's accepted referral information. In additional the CD4 count performed at the time of testing is referred to the treatment site. By referring most patients to government sites this program will leverage the available funding, infrastructure, personnel, ART and laboratory testing from Government. SABCOHA estimates that it will provide Pre-HAART services to approximately 2,100 people in the first year.

ACTIVITIES AND EXPECTED RESULTS:
ACTITY 1: identification of HIV positive individuals who are not treatment eligible and ensuring that they receive the appropriate care
After undergoing VCT, The Vender Chain and Biz AIDS components of the existing SABCOHA program will refer HIV positive individuals to general practitioners within the established GP Network. The general practitioners will provide treatment for opportunistic infections, a minimum of 3 visits during the course of the year to monitor disease progression, laboratory services; prophylaxis or treatment for TB and Health Risk Management services to each patient. Health care providers will provide patients with pamphlets on signs and symptoms of disease progression. This will ensure patient awareness of disease progression.

SABCOHA's care activities will contribute to the PEPFAR 2-7-10 goals by identifying HIV-infected individuals for care, and ensuring they get the appropriate care until they are treatment eligible. This will contribute to the PEPFAR vision outlined in the Five-Year Strategy for South Africa by expanding access to, and availability and quality of care services.

Activity Narrative: BACKGROUND:

The overall objective of the Ripfumelo project is to reduce HIV vulnerability of farm workers in various districts of South Africa by implementing a coordinated, evidenced-based and focused HIV and AIDS prevention and care program. Building on experiences and lessons learnt from IOM pilot projects in the southern Africa, the Ripfumelo project aims to provide sustainable prevention and care services to farm workers by building the technical capacity of local implementing partners (IPs); strengthening partnerships among and with local, provincial, and national governmental agencies; promoting public/private partnerships; and developing a network of stakeholders working specifically on HIV-related issues within the commercial agriculture sector.

The overall anticipated results of the project are a reduction in the HIV incidence in the targeted areas, and a mitigation of the impact of AIDS on farm workers and their families and communities. The project will build particularly on experiences and lessons learned from the ongoing IOM prevention and care project which has been implemented in Hoedspruit, Mopani District, Limpopo Province since 2005. The Ripfumelo project will strengthen the existing intervention in Hoedspruit and target additional seasonal, temporary, and permanent farm workers, whether South African or foreign, documented or undocumented, in the commercial agricultural areas of Hectorspruit/Malelane (Lowveld, Mpumalanga), Makhado/Musina (Vhembe, Limpopo), and Tzaneen (Mopani, Limpopo). The project will initially target approximately 20,000 farm workers on about 120 commercial farms.

Activity ID: 21168.08

Planned Funds: $200,000

Activity System ID: 21168

Activity Narrative: The purpose of AgriAids is to address the practical & manageable aspects of HIV/AIDS on farm level, both emerging farmers as well as commercial farmers: improving access to VCT, care – and treatment for farm workers through innovative new partnerships and existing health care facilities. AgriAids has built up an expanding network within the agricultural sector over the last 3 years, building up a “skills bank” and knowledge base on issues such as awareness, stigma, treatment, advocacy, etc. The rationale of AgriAids is to address the micro-level impact of HIV/AIDS on farm workers, which in turn will prevent the macro-level impacts from taking effect. AgriAids acts as the “spider in the web” which connects farms in need of services with supplying organisations. In this sense AgriAids will act as a “broker” between farms and service providers, using its existing network but also through identifying and setting up new partnerships.

In 2004, AgriAids came into life in order to address this regional problem: reducing the direct effects of HIV/AIDS on farm workers. This requires intervention on two levels (as explained in this proposal):
- Direct: facilitating rapid access to information, VCT, medical care – and ART for farm workers
- Indirect: lobbying the commercial agricultural sector to start viewing HIV/AIDS as an “occupational health threat” and encourage CSR spending on care – an treatment programmes on farm level

A great deal of interaction is also called for with Government (notably Dept of Health & Agriculture), since the plight of the farm worker is not high enough on the policy agenda.

The key strategy of AgriAids is to identify relevant medical service providers which can be linked to farms in need. AgriAids will act as a “broker” between farms and service providers, using its existing network but also through identifying and setting up new partnerships. This will result in an increase of farm workers accessing VCT, care – and treatment. This approach has proven its viability recently: AgriAids partnered with FPD since 2007 and several farm workers in the Brits area (North West) is now enrolled in the project and the demand is already growing from other farms. FPD will be a key partner, since they support a large number of public ART sites. AgriAids will therefore support the SA Government’s National Strategic HIV/AIDS plan, since it will create a demand for ART services in rural areas, but also facilitate access on behalf of those who have traditionally been “sidestepped” by the healthcare system.

Some key outcomes of this project will be:
? Increase in farm workers accessing IEC campaigns on HIV/AIDS
? Increase in farm owners implementing HIV/Aids workplace policies, prevention and management plans on farms
? Increase in health-seeking behaviour of farm workers
? Increase in NGO’s making farm workers target groups
? Increase intervention from Dept of Health & Agriculture to mitigate the impact of the disease
? Increase in condom distribution and usage on farms
? Increase in female condom distribution and usage on farms
? Decrease in multiple concurrent sexual partners on farms
? Decrease in new infections
? Increase in number of farm workers/managers/owners doing VCT, starting ART and receiving care & support
? Increase in organisations (public, private, NGO’s, commercial, etc) adopting a common strategy, with specific focus on Dept of Agriculture
? Creation of a replicable model for decentralized rural healthcare in a workplace setting

These indicators point towards the fact that the project activities will look at HIV/AIDS holistically, and that activities will include workplace interventions, gender training, AIDS awareness, VCT, care – and ART.

Activity ID: 16898.08
Planned Funds: $615,819
Activity System ID: 16898

Activity Narrative: SUMMARY:

The Medical Research Council (MRC) in partnership with University of the Western Cape (UWC) will strengthen basic care and support to people living with HIV (PLHIV) by developing training modules, and by improving monitoring and evaluation of the impact of nutritional support provided to PLHIV. The proposed project aims to train and build capacity throughout South Africa. This project will implement a mixture of short and distance learning courses, and related mentoring activities. The overall aim of this activity is to (a) strengthen nutrition programs in relation to HIV and AIDS and TB; (b) facilitate future development of community-based programs; and (c) enable evaluation of the effects of nutrition interventions through other programs. The target population includes national, provincial, district, sub-district, and facility level nutrition, maternal and child health, TB and HIV managers, and non-governmental organization's (NGO) managers who are involved in the management of TB and HIV programs at either the facility or community level.

BACKGROUND:

Significant resources are invested in providing nutrition supplements to many patients on antiretroviral treatment (ART). Hundreds of nutrition advisors and dieticians have been employed to provide nutrition counseling, and the Department of Social Development is implementing a large HIV and AIDS livelihoods program aimed at improving access to nutrition.

There has not been a formal evaluation of nutrition programs. However, reports from provincial government and other food and nutrition programs in the country strongly point to the lack of human resource capacity to implement, monitor, and evaluate these interventions optimally. This project aims to strengthen the capacity of provincial, district and sub-district nutrition and HIV managers to design, monitor, and evaluate facility and community-based food and nutrition interventions targeting people infected with HIV and TB.

ACTIVITES AND EXPECTED RESULTS:

Building such capacity is particularly challenging since a large number of people need to be reached but as these people (managers) are in positions of responsibility they cannot be removed from their posts for significant periods. The School of Public Health at the University of the Western Cape has conducted short courses on nutrition policies and programming, nutrition information management and nutrition science for more than 10 years, recently in collaboration with Tulane University's School of Public Health and Tropical Medicine. However, the impact of such short courses is limited by the lack of follow up to consolidate and implement such learning. Experience suggests that the combination of intensive face-to-face sessions along with distance learning materials that encourage the implementation of knowledge learned, followed by feedback and further learning can be an effective strategy. This project therefore aims to create learning modules including a mix of face-to-face and distance learning formats. These modules are described in detail below.
ACTIVITY 1: Nutritional Aspects of the Management of HIV and TB
This module will summarize the latest scientific evidence on the relationship between nutrition and TB/HIV; provide updates on latest nutritional guidelines for HIV; include challenges of implementing clinical guidelines; and provide information on aspects to consider when implementing nutrition interventions in primary healthcare settings.
ACTIVITY 2: Nutrition Programming and Planning
This will build upon a module created by the University of the Western Cape with input from Tulane University. The focus of this module is on community-based HIV and nutrition programs. This module will emphasize the design, development, and implementation of community-based health and nutrition programs, and their adaptation and application to addressing the HIV epidemic.

ACTIVITY 3: Nutrition Information Systems, Including Program Monitoring and Evaluation

This course will be based on existing modules used at Tulane University and University of the Western Cape; a recent short course on this topic, run by UWC and Tulane with UNICEF support, provides a basis for a distance module. Each of these modules will consist of five days of face-to-face teaching along with readings and exercises that focus on the implementation of what has been learned. Participants may take related distance learning courses that will count towards a masters degree in public nutrition, to be developed under this program.

ACTIVITY 4: Mentoring and Trouble-shooting

The capacity to follow up with people trained through this process, and others working in national and local offices, will be developed. Mentoring is already part of the UWC teaching procedures, with participants conferring with faculty during the period of their learning (mostly in a distance format). These efforts will be expanded to supporting nutritional interventions, which will require some strengthening of UWC/Tulane capacities themselves. Trouble-shooting problems, as they arise, may form an integral part of this process. The people who can provide this mentoring may be from UWC/Tulane, from other institutions (e.g. faculty of other universities who participated in the UWC/Tulane training – and who may be providing similar training themselves). Some resources will be needed for the mentors' time and travel expenses even though some mentoring can be done at a distance by email for example.

Through the strengthening of and integration of nutrition into basic HIV and AIDS and TB services, the MRC and its partners will help PEPFAR achieve its 2-7-10 goals.

Planned Funds: $0

Activity System ID: 16851

Activity Narrative: SUMMARY:

Genesis Trust (GT) is a new South Africa PEPFAR partner under the New Partners Initiative. Palliative care is a major aspect of the GT program incorporating home-based care in 9 communities, in a 40-bed, 24-hour inpatient unit and HIV counseling and testing services. The project will emphasize increasing gender equity in the programs. This will be done through couple counseling and testing; adopting a family-centered approach to care and treatment services; health worker training to recognize signs of gender-based violence and providing appropriate counseling and referral services to the prevention program to address societal and community norms to reduce stigma. Another area of emphasis is human capacity development, which will be done through in-service training and a retention strategy. The primary target populations are individuals who are referred to the inpatient unit by local government hospitals (patients with HIV and AIDS and/or TB), their families, and community members in need of home-based care and /or counseling and testing.

BACKGROUND:

The Ugu AIDS Alliance (UAA) project's palliative care program consists of two components, an inpatient hospice/step-down care unit and a home-based care component. Palliative care services are offered to patients and family members in a holistic and family-centered approach. It optimizes the quality of life of adults living with HIV through the active anticipation, prevention, and treatment of pain, symptoms and suffering from the onset of HIV diagnosis through death. GT palliative care involves offering patients clinical/ physical, psychological, spiritual, social support care and integrated prevention services.

GT has had an agreement with KwaZulu-Natal Department of Health (DOH) and is paid by the DOH on a per patient-bed-day status (the fee covers a portion of the cost of care). Patients are admitted to Genesis Trust Care Centre GTCC only on referral from one of the local hospitals (Port Shepstone and Murchison Hospitals). Both hospitals strongly support and depend on the services of GTCC, which help to decongest their overcrowded wards. In-patients with HIV who require ongoing step-down or palliative care can be transferred to GTCC, opening hospital beds for patients with more acute conditions.

ACTIVITIES AND EXPECTED RESULTS:

Clinical care services offered include: screening and management of pain and symptoms, prevention and treatment of TB/HIV, and prevention and treatment of other opportunistic infections (OIs) including the provision of cotrimoxazole and nutritional assessment and counseling. Nutritional rehabilitation for malnourished PLHIV may be provided if patients fall within the parameters of OGAC guidance and the South African Government recommended interventions.

GT psychological care services include: interventions that address the non-physical suffering of individuals and family members, identification and treatment of HIV-related psychiatric illnesses such as depression and related anxieties, and bereavement services.

The spiritual care services include: offering culturally sensitive interventions that support individuals and families through life review, counseling on hopes, fear, meaning of life, guilt, forgiveness, life completion tasks and life planning for those who feel renewed life following improved quality of life after starting ART.

While in the Genesis Trust Care Centre patients and their families receive intensive counseling about HIV as well as their treatment. The families are encouraged and enabled to provide supportive care of the patients. Family members are also educated on the importance of HIV testing and referred to government testing sites. Appropriate patients are counseled on CD4 testing and ARV treatment. CD4 counts that are drawn at the GTCC are sent to the hospitals for testing. Patients are then counseled on their results and referred for follow up monitoring or initiation of ARV treatment.

Supportive care services offered include: assisting individuals and family members in linking to care services such as adherence to treatment, accessing government grants, linking to income generating programs.

Prevention with positives interventions for HIV-infected individuals are an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals.

The home-based palliative care component is done through locally-based community members who are trained as volunteers. These volunteers are recruited and employed by Positive Ray (PPR). The volunteers are trained to provide a professional, but compassionate service to those who are sick with AIDS with the goal of restoring dignity and providing a caring service. Training topics covered include capacity building on the services outlined above and specifically cover: palliative care overview; fire prevention; basic health & safety; oral hygiene; HIV infection; pain management; dying patient care and bereavement; basic nursing skills; administrative skills; computer skills; HIV medication; diet/nutrition; conflict management; self-development skills; and, physiotherapy workshops for professionally accredited physiotherapists. The duration of the training will vary according to training needs and will be offered throughout the course of the year as and when required. Several of the courses are accredited by the South African Government but some of them are offered by local doctors and other medical personnel from the government hospitals. Training quality assurance is done through questionnaires and quality of output of trained staff.

All HIV-infected individuals will receive palliative care with at least one clinical intervention and at least one non-clinical intervention. Family members of HIV-infected individuals will receive palliative care services two of the five categories of palliative care.

These activities contribute to the PEPFAR care goal for reaching 10 million people affected by HIV.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	7311.08	**Mechanism:**	N/A
Prime Partner:	GRIP Intervention	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	16273.08	**Planned Funds:**	$300,000
Activity System ID:	16273		

Activity Narrative: SUMMARY:

Greater Mpumalanga Rape Intervention Program (GRIP) provides basic health and care services to sexually assaulted/domestic violence survivors and people living with HIV (PLHIV). GRIP is involved in palliative care by supporting care rooms in hospitals, courts, police stations, and providing community-based support. The emphasis areas are gender and human capacity development. Primary target populations are survivors of sexual assault including children and adults, and PLHIV and their families.

BACKGROUND:

GRIP was established in 2000 in response to the high levels of sexual assault and domestic violence and the concordant high levels HIV and AIDS infection transferred to survivors. GRIP was initiated by volunteers and seeks to empower women, men, and children by providing comprehensive basic health care services. GRIP's approach to providing care services was established in consultation with volunteers, survivors, PLHIV, and community, to offer the services that best meet the needs of the community.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Hospital Care Rooms

GRIP will support care rooms in hospitals to provide clinical and psychosocial support to survivors of sexual assault including children and adults. The medical care rooms are maintained by GRIP and open twenty-four (24) hours, 7 days a week. With support from the Department of Health, care rooms have a full time forensic professional nurse during the day alternating with the doctor on-call in the evening. Survivors undergo examination, are screened for STIs and OIs, receive treatment and cotrimoxazole as appropriate, and receive post-exposure prophylaxis and other necessary medication. In addition, survivors receive psychosocial support, counseling and testing, and are also referred to support groups to assist with recovery.

ACTIVITY 2: Police Care Rooms

GRIP will open care rooms in police stations where victims can report their cases and receive comprehensive care services including protection. GRIP has existing Victim-Friendly Facilities in some police stations which also operate 24 hours, 7 days a week. At these facilities, J88 Forms (police dockets) are completed to open cases against the perpetrator, and psychosocial support and practical assistance is offered. Each care room has an Area Manager who oversees the daily operations to ensure that necessary procedures are followed and services are offered to the survivor once the case is reported. These care rooms are an initial entry point for psychological support and survivors are referred to hospital care rooms in Activity 1.

ACTIVITY 3: Community-based Support for Survivors

The community-based support for survivors is integrated with the Care Rooms operations. Survivors are allocated counselors who offer them service in the care room and conduct follow-up thereafter. These same counselors will remain the support counselors to the survivor throughout the program. These counselors will then visit survivors at home for the provision of psychological and social support. A holistic approach is employed, an integrated approach to holistic social welfare intervention, where survivors of sexual assault and domestic violence needs are addressed in collaboration with other stakeholders, for example the Department of Education, Health and Social Services, Justice, Safety and Security, and Home Affairs. GRIP acts as the eyes and ears of each community. By conducting these home visits, GRIP accesses each family's and individual's unique care needs, and can refer and act upon accordingly. Confidentiality and privacy is respected.

ACTIVITY 4: HIV and AIDS Support Groups for Survivors

The goal of the HIV and AIDS support group is to establish, build and facilitate area-specific sites for an ongoing support system, catering to HIV-infected persons, which offers a forum for continuous information and sharing of life experiences, for mutual benefit to those needing or requesting it. These groups are facilitated by trained counselors and have more or less 15 persons to meet on a twice a month basis for a 6 month period. The venue for the meetings will be sourced through collaboration with traditional leaders or community halls. These meetings will enhance the psychological, spiritual, and social aspects of palliative care.

Through the support groups, a major component will include the following activities: acceptance, disclosure, prevention with positives, opportunistic infections, adherence counseling, treatment literacy, nutrition, and counseling.

Through the provision of clinical, psychological, social, spiritual, prevention and victim empowerment interventions, these activities contribute to the PEPFAR goal of reaching 10 million with care.

Planned Funds: $142,500

Activity System ID: 16088

Activity Narrative: SUMMARY:

Currently, USAID/South Africa (SA) supports institutional capacity building of indigenous organizations that implement PEPFAR programs, including basic health care and support (BHCS) programs, through three competitively-selected Umbrella Grants Management partners: Pact, the Academy for Educational Development (AED) and Family Health International (FHI). The main purposes of these UGM projects are to: (1) facilitate further scale-up of HIV and AIDS care services and (2) develop indigenous capability, thus creating a more sustainable program. The emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs) and community-based organizations (CBOs). The current UGM with FHI will support five sub-partners who have transitioned over from Pact and five new sub-partners. This activity refers only to the USAID/SA UGM project managed by FHI.

BACKGROUND:

USAID/SA's Health and HIV/AIDS strategy responds to the overwhelming challenges posed by the HIV and AIDS epidemic on individuals, families, communities and society in South Africa. Through this UGM, FHI is responsible for managing subgrants to ten USAID partners (all of whom submit their COPs directly to USAID). As USAID's prime partner and the managing umbrella organization, FHI will not directly implement program activities, but rather act as a grants management partner to manage and mentor its ten sub-recipients who, in turn, will carry out the assistance programs. Thus, FHI functions primarily as a sub-grant making entity, and a relatively small percentage of overall funds are used for administrative purposes. Given that recipients require significant technical assistance and management support to grant recipients, FHI will devote a reasonable percentage of overall funding to providing this support.

USAID closely collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grant mechanism. Although some of the partners work closely with various SAG Departments, at national, and/or local (i.e., provincial and district) levels, the umbrella grant's primary interface with the SAG is through the Senior Management Team (SMT), which includes key staff from USAID, National Departments of Health and Social Development (NDOH, DOSD), and representatives from the provincial departments.

Under this UGM with FHI, USAID is supporting four indigenous and international FBO and NGO partners who provide basic health care and support services such as palliative and home-based care (HBC) to communities in the provinces. These are: Humana People to People; LifeLine; MCDI; and PSA-SA. Grants to palliative care partners support government clinics and hospitals with human resources including doctors, nurses, pharmacists, and counselors. These partners also work closely with new and established hospices to ensure hospice accreditation in accordance with national and global standards of palliative care. Palliative care services supported by partners include holistic; family-centered; clinical, psychological, spiritual, social care and integrated prevention services for PLHIV and their families, supported by multidisciplinary teams at facility and community levels. An emphasis will be placed on TB screening, national guidelines for OI prophylaxis, identification of pediatric cases, and ART referral, as services become available. Through their partnership with PEPFAR, these providers will increase their reach two to three-fold. This scale-up requires strong financial, monitoring and evaluation, and management systems to accommodate growth in reach and maximize sustainability.

ACTIVITIES AND EXPECTED RESULTS:

In the FY 2008, USAID/SA will continue to support existing palliative care partners through this UGM with FHI. Funds budgeted under this narrative will support costs for administering, managing and facilitating technical support for FHI's palliative care sub-partners. Separate COP entries describe the palliative activities implemented by each sub-partner under FHI. Institutional capacity building of indigenous organizations is a key feature of the umbrella grant mechanism and an important strategy for achieving prevention, care, and treatment goals of PEPFAR to ensure long-term sustainability of programs and organizations.

ACTIVITY 1: Grant Management

Through this UGM, FHI will award and administer care grants to partners selected through a USAID/PEPFAR APS competitive process to implement HIV and AIDS activities. This involves an array of related activities including award and administration of grants, monitoring of grant progress, meeting reporting requirements, and grant closeout. FHI will continue to monitor palliative care program implementation and adherence to financial regulations both within FHI and in its sub-partners (USAID's partners). This involves provision of extensive technical assistance to partners on palliative care project development and implementation, financial management, monitoring and evaluation, and reporting. All these functions provide key support to organizations so they can better implement care activities.

ACTIVITY 2: Capacity Building

This new umbrella mechanism will support institutional and technical capacity building of indigenous organizations, defined as activities that strengthen the skills of indigenous organizations to implement HIV and AIDS programs efficiently, with diminishing reliance on external technical assistance and support. FHI will support activities to improve the financial management, program management, quality assurance, strategic information (M&E) and reporting, and leadership and coordination of sub-partner organizations implementing preventive activities. FHI will also provide technical assistance to the USAID partners, as needed, to improve the technical approaches used for AB prevention activities and to enable quality assurance/quality improvement (QA/QI) of activities falling within this technical area. All these functions provide key support to organizations so they better implement care activities.

ACTIVITY 3: Monitoring and Evaluation (M&E) and Reporting

The umbrella grants mechanism will ensure support to USAID's care partners in M&E, in order to strengthen measurement of the implementation and impact of palliative care program activities, an eventual achievement of PEPFAR goals. M&E support of palliative care partners include: measurement of program

Activity Narrative: progress; provision of feedback for accountability and quality; surveillance; and implementation of information management systems. In addition, the umbrella mechanism will provide supportive supervision to provide guidance, monitoring, mentoring and oversight through site visits, technical assistance, and performance evaluation.

The management of service delivery programs under the umbrella grant mechanisms will contribute to the PEPFAR goals to provide treatment to 2 million HIV-infected people; prevent 7 million HIV infections; and provide care to 10 million people infected by HIV and AIDS, including orphans and vulnerable children.

Budget Code: HBHC
Program Area Code: 06
Activity ID: 15940.08
Planned Funds: $250,000
Activity System ID: 15940

Activity Narrative: SUMMARY:

Pathfinder will conduct a situational analysis and select communities for implementation of community and home-based care (CHBC) services according to availability of referral sites, such as hospitals and other facilities offering treatment of opportunistic infections (OIs) and ART. Peer educators will also be trained and peer supervisors in CHBC and establish linkages with programs providing nutritional support to people living with HIV (PLHIV) and OVC. The objective under this program area is to improve the quality of life for young PLHIV and their families through expanded access and improved quality of CHBC services. All activities will be implemented by Planned Parenthood of South Africa (PPASA) and services will be made available in PPASA youth clinics in KwaZulu-Natal, Gauteng, North West, and the Eastern Cape. The emphasis areas for these activities are human capacity development and local organizational capacity development. Specific target populations include young people between the ages of 15-24 years and their families around the clinic catchment areas.

BACKGROUND:

As the number PLHIV increases in South Africa, the gap continues to widen between the supply and demand for health care services. Relying on the strengths of community networks, community home-based care has emerged as an effective method of providing compassionate care to those infected and affected by HIV and AIDS. Since the 1980s, Pathfinder has been a leader in managing successful CHBC programs in a number of countries, including Uganda, Kenya, Tanzania, and Ethiopia, as well as a new youth CHBC program in Mozambique. Pathfinder will transfer this experience to better meet the needs of PLHIV -- particularly youth infected or affected by HIV and AIDS in South Africa. This is a new partner for FY 2008. CHBC will be implemented by NGOs, Community-Based Organizations (CBOs), volunteers, and youth organizations with technical oversight provided by Pathfinder/PPASA. Youth CHBC volunteers will provide an important link between PLHIV, community services and the youth-friendly clinics providing HIV and AIDS care and support services. They will identify potential barriers to ART adherence and ensuring treatment compliance for PLHIV on ART.

ACTIVITY 1: CHBC Networks

CHBC programs provide clients and family members with practical nursing skills such as how to treat bed sores, pain and symptom management, how to treat opportunistic infections etc., psychosocial support and linkages to other community services, such as income generation, food, and orphan support. CHBC relies on networks of community health workers who are attached to local CBOs; they regularly visit homes of those who are affected and teach caretakers how to provide emotional support and physical care to household members living with HIV and AIDS. In addition, community health workers play a major role in prevention, stigma reduction and social mobilization within their communities. CHBC programs strengthen linkages with nearby health facilities, such as hospitals and PMTCT sites, establishing two-way referral systems between these facilities and community health workers. CHBC is a critical element in the continuum of HIV and AIDS prevention, care and support. CHBC programs will expand their focus on palliative care to include adherence support, community engagement, prevention with positives, and nutritional support. Through this project, Pathfinder will facilitate CHBC services in selected communities around the four youth-friendly clinics upgraded to provide HIV and AIDS care and support services under this project. The project will build upon existing relationships with the Provincial Departments of Health, (PDOH) as well as with youth NGOs and youth associations currently providing community outreach services. CHBC will be implemented by NGOs, CBOs, and youth organizations, with technical oversight provided by Pathfinder/PPASA. Under the coordination of PDOH, Pathfinder/PPASA and project stakeholders will select communities for CHBC during project start-up. Criteria for selection will include proximity to a youth-friendly clinic, referral facilities, and existence of appropriate youth NGOs, CBOs or associations that have the capacity to carry out such activities. Pathfinder will conduct situational analysis and select communities for CHBC services based on the above criteria. Peer Educator Supervisors will be selected in each of the communities, where peer educators will receive training in CHBC and subsequently become Youth CHBC Activists. The Youth CHBC Activists will be trained to provide palliative care and training for primary caregivers and especially to youth affected by HIV/AIDS in their communities. From its long history of implementing CHBC programs and working with youth, Pathfinder recognizes the need for effective and frequent supervision and mentoring of Youth CHBC Activists. These Activists will be given the emotional support they need to do their jobs, which are often demanding and difficult. Supervisors will conduct monthly meetings with them to track progress and provide updates, as well as provide a forum for the health workers to support one another and discuss difficulties and solutions as a group.

ACTIVITY 2: Community Support and Mobilization

Community support and mobilization are key to CHBC. Peer Educator Supervisors and Youth CHBC Activists will be trained on social mobilization as a part of basic CHBC training. Peer educators will be trained as Youth CHBC Activists to provide palliative care and training for primary caregivers and especially to youth affected by HIV and AIDS in their communities. The Youth CHBC Activists will identify and follow up with young pregnant women for PMTCT services and promote VCT among community members (especially youth). They will facilitate anti-AIDS clubs and support groups for youth infected or affected by HIV and AIDS, and identify and link orphans and vulnerable children (OVC) to available services, such as nutritional support and support for payment of school fees. In those families with a PLHIV receiving ART, Youth CHBC Activists will provide adherence support, follow-up, and linkages to referral centers. Youth CHBC Activists will be trained on the referral systems, and will refer clients appropriately. Activists will play a key role in community sensitization and stigma reduction around HIV and AIDS, working to introduce CHBC services in their communities and garner the support of local leaders, faith-based groups, and other youth organizations. Pathfinder together with PPASA will conduct community sensitization meetings to introduce CHBC services and garner support for program and youth community health workers. Health workers will be supplied with basic home-based care kits, containing gloves, swabs, disinfectant, and basic medicines such as paracetamol and hydrocortisone cream to assist in their work. A communication strategy will be designed to help Youth CHBC Activists to facilitate dialogue and collective action in their communities.

ACTIVITY 3: Gender Issues

Activity Narrative: Gender and sexuality are significant factors in the sexual transmission of HIV and they influence access to treatment, care, and support. Pathfinder will facilitate adaptation of the DOH HBC curriculum to be more gender sensitive and responsive, especially in regard to gender roles and norms among young people to improve gender-sensitive training for Youth CHBC Activists and Supervisors. Pathfinder will also add youth, gender, human rights and social mobilization components to national HBC training curriculum. Pathfinder will ensure appropriate representation of male and female Youth CHBC Activists and ensure that the number of families and young people reached with CHBC is proportionate with the number of young males and females in need in each community. Special attention will be given to young women infected or affected by HIV/AIDS to ensure that care and support services are available and that schooling continues whenever possible.

ACTIVITY 4: BCC and social mobilization: Participation of young people and community members in social mobilization processes will be valued as a goal. To start this process, community members need clear values in relation to young people, especially those living with HIV and AIDS. They must believe that living conditions of these young people ought to change. Through dialogue and establishment of prevention clubs, community members will collectively evaluate the social consequences of those living conditions and elaborate a different future, free of stigma and discrimination. Materials explaining the purpose of CHBC and helping PLHIV to "live positively," as well as those that build treatment literacy will be sourced and disseminated by the Youth CHBC Activists. Addressing prevention with HIV-infected individuals is an important part of this comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission.

These results contribute to the PEPFAR 2-7-10 goals by improving the quality of life for young PLHIV and their families through expanded access and improved quality of CHBC services.

Program Area: Palliative Care: Basic Health Care and Support

Budget Code: HBHC

Program Area Code: 06

Activity ID: 3015.08

Planned Funds: $291,000

Activity System ID: 15075

Activity Narrative: SUMMARY:

This activity is aimed at partnering with key civil society organizations focusing on mobilizing people living with HIV and AIDS (PLHIV) to access basic preventive care services. The Health Policy Initiative, Task Order 1 (HPI TO1) has technical expertise and existing nationally-recognized materials to support this activity which include 'To the Other Side of the Mountain - A Toolkit for People Living with HIV and AIDS in South Africa', 'National Support Group Guidelines', as well as materials to address stigma and discrimination at individual and community levels. Emphasis will be placed on mitigating stigma and discrimination and addressing gender inequalities in palliative care.

BACKROUND:

The HPI TO1 will provide technical assistance to PLHIV organizations to equip them with skills to mobilize and advocate for essential care and treatment support services, training on essential care messages and referrals for essential HIV and AIDS PMTCT, ART, opportunistic infection (OI) management (including TB) and counseling and testing (CT) services for its members and their families. The target populations for this activity are HIV-infected TB patients, PLHIV, their families, and community-based organizations. The major emphasis areas are local organization capacity development, with additional emphasis on community mobilization/participation and training. HPI TO1 will increase access to basic preventive care services under the umbrella of quality palliative care service delivery through a national rollout of the Toolkit for People Living with HIV and AIDS and through strengthening the capacity of three TB/HIV outlets. The Toolkit was developed in collaboration with PLHIV and the National Department of Health (NDOH) Chief Directorate on HIV and AIDS, Care and Support, STIs and TB. The Toolkit was developed to address the needs of PLHIV in South Africa particularly in the areas of disclosure, rights, communication, facilitation, advocacy and mobilizing access to essential prevention, care and treatment services. This activity will also integrate psychosocial support to family members of people living with HIV and AIDS.

ACTIVITIES AND EXPECTED RESULTS:

HPI TO1 will provide capacity development for PLHIV organizations in South Africa to equip them with skills to mobilize and advocate for essential care and treatment support services, knowledge and awareness of essential prevention and basic preventive care interventions and the importance of mobilizing and referring for essential HIV and AIDS PMTCT, ART, OI management (including TB), family planning and CT services for its members and their families. This activity will focus on strengthening and building the capacity of PLHIV organizations at provincial and district levels to provide quality programs designed to meet the needs of people infected and affected by HIV and AIDS. These organizations work with the South African National AIDS Council (SANAC) and they will be selected through SANAC and provincial Departments of Health. In FY 2008, HPI TO1 will provide training and technical support through nine provincial workshops for 10 participants per workshop per province who represents the Hospice Association of South Africa and its provincial branches, HPI TO1 will further train individuals from several community-based organizations providing community-based prevention and basic preventive care services, stigma and gender-based violence mitigation, using the toolkit. Additional workshops for students from two nursing colleges in Gauteng and Western Cape Province will be conducted, using the toolkit as part of their curriculum. The workshops will focus on providing participants with advocacy skills, community group facilitation skills, skills which support disclosure of HIV status, mobilizing for essential care services including prevention strategies and prophylaxis and treatment for OIs, ART support, counseling on HIV prevention and behavioral change and provision of condoms; mobilizing for counseling and testing (CT) of family members; counseling in nutrition and personal hygiene; psychosocial support and mitigation of gender-related violence and mobilizing for PMTCT, ART, OI management (including TB), CT services and workplace interventions. This activity will strengthen the capacity of NGOs and CBOs which are messaging and mobilizing for basic preventive care services in South African communities. This activity will also address gender issues through the provision of basic HIV screening and care and prevention messaging to large numbers of male and female adult PLHIV, support for disclosure of HIV status and reduction of gender-based violence, involvement of males in the program, mobilization of community leaders for promoting community efforts against stigma and discrimination and for raising awareness regarding HIV prevention, care and treatment.

With the epidemics of HIV and TB interlinked, and the increasing incidence of active TB disease, HPI TO1 recognizes that the strengthening of HIV/TB outlets is essential to ensure that the people affected by the co-epidemics receive appropriate care and treatment. HPI TO1 will focus on the integration of programs, the decrease of TB among PLHIV and the increase of HIV care available for TB patients within these service outlets. Three service outlets will be targeted VUKA TB/AIDS Project, NWATHA and a new outlet from the Western Cape.

VUKA TB/AIDS Project operates in an urban area, Hillbrow, Johannesburg. This is an area that is characterized by a diverse, overcrowded, poor, mobile and high risk community. Hillbrow has also been identified by the National Tuberculosis Control Program as a focus area for TB. VUKA utilizes volunteers to deliver a comprehensive service to the community of Hillbrow.

NWATHA has been a service provider to North West Provincial Department of Health in different districts in the North West Province. Given the strong link between TB and poverty which is evident in the province as it is predominantly rural, TB and HIV mobilization and awareness in these communities is needed.

The Western Cape has one of the highest TB prevalence in the world. It has also been identified as one of the focus areas of TB by the National TB Control Program of South Africa. Through the TB Alliance in the Western Cape, an organization will be identified that requires capacity and systems strengthening.

The activities outlined above will contribute towards meeting the vision outlined in the USG Five-Year PEPFAR Strategy for South Africa by mobilizing PLHV organizations and individuals and equipping them with skills to promote that mitigate stigma and discrimination

Planned Funds: $188,000

Activity System ID: 14253

Activity Narrative: SUMMARY:

Pact's Rapid Response for HIV and AIDS in South Africa is an umbrella grant mechanism for USAID PEPFAR grants identified through a USG interagency competitive (APS) process. Pact's primary goal is to build sustainable institutional capacity and increase the effectiveness of local partners to achieve expanded and quality services in the spectrum of palliative care. Primary targets include non-governmental organizations (NGOs), private voluntary organizations (PVOs), and faith-based organizations (FBOs). Pact's major emphasis is the enhancement of local subpartner capacity through the development and implementation of documented organizational systems and procedures and human capacity development at management and operational levels.

BACKGROUND:

Since 2004, Pact has facilitated the efficient flow of grant funds during the rapid scale-up of the PEPFAR South Africa program. Pact provides PEPFAR funding and assistance to over 30 total PEPFAR partners and sub-partners in South Africa playing valuable roles in the fight against HIV and AIDS.

Pact has contributed to the 2-7-10 PEPFAR goals through support to 8 partners providing palliative care to over 80,000 individuals infected and affected by HIV and AIDS. These partners equip government clinics and hospitals with the human resources including doctors, nurses, pharmacists and counselors. They offer specialized training and infrastructure renovation required to more effectively serve their communities. In addition, these partners work closely with new and established hospices to develop, improve, and evaluate current services to ensure hospice accreditation in accordance with national and global standards of palliative care.

Palliative care services extend beyond patient facilities and include the support of grassroots initiatives for home-based care, prevention, and positive living activities. Partners engage private doctors, traditional healers, church groups, and people living With HIV (PLHIV) support groups to extend and enhance the networks for entry point and follow-up care. During their partnership with PEPFAR, these providers will increase their reach two to three-fold. This scale-up will require strong financial, monitoring & evaluation, and management systems to both accommodate the growth in reach and maximize sustainability. In FY 2008, Pact will continue to provide capacity building support through training and mentoring necessary to further develop and strengthen partner organizations. Pact will also facilitate the sharing of these systems between emerging and well-established partners and reinforce the use of data and reporting for strategic decision making.

ACTIVITY 1 - Grant Management

Pact conducts a participatory assessment of each partner organization and collaboratively develops an organizational capacity building strategy that details planned interventions. These assessment results also inform Pact of what type of assistance must be provided urgently in order to ensure that the organizations comply with USAID rules and regulations.

Prior to the signing of grant agreements, Pact provides extensive assistance to organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact assists partners in developing realistic cost share levels and emphasizes the sustainability aspect of this requirement. After the signing of the agreement, Pact works with each partner in developing a very detailed annual work plan that includes specific activities to be implemented, timelines, budgeted amounts, target beneficiaries and projected reach. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of partner organizations to diversify their funding base and ensure sustainability. Consistency with National Guidelines is emphasized.

ACTIVITY 2 - Human Capacity and NGO Development

Pact has developed a customized training series to orient new partners and their sub-partners. The training series includes basic and advanced grants and sub-grant management which addresses USAID rules and regulations, good governance and minimum financial management standards. Monitoring and evaluation courses cover basic principles of monitoring and evaluation and PEPFAR data requirements as well as internal data quality assurance. Refresher courses are also offered throughout program implementation. Pact also ensures that ongoing, intensive on-site training and mentoring is provided to partners and sub-partners. On a quarterly basis, Pact assesses the level and type of assistance required by each organization and develops a site visit plan that ensures that the necessary support is delivered to each partner and subpartner. Pact organizes and supports technical consultation meetings for the sharing of best practices and lessons learned among PEPFAR and non-PEPFAR partners. As required, technical assistance from select regional and international providers is sourced to assist partners in improving their technical capacity.

ACTIVITY 3 - Monitoring and Evaluation (M&E)

Pact assists each grantee in developing a results framework that tracks success against both PEPFAR program and organizational indicators. Pact further assists partners and sub-partners in the development of monitoring, evaluation and reporting (MER) plans and systems. Participation in a five day M&E training is mandatory for all partners prior to full implementation. Pact provides additional M&E assistance to all partners in the following areas: review and development of effective data collection, analysis and reporting tools; setting realistic and achievable targets; establishing and strengthening data quality management systems, conducting internal data quality audits and verifying and validating partner and sub-partner data submissions

ACTIVITY 4 - Program and Financial Monitoring

Pact recognizes the importance of monitoring partner and subpartner program progress and early identification and resolution of implementation issues. Pact has frequent and regular contact with partners

Activity Narrative: and if technical/programmatic gaps or problems are identified, ensures that issues are promptly addressed and resolved.

In addition to monitoring program progress, Pact closely monitors partner financial management and ensures that grants funds are utilized only for activities approved by USAID under PEPFAR funding. All partners submit monthly financial reports that that detail and document expenditures. Once Pact has ascertained that the partner has implemented and/or strengthened financial management systems which fully comply with USAID regulations, the documentation requirement is removed and only the monthly reporting requirement remains in effect. Pact finance staff visit partners every quarter to audit program expenses and accompanying documentation, compliance with USAID rules (including branding requirements) and cost share.

ACTIVITY 5 - Technical Assistance

Pact will provide and manage direct technical assistance in prevention, care and support strategies for all sub-grantees. Pact technical staff will conduct assessments and provide consultation and training on the development and implementation of programs and services (in line with best practice models, donor and SAG recommended methodologies and standards). In addition, sub-grantees will be supported with guidance and ongoing assistance on the design and delivery of partner HIV and AIDS curricula, training modules and publications. Pact will also work closely with partners to ensure the effective incorporation and strengthening of nutrition and food security, protection services, gender mainstreaming, and human capacity development in existing programs.

Funding Source: GHCS (State)

Program Area: Palliative Care: Basic Health Care and Support

Budget Code: HBHC

Program Area Code: 06

Activity ID: 14071.08

Planned Funds: $1,285,000

Activity System ID: 14071

Activity Narrative: SUMMARY:

The aim of this project is to provide technical assistance to the National Department of Health (NDOH) and provincial health departments to ensure expansion and integration of palliative care services within all palliative care programs, including PEPFAR, in all provinces. Target populations for these activities include host country government, healthcare workers and community healthcare workers. PEPFAR funds will be used to employ one full time palliative care technical advisors to be placed at CDC and one full time palliative care technical advisor in each of the nine provinces to assist with the coordination of palliative care activities at provincial and district level, enhance capacity of provincial and district staff by providing support and technical assistance for the implementation of the Basic Care Package at district level in all nine provinces. The funds will also be used as part of a joint (inter-agency) APS to attract new partners to implement the Basic Care Package for PLHIV who do not qualify for ARV treatment.

BACKGROUND:

The goal of the National palliative care program is to ensure the universal access to palliative to all PLHIV and family members especially those who do not qualify for ARV therapy thus establishing a continuum of care from testing HIV positive to end of life care.

ACTIVITY 1:

The technical advisors at provincial level will be responsible for coordinating the implementation of the Basic Care Package and the integration of pain assessment and management into HIV care services at district level. This will ensure consistency and quality across all palliative care services and will build capacity within the provincial DOH to monitor and support palliative care services. It is expected that these advisors will be able to support and advocate for supportive palliative care policies at the national level and within the provinces respectively and ensure that these policies are in line with the South Africa National Strategic Plan for HIV and AIDS. These coordinators will liaise with provinces and work across all PEPFAR partners within the provinces to ensure quality palliative care services are rendered according to national and PEPFAR guidelines. They will also provide technical assistance at provincial level in monitoring and evaluation of Care programs at district level.

ACTIVITY 2:

Funds will be utilized in the joint agency APS to attract new partners to implement the Basic Care Package in all nine provinces. USG is seeking partners to implement services in: acceptance of status, disclosure, screening and treatment of opportunistic infection (cotrimoxazole and INH prophylaxis), nutrition assessment and counseling, pain and symptom screening and management, knowledge of HIV infection and disease progression, ART and treatment adherence, TB treatment and adherence and basic hygiene and safe water. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals. The rapid scale-up of HIV care and treatment has created an opportunity to reach many HIV-infected individuals with prevention with positives interventions on a regular basis. Emphasis will also be placed on accessing gender equity in care programs. USG is seeking partners to implement these services in hard to reach rural areas.

The main beneficiaries for this program will be PLHIV who will be encouraged to compete. This program will contribute to 2-7-10 goals by ensuring the implementation of quality palliative care and increasing access to palliative care services.

Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	6424.08	**Planned Funds:**	$582,000
Activity System ID:	14073		

Activity Narrative: SUMMARY:

This activity supports screening and testing people living with HIV for sexually transmitted infections (STI), and help to improve the health of women in prostitution and engaging in transactional sex through cervical screening. The major emphasis area is policy/guidelines, and implementation of STI screening, with minor emphasis on needs assessment, and training. Target populations will be people living with HIV and partners in general population and women in prostitution and engaging in transactional sex.

BACKGROUND:

Both activities are on-going and were funded in FY 2007. STIs are strongly linked to HIV transmission and can further complicate the clinical care of the HIV-infected patient. South Africa is also experience a rapid rise in ciprofloxacin resistant gonorrhea and ciprofloxacin, the national first-line therapy, is no longer reliable as a therapeutic intervention. It is therefore important to test gonococci isolated from HIV-infected patients for likely ciprofloxacin resistance and ensure appropriate treatment is prescribed. Screening and treating HIV-infected individuals for STIs identified will result in better palliative care services, will reduce the likelihood of HIV and STI transmission to their partners and will identify those HIV-infected individuals that could potentially benefit from additional prevention/risk reduction services, including prevention with positives services. Currently the South African Government operates all public health clinics, including ARV sites, using a syndromic management model for STI treatment. Asymptomatic individuals go undetected and untreated with the syndromic approach, unless such patients present as contacts of other symptomatic STI-infected patients. Activity 2 is a continuation of the cervical screening service for women in prostitution and engaging in transactional sex (SWs) who attend a mobile clinic service in the Carletonville area of Gauteng Province. These women, of whom 65% are HIV seropositive, will be also tested for high risk types of human papilloma virus (HPV) infection to determine those most at risk of developing cervical cancer. The prime partner, The Sexually Transmitted Infections Reference Centre (STIRC) carrying out these projects is part of the South African National Institute for Communicable Diseases (NICD). NICD is organized as a parastatal, with accountability to the National Department of Heath through a Board of Directors. STIRC will implement both activities in collaboration with CDC's Division of STD Prevention, an HIV clinic in Johannesburg and the Mothusimpilo NGO which provides outreach services to SWs.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Screening and testing for STIs among HIV-infected patients will be carried out in the South African Government's largest Johannesburg hospital-based ARV site. People living with HIV will be screened for asymptomatic STIs and tested for pathogenic causes of STI syndromes when present. Since these activities will take place in a public ARV clinic, medicines needed to treat the STIs diagnosed will be provided by the South African Government, and not purchased with PEPFAR funds. Those with STIs will be counseled regarding enhanced risk of HIV transmission in the presence of STIs and will be offered prevention with positives services. Partner notification and counseling of those infected will result in the referral of sex partners for STI diagnosis and treatment as well as HIV counseling and testing. Couples counseling will be encouraged for discordant couples.

ACTIVITY 2:

Women in prostitution and engaging in transactional sex will be tested for HIV infection using rapid tests in informal settlements by the NGO program. These women will then be screened with cervical Pap smears to detect either dyskaryosis or cervical cancer as well as undergo HPV screening/typing. Women in prostitution and engaging in transactional sex with abnormal smears will be referred to gynecologists for further assessment and treatment.

Total staffing for both activities includes three nurses and three counselors, who will deliver the clinical service to those with STIs and their partners as well as to women in prostitution and engaging in transactional sex; two clerks will double-enter data. STI screening results and the importance of the STI-HIV link will be disseminated through training and building of human capacity of healthcare workers. Treating STIs will reduce on-going HIV transmission from index HIV clients. Partners in Activity 1 will receive epidemiological treatment for STIs as contacts and be offered HIV testing. Early treatment of cervical dysplasia in Activity 2 will prevent cervical cancer in women in prostitution and those engaging in transactional sex. Activity 2 will involve training in the taking of cervical smears by the NGO project nurses as well as raise awareness about cervical cancer among women in prostitution and those engaging in transactional sex . Findings from both activities will be used by STIRC to influence local and national health policy and guidelines which will enhance sustainability of each activity.

FY 2008 activities will be expanded to include the addition of symptomatic HIV-infected individuals for STI testing at the HIV clinic in Johannesburg, in addition to the screening of asymptomatic patients. The other activities remain the same, although approximately 20% more patients and women in prostitution or engaging in transactional sex will be included in the FY 2008 targets.

These activities contribute to PEPFAR goal of 10 million people in care by improving the palliative care provided to HIV-infected individuals presenting at ARV sites through the diagnosis and treatment of their asymptomatic STIs. These activities further contribute to the 2 and 7 portions of the PEPFAR goals through the referral, testing and treatment of the sex partners of HIV-infected patients and by identifying those HIV-infected patients that may benefit from further risk reduction and prevention counseling.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	486.08	**Mechanism:**	N/A
Prime Partner:	National Department of Correctional Services, South Africa	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	3030.08	**Planned Funds:**	$135,800
Activity System ID:	14036		

Activity Narrative: SUMMARY:

PEPFAR funds will be used by the National Department of Correctional Services (DCS) to provide basic HIV and AIDS care and support to offenders and staff in DCS Correctional Centers in all nine provinces. The major emphasis area for this program will be the training of personnel as facilitators on the establishment and maintenance of support groups for infected and affected HIV and AIDS offenders in Correctional Centers. Special emphasis will be placed on integrated preventions services, including prevention with positives and behavior change as well as the management of psychosocial challenges. Minor emphasis will be given to community mobilization and participation; development of network/linkage/referral systems; information, education and communication; linkages with other sectors and initiatives; and local organization capacity development. The target population will include men and women offenders, people living with HIV (PLHIV), their caregivers and several most at-risk populations (e.g., men who have sex with men, injection drug users and tattooing with contaminated instruments).

BACKGROUND:

The training will be provided by an identified service provider registered and accredited according to the South African laws and contracted through the DCS procurement process. However, the actual services will be carried out by both offenders and DCS members who have been trained. This activity is also one of the National Department of Health's strategies aimed at promoting positive living among people who have tested HIV-infected and integrate prevention services with those who seek to support one another and to cope with their status. The activity will contribute to the core objective of the Department of Correctional Services which is rehabilitation by enhancing a rational thinking among offenders and allowing them to take charge of their own behavior and future.

Although the DCS is encouraging the establishment of care support groups in Correctional Centers, no formal training was conducted to ensure that facilitators (personnel) are equipped with the necessary skills and knowledge to establish and maintain these care support groups. Challenges have been previously experienced whereby the support groups were without a skilled coordinator, and the concept of support groups lost its meaning in terms of its objectives and core business. The establishment of support groups for infected and / or affected members will also contribute positively towards creating an enabling and conducive environment and will promote the Department's intentions to care and support members who have to deal with the psychosocial impact of this epidemic. DCS will also encourage family members, where possible, to be part of the support activities for PLHIV.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

FY 2008 funds will continue to support personnel that are aimed at strengthening the HIV and AIDS Workplace Program. It is envisaged to train 180 members (at least 5 from each Centre of Excellence).

The activity will ensure gender balance by training both males and females as HIV and AIDS Support Group Facilitators to establish and maintain support groups. Coverage will include the 36 Correctional Centers identified as Centers of Excellence by the DCS in all six of its Regions which correspond with the nine provinces of South Africa. The support group facilitators will consist of custodial officials, administrative staff, professionals, etc to become comfortable with basic facts of HIV and AIDS and the support and care of infected and / or affected members.

ACTIVITY 2: Provision of Care

The training of offenders in basic palliative care and support will continue. Trained offenders will provide basic palliative care and support to other HIV-infected offenders. The basic palliative care activities will stem from those provided by the DOH as adapted for prison use. Nutritional referral, personal care, counseling (both pastoral and basic support), recognition of worsening condition such as increased pain or wasting, knowledge of when to refer to clinical providers in the prison, treatment adherence, prevention (including prevention with positives) and other holistic care activities as allowed (bathing, wound care). Screening for TB, STI, and OIs with appropriate referral and follow-up will be emphasized. This will be done in collaboration with the nurses at the prison since treatment for pain can only be done with a physician's orders and under strict supervision. A two-day workshop will be conducted with care specialist to look at the basic care package for offenders.

ACTIVITY 3: Care for Family Members

DCS will introduce a care and support package of family members of PLHIV to assist the individuals who are about to be released. This will assist in the transition from incarceration to civil society while continuing to be supportive of positive living behaviors. The training will include, promotion of family member CT, coping mechanisms, referral and follow up to public sector facilities for the continuation of palliative care services.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

The Department of Correctional Services activities contribute to the PEPFAR objective of 2-7-10 by increasing the number of people in care as well as preventing new infections.

6.4 Total number of service outlets providing HIV-related palliative care (excluding TB/HIV)	50	False
6.5 Total number of individuals provided with HIV-related palliative care (excluding TB/HIV)	9,000	False
6.6 Total number of individuals trained to provide HIV-related palliative care (excluding TB/HIV)	180	False

Indirect Targets

The Department currently has 49 support groups comprised of HIV and AIDS infected and affected offenders. The number of established support groups as well as offenders attending these groups is expected to increase after the training of personnel as HIV and AIDS Support Group Facilitators. There is no mandatory testing to determine the HIV status of offenders upon admission into the Correctional Centers. Hence, well structured and sustained support groups are a necessity to promote positive living and to create an environment in which HIV and AIDS infected and/or affected offenders share information and experiences and encourage one another.

Program Area Code: 06
Activity ID: 7961.08
Planned Funds: $679,000
Activity System ID: 14050

Activity Narrative: SUMMARY:

The Eastern Cape Regional Training Center (RTC) will use FY 2008 funds in the Eastern Cape for sustainable human capacity development for all health workers through provision of support and training for improvement of health systems of HIV and AIDS care in the Eastern Cape. RTC staff will also continue to improve their knowledge and skills by having weekly academic clinical discussions, internal workshops, and ongoing mentoring and Performance improvement meetings with staff of partner facilities and their feeder clinics and in so doing, creating a "learning" network across all the LSAs of operation. This will facilitate health workers to deliver quality HIV and AIDS palliative care and enhance their capacity to participate effectively in all levels of HIV and AIDS care. Three teams from RTC will each support a facility and its feeder clinics for a period of four months to initially evaluate the HIV and AIDS palliative care training needs and provide targeted didactic training, ongoing mentoring and coaching using standardized procedures manuals and tools that are in line with the national guidelines. A performance Improvement officer will continuously mentor and improve performance of the trained personnel while the teams move on to cover other clinics. Community support groups will be supported and trained in delivering the basic Care package to PLHIV and their families in their respective communities. The primary emphasis will be given to core activity of training, with minor emphasis to quality assurance and supportive supervision for health systems improvement in HIV and AIDS care, information, education and communication (IEC). The primary target groups are public and private health care workers. FY 2008 activities will be expanded to include continuous performance improvement of facilities and feeder clinics There will also be a central information officer supporting the three teams, information systems strengthening at facility and feeder clinic levels, thus building information management and reporting capacity of these clinics. Teams will ensure all team data collection is captured into the main RTC M&E systems.

RTC will also train local PLHIV groups on the Basic Care Package and mentor these in the areas of support to implement the Basic Care Package. RTC will be responsible for the accreditation and production of the training material for this purpose. The Basic Care Package will include: Acceptance of status, disclosure, prevention with positives, nutrition assessment and counseling, What is HIV, progression of illness, treatment literacy and adherence counseling.

BACKGROUND:

Since 2004 RTC has developed two care support centers in two hospitals and nine clinics and generated a model and protocols which will be introduced at new sites in FY 2007. A system of improvement cycles have been introduced in one sub-district.

RTC has been working with ECDOH managers in developing and disseminating care protocols and will be providing support and working closely with the district and facility managers to increase skills capacity to improve the quality of HIV treatment and support services at facilities and community level.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008 RTC activities will continue to address activities related to training; local organization capacity development; quality assurance; and supportive supervision. Funding will be used to train and mentor health care providers on HIV and AIDS related palliative care and support programs. This will include the preventive package of care including prevention with positives, screening for opportunistic infections according to national guideline for management of HIV; WHO clinical staging and provision of cotrimoxazole prophylaxis, screening for and treating TB in PLHIV and provision of INH prophylaxis. RTC will also seed accreditation of training curriculum for the Basic Care Package for PLHIV in conjunction with NASTAD and train PLHIV in implementing the basic care package. Target personnel will include physicians, nurses and nurse practitioners and other hospital and clinic staff.

ACTIVITY 1:

RTC will through the 4 clinical teams assess the palliative care training needs of health care providers at selected hospital and feeder clinics sites in the Eastern Cape province. Palliative care training will be designed according to the needs of the care providers. The areas to be covered are: basic prevention including prevention with positives, clinical screening and monitoring of the PLHIV, treatment of opportunistic infections, cotrimoxazole and INH prophylaxis and pain and symptom management. These training will be in the form of case discussions, ward rounds, targeted didactic training, mentoring and coaching. This will be followed up with quality assurance interventions by the QA team to ensure transfer of skills into practice.

ACTIVITY 2:

RTC will in conjunction with NASTAD's sub-partners (JRI and SA Partners) seek accreditation for the training curricula for the Basic Care Package for PLHIV. RTC will also produce the training material for this training and train PLHIV to form and facilitate support groups to deliver the Basic Care Package. This package will cover the following: acceptance of HIV status, disclosure, prevention with positives, and treatment of opportunistic infections (with a special focus on TB/HIV co infection and the provision of cotrimoxazole), ARV and adherence and nutrition assessment and counseling. RTC will form support groups for PLHIV and their families in each of the sites they support to deliver the basic care package.

These activities will contribute to the PEPFAR goal of reaching 10 million HIV-infected and affected individuals with care.

Activity ID:	7904.08	**Planned Funds:**	$224,000
Activity System ID:	14016		

Activity Narrative: SUMMARY:

Medical Care Development South Africa (MCDI-SA) will carry out activities to support expansion of holistic, comprehensive community HIV and AIDS and TB care and support from Ndwedwe sub-district to the other sub-districts of Ilembe District in KwaZulu-Natal province. FY 2007 and FY 2008 PEPFAR funding will be used to expand the primary activities of training, support and supervision of home-based care volunteers (HBCVs) and Directly Observed Treatment, Short-course (DOTS) providers, as well as the introduction of software to monitor home-based patient care. This will help to improve quality of care and treatment adherence for those on TB medication and/or ART; facilitate linkages between HIV and AIDS and TB-related community-based projects with the local health facilities; and build capacity among relevant community-based organizations (CBOs).

The emphasis areas include human capacity development (Pre- and In-service training, Retention strategy), local organization capacity building, and are extended through Child Survival and Safe Motherhood Wraparound Programs. The target populations are children, adolescents and adults, discordant couples, pregnant women, people living with HIV and AIDS, and orphans and vulnerable children.

BACKGROUND:

MCDI-SA is a US-based private voluntary organization (PVO) that is registered as a Section 21 company (NGO) in South Africa. MCDI-SA has been successfully implementing community public health and social support projects in KwaZulu-Natal, South Africa, since 1995. Prior to PEPFAR funding, projects have incorporated activities focusing on traditional Child Survival (CS) interventions, reducing HIV/AIDS through prevention among youth and adolescents, assisting with CT/PMTCT site establishment, strengthening the government healthcare system's provision of services to and creating support groups for HIV-infected and TB-affected individuals, and supporting other health-supportive community-based initiatives.

The activities proposed are expansions of those previously implemented by MCDI-SA in Ndwedwe sub-district and are in line with the PEPFAR and SAG objective of providing quality palliative care for HIV-infected and -affected individuals. The key program partner is the South African National Department of Health (NDOH), whose current policies on HIV and TB care and gender equity inform all project objectives, and whose representatives are actively engaged in the design and implementation of activities to promote consistency and long-term sustainability. The NDOH has agreed to provide staff and financial support for project activities, as needed. Other project partners include The Valley Trust, the National Association of People With AIDS (NAPWA), and Strengthening Pharmaceutical Systems (SPS).

ACTIVITES AND EXPECTED RESULTS:

ACTIVITY 1: Training, Support and Supervision of HBCVs

Due to the large distances between households and health facilities throughout the Ilembe District, HBCVs are a crucial part of a comprehensive system of care for people living with HIV and AIDS (PLHIV) and people living with TB (PLWTB) and play a significant role in their day-to-day treatment. As part of its ongoing USAID-funded Child Survival Project and the ongoing Ndwedwe Integrated HIV/AIDS Tuberculosis Project, MCDI-SA will broaden its existing integrated home-based care (HBC) program in Ndwedwe sub-district to the three other sub-districts of the Ilembe District: Maphumulo, Mandeni and KwaDukuza. PEPFAR funds will be used to train new HBCVs in comprehensive home-based care skills during a three-week course on providing quality care for community members, including elements of the preventive care package, pain and symptom management and other palliative care services for PLHIV and PLWTB. Trainers from The Valley Trust will assist with this activity. Supervisory training and checklists will be provided, also in collaboration with The Valley Trust. Ilembe District community health facilitators (CHFs), who are responsible for overseeing HBCV activities in the District, and previously trained HBCV will be provided with refresher training in comprehensive home-based care skills for patients and their families. Distinctions between the needs of adults and children will be emphasized, as well as gender-specific issues such as integrating males into household care practices; increasing male knowledge of effective HIV prevention measures; increasing women's and girls' use of healthcare services; and recognizing and addressing domestic abuse against women and girls. Monthly meetings will be held between HBCVs and facility staff members to promote consistent quality care. Trained HBCVs will also become eligible for registration with the NDOH and to receive a government stipend for their work. Community-based organizations (CBOs) will be identified and supported to serve as supervisors of HBCVs. CBOs will also distribute HBCV supply kits, provide care for caregivers, assist with training, and arrange for HBCVs to receive recognition for their work at community gatherings. MCDI-SA will provide participating HBCVs with regular incentives, such as cell phone airtime, so that they will have the means to remain in contact with the supervising CBOs, clients and health facilities. Supervised by MCDI-SA, the CBOs will work in collaboration with CHFs to monitor and maintain the quality of services provided.

ACTIVITY 2: Introduction of Software to Monitor HBC Visits

Once HBCVs are trained, supported and supervised, and strong linkages are established with facility staff, it will be important to monitor HBCVs activities. Consequently, the introduction of software to monitor HBC visits is proposed. The Outreach Home-Based Care Database Software Program will be installed on DOH computers to tracks HBC monthly visit rates, activities during visits, client conditions, and the number of OVC in target communities. The system includes paper forms that are filled out by HBCV and their CBO supervisors, and the data is then captured and analyzed at the District level. As part of its collaboration with MCDI-SA, the RPM Plus project has agreed to collaborate with MCDI-SA to help institute this system as a pilot test of the concept. MCDI-SA will collect and analyze the data initially and will train Ilembe District health information officers to continue using the system to monitor the performance of its ongoing HBC program with potential scale-up to the KwaZulu-Natal provincial level. This system will strengthen the capacity of the District Health Office in monitoring health events at the community level and provide data to show the breakdown by gender of those receiving care services. The data also will be used to monitor the project's HBCV activities and inform project management decisions. The ultimate focus of this tool is to provide feedback to service providers with a focus on quality improvement.

These results contribute to the PEPFAR 2-7-10 goals by improving access to and quality of care and

6.5 Total number of individuals provided with HIV-related palliative care (excluding TB/HIV)	5,400	False
6.6 Total number of individuals trained to provide HIV-related palliative care (excluding TB/HIV)	50	False

Indirect Targets

In addition to the direct patients reached, MCDI-SA will indirectly support palliative care in the Ilembe District for 2008. Project activities done to support ongoing Department of Health services include (1) establishing home-based care referral systems at all sites; (2) comprehensive training of all facility nurses on home-based care protocols that adhere to national palliative care standards, and (3) integration of community-level data collection software into the Ilembe DOH District Health Information System. These interventions will provide substantial and sustainable benefits to all community members. The target estimate is based on KZN DOH statistics for the number of VCT clients who test positive for HIV in Ilembe District within a one-year period.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	4753.08	**Mechanism:**	N/A
Prime Partner:	LifeLine North West - Rustenburg Centre	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	8253.08	**Planned Funds:**	$200,000
Activity System ID:	13991		

Activity Narrative: SUMMARY:

LifeLine's activities in Palliative Care/Basic Health Care & Support involve sub-grantees who have prior home-based care services and protocol training in line with SAG policies and guidelines. Activities include the following three components: 1) referral of HIV-infected individuals from the Counseling and Testing unit to local faith-based and community-based organizations (FBOs/CBOs) for follow-up; 2) Supervision of the delivery of palliative care services by LifeLine's second-tier sub-grantees (FBOs/CBOs); and 3. Capacity building in the form of training to support LifeLine's sub-partner FBOs/CBOs.

The Bojanala District Department of Health in North West province assists LifeLine with capacity building and supervision of the FBOs/CBOs. The program increases access to services for PLHIV, especially women and their families, who are disproportionately HIV-infected in South Africa.

Emphasis areas for this PEPFAR supported program are human capacity development and local organizational capacity development. The target populations adolescents aged 15 -24 and adults and also include most at risk populations namely, mobile population, non injecting drug users, persons who engage in transactional sex, but who do not identify as persons in sex work, people living with HIV and AIDS (PLHIV), and HIV and AIDS affected families.

BACKGROUND:

LifeLine Rustenburg is a non-governmental, non-profit, community-based organization, affiliated to LifeLine Southern Africa which in turn is affiliated to LifeLine International. Affiliation is awarded annually based on maintenance of standards, adherence to policy and procedures and acceptable performance in areas of service. LifeLine Rustenburg has been operational since 1991, and serves an area of approximately 200 kilometers radius. A close working relationship exits with the National Office –which is informed about projects and services run by LifeLine Rustenburg. Bi-annual consultative meetings are held and quarterly reports are submitted to the main office by LifeLine Rustenburg.

LifeLine focuses on counseling and crisis intervention services; provision of life skills and personal development training; capacity building for less established CBOs; CT (counseling and testing) and prevention activities with regards to HIV and AIDS. To date, LifeLine has implemented a CCP (community counselor project) which provides counselors to 150 health facilities in Bojanala (in partnership with Provincial Department of Health), established a non medical CT site, provide 24 hour counseling service via a national counseling line, and have provided training to numerous other organizations. Future plans for the project is to place counselors at all health facilities; supply mobile (outreach) CT; support and care to HIV-infected individuals and other affected persons; and, HIV and AIDS prevention services to rural and other under serviced communities throughout the Bojanala District of the North West province. Care and support activities will be provided through ongoing partnerships with other CBOs/FBOs with expertise in these areas.

FY 2007 funds were provided to LifeLine to work in 8 such hot spots. FY 2008 PEPFAR funding will be used to expand the number of hotspots to increase care coverage. The target groups for the Care activities messages are PLHIV located in the identified hot spots within Northwest province. A hot spot is defined as an area that has a high rate of traffic of vulnerable persons; for example, taxi ranks and the mining hostels. The LifeLine hot spots are currently located in the Bojanala region, with 2 hot spots identified in each sub-district.

ACTIVITIES AND EXPECTED RESULTS:

After initial CT services are provided, clients and/or their family members will be referred to LifeLine's sub-grantee FBOs/CBOs for ongoing care and support. Counseling and testing is the entry point to care and support. The care component will be linked to CT services. After initial testing, clients and/or their family members are referred to the nearest sub-grantee FBO/CBO for ongoing care and support.

ACTIVITY 1: Palliative Care and Support Services

The sub-partner, i.e. the FBOs/ CBOs, carry out the palliative care services. Each sub-partner provides service delivery in at least two of the five required categories i.e. clinical, psychological, spiritual care, social care and prevention services. This minimum package includes screening and referral for opportunistic infections including the provision of cotrimoxazole, screening and referral for TB, psychosocial counseling, wellness/healthy living education, monitoring and referral, home-based care, advice and assistance on welfare issues and applications for welfare grants, and hospice and end-of-life care for terminally-ill patients. Through the public health system, the North West Department of Health will provide rudimentary clinical services to PLHIV that are receiving palliative care services from the sub-grantee FBOs/CBOs. LifeLine monitors that activities are carried out as per subpartner agreements.

ACTIVITY 2: Local Organization Capacity Building

LifeLine provides capacity building to sub-partners and strengthens the referral system. The palliative care program is set-up to foster sustainability to enable the sub-partner FBOs/CBOs to receive organizational capacity building from LifeLine. PEPFAR funding will support in-service training activities conducted by four LifeLine trainers targeting members of the sub-partner FBOs/CBOs. Training consists of workshops of five days covering topics relevant to administrative and financial systems By the end of the project, these FBOs/CBOs will have the skills and expertise necessary to do fundraising for their own sustainability and to provide proficient services without the technical support of LifeLine. Peace Corps volunteers help with development, training, assessment and monitoring of the project activities.

In the above activities, to be counted as having received palliative care service, all HIV-infected clients will receive at least one clinical service and one non-clinical service and family members will receive service in at least two categories of palliative care.

These activities will contribute to 2-7-10 PEPFAR goal by ensuring PLHIV receive adequate care and support. Its efforts to strengthen referral networks also ensure PLHIV have greater access to treatment.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	4094.08	**Mechanism:**	N/A
Prime Partner:	Research Triangle Institute	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	6547.08	**Planned Funds:**	$1,455,000
Activity System ID:	13947		

Activity Narrative: PEPFAR funds were allocated to the Research Triangle Institute (RTI) in FY 2007 to improve care provided to victims of rape, through the establishment of seven new Thuthuzela Care Centers (TCCs). These multi-disciplinary centers provide comprehensive care services to women and children rape survivors, including post-exposure prophylaxis (PEP), HIV and AIDS counseling and testing, and referral to HIV care and treatment services. These centers also assist men and boys, who are increasingly becoming victims of rape. In FY 2008, funds will no longer be provided to RTI as the ceiling of this contract can not be increased. This activity will be re-competed and the RFP will be issued by December 2007.

This activity was approved in the FY 2007 COP, was funded with FY 2007 PEPFAR funds, and is included here to provide complete information for reviewers. Therefore there is no need to continue funding this activity with FY 2008 COP funds.

SUMMARY:

The goal of this project is to improve care provided to victims of rape and sexual violence by establishing or upgrading a network of operations for Thuthuzela Care Centers (TCCs) nationwide. These multi-disciplinary centers, piloted by the Department of Justice and Constitutional Development (DoJCD) South African Government (SAG) provide comprehensive services to women and children rape or assault survivors. These centers also assist girls and boys who are increasingly becoming victims or perpetrators of rape. Activities include support to strengthen the HIV-related clinical, psychological, social, and preventive care services at the TCCs for rape victims in all provinces. Populations served are adults and children, PLHIV, health care workers and caregivers. The major emphasis area is training with minor emphasis areas in information, education and communication, commodity procurement, referral systems, linkages with other sectors and initiatives, and local organization capacity development. This is the second year of support to the TCCs. Thuthuzela means "to comfort" in isiXhosa. Target populations will include infants, girls, boys, men, women, doctors, nurses and pharmacists as well as the TCC core team that staffs each center. Commodities to be procured include rape kits, medical equipment, and comfort kits.

BACKGROUND:

This project is a continuation of work supported through PEPFAR funds since FY 2006. The program started by evaluating and upgrading existing TCCs in keeping with the National Department of Health's (NDOH) National Management Guidelines for the Care of Rape Victims. In FY 2008, this project will focus on maintaining established TCCs in provinces where they do not currently exist and in other locations where need is identified. This activity is linked to the USAID Governing Justly and Democratically (GJD) office's program to support the Sexual Offences and Community Affairs (SOCA) Unit of the National Prosecuting Authority (NPA) of the Department of Justice and Constitutional Development in its endeavor to eradicate all forms of gender-based and sexual violence against women and children, especially the crime of rape. The DoJCD/NPA/SOCA Unit has responded to the ongoing problem of sexual offences, and specifically rape, in the country by seeking to upgrade and expand the TCC network from 10 to 80 TCCs nationwide. The TCCs are a bold approach to rape prevention, care and treatment for victims of sexual violence and assault involving the health, justice, and civil society sectors in this endeavor. This project will advance the Women's Justice and Empowerment Presidential Initiative (WJEI) which seeks to establish or upgrade at least 30 TCCs to help the SAG achieve its goal of 80 TCCs nationwide. For victims of rape, the benefit of being assisted through a TCC is that the rape survivor can obtain all of the services needed at a single location, including medical assistance, access to justice by working with the local police and prosecutors, and access to counselors and emergency support services. Most TCCs are located within hospitals or near health care facilities, where there is a growing recognition of the links between violence against women or children and HIV and AIDS. The risk of HIV infection is a very real possibility with rape. Perpetrators seldom use condoms, placing the vast majority of women and children who are victims of this crime at risk.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthening HIV care in the TCCs

Using FY 2008 PEPFAR funds, a partner TBD will continue to support DOJCD/NPA/SOCA efforts to enable the TCCs to improve the quality of basic HIV-related clinical, psychological, social and preventive care services offered by the TCCs for rape victims with an emphasis on women and children rape victims. The TCCs offer a place of refuge and comfort for raped women and children, with an aim to reduce secondary victimization suffered by rape victims by ensuring that the crime reporting process, medical examination, initial counseling, quality of HIV-related care services are all done in one place on a 24-hour basis. Care services that will be provided include counseling and testing, disclosure support, post exposure prophylaxis, gender-based violence screening, quality and supportive medical examination, psychological care and counseling by trained providers, personal hygiene, screening for pain and symptoms and HIV-related conditions such as opportunistic infections and provision of shelter and comfort measures. Qualified health care workers will also provide messaging on HIV prevention and counsel and refer for the provision of CD4 testing, ART, OI prevention and treatment (including cotrimoxazole prophylaxis, and TB care), nutritional care and appropriate child survival and child care interventions (growth monitoring, child-specific nutritional care, immunizations). The program will provide legal counseling, program linkages for the legal protection of women and children and follow-up legal advice. A particular program emphasis is ensuring that women's legal rights and child protection is promoted and protected.

ACTIVITY 2:

Using FY 2008 PEPFAR funds, a partner TBD will continue to support DOJCD/NPA/SOCA efforts on training of medical officers (doctors, nurses and pharmacists) on how to provide PEP. Site coordinators and Victim Assistance Officers (VAOs) will receive training on how to educate victims on compliance with PEP as well as training and technical assistance to site coordinators who manage the multidisciplinary team. Each rape victim will be encouraged to test for HIV. If the rape is reported within 72 hours, the rape survivors who test negative will be provided with PEP. They will be placed on PEP for 28 days and tested again for sero-conversion at 3 months and again at 6 months. They will be supported by TCC staff or affiliated CBOs and NGOs to ensure compliance with medication as well overall well-being. Rape victims who test positive for HIV will be given appropriate counseling and will be referred to the nearest government

Activity Narrative: treatment site for further counseling, care and Antiretroviral Treatment (ART) when necessary. This project will be sustainable beyond the provision of PEPFAR funds, as the SAG will continue to support the TCC system and incorporate operating funds for the TCCâ€™s system in the national budget.

These activities will contribute to PEPFAR goals of providing palliative care to 10 million HIV-infected individuals and their families, including OVC.

Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	12354.08	**Planned Funds:**	$485,000
Activity System ID:	13954		

Activity Narrative: SUMMARY:

The Johns Hopkins University/Center for Communication Programs (JHU/CCP), coordinates the work of 20 South African partners, provides technical assistance and capacity building to prevent HIV and AIDS through a comprehensive HIV prevention program that addresses risky behaviors and the key drivers of the epidemic in the general population through mass media and social mobilization. Three partners working across South Africa will support efforts around palliative care. The target populations are: youth, adults, people living with HIV (PLHIV), religious leaders, teachers, public health workers, and community, faith-based and non-governmental organizations.

BACKGROUND:

This is the second year that JHU/CCP will undertake strategies using community-based mobilization in support of palliative care. Their approach recognizes the need to mobilize communities to provide care and support for people living with HIV and their families throughout the continuum of illness. To achieve this, medical practitioners and community-based organizations need to be capacitated so that they can respond appropriately to the needs of patients.

ACTIVITY 1: Community Mobilization and Support for Palliative Care

Community Health Media Trust (CHMT), with PEPFAR funding, has developed a series of video and print materials for people affected by and living with HIV, their caregivers and communities. PEPFAR funding assists CHMT in the updating and community rollout of the series on palliative care including opportunistic infections that will be used in group sessions and workshops. CHMT has 92 Treatment Literacy and Prevention Practitioners (TLPPs), (72 funded by PEPFAR and 20 by the National Department of Health (NDOH)), that train and mentor community-based organizations to use their treatment literacy materials and provide training and counseling to organizations of PLHIV on palliative care. This intervention has received National Department of Health (NDOH) accreditation. TLPPs also work with PLHIV within health care sites to provide advice and guidance on palliative care that will be broadcast through Mindset's patient channel at 400 health facilities.

The Mindset Health Channel (MHC) provides direct information to health clinics, targeting patients in waiting rooms with general information, and healthcare providers with technical and training information. To broadcast current and accurate information on palliative care, JHU/CCP continues its collaboration with MHC which, at the beginning of FY 2008, will be in more than 400 health facilities. Existing material will be revised and updated, including treatment videos, web content and print materials in up to five languages for healthcare workers at these sites. Materials developed through previous PEPFAR funding will be updated as national guidelines and protocols change. CHMT TLPPs spend half their time with patients in ARV rollout sites and downstream referral sites that have the MHC. Both Mindset and CHMT material have been developed through public-private partnerships including business (MTN, Liberty Foundation and Sunday Times) as well as assistance from government and parastatals (e.g. NDOH, SABC).

DramAidE utilizes Health Promoters In 23 Tertiary institutions in South Africa to provide information on palliative care and support, including the treatment of opportunistic infections for tertiary students living with HIV through the HIV support groups that they manage on tertiary campuses using the treatment literacy series developed by CHMT.

The Valley Trust, working in KwaZulu-Natal, promotes and provides palliative care including clinical, social, psychological care and prevention services to persons in need in the rural areas of KwaZulu-Natal through its 15 mobile clinic sites and one fixed site. They train clinical personnel and peer educators in palliative care using the treatment literacy series developed by CHMT that addresses the continuum of care and support, including treatment for opportunistic infections as well as cotrimoxazole prophylaxis that will support vulnerable women and mine workers.

Lesedi Lechabile and Mothusimpilo have 11 and 20 mobile clinics respectively, working in the mining areas of the Free State and the North West Provinces that provide palliative care to persons living with HIV through their mobile clinic sites. They train their clinical personnel and peer educators in palliative care using the treatment literacy series developed by CHMT that addresses the continuum of care and support including treatment for opportunistic infections that will support vulnerable women and mine workers.

Lighthouse Foundation trains its Peer Educators and Community Facilitators to work in the 13 informal settlements in the Madibeng District of the North West Province to incorporate palliative care including the treatment of opportunistic infections into their community outreach, comprising door to door campaigns and their HIV support group based on the treatment literacy series developed by CHMT.

6.6 Total number of individuals trained to provide HIV-related palliative care (excluding TB/HIV)	5,000	False

Indirect Targets

Through undertaking community mobilization and preparedness concerning the management of HIV, including providing palliative care within the context of treatment literacy, this activity will contribute towards ensuring that greater numbers of persons in need of palliative care are able to access palliative care in a timely manner. A study that will investigate the manner in which task shifting the management of people living with HIV in health centers and tertiary institutions from health care workers to TLPPs and HPs will contribute towards improved care and support for people living with HIV.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	4749.08	**Mechanism:**	N/A
Prime Partner:	Ingwavuma Orphan Care	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	8244.08	**Planned Funds:**	$300,000
Activity System ID:	13983		

Activity Narrative: SUMMARY:

Ingwavuma Orphan Care (IOC) activities are carried out to expand the current home-based care project through recruiting and training of lay caregivers and to provide medical support in the way of hiring and training nurses and provision of medical supplies.

BACKGROUND:

This project started in 2002 and was expanded in 2003 to include additional patients and caregivers. IOC is a member of the Hospice and Palliative Care Association (HPCA) and has benefited indirectly from PEPFAR through mentoring and support of the HPCA medical director and professional nurse. IOC became a PEPFAR partner in FY 2007. The project works closely with Mosvold Hospital and its clinics in KwaZulu-Natal, with referrals in both directions. The hospital supplies the project with drugs, food and nursing supplies. The project is also partially funded by the provincial Department of Health/European Union Partnership. Most of the caregivers are women and the project provides them with education and a regular income. Male caregivers provide good role models to show that men can also be caring and look after the sick.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Improving/Expanding Health Services

IOC will use PEPFAR funding to continue to improve and expand its health services. IOC employs three nurses, a chaplain to offer spiritual support and 25 paid caregivers. All staff are paid adequately and care is taken to provide good working conditions in order to retain staff in this remote rural area This project offers pre-employment and in service training and employment for volunteers, all of whom are affected by HIV, as home-based caregivers. The home-based caregivers live in their own communities spread across 2,100 square kilometers of the health district. They work in teams of 1-4 caregivers plus several local untrained volunteers. They visit people who are ill, providing basic nursing care and ensuring delivery of the elements of the preventive care package that includes: psychological, social and spiritual care. Family members are taught basic nursing techniques and about hygiene and nutrition. The caregivers distribute items such as gloves to promote infection control. If they suspect that a patient is HIV-infected, they will counsel them about the need for testing and encourage disclosure and testing of the whole family. Clients who test positive are then referred to the nearby local Department of Health (DOH) clinics and hospital for administration of ARVs. Caregivers follow up on referrals to ensure that patients have received the necessary care and understand medication instructions. Effort will be made to ensure equitable access to care services for both men and women. The teams of caregivers are visited by the nurses and chaplain 1-4 times a month ensuring the delivery of elements of the basic care package. The nurses and chaplain, together with the caregivers, then visit the clients needing specialized care. The nurse carries a basic supply of drugs, including cotrimoxazole, pain medication and treatment for opportunistic infections. Nurses collect sputum samples if TB is suspected and deliver the samples to the nearest clinic for analysis. If the results are positive, the clients are referred to the DOH clinic for DOTS. The chaplain visits clients who request spiritual support. The project also advocates to government sources for HIV-affected families who do not have enough food. The open and caring attitude of the caregivers helps to reduce discrimination and stigma against those who are HIV-infected. The caregivers counsel relatives and neighbors who exhibit discriminatory behavior against the clients. Vulnerable children in the families are identified and referred to the OVC branch of the project. Bereavement support is provided, if necessary. PEPFAR funding will allow the project to employ nearly twice as many trained home-based caregivers, which will result in nearly twice as many patients receiving care. It will also contribute to the support of the clients through medical personnel and medical supplies. This funding enhances the support already given to the project through the DOH, which contributes to some of the existing caregivers' salaries and project running costs. The project will aim to recruit volunteer nurses from the United States to assist with ongoing supervision and in-service training of the lay caregivers. FY 2008 activities will be expanded to ensure that the entire catchment area of Mosvold Hospital is provided with palliative care. Quality of care will be further improved to provide the basic care package to encompass clients who are HIV-infected but asymptomatic.

ACTIVITY 2: Caregiver Training

The main objective of the training is to increase skills in delivery of quality palliative care services including elements of the preventive care package. Lay caregivers are trained by a former home-based caregiver, who is assisted by the nursing staff, paralegals, a social worker, and other staff. Subjects covered in the training include HIV counseling, basic nursing, TB and ARV support, screening for pain and symptoms and methods of encouraging clients to start and continue taking ARVs or TB medication properly. Volunteer caregivers will be trained at IOC's training center, doing their practical training at Mosvold Hospital. This 56-day training is in line with the South African DOH guidelines for home-based caregivers. At the end of the training these caregivers could be employed by the project to further extend the reach of home-based care support, funds permitting. FY 2008 activities will be expanded to include training of all staff in the basic care package. New caregivers will be recruited and trained to provide services in areas which are currently uncovered. PLHIV will be trained to implement the basic care package.

ACTIVITY 3: Renovation of training center and expanded office facility

The purpose of this activity is to renovate buildings at a new office complex which will allow the integration of all the activities of Ingwavuma Orphan Care at the geographical center of the area in which it works. A run down building requires extensive renovation to convert it into some offices and storage area for PEPFAR-funded staff. Current offices were built to accommodate 7 staff while by 2008 there will be around 30. The current offices will be converted to a full time training center, providing much needed infrastructure and services in the area. The training center will be used by the organization to train staff, volunteers and community members for many of the PEPFAR-related activities. Changes to the building will include landscaping the grounds and purchasing appropriate furniture. Funding for renovation is expected to cost no more than 10% of funding for this program area.

ACITVITY 4: Support Groups

Activity Narrative: Support groups will be formed to better provide the basic care package. Support groups will be strengthened throughout the health district. Support groups are aimed at mixed groups of men and women who are HIV-infected. There are separate groups which target children and their caregivers. Groups meet once a month. Groups are led by caregivers, especially those who are HIV-infected themselves, but members of the groups are encouraged to take the lead over time. This will be a place where the basic care package is implemented as well as integrated prevention strategies. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals.

In the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

These results contribute to the overall PEPFAR objectives of 2-7-10 by increasing the number of people trained as home-based caregivers, increasing the number of people receiving palliative care, and increasing the quality of palliative care services.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	4625.08	**Mechanism:**	N/A
Prime Partner:	McCord Hospital	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	7912.08	**Planned Funds:**	$729,180
Activity System ID:	14007		

Activity Narrative: SUMMARY:
The McCord Hospital/Zoë-Life (MZL) activities in this area will build capacity in four municipal clinics, three NGOs, and businesses in Durban, KwaZulu-Natal, to provide a comprehensive range of care and support services for HIV-infected clients and their families. These services will be available to adults and children from the time of CT, and will support sustained care services for clients not on ART as well as those receiving treatment. Services will extend to end-of-life care with referral linkages to community-based care services where available. Emphasis areas include community mobilization (church or community groups) to augment spiritual and psychosocial services; development of linkages and referrals, particularly with regard to end of life, spiritual support and community-based care; human resource development with regard to training, mentorship and supervision of staff to provide sustainable services; organizational capacity development by training key personnel to manage sustainable palliative care systems at each site; and quality assurance and improvement through the development of an integrated monitoring and evaluation (M&E) system. The primary target groups are the general population; refugees and asylum seekers; and the private sector.

McCord Hospital receives funding for PMTCT and ARV treatment through the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF). This program focuses on strengthening the capacity of public sector facilities, and is distinct from EGPAF's hospital-based program.

BACKGROUND:
This project seeks to address health seeking behavior by helping communities access comprehensive HIV care proactively in a primary health setting, encouraging HIV-infected individuals and their family members to access care as early as possible, and in so doing emphasize sustained wellness, quality of life and productivity for as long as possible. Palliative care services offered by a multidisciplinary team will play an integral part in this health behavior change model of care and improve palliative care services within the context of both an HIV care program and ARV services. Clinical services will be nurse-led, with only complex clinical issues referred to a clinician or secondary level facility. The emphasis on care services will promote screening for pain and symptoms, prophylaxis and prompt treatment of opportunistic infections (OIs), integration prevention services including prevention with positives, with well established systems for tuberculosis (TB) screening and treatment. Psychosocial services are essential to promote early engagement with health services, family-centered care, and the chronic health model. Increasing access to care and treatment for men is a critical gender issue for the success of this program. This will be addressed through access to couple counseling, family-centered services and mobile services offered in the workplace to employed men (and women). This project is supported by both municipal and provincial government. All protocols followed will be in line with the provincial treatment guidelines, and outcomes of the program will be reported monthly and quarterly to the eThekwini municipality (Durban) as well as to the KwaZulu-Natal Department of Health (KZNDOH).

ACTIVITES AND EXPECTED RESULTS:
The areas of legislative interest addressed in this program area are increasing gender equity as described in the summary above, and increasing women's access to income and productive resources through linkages with the three NGO income-generating programs.

ACTIVITY 1: Human Capacity Development
This activity will focus on training multidisciplinary teams in each site to provide comprehensive palliative care services. Clinical staff will be trained to provide prophylaxis, screening and treatment for opportunistic infections; training of counselors, community workers and spiritual supporters to provide augmented counseling and support services to adults and children.

Clinical and psychosocial staff will support and mentor staff to develop skills and confidence to provide the following services: couple counseling, psychosocial support for children, family-centered counseling, wellness literacy for adults, children and caregivers, clinical care (including screening and prophylaxis of OIs) and treatment of primary health level OIs.

ACTIVITY 2: Psychosocial services
MZL will establish community linkages to strengthen community referrals and to utilize existing community-based psychosocial services (such as home-based care, church-based counseling and support groups).

MZL will develop and implement sustainable psychosocial support services, including a support group for children at two clinics and one NGO site.

ACTIVITY 3: Monitoring and Evaluation
MZL will develop a monitoring and evaluation (M&E) system for palliative care services for use in quality improvement and capacity building at local and provincial level.

ACTIVITY 4: Care services for refugee and asylum seekers
MZL will provide appropriate palliative care services for refugees and asylum seekers in the Durban central area in collaboration with the United Nations High Commission for Refugees (UNHCR) and KHWEZI AIDS Project. These services will be provided in French and Swahili. Palliative Care services for HIV-infected clients and their families, adults and children from the time of testing, and will support sustained care for clients not on ART as well as those receiving treatment, and includes: psychosocial support services (patient HIV literacy, psychosocial assessments, augmented counseling, interventions and appropriate referral); initial care screening: WHO staging, CD4 screening, TB screening, pregnancy tests; basic primary health care: screening for pain and symptoms, prophylaxis and prompt treatment of opportunistic infections (OIs), treatment with clinic level drugs from a limited formulary and referral for more complex medical problems; care support: CD4 counts at regular, designated, appropriate intervals, support groups, spiritual support, health education updates.

Services will extend to end-of-life care with referral linkages to community-based care services where available.

ACTIVITY 5: Mobile services
A range of onsite palliative services will be provided for employees in industry who do not have access to medical aid. PEPFAR will fund staff to provide mobile onsite services such as counseling, wellness literacy,

Activity Narrative: CD4 count monitoring, screening, prophylaxis and treatment for OIs where possible and integrated prevention services including prevention with positives. Drugs and laboratory tests will be supplied by the KZNDOH.

Sustainability at the municipal clinic sites will be addressed by assisting sites to become accredited with the KZNDOH, and thus making all direct costs of maintaining a quality palliative care service the responsibility of the KZNDOH. This project will build capacity in these sites to effectively manage the program without ongoing technical assistance. The NGO sites will be assisted to build infrastructure and referral networks to ensure sustainability of services. The long-term plan for the NGO sites is to build strong relationships with nearby clinics with the intent of building clinical capacity to take over the clinical aspects of palliative care services. This project will later build capacity with these institutions to become accredited sites. Staff will assist the NGOs to source alternative funding. The services for workers in an industrial setting will be co-funded by industry.

NEW ACTIVITIES for FY 2008:

1.Staff at the clinics and NGOs as well as community-based organizations will be trained to provide nutritional assessments and counseling, and to link eligible clients with nutritional support. This entails accessing nutritional supplementation available from the KZNDOH, as well as infant feeding supplementation included in the PMTCT program.

2. Additional training will be provided at community level to assist with TB and other OI screening and referral.

3. Linkages with social services, home-based care and community-based services will be strengthened to ensure sustainable food security and follow up

PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

With FY2008 reprogramming funds, MZL will undertake a basic program evaluation focused on expanded HIV testing and linkage to care. While McCord has focused on retention in care of HIV-infected patients who have already initiated ART, data suggests that substantial numbers of HIV-infected persons never reach care following the HIV diagnosis. The currently proposed program evaluation will focus on determining the success of linkage to care of patients along the pathway from being offered an HIV test to beginning and maintaining care at McCord and St. Mary's Hospital (a collaborating partner). The evaluation will identify socio-demographic and clinical factors that correlate with patients who are most likely not to be in care 12 months after a new HIV diagnosis. In addition, the two sites will also develop, pilot, and evaluate a multifaceted, supportive intervention to improve linkage to HIV care for HIV-infected individuals at McCord and St. Mary's. The pilot intervention will provide insight into the feasibility, efficacy, and cost of preventing pre-treatment loss to care in these settings. Insights from this evaluation will enhance both the McCord Hospital-based HIV testing program as well as strengthen linkage to HIV care at its primary clinic sites.

The McCord Hospital/Zoe Life activities contribute to the 2-7-10 PEPFAR goals and the USG South Africa Five-Year Strategic Plan by strengthening the public sector and expanding access to care and treatment.

Mechanism ID: 1235.08 **Mechanism:** Small Grants Fund

Prime Partner: US Department of State

USG Agency: Department of State / African Affairs

Funding Source: GHCS (State)

Program Area: Palliative Care: Basic Health Care and Support

Budget Code: HBHC

Program Area Code: 06

Activity ID: 3117.08

Planned Funds: $300,000

Activity System ID: 13921

Activity Narrative: SUMMARY:

The Ambassador's HIV and AIDS Small Grants Program in South Africa will use PEPFAR funds to continue to support South Africa's most promising small community and faith-based organizations making significant contributions to the fight against HIV and AIDS. Major emphasis areas are commodity procurement and human resources. The activities target PLHIV and their families and caregivers, community volunteers, CBOs and FBOs.

BACKGROUND:

The Ambassador's HIV and AIDS Small Grants Program in South Africa (Small Grants) has had three tremendously successful years. Out of over 1,000 applications, the South Africa Mission has entered into agreement with 237 small community-based organizations (FY 2005, FY 2006, and FY 2007) in the areas of prevention, hospice care, home-based care, treatment support, and care for orphans and vulnerable children. Funded projects are located in nine provinces, primarily in disadvantaged rural areas. The average funding amount is approximately $10,000. Programs supported with Small Grants funds provide service delivery that directly impacts communities and people affected by HIV and AIDS. The USG PEPFAR Task Force is increasingly linking community and faith-based organizations funded through Small Grants with larger PEPFAR partners and South African Government departments to build capacity and ensure project sustainability. Small grants projects generate positive publicity for PEPFAR and goodwill in communities. The Mission has established guidelines and review procedures to ensure that strong applications are considered for funding through a fair, transparent process. Criteria for selection include: improvement of basic conditions at the community level; benefit a substantial number of people in the community; be within the means of the local community to operate and maintain; and quick implementation of grant within one-year agreement period. Grants must conform to the PEPFAR Small Grants Guidelines. Projects are reviewed by a technical Mission Health Committee and supervised through the Embassy and each Consulate General by State Department Small Grants Coordinators. Based on experience in FY 2005, FY 2006 and FY 2007, the USG PEPFAR Task Force anticipates the strongest applications for FY 2008 will be in the areas of (1) care, particularly hospice and community-based care, and (2) orphans and vulnerable children.

ACTIVITIES AND EXPECTED RESULTS:

The next round of applications and approvals for Small Grants has begun (with anticipated FY 2008 funding). Given three successful years of the program, the USG PEPFAR Task Force expects to fund approximately 30 community and faith-based organizations that will assist HIV-infected individuals and their families with clinical and physical care, psychological care, spiritual care and social care, as well as elements of the preventive care package for adults and children. Anticipated activities include the provision or referral for psychosocial support and household support including assistance with house cleaning, cooking, feeding and changing of linens. Some Small Grants grantees will be involved in pain and symptom recognition and referrals to health care facilities as necessary. Referral for counseling and testing, treatment and ARV services will also be part of the care package. For organizations working in home-based care, the use of preventive measures such as the use of gloves, will also emphasized. Grantees will message and mobilize for cotrimoxazole prophylaxis, screening for TB, and referral for appropriate opportunistic infection management. Grantees will make and effort to ensure equitable access to care services for both males and females and advocate for increased participation by men in service delivery.

ACTIVITY 2: Monitoring of Small Grants
The Small Grants Program monitors grantees on a regular basis to ensure financial and technical compliance as well as to review organizational capacity to adequately implement the program.

These activities support the South Africa Mission's Five-Year Strategy by providing support to and building capacity in small local organizations working at the community level. These activities also contribute to the PEPFAR goals of providing care and support to 10 million HIV-affected individuals.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	1071.08	**Mechanism:**	N/A
Prime Partner:	US Peace Corps	**USG Agency:**	Peace Corps
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	3106.08	**Planned Funds:**	$150,000

Activity System ID: 13926

Activity Narrative: SUMMARY:

Peace Corps Volunteers (PCVs), who work in civil society organizations (CSOs) that focus on home-based care and that address stigma and discrimination against those with HIV and AIDS, are assigned to the Community HIV/AIDS Outreach Project (CHOP). PEPFAR funds will be used to train these CHOP PCVs and their counterparts in (a) organizational capacity building-that is the strengthening of organizational and human capacity (b) PLHIV caregiver support-that is enabling them to meet the physical and psychosocial needs of those living with HIV and AIDS and (c) empowering CSO employees and HBC volunteer workers to address stigma, discrimination, and gender-based violence. CSO employees and HBC volunteer workers, who work with PLHIV caregivers, are the primary target populations for the PCVs and their counterparts. PCVs and their counterparts may also provide direct outreach to caregivers of PLHIV. PCVs will be primarily placed in the rural areas of North West, Limpopo, Mpumalanga and KwaZulu-Natal provinces. Funds requested in FY 2008 will cover the costs of training of PCVs and their counterparts and, through the VAST mechanism, the training of CSO employees, HBC volunteer workers and PLHIV caregivers.

BACKGROUND:

To date, the program in South Africa has relied primarily on PEPFAR-funded PCVs assigned to the (previous) NGO Capacity Building Project. Although the FY 2007 program still utilizes PEPFAR-funded PCVs, beginning in FY 2008 there will be no PEPFAR-funded PCVs and instead PCVs and their counterparts assigned to the (now) Community HIV/AIDS Outreach Project (CHOP) will be encouraged to be involved in training and outreach activities that will enable PLHIV caregivers, HBC volunteers and CSO employees to meet the needs of PLHIV and to address HIV/AIDS stigma, discrimination and gender-based violence.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008 40 CHOP PCVs and their counterparts will devote more than 50% of their time to training PLHIV caregivers, CVO employees, and HBC volunteer workers in ways of addressing the needs of PLHIV and addressing stigma, discrimination and gender-based violence. While these PCVs and their counterparts will still be engaged in organizational capacity building assistance, they will be encouraged to become more actively involved in the above issues. In FY 2008 the program will not place PEPFAR-funded PCVs and instead will rely on the use of PEPFAR-funded staff to train and engage all CHOP PCVs in palliative care and stigma, discrimination and gender-based violence reduction.

ACTIVITY 1:

In FY 2008, approximately 40 PCVs and 40 counterparts will receive training in meeting the physical and psychosocial needs of those living with HIV and AIDS, using internationally and locally produced materials. The training will provide skills and knowledge in counseling (e.g. dealing with self-stigma on the part of PLHIV and the negative attitudes of others), physical care (e.g., helping PLHIV in bathing, eating, dressing, using the toilet), household assistance (e.g. cleaning, cooking, shopping, running errands, gardening) and legal and financial assistance (e.g. government health grants).

ACTIVITY 2:

Approximately 40 PCVs and 40 counterparts will receive training in addressing stigma, discrimination and gender-based violence, using internationally and locally produced materials. The training will focus on combating physical violence directed against PLHIV, particularly HIV-infected women, (e.g. punching, kicking), psychological intimidation (e.g. threats to harm a woman's children, destruction of favorite clothes or photographs, repeated insults meant to demean and erode self-esteem, forced isolation from friends and relatives, threats of physical abuse), and financial punishment (relatives taking away property after the death of a husband, a husband limiting or forbidding access to his income).

ACTIVITY 3:

Approximately 40 PCVs and 40 counterparts will train 100 CSO employees, HBC volunteer workers and PLHIV caregivers in topics addressed in Activity 1 and Activity 2 above, using the PEPFAR VAST mechanism to fund the training. Their activities are also closely aligned to the South African government strategies in each of the provinces in which PCVs work. NOTE: PCVs involved in this program area are part of the population of PCVs who are required to participate in Activities 2 and 4 described under the prevention program area. CHOP PCVs in this program area are part of the population of PCVs who may participate in Activity 3 described under the prevention program area.

These activities will contribute to the PEPFAR goal for reaching 10 million HIV-infected and affected individuals with care through the provision of training and capacity building.

Mechanism ID:	4103.08	**Mechanism:**	World Vision
Prime Partner:	World Vision South Africa	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	12355.08	**Planned Funds:**	$194,000
Activity System ID:	13907		

Activity Narrative: SUMMARY:

World Vision (WV) is expanding OVC care activities by increasing the coverage, scope, and quality of services to family members of HIV-infected individuals and older OVC. Emphasis areas are community mobilization, training, and development of linkages and referral systems. The target populations are people living with HIV and AIDS.

BACKGROUND:

World Vision is a non-profit organization established in 1967 working in 14 Area Development Programs (ADPs) in six provinces of the country, reaching over 42,000 children with holistic development support. World Vision has already identified and is providing community-led support to 4,439 OVC in these ADPs. With PEPFAR funding this number will be increased to 17,500 children through the OVC project. For this project, the target will be to address the needs of primary caregivers of OVC and older OVC which are not covered by OVC funding. By working with community partnerships through their Community Care Coalitions (CCC) model, World Vision enhances their ability to prevent, mitigate and alleviate the impact of HIV and AIDS. Care at the home and community level is a strategy within the South African Government National Strategic Plan.

World Vision will continue to strengthen access to integrated services as a part of a comprehensive care package for PLHIV and their families in Free State, Limpopo and Eastern Cape provinces, with expansion to at least 2 ADPs in Kwazulu-Natal province. The activities reinforce and expand services provided by Community-based Organizations (CBOs) and government care programs, such as basic hygiene, wound care, screening for pain and symptoms, nutrition assessment and support, spiritual care and support, psychological care and promotion of the HIV preventive care package. With FY 2008 funding, World Vision will further institutionalize the program within government and CBOs, while also expanding its reach. World Vision will emphasize capacity building and local skills transfer, and assist HBC programs to develop strategies to alleviate the care burden on girls. These strategies will specifically address gender sensitive counseling, community outreach and couple counseling furthermore World Vision will ensure quality of community-based services, and identify/apply lessons learned.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Home-based care program

The majority (over 70%) of care workers (home visitors - HVs) in OVC programs are women (while two thirds of the adult beneficiaries of the current home care programs are also women. In many cases, care workers may also be recognized as traditional healers. World Vision will work to increase the involvement of men in care giving. As part of psychosocial support trainings, care workers will engage men by focusing on such topics as family violence, anger management, fathering and parenting skills. A stipend provided to care workers and volunteers through the HBC program is an important source of household income. Regular financial training seeks to improve the capacity and economic advancement of care workers in the program. In addition to the psychosocial support training HVs will be trained on Palliative Community Caregiving by Hospice.

Trained HVs provide a minimum standard of care focusing on physical, psychological, spiritual and social interventions. In addition to sharing integrated HIV-related palliative care messages with HIV-infected individuals and their families, care workers will use a family-centered approach to client assessment. Based on the need, clients will be referred to partner clinics and hospitals for pain management, treatment of OIs including cotrimoxazole prophylaxis, family planning or other issues as observed. Home visitors will monitor referrals to ensure appropriate follow-up and ongoing care and support. All clients will be counseled on prevention with positives and family members will be referred for counseling and testing. Outreach to the community and referrals are part of the HBC activities. An additional key activity of care workers is monitoring of adherence to TB and HIV treatment. Elements of the preventive care package for adults and children are also included during interaction between the care worker and the client. Special emphasis during training will ensure HVs have a comprehensive understanding of referrals and linkages with other services, including linkages with health and social welfare sectors for grants, legal aid, micro-finance, spiritual support, CT, ARVs, and FP. With FY 2008 funding, World Vision will also seek to include bicycle transport options for care workers to further improve coverage and support.

ACTIVITY 2: Psychosocial support training

In addition to home visitors, World Vision will also continue to identify and train supervisors and group leaders to provide psychosocial support services. In districts where psychosocial support will be established, community group leaders will be trained to reach family members of PLHIV and OVC, adults, and their households through group counseling. At each site, qualified and trustworthy community members to guide support group activities will be identified. These community-based group leaders will lead weekly support sessions for the group members and conduct home visits to families of OVC. WV's Regional Psychosocial Advisor will train supervisors as well as selected World Vision staff on a training curriculum based on successful modules designed to address the particular needs of children and of adults. The training will equip supervisors to assist and support others in care of the carer. At all levels, care of the carer and care support training will focus on psychosocial interventions, including assessment, basic counseling, group facilitation, and advocacy. Complementing health and nutrition lessons, training will ensure that all trainees are able to recognize general physical as well as psychosocial health problems associated with HIV and AIDS in children, and to make appropriate referrals to Child and Family Wellness clinics, Health Centers and PHC Centers as needed.

Support group meetings led by trained group leaders using interactive and participatory techniques will be held regularly with HVs. Working with churches/FBOs, and CBOs, World Vision will invite community members to form psychosocial support groups. Group members will also be identified through assessment interviews and information provided by relevant community members. During these support group sessions, HVs and volunteers will learn to enhance coping skills to accomplish activities of daily living. Members will carry out tasks designed to enhance relationships and build self-esteem. Positive living is reinforced as group members develop emotional resilience. At the end of the project's first year, groups will be

Activity Narrative: encouraged to continue meeting, with ongoing guidance from World Vision's staff. The positive impacts of psychosocial support will extend to group members' households, and family members will benefit indirectly from the support group's second year of activities.

In all of the above activities, OVC will be counted only in the OVC program area. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services. PLHIV will receive at least one clinical and one other category of palliative care service.

These activities will contribute to the PEPFAR goal of reaching 10 million HIV-infected and affected individuals with care.

Funding Source: GHCS (State)
Program Area: Palliative Care: Basic Health Care and Support
Budget Code: HBHC
Program Area Code: 06
Activity ID: 8262.08
Planned Funds: $611,100
Activity System ID: 13832

Activity Narrative: SUMMARY:

St. Mary's Hospital in Durban, KwaZulu-Natal will implement palliative care activities that encompass human resources, training and consumables. A dedicated palliative care team will identify and provide clinical, spiritual, psychosocial, social and preventive support to the HIV-infected client and family. A hospital-wide education program will be initiated to enhance knowledge of palliative care practice. In addition a number of consumable items will be purchased to assist in managing pain and symptoms related to HIV and AIDS and ensuring comfort of people living with HIV (PLHIV). The emphasis areas of the project are related in particular to human resource support for the palliative care team, training, commodity procurement and the development of networks/linkages/referral systems. The primary target population is pregnant mothers, children, adults infected with HIV and AIDS; family members affected by HIV and AIDS and healthcare workers.

BACKGROUND:

This is a new program funded since FY 2007, although St. Mary's has received previous PEPFAR funding as a sub-partner to another PEPFAR partner, Catholic Relief Services. The project is an expansion of the current palliative care program that functions at St. Mary's Hospital. The hospital, established in 1927, serves a peri-urban/rural community of 750,000 people, a third of which are HIV-infected. The community has a high unemployment rate of around 60% and an estimated 25,000 people in the community require ART. On an annual basis approximately 3,000 of St. Mary's inpatients require palliative care support, 35,000 require palliative care, and over 2,500 patients are currently in HIV care at the hospital, who by definition fall into the category of people requiring palliative care including ART adherence support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Dedicated Palliative Care Team and Trained personnel to Ensure Delivery of Quality Services

The overall objective of this activity is to ensure that patients who require palliative care and their affected families are adequately supported in the hospital and in their surrounding communities; including clinical, spiritual, psychological, social, and prevention support. Patients and families requiring palliative care will be identified in the inpatient, maternity section, outpatient and ART clinic and hospice care settings. The need to expand to the wards dedicated to pregnant mothers is due to a high maternal death rate as a result of HIV and AIDS. The Hospital's caesarian rate is increasing due to HIV and averages around 29%. It is estimated that around 68% of the births at St. Mary's Hospital are from HIV-infected mothers. Activities to address this are described elsewhere in the COP. The HIV-related services offered by the hospital and its hospice service is based on the belief that the palliative care activity is central and automatically provides a network of services, from counseling and testing, stigma reduction, integrated preventions services, including prevention with positives, ART and adherence, counseling and support to the individual and family, end of life care, referral to other organizations and continuous education and support thereafter to all concerned. The palliative care team will work with other facility-based health providers to ensure that HIV-infected adults and children in all facility settings are either provided or referred (with follow-up) for evidence -based preventive care interventions which include the following: OI screening and prophylaxis (including cotrimoxazole, TB screening/management), counseling and testing for clients and family members, safe water and personal hygiene strategies to reduce diarrheal disease, HIV prevention counseling, including prevention with positives, provision of condoms, referral for family planning services for HIV-infected women, appropriate child survival interventions for HIV-infected children and nutrition counseling, clinical measurement, nutrition monitoring and targeted support based on WHO criteria for severely malnourished PLHIV. The package of services also includes basic pain and symptom management and facility-based support for adherence to OI medications (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART). Community and home-based psychological support, stigma reduction strategies and adherence support for OI medications and ART will be provided by therapeutic counselors who are trained PLHIV, employed by the hospital that visit the patients and their families in the community. Attention will be given to increasing the gender equity in the HIV and AIDS programs, increasing male involvement in the program, addressing stigma and discrimination, and partnerships with local NGOs, FBOs and CBOs. In addition to care for PLHIV, therapeutic counselors and hospital staff will also expand their provision of psychological, spiritual and social support of affected family members. A complex referral network to a number of organizations, inter alia the KwaZulu-Natal Department of Health, the Ethekwini Metropolitan (Durban), other NGOs, the Highway Hospice, and the Dream Centre exists and is used on a proactive basis. A dedicated palliative care professional nurse and pastoral care worker will manage this activity, with additional involvement of other members of the palliative care multi-disciplinary team including hospital doctors and nurses, a social worker and the community outreach coordinator. The palliative care program is managed and administered via the organizational arrangements pertaining to the hospital itself and relies on a multi-disciplinary team approach for service delivery.

Training & Volunteer Engagement: The program relies on both volunteer and fulltime qualified and registered healthcare professionals who require technical support and training. St. Mary's hospice care program is a member of the PEPFAR-funded Hospice Palliative Care Association (HPCA) who is supporting St. Mary's with critical areas including staff training and clinical protocols so St. Mary's may meet the HPCA accreditation requirements essential to providing holistic quality health care to patients. In FY 2007, St. Mary's will scale up its palliative care training for all health professionals, volunteers and PLHIV therapeutic counselors involved in palliative care service delivery with training materials from HPCA and from the World Health Organization's (WHO) Integrated Management of Adolescent Illnesses (IMAI) program. All modules of IMAI will be utilized, however, the IMAI module on palliative care which will be made available to all the nursing students and staff at St. Mary's who will be directly involved in palliative care. Clinical protocols designed and approved by the HPCA are used for support and clinical services for opportunistic infections and pain assessment and management. St. Mary's has a number of partnerships with US universities and interest and support from US-based volunteers. On average, four to six U.S. volunteers will be accommodated by St. Mary's on a monthly basis (supported with non-PEPFAR funds). A relationship is currently being explored to link in with an active OVC program in the area that cares for children at drop-in centers in and around the community. St. Mary's will offer testing; counseling and treatment services; and the OVC program will provide the ongoing adherence support for the children. All palliative care support services will be offered by St. Mary's Hospital to children in care at the relevant drop-in centers

Activity Narrative: ACTIVITY 2: Commodity Procurement

Provision has been made for palliative care medications and commodities which directly improve the comfort of PLHIV, including medications for appropriate pain and symptom control (additional morphine for pain control, syringe drivers, anti-nausea medications, cotrimoxazole and other drugs for symptom control). Provision for such palliative medications and supplies are included in this activity and are vital to the overall success of the program. In addition there is a need to address some of the theatre requirements and consumables associated with caesarian section births at the Hospital. Almost 30% of all the births (150 births per month) in hospital are non elective caesarian sectional births. The primary reason for this high rate is due to the impact of HIV and AIDS in pregnant mothers. There is a steady increase in the number of maternal deaths due to HIV and very sick mothers are too weak to deliver naturally. The affect of this is the long stay of many mothers and their premature babies in the high care nurseries and palliative care medical wards, post delivery.

These activities contribute directly to the overall PEPFAR objectives of 2-7-10 as HIV-infected people will be identified, appropriately treated, cared for and supported. Family members affected will benefit directly from counseling and support within the hospital environment as well as within the community setting during home visits.

Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	2925.08	**Planned Funds:**	$1,600,500
Activity System ID:	13724		

Activity Narrative: This activity was approved in the FY 2007 COP, was funded with FY 2007 PEPFAR funds, and is included here to provide complete information for reviewers. The funding mechanism from field support to a local agreement for Family Health International (FHI) is changing in October 2008 therefore a COP entry is being made to reflect this change in mechanism and activity number only. FHI activities under HBHC are expected to continue under the FY 2008 COP and funds are being requested in the new COP entry.

SUMMARY:

Family Health International (FHI) will continue to improve access to holistic services for people living with HIV and AIDS (PLHIV) and their families by enhancing palliative care (PC) programs and strengthening links to ARV, counseling and testing (CT), family planning (FP), and other essential services. Emphasis areas are pre-service and in-service training, local organization capacity development and wraparound programs in family planning. Target populations are people living with HIV and AIDS and men and women of reproductive age.

BACKGROUND:

The FHI-supported Integrated Community Palliative Care (ICPC) model is the first public sector palliative care model at the district level funded by the South African Government with technical assistance from FHI. As requested by the Departments of Health (DOH) and Social Development, FHI provides support to both community- and facility-based PC services at the primary care and hospital level, while strengthening the linkages between PC, CT, ARV and family planning (FP) for comprehensive care and support. FHI's interventions strengthen the physical, spiritual, social, psychological and preventive aspects of PC, and leverage government resources through service networks to meet multiple care needs. Tighter links between PC, CT, ARV and FP services, in particular, afford men and women the opportunity to improve their overall quality of life through integrated services. Since FY 2005, FHI and partners trained 828 community volunteers and provided services to over 12,000 home-based care (HBC) clients in Mpumalanga and KwaZulu-Natal; trained 50 government HBC volunteers in Limpopo and Northern Cape using the Health/Welfare Sector Education and Training Authority curriculum; trained 484 health care professionals in PC; and provided support to the Johannesburg Hospital Palliative Care Team (HPCT), reaching out to more than 4,000 clients. In the communities where they are working, FHI is expanding pediatric PC services to ensure HIV-infected children are receiving appropriate care, and setting up a mobile clinic to improve access to integrated services in remote HBC programs. FHI carries out PC activities with government and community-based organizations (CBOs), including Project Support Association-South Africa (PSASA), the South African Council of Churches, South Africa Red Cross, Nightingale Hospice and Evelyn Lekganyane HBC.

ACTIVITIES AND EXPECTED RESULTS:

FHI will continue to strengthen access to integrated services as a part of a comprehensive palliative care package for PLHIV and their families in Mpumalanga, KwaZulu-Natal, Limpopo, Northern Cape and Gauteng provinces. This includes the ICPC model in 2 provinces. Effort will be made to ensure equitable access to care services for both males and females and increased participation by men will be encouraged in service delivery. The activities expand existing services that CBOs and government care programs currently provide with an emphasis on promotion of the HIV preventive care package. With FY 2008 funding, FHI will further institutionalize the program within government and CBOs, while also expanding its reach. FHI will emphasize capacity building and local skills transfer, and will also stress gender sensitivity in counseling and community outreach, promote couples counseling, and assist HBC programs to develop strategies to alleviate the care burden on girls.

ACTIVITY 1: Strengthening community-based organizations

Benefiting HBC clients, family members and caregivers in Mpumalanga, KwaZulu-Natal, Limpopo, and Northern Cape provinces, FHI will continue to work with community groups through outreach to :1) Provide technical assistance (TA) to HBC volunteers to identify PC, CT, ARV and FP needs in the household and to refer to appropriate services; 2) Leverage government and partner resources by building/strengthening formal referrals between HBC projects and CT sites, nearby ARV providers, and FP clinics; 3) Train HBC volunteers to assist clients with adherence to ARV therapy and care interventions; e.g. referral for cotrimoxazole prophylaxis and caring for caregivers; 4) Strengthen TB management and nutritional assessment, monitoring and supplements, including and referrals to government/NGO services for food parcels; 5) Support select HBC programs through financial assistance, supportive supervision TA, and reporting; 6) Provide PC training for health providers and HBC programs using the nationally accredited curriculum, and expand services to include pediatric PC as appropriate, and; 7) Conduct trainings for ARV providers on prevention with positives including FP referral for HIV-infected couples, including those on ARVs. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals.

ACTIVITY 2: Strengthening government programs

FHI will provide TA, training and financial support to four districts of Limpopo and Northern Cape. Specifically, FHI will continue to work with government to: 1) Train district-level PC health providers in pain and symptom assessment and management, TB and other opportunistic infection screening, pediatric PC, psychosocial and spiritual needs of PLHIV and affected families, PMTCT and FP counseling; 2) Implement mechanisms for quality assurance and supervision, as per standard operating procedures; 3) Conduct district-level workshops for family members, traditional healers, and local AIDS councils to promote care, support and treatment services; reduce discrimination and stigma; increase awareness of HIV-infected individuals needs; and support pediatric PC, and; 4) Strengthen referral networks between primary health care and CBO services, including linkages with health and social welfare sectors for grants, legal aid, micro-finance, spiritual support, CT, ARVs, and FP.

ACTIVITY 3: Technical assistance to Johannesburg

Activity Narrative:

HPCT FHI will continue to support the Johannesburg HPCT and other government-accredited ART sites by increasing access to pediatric PC and reinforcing the integration of HIV and FP services. Through TA to nurse managers, nurses, midwives, medical officers, coordinators and other providers in ART sites, FHI will continue to improve the capacity of Johannesburg HPCT, including strengthening linkages with community-based organizations to enhance client follow-up and contribute to identification of new clients. In addition, FHI will provide TA to strengthen prevention with positives, including increasing providers' knowledge and skills to address the FP needs of their ART clients.

ACTIVITY 4: Support to the NDOH

To guide the HIV/FP integration efforts described above, and in response to specific requests from the DOH, FHI will support National DOH (NDOH) and provincial staff in Mpumalanga, KwaZulu-Natal, Northern Cape, Limpopo and Gauteng provinces to strengthen integration of family planning and HIV services. With separate funding, FHI will help the NDOH to revise the current sexual and reproductive health curriculum to include guidelines for HIV-infected couples, including those on ARVs. In FY 2008, FHI will provide TA to the NDOH on implementing the new curriculum and integrating HIV and FP services, particularly in PC service sites. In FY 2008, FHI will continue to support NDOH and provincial staff to build on government operational plans and address gaps, including: 1) Providing mentoring and on the job training to enhance prevention with positives through integration of HIV and FP services; 2) Enhancing functional referrals between HIV and FP services; 3) Providing technical assistance to the NDOH to continue to roll out the revised sexual reproductive health (SRH) curriculum and ensure that more providers are equipped with skills to address the SRH needs of HIV-infected women and men; 4) Collaborating closely with district DOH management to strengthen supportive supervision for integrated HIV/FP services, including use of provider tools that reinforce new FP counseling skills and revision of routine monitoring forms to include FP information and indicators.

These activities contribute to the PEPFAR goal of providing care services to 10 million. The activities also support the USG strategy for South Africa by collaborating closely with the DOH to improve access to and quality of basic care and support.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	193.08	**Mechanism:**	N/A
Prime Partner:	Elizabeth Glaser Pediatric AIDS Foundation	**USG Agency:**	HHS/Centers for Disease Control & Prevention
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	3805.08	**Planned Funds:**	$1,825,000
Activity System ID:	13764		

Activity Narrative: SUMMARY:

Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will use FY 2008 PEPFAR funds to continue palliative care support for its existing partners in KwaZulu-Natal. The Foundation is also expanding its program activities to the Free State, North West, and Gauteng provinces. EGPAF aims to improve the quality of life for people living with HIV (PLHIV) by strengthening care and support services at facility as well as community level. The primary emphasis areas are human capacity development and expansion of services through training and task shifting, quality improvement, development of networks, linkages, referral systems and strengthening local organization, development of infrastructure, development of policies and guidelines, and health information systems strengthening. Primary populations to be targeted include PLHIV, pregnant women, OVC, and family members.

BACKGROUND:

The long-term goal of EGPAF care and support program in South Africa is to achieve optimal quality of life for PLHIV. Ongoing care and support of HIV infected individuals and their families are pivotal to their long-term wellbeing. Sites supported by EGPAF will expand their activities and partnerships with community-based leaders and organizations providing care and support to communities thus ensuring sustainable community-based care and support of HIV infected and their families. Strategies to identify family members who may or may not be infected and are in need of care and support will be explored. Project Help Expand Antiretroviral Treatment (HEART) care and support services will expand with increased geographic coverage during FY 2008. The program will focus on routine screening and treatment of opportunistic infections (OIs) such as tuberculosis (TB), ongoing adherence counseling and support, general HIV prevention, prevention with positives, nutrition and infant feeding options support, psychosocial support, as well as strengthen linkages with home-based care, orphans and vulnerable children (OVC), legal, and social welfare support systems or organizations. In their regular reporting, sites will be required to demonstrate functional networks/ linkages with existing governmental and non-governmental support services, especially (OVC), home-based care services. EGPAF utilizes Project HEART resources to complement those of the Department of Health (DOH) and private partners, such as faith-based organizations (FBOs) and other non-governmental organizations(NGOs) providing health care services.

EGPAF will expand/strengthen care and support service delivery through training and task-shifting. A syndromic approach to the most common adult illnesses including sexually transmitted infections (STIs) and most opportunistic infections will be emphasized in training. EGPAF will also provide additional health care providers e.g. nurses, counselors, based on staffing needs. The provision of additional staff ensures that ongoing clinical monitoring and assessments viz. laboratory tests, nutritional assessment, screening for TB and, other OIs, cotrimoxazole prophylaxis, are conducted at all times. PLHIV as well as family members will also be utilized in treatment support to achieve optimal compliance and adherence to ART

The existing sites are:

1. McCord Hospital, Durban
2. Aids Healthcare Foundation (AHF), Umlazi, Durban
3. KwaZulu-Natal Department of Health (KZNDOH), Umgungundlovu District (Edendale and Northdale Hospitals and their feeder clinics),
4. KZNDOH, Zululand District, Vryheid, Benedictine Hospital and their feeder clinics, as well as eDumbe Community Health Centre (CHC) and its feeder clinics

New HEART partners include the remaining St Francis, Nkonjeni, Ceza, Itshelejuba, and Thulasizwe TB Hospitals and their feeder PHC clinics, in the Zululand District in KZN; all five districts in the Free State Province; two sub-districts in North West Province, as well as Eastern Ekurhuleni sub-district in Ekurhuleni District and Lesedi sub-district in the Sedibeng District in Gauteng Province.

ACTIVITIES AND EXPECTED RESULTS:

Project HEART aims to improve the quality, availability, and accessibility of care and support services.

Activities undertaken in order to achieve the program objectives include:

1. Conducting site assessments to identify gaps or needs to be addressed to increase the number of patients on palliative care. This could include minor renovations to address space constraints.

2. Improving the quality of counseling and testing by providing ongoing support to lay counselors and health care professionals.

3. Assessing quality of the program and supportive supervision to staff.

4. Providing technical assistance to enhance family-centered approach to clinical screening and opportunistic infection prophylaxis in community settings.

5. Human capacity development through training and task-shifting to improve the quality of palliative care services. This includes a syndromic approach to the most common adult illnesses including sexually transmitted infections (STIs) and most opportunistic infections will be emphasized in training. Clear instructions will be provided according to the DOH guidelines so that health worker knows which patients can be managed at the first-level facility and which require referral to the district hospital or further assessment by a more senior clinician. Preparing health workers to treat the common, less severe opportunistic infections will allow them to stabilize many clinical stage 3 and 4 patients prior to ARV therapy without referral to hospital. All patients are asked/observed for cough (to improve TB case detection) and asked about genital ulcers or sore or (in men) a urethral discharge.

These trainings enable HCW to offer appropriate prophylaxis and treatment of opportunistic infections for adults and children. They will also cover Integrated Management of Childhood Illness (IMCI). Trainings will also cover appropriate referral to and linkages with provision of antiretroviral therapy for eligible patients, including both adults and children.

Activity Narrative:

6. Providing M&E support with a focus on strengthening data management systems to enhance routine program monitoring, improve data quality and facilitate data use.

7. Developing/ strengthening linkages and referral systems with community-based government and non-government support services namely, home-based care, OVC, social welfare and support groups, or other primary health care services like PMTCT and TB care.

8. Screening and treatment of opportunistic infections e.g. TB screening, INH and cotrimoxazole prophylaxis).

9. Nutritional support including infant feeding options support

In FY 2008, the HEART program will increase the percentage of HIV-infected patients with palliative care by 30%. EGPAF plans to embark on a growth strategy - building on the experience and success achieved in FY 2007. This growth in patient numbers will be achieved through a combination of expanding the efforts of existing HEART programs, forming alliances with new sub-partners, and supporting the efforts of South African Government Departments of Health at provincial and district level.

By supporting HIV care and treatment services, EGPAF contributes to the 2-7-10 goals of PEPFAR and the USG South Africa Five-Year Strategic Plan.

With FY08 reprogramming finds, EGPAF will scale up, raise awareness and champion the need for early initiation of HAART, especially for those babies that are coming out of the PMTCT program, 50% of whom should be on HAART by the first birthday; support the implementation of community IMCI; strengthen adult care at the community level; and create pediatric-friendly family clinics and adolescent services.

Program Area: Palliative Care: Basic Health Care and Support

Budget Code: HBHC

Program Area Code: 06

Activity ID: 3102.08

Planned Funds: $1,619,000

Activity System ID: 14264

Activity Narrative: SUMMARY:

The Perinatal HIV Research Unit (PHRU) will use PEPFAR funds to continue to provide quality holistic care for PLHIV comprising of elements in the preventive care package, medical care and psychosocial support categories in Gauteng, rural Limpopo, Mpumalanga and Western Cape provinces. Clients are monitored, prepared and referred for antiretroviral treatment (ART). Linkages to counseling and testing (CT), the prevention of mother-to-child transmission (PMTCT) and referral to ARV services will be strengthened. The major emphasis area is human resources, minor emphasis areas are development of networks, local organization capacity development and training. A family-centered approach targets HIV-infected adults, children and infants.

BACKGROUND:

Since 2002, PHRU has established palliative care programs in Gauteng, rural Limpopo and Mpumalanga provinces for people identified as HIV-infected through PMTCT and CT (also funded by PEPFAR). Primary health care nurses are the main providers of care under physician supervision. The Department of Health (NDOH) guidelines for HIV care and laboratory testing are used to ensure compatibility with South African Government (SAG) treatment sites. In South Africa, a care program covers the period from testing positive through end of life care. A holistic approach is taken comprising elements of the preventive care package for adults and children, clinical services, psychosocial support, healthy lifestyle promotion and preparation and transition of clients onto ART when required. These programs are predominately accessed by women; however PHRU is attempting to redress this imbalance. Men are encouraged to participate through CT programs which specifically target men. Clients are encouraged to bring partners, children and other family members. A focus of the program is to identify HIV-infected infants and children and to provide family-centered care and support. Quality assurance, client retention, monitoring and evaluation are integral parts of the program. The aim of the programs is to delay progression of HIV to AIDS by providing palliative care and support to HIV-infected clients who do not yet qualify for ART. Care includes: screening for active TB, preventative treatment for latent TB infection, cotrimoxazole prophylaxis for OIs, syphilis screening, symptomatic screening for syndromic STIs, screening for cervical cancer, provision of family planning and regular CD4 counts. Opportunistic illnesses are treated using a formulary based on the South African Essential Drug List. Support for clients, their families and community members is provided through support groups and education sessions at all sites covering issues such as basic HIV and AIDS information, HIV services, PMTCT, ART, opportunistic infections, TB, prevention, disclosure, prevention, nutrition, stigma, positive living and adherence.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Soweto, Gauteng

The Soweto care program was initiated in 2002 serving over 4,500 adults with around 700 people being transferred onto ART and others who have been referred to SAG rollout sites. Support groups and education sessions are run by an NGO partner, HIVSA. Since 2004, a focus has been to identify children requiring care, ART and psychosocial support through linkages to PMTCT and infant testing. Over 630 children are currently receiving care and referred for growth monitoring and routine immunizations. Support programs are in development to assist caregivers and children, in particular around issues of bereavement, disclosure, dealing with stigma and discrimination, positive living and life skills.

ACTIVITY 2: Bushbuckridge, Rural Mpumalanga/Limpopo

The Bushbuckridge District in Limpopo/Mpumalanga province is one of the poorest in South Africa. Access to information and HIV healthcare and support is a basic need. The PHRU in partnership with Rural AIDS Development Action Research Program (RADAR) and HIVSA established a wellness clinic at Tintswalo hospital and a district wide support network for people living with HIV and AIDS. Since 2003, over 2,000 people have accessed the wellness clinic and 2,500 have accessed support groups running in the district clinics. A training program has been implemented to train nurses, lay facilitators, counselors and local NGOs to provide effective support to people living with HIV and AIDS and the preventive care package, pain and symptom management, basic education on HIV, CT, HIV treatment services and related issues to the broader community. Disclosure is encouraged to reduce stigma, discrimination, improve male norms and attitudes and reduce violence. US-based volunteers have worked in these programs. Expansion of medical care to the district primary health care clinics and to prepare for down referral from tertiary facilities is planned.

ACTIVITY 3: Tzaneen, Rural Limpopo

Since 2003, the University of Limpopo (UL) has been supporting the DOH to develop a district-wide wellness program based in the primary health care clinics in the Letaba sub-district of the Mopani District in Limpopo province. PHRU partnered with UL to formalize and expand the program. With PEPFAR funding health workers have been trained in HIV care of adults and children and infrastructural support provided. HIVSA has provided training to support group members to enable them to run more effective support groups and provide better information to people in the district. The Mopani District (population 1 million) is extremely poor. The program operates in the primary care clinics with support by a medical doctor and aims expand to the whole district. Over 600 people have enrolled and more than 100 are now on treatment and supported at the clinics. On going in-service training and mentoring occurs at the clinics. US-based volunteers support the program. These activities will be continued and expanded to additional groups with FY 2008 funding.

ACTIVITY 4: Western Cape

In 2006, PHRU partnered with a number of organizations in the Western Cape including the University of Stellenbosch, Red Cross Hospital and the Desmond Tutu HIV/AIDS Foundation that support a number of DOH ART sites. PEPFAR funds support these programs to improve linkages to primary care clinics for down referral, and to provide holistic care and support to people on ART and their families. Training staff to assist with scale-up and sustainability are focus areas. These activities will be continued and strengthened and will reach additional people with FY 2007 funds. With FY 2008 funds PHRU will continue to support one

Activity Narrative: of its sub-partners, HIVSA, to expand palliative care services in rural areas in Mpumalanga, Western Cape, and Limpopo and in urban areas in Gauteng Province. HIVSA utilizes male involvement, door to door, home -based care, and youth friendly models. HIVSA will implement systems to ensure that all PHRU assisted ART sites will reduce loss to ART initiation from the time tested positive until eligible for ART and will improve uptake of ART as soon as a patient is eligible. Support group models will also be expanded. HIVSA will also assist PHRU treatment programs to better monitor care provided to family members. Retention in care after HIV diagnosis will be a focus for FY 2008.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two of the five categories of palliative care services.

These activities directly contribute to the PEPFAR 2-7-10 goals by improving access to and quality of palliative care for HIV-infected individuals and their families.

Budget Code:	HBHC	**Program Area Code:**	06

Activity ID: 8243.08

Planned Funds: $150,000

Activity System ID: 14028

Activity Narrative: SUMMARY:

This is a follow on PEFPAR funded activity to be implemented through Mpilonhle. Mpilonhle is working with the support from district and provincial South African Government (SAG) leadership. It will begin operating in late 2007 with a single mobile unit funded with support from Oprah's Angel Network, and expand with two further mobile unites funded by PEPFAR funds. It is currently building up its staff, which is expected to be 40, and is based in the Mpilonhle office in Mtubatuba, Kwazulu-Natal (KZN).

Mpilonhle will provide elements of HIV-related clinical care and social care through two main activities: 1) provision of HIV-related screening, care and prevention, and 2) school and community-based HIV and AIDS education. These activities will be delivered through mobile clinics deployed to secondary schools and community (non-school) sites in rural KwaZulu-Natal. Emphasis areas are gender and human capacity development. Target populations are adolescents aged 10-24, adults, and PLHIV.

BACKGROUND:

Mpilonhle is a new South African community-based organization registered in 2007 with the South African Directorate of NGOs. It is dedicated to improving the health and well-being of adolescents in high schools in Umkhanyakude District Municipality, KwaZulu-Natal through its "Mpilonhle Mobile Health and Education Project" whose key activities are described below. The care activities will be implemented in Umkhanyakude District Municipality, the poorest and most rural district in KwaZulu-Natal, and one that has extremely high HIV prevalence rates, at 39.1%.

Implementation will take place in representative rural secondary schools and non-school sites that suffer from physical remoteness, poor health conditions, and inadequate resources. Partners consist of the Department of Education, PLHIV, the South African Democratic Teachers' Union, District Health Services, and District Municipality and Municipal leadership, including that of Traditional Authorities. School principals, local Department of Education officials, district and municipal mayors and focus groups of teachers and students have expressed the community acceptability of school-based CT.

ACTIVITIES AND EXPECTED RESULTS:

These activities will be provided through mobile clinics that visit schools to address the needs of PLHIV in the secondary school population and that visit non-school sites to address the needs of adult PLHIV in the general population. These activities will satisfy minimum requirements for Palliative Care by providing PLHIV with clinical services, integrated prevention, psychological support, and support with social services. Each mobile clinic is staffed by one primary care nurse, four health counselors, and one health educator. Each mobile clinic will visit a participating secondary school one week per month for eight months per year.

ACTIVITY 1: Screening and provision of basic HIV-related clinical and social care and HIV prevention messaging at schools and in communities

The first care component is the clinical aspect which includes HIV and AIDS counselors offering one-on-one health screening, messaging and referrals for preventive care services at secondary schools via a mobile clinic. This will include screening and treating for symptoms indicative of Opportunistic Infections (OI) and other HIV-related illnesses (including TB); individualized counseling on HIV prevention and behavioral change; provision of counseling and testing (CT); provision of counseling in nutrition and personal hygiene; psychosocial support for students (including support for disclosure of status); and referral to essential HIV and AIDS services such as PMTCT, ART, symptoms and pain (including screening and referral to TB services). A mechanism will be established to provide parental consent and referrals for family members of HIV-infected students. The partners and focus groups of teachers and students have expressed the community acceptability of schools-based CT and HIV prevention and care services. Effort will be made to ensure equitable access to care services for both males and females. The second care component is the social aspect which includes screening of HIV-related social problems and referrals to a staff social worker for assistance with accessing government grants and legal services for; PLHIV and their families.

ACTIVITY 2: Group HIV and AIDS education sessions

An HIV and AIDS educator will conduct group education sessions at secondary schools and in surrounding communities that will discuss the basic facts about HIV prevention and care targeted. Topics include the importance of HIV prevention (AB for adolescents and ABC for adults); CT; prevention and care of opportunistic infections including TB, ART adherence; accessing PMTCT services; nutrition counseling; and the importance of personal hygiene and utilizing safe water to reduce diarrheal disease. Information, Education and Communication (IEC) materials will also be provided. Mpilonhle will work with community leaders and PLHIV to reduce stigma and discrimination against PLHIV and raise community awareness to mobilize for essential HIV prevention, care and treatment services. Efforts will be made to engage male community members and promote respect between men and women in communities. Support will be provided for disclosure of HIV status and strategies to reduce disclosure-related gender-based violence will be encouraged. An age-appropriate curriculum will be developed by the Educational Development Center (EDC) and the South African Democratic Teacher's Union (SADTU), drawing on material developed by the EDC in collaboration with SADTU, and the World Health Organization. This curriculum emphasizes the traditional three-part public health theory of improving Knowledge, Attitudes, and Practice, skill-building methods in topics such as risk reduction, being faithful, decision making, and social responsibility, as a way of preventing HIV infection, providing care to those infected and affected by HIV, respect for women, fighting stigma and discrimination, and dealing effectively with the challenges of everyday life. Group health education provides supportive social care in the form of efforts to reduce stigma and efforts to increase community awareness of care, prevention, and treatment. Providing care to those infected and affected by HIV, respect for women, fighting stigma and discrimination, and dealing effectively with the challenges of everyday life.

Building human capacity in remote rural areas is a critical issue. Mpilonhle responds to this challenge by maximizing the capacities and skills of relatively abundant lay health workers through rigorous training and regular refresher courses to enable them to perform critical yet currently scarce services such as the promotion of elements of the preventive care package, provision of screening for Opportunistic Infections,

Activity Narrative: basic pain and symptoms management, and health education thus shifting the burden of these activities away from relatively scarce professional health workers. Gender issues will be addressed in the provision of basic HIV screening and care and prevention messaging to large numbers of male and female adolescent and adult PLHIV support for disclosure of HIV status and reduction of gender-based violence), involvement of male adolescents and adults in the program mobilization of community leaders for promoting community efforts against stigma and discrimination, and for raising awareness regarding HIV prevention, care and treatment.

Sustainability of activities is facilitated by political commitment from District and Municipal governments, and the local Department of Education to scaling-up and to fund-raising in support of such scaling-up; the relatively low-tech and easily replicable nature of many core program features; minimal dependence on scarce health professional such as doctors and nurses; the ability of rugged mobile facilities to reduce the need for additional investments in fixed physical infrastructure; declining prices over time for the program's information technology requirements; the possibility of adapting the service delivery model to workplaces as well as schools; the multi-dimensionality of program activities, which includes HIV and AIDS, general health, and education related activities, and which broadens the scope of donors interested in funding continuation and scale-up of activities.

These activities will contribute to PEPFAR goals of providing palliative care to 10 million HIV-infected individuals and their families.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	2312.08	**Mechanism:**	N/A
Prime Partner:	National Association of Childcare Workers	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	12366.08	**Planned Funds:**	$200,000
Activity System ID:	14031		

Activity Narrative: SUMMARY:

The National Association of Childcare Workers (NACCW) provides accredited child and youth care training to community members in order to provide holistic services to family members of OVC. Funding will be used in the emphasis areas of training and community mobilization, developing referrals and linkages, and conducting needs assessments. Primary target populations are HIV-infected families and their caregivers, and community organizations.

BACKGROUND:

NACCW is the only South African NGO focusing on provision of specialized, professional training in child and youth care. NACCW has developed a unique community-based child and youth care response to the HIV and AIDS crisis called the Isibindi Model. This program trains unemployed community members in an accredited child and youth care course and provides an integrated child and youth care service to child headed households and vulnerable families through partnerships between NACCW and community-based organizations. This project is part of a larger initiative of the NACCW to replicate the Isibindi Model nationally in partnership with the Department of Social Development (DOSD). Since 2004, PEPFAR has supported 24 of NACCW's 40 Isibindi projects, providing direct services to 10 891 OVC and training for 430 child and youth care workers in 7 provinces in South Africa. The NACCW also offers this accredited training to other PEPFAR funded projects. From FY 2007 PEPFAR funding has supported palliative care activities. To promote the sustainability of the NACCW Isibindi childcare model, public-private partnerships will support the program in selected provinces. Partners include De Beers Fund, Anglo America Chairman's Fund, AngloGold, Royal Netherlands Embassy, UNICEF, ABSA Bank and the Impumelelo Innovations Award Trust.

ACTIVITY 1: Clinical Services for Family Members of HIV-infected and OVC

Child and Youth Care Workers (CYCW) will provide information on clinical services and refer OVC and their families for screening of pain and symptoms, diagnosis, treatment services such as TB or ARVs. CYCW will regularly follow up to ensure that services are accessed and to provide adherence support for adults and children on treatment. CYCW will be capacitated to identify children requiring clinical services or hospitalization and to provide referrals to children and family members. NACCW will ensure each Isibindi site is linked to a network of clinical care services and providers. The NACCW has a non-PEPFAR program called Masihlangane: Make a Difference which focuses on securing funding for food parcels for the Isibindi projects. Essential nutritional requirements through the food parcels will be provided to children and families who are on antiretroviral treatment. This will complement the treatment process.

ACTIVITY 2: Psychological/Social Services for OVC and their Families

CYCW will assist family members of HIV-infected and OVC with a range of social and psychological services. This will include providing information on and assisting caregivers to access disability grants and other forms of economic support. CYCW will also provide family counseling and assist with succession planning. This will include ensuring caregivers have wills, making arrangements for the care of children, ensuring children have birth certificates and identity documents and providing support for disclosure. CYCW will provide bereavement support and counseling and refer family members to social workers and other support services. CYCW also ensure that families live in hygienic and safe home environments and assist family members to maintain their households.

ACTIVITY 3: Training of CYCW

CYCW in Isibindi project sites will be trained by Bigshoes on a 5-day program focusing on providing palliative care services to OVC and their families or caregivers with the aim of delaying orphanhood. This will include providing referrals to clinical services, follow ups and providing social and psychological services designed to support family caregivers and sick OVC. Monthly Regular mentorship will ensure that CYCW are able to implement the services and provide quality care and support to family members of HIV-infected individuals and OVC.

ACTIVITY 4: Care for Caregivers

NACCW will contract the services of registered therapists to provide support to CYCW in all Isibindi sites, thereby facilitating deeper and more sustainable relationships with their clients. The less they are burdened by their personal feelings and stories, the more emotionally available they will be for their clients. They should also begin to develop a healthy discrimination for appropriate levels of involvement with their clients. The support will include debriefing sessions, workshops and individual counseling in a structured six-month program. It is anticipated that this intervention will reduce burn out, psychosomatic symptoms among CYCW, increase the quality of services provided and improve the long-term sustainability of the program.

In all of the above activities, OVC will be counted only in the OVC program area. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services. PLHIV will receive at least one clinical and one other category of palliative care service.

These activities will contribute to meeting PEPFAR's goals of providing 10 million people with care and support, including family members of PLHIV and OVC.

Program Area: Palliative Care: Basic Health Care and Support

Budget Code: HBHC

Program Area Code: 06

Activity ID: 12357.08

Planned Funds: $1,264,000

Activity System ID: 14033

Activity Narrative: SUMMARY:

In FY 2008 The National Alliance of State and Territorial AIDS Directors (NASTAD) will continue to support government-to-government twinning relationships between four South African provincial Departments of Health AIDS Directorates and four U.S. state health department AIDS programs, resulting in bi-directional exchange of expertise and improved capacity of provincial health systems. The primary emphasis area for the activity is local organization capacity building, with secondary emphasis on community mobilization, linkages with other sectors and initiatives, and policy and guidelines. The activity targets persons living with HIV (PLHIV), policy-makers, teachers, public health workers, and faith-based organizations (FBOs).

BACKGROUND:

NASTAD is a U.S. non-governmental organization (NGO) with a membership of U.S. state health department AIDS program directors whose positions are analogous in program responsibility to provincial AIDS Directors in South Africa. NASTAD utilizes state AIDS program directors and their staff to engage in twinning relationships with South African provincial and district staff, providing peer-based technical assistance to increase program capacity. This project builds on a government-to-government twinning relationship between the Massachusetts Department of Health AIDS Bureau and the Eastern Cape Department of Health AIDS Directorate and the Eastern Cape PLHIV community that has been in existence since 2000, and has been facilitated by South Africa Partners. NASTAD has been provided with PEPFAR funding to expand these initiatives and to support three additional twinning relationships between California and the Western Cape Department of Health (WCDOH), Indiana and Free State Province Department of Health (FSDOH) and between Illinois and the Northern Cape Department of Health (NCDOH). NASTAD will also assist Mpumalanga Provincial Department of Health (MDOH) and coordinate twinning with a U.S. state to be determined.

ACTIVITIES AND EXPECTED RESULTS:

NASTAD will (1) maintain the existing four health department twinning relationships (2) add a fifth twinning relationship with Mpumalanga province, and (3) enhance capacity of the provincial health departments by promoting twinning relationships between U.S. state and South African provincial academic centers and NGOs. This twinning activity will demonstrate best practices in the areas of community capacity building for antiretroviral treatment (ART) roll-out and for prevention programs for PLHIV.

ACTIVITY 1: Training

NASTAD will train PLHIV in Eastern Cape, Free State, Northern Cape and Mpumalanga to form and facilitate support groups for PLHIV to implement the Basic Care Package for PLHIV. This package includes: acceptance of HIV status, disclosure, prevention with positives, and treatment of opportunistic infections (with a special focus on TB/HIV co infection and the provision of cotrimoxazole), and ARV and adherence. Addressing prevention with HIV-infected individuals is an important part of the NASTAD comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals. Elements of the impact of nutrition and gender issues on HIV status will be covered. NASTAD will foster twinning relationships between PLHIV groups in the US and South Africa. There will be an exchange of training programs, building capacity of local institutions to accredit and maintain these training programs, strengthening PLHIV support groups in each of the four provinces where these programs will be institutionalized with the support of local universities and the regional training centers. The aim is introduce care for PLHIV as soon as they are diagnosed as HIV-infected. It will serve to bridge the continuum of care from testing to treatment and end of life care.

ACTIVITY 2: Support Groups and Counseling

iBhayi Living Centre: NASTAD and its sub-partners will continue to work closely with the MANEPHA (a network of PLHIV), ECDOH, the EC Department of Social Development, and the Nelson Mandela Bay Municipality to strengthen the reach and activities offered by the Centre. These will include the following: 1) weekly support groups in all three NMBM Local Service Areas (LSAs), in partnership with local churches, to provide a psychosocial support for PLHIV, and 2) continuation of monthly counseling sessions led by local professionals at district level that provide important information and referrals for key areas (e.g. nutrition, substance abuse, social grants, prevention with positives).
Activity 3:
NASTAD will integrate Prevention with Positives into the Basic Care Package for PLHIV. They will train facilitators of the support groups on PwP and deliver these services through the support group facilitators (employed by NASTAD) to deliver PwP training to PLHIV within support groups in EC, NC and FS provinces.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID: 479.08
Mechanism: N/A
Prime Partner: Humana People to People in South Africa
USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)
Program Area: Palliative Care: Basic Health Care and Support
Budget Code: HBHC
Program Area Code: 06
Activity ID: 7885.08
Planned Funds: $339,500
Activity System ID: 13978

Activity Narrative: SUMMARY:

Humana implements a comprehensive HIV and AIDS prevention and care program called Total Control of the Epidemic. This program trains community members as Field Officers (FOs) to utilize a person-to-person campaign methodology to reach every single household within the project target area with HIV-related care services where necessary. The major emphasis area is community mobilization/participation, while minor emphasis areas are development of referral systems and training. Key target populations are PLHIV, pregnant HIV-infected women, families affected by HIV and AIDS, and caregivers.

BACKGROUND:

Since 2000, TCE has been implemented in eight countries in Southern Africa reaching a population of 5 million people. This program trains community volunteers to reach every single household within the project target area with a comprehensive program that includes care, prevention and CT. Effort will be made to ensure equitable access to care services for both males and females. In 2007 Humana has 5 PEPFAR funded TCE areas in the Mpumalanga province and one area in the Limpopo province. With FY 2007 funding, Humana added elements of palliative care to its program. Humana has previously implemented home-based care (HBC) programs and activities are implemented according to the experiences gained from those programs and work across the region. Furthermore, Humana is implementing the TRIO program, which provides support for people on ARV treatment in Limpopo and Gauteng in a public-private partnership with Johnson & Johnson who have provided $750,000 for similar activities in different geographic areas. Humana works in partnership with the South African Government (SAG) and the Ehlanzeni and Mopani District Municipalities, which are major partners for the program and contribute with a significant counterpart support. The program has received a number of awards, including the 2003 Stars of Africa Award (in partnership with Johnson and Johnson) for best Corporate Social Investment Program within Health/HIV/AIDS in South Africa.

ACTIVITIES AND EXPECTED RESULTS:

Humana has identified a need for palliative care services in the existing TCE areas. In the areas where Humana operates, few HBC organizations exist or they lack the capacity to effectively deliver services. TCE will implement palliative care activities with an emphasis on elements of the preventive care package with home-based care and treatment adherence programs.

ACTIVITY 1: Home-based care

TCE will follow two strategies: 1) TCE strengthens existing HBC initiatives carried out by local CBOs through training, monitoring and support of the caregivers and by employing a nurse who offers clinical services to such programs, where it is appropriate, or 2) TCE starts its own HBC program and employs and trains Passionates (community volunteers) as caregivers, and monitors and supports them in their work. The caregivers will form groups of 10-20 and a nurse will be employed to carry out training and supervision and offer clinical services to patients. The HBC program is implemented by Hope, a sub-program under TCE with its own Project Leader and staff. The patients are identified through TCE's door-to-door campaign. TCE makes use of SAG standards for HBC training and ensures that all caregivers are accredited by the SAG. The HBC program provides and mobilizes for the elements of the preventive care package and screening for pain and symptoms in addition to other clinical, psychological, social support and prevention services to patients in need. The objective of the program is to bring relief and add quality to the lives of the patients and their families. The home-based caregivers offer psychological and spiritual support to the patients and their families, and clinical services, such as cleaning of wounds, analysis of symptoms, monitoring of patients are offered by trained nurses. The program works in close conjunction with public or other private services and refers patients to services; including where needed accompanying patients, and conducting follow up visits. In order to be able to meet the challenges of their work, the home-based caregivers will meet at least twice a week to receive continued training and support.

ACTIVITY 2: Support for people on ARV treatment (TRIO)

TCE has developed a unique system to offer support to people on ARV treatment. It is called the TRIO, as it involves the patient, a family member or a friend, and a Field Officer. This system has been successfully tested in Botswana, where TCE has reached a population of 900,000 people. TRIO will seek to provide and mobilize for the elements of the preventive care package and ensuring that each patient adheres to the ARV treatment through a Directly Observed Therapy strategy (DOT). Patients in the Humana TRIO program will receive a package of care services tailored to their individual needs: education about ART and adherence; screening for OIs, pain, symptoms; nutritional counseling and support, e.g. by facilitating the patient receiving food parcels from the Department of Social Services or by vegetable gardens; and referring patients to positive living clubs or support groups, either run by TCE or other organizations. Volunteers will undergo training as trainers (TRIO supporters) in the above issues and carry out trainings of family members and Passionates. In cases where needed, family members will also receive support from the FOs, e.g. by being referred to CT, PMTCT and other services in the area. A nurse will be attached to the program to offer clinical services to clients and to provide monitoring and supervision of services.

ACTIVITY 3: Linkages with sectors and initiatives

The activities within palliative care are a strongly integrated part of the TCE program. The Field Officers in the basic prevention activities of TCE are well placed to identify community members in need of services. Through this prevention strategy, all households receive messages on the benefits of care services and the TRIO program, and are informed how to receive support from these programs. The care activities will be integrated closely to Humana's CT activities, where people who have tested positive and who need care can be referred to these programs to receive immediate support. Proposed collaboration includes: Linkages with SAG clinics and hospitals providing treatment to facilitate access to ARVs and related services such as support groups. A strong partnership with the TB sub-directorate in the Bohlabela district. FOs are trained to raise awareness about TB, make referrals to clinics and collect sputum. Working with public clinics to ensure that pregnant women have access to antenatal services and PMTCT. Working with the Department of Education to ensure children and youth access education and receive HIV and AIDS information and education.

Activity Narrative: These activities will contribute to the PEPFAR goal of reaching 10 million with care by offering care and support to people living with HIV and AIDS through the already existing TCE program.

Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	3025.08	**Planned Funds:**	$325,000
Activity System ID:	13994		

Activity Narrative: SUMMARY:

Living Hope (LH) will provide in-patient hospice care and home-based care (HBC) for HIV-infected individuals in the Western Cape peninsula. The program will also provide elements of the preventive care package, post-test counseling and support groups for PLHIV. The emphasis areas include human resources, training and the development of referral systems. The main target population is people living with HIV.

BACKGROUND:

Living Hope Community Center is an indigenous South African FBO formed in 1999 in direct response to the HIV and AIDS epidemic. The activities below are ongoing; PEPFAR funding for this activity began in 2005, helping to expand LH's reach into high risk communities with HBC, caring for caregivers and providing hospice-based services and referrals.

LH is working in partnership with the False Bay Hospital by providing a lay counselor for PMTCT counseling and support and with a local government clinic in Masiphumelele, Fish Hoek, Muizenberg, Ocean View, Simon's Town, Red Hill and Seawinds Clinic where lay counselors assist in offering pre and post-test counseling.

LH coordinates with the DOH to ensure that their care activities complement the HIV and AIDS strategy of local government facilities and strengthening their prevention and care policies. With non-PEPFAR funds, LH has also constructed a 22 bed hospice to care for HIV-infected patients referred by local hospitals and HBC givers in the surrounding communities to offer culturally appropriate end-of-life care, symptom and pain management, and referral for ART.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

All members of LH's HBC and hospice staff receive specialized training in palliative care including the basic preventive care package. LH is working in partnership with the Palliative Association of South Africa to develop a carefully managed, outcomes-based, training curriculum for their home-based caregivers. The training modules and time frames are still under development but will be have the accreditation of the Hospice Palliative Care Association (HPCA) and will be tailored for the needs of the caregivers. LH has had negative experience with some of the other outsourced training programs so this provided the motivation to tailor-make a training program.

LH will provide comprehensive HBC to people in four Western Cape communities - Masiphumelele, Ocean View, Red Hill, and Muizenberg. This specifically includes people living with HIV (PLHIV) and their family members. HBC caregiver visits incorporate nursing care, personal hygiene, HIV and AIDS education to infected individuals and family members, screening for symptoms and pain and referral when treatment it is unavailable through routine nursing care. All patients are assessed, referred for ART, TB, STI, OIs and are provided with follow-up and ongoing care and support including the provision of DOTS and cotrimoxazole when appropriate.

LH utilizes a family-centered approach to the provision of care. HBC caregivers spend time in the homes of those who are ill and get to know the client's family, presenting an opportunity to provide training and support to the family caregivers. This includes discussions on knowing one's HIV status and PMTCT for pregnant women that will include safe infant feeding practices and family planning. This training and support for the caregivers of PLWA and their families will include a comprehensive package of basic information about caring for their family member, pain and symptom management and relief in the administration of care. Preventive measures in home-based care are also covered. The hospice also provides ARV treatment and clinical care for those eligible (treatment is procured and funded by the Western Cape DOH).

The HBC program will include services also provided by the Wound Dressing Clinics in Masiphumelele, Muizenberg, and soon to be Ocean View Communities. The wound dressing clinics provide basic clinical services one would find in drop-in clinics including dressing of wounds, treatment for basic injuries and referrals to social or hospital services. These locations and services provide an effective means to establish relationship with those individuals who are HIV-infected and need HBC or other services. It is also an opportunity to encourage all individuals to get tested.

As part of the HBC activity a system will be established for the referral of HIV-infected individuals needing holistic inpatient and/or hospice services (including those experiencing acute HIV-related illnesses, including TB and other opportunistic infections) to LH's hospice or other appropriate healthcare institutions for preventive care and symptom and pain management. A system will also be established for the referral and follow up of ARV treatment-eligible patients to the nearest public health treatment site.

ACTIVITY 2: In-patient Hospice Care

LH will provide holistic in-patient care at their 22-bed hospice facility (20 of those beds are funded by PEPFAR and are shorter term). The hospice is designed to provide palliative in-patient care to adults and children over 12 with pain and symptom management such as those who are experiencing acute HIV-related illnesses including TB, other opportunistic infections, and any other HIV and AIDS complication requiring inpatient care. In addition to short-term hospice care, LH and its staff provide a place to die in peace and dignity with psychosocial and culturally appropriate bereavement and spiritual support to the patient as well as their family members.

The hospice is part of a network of care and support offered by LH that works in collaboration with government and other NGO HIV and AIDS services in the area such as ART, counseling and testing and clinical support including the basic package of care. LH also provides transportation for clients to access any of the medical or care services required in the area from hospital care, clinical results or collecting the ARVs for patients at the LH hospice.

Activity Narrative: ACTIVITY 3: Non-clinical Care and Support

As part of providing comprehensive palliative care, LH places an emphasis on meeting emotional and spiritual needs. There are weekly support groups and one-on-one counseling available for HIV-infected community members where they find acceptance, hope, encouragement and support needed to live a productive and satisfying life. Those who attend are also coached in how to plan for their family members who may be affected by an HIV-infected member of the household. LH's social workers link the OVC and other vulnerable family members to social services, government grants where applicable, non-USG nutritional support through temporary food parcel delivery, skills training, as well as ongoing emotional and spiritual support.

ACTIVITY 4: Referrals & Linkages

The referrals system links HIV-infected people from initial pre and post-test counseling with LH lay counselors to appropriate next level of service such as psychosocial support, home-based care, government clinic or hospital services, PMTCT support or hospice care.

The LH Hospice receives and sends out referrals via partnerships with local area government hospitals and clinics. Local hospitals refer clients to the hospice or home-based care program if the patient requires this level of care. LH's social worker and chaplain are also called upon in many cases to visit or work with clients from the government hospitals and clinics.

Home-based caregivers also refer and receive clients from local area hospitals or community members that are aware of LH’s service. Many times, clients looking for home-based care inquire about these services at local hospitals and then the client is referred to Living Hope. Home-based carers are also being utilized in area clinics to assist in wound care. They are learning as well as providing additional medical support in these clinics. From this, better cooperation and referral linkages are made.

LH is in the process of developing a planned approach to South African Business inviting partnerships with those businesses looking to fulfilling their social responsibility to reduce HIV infections in the workforce.

FY 2008 activities will be expanded to include an additional full day professional care staff to help provide a broader level of clinical and medical services to clients in LH's home-based care programs. This service will contribute to the holistic care and improve the basket of services to care clients. The geographic reach and number of sites will remain the same although targets will increase due to improved 'family member' indicator tracking and counting and more integration between the prevention program linking clients who require the service to care providers.

In the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

This activity specifically contributes to the overall PEPFAR objectives of 2-7-10 by providing direct health care, emotional and spiritual support or those who are HIV-infected and their families.

Mechanism: TASC2: Intergrated Primary Health Care Project

Prime Partner: Management Sciences for Health

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Palliative Care: Basic Health Care and Support

Budget Code: HBHC

Program Area Code: 06

Activity ID: 2949.08

Planned Funds: $794,250

Activity System ID: 13997

Activity Narrative: SUMMARY:

Management Sciences for Health/Integrated Primary Health Care Project (IPHC) in collaboration with the National Department of Health (NDOH) will support the provision of basic care and support to HIV-infected adults in 80 public health facilities (hospitals and clinics) in 8 districts in 5 provinces (Eastern Cape, Mpumalanga, KwaZulu-Natal, Limpopo and North West). IPHC will provide technical assistance to both provincial and district managers for HIV and AIDS programs to strengthen basic care and support services to HIV-infected clients. The target populations are men and women of reproductive age, children and adolescences, family planning clients, pregnant women, nurses and other health care workers. The major emphasis area for this activity will be in-service training; child survival activities; quality assurance and supportive supervision.

BACKGROUND:

This activity was initiated FY 2006 and continues in FY 2008. All activities will be supported directly by IPHC in collaboration with district and provincial counterparts from the Department of Health. IPHC will also work closely with service providers at facility level to ensure that a high quality, comprehensive service is delivered. This activity will build on IPHC's past activities conducted at current sites and with an additional focus on gender-related activities. Family-centered counseling will be a major part of the activities that will be implemented. To ensure integration of programs, IPHC will strengthen the formation of district level HIV and AIDS, STI and TB (HAST) committees and Local and District AIDS councils. This will ensure that people living with HIV (PLHIV) are offered a comprehensive package of care that takes into consideration opportunistic infections (OI) and the provision of cotrimoxazole at the facilities mentored and supported by IPHC. IPHC is strengthening the referral system between the clinics and these groups, to ensure continuity of care.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

IPHC will strengthen human capacity development by training health care providers (both professional and non-professional) on basic care and support of HIV-infected clients and ensuring delivery of the preventive care package. This will include screening for and treatment of opportunistic infections including cotrimoxazole prophylaxis. Training will also include the clinical staging of clients using the WHO clinical staging guidelines. Healthcare providers will also be trained on screening STI and TB clients for HIV. Comprehensive nutritional counseling which will include babies will focus specifically on the nutritional needs for HIV-infected and TB clients. IPHC will provide training to home-based caregivers using the Department of Health (DOH) curriculum for community home-based carers (CHBC). The training of home-based caregivers will include counseling components so that ongoing counseling can be provided to those infected and affected by HIV and AIDS. In supporting the home base care providers, IPHC will ensure that those infected and affected by HIV and AIDS receive comprehensive care. IPHC will extend support to local HBC organizations by supporting their data management systems and subsequent reporting to local linked healthcare facilities.

ACTIVITY 2: Support Groups at the Facilities

IPHC will continue to coach and support health service providers by focusing on psychosocial support and clinical management of people infected and affected by HIV and AIDS. All CT sites supported by IPHC will offer palliative care to HIV-infected clients. IPHC will also establish/strengthen the referral system that begins at facility level and continues to home-based care (HBC) to ensure continuity of care for clients, beyond the 80 supported facilities. IPHC will establish linkages and facilitate networks with community organizations, local municipality and health facilities to increase access to palliative care. IPHC will assist community-based organizations (CBO), non-governmental organizations (NGO) and faith-based organizations (FBO) to access other sources of funding for home-based care programs. IPHC will work with the municipalities to ensure that the CBOs, NGOs and FBOs within their local municipalities not only receive support through Integrated Development Program of the municipality, but also are monitored by the local community representatives. IPHC staff will visit the supported community-based organizations at least once a month. These visits will be conducted with the clinic staff to strengthen the relationships between the staff and the community groups, and also to build in sustainability of the program

ACTIVITY 3: Integration of Services

This activity will focus on the integration of HIV and AIDS services into routine Primary Health Care (PHC) services to ensure a holistic approach to basic care and support to the HIV-infected client at the facility level. Integration of services is important for the clinical management of HIV and AIDS clients. All IPHC-supported PHC facilities will be strengthened to provide a basic health care package that includes routine screening for opportunistic infection and the provision of cotrimoxazole prophylaxis, staging for those clients who are ready to go on the ART program, and on-going counseling and support for those that are not yet ready. IPHC will also focus on strengthening the referral system to and from facility level to home-based care services. Service providers from the health facility and HBC services will be trained on the referral system and how to refer clients appropriately. IPHC will support a care support program for clients who are not yet ready to be on an ART program at the 80 IPHC supported facilities. The care support program will provide education on nutrition, family planning and opportunistic infections. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission.

At the facility level, IPHC will focus on ensuring that clients are counseled on prevention with positives and that family members are provided with psychosocial support and HIV and AIDS education. IPHC will focus on the following activities: prevention with positives, care support programs and support for the caregivers activities. The preventive care package will be implemented at all IPHC supported facilities. IPHC will support health providers to ensure stronger links between palliative care, CT, family planning, PMTCT and ARV therapy at the facility level. IPHC will facilitate that gender related issues (behavior change, violence, disclosure to mention a few) are addressed during HIV and AIDS support groups sessions.

Activity Narrative: IPHC activities will increase the public health facilities' capacity to deliver quality basic health care and support services and expand access to quality palliative care services, thereby addressing the priorities set forth in the USG Five-Year PEPFAR Strategy for South Africa. IPHC will assist PEPFAR to achieve its goal of caring for 10 million people.

Indirect Targets

The National Department of Health guidelines on treatment and care stipulate that all health facilities should have referral systems in place for home-based care. IPHC will train the home-based carers that the facilities would refer to, therefore will have an indirect impact on palliative care happening around the community, as well as having direct impact on the patients in the facility itself.

Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06

Activity ID: 3832.08

Planned Funds: $4,750,000

Activity System ID: 13710

Activity Narrative: SUMMARY:

Activities support the provision of palliative care under the comprehensive antiretroviral treatment (ART) program carried out by Catholic Relief Services (CRS) in 25 field sites in 8 provinces in South Africa. The area of emphasis is the improvement of quality of life to people living with AIDS who are not yet on antiretroviral treatment (ART), ensuring their wellness to delay the necessity of commencing the ART for as long as possible, ensuring optimal health for persons on ART, and ameliorating pain and discomfort for those in the terminal stages of the disease. The field sites target those in need of these services, who live in the catchment area of the site, and who lack the financial means to access services elsewhere.
BACKGROUND:

AIDSRelief (the Consortium led by CRS) received Track 1 funding in FY 2004 to rapidly scale up ART in nine countries, including South Africa. In FY 2005, FY 2006 and FY 2007, South Africa COP funding was received to supplement central funding, with continued funding applied for under COP 2008. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and the Institute for Youth Development South Africa (IYD-SA).

All sites operate under the terms of a Memorandum of Understanding (MOU) with the provincial Department of Health (DOH) in which they operate, observing the national and provincial treatment protocols. There is a concerted effort at each site to ensure coordination with the South African Government (SAG) and sustainability by either having the SAG provide antiretroviral drugs, or by referring stable patients in to the SAG treatment plan. Progress made in this regard is discussed below under activities and expected results.

Contrary to initial expectations, the most difficult issue has been ensuring that men access HIV care and treatment services. Currently, only a third of patients on ART in the program are men. Many of the challenges faced in the implementation are rooted in social and cultural backgrounds of the South African male population, which AIDSRelief is trying to address by involving men while doing home-based care, as well as putting increased focus on family-centered CT. In addition, AIDSRelief will involve dieticians at selected sites to identify nutritional deficiencies and problems with patients, in order to assist with referral and proper food supplementation where needed.

ACTIVITIES AND EXPECTED RESULTS:

With funding provided in FY 2008, AIDSRelief will continue implementing activities in support of the South African national ARV rollout. Of the 25 existing field sites activated in March 2004, two have transferred all their ART patients into SAG sites, and have ceased providing treatment. Two new field sites have been activated in FY 2007 to enroll additional ART patients in support of the SAG rollout plan.

Utilizing technical assistance from AIDSRelief staff members and South African experts, ongoing support and guidance will be provided to sites in the form of appropriate refresher medical training courses, patient tracking and reporting, monitoring and evaluation mechanisms and other necessary support.

Basic palliative care services including elements of the preventive care package will be provided by the 25 field sites to patients through clinic-based and home-/community-based activities aimed at optimizing quality of life for HIV-infected clients and their families throughout the continuum of illness, by means of pain and symptom diagnosis and relief; psychological and spiritual support; clinical monitoring, related laboratory services, management of opportunistic infections and other HIV and AIDS-related complications (including pharmaceuticals); integrated prevention services including prevention with positives; and culturally-suitable and religiously-appropriate end-of-life care. Patients within the CRS home-based care network will be given cotrimoxazole prophylaxis where necessary. Effort will be made to ensure equitable access to care services for both males and females.

The home-based carers are recruited through parish networks, and are deployed in the areas they live in, with the intention that they should serve patients who live within the walking distance of their homes. All provincial DOHs pay stipends to their caregivers. Home-based carers within the CRS network tend to pay their caregivers the same stipend that the DOH pays theirs, as the training that they undergo is the same, as is the workload. Stipends paid to caregivers vary from one site to another according to the differences in stipends paid by different provinces. Caregivers are also reimbursed for transport expenses.

AIDS is stigmatized in many South African communities because of the association with death. This is because of the belief that AIDS inevitably leads to death. As the number of patients on treatment grows, and as communities see that those on treatment are living normal, healthy lives, stigma is decreasing visibly and more and more patients are presenting themselves to be tested, either in CT, or if they know that they are positive, to have their CD4 counts tested and see whether they qualify for treatment. This process has been accelerated by the way in which patients on treatment at each site are used as community peer educators and counselors.

All activities will continue to be implemented in close collaboration with the SAG HIV and AIDS directorate and the respective provincial authorities to ensure coordination and information sharing, thus directly contributing to the success of the SAG's own rollout and the goals of PEPFAR. These activities are also aimed at successful integration of AIDSRelief activities into those implemented by the SAG, thus ensuring long-term sustainability.

Holistic palliative care services are provided to all people who come to the field sites irrespective of their age, gender, nationality, religious or political beliefs. Historically, adults with HIV of both genders (children to a lesser extent) have been admitted for palliative care services in partner field sites providing such services. Palliative care services are provided by SACBC and IYD-SA at their respective sites, through the provision of services aimed at optimizing quality of life for HIV-infected patients and their family members, psychological support, management of opportunistic infections (where necessary), other HIV and AIDS related illnesses, and end-of-life care provided either at the clinic level (where available) or through home-based care mechanism. Field sites managed by SACBC provide a vast range of services, ranging from basic (home-based care) palliative support, to in-house, facility-based beds and full palliative care services, depending on the specifics of each site. IYD-SA also provide a different range of palliative care services, ranging from referral to other SAG clinics in the area, to home-based carers who provide compassionate

Activity Narrative: and valuable services to palliative care patients. Even though prevention is not a specific program activity of the overall program, it is promoted through provision of information to patients regarding HIV and prevention of spreading the virus (prevention with positives). Secondly, skills training is provided to vulnerable populations, empowering them to make safer choices about their lives. Additionally, AB messages are shared with the target population, as well as accurate information regarding condoms is provided.

Some of the AIDSRelief sites also receive PEPFAR and other funding through different sources for the provision of OVC care. The overlapping of these services provides OVC with access to both care and treatment services provided under the program.

On the staffing front, AIDSRelief is making a conscious effort towards staff retention, through skills development and strengthening, retreats and debriefing sessions for the staff at the site level where burnout and compassion fatigue support groups are facilitated. In addition, staff remuneration is monitored and, to the extent possible within the faith-based environment, reasonable packages are offered. The task shifting strategy involves shifting certain tasks that medical nurses can do (such as screening the initial patients, follow-up and monitor stable patients) from medical doctors so that the overall workload is more manageable. Treatment counselors and community care workers are encouraged to provide pre- and post-test counseling, adherence training and support and help with basic administrative follow-on work. Other activities include considerations of community care workers conducting the oral rapid HIV tests, and nurses only doing the confirmation tests if necessary.

FY 2008 COP activities will be expanded to include nutritional supplementation for patients receiving care or treatment under the program, primarily to support the effective use of antiretroviral drugs for the patients already on ART, or to assist patients awaiting to be placed on ART by providing them with necessary nutritional supplements, and increasing their chances of accepting ARV drugs once placed on ART. In addition, cotrimoxazole prophylaxis will be given to qualifying HIV-infected persons receiving palliative care within the operational guidelines of the host country and the donor, with special attention given to exposed or infected children.

With supplemental funding in FY08, the following activities will be added:
a) Open and staff a new wellness center in Winterveldt for HIV care and treatment services (satellite center)
b) Provide additional space (parkhome) in Orange Farm for HIV care and treatment services
c) Open a satellite HIV care and treatment program in Pary
d) Implement a new patient data system to accurately collect routine HIV care and treatment data – including equipment where necessary.

Activity ID: 7873.08

Activity System ID: 13704

Program Area: Palliative Care: Basic Health Care and Support

Program Area Code: 06

Planned Funds: $2,437,830

Activity Narrative: SUMMARY:

CARE will continue its work in building HIV and AIDS competence of civil society organizations (CSOs) who deliver HIV-related care services in South Africa. CARE aims to scale up palliative care by administering and managing 26 small grants and targeted technical assistance to identified grantees to scale up HIV-related palliative care services in organizations that are unable to receive direct funding due to limited capacity. Minor emphasis activities include community mobilization, training and development of networks.

BACKGROUND:

The CARE Letsema project is part of a five-year project, which started in October 2005. CARE in FY 2008 will geographically expand implementation further into the Free State (along Lesotho border) and Limpopo border along the Great Limpopo Tranfrontier Park. In FY 2008 other changes will occur, namely, expansion into Mpumalanga, and southerly along the Great Limpopo Transfrontier Park along the borders shared with Mozambique and Swaziland. Technical program areas are supported by small grants and technical assistance for that program area, directly through CARE, as well as through identified Sectoral Education and Training Authority (SETA) accredited partners with specialized expertise in HIV-related palliative care and support. Since FY 2006, Letsema has been working primarily in the eastern Free State near the Lesotho border and will continue to work in this area.

ACTIVITY 1: Strengthen Delivery of Quality HIV-Related Palliative Care Services

Targeted training and mentoring support will be provided to selected organizations to address the clinical, physical and psychological care of HIV-infected individuals, and the psychological, spiritual and social care of affected family members. Technical emphasis will be supporting CSOs to appropriately message, provide and/or refer for elements of the basic preventive care package including prevention with positives. The aim of this activity is to build a more integrated HIV response that responds to the family as a whole and promotes increased coordination of services within the community, facilitating greater uptake and utilization of health and social government services such as HIV counseling and testing, treatment and social assistance. CARE aims to strengthen the referral network within each of the organizations it supports. This is an integrated response that promotes community mobilization, awareness and implementation of HIV prevention, care and treatment support activities as a continuum. Service delivery will be strengthened, and quality and success rates in accessing government services will be improved by:

(1) placing salaried professional staff (nursing supervisors and social workers) together with sub-partners and contracted specialists to train and mentor staff and volunteers to improve the clinical component of home-based care within the government's specified guidelines and curriculum;
(2) technical support to CSOs emphasizing the messaging, delivery and/or referral for evidence-based preventive care interventions which include the following: OI screening and prophylaxis (including cotrimoxazole, TB screening), counseling and testing for clients and family members, malaria prevention with ITNs (where appropriate), safe water and personal hygiene strategies to reduce diarrheal disease, nutrition counseling and supplementary feeding (where clinically indicated) or referral for nutritional and food support, HIV prevention counseling, provision of condoms, referral for family planning services for HIV-infected women, and appropriate child survival interventions for HIV-infected children. The package of services also includes basic pain and symptom management, psychosocial support, treatment support for OIs (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART) and psychological, spiritual and social support of affected family members; and,
(3) strengthening collaboration among government departments at district and provincial levels to ensure access to basic healthcare, ART, legal documentation, state income grants, support for staying in school, and volunteer stipends and improved service coordination; and develop workplace support and supervision for volunteers.

CARE as part of the social service category will expand its savings and lending model, as well as income generation training to households of HIV-infected people to generate an income to deal with the shocks and stressors of HIV and AIDS, consumption and asset building (which includes productive income). Both economic products serve social support functions to deal with issues like that of stigma, discrimination, child rearing, death and hardship that HIV-infected people and their families encounter. A gender analysis of the savings and lending groups through Local Links has revealed that 98% of the beneficiaries are women. Once these women have met their families' basic needs for food, school fees, transport to clinic and medication etc. the savings and the interest earned is put to productive use through income generation activities. This activity addresses gender issues through ensuring equitable access to HIV-related care services for both men and women and encouraging male involvement and mobilization of community leaders throughout the program.

ACTIVITY 2: Capacity Building

The activity combines organizational development training and mentoring to enhance institutional strengthening identified of CSOs to improve organizational functioning and service quality. The program will achieve this through an innovative combination of capacity building approaches including training workshops, mentoring, cross-visits, and organizational technical assistance. The proposed intervention will minimize one-time training and workshops and will develop longer term activities to strengthen CSOs and networks, ensuring sustained capacity building and joint learning. Organizational capacity will be strengthened to improve institutional functioning by (1) undertaking organizational assessments (human resources, policy development, project management, finance and governance) of each of the participating CSOs; (2) developing clear organizational/human development training and mentoring plans to address gaps emerging from the assessment; and (3) providing training in project management, basic book-keeping, narrative and financial reporting, monitoring and evaluation. These activities are key to increase sustainability by building local organization capacity.

ACTIVITY 3: Management of Sub-Grants

The activity provides and manages sub-grants to 26 CSOs, to sustain operations through improved fundraising and coordination. The activity aims to increase access to resources for small CSOs that do not meet the criteria of government and/or international donors, but that provide valuable care and support

Activity Narrative: services at the community level in a culturally appropriate manner.

ACTIVITY 4: Improved Networking and Coordination Among CSOs and Related Stakeholders

The activity supports sharing, cross learning and co-ordination of services among partners and related stakeholders at district level. CARE and partners will continue to interact with government departments and structures for improved access to services for HIV-infected people, their families as well access to resources for CSOs.

ACTIVITY 5: Implement Basic Package of Care

CARE will support the implementation of the Basic Package of Care for individuals infected with HIV but not yet eligible for ARV treatment, as well as individuals who are ready and eligible for ARV treatment but for whom there is no immediate access to services. Services includes spiritual, social, psychological, clinical and prevention for HIV-infected persons and their families. CARE will do this by providing small grants to CSO to form support groups for PLHIV where they will receive a structured program of HIV-related palliative care as approved by PEPFAR and the National Department of Health South Africa. This structured program comprises the Basic Package of Care. CARE will work closely with the Department of Health in Mpumalanga to identify these CSO for funding.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

This activity will increase civil society organizational capacity to deliver quality basic healthcare and to expand access to quality palliative care services, thereby addressing the priorities set forth in the USG Five-Year Strategy for South Africa. In addition, the people receiving care and support will contribute to the care portion of the 2-7-10 goals.

Funding Source: GHCS (State)

Program Area: Palliative Care: Basic Health Care and Support

Budget Code: HBHC

Program Area Code: 06

Activity ID: 3323.08

Planned Funds: $1,150,000

Activity System ID: 13684

Activity Narrative:

SUMMARY:
Aurum's palliative care program provides care to patients infected with HIV following HIV counseling and testing, and screening for treatment eligibility in accordance with South African Government (SAG) guidelines. The facilities where palliative care is provided include general practitioners' clinics, non-governmental clinics and public sector sites. These sites are located mainly in the Gauteng, North West Mpumalanga and KwaZulu-Natal. Patients are also assessed for opportunistic infections and eligibility for ART and provided with preventive therapy i.e. INH and cotrimoxazole. Emphasis areas include human resources, commodity procurement, logistics, quality assurance and training. The primary target populations are people living with HIV (PLHIV), HIV-infected children, prisoners, homeless people and street youth.

BACKGROUND:
This is an ongoing program funded by PEPFAR since October 2004. The PEPFAR-funded project aims to rapidly expand access to HIV care and treatment to South Africans living with HIV, and especially in areas (such as mining areas) where Aurum is familiar and other partners are less likely to work. Aurum has established a number of general practitioner (GP) clinics which are capable of providing care to large numbers of HIV-infected individuals and achieving high quality results. In order to ensure sustainability of this model, Aurum has partnered with Faranani Solutions, a network of general practitioners from a previously disadvantaged population. Advantages of this model, now termed the Auranani model, are that Aurum has been able to secure lower consultation rates for GPs and GPs are encouraged to provide assistance at their local hospital clinics. The presence of trained individuals in these public health facilities will enable the transfer of knowledge to nurses and doctors in the public sector. It is hoped that this model can be used to rapidly scale up delivery of HIV services in South Africa, in partnership with government efforts. Sites are located throughout the country, but are concentrated in Gauteng, North West province and KwaZulu-Natal. There is only one site each in the Northern Cape and the Western Cape. A further extension of Aurum's program is to include care and treatment services in HIV prevention trial sites of the Aurum Institute in the North West and KwaZulu-Natal. Thus patients are being diagnosed in early stages of their disease and are being counseled and prepared for antiretroviral therapy (ART) and palliative care. In both these provinces there is a close collaboration with SAG, and patients are referred to public sector facilities for ART initiation. These clinics are will be used in the future as down referral facilities In FY 2006 Aurum fostered new relationships with non-governmental organizations (NGOs) and public sector sites. A number of primary healthcare clinics attached to NGO and faith-based organizations (FBOs) have been established. Metro Evangelical Services, a sub-partner, is a FBO providing training, housing and health services for the homeless and street youth of Hillbrow, Johannesburg. An HIV center has been established to provide CT and HIV services to this population. In Gauteng, a contract has been concluded with Chris Hani-Baragwanath hospital for support and a contract for extension of these services to other parts of Gauteng is being negotiated with the provincial health departments. In the North West, Aurum supports the provision of HIV Care at Tshepong Hospital through the provision of medical and nursing staff. In addition, through the establishment of a walk-in clinic at Jade Square in Klerksdorp Aurum provides care for HIV patients that are not able to currently access care through the public hospital. Aurum has met with the KwaZulu-Natal Department of Health about sites attached to the Medical Research Council. Furthermore, in Mpumalanga, one of Aurum's sub-partners, Reaction Consulting, has worked with the provincial health department to strengthen support for Ermelo Hospital, and in the Northern Cape, Aurum's public-private partnership with De Beers Consolidated Mines in the Danielskuil area has been discussed. In the Limpopo area, discussions are underway with Anglo Platinum and the Limpopo Department of Health to provide support to a down-referral clinic based in the Capricorn district close to one of the Anglo Platinum mines. Aurum intends to continue to support the Department of Correctional Services in Johannesburg but also to expand activities to other Gauteng-based correctional facilities, namely Pretoria. A number of Aurum's sites, Caritas Care, MES and Duff Scott collaborate with the local health departments that provide funding for inpatient care to palliative care patients. In FY 2008, the SME project will commence the provision of care and support services to HIV positive SME employees including market traders and taxi drivers and their partners and dependents in targeted sites in Gauteng, Mpumalanga and Limpopo provinces.

ACTIVITIES AND EXPECTED RESULTS:
PEPFAR funding will be used to fund all central staff responsible for monitoring and evaluation of the program. FY 2008 funds will also be used to provide training and human resources at the sites. Focus areas of training include how to run support groups, disclosure and stigma, special counseling situations such as couples and children, and the prevention of mother-to-child transmission. Care will be provided through occupational health care clinics, the mobile vehicles, the GP network and at the fixed service points such as Bree Street site.

ACTIVITY 1: Monitoring for Opportunistic Infections
At each of the patient visits, a full physical examination including pain and symptom management of the patient is conducted to exclude the existence of opportunistic infections (OI). If a client presents with an OI, further investigations and management of the infection including the provision of cotrimoxazole may occur at the site, or the patient may be referred to another healthcare service. Adherence to OI medications (including cotrimoxazole prophylaxis and TB treatment) is also part of the package of services. Effort will be made to ensure equitable access to care services for both males and females.

ACTIVITY 2: Provision of Prophylactic Medication
Patients with CD4 below 200 will receive elements of the preventive care package including cotrimoxazole preventative therapy. It is expected that 30% of all patients receiving palliative care will be receiving cotrimoxazole preventive therapy.

ACTIVITY 3: Psychosocial and Spiritual Support As part of a holistic approach to palliative care, patients receive counseling by trained staff member at each clinic visit. A psychologist, a dietician and a social worker based within the central office is responsible for education, training and support of site staff. Some of the sites have established psychological and spiritual support groups. The Basic Package of Care including acceptance of status, disclosure, prevention with positives, opportunistic infections, adherence counseling, treatment literacy and nutrition counseling will be included at all Aurum funded sites (private sector).

ACTIVITY 4: Work with prisons
Aurum provides technical assistance to the Department of Corrections in Gauteng province in three areas: 1) assist in the development of the ART and care delivery system, 2) training health care workers on ART and holistic palliative care, and; 3) development of a data management system to track prisoners who are

Activity Narrative: receiving ART and care support. Patients will be encouraged to bring family members in the facilities. Training on couple counseling and counseling for children is given to the health providers. Family members will be encouraged to test for HIV and will be provided education and counseling on HIV and TB. Those family members that test HIV positive will be enrolled into Aurum's care program and will be provided with all the services as already described above. In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services. Aurum's palliative care services contribute to the PEPFAR goals of 10 million people in care by increasing the quality of care.

ACTIVITY 5: Work with SME Employees
Aurum has established a project that strengthens the provision of services to SME employees, their partners and dependents initially within the Johannesburg CBD. The project will be expanded to an additional site in Gauteng as well as to Witbank and Polokwane. Aurum has developed partnerships with the Johannesburg City Council and with individual companies that have existing occupational health care clinics. Utilizing these partnerships and the mobile vehicles and GP network, HIV positive clients will be screened for the presence of opportunistic infections, provided prophylactic therapy and provided education on nutrition.

Program Area Code: 06

Activity ID: 12351.08

Planned Funds: $824,500

Activity System ID: 13344

Activity Narrative: SUMMARY:

Absolute Return for Kids' (ARK) focus is to provide a comprehensive palliative care package for services to HIV-infected mothers and their children through partnerships with local government health facilities. ARK's primary emphasis areas are human capacity development, local organization capacity development, and construction/renovation. The target population is people living with HIV and AIDS.

BACKGROUND:

ARK is a charity organization whose mission is to facilitate and support delivery of accessible and sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and poverty.

ARK's mission is to facilitate and support delivery of accessible and sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and AIDS. In partnership with the KwaZulu-Natal Department of Health (KZNDOH), ARK, as the implementing partner, has established an antiretroviral treatment program in government primary health facilities and hospitals. Specifically, ARK works with the KZNDOH to identify sites and areas for capacity building, including human resources, modest infrastructure support, and organizational capacity development. PEPFAR funding has enabled ARK to successfully enroll over 15,000 patients in ART in KZN with about 12000 remaining in care at ARK supported sites.

FY 2008 funding will enable ARK to expand its established ARV treatment program to include a comprehensive range of palliative care services. These services will be supported by improvements in the infrastructure of targeted sites, and the provision and training of human resources in partner health facilities to further strengthen their capacity to deliver quality care and support for HIV-infected mothers and their children. ARK provides palliative care services in accordance with South African national treatment guidelines.

ACTIVITIES AND EXPECTED RESULTS:

ARK's primary objective is to keep mothers alive to continue caring for their children. The primary caregiver's continued survival and potential ability to earn a living while receiving ARV treatment will have a substantial impact on the extended family.

ACTIVITY 1: Support to KZNDOH

ARK works with the KZNDOH to develop the necessary processes and systems to manage the palliative care program, to ensure that the model created is scaleable, sustainable and replicable elsewhere. Capacity-building is site specific. Upon identification of a site, an analysis of the needs of each site will be done with respect to staffing (doctors, nurses, pharmacists and pharmacy assistants), clinical equipment, management systems, patient advocacy and temporary structures. The most pressing requirements are met in order to speed up the ability for patients to receive treatment. Where necessary ARK provides support in the ARV site and pharmacy accreditation process.

ACTIVITY 2: Human Capacity Development

ARK will conduct a thorough needs analysis of human resource capacity prior to initiating support to the palliative care program at each site and recruits all the necessary medical and support staff required for the successful rollout of services. The staff recruited varies from site to site but include doctors, nurses, pharmacists, pharmacy assistants, medical technologists, facility-based counselors, and patient advocates. For all key staff, ARK will provide training and follow-up refresher courses cover all aspects of ARK's palliative program including employee and volunteer policies and procedures, onsite mentorship from experienced ARK staff, and an introduction to key performance areas. The specific topics covered include: counseling and testing, screening for pain and symptoms, screening for OIs including the provision of cotrimoxazole prophylaxis, symptom control and management of opportunistic and sexually transmitted infections, nutritional assessment and counseling, adherence support, as well as the value of community access, prevention with positives, referral and patient advocacy. Staff are invited and encouraged to attend formal training offered by external providers including other PEPFAR partners such as the Hospice Palliative Care Association (HPCA) and Foundation for Professional Development (FPD).

ACTIVITY 3: Clinical Care

ARK's palliative care program focuses on a network of clinics operating within a district, in order to create a sustainable and efficient system that supports the continuum of care and up and down referral. ARK-employed doctors and nurses provide comprehensive treatment management including patient uptake, doctor consultations, counseling and testing, TB screening and management, pain management and symptom control, treatment of opportunistic and sexually transmitted infections including the provision of cotrimoxazole, lab testing and patient education. Pharmacists are responsible for the dispensing of medication.

As part of the palliative care package for HIV-infected individual, individuals accessing ARK's services will be staged and entered into ARK's ARV treatment program. All patients with a CD4 count of <200 will be referred to ARK's ART program to confirm their eligibility for treatment. The program's medical and psychosocial criteria are designed to ensure that the patient is prepared and ready to adhere to ART. All patients being assessed undergo a treatment literacy program and are educated about positive living. Patients are encouraged to motivate their partners/spouses to get tested and, if necessary, enter the treatment program. HIV-infected patients, not in-need of ARV treatment and not with active TB, will be offered isoniazid prophylaxis, monitoring, and ongoing counseling support for 6 months. At the end of the 6 months, these patients will be reassessed for further treatment. Although ARK's treatment target population is predominantly mothers and children, increased attention is being given to encourage and increase male partner (and men in general) participation.

ACTIVITY 4: Family-Centered Care and Support Services.

Activity Narrative:

In an effort to encourage adherence among mothers and ongoing care for their infants, ARK's program takes an integrated, family-centered approach to care and extends support (including treatment literacy and prevention education) to all members of a patient's household. Together, trained facility-based counselors, patient advocates and community health workers (CHWs) counsel patients and their partners on treatment literacy, positive living, nutrition, safe infant feeding practices, and safe sex. CHWs conduct pre-treatment home visits and provide ongoing psychosocial support to patients and their families. They also promote and support disclosure to partners and family, partner testing and facilitate treatment access. CHWs are required to facilitate support groups for their clients and ensure that all patients and their families have access to spiritual care, psychosocial support, prevention messaging including prevention with positives, nutritional counseling, economic assistance (government grants), and protection services, when required.

ACTIVITY 5: Reporting and Quality Assurance/Improvement

ARK provides computers and employs data capturers at all sites. Data is captured from patient folders and transferred to ARK's data center, allowing for ongoing evaluation and outcome analysis. Adherence rates, death rates and loss to follow-up are closely monitored. Quarterly updates are provided to the KZNDOH and information is used within the clinics to strengthen service delivery. To ensure high standards and quality of care in line with the national guidelines, all ARK staff are provided onsite, on-the-job training. This is followed up with regular onsite mentorship and site evaluation by ARK's national executive and provincial management teams. Informal training sessions are conducted quarterly by national staff. Staff are also encouraged to attend formal external training courses offered by FPD.

These activities contribute to PEPFAR's 2-7-10 goals by increasing the number of South Africans receiving palliative care.

Program Area Code: 06

Activity ID: 12360.08

Planned Funds: $194,000

Activity System ID: 13372

Activity Narrative: SUMMARY:

The African Medical and Research Foundation (AMREF) will strengthen the capacity of South African district government departments, Child Care Forums (CCFs), NGOs and CBOs, and service providers to provide quality and accessible care and support for family members and caregivers through training, mentoring, awareness raising and advocacy. Emphasis areas for this program are local organization training and capacity building. Target groups for the program include family members and children older than 18 years, caregivers of OVC, community and public sector health and social service workers.

BACKGROUND:

AMREF is an international health and development NGO working in East and Southern Africa. In South Africa, AMREF previously worked in Mpumalanga from 2001 to 2004. This work focused on strengthening community caregiving infrastructures for OVC, including the improvement of capacity and integration of service providers and government departments. Building on the OVC initiative in Kwazulu-Natal and Limpopo province, AMREF has formed partnerships with key government and civil society stakeholders in both Limpopo (Sekhukhune district) and KwaZulu-Natal (Umkhanyakude district). In these two particular districts, in which 55% and 57% respectively of the population are under the age of 18. According to the 2006 antenatal survey, KZN has the highest HIV prevalence rate in the country at 20.6% whilst Limpopo has a prevalence rate of 11.7%. AMREF has identified the need to develop a comprehensive program to address the needs of other family members of HIV-infected individuals and OVC who are in need of palliative care services. The project will be implemented in Kwazulu-Natal where the OVC project is being implemented. AMREF's work is closely aligned to the aims of the Department of Social Development's National Action Plan for OVC and the HIV and AIDS and STI National strategic plan 2007-2011.

ACTIVITY 1: Comprehensive Care for Family Members

The project will seek to facilitate access to health services to address needs of children and adults over 18 who are no longer classified as OVC under the South African constitution as well as PEPFAR guidelines. The palliative care project recognizes that, while formal health services may provide episodic advice and medical and material supplies, only community supporters/carers provide continuous patient care. Currently, partners that AMREF is working with already have volunteers who are already offering home-based care services, these volunteers will be trained to assess family members in need of palliative care services since there are already dealing with and have experience in the provision of palliative care. These services include assistance on how to manage common conditions associated with HIV and AIDS opportunistic infections e.g. dealing with pressure sores, wound dressing etc. In addition, assistance will be provided on how to deal with stigma and emotional trauma, grief management, assisting family members to prepare for death psychologically, spiritually and physically. In addition, any households with family members in need of palliative care that will have been identified by the OVC supporters will be given to the home-based care volunteers for them to be entered into the palliative care program. The same will apply to any OVC who will have been identified by home-based care supporters. Particular attention will be given to child headed households and elderly headed households that may have a limited capacity to respond to the needs of the sick family member. OVC will be counted in the OVC program area and eligible family members will receive at least two categories of service from clinical/physical, psychological, spiritual, social and preventive care.

1.1 Recruitment and Training of Volunteers
The project will not recruit new volunteers to implement the palliative care intervention but will utilize the already existing volunteers who are already working on the home-based care intervention. Volunteers will be encouraged to work within the neighborhoods where they reside in order for them to cover the area adequately as well as minimize traveling time and concentrate on service provision. Training of volunteers will be aimed at strengthening the services that they are already delivering under the department of health's community home-based care program. This training will cover areas such as general health, common diseases, health and hygiene as well as nutrition and wellness. In addition, AMREF will use its home-based care manual to train volunteers in the delivery of home-based care services. Furthermore, volunteers will be trained in the delivery of non-clinical services such as psychosocial support, health education as well as basic HIV and AIDS prevention education for the family members. Care workers and providers will be trained to conduct basic health care needs assessments, provide first aid and refer for clinical services that include screening for pain and symptoms, diagnosis, doctor consultations and treatment. Carers will link with local clinics and hospitals to ensure the provision of quality follow-up support for sick family members. AMREF will link with established service providers in the area to provide clinical care for patients and family members in need. One provider that AMREF intend collaborate with is Mpilonhle which is based in Mtubatuba and operate a mobile medical unit and thus are best placed to conduct clinical assessments of patients identified by AMREF's trained care supporters. The Africa Center will also be a potential AMREF partner on the palliative care project.

1.2 Non Clinical Services Provided
Some of the services that AMREF's partner will provide include psychosocial support and counseling services to clients identified within the home. Family members will also be taught on how to deliver home-based care services to build their capacity to give palliative care to family members in the absence of the community care supporters. Some of the services that they will be trained to deliver include medicine administration, providing social and psychological support as well as how to deal with common conditions such as skin conditions, bed sores, diarrhea, nausea and mouth infections as well as pain management. Family members will also be provided with HIV prevention education to reduce the likelihood of infection during the process of giving care to the sick family member. Other services that will also be provided include home cleaning and washing services and food preparation. AMREF's role on the program will be to provide technical assistance to partners in the implementation of the program. Technical support will be focused on training of the partners' volunteers in the delivery of palliative care services. The training will focus on monitoring and evaluation of their activities concerning the services that clients receive including training in supervisory techniques aimed at ensuring that volunteers work and deliver the appropriate services to clients as well as ensuring that services are of an exceptionally high standard.

ACTIVITY 2: Wellness Programs for Caregivers

Activity Narrative: The wellness model that AMREF will implement for caregivers will empower caregivers and help them develop healthier lifestyles and enhance wellness in both the individual caregivers as well as their families. AMREF will also use PEPFAR funding to conduct wellness programs, in collaboration with sub-partners, for volunteer caregivers through facilitating linkage with the health care centers and Counseling and Testing centers (clinics/hospitals) to ensure that carers receive the non-clinical (psychosocial support, spiritual counseling, nutritional counseling) and clinical care (screening, diagnosis, doctor consultations, treatment, and follow-up care) required. Volunteers will seek to transfer the knowledge and the skills that they will have received from AMREF so that family members are able to provide care and support to family carers. AMREF will also work with the CBO partners and the health care centers to develop support groups to share coping skills and provide a support system for caregivers. Community care supporters will be encouraged to form community carers forums aimed at building solidarity among care supporters, reduce burn out and improve service delivery to clients. The community care forums will also present opportunities for care supporters to socialize; provide each other with literacy training; health education; coping advice; counseling and social support.

ACTIVITY 3: Capacity Building for Community partners

AMREF will continue to develop the capacity of community-based organizations by strengthening training and systems development, support and follow-up for CBOs/NGOs engaged in palliative care and OVC service delivery, including financial management, program and management skills, leadership and governance and resource mobilization training. AMREF will train the selected partner organization selected NGO workers and community care workers in psychosocial support and counseling for family members of HIV-infected and OVC.

These activities will contribute to the PEPFAR goal by providing care to 10 million people who are HIV-infected and family members of HIV-infected and OVC.

Mechanism ID: 416.08 **Mechanism:** N/A

Prime Partner: Broadreach

Funding Source: GHCS (State)

Budget Code: HBHC

Activity ID: 3007.08

Activity System ID: 13693

USG Agency: U.S. Agency for International Development

Program Area: Palliative Care: Basic Health Care and Support

Program Area Code: 06

Planned Funds: $1,000,000

Activity Narrative: SUMMARY:

BroadReach Health Care (BRHC) activities include doctor consultations, lab testing, adherence support, patient counseling, remote decision support, quality assurance monitoring, training for both patients and health professionals, support groups and data management. Basic Care and Support activities are in support of individuals participating in an antiretroviral therapy (ART) program, largely representing the population of those HIV-infected, but not yet eligible for ART. The major emphasis is on human resources with minor emphasis on quality assurance and training. These emphasis areas are realized through clinical and non-clinical services, human capacity development, quality assurance, referrals and linkages and South African Government (SAG) support including meeting equipment, infrastructure and human resource needs. Primary target populations include people living with HIV and AIDS (PLHIV) and their families/households, program managers, public and private doctors, nurses, laboratory workers, pharmacists, other health care workers, the business community/private sector, CBOs, FBOs, and NGOs.

BACKGROUND:

PEPFAR funds support BRHC initiatives which provide HIV and AIDS clinical management, care and support services to HIV-infected, uninsured individuals in public sector government facilities and areas where the SAG ART roll-out has not yet reached or where there is high demand. The BRHC PEPFAR program began in May 2005 and now operates in 15 communities across five provinces. Today, BRHC is supporting approximately 3,500 individuals directly with care and treatment and 15,000 indirectly. The BRHC mission is to tap into private sector health professionals to provide comprehensive care and treatment, fostering capacity building initiatives and service delivery within the public health system, and partnering with and supporting community-based programs with sustainable impact on long-term patient care. BRHC leverages the community-based PLHIV support programs to identify and assist with treatment literacy, adherence support and ongoing community mobilization, prevention education activities, and positive living initiatives. In addition, BRHC works to build capacity in public health facilities, focusing on human capacity development including clinical training, clinical mentorships, patient training and operational assistance training. BRHC is expanding its provision of additional staff and infrastructure support to SAG facilities. Finally, BRHC is expanding its involvement in the design of scaleable down referral models in partnership with FBOs, CBOs, and as a partner in innovative public-private partnerships (PPPs).

ACTIVITIES AND EXPECTED RESULTS:

The primary goal of this program area is to ensure that new patients are started on ART when clinically qualified and enrolled patients continue to receive outstanding care and support.

ACTIVITY 1: Clinical Services

BRHC patients will be treated in accordance with SAG ARV National Guidelines and provided regular doctor visits, laboratory tests, HIV and AIDS education, counseling, TB screening, and cotrimoxazole prophylaxis. Using a family-centered approach, BRHC will recruit eligible family members of HIV-infected patients - including greater numbers of men and children - in order to improve the health of families/households and facilitate family doctor visits and drug pick ups. Care includes the preventive package, symptom and pain management, a care support program (during the time from when a patient finds out his or her HIV-infected status until eligible for ART), are care during and after the initiation and possibly failure of ART. Patient nutrition and wellness needs will be met by the provision of multivitamin supplements, and doctor, patient and facilitator training in nutrition.

ACTIVITY 2: Human Capacity Development

1) BRHC will continue to provide training to its network of providers including doctors, nurses, pharmacists and other healthcare professionals through a variety of initiatives including remote decision support, telemedicine, web-based training, didactic training, and clinical mentoring from experienced HIV and AIDS clinicians. Comprehensive HIV and AIDS training for health professionals includes ART Management, TB, adherence support, management of complications and side-effects, prevention and pediatric HIV management.

2) BRHC will continue to focus on community training on topics including HIV and AIDS, ART, adherence support, living positively and prevention with positives, universal precautions and accessing psychosocial support in communities. BRHC will continue to train support group facilitators on topics including HIV and AIDS, ART, adherence, disclosure, and linking patients with psychosocial services in the community.

ACTIVITY 3: Support to SAG

BRHC will support capacity development for care and support services at partner SAG facilities. According to SAG articulated needs, these services will include commodity procurement, healthcare financing, human resource recruitment and salary support (for doctors, nurses, pharmacy staff etc.), BRHC doctors providing temporary services at SAG facilities, training of SAG staff in HIV care and treatment and/or ART program management, and physical infrastructure building/refurbishment and equipment procurement. BRHC will work with SAG staff to improve operational efficiency in SAG facilities through needs assessments including identification of key bottlenecks and then generate and implement solutions. Additionally, BRHC will support SAG National Department of Health (NDOH) efforts, by assisting with development of down-referral models. Finally, BRHC will build on its existing public-private (PPP) model (SAG - BRHC - Daimler Chrysler) in East London and develop new PPPs to further involve small to medium enterprises in supporting employees and dependents in the communities where they operate, alleviating some of the burden on government services.

ACTIVITY 4: Referrals and Linkages

Development of linkages and referral systems will be provided through strengthened referral networks between the public and private sectors (including referring stable patients back to the SAG ARV program), assistance to local clinics to facilitate SAG down referral process. Finally, BRHC will continue to expand its community-based linkages with CBOs in order to refer patients in need of non-USG funded food parcels and other wraparound services intended to support patients.

Activity Narrative:

ACTIVITY 5: Quality Assurance/Quality Improvement (QA/QI):

Recognizing the critical role of monitoring and evaluation in ensuring a successful program, BRHC QA/QI activities include regular internal data and systems audits, collection of patient level surveillance data, exception reports, doctor-specific feedback report, and doctor decision-making support. The BRHC adherence program monitors and evaluates patient adherence through monitoring of drug pick up information, clinical reports, self-reported adherence, and pill counts.

All BRHC activities articulated in the FY 2007 COP will be scaled up significantly in FY 2008 through its partnerships with 15 SAG hospital systems (which include hospitals and affiliated CHCs and PHCs).

With FY 2008 funding, BRHC's palliative care activities will be expanded and enhanced as follows:

-BRHC will continue to support QA/QI at each of its public sector partner hospitals through QA assessments, systems re-engineering, and the development of reporting systems that provide program management feedback that is used to improve program performance and more closely monitor patient care.

-Strengthen down referral activities between public sector hospital partners and their affiliated clinics (PHCs) by re-engineering referral processes, improved data management and patient tracking, and training.

-Training for health professionals at all public sector sites (hospitals and PHCs)

-HIV and AIDS Literacy training for patients as part of community mobilization

-Expanded care and treatment activities through the BRHC PPP to additional Daimler Chrysler supply chain companies/employees and their families and communities.

-Staff augmentation: BRHC will provide additional salary support to fill key positions within SAG partner hospital sites. BRHC will also work with the site to motivate for the creation of permanent posts where needed and ensure that BRHC/PEPFAR supported staff are incorporated into subsequent site budgets to ensure a sustainable staffing solution

BRHC Basic Healthcare and Support activities directly contribute to the 2-7-10 objectives of supporting 10 million people with basic healthcare and support by expanding these services in South Africa.

6.5 Total number of individuals provided with HIV-related palliative care (excluding TB/HIV)	38,050	False
6.6 Total number of individuals trained to provide HIV-related palliative care (excluding TB/HIV)	625	False

Indirect Targets

In addition to its own treatment program, BroadReach indirectly supports patients who are provided care and support through the Aid for AIDS (AfA) care and treatment program. AfA is a private sector program providing workplace HIV programs for major companies in South Africa. Through BroadReach support to AfA, all patients benefit from enhanced care support, education, and monitoring.

Activity ID: 3319.08

Planned Funds: $1,523,546

Activity System ID: 13731

Activity Narrative: SUMMARY:

Columbia University (Columbia) carries out activities to support implementation and expansion of comprehensive HIV treatment and care. The major emphasis area for this program will be human resources, with minor emphasis on infrastructure development, technical assistance and training, community mobilization, quality assurance and supportive supervision and strategic information. The target population will include infants, children and youth (non-OVC), men and women (including pregnant women and family planning clients), people living with HIV (PLHIV) and healthcare workers in the public and private sectors.

BACKGROUND:

Columbia, with PEPFAR funds, began supporting comprehensive HIV care and treatment activities in South Africa, in 2004. HIV palliative care has included training of healthcare workers in providing standard care for opportunistic infections (OI) management, use of cotrimoxazole prophylaxis for common OIs, and the provision of information on when and where to refer for end-of-life care. In FY 2006, in response to provincial HIV care and treatment priorities, Columbia began strengthening the down-referral of services from hospitals to primary health clinics. This resulted in a total of 42 health facilities receiving technical and financial support from Columbia, including public hospitals, community health centers, primary health care (PHC) and an NGO-run care support center. In FY 2007 additional health facilities in KwaZulu-Natal (East Griqualand and Usher Memorial Hospital and the Kokstad Community Clinic) received technical and financial assistance for HIV care and treatment services.

In FY 2008 Columbia will expand its reach by providing basic care and support to PLHIV in Free State. The health facilities to be supported will be determined after negotiations with the Free State DOH.

ACTIVITIES AND EXPECTED RESULTS:

All activities are in line with South African Government (SAG) policies, and activities will be undertaken to create sustainable comprehensive HIV care and treatment programs and primarily include four activities:

ACTIVITY 1: Training and Onsite Clinical Mentoring

Currently healthcare providers rendering services at ART sites participate in ongoing didactic training events and are continuously supported with regular clinical and supportive supervision. In FY 2007 Columbia initiated a Nurse clinical training with emphasis on the development of a comprehensive HIV nurse preceptor (NP) training and support program. The outcome of this training was to have NPs; situated at the Columbia-supported ART sites, focusing on building the capacity and skills of facility-based nurses to deliver high quality HIV patient care and treatment including elements of the preventive care package for adults and children including OI screening and prophylaxis (including cotrimoxazole, TB screening/management), counseling and testing for clients and family members, safe water and personal hygiene strategies to reduce diarrheal disease. Initially, trained NPs would be responsible for providing daily clinical guidance and constructive feedback, using custom designed assessment and training tools, to facility-based site nurses providing basic HIV patient care and treatment. In keeping with the Department of Health HIV and AIDS and STI strategic Plan 2007-2011 (NSP) objective of increasing the level of nurse participation in management of HIV individuals including those on ART - with nurses initiating ART in 20% and 50% of eligible HIV-infected adults in 2008 and 2009, respectively. The NP program has included: (1) one-week didactic training that includes clinical material currently in development by the WHO as part of their second-level, competency-based 'Integrated Management of Adolescent and Adult Illness' (IMAI) training program; (2) onsite mentoring of patient triaging, provision of complex care and treatment, modeling on how to conduct basic and complex patient case conferences, evaluation of nurses' basic HIV care and treatment skills and developing instructional plans to address the performance gaps and assisting NPs in practicing teaching; and (3) a series of at four continuing education sessions lasting two to three days.

By FY 2008 the first nurse mentorship initiative training would have been completed and Columbia will review the recommendations of this initiative to make a determination as to whether similar training activities need to be rolled out in the Eastern Cape, KwaZulu-Natal and/or in Free State.

ACTIVITY 2: Community-based Support

Columbia is involved in the implementation of Peer Educator (PE) programs to enhance retention into care and to maximize adherence to treatment. More than 30 Columbia-supported PEs are currently working at St. Patrick's, Holy Cross, Frere and Cecilia Makiwane, Dora Nginza and Livingstone Hospitals. PEs work under supervision of the ART site coordinator or his/her designee to provide: elements of the preventive care package, education on HIV and AIDS care, living positively; psychosocial counseling and emotional support; adherence to care and treatment support; promoting referral linkages to clinic/hospital and other networks; where possible conduct home visits; and attend PE-specific and general PLHIV support groups. Approaches to PLHIV support were initially centralized with the development of care support centers; the current implementation strategy through FY 2007 will be supporting the decentralization of PLHIV services.

In Free State, Columbia proposes to implement Peer educator programs, provide HIV clinical training and mentorship for health professional staff, support the design and implementation of HIV information system and support the integration of PMTCT and TB programs into HIV chronic care

ACTIVITY 3: Strengthening Program Integration Activities

District hospitals and public healthcare facilities have co-located TB, PMTCT and STI services, and integration activities to strengthen these services with holistic palliative care will be carried out in collaboration with the following programs at district and provincial levels:

a. PMTCT: Support early infant diagnosis through the use of dry blood spots (DBS) for PCR testing. This activity will include training PMTCT nurses in specimen collection, information gathering to assess the uptake of DBS and referral linkages of HIV-infected children to chronic care, ensure that HIV-exposed children receive cotrimoxazole. DBS training activities will be carried out in collaboration with the Local

Activity Narrative: Service Area authority and the National Health and Laboratory Services (NHLS).

b. TB: Support active TB case finding and referral for TB treatment for the TB/HIV co-infected. Columbia will support the implementation of TB screening and diagnosis algorithm for HIV-infected patients to include the adaptation of a simple questionnaire for use as a screening tool for active TB at the designated HIV clinics and incorporating the questionnaire into routine clinical care.

ACTIVITY 4: HIV Care and Treatment Information System

Columbia will continue to support the implementation of a provincial information system that captures information on HIV palliative care and ART. Activities in FY 2008 will include:

a. Implementation of facility paper-based non-ART registers that captures non-ART indicators. These facility registers will be introduced mainly at the primary and community health clinics that are designated by the provinces as down-referral sites for HIV care and ART services.

b. In collaboration with the Department of Health and other partners in the Eastern Cape, support the development and implementation of standardized individualized patient records for use at health facilities.

c. Strengthen the paper-based data collection systems at HIV care and treatment sites in the Eastern Cape in preparation for computerization of a minimum set of key data elements.

d. Work with ART managers and facility site staff to support the utilization of information to improve service delivery and patient care.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

With FY 2008 reprogramming funds, Columbia will facilitate greater adherence and reduce loss to follow-up through starting a pilot to using text messaging with cell phones.

By providing basic healthcare and support to people in need in Eastern Cape, KwaZulu-Natal and Free State, Columbia's activities will contribute to the realization of the PEPFAR goal of providing care to 10 million people. These activities also support efforts to meet the care and support objectives outlined in the USG Five-Year Plan for South Africa.

Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	2909.08	**Planned Funds:**	$1,264,000
Activity System ID:	13376		

Activity Narrative: SUMMARY:

Africare's Injongo Yethu Project will continue to support home-based care, expand the number of clinics supported in the Lukhanji Local Service Area, and begin support in at least one other Local Service area. Facilitators of support groups will be developed and nutrition support through clinic and home-based gardens will be expanded. Documentation and planning of care and support will be supported by the development of an electronic database of clients. Palliative care services target all HIV-infected clients and their families, adults and children. Training largely targets South African-based volunteers and public sector nurses. FY 2008 will include a strengthened focus on holistic chronic care for all HIV-infected clients (from time of diagnosis) through empowering support groups in support and education and developing continuity of care interventions in clinics. This is part of the basic package of care for PLHIV.

BACKGROUND:

This is an ongoing activity, building on the deployment of Service Corps Volunteers (SCV) to assist clinic nurses with the supervision of home-based care, health talks and counseling in the clinics. Traditional healers have begun to refer clients for care and treatment, with some providing support to clients on treatment. Pastors and church leaders who were trained in HIV-related care have begun pastoral support to clients. Training of PLHIV as support group facilitators began in FY 2006. With non-USG leveraged funding, demonstration gardens and training in permaculture provided the basis for home- and community-based improved food security and nutrition by making nutrient-dense produce more readily available. A constraint to expansion has been funding for seeds, compost and implements from local government resources. Still, several PLHIV and families at each of eight clinics have begun to grow a combination of high-nutrient vegetables, along with appetizing and micronutrient-rich herbs. In FY 2007, support groups were formed and trained on basic support group management and PLHIV personal empowerment (acceptance of status, etc) in several communities and will provide a basis for continuity and accessibility to care. Continuity of care from the time of testing is being strengthened as a program enrolment and baseline process is being piloted in 3 clinics along with a format for care plans. Collaboration with Columbia University (ICAP) and the Health Systems Information Program (HISP) has led to the development of an electronic patient database that will be ready for deployment when the final Eastern Cape province Treatment Record has final changes made.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Improved Quality of Clinic and Home-based Care

Quality-focused care plans for HBC visits that were piloted with three clinics will be adapted and rolled out to additional clinics. Care plan formats and client enrolment records piloted will also be adapted and rolled out for use by clinic nurses to plan care throughout the client's disease. Home-based care supervision training modules will be presented to nurses, building on last year's work with the SCVs. Training in palliative care will include: evidence-based preventive care interventions which include the following: OI screening and prophylaxis (including cotrimoxazole, TB screening/management), counseling and testing for clients and family members, safe water and personal hygiene strategies to reduce diarrheal disease, HIV prevention counseling, provision of condoms, referral for family planning services for HIV-infected women, appropriate child survival interventions for HIV-infected children and nutrition counseling, clinical measurement, nutrition monitoring and targeted support based on WHO criteria for severely malnourished PLHIV. The package of services to be delivered includes basic pain and symptom management and referral for facility-based support for adherence to OI medications (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART) if needed. Prevention with positives interventions will be an important part of this comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals. A social worker will train in basic counseling for clinical staff, volunteers and pastors. This will link closely with the psychosocial training under the OVC component. The provincially supported course implemented by the University of Fort Hare will be adapted with psychosocial support materials. Nurses and volunteers will be trained as they become available for training. Building on the initial training of PLHIV for support group facilitation, the project will refine support group facilitation training, guidance for PLHIV co-facilitators and orientation for nurses as a support resource; a) a guide for leading groups, b) a modular curriculum for facilitators, and c) information packs for use in groups. Effort will be made for the equitable access of services by males and females.

ACTIVITY 2: Develop a Culture of Managing Patients and Services using Data and Information

In collaboration with Columbia University, Africare has been developing a simple electronic database as a continuity register of HIV-infected clients, linked with the antiretroviral treatment component. A database development service provider (HISP) has been engaged to adapt software that will be open source and compatible with the local health information system, to populate the register, provide documentation on the data entry process, data element and indicator definitions, and to train data entry, health and program management staff. Funds will support software development, training and follow-up needed to effect sound implementation. Implementation, including training in software management as well as using data to manage patients and services will continue through FY 2008. HIV Service Review Guides will be drafted and piloted. It is expected that analyzed data will inform improved quality of the program.

ACTIVITY 3: Provide Direct Training for ECDOH and Africare Staff in Basic HIV and AIDS, CT, PMTCT and ART support

Training organized by the ECDOH has been extremely limited in quantity and frequency, hindering the basic development and certification of professional and volunteer staff. FY 2008 funds will support the establishment of Africare as an accredited training provider for the above areas. Training for Africare's volunteers can then be completed and ECDOH volunteers and professional staff will have an additional source of training made available to accommodate turnover and existing gaps.

ACTIVITY 4: Nutritional support through gardens

Activity Narrative: To promote quality, economical nutrition, through non-USG funding, the team will work with Lukhanji DOH to develop a local low-literacy cookbook (in Xhosa) and home economics guide. Clinic nurses and SCVs will be trained on the use of the guide. Cooking demonstrations will be established at clinics and selected churches on using nutritious foods, especially the foods and herbs from the permaculture gardens. Funding will support referral for nutritional support and monitoring as well as training clinic teams and as budget allows, outfitting modest kitchens, such as adding a table, stove or sink to existing clinic kitchens.

ACTIVITY 5: This initiative is to be managed and carried out by South Africa Partners, with technical input from JRI Health. The aim of this project is to promote early recruitment and retention of PLHIV into Care and Support programs. The lost to follow-up rate from the time of HIV diagnosis to commencement of ART|V therapy is 70%. PEPFAR partners will be trained on implementing a basic package of care services to PLHIV and their family from the time they are diagnosed HIV positive. This package will be implemented within support groups at community level. Expert patients will be trained on empowering their peers to better health seeking behaviors. The goal of the National palliative care program is to ensure the universal access to palliative to all PLHIV and family members especially those who do not qualify for ARV therapy thus establishing a continuum of care from testing HIV positive to end of life care.

FY 2008 activities will also include:

-implementation of a patient registration form for chronic HIV care;
-implementation of the new HIV Treatment Record (paper) developed by Columbia University ICAP for the Province;
-training, orientation, mentoring and tools development to expand support group roles and functions to include community-based support, wellness coaching, education and basic health assessment (as per the national DOH basic package);
-continuation of garden production coaching by SCV and support group members to assist in setting up home-based gardens
-integration of family planning, sexually transmitted infection and other reproductive health services into chronic HIV care; and,
-implementation of the basic package of care through support groups for PLHIV and orientation of clinic nurses.

Geographic changes will include a shift from Emalahleni to Nkonkobe Local Service Area (LSA), and possibly to Makana (Port Alfred) LSA, pending provincial decisions.

Table 3.3.06: Activities by Funding Mechansim

Mechanism ID:	397.08	**Mechanism:**	N/A
Prime Partner:	Africa Center for Health and Population Studies	**USG Agency:**	U.S. Agency for International Development
Funding Source:	GHCS (State)	**Program Area:**	Palliative Care: Basic Health Care and Support
Budget Code:	HBHC	**Program Area Code:**	06
Activity ID:	2996.08	**Planned Funds:**	$727,500
Activity System ID:	13368		

Activity Narrative: SUMMARY:
The Hlabisa ART program aims to deliver safe, comprehensive, effective, efficient, equitable and sustainable ART to all who need it in Hlabisa District, in rural KwaZulu-Natal province. Hlabisa District is characterized by a high HIV prevalence (about 22%), high HIV incidence, unemployment and poverty. Basic care and support services are part of the overarching HIV Care and Treatment program that is jointly run by the Africa Centre for Health and Population Studies, University of KwaZulu-Natal, and the Habisa District Department of Health (DOH). In FY 2008, the program will for the first time provide mobile palliative care teams that bring HIV care to people's homes and support the families of HIV-infected people. Major emphasis is on development of linkages and referral systems. This will be done through support to the SAG, clinical and physical care, home-based care and human capacity development.
BACKGROUND:
The Africa Centre is a department within the University of KwaZulu-Natal, fully funded by grants from mostly overseas institutions. The Program is based in Hlabisa sub-District, a rural health district in northern KwaZulu-Natal which provides healthcare to 220,000 people at one district hospital and 14 peripheral clinics. In September 2004 the program started delivery of ART in Hlabisa and has since expanded ART services to 14 clinics in the sub-district. The Africa Centre and KwaZulu-Natal DOH work to complement each other's abilities and resources in providing care and treatment. The Africa Centre has expertise in infectious diseases and management that are not available at the district DOH. The district DOH has clinical staff and infrastructure on which to build a care and treatment program. The Africa Centre contributes nurses, treatment counselors and physicians to the DOH staff, organizes trainings, supports the management of the supply chain and conducts monitoring and evaluation in cooperation with the DOH. The Africa Centre's basic care interventions are largely focused on care support, the period from when a patient tests positive until such time as s/he requires ART. The basic preventive care package is part of the program, as is symptom and pain management.

With FY 2008 funds the Africa Centre will support the functions mentioned above and expand its support for the DOH. Specifically, Africa Centre involvement will strengthen the palliative care, TB/HIV Program, PMTCT, provision of ART and counseling and testing. Increased attention will be given to address gender issues and to promote the care and treatment services among men and children.

ACTIVITIES AND EXPECTED RESULTS:
ACTIVITY 1: Support to SAG in Hlabisa District through home-based care
FY 2008 funding will be used to provide support to five existing home-based care organizations which are located in the least served areas within the sub-district. These HBC organizations are operating on an ad-hoc basis. They are made up of committed caregivers who are passionate about serving their community, but do not have access to resources or training opportunities. Africa Centre will ensure that the HBC organizations will not only take care of the patients, but assess the situations in the households and take care of other family members if necessary. The identified HBC organizations will also be located near DOH clinics where ART initiations are taking place in order that Africa Centre staff at the clinic can serve as a point of contact. The Africa Centre will facilitate the distribution of HBC kits and food parcels, supplied by DOH to the home-based care organizations.

Capacity building will play a major role in the support of the HBC organizations. Africa Centre will ensure ongoing supportive supervision and mentoring. Training will include DOH-approved HBC, ART literacy, social grants (process for referral of HIV patients who qualify for disability grants) and HIV Counseling, Funding will help to support volunteer stipends and equipment (i.e. computers and bicycles) to further enable these organizations to better manage and support their volunteers.

Funding will also go towards financing additional professional staff, including nurses and social workers who will constitute the core of a mobile team to provide home-based palliative care. In addition, funds will be used to finance a car, pharmaceuticals and other necessary supplies. The nurses in the mobile team will provide basic HIV-related care including prevention messages and symptom and pain screening and management, and the social worker will refer families for psychosocial services provided by the government (government food aid, government grants and the services of social workers). A partially financed physician will visit patients who need more specialized care. The target population for home-based care via the mobile team is non-ambulatory patients who cannot access treatment in clinics and ambulatory patients who request a home visit.

Africa Centre's involvement in the existing HBC structure within the sub-district will facilitate a more cohesive referral system between the DOH, AC and HBC organizations. It will ensure that more home-based caregivers are provided with essential training and resources to better serve the needs of PLHIV in their communities.

ACTIVITY 2: Clinical and physical care
HIV-infected people who are not yet eligible for ART will receive palliative care consisting of screening and treatment of TB, screening for pain and symptoms and elements of the preventive care package such as prophylactic treatment with cotrimoxazole, INH and fluconazole. Africa Centre supported HBC organizations will provide ongoing care and monitoring support, including counseling. Patients will be advised to return to the clinic every six months for a CD4 test and clinical assessment. DOH funds are used for laboratory services (CD4 counts, viral loads, and routine and routine blood and urine tests) and drugs (ARV medication, drugs to treat and prevent opportunistic infections (OIs), and drugs to treat non-HIV-related diseases in HIV-infected patients). Patients on ART and those who are monitored for ART eligibility will be referred to a physician for further care if required. A pharmacy assistant will be trained to assist the DOH pharmacist to facilitate faster treatment of OIs and pain.

ACTIVITY 3: Nutrition
All participants will be referred for nutritional assessment and monitoring for food aid (Philani porridge, sugar beans) from the DOH. In order to ensure nutrition and food security, PEPFAR funding will be used to employ a dietician to teach families the basics of good nutrition. Volunteers will be recruited to train the community in nutrition and food preparation. Africa Centre will seek to establish public-private partnerships (PPPs) with other organizations (e.g. Kellogg Foundation, Garden Africa, Seeds for Africa) for sustainability of these activities.

ACTIVITY 4: Income generating programs for PLHIV

Activity Narrative: Poverty, unemployment and unpleasant socioeconomic status are prevalent to PLHIV in the area. Some are receiving disability grant which is still limited to meet their daily basic needs. In order to uplift their economic status and their nutrition there is a need for those able to be engaged in poverty relief projects/ income generating projects such as beadwork, woodwork, sewing, food gardens, poultry farming and sleep mats. Africa Centre has a Community Development Department, which has, over the past several years, successfully developed income generating programs in the rural area of Hlabisa Sub-district. PEPFAR funding will be used to strengthen the department through additional staff. These staff members will then develop business plans for the PLHIV groups and supervise their activities.

ACTIVITY 5: Referrals and linkages
In order to ensure delivery of holistic palliative care, counselors will be trained on available government support structures to link PLHIV and their families to other government programs, like screening for TB/HIV, PMTCT clinics, food aid, legal assistance and social workers, who can assist the families with applying for government grants.

ACTIVITY 6: Caring for Carers
ART Lay Counselors and Nurses are tasked with counseling and caring for patients affected and infected by HIV and AIDS. On a daily basis, during counseling sessions where they must disclose the patient's HIV status, they must deal with the trauma of the varied reactions of patients who are hearing for the first time that they are HIV-infected. To keep staff dedicated and motivated towards achieving their daily demands there is a need to minimize burnout and work-related stress. The Caring for Carers program aims to protect, support and care for employees tasked with caring responsibilities. The program started in FY 2007 and will have a focus on the new staff joining Africa Centre in FY 2008. The program will develop appropriate team building activities and staff retention strategies.

ACTIVITY 7: Human Capacity Development
The South African DOH and Africa Centre counselors and nurses in the hospital and clinics will be trained in all aspects of care according to government guidelines and standards. Refresher and on-the-job training will be provided as needed, keeping healthcare providers up to date in the delivery of care.

Due to the shortage of staff in the clinics and due to the increasing number of patients and increasing workload, additional staffing in clinics and the hospital will be provided.

ACTIVITY 8: Care Support Program
Services for the persons who have newly tested positive for HIV but are not yet eligible for treatment must be improved. A care support program will be established including: screening for TB, screening for STIs, PAP smears, treatment and prophylaxis of opportunistic infections, immunizations, nutritional information, counseling on family planning and help with grant applications.
