The USG-PEPFAR Team foresees significant changes to the strategic approach employed in Nigeria as we segue into the second five years of PEPFAR supported programming. The basic premise of the PEPFAR supports to Nigeria – to reduce the impact of HIV/AIDS through sustainable treatment, care and prevention programs – will continue to be the focus of our efforts. Yet there is a new operational environment due to the overall PEPFAR II authorization and a resultant shift in emphasis from an emergency response to a health systems-based effort aimed at sustainability of the programs. There is also a significant new opportunity with a country-level Compact for increased strategic and effective leadership from the Government of Nigeria (GON). This change in the approach, coupled with increasing availability of surveillance data, new trends in prevention, diagnosis, care and treatment, and increasing opportunities for coordination with a wider range of stakeholders, offer the prospect of consolidating our achievements and deepening the quality of the services we provide.

With an estimated HIV sero-prevalence rate of 3.1%, Nigeria has the second greatest burden of care and treatment worldwide. An estimated 2.6 million Nigerians are infected and 1.2 million orphans and vulnerable children (OVC) are directly affected by HIV/AIDS. Less than five percent of pregnant HIV-positive women are reached by services to prevent mother-to-child transmission (PMTCT). Currently more than 200,000 individuals are on antiretroviral treatment (ART) nationwide and over a million are in care, but an estimated 750,000 people are in need of treatment. This translates into more than 70% unmet need for treatment. In light of the continuing requirement for supports in the face of this unmet need, PEPFAR is looked to by all the stakeholders in Nigeria as the foundation for the public sector HIV/AIDS response.

The availability of data, at the national and sub-national levels, has increased over the first five years of PEPFAR activity in Nigeria, and the program level evaluations are also helping to shape the national response. Specific national targets will be developed with the Government of Nigeria and other key stakeholders over the next few months as they lead the process of developing a new National Strategic Framework (NSF) for the multi-sectoral response to HIV/AIDS. The PEPFAR program targets over the next five years will be informed by this dialogue, as well as from the anticipated results of the 2008 National AIDS and Reproductive Health Survey (NARHS+) and of the 2008 ANC survey. The base for PEPFAR specific targets will be the maintenance of achievements made, with a particular objective of maintaining the quality of care provided for all patients on treatment and care as well as for all OVC currently receiving PEPFAR supports.

Over the next five years, the focus of the National Response in Nigeria will be to continue the long-term campaign to address the fundamental issues facing a limited health care service delivery system attempting to cope with the critical and increasing demands of the long term management of millions of patients requiring sophisticated chronic care. The Government of Nigeria has indicated that they would be looking for an increased focus on PMTCT, orphans issues, behavior change and prevention initiatives and a greatly expanded counseling and testing program. The PEPFAR program will have to balance the need to provide continued care for current patients while also addressing new priorities in systems strengthening, an increased demand for State level engagement and continuing challenges around commodity provision. Increasing effort will also be needed to ensure tighter collaboration and coordination with other donor and resource groups in the country in order to maximize the available technical and financial resources, with further special attention given to the area of human resources for health.

Table 3.2: Sub-Partners List
Table 3.3: Program Budget Code and Program Narrative Planning Table of Contents

Program Budget Code: 01 - MTCT Prevention: PMTCT

Total Planned Funding for Program Budget Code: $17,837,942

Program Area Narrative:

USG Nigeria’s strategy for COP09 PMTCT activities will build on COP08 activities and strategically increase the geographic spread and availability of PMTCT services in Nigeria through a population targeted approach. HIV prevalence among antenatal clinic attendees was estimated to be 4.4% in the 2005 National HIV Antenatal Serosurvey (ANC) in Nigeria; the 2008 ANC results will be released before the start of COP09 and will be utilized to guide any strategic changes in targeting based on changes in prevalence rates seen. Since 2004, PMTCT coverage in ANC attendees is estimated to have increased from 0.1% to 10%.

PMTCT service provision will emphasize strengthening of diagnostic services for exposed infants, linkages to family planning services, referral networks to reduce loss to follow-up, and infant feeding counseling to support appropriate feeding choices. With the shift in emphasis from a rapid scale-up emergency response to a sustainability response, USG Nigeria made critical programmatic decisions in line with the overall desire to maintain all current clients in care (including OVC) and treatment services, the need to ensure the financial integrity to do so, and therefore the need to make strategic decisions regarding the decreased ability to incorporate significant numbers of new clients into the system under FY 2009. USG determined that counseling and testing efforts should be prioritized first to pregnant women and their exposed infants, secondly to TB/HIV co-infected clients, and thirdly to the general population with a focus on MARPs. In keeping in line with the USG/Nigeria 5-year plan, the areas of strategic focus for COP09 are:

a) to tactically increase coverage of services by supporting states and Local Government Areas (LGAs) at the governance level (with special focus on high prevalence states) to adopt an expansion strategy;
b) to continue sustaining a reduction in cost per direct targets while equally ensuring quality of services across partners;
c) to strengthen the development of secondary and primary level facilities that are closer to communities with linkages to services like Family Planning;
d) to strengthen networks of care that increase ARV service access to women who receive PMTCT services at community sites;
e) to strengthen diagnostic services to serve as an entry point to care and treatment for HIV exposed infants;
f) to strengthen Infant Feeding counseling and support the mothers choice in the community and;
g) to strengthen community based PMTCT programming.

For COP08, PEPFAR is supporting PMTCT services at 264 sites in 22 Nigerian states. In COP09, this will increase to provide direct PMTCT services at 743 sites in all 36 states, including the Federal Capital Territory (FCT). 498,176 pregnant women will be counseled, tested and receive results at these facilities. An estimated 21,864 of those tested will require and receive a complete course of ARV prophylaxis. In COP09, it is estimated that HIV infection will be averted in 4,701 children assuming a transmission rate of 30% without prophylaxis versus 8.5% (EID National average). To achieve this, 2,754 Health Care Workers (HCW) including clinicians, pharmacists, laboratory & medical records personnel, lay counselors, community health workers and traditional birth attendants (TBAs) will be trained to provide quality PMTCT services using the revised National PMTCT guidelines and the National PMTCT training package.

In COP09, PEPFAR will support states and LGAs to rapidly increase coverage of PMTCT in high prevalence states while improving on the gains of the LGA coverage strategy. PEPFAR will provide indirect support to strengthen states and LGA PMTCT systems to provide PMTCT services for their citizens and will actively track these activities. Six states were reached with the LGA coverage strategy in COP08; 6 additional states (Nassarawa, Benue, Taraba, Enugu, Niger, and Kogi) will be reached in COP09. Under the LGA coverage strategy, IP expansion will be regional, with a lead partner for each of the LGA strategy focus states. This facilitates efficiency in service delivery and ease of exiting at the end of PEPFAR II. The capacity of states, LGAs, sites and select indigenous partners will be built both in program management (including financial management) and PMTCT core services to ensure ease of handing over. In the SI program area, USG will support the mapping of service delivery points and begin the development of a fully populated geographical information system (GIS) relational database for in-depth analysis of the nature and trends of the HIV epidemic in Nigeria. In addition to basing expansion on the high prevalence states in the LGA coverage strategy, other communities/populations will be targeted based on GIS mapping outcomes.

The downward reduction in cost per target will be sustained in COP09. This will be $32 (previously in the range of $37-$70) for women counseled, tested and receiving results. The reduction has facilitated the use of funds to improve on geographic spread and resulted in increasing targets with fewer resources while maintaining optimal quality of services.

The National guidelines are now better aligned with the WHO guidelines: women who qualify for HAART based on their health and CD4 count will receive triple therapy. An estimated 20% of women will receive HAART. Partners will prioritize CD4 testing for pregnant women and fast track them to treatment if there CD4 count is <350. Those who do not qualify will get AZT from 28 weeks or Combivir from 34 -36 weeks, single-dose NVP during labor and a 7 day tail of AZT and 3TC. Women presenting in labor will receive sdNVP and the 7 day tail of AZT and 3TC. Infants will receive sdNVP at birth and AZT for 6 weeks. Cotrimoxazole (CTX) prophylaxis for all HIV exposed children from the age of six weeks until proven HIV negative is now routine across sites.
Routine group counseling and testing (HCT) with opt-out at the point of service and rapid same-day results will be strengthened in COP09. A national couple counseling training tool has been rolled out to address disclosure, discordance, and support for infant feeding choices. Routinely offering HCT at labor & delivery and during the postpartum period as well as the use of lay counselors, especially PLWHA will continue to be further strengthened.

The uptake of HCT is about 90% in most sites but uptake of ARV prophylaxis has not been optimal largely due to deliveries outside of health facilities. In COP08, activities have commenced to strengthen the training and involvement of TBAs and other CHWs to support the utilization of PMTCT services, including use of ARV prophylaxis and support for Infant Feeding Choices. To ensure this, the USG will support a PHE working with TBA’s using a modified and piloted curriculum. A training manual for Primary Health Care (PHC) centers will be developed in COP08 to advance the scale-up of PMTCT in lower levels of care. USG (including all PMTCT IPs) is working with the GON to develop this training manual for PHC. This will further support scale-up and acceptability of PMTCT.

COP09 will see a focus on strengthening prevention, care, and treatment networks that employ appropriate referral systems for clients to access care and treatment services. Particular focus will be on increasing community-based activities including the establishment of more secondary and primary health care facilities offering services. There will be strengthening of linkages to higher tiered facilities in the network for medical complications and clinical assessment of pregnant HIV positive women who may require ART for their HIV disease. In addition to receiving PMTCT services, each woman and her family’s needs will be considered, and referrals to OVC services upon positive diagnosis will be made, in order to facilitate care to all of her affected children. The woman will also be referred to a support group and ART services for linkages to care and wraparound family planning services.

In COP08, the USG supported the National scale-up of Early Infant Diagnosis (EID) in Nigeria using Dried Blood Spots (DBS). With the support of PEPFAR laboratories, EID is being scaled-up across the country following a national plan. HIV-exposed infants across the country are now diagnosed from 6 weeks of age and actively linked to treatment, care, and support. This program will be strengthened in COP09 with a view to providing all PEPFAR-supported PMTCT sites with access to this technology.

Issues on Infant Feeding Counseling have been a challenge. In COP08, PEPFAR supported the adaptation of the National Infant Feeding Training Manual, and associated education sessions for obstetricians/gynecologists, pediatricians, and other health workers. It has also conducted a series of zonal TOTs and facilitated formal training sessions across all sites. Sessions targeting IP’s were held, facilitated by The National infant feeding technical team. This support will be enhanced in COP09 with more training across sites and monitoring of services. Facilities will be supported to offer counseling in accordance with current national guidelines which support exclusive breastfeeding for six months with early weaning or exclusive replacement feeding only when the AFASS criteria are met. Replacement feeding is not provided by the USG but has been provided in the past by the GON. In keeping with the latest WHO recommendation, weaning foods can be introduced with breastfeeding until foods are adequate to meet the baby’s nutritional needs. The use of peer groups to provide community support for mother’s infant feeding choices will be ensured by all partners.

COP09 will also see a significant focus on follow-up of mother-infant pairs to ensure continuity of care and to strengthen the linkages between PMTCT and OVC programs. In COP09, linkages to wraparound family planning services leveraging various USAID reproductive health projects and other UN agencies will also be developed and strengthened. Although Nigeria is not a focus country for the President’s Malaria Initiative (PMI), HIV-positive pregnant women at PEPFAR-supported sites are linked to care and receive insecticide-treated nets (ITNs) for malaria prevention. PMTCT clients will also receive CTX in the second and third trimesters for OI prophylaxis including malaria.

Strategies for involving men include couples counseling and use of ‘love letters’ amongst others. This will be facilitated by the recent roll out of a national couple counseling training tool. A key service in COP09 will be the integration of Prevention with Positives (PwP) into care and treatment settings. This will be extended to positive pregnant women. In COP08 the PwP curriculum will be adapted for Nigeria and scaled-up across programs. Partners will address gender-based violence through counseling and awareness campaigns. Partners will continue to use personnel from the ‘mothers to mothers’ support groups as models (i.e., positive women who had previously received PMTCT services) and a mechanism for retaining women in care and increasing use of facilities during childbirth.

The USG will introduce a baby friendly package in COP09 to further enhance retention in care and treatment. This will link services from PMTCT, OVC, and pediatric care, and will include PMTCT Enrollment Package, Delivery Package (aka “Mamma Pack”), Newborn Package (Day one Pack), Infant Package (6 Weeks Pack) and an information brochure.

The USG will continue to support the National PMTCT task team, which meets quarterly. It will provide support to GON to print national registers and to ensure proper data flow and usage. Such information will be used to improve programming at sites. USG will continue to engage GON on the importance of putting the HIV exposure status on the mother and child’s health card. In COP09, there will be greater involvement of the SI team in strengthening record keeping at facilities including data quality assessments, and strengthening state ministry of health involvement in data collection and management.

In COP08, PEPFAR is building the capacity of the GON through an RFA on PMTCT. This new opportunity will enhance the internal capacity of the HIV/AIDS Division (HAD) as well as facilitate monitoring of the National PMTCT program. This program will be sustained in COP09.

USG/Nigeria will strengthen its collaboration with the GON on expansion plans, training, and policy development. It will increase partnerships with other donors supporting PMTCT and pediatric care programs in Nigeria, including the Global Fund, The Clinton
Foundation (CHAI) (procurement of sample collection and test kits for EID and support for transportation network for EID), and UNICEF (training of HCWs). The cost savings from CHAI ranges around $193,249.

Beginning in COP07 and continuing into COP09, the USG will continue to play an active role in the Nigerian Inter-Agency Task Team (NIATT), made up of various USG and UN agencies including UNICEF, WHO and UNFPA. The USG will provide technical assistance to complete currents initial efforts at mapping PMTCT services in high prevalence states to plan scale-up and improve facility and community-based linkages.

The USG will continue its upstream support on key areas such as enabling access to essential PMTCT commodities in states, roll-out of HIV and infant feeding support tools, assistance in implementing the Nigerian national PMTCT monitoring systems, zonal trainings on PMTCT and infant feeding, strengthening the integration of PMTCT into MCH services and periodic site visits for supportive supervision. Various partners are supporting the national and state government responses to achieve these goals.

The USG currently has 3 full-time staff on PMTCT and plans to expand the staffing to strengthen scale-up. The USG PMTCT team will continue to hold quarterly working group meetings which serve as a forum to ensure best practices. It will also continue consultations with the HQ TWG particularly around food and nutrition issues. PMTCT clients will be linked to nutrition/food sources based on the outcome of the nutrition concept paper in COP09.

USG Nigeria has participated in efforts to update the monitoring and evaluation of PMTCT internationally. It has since facilitated GON to engage in such discussions nationally. USG will continue to participate in OGAC’s effort to integrate PMTCT into MCH services.

These activities, when taken together, will significantly strengthen both the quality and geographic coverage of PMTCT services in Nigeria during the COP08 year.

**Table 3.3.01: Activities by Funding Mechanisms**

- **Mechanism ID:** 4133.09
- **Prime Partner:** Africare
- **Funding Source:** GHCS (State)
- **Budget Code:** MTCT
- **Activity ID:** 21665.25289.09
- **Activity System ID:** 25289
- **Mechanism:** HHS/CDC Track 2.0 Africare
- **USG Agency:** HHS/Centers for Disease Control & Prevention
- **Program Area:** Prevention: PMTCT
- **Program Budget Code:** 01
- **Planned Funds:** $80,000
Activity Narrative: ACTIVITY HAS BEEN MODIFIED AS FOLLOWS:
Early Infant diagnosis has been added in this narrative, targets have been reviewed upwards from 1500 to 2500

ACTIVITY DESCRIPTION

This activity is linked to HCT, basic care, OVC services, SI, and sexual prevention.

In COP08 Africare initiated PMTCT services with the establishment of two PMTCT sites in Lagos state with a target of 1,500 pregnant women counseled, tested and receiving their results. In COP09, one additional PMTCT site will be set up at a primary health center with a high volume antenatal clinic (ANC) in Lagos. Work will involve regular outreaches to the traditional birth attendants in the three local government areas to ensure more pregnant women receive testing and counseling services; 2,500 pregnant women will be counseled and tested and will receive their results at the three sites. 125 mothers will receive HAART or ARV prophylaxis onsite.

Africare will continue programming during the COP09 year to emphasize provider initiated opt out testing with group pre test counseling, individual post test counseling with provision of results at ANC, labor and post partum wards. Whole blood samples for women who test positive will be collected and sent for CD4+ count and Hb estimation to ensure HAART eligible mothers are identified, contacted by telephone and actively referred into linked treatment programs at nearby treatment facilities. In accordance with National guidelines, non-HAART eligible HIV-positive pregnant women will receive combivir or zidovudine prophylaxis depending on gestational age. Single dose nevirapine (SD-NVP) will be dispensed on first contact to all positive clients to take home with instructions for use at the onset of labor. Sample logging would be done for blood samples from sites where CD4 estimations are not performed onsite. All HIV-exposed infants at birth will receive SD-NVP and a 6-week course of AZT to take home, which will be dispensed at the labor and delivery. All three PMTCT sites will be linked into the National Early Infant Diagnosis (EID) scale up plan to ensure diagnosis at 6 weeks using dried blood spots, and early referral to care and treatment.

In addition, testing of partners and children of the index client, TB screening of HIV-infected pregnant women with referral for treatment where needed, ARV prophylaxis for HIV infected women and newborns, maternal nutrition and infant feeding counseling and infant follow-up will be supported. HIV positive pregnant mothers will be given unbiased counseling on infant feeding with emphasis on AFASS in accordance with the National PMTCT guidelines. Infant follow-up will continue to be optimized through the co-location and co-scheduling of mother support group activities with infant follow-up clinics, immunization/post natal clinic days, and routine care and support services at all times onsite. Mother support groups will be formed in the new facility and strengthened in the old facilities to provide support from more experienced “Champion Mothers” to newer mothers around appropriate options for delivery, infant feeding, maternal nutritional counseling and disclosure, to reduce the effects of stigmatization. These champion mothers will also receive training and onsite supervision. Mothers will also be strongly discouraged from engaging in mixed feeding.

These support activities will be actively linked into existing OVC and pediatric care and support programs and young kids clubs to optimize sustainable infant follow-up. Cotrimoxazole prophylaxis will be provided onsite as part of the OVC basic care and support continuum from age 6 weeks until final HIV status is known, and for all HIV-infected children. The three PMTCT sites will also have care and support services for families. These sites will be actively linked into a care network with a treatment facility where HAART-eligible pregnant women will be referred.

The program will also continue to support identification of fathers for participation in PMTCT through the support of couples counseling, increasing male involvement through the use of “love invitation letters”, and formation of male support groups integrated into existing community support groups. Women and their partners will receive educational materials, brochures, pamphlets, and other materials during ANC visits. In partnership with Gospel Communications, movies focusing on PMTCT will be aired during the visits. They will also focus on promoting early identification of HIV and early initiation of antiretroviral drugs for HAART-eligible HIV-infected pregnant women and their newborns.

Africare will build capacity at the new facility to provide and strengthen integrated PMTCT and family planning services linked with onsite care services. 26 health care workers will be trained this year to provide PMTCT services, including refresher trainings at the two facilities started under COP08. On-site training will be provided at all three primary health centers for all staff. Laboratory staff will receive training on manual CD4 estimation and a transport mechanism will be set up to ensure CD4 samples can be collected and sent to nearby partner-supported labs with the results transported back to the PHCs to determine HAART eligibility for mothers. All health care workers at the PHC will be trained using the National PMTCT curriculum PMTCT services the full complement of PMTCT eligible services include HIV and infant feeding, making medical injections safer, MIS and early infant diagnosis training. Champion Mother counselors will also be trained on an ongoing basis to provide mother support group leadership.

The PMTCT advisor and other project staff will provide onsite mentorship and supervision of staff at the sites to ensure quality of PMTCT care. The project will provide training and onsite mentorship of counselors to increase skills in couple counseling and integration of partners into PMTCT related decision-making. Nigerian National PMTCT manuals, guidelines, SOPs, registers and job aids will be provided throughout the facilities and will be available for referral and use in the ANC, labor wards and post natal clinics.

Particular emphasis will continue to be laid on data collection and reporting. Staff capacity to work with data around collection, compilation and evaluation will be strengthened through training and follow-up at all points of service delivery, with regular hands-on onsite mentoring and supportive supervision on capturing National PMTCT indicators, completion of registers and proper data entry. Staff will be taught how to interpret and integrate data from all the onsite HCT, OVC, care and support and PMTCT services, ensuring
Continuing Activity: 21665

Activity Narrative: smooth referrals into other onsite programs. Staff will be further trained to use data to improve quality of care and to highlight areas for improvement.

Partnering with the NYSC, Africare will support the employment of an additional youth corps member in the new facility, a physician who will provide support for the PMTCT clinics as well as develop and strengthen the linkages between program components, working alongside the facility based staff. Africare will also partner with already identified traditional birth attendants (TBAs) in the communities where HCT outreach is already taking place and whose pregnant HIV-positive patients will be referred to the primary or secondary health facilities for delivery.

Delivery kits will be provided at the facilities. Each kit will contain gloves, sanitary pads, cotton wool, cord clamp, delivery mat, gentian violet, methylated spirits and clean surgical blades. Defaulter mothers who do not return for subsequent visits will be followed up by the TBAs in the communities who will work alongside the mother support groups and referral network coordinators.

PMTCT services will be strengthened within the framework of a decentralized and integrated HIV care program. All protocols followed will be in line with the National PMTCT guidelines, and outcomes of the program will be reported to the health facilities, local government areas (LGAs), State Action Committee on AIDS (SACA) and state PMTCT programs. Attendance at all state PMTCT meetings by community and LGA PMTCT representatives will be facilitated by Africare.

A patient management team and a project monitoring team will be established at the new facility in keeping with the model of care. The responsibilities of these teams will be separate but have some overlap. The project team will consist of leadership from all units of the hospital who will provide support for the entire hospital-wide project including the administrative support and supervision of the other program areas. The patient management team consisting of direct patient care providers will focus on clinical issues as they arise in the PMTCT clinic, and the provision of continuing medical education. Strong referral networks will be established, aimed at strengthening linkages between the PMTCT services and other care services within the facility, and between separate facilities and the communities they serve. The referral network coordinators will meet monthly and the members will include management and clinical staff responsible for the ANC and PMTCT clinics, support group leadership, referral treatment clinics, local and international NGOs, and other donor projects. It is envisaged that these networks will also encourage rapid testing for syphilis and, if possible, gonorrhea, along with single dose, directly observed treatment as appropriate.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
Africare will contribute to the overall PEPFAR goals of preventing further new infections and reducing HIV incidence and prevalence rates in Nigeria. It will also contribute to the National plan of scaling up PMTCT services across all levels of care. It will help to lay the foundation for a more sustainable HIV intervention program in Nigeria through a focus on community-based responses.

LINKS TO OTHER ACTIVITIES
This activity relates to ongoing activities in care and support (mothers are linked into C&S services once they are diagnosed and initially will receive these through the support groups) care of OVC, early infant diagnosis (infants are immediately enrolled upon delivery as well as their older siblings as applicable), adult and pediatric care and treatment, HCT, sexual prevention, and SI. Health systems strengthening with human capacity development will be emphasized. Gender issues are addressed ensuring both males and females are reached though this program.

POPULATIONS BEING TARGETED
Pregnant women, post partum mothers and their partners and household members including young children – HIV-exposed, infected children and non-infected OVC – will be targeted to ensure they have access to HCT services at entry points to care. HIV-infected women will be provided care, prophylaxis and treatment as indicated, and other family members will receive care and treatment. The non infected women will also receive counseling with their HIV testing to support them to stay negative. Men, support groups, and community and faith based organizations will be targeted to ensure their participation in community PMTCT activities. 26 Health care providers will be trained for service provision. Capacity of local government and state leaders will be built to support prevention activities, particularly PMTCT.

KEY LEGISLATIVE ISSUES ADDRESSED
These include gender equity in HIV and AIDS programming and increasing access of vulnerable groups to services. It also will address health related wraparound programs with safe motherhood, child survival, family planning and malaria prevention initiatives. Gender will be addressed through this project by optimizing the number of pregnant women who receive care, support and prophylaxis, as well as increasing male involvement by involving partners of pregnant women in the decision making and actively engaging them in the issues around PMTCT and infant health. Partners will be encouraged to test for HIV using “invitation love letters”, an activity that seeks to actively engage prospective fathers. Infected partners or family members will be integrated into the HIV care and support and ARV service program areas.

EMPHASIS AREAS
Emphasis areas are strengthening of referral networks between PMTCT and other vertical programs and increasing male involvement.

**Table 3.3.01: Activities by Funding Mechanism**

Mechanism ID: 7830.09

Prime Partner: To Be Determined

Funding Source: GHCS (State)

Budget Code: MTCT

Activity ID: 17733.25306.09

Activity System ID: 25306

Mechanism: HHS/CDC RFA TBD/FMOH

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Prevention: PMTCT

Program Budget Code: 01

Planned Funds: [ ]
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Under COP08, the USG through CDC began a process to identify key programmatic areas for direct funding to the Federal Ministry of Health’s HIV/AIDS Division (HAD) through a sole source mechanism. In COP09, this process will continue with the development and implementation of specific work plans for this activity. With this funding, HAD will build the capacity of its staff at the National, State and Local Government levels to lead an integrated health sector response. The capacity of HAD staff to provide integrated program management will be built and will ensure that PMTCT program related trainings, supervision, service provision and quality assurance activities are carried out in line with nationally and internationally acceptable standards. Through this grant, HAD will also ensure that the National PMTCT Technical Working Group (TWG) meets as scheduled in their operational plans. HAD will also facilitate the distribution and dissemination of the PMTCT Standard Operation Procedures (SOP) and Guidelines to ensure they are understood and adhered to by PMTCT service providers across the nation. HAD will develop a mechanism for feedback on both documents from the end users.

The expected outcomes of this technical approach will include: improved technical performance in conducting site visits by HAD staff at all levels; improved performance by thematic Technical Working Groups in their advisory functions; and improved adherence by service providers to National standards for PMTCT services provision.

As a result of the Nigerian Federal Ministry of Health (FMOH) and HIV/AIDS Division (HAD)’s mandate which is national in scope, the funded activities will be implemented in a way that covers the entire country in COP09. However, HAD will focus most of the activities on underserved populations across the nation.

HAD will achieve these through a three-pronged approach as follows:

a. Training of HAD staff at the National, State and Local Government Levels on supervisory and monitoring skills following a gap analysis and development of appropriate training programs. This will be followed by adaptation of existing supervisory and monitoring tools.

b. Enabling and facilitating the meetings of the National PMTCT TWG. HAD will work in collaboration with the TWG to visit service delivery sites and collate and analyze supervision reports to serve as a basis for advisory functions of the TWG. The inactive National HIV/AIDS partners’ forum will be reactivated to meet on a biannual basis.

c. Development of SOPs, guidelines, training curriculum and manuals for program areas that currently do not have such manuals. HAD will also disseminate and distribute these materials to end users (service providers) through National and State level workshops. HAD will ensure that feedback is received from the end-users, articulated and forwarded to the appropriate TWG to enhance their coordination function.

CONTRIBUTIONS TO OVERALL PROGRAM GOAL:
Through improved capacity at the federal government level, this will contribute to the GON goal of increasing access to PMTCT services nationwide.

LINKS TO OTHER ACTIVITIES:
This activity is related to activities in other program areas as the FMOH/HAD develop skills in program management and oversight that can be applied across the broader HIV/AIDS response.

EMPHASIS AREAS:
Emphasis in this activity will be on training, human capacity development, health system strengthening and SI.

New/Continuing Activity: Continuing Activity

Continuing Activity: 17733

**Table 3.3.01: Activities by Funding Mechanism**

- **Mechanism ID**: 9399.09
- **Prime Partner**: Vanderbilt University
- **Funding Source**: GHCS (State)
- **Budget Code**: MTCT
- **Activity ID**: 21671.25312.09
- **Activity System ID**: 25312
- **Mechanism**: HHS/CDC Track 2.0 Vanderbilt
- **USG Agency**: HHS/Centers for Disease Control & Prevention
- **Program Area**: Prevention: PMTCT
- **Program Budget Code**: 01
- **Planned Funds**: $192,000
ACTIVITY NARRATIVE

This activity is linked to ART drugs, OVC and pediatric care and treatment, TB/HIV, lab, HCT, adult care and treatment, and SI. In COP08 Vanderbilt counseled, tested, and provided results to 5,800 pregnant women in 5 sites (2 comprehensive and 3 satellites). In COP09, Vanderbilt will build on the successes achieved in COP08 by supporting the government of Nigeria in providing PMTCT services to a total of 6,000 pregnant women in a total of 7 sites (2 comprehensive and 5 satellite sites) and will provide antiretroviral prophylaxis to 300 HIV-infected pregnant women. To achieve this goal Vanderbilt anticipates training and re-training 20 health care workers (HCWs) to provide PMTCT using the National PMTCT Training Curriculum.

PMTCT services will be offered at the two comprehensive and five satellite sites in line with the National PMTCT Guidelines. Group health information will be provided to ANC clients during the morning health talk and opt-out HIV testing will be offered to all attendees according to the current Nigerian HIV-testing algorithm. Same day HIV test results will be provided to clients during individual posttest counseling. Women who test positive for HIV will be sent for onsite CD4 testing (if available) or referred to one of the comprehensive centers for CD4 testing. Those eligible for treatment will be offered HAART and those eligible for prophylaxis will be provided with ARV prophylaxis consistent with the recommendations of the National PMTCT Guidelines. Currently, the standard ARV prophylactic regimen for PMTCT consists of: antenatal zidovudine (ZDV) beginning at 28 weeks gestation or ZDV/lamivudine (3TC) beginning at 34 - 36 weeks; intrapartum ZDV/3TC/NVP and; postpartum ZDV/3TC to mother for seven days. All HIV-exposed infants will receive single dose NVP within 72 hours of birth and ZDV for the first six weeks of life. Replacement doses of NVP will be available in the labor wards of project-supported facilities for women who forget to take their NVP prior to admission.

Considering that an anticipated 20% - 40% of pregnant women will present to the labor ward “unbooked”, Vanderbilt will train the labor ward midwives to provide point-of-care, opt-out, intrapartum HIV testing and to provide NVP prophylaxis to HIV-infected women. These mothers will also receive the postpartum regimen (ZDV/3TC for seven days) and their infants will be tested at six weeks. Women who present postpartum, or do not receive their test result until after delivery, will be offered HIV testing in the postpartum ward. If the woman tests positive, her infant will receive the standard postpartum infant regimen of single dose NVP and six weeks of ZDV. The mother will be referred to a treatment program for evaluation.

Vanderbilt will support the training of 20 health care workers on PMTCT using current National guidelines. All of the Vanderbilt-supported sites will be enrolled into the National Early Infant Diagnosis (EID) Program by the end of COP09. HIV-exposed infants will initially be tested for HIV infection from 6 weeks of life using DNA PCR. Repeat testing will be performed according to the national EID testing algorithm taking into consideration the child’s breast-feeding status. Vanderbilt will provide EID training using the current national EID training curriculum. Vanderbilt-supported sites will make use of the existing PCR labs as well as the National EID collection supplies and transport support to carry out EID at supported sites. The sites are aware that getting infants back for follow-up and HIV testing is often challenging and will consult with the in-country PEPFAR team regarding effective strategies. One approach may be to use lay counselors for follow-up. Healthcare workers will also be trained using the National Infant Feeding Training curriculum and will provide unbiased information on infant feeding following the FAFFS criteria.

Community outreach activities will raise awareness of the program, encourage pregnant women to receive HCT, and encourage women and their family members to be tested for HIV. Vanderbilt will partner with other groups participating in the national network of care and treatment, government institutions and community-based NGOs in the project area in order to ensure that mechanisms are in place to effectively respond to the treatment needs of HIV positive pregnant women. Vanderbilt will continue to support and expand community outreach programs aimed at increasing community and patient education about PMTCT, encouraging clients to adhere to medication through understanding of treatment, follow-up visits, etc. In collaboration with community-based organizations (CBOs) appropriate follow-up of clients and continuum of care will be assured. Contracts with local CBOs in the vicinity of project sites will be put into place to provide home-based care including medication administration, as needed. The project will also strengthen the capacity of community institutions to provide quality health-related wrap-around services including family planning, safe motherhood, nutritional support and other services as appropriate.

CONTRIBUTION TO PROGRAM

The Vanderbilt PMTCT program activities are consistent with the PEPFAR goal of providing high-quality PMTCT services aimed at preventing mother-to-child HIV transmission including counseling and testing for pregnant women, ARV prophylaxis for HIV-infected pregnant women and newborns, counseling and support for maternal nutrition and safe infant feeding practices. The program will also contribute to strengthening human capacity through training of health workers, community workers and PLWHAs and their families.

LINKS TO OTHER ACTIVITIES

This activity is linked to ART drugs, OVC and pediatric care and treatment, TB/HIV to provide ART to clients with TB, lab to provide ART diagnostics, HCT as an entry point to ART, adult care and support for HIV infected adults and their children, and SI. The activities will provide the GON with crucial information for use in the evaluation of the National ARV program and recommended drug regimens.

POPULATIONS BEING TARGETED

The counseling, testing and clinical care component of these activities will target pregnant women seeking ANC and their babies. The operational elements of these activities (M&E, personnel training, infrastructural supports, technical assistance and quality assurance) target program managers, doctors, nurses, pharmacists and lab workers at PEPFAR-supported sites. The expansion of PMTCT services to satellite rural health facilities will increase access to necessary services in poor communities.
Activity Narrative: KEY LEGISLATIVE AREAS:
Vanderbilt-supported activities will promote gender equity in PMTCT programs and increase access to services by the vulnerable groups of women and children. It will help increase service uptake and promote positive male norms and behaviors. This program will also help reduce stigma and discrimination through its community-based programming.

EMPHASIS AREAS
This program seeks to increase gender equity in programming through counseling and educational messages targeted at vulnerable pregnant women and girls. Furthermore, through gender sensitive programming and improved quality services the program will contribute to reduction in stigma and discrimination and address male norms and behaviors by encouraging men to contribute to care and support in the families. Vanderbilt will strengthen the capacity of community institutions to provide quality health-related wraparound interventions including family planning, safe motherhood, nutritional support, malaria, and other wraparound services as appropriate.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The project will be scaled-up in Zamfara state with replication of activities in other local government areas (LGAs).

Activity Description

The Zamfara Akwa Ibom HIV/AIDS project (ZAIHAP) will use evidence-based technical and programmatic approaches to improve access to quality PMTCT services in the target states. In the first two years of the project (COP08, COP09), the focus will be on Zamfara state where three sites will be supported to provide PMTCT services in COP08 and another three sites in COP09, making a total of 6 sites.

The overall goal of the proposed project is to establish sustainable approaches for the reduction of morbidity and mortality due to HIV/AIDS among vulnerable populations. By using platforms of integrated health services and community outreach to scale-up PMTCT and HIV counseling and testing (HCT) programs, ZAIHAP will strengthen the capacity and expansion of primary prevention of HIV infection.

Jhpiego is currently working in Zamfara state to implement the ACCESS program, which focuses on strengthening primary and secondary health facilities to provide emergency obstetric and newborn care (EmONC) services as well as increasing demand for these services through community mobilization activities.

In COP09, ZAIHAP will continue to work with the State Ministry of Health (SMOH) and State Agency for Control of AIDS (SACA) to increase access to and use of high quality PMTCT services at facility and community levels in Zamfara state. Using a network approach with basic PMTCT secondary health care centers linked to primary health care centers, ZAIHAP will provide a hub and spoke model of PMTCT services across all supported sites.

Group health information will be provided to all antenatal clients. Individual pre-test and post-test counseling will be offered and HIV testing and counseling using the opt-out approach will be provided to all pregnant women at the time of antenatal booking. All points of service will provide same-day results. An estimated 7,500 pregnant women will be counseled, tested, and receive their test results. Partner testing will be offered as part of counseling using onsite facility or referral to an HCT site. Women who are HIV-negative will be counseled on how to remain negative, safer sexual practices, and safe motherhood. Healthcare providers from these sites will participate in the national couple counseling training.

An estimated 300 HIV-positive pregnant women will be provided with a complete course of ARV prophylaxis. Pregnant women who are infected with HIV will also receive other services at PMTCT sites including medical evaluation, laboratory analysis network including CD4 count (onsite or within network through specimen transportation), and treatment of opportunistic infections (OIs). Pregnant women requiring HAART for their own health will be placed on therapy (based on the national guidelines) at the secondary health centers or through referral from the primary health centers. For women not requiring HAART, the national PMTCT guideline that prescribes ZDV from 28 weeks or ZDV/3TC from 34/36 weeks will be followed. They will also be placed on intrapartum NVP and a 7-day ZDV/3TC postpartum tail. Infant prophylaxis will consist of single dose NVP at birth and ZDV for 6 weeks. Cotrimoxazole will be provided to all HIV-exposed infants from 6 weeks of age until a definite diagnosis is made.

The project will ensure that after delivery, all HIV-positive women are properly referred to the nearest ART center for care and treatment and directed to wraparound services such as health and psychosocial support, gender-based violence prevention and response, support for formal and informal education, skills and vocational training and income generation. All HIV-positive women will be counseled on appropriate infant feeding options. This counseling will be done using the national PMTCT guidelines where unbiased counseling will be offered and informed choice made between exclusive breastfeeding (EBF) and formula feeding if AFASS. HIV-positive women will also be linked to support groups within the network, which will provide both education and ongoing support around infant feeding choices.

Jhpiego will participate in the national early infant diagnosis program where all six sites will be linked. These services will be provided using dried blood spots (DBS) technology. All HIV-exposed infants will be linked postpartum to the nearest OVC services.

Jhpiego will train 20 health workers in three sites on the provision of PMTCT services using the national PMTCT training curriculum. ZAIHAP will apply the Community Action Cycle (CAC) and Partnership Defined Quality (PDQ) methodologies, which will bring service providers and community members together to define quality of care, identify and prioritize problems and create solutions. This will empower and mobilize local communities to support and increase demand for uptake of PMTCT services. Support groups for mothers will be established/strengthened to promote uptake of PMTCT and other maternity services and adherence to treatment protocols, using the Mothers-2-Mothers model.

Jhpiego will use national PMTCT registers across all sites and train three M&E officers using the national PMTCT MIS system. These M&E officers will play a critical role in building the capacity of the LGAs and will also send monthly reports to the SASCP.

Contribution to Overall Program Area

Jhpiego’s work at these six sites will contribute to achieving the PEPFAR 2-7-10 goals of preventing more than 1.1 million new HIV infections, providing care to 1.75 million people and providing ART to 350,000 people. To measure and report on progress toward achieving program objectives, Jhpiego will implement a detailed monitoring and evaluation (M&E) plan that acknowledges the critical importance of collecting and reporting on the PEPFAR program-level indicators. Program-level indicators will be collected quarterly during site visits through available project records, client registers, and the Nigerian National Response Information Monitoring System (NNRIMS), as appropriate. Jhpiego’s Training Information Monitoring System (TIMS) will also be used to track persons trained and facilitate follow-up.
Activity Narrative: While recognizing that data from the Jhpiego-supported sites will be reported to the Ministry of Health to calculate the outcome indicators on a national level, Jhpiego will also calculate these indicators on a project level to ensure proper project implementation and management.

Links to Other Activities
The ZAIHAP project will build onto and link closely with Jhpiego’s ongoing ACCESS program in Zamfara state which has strong community mobilization and demand generation interventions. ZAIHAP will take advantage of this existing network and add messages on the benefits of PMTCT, the existence of PMTCT services to reduce the likelihood of HIV transmission to infants, and appropriate infant feeding choices. The PMTCT activities can serve as a platform through which other family members are targeted for HCT services. ZAIHAP activities will be linked to other important services such as HIV care and treatment, OVC services, and other services including psychosocial support and economic empowerment schemes, through referral to nearby services. Understanding the importance of the ‘Three Ones’, Jhpiego will work with the Ministry of Health, UNAIDS, and other donors to implement the National M&E Plan and support the National HIV/AIDS Strategy.

Target Population
The target population is pregnant women and their infants. These women will be reached through both facility based (antenatal clinic) and community-based activities. Women reached through community activities will be encouraged to utilize antenatal care services in the health facilities.

Key Legislative Issues
This activity addresses the key legislative issue of gender, as pregnant women will be provided with ARV prophylaxis and treatment. Data will be collected from our female clients to demonstrate this.

Emphasis Areas
The activity includes a major emphasis on local organization capacity building and minor emphases on quality assurance, quality improvement and supportive supervision, commodity procurement and infrastructure.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP09, the Harvard University plans to move over 4 of its PEPFAR supported sites to APIN, Ltd (APIN). The sites include Lagos University Teaching Hospital, Nigerian Institute of Medical Research, Onikan Women’s Hospital, and Mushin General Hospital. The activity narrative reflects the transfer of targets from Harvard to APIN. The activities will build on the structure and systems put in place through Harvard. APIN will maintain a strong collaboration with Harvard University.

NARRATIVE:
In COP08 APIN supported PMTCT in 2 sites. In COP09 funding will support 4 additional sites, providing a comprehensive PMTCT program in line with the revised National PMTCT Guidelines (2007), for a total of 6 service outlets in 3 states (Lagos, Ogun and Oyo). This consists of 2 tertiary, 3 secondary and 1 primary (PHC) sites. “Opt-out” testing and counseling with same-day test results will be provided to all pregnant women presenting for antenatal care (ANC) and labor and delivery (L&D). The current level of PMTCT counseling and testing uptake from women presenting for ANC or L&D is 90%. All women are provided post-test counseling services on prevention of HIV infection, including the risks of MTCT. They are encouraged to bring partners and family members for onsite HCT. The program has a target of providing HCT to pregnant women with 14,200 receiving results. PMTCT prophylaxis will be provided to approximately 852 women in line with the national guidelines. In addition, APIN will provide basic care and ARV prophylaxis to 852 HIV-exposed infants. Infant follow-up care linked with PMTCT activities includes nutritional counseling and support, growth monitoring, cotrimoxazole prophylaxis and other preventative care services. Early Infant Diagnosis (EID) will be carried out using dried blood spots (DBS) in line with the national EID scale up plan.

Through this program area, APIN will provide linkages to other prevention, care and treatment services. All ART-ineligible women will be placed on zidovudine from 28 weeks and or zidovudine and lamivudine from 34-36 weeks until delivery and will be enrolled into basic care services at the time they access PMTCT services. Following delivery, mothers will be monitored in the care and treatment program, where services include onsite enrollment or referrals for family planning and other reproductive health services. In addition, PMTCT services are integrated into a system of maternal and child services designed to promote maternal and child health for all women. All ART-eligible pregnant women will be provided with ART through the adult care and treatment program area in line with national guidelines. Children who become HIV-infected during the time they are being monitored as part of the PMTCT program will be linked to the pediatric care and treatment program. Those HIV-exposed children placed on single dose nevirapine at birth and zidovudine for 6 weeks and who remain uninfected at 18-months following the completion of ARV prophylaxis will be linked to the OVC program for continued services.

Counseling on infant feeding options occurs during the antenatal period, at L&D, and throughout infant follow-up and is done according to the National PMTCT and Infant Feeding Guidelines. Infant feeding counseling will be performed in an unbiased manner and women will be supported in their choice of method. Clients will also be counseled on the beneficial effect of couple/partner HCT/disclosure on adherence to infant feeding choice. A follow-up team consisting of counselors and a home-based care (HBC) support group of PLWHAs will assist in home and community tracking of positive mothers to provide nutritional support and ascertain infant diagnosis. This funding will support the ANC, labs, ARV prophylaxis intervention to mothers and babies (not ART), and training of personnel involved in PMTCT.

A regular training program will be established at all sites to train and retrain 111 personnel involved in the PMTCT program using the National PMTCT Guidelines. This includes non-laboratory personnel who will be trained in HIV counseling and testing and traditional birth attendants (TBAs) using an adapted curriculum in local areas near sites in PMTCT counseling. PMTCT counselors in the National PMTCT Program will also be trained. APIN Ltd will provide technical assistance for the development of the National Infant Feeding Counseling Manual and will subsequently conduct a zonal training of trainers with this manual.

During COP09, APIN will scale up the Harvard initiated quality assurance/quality improvement (QA/QI) activities to the APIN-supported PMTCT sites. The program will also continue to monitor and utilize electronic data captured through SI activities to measure the quality of services provided as well as the associated patient outcomes.

APIN will partner with Harvard and other implementing partners (IPs) in the implementation of the PEPFAR-Nigeria local government area (LGA) coverage strategy in the program areas of PMTCT, OVC and TB/HIV, designed to ensure the provision of PMTCT and TB/HIV services in at least one health facility in each LGA of Oyo state. Under the coverage strategy, these facilities are all linked with primary health facilities, which provide HCT and referrals for PMTCT services for HIV-infected mothers.

EMPHASIS AREAS
This activity will place emphasis on the development of networks through expansion into more local areas through a network of secondary or primary PMTCT clinics, with rural outreach to community healthcare workers and TBAs involved in home delivery. All community workers and TBAs with whom APIN works are linked to tertiary health care facilities. In addition, major emphasis will be placed on building organizational capacity in order to work towards sustainability of PMTCT centers. These system strengthening activities are led by local investigators at current PMTCT sites who participate in new site assessments, overseeing QA/QI, capacity development and training for new PMTCT centers. Emphasis is also placed on performing targeted evaluations of PMTCT interventions in line with National guidelines to estimate the rate of transmission with each of the ARV prophylaxis regimens used.

POPULATIONS BEING TARGETED
In addition to providing PMTCT services to pregnant women that know their HIV infection status, this program also targets women who may not know their HIV status and may be at greater risk for MTCT. Furthermore, it targets infants who are most at risk of becoming infected from an HIV positive mother during the antepartum, intrapartum and postpartum periods. Through the counseling and testing program area,
**Activity Narrative:** APIN seeks to target a broader group of adults by encouraging women to bring their partners and family members in for HCT. Furthermore, training activities will train public and private health care workers on the implementation of PMTCT protocols and HIV-related laboratory testing.

**CONTRIBUTIONS TO OVERALL PROGRAM AREA**
Through the PMTCT program, APIN will provide counseling and testing with test results to 14,200 pregnant women. Additionally, treatment and prophylaxis will be provided to 852 pregnant women. Implementation of the National PMTCT Guidelines in 6 sites contributes to the PEPFAR goal of expanding ART and PMTCT services. Counseling will encourage mothers to bring their partners and family members for testing to reach discordant couples and expand the reach of HCT. This program is implemented in geographically networked sites to optimize training efforts and provide collaborative clinic/lab services as needed. APIN will train and retrain 111 health care personnel from the PMTCT sites, including doctors, nurses, pharmacists and counselors. Training will build capacity at local sites to implement PMTCT programs and provide essential treatment support to pregnant women with HIV/AIDS. Capacity building efforts are aimed at future expansions of PMTCT programs. QA/QI will be carried out through personnel training, data collection from sites for monitoring and evaluation and supervisory visits from key program management staff, which may include representatives from the USG and government of Nigeria (GON).

The program will increase gender equity by specifically targeting pregnant females for HCT and PMTCT prophylaxis and their male partners for HCT. Data collection on PMTCT regimens in line with the National guidelines provides a basis for developing strategies to ensure that all pregnant women have access to needed and optimally effective PMTCT services. This program addresses stigma and male norms and behaviors through the encouragement of partner notification and bringing other family members in for HCT. Infant feeding counseling, including on the appropriate use of exclusive breastfeeding or exclusive use of breast milk substitute (BMS) where AFASS is available, will be in line with the National PMTCT Guidelines. Referrals to income generating activities (IGAs) will also be provided to women as a part of palliative care and counseling activities.

**LINKS TO OTHER ACTIVITIES**
This activity is also linked to counseling and testing, OVC, adult and pediatric care and treatment, sexual prevention, biomedical prevention, SI and gender. Pregnant women who present for HCT services will be provided with information about the PMTCT program and referred to the PMTCT program if they are eligible for these services. ART services for HIV-infected infants and mothers will be provided through adult and pediatric treatment services. Basic pediatric care and support, including support for chosen feeding option and TB care, is provided for all infants and children through pediatric care and treatment and OVC activities; all exposed infants identified through PMTCT services will be linked to these OVC services. Pregnant women are at high risk for requiring blood transfusion. Personnel involved in patient care will be trained in universal precautions as a part of injection safety activities. Additionally, these activities are linked to SI, which provides support for monitoring and evaluation of the PMTCT activities and QA/QI initiatives.

Activity Narrative: ACTIVITY DESCRIPTION

This activity is related to activities in ARV services, Basic Care and Support, OVC, counseling and testing, SI, and Lab.

In COP08, URC is providing PMTCT services to 2,000 women in Enugu State through work at 12 sites. This was implemented in coordination with the government of Enugu and the state SASCP. In COP09, URC will continue to support and strengthen PMTCT services in all 12 sites and expand services to 3 additional sites making a total of 15 PMTCT supported sites. URC will help set up and improve linkages between comprehensive ART sites at the primary and secondary facility. Following the national PMTCT guidelines, the hub and spoke model will be utilized. The comprehensive sites will form the hub and the primary cares sites will be the spokes. This will allow for increased access to diagnostic and monitoring tests for PMTCT. Stand alone PMTCT points of service at the primary care level will be liked to adult and pediatric care as part of a comprehensive PMTCT network.

At URC supported PMTCT service points 2,500 pregnant clients will be provided opt-out provider initiated HIV testing, counseling and results. URC will train 12 healthcare workers to provide couple counseling using current national training manuals. The prevention with positives package will be utilized in all sites. This will provide an opportunity to interrupt heterosexual transmission, especially in discordant couples. HIV testing and counselling will be provided during labor and delivery by facility supported staff. HIV rapid tests will be used for women who present at delivery without antenatal care.

URC will support facilities to provide highly active antiretroviral therapy (HAART) to pregnant women if their CD4 is less than 350 in accordance with the National PMTCT guidelines. For the women not requiring HAART, the current national guidelines recommended short course ARV option will be provided which includes ZDV from 28 weeks, ZDV/3TC from 34-36 weeks and intrapartum NVP, and a 7 day ZDV/3TC postpartum tail. This will result in the provision of ARV prophylaxis to 125 pregnant women. All HIV-positive women will be linked post-partum to an HIV/ARV point of service, which will utilize a family centered care delivery model whenever feasible, co-locating adult and pediatric care and providing a linkage to family planning services this approach will involve providing the services at the points most appropriate and convenient including maternal and child services.

HIV-exposed infants will be provided with single dose NVP at birth and ZDV for 6 weeks in accordance with Nigerian National PMTCT Guidelines. Cotrimoxazole suspension for all exposed infants will also be provided from 6 weeks until definitive HIV diagnosis. Testing of infants will be carried out using dried blood spot (DBS) specimen collection. URC will actively participate in the national early infant diagnosis initiative by providing infants for DBS testing from 6 weeks of age.

All capacity development undertaken by URC for its PMTCT program will adhere to the Nationally approved training curriculum and will utilize the existing trainer of trainers (TOT) in Enugu to support the training and retraining of 40 health workers on PMTCT across all sites.

URC notes the importance of ensuring postpartum follow up for completion of prophylaxis, early infant diagnosis, cotrimoxazole prophylaxis and referral of mothers for ongoing care, support and treatment if indicated. URC with its partner, Vision Africa, will work with community health workers to prevent losses outside the health facility. Within the health facility, URC will encourage the formation of multidisciplinary teams to adapt national referral procedures and to oversee program implementation and improvement. URC will ensure the use of the national PMTCT registers across all supported sites and work to strengthen data collection and transmission and encourage the use of this data at the site level to improve implementation.

The PMTCT program will work closely with the care and support program to ensure no mothers are lost to follow-up. Particular attention will be paid to community linkages through community health workers as many women obtain most of their pre and postpartum care from them. These workers will be trained and supported to improve referrals to hospitals for antenatal care and to help track and refer clients for delivery. Vision Africa will continue its work, supported by URC, in this area.

POPULATIONS BEING TARGETED
This activity targets pregnant women who will be offered HCT, HIV-positive pregnant women for ARV prophylaxis and infant feeding counseling, and exposed infants for prophylaxis and EID.

KEY LEGISLATIVE ISSUES ADDRESSED
This activity addresses gender since treatment will be provided to women and will focus on family centric issues including male involvement in PMTCT programming.

EMPHASIS AREAS
Major emphasis of this activity focuses on training and network/linkages. Minor emphasis includes other sectors and initiatives, commodity procurement, and community mobilization/participation.

Program Area: Prevention: PMTCT  
Program Budget Code: 01  
Planned Funds: $256,000
Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

ACTIVITY DESCRIPTION:

In COP08 IFESH supported PMTCT activities in 15 sites. In COP09 IFESH will continue to conduct activities at these 15 sites. IFESH will support the equipping of two of the health facilities that are in rural communities and will promote their utilization. All sites will be in Rivers and Imo states. IFESH will serve as lead PEPFAR IP in Rivers state and will support and provide technical assistance to the Rivers state government to improve the quality and coverage of PMTCT services in the state. A total of 8,000 pregnant women will be counseled, tested and receive their results in COP09. Of this number, 352 pregnant positive women will receive Antiretroviral (ARV) prophylaxis for PMTCT.

As in COP08, group health information and opt-out HIV testing and counseling (HCT) will be offered to all pregnant women at antenatal clinic. IFESH will promote task shifting and the use of lay counselors, particularly in facilities within hard-to-reach or underserved communities. Unbooked women presenting in labor will be offered HCT. Same day results will be provided at all points of service. Posttest counseling will be provided to all women. Couple counseling and partner testing will be offered on-site to increase disclosure, address issues around discordance and increase support for mother’s infant feeding choices. HIV-positive pregnant women have access to laboratory services including CD4 counts. Samples for CD4 are collected and transported to the sites where CD4 machines are located. IFESH will strengthen this network of sample transportation. Women requiring HAART for their own health (CD4 count less than 350) will be referred to sites providing ART services with follow-up to ensure access to these services. PMTCT services will be provided based on the recently revised (2007) Nigerian National PMTCT Guidelines. HIV-infected women ineligible for HAART will receive zidovudine (AZT) from 28 weeks or AZT/3TC from 34 weeks and single dose nevirapine (sdNVP) at the onset of labor as well as the combivir tail for 7 days. IFESH will initiate the provision of ‘take home’ sdNVP at first contact. All HIV-positive women will be offered pCTX (cotrimoxazole) within the 2nd or 3rd trimester depending on booking date. Women presenting in labor will be offered HCT and if HIV-infected provided with sdNVP as well as the combivir tail for 7 days. All infants born to HIV-infected women will receive sdNVP at birth and AZT for 6 weeks.

In COP09, IFESH will conduct support groups to promote utilization of PMTCT services, follow-up mother/infant pairs to ensure uptake of ARV prophylaxis and provide support for infant feeding choices. IFESH will support the provision of unbiased infant feeding counseling starting from ANC and continuing through the postpartum period. Community-based workers will also ensure that infant feeding options are in accordance with the WHO and the newly adopted Nigerian infant feeding guidelines: exclusive breastfeeding for the first 6 months of life or exclusive breast milk substitute (BMS) if the AFASS criteria are met. IFESH will strengthen its collaboration with traditional birth attendants (TBAs) in order to improve uptake of PMTCT services. Cotrimoxazole prophylaxis will be provided to all exposed infants from 6 weeks of age and continued pending definitive diagnosis of HIV status. IFESH will strengthen referrals of HIV-exposed infants to appropriate pediatric care and treatment services as well as OVC services. IFESH will support the provision of early infant diagnosis (EID) to HIV-exposed infants in line with the National EID Initiative. Dried blood spot (DBS) samples will be sent to a PEPFAR-supported DNA PCR laboratory. In addition to receiving PMTCT services, each HIV-positive woman will be referred to OVC services upon her HIV diagnosis in order to facilitate care to all of her affected children.

For pregnant women who test negative, IFESH will support the provision of prevention counseling and related support. In COP09, IFESH will initiate the provision of rapid testing in the existing family planning (FP) clinics and also create linkages between the FP clinics and care and support services.

IFESH will use supervisory teams to conduct quarterly visits to all sites to ensure optimal quality of care. All HIV-positive clients who are ART eligible will continue to be referred to the state ARV clinics and state pediatric HIV clinics for treatment. In COP09, 60 PMTCT service providers will be trained using the recently revised National PMTCT Training Manual. Step down trainings will also be carried out regularly to address problems of staff transfer and attrition and also to maintain human capacity.

Quality Assurance (QA) for both counseling and testing will be carried out at timely intervals in COP09 through submitting blood samples to a designated reference laboratory for testing and sending certified counselors for site assessments. All 15 sites will use the National PMTCT registers and data collection for monitoring and evaluation of all activities in line with the National PMTCT MIS.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:

Supporting 15 sites in rural areas of Rivers and Imo states is in line with the desire of the Government of Nigeria to have 1,200 PMTCT sites operational and with the USG’s target of having 80% coverage for PMTCT across the country.

LINKS TO OTHER ACTIVITIES:

This activity is linked to activities in care and support, AB, other prevention, OVC, HCT, TB/HIV, and strategic information. Prevention with positives counseling will be integrated within PMTCT care for HIV-positive women. The basic package of care provided to all HIV-positive patients will be available to HIV-positive pregnant women. Women requiring HAART for their own health will be linked to within network ART services. Laboratory staff will ensure that HIV testing provided within the PMTCT context is of high quality by incorporating PMTCT sites into the laboratory QA program.

POPULATIONS BEING TARGETED:

This activity targets men and women of reproductive age, family planning clinics, pregnant women, their spouses or partners, and the children of the index pregnancy and health care workers. Community and faith-based organizations (CBOs, FBOs), support groups, and men will also be targeted so that they participate fully in community-based PMTCT services.

EMPHASIS AREAS:

The PMTCT service has an emphasis on training, local organization capacity development and development of linkages/referral networks. This activity addresses the issue of “Gender” since services are
Activity Narrative: primarily targeted at women. The activity also addresses the key legislative area of “Stigma and Discrimination” as issues of disclosure and discordance are addressed.

COVERAGE AREAS:
Sites are located in Rivers and Imo states, which were chosen based on high HIV prevalence and proximity to each other.

Mechanism: HHS/CDC Track 2.0 Pathfinder
Prime Partner: Pathfinder International

Funding Source: GHCS (State)

Budget Code: MTCT

Activity ID: 21685.25356.09

Activity System ID: 25356

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Prevention: PMTCT

Program Budget Code: 01

Planned Funds: $192,000
Activity Narrative: Pathfinder (PI) in COP08 supported PMTCT activities in a total of eight facilities (two general hospitals and six primary health centers (PHCs)) in two local government areas (LGAs) of Edo state where the HIV prevalence is 4.6% (HSSS, 2005). In COP08 this program is providing HIV counseling, testing and results to 6,000 pregnant women. In COP09, PI will add on two new ‘feeder’ sites from among PHCs/private hospital facilities in the same LGAs (one in each LGA) as COP08. Therefore, PI will provide PMTCT services and community outreach activities throughout ten (10) hospital networks. These networks will provide HIV counseling and testing to 6,000 pregnant women, who will receive their results.

PI will train 8 health care workers (HCWs) using the National PMTCT training curriculum in addition to those trained under COP08. The program will also support infrastructure, purchase equipment and supplies, monitor, evaluate and provide supportive supervision to the sites. Active efforts will be made to facilitate the public health approach in taking PMTCT services to the primary (PHC) and community levels.

In COP09, PI will support comprehensive PMTCT services for communities, including marked expansion of HIV testing for pregnant women. PI will work to increase uptake of these services, including routine antenatal care and facility-based deliveries. Pregnant women, especially HIV-positive mothers, will be supported to deliver in health facilities through the provision of the national safe motherhood program delivery kits (“mama kits”). Post-delivery care and treatment for women and infants will be augmented. The use of ART for PMTCT will follow the National PMTCT guidelines. HIV-infected women who are not eligible for HAART for their own disease will be offered a combination of zidovudine (AZT) from 28 weeks (when feasible) or combivir from 34-36 weeks, cotrimoxazole prophylaxis (pCTX) and single dose nevirapine (SD-NVP) at onset of labor. Women presenting at labor will be offered rapid testing and if HIV-infected provided with SD-NVP. All positive women ineligible for HAART will receive a combivir tail as their postpartum regimen.

All infants born to HIV-infected women will be provided with SD-NVP at birth and AZT for 6 weeks. 276 mother-baby pairs will receive ARV prophylaxis. PI will provide support for a mother’s infant feeding choice through appropriate infant feeding counseling as well as provide ongoing psychosocial and adherence support. Health facilities will be supported to provide basic laboratory services and will be linked to a laboratory network model in which CD4 testing can be performed via specimen transport systems. In addition, linking with family planning (FP) counseling and service provision and effective condom promotion (including post-partum FP) will be done. Exposed infants will be actively linked to pediatric care and treatment through under-5 cards issued in labor and delivery. Other activities are enhanced pediatric care including prophylactic cotrimoxazole (pCTX) from 6 weeks of age and promotion of best practices for infant feeding, nutritional support and linkages to family planning services.

The project will strengthen the capacity of the additional two (2) facilities to provide quality PMTCT services through providing management and PMTCT technical training for key managers and service providers. Training will include HCT, PMTCT, infant feeding counseling, infection prevention, pediatric follow-up, supervision, monitoring and evaluation and training on laboratory safety skills. Training will again be conducted by selected members of the PMTCT core trainers and supported by staff trained in COP08 of the project using the national curricula as appropriate. An on-site training approach will be used to train laboratory scientists and technicians.

PI will identify and provide orientation for heads of other facilities in the LGA (nurses/midwives) from surrounding local hospitals and provide copies of the referral charts, which will include PMTCT services available at the intervention facilities. PI will strengthen the LGA HIV/AIDS program.

All HIV-exposed infants will be provided with infant diagnosis testing using dried blood spots (DBS) in line with the National Early Infant Diagnosis (EID) Initiative from 6 weeks of age. HIV-positive infants will be linked to appropriate care and treatment services. NGOs (one per LGA) will be sub-granted funds to create demand for PMTCT and implement a number of activities to achieve this objective.

Project staff will visit project facilities on a weekly basis to provide supervision and technical assistance in record keeping and hands-on training on the use of data to improve program quality. There will be on-going technical assistance and oversight of NGO/community-based activities to ensure that activities are carried out as planned. TA will be provided as needed and formal discussions will be held to understand the intervention’s contributions to community needs and to elicit proposed solutions to challenges faced. Visits will carry out quality of service checks, using checklists based on national policy to ensure constant quality service delivery.

The M&E system established in COP08 and led by the M&E officer will be expanded to additional facilities to ensure consistent and continuous reporting and monitoring. Data information and analysis will be shared with facility managers, the PMTCT state team and NASCP. PI will use nationally approved registers and forms across all existing sites.

CONTRIBUTIONS TO OVERALL PROGRAM GOAL
PI, by providing services at the primary and secondary levels, will assist the GON in achieving its goal of decentralizing PMTCT services beyond the tertiary care level and will significantly contribute to an increase in PMTCT services by supporting ten health facilities and also indirectly supporting GON ministries/programs in their rapid scale-up plans for PMTCT. PI will partner with local institutions with appropriate expertise and capacity to reach out to primary facilities in line with national PMTCT scale-up plans.

The targets of 6,000 pregnant women counseled and tested and 276 mother-infant pairs for ARV prophylaxis will be reached by the end of COP09. This will significantly contribute to the emergency scale up plans of COP08. PI will strengthen national and state PMTCT programs by: support of capacity building of healthcare staff for PMTCT services; printing of national PMTCT registers; and support of regular coordination meetings in collaboration with other partners at national and state levels. PI will also strengthen...
Activity Narrative: the programmatic skills of partner CBOs/FBOs in line with GON sustainability plans.

LINKS TO OTHER ACTIVITIES
This activity is related to activities in HCT. HCT will be offered to all pregnant women at ANC, and to their partners. Women presenting in labor will have rapid HIV tests and receive single dose NVP if positive. Infants born to HIV-infected women will access ART (single dose NVP and ZDV) and CTX prophylaxis. Infants will be referred for DBS and linked to appropriate OVC care and treatment services. Community linkages will enable HIV-positive women and family members access to support groups. All pregnant women will be linked into FP services. Partner counseling/communication will be promoted through other prevention with positive activities. M&E activities at PMTCT sites will contribute to the national PMTCT program’s M&E efforts using national PMTCT MIS.

POPULATIONS BEING ADDRESSED
Pregnant women, postpartum mothers, their partners and families, including HIV-exposed infants and HIV-infected children, will be targeted and supported so that they have full access to HCT at multiple entry points of care. HIV infected women will be provided with PMTCT services, while HIV infected infants and children, and infected partners, will access care and treatment services, including OVC services. Uninfected women will be supported to remain HIV negative. CBOs, FBOs, support groups, and men will also be targeted so that they participate fully in community based PMTCT services. Healthcare providers will be trained on providing services while the management skills of GON policy makers and implementers at all levels will be improved to enable them to manage programs effectively.

KEY LEGISLATIVE AREAS
This activity will promote gender equity in HIV/AIDS programs and increase access to services by the vulnerable groups of women and children. It will help increase service uptake, promote positive male norms and behaviors, especially as it relates to discordant couples, and help reduce stigma and discrimination through its community based activities.

EMPHASIS AREAS
Major emphasis of this activity focuses on training, network/linkages and community mobilization/participation. Minor emphasis includes other sectors and initiatives, commodity procurement, IEC, supportive supervision, quality assurance and improvement.

Table 3.3.01: Activities by Funding Mechanisms
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

- Extension of local government coverage to Enugu State
- Extension of EID activities to all sites

The PMTCT services will be linked to HCT, adult and pediatric care and treatment, ARV drugs, OVC, TB/HIV, laboratory services and SI.

ACTIVITY DESCRIPTION:

In COP08, CRS AIDSRelief (AR) supported PMTCT services in 30 Local Partner Treatment Facilities (LPTF) and 2 PMTCT satellite sites (An additional one LPTF and 2 satellites were supported as part of the local government coverage strategy in Anambra state). In COP 09 AR will increase the PMTCT sites it supports to an additional 3 LPTF sites and 13 satellites providing PMTCT services in an effort to decentralize services and increase coverage. This will make it a total of 51 sites providing PMTCT services in 16 states (Abia, Adamawa, Anambra, Benue, Ebonyi, Edo, Enugu, FCT, Imo, Kaduna, Kano, Kogi, Nasarawa, Ondo, Plateau and Taraba). AR, with other IPs, will complete the implementation of the PEPFAR-Nigeria Local Government Area (LGA) coverage strategy in Anambra, ensuring the provision of PMTCT services in at least one health facility in every LGA of the state. This is a critical step toward universal access to PMTCT services. AR will work to extend the local government coverage strategy to Enugu State. This will involve the support of the Enugu state SASCP to establish PMTCT committees.

Through its PMTCT services AR will provide testing, counseling and received results to 29,000 pregnant women. Antiretroviral (ARV) prophylaxis will be provided to 740 women and an additional 246 clients will be placed on HAART for their own disease for a total of 986 women receiving antiretrovirals (4% positivity rate and 85% retention in care based on historical data at AR supported LPTFS). In setting and achieving COP09 targets, consideration has been given to strengthening the quality of service delivery in order to promote the best outcomes.

This activity will include, as a part of the standard package of care, routine provider initiated opt-out HIV counseling and testing (HCT) in antenatal clinics (ANC) for all presenting women and in labor and delivery wards (L&D) and the immediate post-delivery status. Same day results will be provided to clients. AR will use group health information, individual pre test and posttest strategies and rapid testing based on the National testing algorithm. Partner testing and couple counseling will be offered as part of PMTCT services to enhance disclosure. AR, through its community and faith-based linkages, will utilize community and home based care services to promote partner testing. Clients will have access to free laboratory services including CD4 counts and STI screening. Free medications including those for OIs as needed and hematinsics will also be provided. In addition to receiving PMTCT services, children of HIV positive clients will be linked to OVC services and, for those who are HIV positive, to pediatric care and treatment services.

Pregnant women requiring HAART will be placed on such during pregnancy and referred to HIV comprehensive care centers after delivery. Referral coordinators will be identified in all AR-supported sites and the communities, with their capacities built in collaboration with other IPs. Consideration may also be given depending on LPTF acceptability to provide ART services within ANC clinics in order to increase acceptability of initiating care and treatment.

For the anticipated number of women not requiring HAART for their own health, the current National guidelines recommended short course two drug ARV option will be provided. This includes ZDV from 28 weeks with intrapartum single dose nevirapine (sdNVP) and a 7-day ZDV/3TC postpartum tail or ZDV/3TC from 34-36 weeks with intrapartum sdNVP and a 7-day ZDV/3TC postpartum tail. Infant prophylaxis will consist of single dose NVP and ZDV for 6 weeks. Single dose nevirapine will be given to all women at first contact. AR will use its community linkages and mother-to-mother support groups to encourage HIV+ pregnant women to deliver in a health facility. For those HIV+ women who choose not to do so and deliver at home, the same community volunteers will follow-up and identify them for needed postpartum services.

AR will explore the training and utilization of traditional birth attendants (TBAs) in addition to the mother-to-mother support groups to reach HIV+ women who choose to deliver outside of the health facility. A focal person at each LPTF will be responsible for tracing HIV+ mothers and their infants in the community and linking them back to care. The HIV+ mothers and their infants will be linked postpartum to ART care and support services which will utilize a family-centered care model.

AR, through its pediatric care and support program, will offer HIV early infant diagnosis (EID) in line with the National Early Infant Diagnosis scale-up plan from 6 weeks of age using dried blood spots (DBS). Implementation of the EID scale-up will be done under the guidance of the GON and in conjunction with other IPs who will be conducting the laboratory testing. AR will collaborate with GoN as appropriate for commodities and logistics support of the EID program. Exposed infants will be actively linked to pediatric care and treatment, while their families will be referred to age-appropriate OVC services. In COP09, AR will work to implement EID with a view to activating all AR LPTFs and their satellites. PMTCT focal persons at all AR LPTFs will keep records of all exposed infants at enrollment soon after birth, informing HIV+ mothers of the 6 weeks exact date for DBS collection. AR will encourage hub LPTFs to step down DBS collection at affiliate PMTCT satellite sites and thus decentralize EID activities at these sites. AR will train members of PMTCT support groups in HCT skills. AR will engage PMTCT support groups and the larger support group (s) in tracking unbooked pregnant women and infants in the community, linking them to sites where they can access HCT. AR will establish linkages and provide necessary referral to AR LPTFs, with full-fledged ANC activities. This will encourage two-way referrals of HIV+ mothers and their infants from these providers to AR LPTFs and thus benefit from EID/ART activities at AR sites. Throughout these linkages there were be a strong focus on ensuring confidentiality at all levels.

HIV+ women will be counseled in the pre and postnatal periods regarding exclusive breastfeeding with early cessation or exclusive breast milk substitute if AFASS criteria are met using the National Infant Feeding Curriculum. AR will support couples counseling and family disclosure that will enhance adherence to infant feeding.
Activity Narrative: feeding choices. Full and accurate information will be provided on family planning and prevention services. Women accessing family planning services will be offered/referred for HIV Counseling and Testing. Infants of positive mothers will be linked to immunization services and well childcare. Cotrimoxazole prophylaxis will be provided to infants from 6 weeks of age until definitive HIV status can be ascertained.

In COP09, AR will strengthen its program for Continuous Quality Improvement (CQI) in order to improve and institutionalize quality interventions. Monitoring and evaluation of the AIDSRelief PMTCT program will be consistent with the national plan for patient monitoring. Within each regional TA team AR will have a PMTCT specialist assisted by a team of nurses and counselors to offer technical assistance to LPTFs and take the lead on training and supervisory activities. AR PMTCT specialists will work in conjunction with regional CQI specialists, program managers, clinical associates, and LPTF PMTCT coordinators as well as counterparts from other IPs. AR regional PMTCT specialists will join the CQI-led team in conducting site visits at least quarterly during which they will evaluate PMTCT clinical services, HCT done in the PMTCT setting, the utilization of National PMM tools and guidelines/SOPs, proper medical record keeping, referral coordination, and use of standard operating procedures in PMTCT. On-site TA with more frequent follow-up monitoring visits will be provided to address weaknesses when identified during routine monitoring visits.

AR will provide training on PMTCT service delivery to 45 healthcare workers and retraining of an additional 45 staff according to the national curriculum. Trained staff will be required to step down trainings to other Health Care Workers in their facilities and in nearby government health facilities as a human capacity development activity. AR will collaborate with UNICEF-supported PMTCT sites and the CRS 7D programs for community and home based PMTCT initiatives in its scale-up plans.

Sustainability lies at the heart of the AR program, and is based on durable therapeutic programs and health systems strengthening. AR will focus on the transition of the management of care and treatment activities to indigenous organizations by actively using its extensive linkages with faith based groups and other key stakeholders to develop a transition plan that is appropriate to the Nigerian context. The plan will be designed to ensure the continuous delivery of quality HIV care and treatment, and all activities will continue to be implemented in close collaboration with the Government of Nigeria to ensure coordination, information sharing and long term sustainability. For the transition to be successful, sustainable institutional capacity must be present within the indigenous organizations and LPTFs they support; therefore, AR will strengthen the selected indigenous organizations according to their assessed needs, while continuing to strengthen the health systems of the LPTFs. This capacity strengthening will include human resource support and management, financial management, infrastructure improvement, and strengthening of health management information systems.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: This activity will provide counseling and testing services to 29,000 pregnant women, and provide ARV prophylaxis to 740 clients. This will contribute to the PEPFAR and GON prevention goals. With 44 operational sites in 18 states, AR PMTCT program supports the rapid scale up of PMTCT services desired by the FMOH.

LINKS TO OTHER ACTIVITIES: The PMTCT services will be linked to HCT, adult and pediatric care and treatment, ARV drugs, OVC, TB/HIV, laboratory services and SI. Pregnant women who present for HCT services will be provided with information about the PMTCT program and referred accordingly. ARV treatment services for infants and mothers will be provided through ART services. Basic pediatric care, including TB care, is provided for infants and children through pediatric care and treatment. All HIV+ women will be registered for adult care and treatment services.

AR PMTCT activities will focus on strengthening community and home-based care services to pregnant women where appropriate and in collaboration with the CRS 7-Diocese program and other family-centered care services provided by UNICEF, GON and the Catholic Secretariat of Nigeria. The AR senior PMTCT specialist will offer technical assistance to 7-Diocese facilities. AR will collaborate with other IPs, particularly IHV-ACTION, working at tertiary institutions for early infant diagnosis using DBS technology.

POPULATIONS BEING TARGETED: This activity targets women of reproductive age and their partners, infants and PLWHAs. This activity also targets training of health care providers, TBAs and mothers who will work as peer educators.

EMPHASIS AREAS: This activity has an emphasis on training, supportive supervision, quality assurance/improvement and commodity procurement. Emphasis is also placed on development of networks/linkages/referral systems. In addition, integrating PMTCT with ANC and other family-centered services while ensuring linkages to Maternal-Child-Health (MCH) and reproductive health services will ensure gender equity in access to HIV/AIDS services.

</table>
NEPWHAN will implement PMTCT activities in six states consisting of 18 sites, with 3 sites located in each state, to provide comprehensive HIV and AIDS prevention, treatment and care. Capacity of sites will be improved to provide PMTCT services in COP09 serving as the hub to other PHCs providing PMTCT services. This activity will provide counseling, testing and referral services to 2,920 pregnant women who will receive their test results. 128 HIV-positive pregnant women will be placed on antiretroviral (ARV) prophylaxis and HAART for their own health. The national prevalence rate of 4.4% was used in setting and achieving COP09 targets. Consideration will be given to strengthening the quality of service delivery in order to promote the best outcomes.

This activity will include, as a part of the standard package of care, routine provider initiated opt-out HIV counseling and testing (HCT) in antenatal clinics (ANC) for all presenting pregnant women, in labor and delivery wards (L&D), and in the immediate post-delivery setting for women of unknown HIV status. Same day results will be provided to clients. This activity will use group and individual pre- and posttest counseling strategies and rapid testing based on the national testing algorithm. Post test counseling and couple counseling will be offered as part of PMTCT services to enhance disclosure. NEPWHAN will also establish community and faith-based linkages and will utilize community and home-based care services to promote partner testing. Clients will have access to free laboratory services including CD4 counts and STI screening. Free medications including those for OIs as needed and hematinics will also be provided. In addition to receiving PMTCT services, each woman will be referred to the ART clinic for further follow-up treatment and care. Her children will be eligible to access OVC services.

Referral systems that incorporate active follow-up will be put in place to ensure that women requiring HAART are not lost during referral for ARV services. Referral coordinators will be identified at sites and in the communities with their capacities built to carry out needed services. This activity will explore the training and utilization of traditional birth attendants (TBAs) in addition to the mother-to-mother support groups to reach HIV-positive women who choose to deliver outside of the health facility. A focal person at each site will be responsible for coordinating the tracing of HIV-positive mothers and their infants in the community and linking them back to care. The HIV-positive mothers and their infants will be linked postpartum to ART care and support services which will utilize a family centered care model.

For the anticipated number of women not requiring HAART for their own health, the current WHO recommended short course two drug ARV option will be provided. This includes ZDV from 28 weeks with intra-partum single dose nevirapine (sdNVP) and a 7-day ZDV/3TC post-partum tail or ZDV/3TC from 34-36 weeks with intra-partum sdNVP and a 7-day ZDV/3TC post-partum tail. Infant prophylaxis will consist of sdNVP and ZDV for 6 weeks. NEPWHAN will use established community linkages and mother-to-mother support groups to encourage HIV-positive pregnant women to deliver in health facilities. For those HIV-positive women who choose not to do so and deliver at home, the same community volunteers will follow-up and identify them for needed postpartum services.

HIV exposed infants will be referred for early infant diagnosis (EID) to the pediatric clinic of the sites for testing in line with the National Early Infant Diagnosis scale-up plan from six weeks of age using DBS. Implementation of the EID scale-up will be done under the guidance of the GON and in conjunction with other IPs who will be conducting the laboratory testing. NEPWHAN will collaborate with Clinton Foundation as appropriate for commodities and logistics support of the EID program. Exposed infants will be actively linked to pediatric care and treatment, while their families will be referred to age-appropriate OVC services. In COP09, PMTCT focal persons at the sites will keep records of all exposed infants at enrollment soon after birth; informing HIV-positive mothers of the six weeks exact date for DBS collection.

Support groups consisting of HIV-positive individuals will be established in communities including identified HIV-positive pregnant women and mothers and will train five members from six communities where the sites are located in HCT skills. These 30 trained members of the PMTCT support groups will be engaged in tracking un-booked pregnant women and infants in the community, and linking them to sites where they can access HCT, PMTCT, EID/DBS collection for their exposed infants and pediatric care and treatment. Linkages with other providers, public and private, who provide full-fledged ANC activities will be established. This will encourage two-way referrals of HIV-positive mothers and their infants from these providers to supported hospitals. Throughout these linkages, there will be a strong focus on ensuring confidentiality at all levels.

HIV-positive women will be counseled in the pre- and postnatal periods regarding exclusive breastfeeding with early cessation or exclusive breast milk substitute (BMS) if FAFASS criteria can be met using the WHO UNICEF curriculum adapted for Nigeria. This activity will support couples counseling and family disclosure that will enhance adherence to infant feeding choices and also record issues of violence surrounding disclosure especially among discordant couples. Full and accurate information will be provided on family planning and prevention services. Women will be offered or referred for HIV counseling and testing. Infants of positive mothers will be linked to immunization services and well childcare. Cotrimoxazole prophylaxis will be provided to infants from six weeks of age until definitive HIV status can be ascertained.

In COP09, NEPWHAN will initiate its program for Continuous Quality Improvement (CQI) in order to strengthen and institutionalize quality interventions. Monitoring and evaluation of the activity’s PMTCT program will be consistent with the national and trained activity-supported PMTCT specialists will work in conjunction with CQI specialists, program managers, clinical associates as well as counterparts at other IPs. PMTCT specialists will join the CQI-led team in conducting site visits at least quarterly, during which they will evaluate PMTCT clinical services, HCT done in the PMTCT setting, the utilization of national PPM tools and guidelines/SOPs, proper medical record keeping, referral coordination, and the use of standard operating procedures in PMTCT. On-site TA with more frequent follow-up monitoring visits will be provided to address weaknesses when identified during routine monitoring visits. State agency representatives and the USG will be included in quarterly monitoring and
**Activity Narrative:** supportive supervision visits and submit reports of visits accordingly.

The activity will collaborate with UNICEF-supported PMTCT sites to provide training on PMTCT service delivery to 36 healthcare workers according to the national curriculum. Trained staff will be used as facilitators to step down trainings to other health care workers in their facilities and in nearby government health facilities as a human capacity development activity.

**CONTRIBUTIONS TO OVERALL PROGRAM AREA:**
This activity will provide counseling and testing services to 2,920 pregnant women, and provide ARV prophylaxis to 128 clients. This will contribute to the PEPFAR goal of preventing 1,145,545 new HIV infections in Nigeria by 2009.

**LINKS TO OTHER ACTIVITIES:**
The PMTCT services will be linked to HCT, basic care and support, ARV services, ARV drugs, OVC, TB/HIV, laboratory services, and SI. All identified pregnant women who present at every point of service will be provided with information about the PMTCT program and referred accordingly. ARV treatment services for infants and mothers will be provided through ART services. Basic pediatric care, including TB care, is provided for infants and children through OVC activities. All HIV-positive women will be registered for adult care and support services.

**POPULATIONS BEING TARGETED:**
This activity targets women of reproductive age and their partners, infants and PLWHAs. This activity also targets training of health care providers, TBAs, and mothers who will work as peer educators and referral persons.

**EMPHASIS AREAS:**
This activity includes major emphasis on training, supportive supervision, quality assurance/improvement and commodity procurement. Emphasis is also placed on development of networks/linkages/referral systems. In addition, integrating PMTCT with ANC and other family-centered services while ensuring linkages to Mother-Child-Health (MCH) and reproductive health services will ensure gender equity in access to HIV/AIDS services.

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

- Targets revised for COP09

ACTIVITY DESCRIPTION

The Nigerian Military provides prevention, care and treatment to its service members and the surrounding civilian community (constituting approximately 75% of the Military’s patient load). The Department of Defense (DOD) – Nigerian Ministry of Defence (NMOD) HIV Program will provide free comprehensive PMTCT services, which will follow the revised national guidelines (2007), to 20 existing sites in COP09. 12,600 pregnant women will receive HIV counseling and testing for PMTCT and receive their test result. 554 women will receive a complete course of antiretroviral prophylaxis in a PMTCT setting. 50 individuals will be trained to provide these services.

A family-centered network approach will be adopted and group health information with routine “opt out” counseling and testing will be provided to pregnant women presenting for antenatal services. Testing will be done following the National testing algorithm with same day results. Post-test counseling will include prevention counseling and education for both HIV+ and HIV- women. A total of 12,600 women will be counseled, tested and receive their results. Partner testing will be promoted. DOD will promote couples counseling and testing to promote disclosure, address discordance and to increase support for infant feeding choices. Staff will counsel clients on their disclosure of HIV status and partner/family notification with an emphasis on client safety. Partner referrals for HCT (individual and/or couple) will be provided. Also, referrals to community-based and barracks-based support groups will be provided to HIV+ clients. Linkages will also be enhanced by counselors who are members of PLWHA support groups.

HIV testing will be offered to all women of unknown HIV status presenting for labor and delivery and in the postpartum period. In accordance with National guidelines, a full course of ARV prophylaxis will be provided to approximately 554 women. ARV prophylaxis will include ZDV at 28 weeks or 3TC/ZDV at 34/36 wks and single dose Nevirapine (sdNVP) in labor with a 7 day 3TC/ZDV tail. All infants born to HIV+ women will be provided with sdNVP at birth and ZDV for 6 weeks. HIV-exposed infants will be provided with cotrimoxazole (CTX) prophylaxis from 6 weeks and will be discontinued once confirmed HIV- and no longer breastfeeding. Post partum women who are clinically eligible for ART will be referred for ARV services at the sites. Family planning and other reproductive health best practices will be promoted while linkages to OVC activities will be enhanced.

Infant feeding education and counseling will begin in the antenatal period in accordance with National guidelines, accompanied by appropriate prevention messages and education to all pregnant women and family members. After delivery, mothers and infants will be followed up to monitor the mother’s health and to support the mother’s compliance of her infant feeding option as well as to provide nutritional support for both. DOD will actively participate in Early Infant Diagnosis (EID) as a component of its pediatric care and treatment program, using revised national guidelines (2007).

In support of DOD’s commitment to build capacity and long-term sustainability in the NMOD, formal training for an additional 50 staff from the existing 20 sites, covering physicians, nurses, midwives and others involved in PMTCT services will be conducted. Trainings will be done in line with the revised National PMTCT training curriculum (2007). By training uniformed members and civilian employees that are in a career track in the Government of Nigeria, this program fosters a generation of skilled workers who are more likely to remain in the military. This contributes to fulfilling PEPFAR goals for independent and sustainable programs.

In addition, commodities and equipment that are required in PMTCT services will be procured via SCMS ($150,000). Depending on site inventories and needs, commodities may include gloves, soap or other disinfectant and other medical consumables. Commodities will be provided to all 20 military sites.

By the end of COP09, the DOD will support 20 NMOD sites in Edo, Benue, Borno, Cross River, Rivers, Delta, Enugu, FCT, Kaduna, Lagos, Oyo, Plateau, Sokoto, Kano, Imo, Anambra and the FCT (15 states and FCT).

CONTRIBUTION TO OVERALL PROGRAM AREA

The DOD PMTCT program will providing HIV counseling and, testing to 12,600 pregnant women and provide ARV prophylaxis to 554 women. This contributes to the goal of preventing new HIV infections in Nigeria. The PMTCT services identify HIV+ women who may need HAART for their own health, thus contributing to PEPFAR Nigeria’s care and treatment goals.

LINKS TO OTHER ACTIVITIES

This activity relates to activities in adult and pediatric care and treatment, laboratory infrastructure, safe blood, TB/HIV and strategic information. Pregnant women who present for counseling and testing services will be provided with information about the PMTCT program and referred accordingly to ART treatment services for infants and mothers will be provided through ART services. Basic pediatric care support, including TB care, is provided for infants and children through pediatric care and treatment activities.

POPULATIONS BEING TARGETED

This activity targets pregnant women and their family members. Activities also target military personnel, civilian employees, dependents and the general population in the communities surrounding the 20 sites.

EMPHASIS AREAS

This activity will address gender equity in HIV/AIDS programs by specifically targeting pregnant women and girls for counseling, testing and treatment. This activity also addresses military populations.

**Program Budget Code**: 01

**Planned Funds**: $220,500
Activity Narrative:
This activity represents funding for one contracted Nigerian program officer/physician position in support of PMTCT activities as well as external technical assistance. The budget includes one FSN salary, overhead charges, funding required for domestic travel, training funds and allocated minor support costs. This funding also includes support for a USMHRP HQ Technical Assistance visit for one week of in-country support by a physician who will provide TA, continuing medical education and mentorship, particularly in the area of early infant diagnosis (EID). TA may also be provided by the USMHRP’s site staff in Kenya, Uganda and/or Tanzania.

The PMTCT program officer will work as a members of the USG Prevention and PMTCT Working Groups, as well as serve on the U.S. Department of Defense – Nigerian Ministry of Defense (NMOD) Clinical Working Group. The program officer’s responsibilities also include: 1) representing the DOD-NMOD in technical discussions with the GON and 2) overseeing relevant technical aspects of the program, including program management and oversight of the 20 DOD-NMOD PEPFAR site PMTCT programs. The program officer will also ensure the expansion of EID, as appropriate, in the Nigerian Military. The program officer will work with other Implementing Partners and the USG team to ensure a harmonized approach that is consistent among partners and promotes the GON national treatment guidelines. S/he will liaise with other non-governmental organizations, such as the Clinton Foundation, to ensure efforts are coordinated.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:
The USG Nigeria team and the implementing partner Harvard University (APIN+ Program) have split the APIN+/Harvard activities between Harvard University and the indigenous partner APIN, Ltd. Therefore, the activity narrative for Harvard that follows has been modified to reflect activities that will be performed specifically by the efforts of Harvard through the APIN+ Program (Harvard) as opposed to APIN, Ltd (which is submitting as a separate narrative under the name APIN). The narrative has also been updated to reflect COP09 goals and targets. In addition, APIN Ltd will be taking over all activities for the following sites previously supported by Harvard: Nigerian Institute of Medical Research (NIMR), Lagos University Teaching Hospital (LUTH), Onikan Women’s Hospital (OWH), and Mushin General Hospital (MGH). In accordance, those sites, their activities and their respective patients are reflected in the APIN Ltd narratives. This transition to building the capacity of the indigenous partner APIN Ltd will promote the long term sustainability of the program.

NARRATIVE:
COP09 funding will support a comprehensive PMTCT program in line with the revised National PMTCT Guidelines (2007) at 64 service outlets in 9 states (Benue, Borno, Ebonyi, Enugu, Kaduna, Lagos, Oyo, Plateau, and Yobe). This consists of 10 tertiary, 21 secondary and 33 primary sites. Opt-out testing and counseling with same-day test results will be provided to all pregnant women presenting at antenatal care (ANC) or labor and delivery (L&D). The current level of PMTCT testing and counseling uptake from women presenting for ANC or L&D is 90%. All women are provided post-test counseling services on prevention of HIV infection, including the risks of MTCT. They are encouraged to bring partners and family members for on-site HCT. The program has a target of providing counseling and testing results to 65,500 women. PMTCT prophylaxis will be provided to approximately 3,275 women in line with the national guidelines. Infant follow-up includes nutritional counseling and support, growth monitoring, cotrimoxazole prophylaxis, HIV testing, and other preventative care services. It is estimated that, of the infants tested for HIV infection, 131 will be HIV-positive; these infants will be referred to the pediatric care and treatment program. Early infant diagnosis (EID) will be carried out using dried blood spots (DBS) in line with the national EID scale up plan. This funding will support the ANC, lab, ARV prophylaxis intervention to mothers and babies (not HAART), and personnel involved in PMTCT.

Through this program area, Harvard will provide linkages to other prevention, care and treatment services. All ART-ineligible women will be placed on zidovudine from 28 weeks and or zidovudine and lamivudine from 34 weeks until delivery and will be enrolled into palliative care services at the time they access PMTCT services. Following delivery, mothers will be monitored in the care program, where services include on-site enrollment or referrals for family planning and other reproductive health services. In addition, PMTCT services are integrated into a system of maternal and child health services designed to promote maternal and child health for all women. All ART-eligible pregnant women will be provided with ART through the adult treatment program in line with the PMTCT guidelines. Children who become HIV-infected during the time they are being monitored as part of the PMTCT program will be linked to the pediatric care and treatment program. Those HIV-exposed children placed on single dose nevirapine at birth and zidovudine for 6 weeks that remain uninfected at 18-months following the completion of ARV prophylaxis will be linked to the OVC program for continued care services.

Counseling on infant feeding options will be conducted during the antenatal period, at L&D and/or at infant follow-up visits using the National PMTCT and Infant Feeding Guidelines. Infant feeding counseling will be performed in an unbiased manner and women will be supported in their choice of method. Clients will also be counseled on the beneficial effect of couple/partner HCT/disclosure on adherence to infant feeding choice. A follow-up team consisting of counselors and a home-based care (HBC) support group of PLWHAs will assist in home and community tracking of HIV-positive mothers to provide nutritional support and ascertain infant diagnosis.

A regular training program will be established at all sites to train and retrain 363 healthcare personnel involved in the PMTCT program using the National PMTCT Guidelines. This includes non-laboratory personnel who will be trained in HIV counseling and testing and traditional birth attendants (TBAs) using an adapted curriculum in local areas near sites in PMTCT counseling. PMTCT counselors in the National PMTCT Program will also be trained. Harvard will provide technical assistance for the development of the National Infant Feeding Counseling Manual and will subsequently conduct a zonal training of trainers with this manual.

During COP08, Harvard piloted a clinical quality assessment (QA) for PMTCT activities at 3 supported sites. During COP09, Harvard will continue to conduct QA activities to improve quality of care in the PMTCT program. The program will also continue to monitor and utilize electronic data captured through SI activities to measure the quality of services provided as well as the associated patient outcomes and transmission rates.

Harvard will partner with other implementing partners (IPs) in the implementation of the PEPFAR-Nigeria local government area (LGA) coverage strategy in the program areas of PMTCT, OVC and TB/HIV, designed to ensure the provision of PMTCT and TB/HIV services in at least one health facility in every LGA of 6 identified states. In COP08, this will be expanded to Benue state. Per patient costs reflect the expansion to at least 33 new sites and scale up as a part of this LGA coverage strategy. Under the coverage strategy, these facilities are all linked with primary health facilities which provide HCT and referrals for PMTCT services for HIV-infected mothers. Harvard will leverage FMOH, UNICEF and other IP support in capacity building/training in identifying new PMTCT sites in its scale-up plans. Harvard will strengthen the Benue state PMTCT committee as part of the LGA coverage strategy. Harvard will support one quarterly PMTCT task team meeting as part of the support to the GON.

EMPHASIS AREAS
This activity will place major emphasis on the development of networks through expansion into more local areas through a network of secondary or primary PMTCT clinics, with rural outreach to community healthcare workers and TBAs involved in home delivery. All community workers and TBAs with whom
**Activity Narrative:**

Harvard works are linked to tertiary health care facilities. In addition, major emphasis will be placed on building organizational capacity in order to work towards sustainability of PMTCT centers and further expansion of the Nigeria PMTCT program in conjunction with the Federal Ministry of Health and USG. These system strengthening activities are led by local investigators at current PMTCT sites who participate in new site assessments, overseeing QA/QI, capacity development and training for new PMTCT centers. Minor emphasis is placed on performing targeted evaluations of PMTCT interventions to estimate the rate of transmission with each of the ARV prophylaxis regimen used. Emphasis areas also include military populations through support for PMTCT activities staff at 68 Military Hospital and Military Hospital Ikoyi, Lagos.

**POPULATIONS BEING TARGETED**

In addition to providing PMTCT services for pregnant women that know their HIV infection status, this program also targets women who may not know their HIV status and may be at greater risk for MTCT. Furthermore, it seeks to target infants who are most at risk of becoming infected from an HIV-positive mother during the antepartum, intrapartum and postpartum periods. Through the HCT program area, Harvard seeks to target a broader group of adults by encouraging women to bring their partners and family members in for HCT. Furthermore, training activities will train public and private health care workers on the implementation of PMTCT protocols and HIV-related laboratory testing.

**CONTRIBUTIONS TO OVERALL PROGRAM AREA**

Through the PMTCT program, Harvard will provide HCT with test results to 65,500 pregnant women. Additionally, treatment and prophylaxis will be provided to 3,275 pregnant women. Implementation of the National PMTCT guidelines in 64 sites (new and continuing) contributes to the PEPFAR goal of expanding ART and PMTCT services. Harvard is increasing the number of sites by adding secondary and primary level sites in the radius of Harvard-supported tertiary care institutions. The tertiary centers will continue building the network capacity and coverage in of target states. Counseling will encourage mothers to bring their partners and family members for testing to reach discordant couples and in focused HCT programming. This program is implemented in geographically networked sites to optimize training efforts and provide collaborative clinic/lab services as needed. Harvard will train and retrain 383 health care personnel from the PMTCT sites, including doctors, nurses, pharmacists and counselors. Training will build capacity at local sites to implement PMTCT programs and provide essential treatment support to pregnant women with HIV/AIDS. Capacity building efforts are aimed at future expansions of PMTCT programs. QA/QI will be carried out through personnel training, data collection from sites for monitoring and evaluation and supervisory visits from key program management staff, which may include representatives from the USG and GON.

The program will increase gender equity by specifically targeting pregnant females for HCT and PMTCT prophylaxis and their male partners for HCT. Data collection on PMTCT regimens provides a basis for developing strategies to ensure that all pregnant women have access to needed and optimally effective PMTCT services. This program addresses stigma and male norms and behaviors through the encouragement of partner notification and bringing other family members in for HCT. Infant feeding counseling, including on the appropriate use of exclusive breastfeeding or exclusive use of breast milk substitute (BMS) where AFASS is available, will be in line with the National PMTCT Guidelines. Referrals to income generating activities (IGAs) will also be provided to women as a part of palliative care and counseling activities.

Additionally, as part of the PEPFAR sustainability building efforts, Harvard will provide technical assistance and support for APIN Ltd. to assume program management responsibility for PMTCT activities. This will include the implementation of a plan to transition site oversight, management and training over to APIN. The goal of such efforts is to provide for greater assumption of responsibility for management and implementation of PEPFAR programming by Nigerian nationals through an indigenous organization.

**LINKS TO OTHER ACTIVITIES**

This activity is linked to counseling and testing, OVC, adult and pediatric care and treatment, sexual prevention, biomedical prevention, SI, human capacity development, health system strengthening, and gender. Pregnant women who present for HCT services will be provided with information about the PMTCT program and referred to the PMTCT program if they are eligible for these services. ART services for HIV-infected infants and mothers will be provided through adult and pediatric treatment services. Basic pediatric care and support, including support for chosen feeding option and TB care, is provided for all infants and children through OVC activities. All exposed infants identified through PMTCT services will be linked to these OVC services. Pregnant women are at high risk for requiring blood transfusions. Personnel involved in patient care will be trained in universal precautions as a part of injection safety activities. Additionally, these activities are linked to SI, which provides support for monitoring and evaluation of the PMTCT activities and QA/QI initiatives.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS: 30 new points of service added. Early infant diagnosis (EID) is referenced and reader is referred to Pediatric Care and Treatment narrative.

ACTIVITY DESCRIPTION:
Utilizing a network model with PMTCT care centers linked to secondary and tertiary “hub sites” that provide more complex PMTCT care and lab testing, in COP09 125,000 pregnant women will receive PMTCT counseling & testing and receive their results. A total of 136 PMTCT sites will be supported (106 sites established by the end of COP08 and 30 sites added by the end of COP09). Sites are located in 23 states: Akwa Ibom, Anambra, Bauchi, Benue, Cross Rivers, Delta, Edo, FCT, Gombe, Imo, Jigawa, Kaduna, Katsina, Kogi, Kwara, Lagos, Nasarawa, Niger, Ogun, Osun, Plateau, and Sokoto. ACTION will pay particular attention in Nasarawa state as the Lead IP to support the development and implementation of the PMTCT LGA (local government area) coverage strategy that ensures there is at least one PMTCT point of service in each LGA. The scale up of ACTION-supported PMTCT services in COP09 will be focused at ANC sentinel sites including the primary health center level.

PMTCT stand alone points of service in the network are linked to adult and pediatric ARV care through utilization of a PMTCT consultant coordinator in each network based at the hub site, network referral standard operating procedures (SOPs), monthly PMTCT network meetings, and incorporation of team approaches to care in all training and site monitoring. Through this SOP, HIV-positive pregnant women who require HAART are linked to an ARV point of service. Particular emphasis is placed on the involvement of community health workers who are the primary source of care for women in the pre and post-partum period and are integral to a program that seeks to engage women where they seek care. This program will work closely with the care and support team to maximally engage community based PMTCT and ARV linkages. In addition to receiving PMTCT services, each HIV-positive pregnant woman will be referred to OVC services in order to facilitate care for all of her affected children.

Opt-out testing and counseling with same day test results will be provided to all women presenting for ANC and untested women presenting for labor and delivery. All women are provided pre-test counseling services on prevention of HIV infection including the risks of MTCT. Partner testing is offered as part of PMTCT services or through referral to on-site HCT centers where couples can be tested and counseled and a prevention with positives (PwP) package will be utilized in all sites. This will provide an opportunity to interrupt heterosexual transmission, especially in discordant couples and will facilitate partner involvement in care, treatment and support. Master trainers for HCT will train labor and delivery staff in the use of HIV rapid tests for women who present at delivery without antenatal care.

An anticipated 6,625 HIV-positive pregnant women will be identified and provided with a complete course of ARV prophylaxis (based on ACTION’s current program prevalence of 4.5% and loss to follow up). HIV-positive women will have access to lab services including CD4 counts without charge. This will be available on-site or within the network through specimen transport. Women requiring HAART for their own health care are linked to a network ARV center. For the anticipated 2/3 of women not requiring HAART, the current Nigerian PMTCT guidelines recommended short course ARV option will be provided which includes ZDV from 28 weeks or ZDV/3TC from 34/36wks, intra-partum NVP, and a 7-day ZDV/3TC post-partum tail. Women presenting in labor will receive SDNVP and a 7-day ZDV/3TC post-partum tail. All HIV-positive women will be linked post-partum to an HIV/A family centered care delivery model whenever feasible, co-locating adult and pediatric care and providing a linkage to family planning services. Women frequently face barriers to facility-based treatment access as a result of demands on them for childcare and to contribute to the family economic capacity. To address this, mobile clinic outreach as described in the adult care and treatment narrative will be integrated at the community level to bring PMTCT services to women who otherwise will opt-out of care and treatment.

HIV-positive women will be counseled pre- and post-natally regarding exclusive breast feeding with early cessation or exclusive breast milk substitute (BMS) if AFASIS using the WHO UNICEF curriculum adapted for Nigeria. Couples counseling or family member disclosure will be utilized to facilitate support for infant feeding choices. Consistent with national policies on importation of infant formula and recent concerns regarding appropriate use of BMS, ACTION will not utilize EP funds to purchase BMS. As part of OVC programming ACTION will provide safe nutritional supplements including safe weaning for exposed infants as well as water guard, bed nets and other home based care items. HIV-positive women will be linked to support groups in their communities, which will provide both education and ongoing support around infant feeding choices, antenatal care, HAART, early infant diagnosis (EID), ART, adherence and PwP. PLWHAs are currently employed at ACTION-supported ARV points of service as treatment support specialists. The use of dedicated treatment support specialists for PMTCT in the clinic and community will be expanded based upon the successful “Mothers to Mothers” model in Southern and East Africa. This will ensure that HIV-positive women remain in care throughout pregnancy and receive appropriate services for herself and her infant.

Infant prophylaxis will consist of single dose NVP with ZDV for 6 weeks in accordance with Nigerian National PMTCT Guidelines. Cotrimoxazole suspension is provided to all exposed infants pending a negative virologic diagnosis. Ten regional laboratory centers for DNA PCR have been established by ACTION. Testing of infants will be carried out using dried blood spot (DBS) specimen collection. ACTION will actively participate in the national early infant diagnosis initiative by providing DNA PCR testing of dried blood spots (DBS) at ACTION-supported labs. The source of DBS samples will include ACTION and non-ACTION supported PMTCT sites. A systematic coordinated approach to program linkages will be operationalized at the site level and program level including linkages to adult and pediatric ART services, OVC services and basic care and support. Quality monitoring will be undertaken through site visits using an existing assessment tool and routine monitoring and evaluation indicators.

ACTION will train an average of 10 HCWs from each of the 30 new sites in COP09 sites including community-based health workers in the provision of PMTCT services and infant feeding counseling. The revised and updated national PMTCT training curriculum and the infant feeding curriculum will be utilized. Under COP08, ACTION has adapted and piloted a modified version of the PMTCT National Curriculum for traditional birth attendants (TBA), which focuses on HCT and referral of HIV-positive women. ACTION
Activity Narrative: piloted this with 20 TBA in COP07 and 50 in COP08. ACTION will expand this to additional an 100 in COP09, targeting TBAs based on a community needs assessment that has been carried out in COP08 identifying points of deliveries for women in the community. Site-based step down trainings will be carried out in conjunction with the Ministry of Health (MOH) utilizing Master Trainers that were trained on infant feeding in COP08. There will be a minimum of 10 trainees per new site for a total of 300. Thus, the total direct training target is 400. ACTION will continue to collaborate with the government of Nigeria (GON) and the Clinton Foundation to increasing access to early diagnostic services for infants. This activity is described under Pediatric Care and Treatment.

In addition to routine monitoring and evaluation activities, ACTION will contribute to a Multicountry PHE that will evaluate best practices and document best program models for increasing the number of HIV-positive pregnant women who receive HAART. The aim is to identify which models of ART service delivery to pregnant women result in the best uptake for PMTCT and maternal treatment interventions.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
This activity will provide counseling & testing services to 125,000 pregnant women, and provide ARV prophylaxis to 6,250 mother and infants pairs. This will contribute to Nigeria’s goal of increasing PMTCT coverage by 80% by 2010 and the EP goal of supporting this effort.

LINKS TO OTHER ACTIVITIES:
This activity is linked to adult and pediatric care and treatment, OVC, laboratory infrastructure, condoms & other prevention, AB, and SI where action will continue to provide TA for the National PMTCT MIS. PwP counseling will be integrated within PMTCT care for HIV-positive women. The basic package of care provided to all HIV-positive patients will be available to HIV-positive pregnant women. ACTION lab staff will ensure that HIV testing provided within the PMTCT context is of high quality by incorporating PMTCT sites into the laboratory QA program. ACTION will collaborate with UNICEF in the support of PMTCT services at some sites, leveraging resources without duplication and creating a more sustainable service support structure.

POPULATIONS BEING TARGETED:
This activity targets pregnant women who will be offered HCT, HIV-positive pregnant women for ARV prophylaxis, infant feeding counseling and family planning. The exposed infants will be offered prophylaxis and early infant diagnosis services. Family members will have access to prevention, care and support services.

EMPHASIS AREAS
The key emphasis area is training, as most supported personnel are technical experts. A secondary emphasis area is commodity procurement as ARVs for prophylaxis and laboratory reagents for infant diagnosis will be procured. Another secondary emphasis area is network/referral systems as networks of care will be supported, which are critical to ensuring quality of care at the PHC level, identifying women in need of HAART, and ensuring access to HAART within the network. In addition, partners and PABAs will be identified for linkage to care and support services. This activity also addresses gender since treatment will be provided to women and will focus on family centric issues including male involvement in PMTCT programming.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

By the end of COP08, the Global HIV/AIDS Initiative Nigeria (GHAIN), through collaboration with the Government of Nigeria (GON) and Faith Based Organizations (FBOs), provided prevention of mother to child transmission (PMTCT) services at a total of 168 PMTCT sites in all 36 states and the FCT, exceeding the USG-PEPFAR target of 88. This was accomplished through the PEPFAR funding to support 88 sites together with resources leveraged from Global Fund (GF).

In COP 09, GHAIN will maintain its PMTCT coverage in all 168 existing PEPFAR and GF supported sites. The leveraged support from the Global Fund is expected to continue throughout the COP09 timeframe, allowing for a sustained support of PMTCT services at all the sites. In COP09, GHAIN will reach 120,000 clients with PMTCT counseling and testing services (including results) with 4,000 receiving ARV prophylaxis. PMTCT services will continue to be integrated into antenatal care (ANC) at the primary health care (PHC) level which serves as an entry point to HIV/AIDS prevention, care and support services for mothers, their infants, family members and the community. This is in line with the minimum package stipulated by the Government of Nigeria (GON) PMTCT service coverage at the LGA level; initially in states with high prevalence and in facilities with a high volume of ANC clients. In addition to the over 400 health facility staff trained in COP08, 325 health care workers (HCWs) will be trained and re-trained in COP09 in collaboration with other stakeholders (especially UNICEF) using the National PMTCT training curriculum with additional modules on RH and infant feeding counseling (IFC). To ensure effective decentralization and increase in coverage at the LGA level, the experience and lessons learned from piloting the HAST (HIV/AIDS, sexually transmitted infections/reproductive health and TB) model of providing integrated services at the LGA level in Kano and Cross Rivers states will be utilized. Community volunteers identified by CBOs and NGOs will be trained using a specially modified national PMTCT curriculum that incorporates reproductive health (RH) modules to render minimum PMTCT services (linkages and referrals, awareness and demand creation for PMTCT) appropriate to their level of care. Referral from the PHC level to secondary facilities will be provided when the need arises for higher quality care and treatment.

GHAIN will lay emphasis on strategic prevention activities to promote options such as partner notification and testing, treatment support and community outreach activities to cluster ANC clinics and delivery facilities. Emphasis will also be laid on the counseling on infant feeding options (exclusive breast-feeding for six months or breast milk substitute if Affordable, Feasible, Acceptable, Safe and Sustainable - AFASS). Additional emphasis will be laid on the sensitization and training of traditional birth attendants (TBAs) using the national TBA training curriculum to develop skills in conducting safe delivery practices and recognizing early signs of obstetric complications. They will be supervised and monitored by trained health workers in order to ensure that they refer all potential complications to the hospital for quality and safe obstetric care/practices. They will also be used to raise awareness and create demand for PMTCT and be linked to facilities through the GHAIN referral network. TBAs will be linked to GHAIN-trained community pharmacists who will ensure increased access to prophylactic drugs for their HIV-positive clients and exposed babies. This will lead to the expansion of the GHAIN network of services through collaboration with these non-formal health service providers. Conversely, the formal health care providers in the 168 supported facilities will be trained in line with the national PMTCT training curriculum modified to include RH modules. This activity will strengthen the second prong of core PMTCT, which is aimed at preventing unwanted pregnancies amongst women/couples who are HIV-infected.

To address gender issues and generate greater male involvement in PMTCT services, couple counseling will continue to be included in the PMTCT/RH integrated trainings. This will lead to improved service delivery, and adherence to interventions. The introduction of this new strategy into the program will further bridge the gap of the challenges of partner disclosure and the negative consequences (domestic violence, divorce and abandonment) that have occasionally been noted in discordant couples. Using a family-centered approach, PMTCT service providers will promote testing for any other children in the family. In addition, the family will be encouraged to enroll all their children into OVC services and, for those children who are HIV positive, into the facility-based pediatric care and treatment program.

Quality PMTCT service provision will be extended to clients in COP09 in line with updated recommendations and evidence-based best practices. Project activities will be tailored towards: improving the quality and use of Maternal Child Health (MCH) facilities; sensitizing and mobilizing communities to create demand for PMTCT services; encouraging that routine point of service (HCT with ‘opt out’ option) is offered to all women presenting in ANC, labor and delivery wards and the family planning units while encouraging male involvement; and ensuring that antiretroviral (ARV) drugs are offered to HIV-positive pregnant women. PMTCT prophylaxis or ARV treatment for the mother’s own health will be provided according to the national guidelines. Postpartum interventions for exposed infants will be provided and include single dose nevirapine within 72 hours of birth and zidovudine syrup for 6 weeks. CTX prophylaxis is commenced from six weeks after birth until the child’s HIV status is determined, utilizing the national guidelines as the basis for treatment decisions. Two tests will be actively encouraged and women/couples counseled and linked to family planning services as needed. This will be ensured through the continuation of the GHAIN supported RH-HIV integrated services. All clients who are tested will receive results on the same day. Those who test negative to HIV will receive posttest counseling on how to remain negative. Positive and discordant couples will be given the prevention for positives package and provided information or referrals to address their future fertility desires (family planning services) as well as HIV care and treatment services. Furthermore, possible scale-out of the distribution of nevirapine pouches for exposed infants delivered outside supported facilities will improve access to prophylaxis to these exposed infants and also strengthen the link between PMTCT and MCH services by strengthening referrals. This will also provide opportunity for continuous counseling to couples including prevention strategies for positives and discordant couples. GHAIN will utilize lessons learned and best practices from other programs in ensuring that more HIV-positive mothers delivering outside health facilities have access to single dose nevirapine in labor.

Mothers’ support groups will also be used to track and support mother-infant pairs and other family

**Activity Narrative:**

members in the communities and link them to care. GHAIN will continue to train lay counselors to provide counseling services to pregnant mothers, thus reducing workload and burnout of regular counselors. Other activities will include encouraging male involvement by using trained community gate-keepers to sensitize the community with a special focus on men; encouraging men to accompany their wives to the clinic, and ensuring that holistic services are offered to HIV-positive pregnant women and their families. Positive pregnant women identified at the PHC level will have their CD4 done at a linked secondary facility through sample referral. Identified HIV-positive women will subsequently be followed up at an HIV comprehensive care center to ensure continuity of care. CD4 testing will be prioritized for pregnant women to identify those who require ART for their own health. In addition, CTX prophylactic therapy will be provided for HIV-positive pregnant women as indicated in the national guidelines. PMTCT services will also be geared towards ensuring that safe obstetrical practices and universal precautions are implemented in labor and delivery rooms.

Funding will address capacity building of health care workers on counseling, strengthening linkages with Early Infant Diagnosis services (EID, supported under pediatric care and treatment) and support to families on infant feeding options in accordance with the mother's choice and the national guidelines on infant feeding. GHAIN will train and re-train pharmacists on pharmaceutical care, pharmacy best practices and adherence counseling in PMTCT sites while collaborating with the community pharmacists to expand the reach and quality of services at the LGA and community levels.

Joint GON/USG/GHAIN supportive supervision will be carried out to all the sites on a quarterly basis, in addition to regular onsite mentoring and support of the sites by the FHI/GHAIN technical team. Appropriate tools for program monitoring including National PMTCT registers will be provided to all the sites while monthly DOA will be carried out in collaboration with the relevant state and national bodies. Feedback will be provided to the facilities and stakeholders through the monthly M&E meetings hosted at SACA offices. The quality of services will be assured through facilitative supervision, M&E, QA/QI analysis and QA checks using standardized national tools developed for this purpose. In line with the ‘3 ones’, GHAIN will disseminate information through regular reporting to the GON via NACA and NASCP.

CONTRIBUTION TO OVERALL PROGRAM AREA

The scale-out of PMTCT services will significantly contribute to Nigeria’s 5-year national strategic plan in response to HIV/AIDS. This plan encourages pregnant women and their spouses to know their HIV status with a view to reducing their risky behaviors and seek appropriate intervention and emphasizes referrals and necessary linkages.

LINKS TO OTHER ACTIVITIES

The GHAIN supported PMTCT services relate to activities such as HVTB, HVCT, adult and pediatric care and treatment and GHAIN supported RH-HIV integration program (supported by non-PEPFAR USAID funds). The pregnant women attending PMTCT services and their children will be appropriately linked to TB, ART, STIs, care and support, OVC, income generating activities, and other services according to their needs, at the LGA level through the HAST model. There will be close collaboration with the referral coordinators to ensure tracking of clients that are lost to follow-up.

POPULATIONS BEING TARGETED

This program will target pregnant women, ensuring that HCT (opt-out) is offered to all women presenting in ANC clinics and in labor and delivery wards and TB patients that are pregnant. The activities will ensure that ARV drugs are offered to HIV-positive pregnant women for PMTCT prophylaxis and/or for their own health, utilizing national guidelines as a basis for treatment decisions. Exposed infants will be followed-up to ensure referral for HIV early infant diagnosis testing using dried blood spots (DBS) in line with the National Early Infant Diagnosis scale-up plan.

KEY LEGISLATIVE ISSUES ADDRESSED

This activity will strive to increase gender equity in HIV/AIDS programs. Male involvement in PMTCT will be encouraged through sensitization, encouraging the male partners to know their HIV status and/or provide support to their spouse. Opportunities will be sought to identify and work with other USG projects to increase women’s rights and increase women’s access to income and productive resources.

EMPHASIS AREAS

Major emphasis will be placed on strengthening referral and patient tracking, while minor emphasis will be on quality assurance, quality improvement and supportive supervision.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP09 LMS will continue the activities initiated in 17 project-supported sites in Kogi, Niger, Adamawa, Taraba, Kebbi and Kwara States during COP07 and COP08. In addition, PMTCT services will be initiated at 2 secondary and 10 PHC health facilities in existing states. This makes a total of 29 PMTCT sites in COP09. Using the revised National PMTCT Guidelines, 12,000 pregnant women will be counseled, tested and receive their results and 560 HIV-positive pregnant women will receive ARV prophylaxis. In addition, LMS will provide food and nutritional supplementation to 50 HIV-positive pregnant women/lactating women and will train 175 health care workers to work in ANC clinics and delivery wards.

In Nigeria, PMTCT services were originally available only at the tertiary level, but are now being expanded to the secondary level. In COP09, PMTCT services will further be decentralized to the primary care and community levels to ensure increased access of PMTCT services to remote populations. All women tested including HIV-negative women will receive posttest counseling to encourage them to remain negative. Peer support coordinators will provide continuing support after testing and encourage pregnant women to adhere to their ART prophylaxis and and infant feeding options will be trained and supported to provide ongoing counseling to newly recruited PMTCT mothers. LMS will emphasize and support the provision of PMTCT services at selected primary care facilities that have capacity for providing minimum PMTCT services that include group health information, post test counseling, lab investigation, dispensing of NVP and client follow-up using PLWHA and PMTCT support groups.

During COP09, LMS will train health care workers in provider-initiated testing and counseling (PITC) to be offered during ANC, labor and the immediate post-delivery period. In order to reduce the workload on healthcare providers, lay counselors will be trained to carry out PMTCT counseling and support newly recruited PMTCT parents to adhere to prophylaxis and infant feeding practices. The project will offer same-day HIV counseling, testing and results to clients. Spouse/partner and family testing will be encouraged so that PMTCT becomes the entry point to family-centered HIV care, support and treatment (PMTCT plus).

During COP09, LMS will continue the activities initiated in 17 project-supported sites in Kogi, Niger, Adamawa, Taraba, Kebbi and Kwara States during COP07 and COP08. In addition, PMTCT services will be initiated at 2 secondary and 10 PHC health facilities in existing states. This makes a total of 29 PMTCT sites in COP09. Using the revised National PMTCT Guidelines, 12,000 pregnant women will be counseled, tested and receive their results and 560 HIV-positive pregnant women will receive sdNVP + Combid air with a 7-day Combid tail. All HIV-positive pregnant women will be given sdNVP tablet to take home on their first antenatal visit, with instructions to swallow the tablet when labor begins and before they report to hospital for delivery. Women who receive no antenatal care during their pregnancy or who have had only limited antenatal care but presented to the facility with unknown HIV status will receive HCT during labor and if positive, will receive sdNVP and 7-day Combid tail. LMS will ensure the mother’s CD4 count results are available the same day to guide commencement of HAART if <350 or PMTCT prophylaxis if 350 and above. The mother options and supported to adhere to her chosen option. Mothers will be encouraged to disclose their HIV sero status and the PMTCT services they are receiving to their spouses and to request the spouses to come with them to the clinic at the next visit for family counseling and testing.

Food and nutritional supplements will be leveraged from non-PEPFAR implementing partners to provide to malnourished pregnant and lactating positive women. Infants of HIV-positive women will receive NVP syrup at birth and AZT for six weeks. All HIV-exposed infants will be followed-up in the postnatal period and provided with cotrimoxazole prophylaxis from 6 weeks of age until their HIV status is confirmed negative and are no longer exposed to risk of HIV infection through breast milk. Cotrimoxazole prophylaxis will be continued if the children are confirmed HIV-positive. All HIV-exposed infants will be referred for early infant diagnosis (EID) at 6 weeks and followed-up with care and treatment depending on their HIV result.

All HIV-positive mothers receiving project-supported PMTCT services will be encouraged to exclusively breastfeed their infants for six months as this strategy will reduce mother to child transmission of HIV while not stigmatizing HIV-positive mothers. A PISS model will be supported and guided on safe infant feeding with breast milk substitute. Healthcare workers will be taught that recent research has demonstrated far better outcomes for exclusively breastfed infants of HIV-positive mothers even in more affluent situations. In addition to receiving PMTCT services, each mother-baby pair will be registered with the health facility referral coordinator for linkage and access to community HIV/AIDS services like follow-up and support of mother-baby pairs, OVC services, ongoing adherence counseling, home-based care (HBC) and others. This will enable the NBO volunteers to give psychosocial support and nutrition education, and leverage nutritious foods and conduct child growth monitoring.

LMS will train and support some of the women living with HIV to function as peer support coordinators in antenatal care (ANC) settings, helping newly recruited PMTCT families to understand and appreciate the benefits of PMTCT services and to adhere to the counseling and prophylaxis information given to them. The peer support coordinators will be positive role models to reduce stigma and act as champions for HIV-positive pregnant women to ensure that they are not discriminated against during their antenatal and maternity care. The peer support coordinators will share their own experience with newly diagnosed pregnant HIV-positive mothers and assess how they are coping. This will support the pregnant HIV-positive mothers to come to terms with their own HIV status and reduce “self-stigma”. Through the work of peer support groups, traditional birth attendants (TBAs) and engagement of spiritual leaders, the project will reduce dropout rates from PMTCT services and increase adherence to ARV prophylaxis and safer infant feeding choices. The Nigerian-adapted curriculum for training TBAs will be used to equip TBAs with knowledge and skills to support PMTCT services in the community. Every pregnant HIV-positive mother at first antenatal visit will be given a tablet of nevirapine to take home for use at the onset of labor.

In COP09, LMS will support zonal training programs on infant feeding counseling in collaboration with the GON and will support cascade training for selected facility-based healthcare workers. Also, LMS will continue to support the Niger State PMTCT committee to develop a scale-up and implementation strategy to ensure that all local government areas (LGAs) in Niger state have at least one site with PMTCT services, hence reaching more underserved communities. LMS will further strengthen the partnership with Clinton Foundation for supply of antiretroviral drugs and dried blood spot (DBS) kits. The advocacy strategy with...
Activity Narrative:
National, State and LGA governments implemented in COP08 will be enhanced in COP09 to promote government ownership and increase their contributions to HIV/AIDS services in general and PMTCT services in particular.

Joint GON/USG/LMS supportive supervision will be carried out in all sites on a quarterly basis, in addition to regular onsite mentoring and support of the sites by the LMS technical team. Appropriate tools for program monitoring including National PMTCT registers will be provided to all the sites, while monthly data quality assurance (DQA) will be carried out in collaboration with the relevant state and national bodies. Feedback will be provided to the facilities and stakeholders through LMS's participation in monthly M&E meetings hosted at SACA offices. Quality of services will be assured through supervision, M&E, QA/QI analysis and QA checks using standardized national tools. LMS will disseminate information through regular reporting to the USG and the GON via NACA and NASCP.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
Activities in this area will strengthen the capacity of facility and community-based resources to provide ARV prophylaxis, counseling and support for improved maternal nutrition and safe infant feeding and additional HCT and support as included in PMTCT plus activities. This will also contribute to the more general interest of improving the lives of children and families directly affected by HIV/AIDS.

LINKS TO OTHER ACTIVITIES:
This activity relates to the HCT where every effort will be made to counsel and test every pregnant woman that visits the project-supported health facilities through the PITC approach, and if positive enrolled into care to utilize the PMTCT services provided. Adult care and support will be provided in terms of basic investigation like CD4 count for women that are positive, diagnosis and treatment of OIs, malaria, urinary tract infection and provision of ITN and water guard, and ARV drugs for prophylaxis.

POPULATIONS BEING TARGETED
This activity focuses on pregnant women and their families from the communities served by project-supported sites.

EMPHASIS AREAS
This activity addresses gender concerns related to the specific HIV/AIDS-related care and treatment needs of pregnant women. Many gender issues have been reported in relation to PMTCT services ranging from rejection by spouses and families to gender-based violence. The project will train healthcare workers to appreciate gender issues and learn ways they can be mitigated. The activity emphasizes developing the capacity of a wide range of persons (healthcare personnel, mothers’ peer support groups, PLWHA and TBAs) to increase testing, counseling and treatment and prophylaxis for pregnant women and their infants, to provide them and their families the appropriate protection and care to reduce the risk of HIV infection or mitigate transmission and negative health effects.

Male involvement will be encouraged through various strategies including partner testing together and sensitizing men through the fora that are appropriate to them. Pregnant women accessing PMTCT services will be counseled and referred to family planning (FP) services to enable them to make informed decisions on future pregnancies. HIV-exposed infants will be followed-up in young children clinics where they will receive routine immunizations, nutritional counselling and growth monitoring. Malnourished mothers and their children will receive nutritional supplementation leveraged from the Clinton Foundation and the community-food basket to be established through the peer support coordinators.

Budget Code: MTCT  Program Budget Code: 01
Activity ID: 5348.24868.09  Planned Funds: $448,000
Activity System ID: 24868

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP08, 7D PMTCT services expanded to 16 sites in Benue, FCT, Plateau, Cross River, Lagos, Kogi, Osun, Edo and Niger states. Given the reduced testing targets in COP09, 7D PMTCT will not expand to further sites and will instead focus on increasing access to PMTCT services for pregnant women by building community support for PMTCT and increasing the capacity of supported health facilities to provide PMTCT services. The 16 centers activated in COP07 and COP08 required extensive financial and technical investment for startup; therefore cost per beneficiary was comparatively higher. Overall PMTCT costs will be slightly reduced in COP09, as there will not be significant investment in expansion of sites. However, investments in PMTCT demand creation and establishment of referrals, ANC and HIV counseling and testing (HCT) networks will be undertaken more intensively in COP09 and there will be associated costs with this effort.

This project seeks to increase access to PMTCT services for pregnant women by building community support for PMTCT and increasing the capacity of health facilities to provide PMTCT services. 7D will use existing diocesan AIDS structures and Parish AIDS Voluntees to promote demand for PMTCT services through social mobilization campaigns in two ways. Firstly, PMTCT Points of Service (POS) will establish a network of Primary Health Care Centers that will provide basic ANC and Counseling and Testing Services for everyone including pregnant women. Secondly, educational sessions on PMTCT followed with HCT will be done during outreach activities. The uniqueness of this structure is the linkage of community-based PMTCT with health facility-based PMTCT. This synergy will facilitate effective tracking of HIV-positive pregnant women throughout the course of their pregnancies and after delivery. This tracking is essential to support women to make informed infant feeding choices as well as early testing of exposed children and linkage to pediatric care and treatment (if needed), adult care and treatment, and OVC services.

Individual/group grants and the promotion of Savings and Internal Lending Communities (SILCs) -- a CRS program that works with groups to leverage internal savings as a mechanism for raising loan capital for group members – is expected to be extended to PAVs in COP09. A key component of the SILC program is the training of participants in basic business management skills to ensure that beneficiaries who may not have strong educational backgrounds can fully participate. In COP09, CRS will expand this program and will seek to identify PAVs who can be trained to serve as SILC group leaders and thus act as agents to further promote PAV’s access to credit through community-based internal/rotating savings.

The PMTCT package will include group counseling and testing using an opt-out strategy with same day results in ANC as well as labor and delivery. Services will also include partner counseling and testing, OI treatment and prophylaxis (like malaria, Pneumocystis and management of diarrhea. Free baseline hematology, STD screening, CD4 count to assist with determining need for immediate therapy and viral loads where needed for monitoring HIV progression will be conducted on all pregnant women accessing PMTCT in 7D-supported sites. Infant feeding counseling during first and subsequent ANC visits will take place using messages like exclusive breast feeding for the first 6 months or exclusive replacement feeding if Acceptable, Feasible, Affordable, Sustainable and Safe (AFASS).

For clients with CD4 count >350 and not requiring ART, the nationally recommended prophylaxis course will be available. ART prophylaxis for pregnant women using zidovudine at 28 weeks or a combination of zidovudine/lamivudine at 34 weeks with single dose nevirapine at onset of labor will be given; this will be followed by a zidovudine/lamivudine tail as part of their regimen after delivery. The infant will receive single dose nevirapine and six weeks of zidovudine. All HIV-exposed infants will be provided cotrimoxazole from 6 weeks to 18 months or until HIV infection has been ruled out. ARV treatment when indicated during pregnancy improves the health of the woman and decreases the risk of HIV transmission to the infant; where these services are not available, they will be referred to facilities including AIDS Relief (AR) ART sites and other IP-supported ART sites.

7D-supported PMTCT sites are positioned within AIDS Relief, GON and other IP-supported ART networks to which women who need ART will be referred. Since 7D and AIDS Relief (AR) PMTCT teams function as a unit and are co-located in 90% of sites, seamless transition of patients between the two will be initiated. This will happen in two ways. The first way is through the existing co-location in facilities. Since 7D's PMTCT and AR's ART sites are already located in the same facilities in current 7D-supported PMTCT sites, women determined by a lower CD4 count (<350) to be eligible for ART in accordance with the national PMTCT guidelines will be referred to AR-supported ART for full HAART. Secondly, for co-location in geographic areas, 7D PMTCT attendants who qualify for HAART will be referred to nearby AR-supported treatment sites. This referral mechanism will function since 7D and AR PMTCT teams currently function as an integrated team that plans and executes tasks as one unit. To prevent double counting or loss of clients to AR, all clients from 7D that access services from AR sites are required to provide proper documentation (like a referral note) before the client is taken up by AR; the same will apply for AR clients seeking treatment at 7D-supported sites. 7D will also ensure that all supported PMTCT sites have the approved PMTCT registers.

7D will refer clients for HIV infant diagnosis testing in line with the nationally recommended early infant diagnosis (EID) initiative from 6 weeks of age using dried blood spots (DBS). Infants will also be linked to immunization services to access the WHO/UNICEF and GON recommended set of vaccines. This will be done in health facilities that provide immunization services in areas where 7D operates.

7D will continue to collaborate with traditional birth attendants (TBAs) through trainings using nationally recommended curricula and provision of PMTCT home-based care kits and information packs for effective support of pregnant women who choose to give birth outside health facilities. Trained TBAs are expected to work in partnership with the health center with back and forth linkages. Two TBAs from each PMTCT site will be trained and 1 TBA from 13 partner arch/dioceses will also be trained resulting in 45 trained TBAs. The expected outcome of the TBA training will be improved obstetric practices and awareness of key

Generated 9/28/2009 12:04:42 AM  
Nigeria  Page 233
Activity Narrative: PMTCT issues.

Counselors from 7D and supported PMTCT sites will be trained as Trainers of Trainers on infant feeding using the adapted WHO/UNICEF infant feeding tool for Nigeria. Two counselors per PMTCT site (32) and 1 per partner arch/diocese (13) will be retrained giving a total of 45 staff trained (not included in targets as this is infant feeding rather than PMTCT provision). Each of these trained people will reach about 14 mothers adequately targeting the 600 mothers that will be linked to services.

To ensure quality, supervisory visits will be made by diocesan staff monthly to each site. CRS staff will visit each site quarterly and visits with USG/GON/IP will occur bi-annually. These will continue in COP09. Monitoring tools will be improved and standardized with national tools and disseminated to all arch dioceses. Volunteers will continue to be sensitized on PMTCT, maternal nutrition and safe infant feeding practices for correct PMTCT service provision. Volunteers will support mothers’ infant feeding choices through on-going counseling.

Support and capacity building given to Abuja, Ibadan and Makurdi provincial structures in COP08 will continue in COP09. This support has encompassed engagement of key points of staff including PMTCT and financial management specialists.

Targets for COP09 include HIV counseling and testing for 14,500 pregnant women with 14,000 receiving results, 600 pregnant women placed on ARV and retraining of 30 health care workers using national PMTCT curriculum in 16 sites. Test kits will be procured centrally through the USG supply chain management system.

COP07 Plus Up funds were used for hiring PMTCT specialists to respond to immediate and long term PMTCT needs. It also enabled 7D collaboration with AR in leveraging resources and expertise through forming a PMTCT team that plans and responds to 7D, AR and sub-partner PMTCT needs coherently. Sub-partner PMTCT capacities have been enhanced through training of POS staff and archdiocesan PMTCT coordinators. Site antenatal clinic refurbishment and laboratory support have also been done.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
PMTCT services will continue to contribute to several of the PEPFAR goals. The goal of preventing new infections by offering HCT services to pregnant women, as well as providing PMTCT prophylaxis to prevent infecting in the newborn child is already contributing to prevention of new infections.

Issues of violence against women after disclosure of HIV status are a grim reality, which will be tackled during couple counseling sessions as a preemptive measure. It is the goal to reduce the incidence of acts of violence against women as their partners are engaged in these exercises.

PMTCT-specific home-based care is being provided to pregnant women by PAVs. Support groups provide participants with coping mechanisms for addressing stigma and discrimination towards PLHWA.

LINKS TO OTHER ACTIVITIES
PMTCT activities will be linked to HCT, adult and pediatric care and treatment services, TB/HIV and OVC services. 7D has established referral linkages with TB DOTs centers and other health care facilities to ensure that PMTCT clients are treated for TB, STIs and other opportunistic infections. However, there will also be STI and opportunistic infection treatment in 7D-supported health facilities. 7D will work closely with AR for ART services where project activity areas overlap. Referral coordinators have been employed to ensure timely referrals to services offered by other implementing partners. This area has been identified as a “best practice” that needs support both at state and national levels. 7D will continue linking with the GON by sending reports to them and attending PMTCT task team meetings on a regular basis. Also there are plans to link the sites to the GON drug program as it is strengthened for sustainability.

POPULATIONS BEING TARGETED
Pregnant women and HIV-positive pregnant women, HIV-exposed infants, caregivers, partners, religious leaders and all HIV exposed infants are the populations being targeted.

KEY LEGISLATIVE ISSUES ADDRESSED
Gender-based activities have been organized with the aim of addressing inequalities between men and women and subsequent behaviors that increase the vulnerability to and impact of HIV/AIDS. Women’s legal rights and access to income and productive resources will be carried out through linking care and support programs to income generating activities within 7D SUN programs.

Work has been done to reduce the stigma associated with HIV status and discrimination faced by PMTCT mothers and their families through support group membership. This aspect will be enhanced in COP09.

EMPHASIS AREAS
The major emphasis area is developing the capacity of partners to effectively manage the PMTCT program with a focus on sustainability. The minor emphasis areas are: improving linkages/networks/referral systems between the communities and the 7D-supported PMTCT sites.

**Funding Source:** GHCS (State)
Activity Narrative:  ACTIVITY DESCRIPTION:

This MTCT activity relates directly to all Nigeria PMTCT COP09 activities as part of the USG technical oversight role.

The USG team, through the HHS/CDC Global AIDS Program (GAP) Office in Nigeria, has two full time staff positions (one Senior Program Specialist and one Program Specialist) for PMTCT, both of which were first approved in COP05. The budget includes funding for 2.25 FSN salaries, funding for (limited) international and required domestic travel, training funds and allocated minor support costs. Funds are not requested in COP09 for international TA as this is understood to be funded by the HQ operational plan (HOP). These staff members will be supervised by a Senior Prevention Unit Manager partially funded under HHS/CDC PMTCT as noted above.

These HHS/CDC PMTCT staff members will work in close coordination with the USAID and DOD PMTCT staff and directly provide quality assurance and program monitoring to all HHS supported implementing partners including: University of Maryland-ACTION, Harvard, Columbia University SPH-ICAP, International Foundation for Education and Self-Help (IFESH), Catholic Relief Services-AIDSRelief, Africare, Vanderbilt University, Partners for Development, Johns Hopkins-Jhpeigo, APIN LLC, University Research Co., and Pathfinder International. HHS/CDC PMTCT staff will also assist USAID staff in joint monitoring visits of Family Health International-GHAIN, Catholic Relief Services-7 Dioceses, LMS Associate and USAID APS awards for COP09. USAID and CDC PMTCT staff will provide assistance as needed to the U.S. Department of Defense program with the Nigerian Ministry of Defence.

HHS/CDC and USAID PMTCT staff will also provide technical support and capacity development to new partners undertaking PMTCT activities through the New Partner Initiative as well as provide support to the Government of Nigeria at the national and state levels to promote Nigerian national PMTCT guidelines. Support to Global Fund activities will be also be provided as requested. It is estimated that the PMTCT staff under this activity will provide monitoring and support to approximately 700 PMTCT sites in COP09.

ICASS and CSCS charges related to these positions are funded under M&S in compliance with COP09 guidance.

In COP08, the Christian Health Association of Nigeria (CHAN)’s Nigeria Indigenous Capacity Building (NICaB) project used drugs donated by the Clinton Foundation and leveraged training resources from other US government (USG) funded Implementing Partners (IPs) to provide PMTCT services at 12 facilities in 6 states of Abia, Benue, Delta, Oyo, Sokoto and Taraba. Services provided included HIV counseling and testing, early infant diagnosis (EID) and infant feeding counseling. Prophylaxis was given to pregnant mothers, while those who needed HAART for their own health were referred to the ART clinic. Community health workers promoted PMTCT and followed up mother/infant care within the community to provide support for infant feeding choices and provide referrals in case of complications. In COP09 this activity will be modified by conducting EID and infant feeding counseling components under the pediatrics care and support program area. Additionally, NICaB will participate in the USG local government area (LGA) coverage strategy and facilitate the formation of PMTCT committees in three of the six states where CHAN is working and committees do not already exist. NICaB will initiate and participate in their monthly meetings with the aim of supporting states to develop a scale-up and implementation plan.

The NICaB project will utilize a network model with PMTCT care centers linked to secondary level CHAN member institution health facilities - “hub sites” that provide more complex PMTCT care and lab testing to reach HIV-positive women with HIV-related services. In COP09, 6,200 women will receive PMTCT counseling & testing and receive their results through networks that include 12 hub and 12 spoke sites, giving a total of 24 PMTCT sites supported in 6 states of Abia, Benue, Delta, Oyo, Sokoto and Taraba. This activity will impact both HIV-negative and HIV-positive pregnant women — HIV-negative women to stay negative and HIV-positive women to avoid cross infection due to increased vulnerability during pregnancy.

As part of the USG LGA coverage strategy in PMTCT, CHAN NICaB will support PMTCT services at ANC sentinel survey sites in Abia state, with future expansion to primary health center level based on resources. PMTCT stand-alone points of service in the network will be linked to adult and pediatric ARV care through utilization of a PMTCT consultant coordinator and a health facility coordinator in each network based at the hub site. NICaB will utilize network referrals, SOPs, monthly PMTCT network meetings and incorporation of team approaches to care in all training, service provision and meetings with the State Action Committees on AIDS (SACAs) will be facilitated and will lead to the formation of state PMTCT committees in order to strengthen the scale-up and implementation plans in 3 NICaB-supported states of Abia, Sokoto, and Delta. In line with the National PMTCT guideline, HIV-positive pregnant women with CD4 cell count of <350 require HAART for their own health and will be linked to an ARV point of service at CHAN member institutions (MIs). CHAN will facilitate linkages between HIV-exposed infants by stating this in the health card for mother/infant pairs. Particular emphasis will be placed on the involvement of community health workers who are the primary source of care for women and are integral to a program that seeks to engage women where they seek care. This program will work closely with the care and support team to maximally engage community based PMTCT and ARV linkages. In addition to receiving PMTCT services, each HIV-positive pregnant woman will be referred to OVC services in order to facilitate care for all of her affected children.

Provider initiated testing and counseling services with opt-out option and with same day test results will be provided to all women presenting for ANC and untested women presenting for labor and delivery. All women would be provided pre-test group health information services on prevention of HIV infection including the risks of MTCT using lay counselors who will be members of mother-to-mother support groups. Male involvement in PMTCT will be strengthened by promoting couples counseling and partner testing will be offered as part of counseling through referral to on-site HCT centers. A step down training of couples counseling and prevention for positives package will be utilized in all sites. This will provide an opportunity to prevent heterosexual transmission and reduce incidence of violence against positive partners, especially in discordant couples. Master trainers for HCT already trained in COP08 at CHAN-supported comprehensive sites will in turn train labor and delivery staff in the use of HIV rapid tests for women who present in labor without antenatal care.

An anticipated 248 HIV-positive pregnant women will be identified and provided with ARV prophylaxis (based on CHAN NICaB’s current program utilizing 4% prevalence), HIV-positive women will have access to lab services including CD4 counts without charge. This will be available on-site or within the network through specimen transport. Women requiring HAART for their own health will be linked to a network ARV center. For the anticipated 2/3 of women not requiring HAART, the current WHO recommended short course ARVs option will be provided which includes 2DVP from 8 weeks or ZDV/3TC from 34/36 weeks, intra-partum NVP, and a 7 day ZDV/3TC postpartum tail. Women presenting in labor will receive single dose nevirapine (sdNVP) and a 7-day ZDV/3TC postpartum tail. All HIV-positive women will be linked postpartum to an HIV/ARV point of service, which will utilize a family centered care delivery model whenever feasible, co-locating adult and pediatric care and providing linkages to family planning services. HIV-positive pregnant women with CD4 <350 will be placed on cotrimoxazole preventive therapy in the 2nd and 3rd trimesters. Healthcare workers at the facility and community levels will be trained to counsel HIV-positive women pre- and postnatally regarding exclusive breast feeding during the first six months of life or exclusive breast milk supplements (BMS) if Acceptable, Feasible, Affordable, Sustainable and Safe (AFASS) based on the WHO UNICEF curriculum adapted for Nigeria. Couples counseling or family member disclosure will be utilized to facilitate support for infant feeding choices. Consistent with national policies on importation of infant formula and recent concerns regarding appropriate use of breast milk substitute (BMS), CHAN NICaB will not utilize emergency program funds to purchase BMS. As part of OVC programming CHAN NICaB will provide safe nutritional supplement as well as water guard, bed nets and care items. HIV-positive women will be linked to support groups in their communities, which will provide both education and ongoing support around infant feeding choices and prevention with positives. PLWHA are currently engaged at CHAN NICaB ARV points of service as treatment support specialists. The use of dedicated treatment support specialists for PMTCT in the clinic and community will be expanded based upon the successful “Mothers to Mothers” model. This will ensure that HIV-positive women remain in care throughout pregnancy and receive appropriate services for herself and her infant during follow up.
Activity Narrative: Infant prophylaxis will consist of single dose NVP with ZDV for 6 weeks in accordance with Nigerian National PMTCT guidelines. Cotrimoxazole suspension is provided to all exposed infants pending a negative virologic diagnosis. CHAN NICaB will refer all HIV-exposed infants to USG supported laboratories for DNA PCR. Testing of infants will be carried out using dried blood spot (DBS) specimen collection. DBS specimens from PMTCT sites in the network will be pooled at the hub sites from where they will be taken to nearby USG-supported labs for testing by trained lab personnel using DNA PCR.

A systematic coordinated approach to program linkages will be operationalized at the site and program level including linkages to adult and pediatric care and treatment services as well as OVC services. Quality monitoring will be undertaken through site visits using an existing assessment tool and routine monitoring and evaluation indicators. Hospital coordinators will supervise activities on a daily basis while the NICaB clinical coordinator will collaborate with the USG TWG and GON to conduct quarterly site visits. Reports of activities will be sent to the USG and copies to NACA and the HIV and AIDS Division (HAD) of the FMOH. The NICaB project will work with community based workers including traditional birth attendants to support the already widespread practice of male child circumcision.

The CHAN NICaB project will train an average of 2 healthcare workers (HCWs) from each of the 24 sites, including community-based health workers and traditional birth attendants (TBAs), in the provision of PMTCT services and infant feeding counseling. The national PMTCT training curriculum, national infant feeding curriculum and new national training tools currently under development will be utilized. TBAs will be trained using a version of the PMTCT National Curriculum that has been adapted and modified for TBAs which focuses on HCT and referral of HIV-positive women. Thus the total direct training target is 72.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
This activity will provide counseling & testing services to 6,200 pregnant women and provide ARV prophylaxis to 248 mother and infants pairs. This will contribute to the PEPFAR goal of preventing new HIV infections. With 24 operational sites, the PMTCT activity is in line with the desire of the GON to have 1,200 PMTCT sites operational by 2009 and the USG’s target of having 80% PMTCT coverage.

LINKS TO OTHER ACTIVITIES:
This activity is linked to adult and pediatric care and treatment, OVC, laboratory infrastructure, condoms & other prevention, AB, and SI. Prevention with positives counseling will be integrated within PMTCT care for HIV-positive women. The basic package of care provided to all HIV-positive patients will be available to HIV-positive pregnant women. Positive pregnant women will be linked with nutritional support programs where they exist. CHAN NICaB lab staff will ensure that HIV testing provided within the PMTCT context is of high quality by incorporating PMTCT sites into the laboratory QA program. CHAN NICaB will collaborate with UNICEF in the support of PMTCT services at some sites, leveraging their training expertise and other resources without duplication and creating a more sustainable service support structure.

POPULATIONS BEING TARGETED:
This activity targets pregnant women who will be offered HCT, HIV-positive pregnant women for ARV prophylaxis and infant feeding counseling and exposed infants for prophylaxis and referral to EID. Couple counseling will be used to reach partners of pregnant women so as to reduce instances of violence following disclosure. Family members will be counseled to provide support to pregnant and breast feeding mothers.

EMPHASIS AREAS
The key emphasis area is training, as most supported personnel are technical experts. A secondary emphasis area is network/referral systems as networks of care will be supported which are critical to ensuring quality of care at the PHC level, identifying women in need of HAART and ensuring access to HAART within the network. In addition, partners and people affected by HIV/AIDS will be identified for linkage to care and support services. This activity addresses gender since treatment will be provided to women and will focus on family centric issues including male involvement in PMTCT programming.
**Emphasis Areas**

**Gender**

- Addressing male norms and behaviors
- Increasing gender equity in HIV/AIDS programs
- Reducing violence and coercion

**Health-related Wraparound Programs**

- Family Planning
- Safe Motherhood
- TB

**Human Capacity Development**

Estimated amount of funding that is planned for Human Capacity Development $72,000

**Public Health Evaluation**

**Food and Nutrition: Policy, Tools, and Service Delivery**

**Food and Nutrition: Commodities**

**Economic Strengthening**

**Education**

**Water**

---
Activity Narrative: ACTIVITY DESCRIPTION
This activity also relates to activities in human capacity development and health system strengthening.

AIDSTAR commences activities in COP09 by building staff capacity in three teaching hospitals to implement PMTCT services. The AIDSTAR project will work with three hospitals in the south-south zone of Nigeria (Abia, Akwa Ibom and Rivers states) to design interventions aimed at preventing HIV transmission of mother to child, including targeting STI and HIV infections in women of reproductive age. This is in accordance with the 2005 Abuja Call for Action in order to ensure universal access to PMTCT Plus interventions by 2010 and increase uptake of services.

AIDSTAR will build capacity of these hospitals to provide comprehensive HIV and AIDS prevention, care and treatment to women of reproductive age and their families, and will work to integrate HIV intervention activities into existing maternal child health (MCH) and reproductive health (RH) services being provided in the facilities to provide the minimum service requirements. AIDSTAR will provide counseling and testing services to 1,600 pregnant women with same day results. Based on the 2005 ANC prevalence of 4.4% it is expected that 70 women who are counseled, tested, and receive their results will be found to be HIV-positive and will be placed on ARV prophylaxis. All HIV-positive women identified will be linked to further care and support services regardless of their eligibility for treatment for their own disease.

For the HIV-positive women not requiring HAART, the current WHO recommended short course two drug ARV option will be provided. This includes zidovudine (ZDV) from 28 weeks with intrapartum single does nevirapine (sdNVP) and a 7-day ZDV/3TC postpartum tail or ZDV/3TC from 34-36 weeks with intrapartum sdNVP and a 7-day ZDV/3TC postpartum tail. Infant prophylaxis will consist of sdNVP and ZDV for 6 weeks.

Routine provider initiated testing and counseling (PITC) will be implemented as part of the standard of care in health facilities with opt-out decision at ANC and labor and delivery wards. HIV positive pregnant women will be provided with Mama Packs at the point of registration. CD4 testing will be prioritized for all HIV-positive pregnant women and regimens as outlined in the national PMTCT guidelines will be implemented. AIDSTAR will build the capacity of the sites to encourage linkages for PMTCT and child health services by having HIV exposure status on child health card registered on the mothers’ card. In continuation of the plan to integrate MCH and PMTCT services, AIDSTAR will work with the sites to provide family planning services at ANC and HCT with HIV-positive women linked to family planning services six (6) weeks postpartum. Couple counseling and testing will also be addressed as part of the PMTCT services and will focus on disclosure as well as to address issues of violence to women at disclosure. Couple counseling will also afford opportunities for providers to address exclusive breast feeding and breast milk substitute if AFASS, and to provide necessary support for HIV-positive mothers and exposed infants.

AIDSTAR will build the capacity of 24 healthcare workers (HCWs) to provide standard package for PMTCT including referral and supportive supervisory skills. This will be integrated through the training of a core group of senior HCWs in quality improvement and in mentoring lower level facilities which will be linked to the sites as part of a referral system. An additional four nursing staff from each of the sites, making a total of 12 nurses, will especially be trained on counseling issues which will include couples counseling, infant feeding counseling and referral systems in order to focus on all issues regarding counseling and referrals.

AIDSTAR will assist the sites to upgrade their facilities to provide the necessary clinical regimens to prevent mother to child transmission based on outcomes of HIV test, CD4 cell count and other clinical staging. HCT services will be provided at point of contact of ANC. The sites will have the capacity to offer appropriate treatment for things such as management of opportunistic infections (OI), nutritional support, antiretroviral therapy and psychosocial support for HIV-positive pregnant women. AIDSTAR will ensure that the facilities will also provide objective and individualized systematic follow-up care for HIV-positive mothers and their infants from initial contact to referral to other follow-up care and treatment.

For HIV exposed infants, AIDSTAR will work with sites to expand diagnostic capacity through collection of dried blood spots (DBS) and linkages to sites with early infant diagnosis (EID) PCR, to strengthen infant follow-up, to introduce earlier antibody testing (9-12 months), and to institutionalize cotrimoxazole prophylaxis.

In order to reinforce family-based HIV care, AIDSTAR will assist the sites to initiate PMTCT services that will be linked to existing community services to support HIV-positive mothers, their infants and family members with the use of a standard care package for the community-based service providers. Community services and support will enhance community awareness of HIV prevention, treatment adherence and counseling on individualized choice regarding infant feeding, as well as other psychosocial support needed. ARV and tuberculosis clinic linkages will also be established and strengthened.

Necessary follow-up of HIV-positive clients from the clinic setting will further be strengthened and loss due to follow-up will be greatly reduced. Linkages to networks of people living with HIV and other community-based and faith-based organizations will be strengthened for service delivery in PMTCT and care for children. HIV-positive women and mothers will be included in service delivery, especially in increasing awareness and advocacy at the community level. HIV-positive women who have accessed PMTCT services will provide periodic awareness programs during ANC to educate clients on the advantages of services being provided. This will increase uptake of PMTCT services and reduce loss to follow-up as well as encourage more women to utilize delivery services in the health care setting.

AIDSTAR will be required to submit monthly data of clients accessing PMTCT and other treatment services to USAID as well as quarterly, semi-annual and annual progress reports of implementation and management. Supportive supervisory services will be provided to staff monthly in collaboration with state government HIV/AIDS programs (SACAs and SASCPs).

Contributions to overall program area:
Activity Narrative: AIDSTAR will support the national scale up plan to improve access to PMTCT services in Nigeria, especially in hard to reach sites in the south-south geo-political zone. Activities in the program area are focused on ensuring that HIV-positive pregnant women get quality healthcare and support and that referral systems are in place to address their health needs. It also mobilizes the focal communities to provide further needed care and support for mothers and children. These activities will contribute to global PEPFAR goals and are consistent with the Nigerian National Plan of Action on PMTCT.

Links to other activities
The PMTCT services will be linked to HCT, adult and pediatric care and treatment, OVC, TB/HIV, laboratory services, and SI.

Population being targeted:
This activity intervention targets women of reproductive age and their partners, infants and PLWHAs. This activity also targets training of health care providers and mothers who will work as peer educators and referral persons.

Emphasis areas:
This activity has a major focus on capacity building and supportive supervision aimed at basic capacity building for sites to implement PMTCT services and other referral services in the health system for the target population. Community mobilization and participation, development of network/linkages/referral systems, and information and communication issues will also be addressed.

Activity System ID: 24936

Activity Narrative: ACTIVITY DESCRIPTION:
This activity represents the “fully-loaded” costs of a full-time Nigerian technical program officer for PMTCT. This is a continuing position.
The PMTCT officer’s responsibilities include: 1) representing the USG in technical discussions with the GON, 2) overseeing technical aspects of the program, including program management and oversight of partners to ensure high-quality and accountable programs, 3) interfacing with O/GAC Technical working groups, and 4) interfacing with the USG/Nigeria team’s prevention and treatment technical working groups. This person will work to ensure a harmonized, consistent, and relevant technical approach across USG Agencies and amongst all partners implementing PMTCT programs. The officer will also provide a significant level of in-field technical and monitoring support, as the PMTCT program area will be expanding greatly over the coming year, both in terms of dollar value and in terms of numbers of service delivery points. This advisor spends 100% of the time advising in the PMTCT program area.

The budget represents the loaded costs for this staffer, with the exception of ICASS costs (see another submission in this program area) and IT Tax costs, which are captured under the USAID Agency M&S line.

Activity Narrative:

ACTIVITY DESCRIPTION

This activity also relates to activities in Health System Strengthening and PMTCT.

This activity will implement PMTCT activities in three states consisting of 2 sites each to provide comprehensive HIV and AIDS prevention, treatment and care. This activity will provide counseling, testing and referral services to 3000 pregnant women. 132 pregnant women will be placed on antiretroviral (ARV) prophylaxis and HAART. Consideration will be given to strengthening the quality of service delivery in order to promote the best outcomes.

This activity will include, as a part of the standard package of care, routine provider initiated opt-out HIV counseling and testing (HCT) in antenatal clinics (ANC) for all presenting pregnant women and in labor and delivery wards (L&D) and the immediate post-delivery setting for women of unknown HIV status with referral for family planning services. Same day results will be provided to clients. This activity will use group and individual pre- and posttest counseling strategies and rapid testing based on the national testing algorithm. Partner testing and couple counseling will be offered as part of PMTCT services to enhance disclosure.

The awardee will also establish community and faith-based linkages and will utilize community and home based care services to promote partner testing. Clients will have access to free laboratory services including CD4 counts and STI screening. Free medications including those for OIs as needed and hematinics will also be provided. In addition to receiving PMTCT services, each woman will be referred to ART clinic for further follow-up treatment and care. Her children will be eligible to access OVC services referral for care.

Referral systems that incorporate active follow-up will be put in place to ensure that women requiring HAART are not lost during referral for ARV services. Referral coordinators will be identified at sites and in the communities with their capacities built to carry out needed services. This activity will explore the training and utilization of traditional birth attendants (TBAs) using an appropriate curriculum. This national TBA training curriculum when available will be used to develop skills in conducting safe delivery practices and recognizing early signs of obstetric complications, in addition to the mother-to-mother support groups that the awardee will establish at each site to reach HIV-positive women who choose to deliver outside of the health facility. Trained TBAs will be supervised and monitored by trained health workers in order to ensure that they refer complications and positive pregnant women to the hospital for quality and safe obstetric care. TBAs will also raise awareness and create demand for PMTCT. A focal person at each facility will be responsible for coordinating the tracing of HIV-positive mothers and their infants in the community and linking them back to care. The HIV-positive mothers and their infants will be linked postpartum to ART care and support services which will utilize a family-centered care model.

Emphasis will be laid on counseling on infant feeding options (exclusive breast-feeding for six months or breast milk substitute if Affordable, Feasible, Acceptable, Safe and Sustainable - AFAS) for identified HIV positive pregnant women. For the anticipated number of women not requiring HAART for their own health, the current WHO recommended short course two drug ARV option will be provided. This includes 28 weeks with intra-partum sdNVP and a 7-day ZDV/3TC post-partum tail or ZDV/3TC from 34-36 weeks with intra-partum sdNVP and a 7-day ZDV/3TC post-partum tail. Infant prophylaxis will consist of single dose NVP and ZDV for 6 weeks.

HIV exposed infants will be referred for early infant diagnosis (EID) to the pediatric clinic of the health facilities for testing in line with the National Early Infant Diagnosis scale-up plan from six weeks of age using DBS. Implementation of the EID scale-up will be done under the guidance of the GON and in conjunction with other IPs who will be conducting the laboratory testing. Awardee will collaborate with Clinton Foundation as appropriate for commodities and logistics support of the EID program. Exposed infants will be actively linked to pediatric care and treatment, while their families will be referred to age-appropriate OVC services. In COP09, PMTCT focal persons at the facilities will keep records of all exposed infants at enrollment soon after birth; informing HIV-positive mothers of the six weeks exact dates for DBS collection. The partner will ensure necessary training is given to 36 identified staff.

Support groups consisting of HIV positive individuals will be established in communities including identified HIV positive pregnant women and mothers and will train five members each from six communities where the sites are located in HCT skills. These 30 trained members of the PMTCT support groups will be engaged in tracking unbooked pregnant women and infants in the community, linking them to sites where they can access HCT, PMTCT and EID/DBS collection for their exposed infants and linked to pediatric care and treatment.

Full and accurate information will be provided on family planning and prevention services. Women accessing family planning services will be offered or referred for HIV Counseling and Testing. Infants of positive mothers will be linked to immunization services and other childcare services. Cotrimoxazole prophylaxis will be provided to infants from six weeks of age until definitive HIV status can be ascertained.

In COP09, the awardee will initiate its program for Continuous Quality Improvement (CQI) in order to strengthen and institutionalize quality interventions. Monitoring and evaluation of the activity’s PMTCT program will be consistent with the national plan for patient monitoring. Identified and trained activity-supported PMTCT specialists will work in conjunction with CQI specialists, program managers, clinical associates as well as counterparts at other IPs. PMTCT specialists will join the CQI-led team in conducting site visits at least quarterly, during which they will evaluate PMTCT clinical services, HCT done in the PMTCT setting, the utilization of nets, and PMTCT tools and guidelines/SOPs, provider medical record keeping, referral coordination, and use of standard operating procedures in PMTCT. On-site TA with more frequent follow-up monitoring visits will be provided to address weaknesses when identified during routine monitoring visits. State agency representatives and the USG will be included in quarterly monitoring and supportive supervision visits and submit reports of visits accordingly.

The activity will collaborate with UNICEF-supported PMTCT sites to provide training on PMTCT service delivery to 36 healthcare workers according to the national curriculum. Trained staff will be used as...
Activity Narrative:facilitators to step down trainings to other health care workers in their facilities and in nearby government health facilities as a human capacity development activity.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: This activity will provide counseling and testing services to 3000 pregnant women, and provide ARV prophylaxis to 132 clients. This will contribute to the PEPFAR goal of preventing 1,145,545 new HIV infections in Nigeria by 2009.

LINKS TO OTHER ACTIVITIES: The PMTCT services will be linked to HCT, basic care and support, ARV services, ARV drugs, OVC, TB/HIV, laboratory services, and SI. All identified pregnant women who present at every point of service will be provided with information about the PMTCT program and referred accordingly. ARV treatment services for infants and mothers will be provided through ART services. Basic pediatric care, including TB care, is provided for infants and children through OVC activities. All HIV-positive women will be registered for adult care and support services.

POPULATIONS BEING TARGETED: This activity targets women of reproductive age and their partners, infants and PLWHAs. This activity also targets training of health care providers, TBAs and mothers who will work as peer educators and referral persons.

EMPHASIS AREAS: This activity includes major emphasis on training, supportive supervision, quality assurance/improvement and commodity procurement. Emphasis is also placed on development of networks/linkages/referral systems. In addition, integrating PMTCT with ANC and other family-centered services while ensuring linkages to Mother-Child-Health (MCH) and reproductive health services will ensure gender equity in access to HIV/AIDS services.

Table 3.3.01: Activities by Funding Mechanism

Mechanism ID: 4043.09
Prime Partner: Partnership for Supply Chain Management
Funding Source: GHCS (State)

Mechanism: USAID Track 2.0 SCMS
USG Agency: U.S. Agency for International Development
Program Area: Prevention: PMTCT
Budget Code: MTCT

Activity ID: 9748.26051.09

Activity System ID: 26051

Program Budget Code: 01

Planned Funds: $1,642,065
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY NARRATIVE:
The Supply Chain Management System’s (SCMS) objective is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers the procurement but also the shipment, distribution and delivery of Prevention of Mother To Child Transmission (PMTCT) commodities as well as other supply chain management related activities. It also covers technical assistance (TA) and system strengthening (SS) activities provided to PEPFAR Implementing Partners (IPs) and to the Department of Defense (DoD) to strengthen or build their supply chain management capacity within their respective programs.

In COP09, SCMS will procure PMTCT related supplies and equipments including ARV prophylaxis for HIV-infected pregnant women and newborns, rapid test kits (RTKs), laboratory supplies and equipment, as well as other medical and non-medical supplies used in PMTCT services, for IPs and DoD.

Through its continuous support to and strengthening of commodity supply in PEPFAR PMTCT programs, SCMS works towards ensuring uninterrupted availability of needed commodities to the target populations of pregnant women and children under 5 years old.

The present budget will cover the cost of commodities as well as those logistical and administrative services from the field office for the coordination and management of the procurements undertaken by SCMS related to this area of work. The budget also supports the cost of TA and SS. The budget is broken into the following categories: (1) provision of HIV test kits to all PEPFAR PMTCT programs (DoD: Columbia University (CU)/ICAP; Family Health International (FHI)/GHAIN; Harvard University School of Public Health; APIN+; University of Maryland (UMD)/Institute of Human Virology (IHV)/ACTION; Catholic Relief Services (CRS)/AIDSR; Catholic Relief Services (CRS)/7 Dioceses; The International Foundation for Education and Self-Help (IFESH); LMS-ACT; Aficare; AIDSTAR; CHAN; NEPWHAN; ProHealth; Vanderbilt University; Partners For Development; Johns Hopkins University; and URC) and new partners who are deemed eligible for such support under this program area via USAID’s APS and CDC’s RFA upon award; and (2) provision of other PMTCT related supplies, equipment or technical assistance for three IPs and DoD, each of which has attributed specific funds to SCMS for these services (DoD, ICAP, UMD/ACTION, and URC).

SCMS will support the PEPFAR IPs and DoD in the following areas of the supply chain cycle: product selection in accordance with the Federal Government of Nigeria’s (GON) national treatment guidelines, HIV testing algorithm, marketing authorization status (NAFDAC registration) and GON importation regulation. SCMS will also be responsible for ensuring that commodities meet criteria under the USG acquisition rules and regulations including source and origin waivers and approvals or tentative approvals by the US Food and Drug Administration or other relevant stringent drug regulatory authorities, depending on the type of supply or equipment.

SCMS will assist in quantification and forecasting of requirements and will support the development of long term supply plans (considering in country stocks and anticipated consumption rates) for stock management and delivery planning. In addition to procuring required test kits for both training and use, SCMS will handle all the test kits donated by GoN to support PEPFAR programs.

SCMS will identify suitable sources of supply both internationally and nationally. SCMS will work with IPs in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and/or associated services (i.e. maintenance service). SCMS will coordinate with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by the National Agency for Food, Drug Administration and Control (NAFDAC), SCMS will make suitable recommendations including waiver applications where appropriate. SCMS will take the lead to communicate with manufacturers on registration gaps in Nigeria.

SCMS procurement leverages global spending to provide best value and offers clients certainty of competitive prices and international quality standards. SCMS’ procurement strategy is articulated around buying generics whenever possible, pooling procurement for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries and negotiating long term contracts with suppliers. With support from the SCMS field office, the USG team will coordinate and aggregate HIV test kits requirements on behalf of PEPFAR IPs and DoD. IPs’ requests for commodities other than test kits will be addressed also and coordinated with the SCMS field office directly.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry as required. SCMS will take the lead and further streamline the customs clearance process as appropriate including management of the CC1, CC2 or CC3 duty exemption forms. SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Where appropriate, commodities procured and imported by SCMS will be supplied through the SCMS Regional Distribution Center (RDC) in Ghana. The warehousing of commodities in the RDC is a critical component of the SCMS technical solution. The use of the RDC will significantly reduce lead times and provide an important buffer between the supply from manufacturers and demands from the PEPFAR programs in Nigeria. The RDC also ensures that their recipients in country, an increasing challenge in the context of program scale up. The RDC concept also brings an increased flexibility in stock management thus reducing risk of stock obsolescence or need for emergency replenishments, resulting in important savings. Finally, the RDC approach serves regional and national sustainability, as the RDC is designed to be a commercially viable entity, available to other health (and non-health) programs, whose benefit will last beyond SCMS. Where possible and appropriate, SCMS will road freight from the RDC Ghana to Abuja, a mode of delivery that will provide significant savings over airfreight.
Activity Narrative: Delivery arrangements will be negotiated with URC, ICAP, UMD and DoD for their specific procurements; SCMS will either deliver to a central location or to point of services as needed. Centrally procured test kits for all PMTCT partners will utilize the SCMS warehousing option as a point of centralized distribution. When local warehousing is needed SCMS will continue to explore viable options and make use of its recently acquired cross-docking facility and the long term warehouse facility (which will be acquired in COP09). For in-country distribution where necessary, SCMS will competitively source for and utilize the service of an efficient and safe in-country courier services operator.

SCMS will also assist IPs to monitor/report on stock levels and usage through the deployment of pipeline databases. In COP09, Supply Chain Support Teams (to be made up of technical SCMS staff and GON or IP staff as appropriate) will be constituted by SCMS to work with the IPs in providing their trained logisticsianists with the capacity to monitor and support the performance of the supply chains at various levels. Using standardized indicators of logistics performance, the SCSTs will track performance of the supply chains and act as an early warning system to identify impending or imminent supply chain breakdowns and act to forestall these. By developing methodologies and tools for conducting these activities, SCMS will work with GON and IPs to establish and institutionalize this activity thereby building the capacity to identify these problems and resolve them before service delivery is compromised. Additionally SCMS will monitor product safety and tracking for recalls (pharmacovigilance) in collaboration with appropriate GON and USG entities.

SCMS provides TA and SS services in all areas of the supply chain including product selection, quantification and forecasting, supply planning, procurement, warehousing, customs clearance and delivery. In COP09, SCMS will provide TA and SS services to IPs including the training of individuals in the use of the ProQ or Quantimed forecasting and pipeline supply planning tools. SCMS will continue to provide TA and SS services to DoD based on the recommendations that came out of a supply chain system’s assessment carried out in COP08. By providing training and supporting capacity building of local organization, SCMS addresses the emphasis area of human capacity development.

SCMS will provide the USG team with regular reports on supplies and equipments as well as monthly financial reports. In addition, an automated web-based procurement tracking database will ensure that the USG team and IPs have adequate visibility on SCMS procurement status by providing an easy access to accurate and up-to-date information on procurement. Further procurement automation and harmonization will also be facilitated through linkages with the Logistics and Health Program Management Information Platform (LHPMIP) system.

Under this program area, SCMS does not have targets of its own but supports PEPFAR IPs and DoD reaching their PMTCT planned targets.

Activity Narrative: In COP08, Pro Health International (PHI) provided counseling and testing to 1,200 pregnant women with training of 10 healthcare workers (HCWs). In addition, at least 80 traditional birth attendants (TBAs) were trained. In COP09 PHI will provide a comprehensive package of PMTCT services in Rivers and Cross River states of Nigeria, through the HARPIN program (HIV/AIDS Reduction Program in the Niger-Delta). Through effective mobilization of resources, community participation and stakeholder involvement, PHI will carry out this multifaceted program by building local capacity and strengthening existing healthcare delivery systems to achieve Prevention of Mother to Child Transmission. In view of this pursuit, PHI will support 4 selected health facilities (with the view of establishing a hub and spoke design of comprehensive treatment) in providing the minimum package of PMTCT – these four facilities will be selected based on strategic capacity to create the most meaningful impact on the long term, provide testing and counseling services to 3,700 pregnant women, of which 3,556 will receive their results; provide ARV prophylaxis to an estimated 104 positive pregnant women and providing training in PMTCT to 25 healthcare delivery staff especially ANC, labor and delivery staff (five from each of the four facilities) while ensuring that national standards are adhered to at the minimum.

In the PHI PMTCT program a ‘top to bottom’ approach to advocacy will be employed during which stakeholders will be identified and engaged appropriately to ensure a hitch free program execution and also to build a basis for program sustainability. These stakeholders include the community leaders, traditional leaders, religious leaders, policy makers, TBA and youth group leaders, association leaders, and age group leaders. Visits will be made to the State Ministry of Health to introduce and gain support for the program from the ministry. Similar visits will be made to the respective local government councils, SACAs, SASCAP, LACA etc., for the same reasons. Other state level committees that are involved in PMTCT will also be visited and intimated on the HARPIN program as a means of integrating the program into already existing HIV/AIDS frameworks. Of particular interest will be the PMTCT/Pediatrics committee. The HARPIN program will also be involved in state HIV/AIDS activities. Facility level advocacy will be aimed at key hospital staff in a bid to gain their support and acceptance of the program. This will translate to a means of achieving target as other staff within the same facility will be encouraged to refer pregnant women to the proper unit where they will access testing and counseling and early enrollment into the program with linkages to treatment and care if found positive. Facility level advocacy to nearby facilities without PMTCT services will further accomplish this objective. Since gender, especially female coercion, trans-generational sex, and inequitable gender roles are known drivers of MTCT, community gatherings, women group meetings, support group meetings, local government staff meetings, and other gatherings will be used as an avenue to address these gender disparities and disseminate gender-based messages that affect PMTCT, as well as avenues to encourage the practice of infant male circumcision. These are with the aims of reducing HIV transmission, reducing stigma, and making the stakeholders gain acceptance of the program down to the grassroots level.

The most cost-effective health facilities will be used and this will be achieved by selecting secondary health facilities where there is high traffic of patients, especially pregnant women. Where these are not available the most viable PHCs will be utilized. These health facilities will be supported to provide counseling and testing for pregnant women, ARV prophylaxis to prevent MTCT, counseling and support for safe infant feeding practices, and finally family planning counseling or referral. These will be in accordance with the national guidelines. A viable network of comprehensive prevention, treatment, care and support will be established between these health facilities and other providers of HIV/AIDS care, and support services to facilitate patient referral and linkage to other services that may not be available at the supported health facilities. Health facilities will be supported to provide basic laboratory services by providing technical assistance with donation of laboratory materials from the free healthcare program in the Niger Delta. Of particular interest would be establishing a ‘hub and spoke’ design of ARV treatment and PMTCT services, should more funds be available as a means of creating a complete continuum of diagnosis and treatment for those who are positive and to prevent client loss.

Both formal and hands-on training will be provided to both lay counselors and the health facility staff (especially labor and delivery staff) with emphasis on the former so as to avoid over-burdening the local health workforce, should that be the case. Attempts will be made to mostly use PLWHAs as the lay counselors. They will provide counseling and testing for all ANC, labor and delivery clients using the provider-initiated opt-out approach while ensuring that patients’ right to refusal are guarded. Post-test counseling will include an assessment of the mother’s risk of infection as well as information on reduction of the risks of MTCT. Partner testing with partner focused counseling techniques will be utilized while ensuring that test results will be made available on the same day using the serial algorithm. In addition to the regular post test counseling, clients that test positive will be linked to the prevention with positives program as a means of preventing further transmission or re-infection leading to increased viral load. Clients that test negative will be counseled to stay negative. Infants of mothers that test positive will be referred for early infant diagnosis (EID). This will enable prompt referral for pediatric treatment, care and support facilities including the OVCs.

In the PMTCT program PHI will identify and provide a complete course of ARV prophylaxis to 104 positive pregnant women with their babies of the 3,556 that will receive HCT results. Following confirmatory tests, CD4 estimation and subsequent staging at designated referral sites will be carried out. All positive pregnant women will be given sdNVP to take home at their first visit. HIV positive pregnant women will be categorized into those needing HAART and those requiring conventional prophylaxis. Client with high CD4 counts (above 350) will receive ARV prophylaxis, while those with low CD4 counts (below 350) will often require HAART and will be linked to a referral ARV center. The other two-thirds who will require conventional ARV prophylaxis will then be commenced on the current WHO recommended short course ARV prophylaxis which will include ZDV from 28 weeks, intrapartum NVP, and a 7 day ZDV/3TC post-partum tail. Alternatively, a regimen consisting of combivir with nevirapine will be given at 36 weeks or during labor. Following delivery, all HIV-positive women will be linked to comprehensive treatment, care, and support sites especially where pediatric and adult services are co-located and long term follow-up instituted. Infant prophylaxis will be according to the Nigeria National PMTCT Guidelines, which recommend a single dose of NVP with ZDV for 6 weeks and will be accessed at referral sites. All exposed infants with their mothers will be linked with care and treatment services including providers of cotrimoxazole...
Activity Narrative: suspension pending a negative virologic diagnosis after EID testing.

Training will be provided to healthcare workers on counseling and support for safe infant feeding, which will be provided at the 4 supported health facilities. HIV-positive women will be counseled pre/postnaturally on breastfeeding using the WHO/UNICEF curriculum adapted for Nigeria. Positive mothers will be counseled and supported on the use of exclusive breastfeeding with early weaning as one option. They will also be intimated on the pros and cons of other options like the exclusive use of breast milk substitute (BMS) and allowed to make an informed choice, in accordance with the national program. Linkages will be established with proximal OVC programs for the provision of safe weaning nutritional supplements, provision of water guard, bed nets and other home-based care materials. Also, linkages will be established with support groups that will provide education and ongoing support around infant feeding choices and prevention with positives. PHI will consider the affordability, feasibility, acceptability, sustainability and safety of each of the services offered. Direct training for a total of 25 HCWs including community based health workers will be provided using the National PMTCT Training curriculum. These HCWs will also be provided with follow up and mentoring by PHI PMTCT specialists to ensure proper and adequate use of knowledge and skills acquired during training. PHI will conduct referrals and linkages for family planning to accessible centers while group counseling will be provided in other areas like nutrition and general prevention of HIV/AIDS.

The HARPIN PMTCT program will be closely monitored by the PHI strategic information unit headed by the strategic information officer. National PMTCT registers and summary sheets will be provided to the supported facilities. Training, in addition to monitoring and evaluation, will be provided on proper data collection and entry methods as the means to data quality assurance. Site data will be collated and collected weekly following which it will be entered into the master data sheets and analyzed for reporting and action. Qualitative assessments will also be carried out by regular site visits by PHIr staff and external assessors. As the need arises, PHI will also provide assistance to the state committee for site visits. Monthly reports will be sent to PHI headquarters in Jos while quarterly reports will be sent to USAID and the GON (NACA and NASCAP).

Partnerships will be developed with other USG and non-USG implementing partners to build PHI's capacity by way of adopting best practices; leveraging on laboratory and testing services like CD4 count and PCR estimation for EID; capacity building and mentoring, etc. These will help to boost PHI's capacity in the program year as well as adding value to its PMTCT service delivery.

The emphasis areas for this program are building of local capacity and network/linkage formation. Local health workers that reside within the target communities will be given priority during selection to ensure an increase in the local pool of human capacity. Linkages and referral paths will be created with other IPs, FBOs, CBOs and CSOs as a means of ensuring that clients and patients do have easy access to needed services promptly.

PHI will hold a two-day training for traditional birth attendants with a view to building the requisite community framework for the mobilization and referral of pregnant women within the community. The TBA training is aimed at improving access to PMTCT services especially in the rural regions where TBA services are preferably patronized.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP09, ICAP will continue to work in the six states of Kaduna, Cross River, Benue, Kogi, Akwa Ibom and Gombe. A total of 100 existing Government of Nigeria (GON), mission and private health facilities will continue to receive support to provide PMTCT services and community outreach activities through existing hospital networks. These networks, which will include 30 secondary health facilities and 70 primary health centers (PHCs), will provide HIV counseling testing and results to 57,100 pregnant women and be linked into appropriate care and treatment programs.

ICAP will support 650 healthcare workers (HCWs), support infrastructure, purchase equipment and supplies, monitor, evaluate and provide supportive supervision to the sites. ICAP, with other implementing partners, will continue to support the implementation of the PEPFAR-Nigeria local government area (LGA) coverage strategy in Kaduna and Kogi, ensuring the provision of PMTCT services in at least one health facility in every local government area for designated states. In these states ICAP will actively engage the state level ministry of health to improve leadership and management of PMTCT programming in each state. Active efforts will be made to facilitate the public health approach in taking PMTCT services to the PHCs and community levels.

In COP09, ICAP will support comprehensive PMTCT services for communities, including HIV testing for pregnant women. ICAP will work to increase uptake of these services, including routine antenatal care and facility-based deliveries. ICAP will support PMTCT activities through these approaches: HIV counseling and testing (HCT) for all pregnant women (ANC, labor and postpartum period); ARV interventions dispensed in ANC and maternity for HIV-positive women; integrated routine group counseling into other health services attended by pregnant women and women of childbearing age; provision of services for well or sick children (immunization clinic); linkages to family planning and sexually transmitted infections (STI) clinics; and integration of HAART into maternal child health (MCH) services at comprehensive ART sites. Pregnant women, especially HIV-positive mothers, will be supported to deliver in health facilities through the provision of the national safe motherhood program delivery kits (“mama kits”). Mothers-To-Mothers support groups will be established and/or strengthened to increase facility-based delivery and reduce the number of women lost to follow-up. ICAP will support and train mentor mothers and support groups at PMTCT sites. Mentor mothers will conduct peer counseling to newly diagnosed HIV-positive pregnant women, adherence counseling to women on ARV prophylaxis or HAART, and default tracking for positive mother-baby pairs. The use of ART for PMTCT will follow the National PMTCT guidelines. HIV-infected women ineligible for ART will be offered a combination of zidovudine (AZT) from 28 weeks or Combivir from 34/36 weeks and single dose nevirapine (SD-NVP) at onset of labor. All positive women ineligible for HAART will receive a Combivir tail as part of their regimen. Women presenting in labor will be offered rapid testing and, if HIV-infected, provided with ART. Women will be provided with SD-NVP at birth and AZT for 6 weeks. 3,300 mother-baby pairs will receive ARV prophylaxis. Through appropriate infant feeding counseling and follow-up, ICAP will provide support for a mother’s infant feeding choice as well as provide ongoing psychosocial and adherence support. HAART eligible women (20% of positive women) will be enrolled at the nearest comprehensive site through referral and linkages. Health facilities will be supported to provide basic laboratory services and, if not available on site, will be linked to a laboratory in which CD4 testing can be performed by logging samples through specimen transport systems. ICAP will provide support for CD4 capability to high volume PHCs. Exposed infants will be actively linked to pediatric care and treatment through under-5 cards issued in labor and delivery. Women who test HIV-negative will receive prevention counseling and appropriate support to remain negative.

ICAP programming will emphasize group counseling and opt-out testing with same day results at ANC, labor and postpartum service delivery points. Partners, households and children will be linked into HCT. ICAP will actively promote community-based PMTCT services through CBOs to provide “doorstep” counseling services to pregnant women, their partners and children. Home-based care activities. Clients will be counseled on the beneficial effect of couple/partner HCT and disclosure on adherence to infant feeding choice. Eligible HIV-infected women will be assessed and linked into care and treatment services including ART and cotrimoxazole prophylaxis (CTX). Other activities are enhanced pediatric care including CTX from 6 weeks of age and promotion of best practices for infant feeding, nutritional support and linkages to family planning services. ICAP will ensure that 330 HIV positive pregnant and lactating women are provided with food and nutritional supplementation. In addition to receiving PMTCT services, each woman will be referred to OVC services upon her HIV diagnosis in order to facilitate care to all of her affected children. ICAP will actively encourage male circumcision as a preventive measure especially in Kaduna and Gombe states.

Identification and follow-up of HIV-infected and exposed children living within the community will be a priority with CBOs/FBOs assisting with adherence issues and defaulter tracking. ICAP will continue to implement a basic minimum package of care services to exposed infants at PMTCT/HCT-only sites. This would ensure that exposed infants are linked in. The minimum package includes: simplified Exposed Infant Registers for data capturing, prophylactic ARV syrups (NVP and AZT) within exposed infant/immunization clinic, HCT services at immunization clinics and for women with unknown HIV status. To implement these services at the PHC level, ICAP will train PHC staff to encourage task shifting in the care of HIV exposed infants. ICAP will also support training of non-lab personnel in HCT and utilize lay counselors as well as peer health educators to improve care and support services.

ICAP and its sub-partners will train 650 HCWs using GON curricula to provide quality services to HIV-infected pregnant women. The training will focus on prevention messaging (including balanced ABC messaging as appropriate), STI screening and treatment, safer sex, nutrition, malaria prophylaxis, use of ITNs and safe water. It is estimated that about 15% of babies born to HIV-positive women will become HIV-infected through mixed feeding. To reduce this risk, ICAP will provide unbiased infant feeding counseling to mothers based on WHO/GON recommendations (exclusive breastfeeding or use of breast milk substitute based on AFAS criteria). ICAP will facilitate the government’s efforts in improving infant feeding counseling by supporting a zonal training of trainers on HIV and infant feeding. ICAP will also support infant
Activity Narrative: feeding meetings and reprinting of National guidelines. 100 additional health care providers will also be trained to educate and assist mothers make appropriate infant feeding options and discourage mixed feeding practices.

Home deliveries remain a very strong preference among many communities in Nigeria as two-thirds of pregnant women either deliver with birth attendants or in their homes (DHS, 2005; Piper CJ, 1997). In order to reduce the number of HIV-positive mothers and their exposed infants lost to follow-up after home deliveries, ICAP will support community sensitization building of 200 traditional birth attendants (TBAs) across communities surrounding PMTCT sites in the six ICAP-supported states. TBAs will be trained on basic HIV prevention and infection control, the need for HIV counseling and testing especially among pregnant women, and their role in referrals of newly delivered mothers and their babies for follow-up care. Retired midwives and healthcare providers will be identified to monitor effective case finding and referrals of pregnant women, newly delivered mothers and their exposed infants to nearby PMTCT sites for enrollment into care.

ICAP will address the critical challenge of limited/lack of male partner involvement in PMTCT services and will strengthen male involvement through gender transformative activities. Through ‘Men taking Action’ ICAP will strive to increase service uptake, promote positive male norms and behaviors (especially as it relates to discordant couples) and help reduce stigma and discrimination through community-based activities. These activities include community education/behavioral change communication (EBCC), outreach HCT at male-friendly HIV/AIDS events, use of trained community leaders/gate keepers to conduct EBCC, deliver accurate messages related to PMTCT and offer HCT to male partners of pregnant women attending ANC.

ICAP will work in close partnership with GON on HIV early infant diagnosis, offering HIV infant diagnosis testing in line with the National Early Infant Diagnosis Initiative from 6 weeks of age using dried blood spots (DBS). HIV-positive infants will be enrolled and linked to appropriate care and treatment. A joint USG/GON/ICAP team will provide ongoing monitoring and evaluation (M&E), provide supportive supervision, and contribute to the national PMTCT program’s M&E efforts. ICAP is also earmarking USD125,000 for procurement of goods and supplies through the SCMS mechanism.

CONTRIBUTIONS TO OVERALL PROGRAM GOAL:
ICAP and its sub-partners target states with some of the highest seroprevalence rates in Nigeria. Providing services at the primary and secondary levels assists the GON in achieving its goal of decentralizing PMTCT services beyond the tertiary care level. ICAP will significantly contribute to an increase in PMTCT services by supporting 100 existing primary and secondary healthcare facilities, (government, mission and private facilities) and also indirectly supporting GON ministries/programs in their rapid scale-up plans for PMTCT. ICAP will partner with local institutions with appropriate expertise and capacity to reach out to primary facilities in line with national PMTCT scale-up plans.

The targets of 62,817 pregnant women counseled and tested and 3,300 mother-infant pairs for ARV prophylaxis will be reached by the end of COP09. This will significantly contribute to the emergency plan targets of increased national coverage. ICAP will strengthen national and state PMTCT programs by: support of capacity building of master trainers for PMTCT services; production of GON-approved infant feeding support tools; printing of national PMTCT registers; and support of regular coordination meetings in collaboration with other partners at national and state levels. ICAP will also strengthen the programmatic skills of partner community and faith-based organizations (CBOs, FBOs) in line with GON sustainability plans.

LINKS TO OTHER ACTIVITIES:
This activity is related to activities in adult and pediatric care and treatment, OVC, counseling and testing, SI, lab, and sexual prevention. Provider-initiated opt-out HCT will be offered to all pregnant women at ANC and to their partners. Women presenting in labor will have rapid HIV tests and receive single dose NVP if positive. Infants born to HIV-infected women will access ART (single dose NVP and ZDV) and CTX prophylaxis. Infant PCR HIV testing via DBS will be conducted, with HIV-positive infants linked to appropriate OVC care and treatment services. Linkages will enable HIV-positive women and family members access to support groups. All pregnant women will be linked into family planning services. Partner counseling/communication will be promoted through sexual prevention activities. M&E activities at PMTCT sites will contribute to the national PMTCT program’s M&E efforts using national PMTCT management information systems.

POPULATIONS BEING ADDRESSED:
Pregnant women, postpartum mothers, their partners and household members, including HIV exposed infants and HIV infected children, will be targeted and supported so that they have full access to HCT at multiple entry points of care. HIV infected women will be linked to PMTCT/PMTCT-plus services, while HIV infected infants/children and infected partners will access care and treatment services, including OVC services. Uninfected women will be supported to remain HIV-negative. CBOs, FBOs, support groups and men will also be targeted so that they participate fully in community based PMTCT services. Healthcare providers will be trained on providing services while the management skills of GON policy makers and implementers at all levels will be improved to enable them to manage programs effectively.

EMPHASIS AREAS:
Emphasis in this activity will be on training, increasing gender equity in HIV/AIDS programs, human capacity development and SI. Gender plays an important role in determining a woman’s vulnerability to HIV infection and violence, her ability to access care and treatment, and her ability to cope when infected or affected. This activity will promote gender equity in HIV/AIDS programs and increase access to services by the vulnerable groups of women and children. Emphasis will also be on primary prevention of HIV infection and prevention of unintended pregnancies among women living with HIV. HCT services will be integrated in reproductive health and family planning (RH/FP) services, while all PMTCT clients will be referred to access RH/FP testing especially among pregnant women, and their role in referrals of newly delivered mothers and their babies for follow-up care. Retired midwives and healthcare providers will be identified to monitor effective case finding and referrals of pregnant women, newly delivered mothers and their exposed infants to nearby PMTCT sites for enrollment into care.

ICAP will address the critical challenge of limited/lack of male partner involvement in PMTCT services and will strengthen male involvement through gender transformative activities. Through ‘Men taking Action’ ICAP will strive to increase service uptake, promote positive male norms and behaviors (especially as it relates to discordant couples) and help reduce stigma and discrimination through community-based activities. These activities include community education/behavioral change communication (EBCC), outreach HCT at male-friendly HIV/AIDS events, use of trained community leaders/gate keepers to conduct EBCC, deliver accurate messages related to PMTCT and offer HCT to male partners of pregnant women attending ANC.

ICAP will work in close partnership with GON on HIV early infant diagnosis, offering HIV infant diagnosis testing in line with the National Early Infant Diagnosis Initiative from 6 weeks of age using dried blood spots (DBS). HIV-positive infants will be enrolled and linked to appropriate care and treatment. A joint USG/GON/ICAP team will provide ongoing monitoring and evaluation (M&E), provide supportive supervision, and contribute to the national PMTCT program’s M&E efforts. ICAP is also earmarking USD125,000 for procurement of goods and supplies through the SCMS mechanism.

CONTRIBUTIONS TO OVERALL PROGRAM GOAL:
ICAP and its sub-partners target states with some of the highest seroprevalence rates in Nigeria. EMPHASIS AREAS:
Emphasis in this activity will be on training, increasing gender equity in HIV/AIDS programs, human capacity development and SI. Gender plays an important role in determining a woman’s vulnerability to HIV infection and violence, her ability to access care and treatment, and her ability to cope when infected or affected. This activity will promote gender equity in HIV/AIDS programs and increase access to services by the vulnerable groups of women and children. Emphasis will also be on primary prevention of HIV infection and prevention of unintended pregnancies among women living with HIV. HCT services will be integrated in reproductive health and family planning (RH/FP) services, while all PMTCT clients will be referred to access RH/FP
Activity Narrative: services post-delivery. The health status of HIV-positive women will be further enhanced by actively screening them for TB. Recognizing the impact of male involvement on a woman's access to PMTCT and HCT services, ICAP will use strategies to enhance partner testing, engagement in care and overall awareness of HIV/AIDS.

In the public health approach, tasks can be shifted from more specialized to less specialized healthcare workers. At comprehensive/high volume PMTCT/HCT-only sites "Mentor Mothers" will be trained to spearhead support groups. They will also be trained to participate in peer/adherence counseling and tracking of defaulting mother-infant pairs, thus further leveraging task-shifting. At the state government level, training of trainers will build the capacity of state PMTCT task force members, provide an opportunity for task shifting, and promote sustainability by engaging these state personnel in clinical system mentoring/supervisory activities at sites.

Activity Narrative: ACTIVITY DESCRIPTION

In COP08, Partners for Development (PFD) and their faith-based organization (FBO) sub-partner the Daughters of Charity (DC) implemented the PMTCT component of their CDC funded project entitled “Counseling, Care and Antiretroviral Mentoring Program” or CAMP, the name of PFD’s CDC-funded project. PFD and DC worked in two sites located in Delta and Akwa Ibom states providing PMTCT services through a combination of community based organizations (CBOs) and facilities with a target of reaching 1,800 pregnant women. In COP09, PFD will continue to provide PMTCT services to the same target population and plans to reach 2,000 pregnant women. Utilizing a network model with primary health care outposts linked to secondary “hub” sites that provide more complex PMTCT care and lab testing, in COP09 2,000 women will receive PMTCT counseling and testing and receive their results. A total of 2 PMTCT hub sites will be supported linked to at least 10 LGA level primary health care sites. Sites are located in the two states of Akwa Ibom and Delta. PMTCT standalone points of service in the network are linked to adult and pediatric ARV care through utilization of a PMTCT network. Using the referral SOP, HIV-positive pregnant women who require HAART are linked to an ARV point of service. Particular emphasis is placed on the involvement of community health workers who are the primary source of care for women in the pre and post-partum period and are integral to a program that seeks to engage women where they seek care. This program will work closely with the care and support team to maximally engage community based PMTCT and ARV linkages. In addition to receiving PMTCT services, each HIV-positive pregnant woman will be referred to OVC services in order to facilitate care for all of her affected children.

Opt-out HCT with same day test results will be provided to all women presenting for ANC and untested women presenting for labor and delivery. All women are provided pre-test counseling services on prevention of HIV infection including the risks of MTCT. Partner testing is offered as part of counseling through referral to on-site HCT centers. A step down training of couple counseling and a prevention with positives package will be utilized in all sites. This will provide an opportunity to interrupt heterosexual transmission, especially in discordant couples. Master trainers for HCT will train labor and delivery staff in the use of HIV rapid tests for women who present at delivery without antenatal care.

As a result of these PMTCT HCT activities, PFD anticipates that 2,000 HIV-positive pregnant women will be tested with an estimated 200 identified as HIV-positive and provided with a complete course of ARV prophylaxis. HIV-positive women will have access to supported lab services including CD4 counts without charge. This will be available on-site or within the network through specimen transport. Women requiring HAART for their own health care are linked to a network ARV service provision point. For the anticipated 2/3 of women not requiring HAART, the current national PMTCT guidelines recommended short course ARV option will be provided which includes ZDV from 28 weeks, ZDV/3TC from 34/36weeks and intra-partum NVP and a 7-day ZDV/3TC post-partum tail. All HIV-positive women will be linked post-partum to an HIV/ARV point of service, which will utilize a family centered care delivery model whenever feasible, coordinating adult and pediatric care and providing a linkage to family planning services. Women frequently face barriers to facility-based treatment access as a result of demands on them for childcare and to contribute to the family economic capacity. To address this, outreach services will be integrated at the community level to bring services to women who otherwise will opt-out of care and treatment. HIV-positive women will be counseled pre- and postnatally regarding exclusive breast feeding with early cessation or exclusive breast milk substitute (BMS) if AFASS using the National infant feeding curriculum. Couples counseling or family member disclosure will be utilized to facilitate support for infant feeding choices. As part of OVC programming, PFD will provide safe nutritional supplements as well as water guard, bed nets, and other home based care items. HIV-positive women will be linked to support groups in their communities, which will provide both education and ongoing support around infant feeding choices and prevention for positives. This will ensure that HIV-positive women remain in care throughout pregnancy, receive ARV prophylaxis, are supported in their infant feeding choice, access EID, and are linked to HIV care postpartum, thereby reducing loss to follow-up throughout the PMTCT cascade.

Infant prophylaxis will consist of single dose NVP with ZDV for 6 weeks in accordance with Nigerian National PMTCT Guidelines. Cotrimoxazole suspension is provided to all exposed infants pending a negative virologic diagnosis. Testing of infants will be carried out using dried blood spot (DBS) specimen collection. PFD will actively participate in the national early infant diagnosis initiative by providing infant for DBS testing from 6 weeks of age. A systematic coordinated approach to program linkage will be operationalized at the site level and program level including linkages to adult and pediatric ART services, OVC services and basic care and support. Quality monitoring will be undertaken through site visits using an existing assessment tool and routine monitoring and evaluation indicators.

PFD will train 5 healthcare workers from each of the 2 sites including community-based healthcare workers in the provision of PMTCT services and infant feeding counseling. The national PMTCT training curriculum, national infant feeding curriculum and new national training tools will be utilized.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
This activity will provide counseling & testing services to 2,000 pregnant women, and provide ARV prophylaxis to 200 mother and infants pairs. This will contribute to the PEPFAR country specific goals of preventing 1,145,545 new HIV infections in Nigeria by 2009.

LINKS TO OTHER ACTIVITIES
This activity is linked to care and support, OVC, ARV services, laboratory infrastructure, sexual prevention, and SI. Prevention for positives counseling will be integrated within PMTCT care for HIV-positive women. The basic package of care provided to all HIV-positive patients will be available to HIV-positive pregnant women. Women requiring HAART for their own health care will be linked to ARV services. Lab staff will ensure that HIV testing provided within the PMTCT context is of high quality by incorporating PMTCT sites into the laboratory QA program.

POPULATIONS BEING TARGETED
This activity targets pregnant women who will be offered HCT, HIV-positive pregnant women for ARV...
**Activity Narrative:** prophylaxis and infant feeding counseling, and exposed infants for prophylaxis and EID.

**KEY LEGISLATIVE ISSUES ADDRESSED**
This activity is related to issues of gender equity since treatment will be provided to women and will promote male involvement in PMTCT programming.

**EMPHASIS AREAS**
The major emphasis area is training, as most supported personnel are technical experts. A secondary emphasis area is commodity procurement as ARVs for prophylaxis and laboratory reagents for infant diagnosis will be procured. Another secondary emphasis area is network/referral systems as networks of care will be supported which are critical to ensuring quality of care at the primary health center level, identifying women in need of HAART, and ensuring access to HAART within the network. In addition, partners and PABAs will be identified for linkage to care and support services.

**MONITORING AND EVALUATION**
CAMP clinics will track the number and proportion of women attending antenatal care each year who receive PMTCT services and the number of HIV-positive women receiving antiretroviral prophylaxis. The quality of PMTCT sites will be monitored through indicators such as reduction in waiting time experienced by participants, the percentage of participants who complete their treatment, and the number of HIV-positive women who undertake peer education activities in their communities about the benefits of VCT.

**Table 3.3.01: Activities by Funding Mechanism**

| Mechanism ID: 1561.09 | Mechanism: HHS/CDC Track 2.0 Agency Funding |
PEPFAR programming in the area of sexual transmission prevention utilizes current data on the drivers of the epidemic and the most-at-risk populations (MARPs) for program strategy and targeting. Preliminary results from the 2007 National HIV/AIDS and Reproductive Health Survey (NARHS-Plus) highlight significant aspects of the Nigerian epidemic. National coverage of HIV testing is only about 14.5%. Overall HIV prevalence was found to be 3.6%. HIV prevalence was higher among females (4.0%) than males (3.2%) and slightly higher in urban areas (3.8%) compared with rural areas (3.5%). It was highest in the North Central zone (5.7%) and lowest in the South East zone (2.6%). It was highest among respondents with primary education (4.6%) and lowest among respondents that had no education (2.7%). It was highest among those who rated themselves as high risk for infection than among those who felt they were at a low risk. HIV prevalence was highest among respondents who had exchanged sex for gifts than among those who did not. The rate of condom use with a non-marital partner was generally low (49%) across the nation, with the least use in the North-East, North-Central and North-West zones.

The 2007 Integrated Bio-Behavioral Surveillance Survey (IBBSS) identified female sex workers (FSWs) as the sub-population most affected by HIV/AIDS in Nigeria (30% Prevalence). HIV prevalence was also high among men who have sex with men (MSM; 13.5%). The IBBSS also revealed a generally low risk perception among MARPs (FSWs, MSM, injecting drug users (IDU), transport workers, police, and armed forces), at less than 20%. Evidence from these recent studies show that the drivers of the epidemic in Nigeria include transactional sex, low risk perception, high risk behavior and sexual networks among MARPS, multiple and concurrent partnerships (MCP), poor sexually-transmitted infection (STI) management, and vulnerability arising from economic challenges.
In COP08, the Sexual Prevention program was redesigned based on suggestions from a prevention technical assistance visit, results of recent surveys, and the introduction of the National HIV Prevention Plan. USG/Nigeria’s strategy for COP09 Sexual Prevention programming will build on the COP08 strategy and be refined based on the currently available evidence. Focus areas will include: (1) development of a comprehensive package of services to promote abstinence, fidelity and related community and social norms; (2) development of a comprehensive prevention package of services for persons engaged in high-risk behaviors (PEHRBs), promoting correct and consistent use of condoms as well as STI management; (3) implementation of the minimum prevention package of services targeting the general population and targeted programming for MARPs guided by evidence from recent studies, taking into account the drivers of the Nigerian epidemic; (4) continued growth in the capacity of faith-based and community based organizations (FBOs and CBOs) to implement high-quality prevention programming; (5) integration of comprehensive prevention programming in care and treatment services including Prevention with Positives; and (6) evidenced-based programming within the national and USG prevention portfolios.

USG/Nigeria, through its implementing partners (IPs), will continue to provide a minimum package of services with particular attention to intensity and dosage of messages. Best practices in abstinence and be-faithful (AB) include: peer education model; post-exposure prophylaxis (PEP) plus model; curriculum and non-curriculum based school programmes; community awareness campaigns; interventions that address income generation activities, and build essential life skills; and workplace programmes providing interventions targeting adult males and females that encourage greater involvement of people living with HIV/AIDS (GIPA). Best practices in condom and other prevention (C&OP) program area, include: appropriate condom messaging; structured peer education using systematic training curricula; STI management; interventions addressing vulnerability issues like income generation activities, and essential life skills for young women engaging in informal transactional sex; and condom services, including education of sex workers on the use of water based lubricants, condom negotiation skills and condom use. Messages related to alcohol use and its attendant disinhibition effects will feature as a cross cutting message for target populations. IPs will utilize a minimum of three of these interventions to count a target as reached, and these will be reinforced with mass media activities. It is envisioned that, following the data triangulation exercise, population-specific packages will be recommended based on evidence from successful practices in the field.

In COP09, USG/Nigeria will focus on expanding services to reach specific high risk populations located within the 36 states and the Federal Capital Territory (FCT) of the Federation, as guided by available epidemiological evidence. This expansion effort will be guided by the distribution of the target populations as well as HIV prevalence rates. At the community level, the Condoms and Other Prevention program will target “hot spots” where high risk behaviors are more likely to occur. The Priorities for Local AIDS Control Efforts (PLACE) method, a new assessment and monitoring tool to identify potentially high transmission areas, will guide deployment of services.

Key achievements to date include: a successful mass media campaign (Zip-up) targeting youth and males in the general population; successful dissemination of the national prevention plan with roll out of its recommended minimum package of services; and successful conduct of surveys such as the IBBSS and NARHS. The diversification of the AB portfolio has been another significant achievement and has resulted in the deployment of varied combinations of partners and strategies addressing specific high risk populations. The Winrock vulnerability intervention strategy resulted in 6.7% of their target population (i.e., FSWs) taking up alternative means of livelihood, in addition to increased correct and consistent condom use in the target population.

In COP09, USG/Nigeria will continue to encourage mutual fidelity and avoidance of multiple and concurrent partners, through targeted mass media approaches and specific community-based interventions that address social norms and attitudes. A reinforcement of the successful Zip-up campaign and peer education plus models will target youth. These will be complemented with the “parents as counselors” model that encourages “A” messaging from an early age. The expanded scope of curriculum-based school HIV/AIDS program achieved in COP07 and COP08 will be reinforced in COP 09.

Programmatic gaps identified in COP07 and addressed through new procurement mechanisms in COP08 will continue to be addressed in COP 09. IPs will build sustainability through programming at the grass-root level and, when capacity reaches a level of sustained implementation, the IP will move to a new community, while Community Reach/PACT will provide continued support to these local CBOs and FBOs for their behavior maintenance interventions. This will expand the national prevention program to rural communities.

A data triangulation exercise will be conducted with COP08 funding to provide input to COP09 prevention programming through analysis of available qualitative and quantitative data. In COP09, a second wave of IBBSS will be conducted and will include a wider range of MARP groups and a larger sampling frame covering all geo-political zones of the country.

COP09 will also target efforts at special populations to address the ‘bridge’ phenomenon. Efforts towards reaching transport workers and adult males will be replicated in more states and sites across the country. Current services to the military will be expanded to reach other uniformed services. The C&OP program will be strengthened to provide priority population groups (e.g., female sex workers, male and female out-of-school youths, members of the uniformed services, incarcerated populations, long distance truck drivers, and taxi drivers) with direct access to quality counseling and testing services, STI treatment, and condom services, including messages on consistent and correct use guided by the findings of the 2007 IBBSS.

Current work with FSW will be expanded to non-brothel settings and will include STI management, counseling and testing services, provision of condoms and training on condom negotiation skills, with appropriate information on use of water-based lubricants. Training of FSWs in vocational skills (as income generating alternatives) will reduce dependence on commercial sex activity. Information will be provided and awareness created on the need for alcohol use reduction as well as condom use with boyfriends, spouses and non-paying clients to ensure risk reduction.
Interventions with transport workers will be continued through successful peer education models and condom services in motor parks, selected transport corridors and recreational spots of transport workers. Major transport corridors will be targeted with mobile and “moonlight” voluntary counseling and testing (VCT) services provided at truck stops and parks to encourage transport workers to know their status, and receive behavioral counseling on multiple partner reduction, as well as correct condom use with every sexual encounter. STI treatment services will be provided along these major corridors.

Work with high risk-youth will be refined to develop gender sensitive programming to meet the prevention needs of young, unmarried out-of-school females and males. The peer education model will be used as a channel to offer appropriate condom messages, essential life skills training and address the risks of multiple partnerships, intergenerational and transactional sex. Messages promoting abstinence (primary or secondary) as the most effective form of prevention will also be given.

In COP07, a formal labor force program with AB and appropriate C&OP messaging and services was developed to reach men and women in the workplace. This mechanism was sustained in COP08 and will be continued in COP09.

In COP09, to ensure comprehensiveness of HIV/AIDS services, steps will be taken to integrate ABC with care and treatment services. In this effort, treatment partners will continue to integrate prevention services into care and treatment settings. Also, implementing partners providing care and treatment services will continue to provide a minimum package of prevention services for people living with HIV through the adoption of a comprehensive Prevention with Positives (PwP) package. This PwP package will have a community component in line with the National Response, which will be implemented through support groups and CBOs. Several partners will provide appropriate information on correct and consistent use of condoms as well as provide condoms to PLWHA. The majority of costs associated with PwP will be offset under care and treatment. In addition, prevention services will be integrated into other clinical services, including family planning and reproductive health. STI treatment, rather than referrals, will be provided in clinical settings for HIV positives and MARPS. This intervention will be implemented using the recently adapted HIV Prevention in Care and Treatment Settings Prevention Package, which includes several training modules and job aids.

In COP09, the USG/Nigeria Prevention technical working group (TWG) will continue to implement the peer and participatory rapid appraisal for action (PPRAA) approach to help foster coordination and harmonization of partner activities. The combined USG Nigeria/IP/GoN prevention TWG (including state and local government levels) will visit various partner implementation sites together to assess their programs and interact with recipient communities and target populations. This allows for constructive criticism of strategies and a sharing and adoption of successful strategies without inhibition since they participate as peers with similar goals and objectives. This also helps partners and local authorities to leverage resources from one another and foster referral linkages.

The USG continues to collaborate with the UN and other organizations for condom commodities. Collaboration with DFID to leverage condoms from their social marketing programs will continue. UNFPA provides female and male condoms through federal and state government machinery. Quantification for condom supplies nationwide will be hinged on the 5-year national condom strategy. These mechanisms will be further exploited in COP09 with partners assisted to provide quantifications disaggregated according to male and female condoms. In COP09, the principle of the “three-ones” will remain the overarching principle guiding USG collaborations with GON through compacts, grants and cooperative agreements, which will aim at motivating the GON to provide enabling policy environment for, and efficient coordination of, an effective national response to the epidemic.

The GON’s 2003 National Policy and 2005-2009 Strategic Framework for Action provides a comprehensive framework for HIV/AIDS control efforts. Results from the recent IBBSS and NARHS-Plus studies provide evidence for policy support for targeted programming for vulnerable populations (MSM, IDUs). However, victims of trafficking as a vulnerable group presents a gap that will require programmatic intervention. The National Prevention Technical Working Group (NPTWG) inclusive of the USG Prevention TWG is providing technical leadership and direction for HIV prevention activities in Nigeria. The two-year National Prevention Plan developed by the NPTWG continues to provide programmatic guidelines for the National Prevention response. In COP09, the USG team will further support the NPTWG to develop National Sexual Prevention curriculum and guidelines in an effort to harmonize prevention efforts in Nigeria.

**Activity Narrative:** This activity is linked to counseling and testing, basic care and support, TB/HIV, OVC, strategic information, and PMTCT.

In COP 08, Partners for Development (PFD) worked collaboratively with their sub-partner, the faith-based organization (FBO) Daughters of Charity (DC) to provide services aimed at preventing transmission of HIV/AIDS through two project sites: 1) the Assumption Clinic in Warri, Delta State; and 2) Catholic VCT Center, Ikot Ekpene, Akwa Ibom state. Targets for COP 08 abstinence, be faithful, and condoms and other prevention (ABC) programming included reaching 4,091 individuals (2,000 males and 2,091 females) with AB prevention messages and 2,727 (1,527 males and 1,250 females) with other behavior change prevention messages from 2 outlets, and 2,000 individuals reached through abstinence only. These activities were implemented under the “Counseling, Care and Anti-retro Viral Mentoring Program” or CAMP, the name of PFD’s CDC-funded project.

In COP 09, CAMP will support the government of Nigeria in providing timely, accessible, factual and balanced ABC programming in line with the overall PEPFAR Nigeria goal to deliver a comprehensive package of prevention services to targeted individuals and motivation to practice preventive behavior, build self-efficacy, and create an enabling environment for sustaining HIV prevention behavior change. Messages and materials will focus on: increasing risk perception of HIV and AIDS; increasing demand for HIV testing and appropriate application of AB prevention strategy; delaying sexual debut; and reducing the number of sexual partners. This is of particular importance, as it has been reported that risk perception among Nigerians remains low, with 67% perceiving themselves not to be at risk of contracting HIV, and 29% assuming they are at low risk of contracting the virus (2005 National HIV/AIDS and Reproductive Health Survey).

CAMP prevention will focus on creating an enabling environment for sustaining HIV prevention behavior change through providing timely, accessible, factual and relevant HIV prevention information, and ensuring effective communication and motivation among stakeholders and targeted populations to practice preventive behavior and build their self-efficacy. Messages and materials will focus on increasing risk perception of HIV and AIDS; increasing demand for HIV testing; increasing self efficacy for the appropriate application of AB prevention strategy; and delaying sexual debut and reducing the number of sexual partners.

AB behavioral change communication programming will be implemented primarily through the following strategies: community awareness campaigns; peer education model; “peer education plus” model; and a school-based approach. In line with the National Prevention Plan’s guidance on a minimum prevention package, an individual will only be counted as reached after receiving AB messaging through at least three of the above listed strategies. For the condoms and other prevention (C&OP) programming, PFD’s minimum prevention intervention package will include: 1) community outreach; 2) specific population awareness campaigns; 3) peer education model; and 4) provision of STI management. Individuals will be counted as having been reached when they have received C&OP messaging through at least 3 of these strategies. The CAMP prevention team will be coordinated by a Prevention Officer who will mobilize 60 prevention volunteers from the membership of various community-based organizations (CBOs) active in and around the two project sites. These volunteers will be trained to educate their peers in ABC messaging, although in practice 30 volunteers will specialize in AB message delivery and 30 others will specialize in condoms and prevention messages. The CAMP prevention volunteers will be drawn primarily from CBOs active with church and primary school groups and the condoms and other prevention volunteers will be drawn primarily from with unemployed youth and transport workers groups. The CAMP project will use an almost exclusively a community outreach approach for transmitting prevention message that will be supplemented by complementary clinical based and counseling and testing service providers that will reinforce and expand upon prevention messages.

HIV prevention team members will be self-nominated from local support groups of people infected and affected by HIV/AIDS, as well as any interested members of communities groups linked to the CAMP catchment areas. These individuals will be trained by CAMP Program Officers to promote AB messages as well as C&OP messages, as appropriate to the population they are targeting. Training will emphasize routine counseling and testing for couples and individuals, and AB prevention as normative in their communities. These teams will adapt the Society for Family Health (SFH) behavior change communication (BCC) materials and work with local support groups to translate material into their community’s language.

Prevention teams will pay advocacy visits to the traditional community gatekeepers for access to the women, men and youth in each targeted locality, and organize community mobilization events with relevant HIV prevention messages for each group. These volunteers working with high risk groups will be coached to link the target population to condom outlets and appropriate testing/counseling and follow-up services (i.e., PMTCT, counseling for discordant couples, etc.) as well as sexually-transmitted infection (STI) treatment and care.

The AB prevention team will target 4,091 individuals with a subset reached with A only message activities (i.e., messages delivered to school groups up to the age of 13). A only messaging starts with an awareness talk in small group discussions facilitated by the Prevention Officer, followed up by peer education outreach by volunteer students trained as peer educators, and by a dance/drama presentations with an A message theme. AB messages will be delivered in secondary schools following the same first two steps and including a sporting or cultural event accompanied by an AB theme.

Condom and other prevention messages will target 2,727 individuals among those considered to be high risk groups — unemployed youth, transport workers, STI patients, persons living with HIV/AIDS (PLWHAs), and pregnant women. Messages will be reinforced at multiple fora such as small group discussions (including ante-natal care talks given at health facilities), interpersonal communication and social events, followed by mobile counseling and testing, condom distribution and follow-up prevention information for positives. Educational messages will cover the importance of partner reduction and STI prevention and treatment.
Activity Narrative: CAMP will utilize the recently adapted national prevention with positives (PwP) training package across all supported sites. In HIV counseling and testing (HCT), prevention of mother-to-child transmission (PMTCT), and adult care and treatment settings, clinical staff and community workers will encourage patients to promote testing and counseling for their sex partners. During each encounter with a positive person during the CAMP program, CAMP staff will support the integration of prevention into care and treatment settings, including family planning counseling and services, identification and treatment of STIs, and prevention counseling, provided by lay counselors. The C&OP portion of this activity will include provider- and lay counselor-delivered prevention messages promoting correct and consistent condom use during every sexual encounter. Also, condom use will be encouraged during family planning counseling as a method of dual protection and as part of STI management for reducing STI transmission and acquisition. These prevention messages and interventions will be delivered during risk-reduction counseling, family planning counseling, and STI management and counseling. CAMP staff will work with patients to encourage them to reduce alcohol and limit all other risky behavior and activities that affect their ability to adhere well to their ART regime, and adherence to the full course of any other medication the client is taking.

Program Officers will meet with prevention teams monthly to plan community outreach projects, address concerns, and provide any relevant or needed training in communication skills. Prevention team members will be trained to report on delivery of behavior change communication (BCC) methodology. Delivery of the MARCH methodology will be tracked and reported on by CAMP Prevention Project Officers. Focus will be placed on verifying the basic prevention package of at least 3 interventions per target reached in both AB and C&OP prevention components.

Contribution to overall program area: PFD/DC’s activities are consistent with the PEPFAR 5-year strategy, which seeks to scale-up prevention services, build capacity for long-term prevention programs, and encourage testing and targeted outreach to high-risk populations. The establishment of networks and referral systems from prevention efforts at the community level to PMTCT and HIV care and treatment will help facilitate the scale-up of the overall program.

Links to other activities: This activity is linked to counseling and testing, basic care and support, TB/HIV, OVC, strategic information, and PMTCT. PFD will procure condoms from Society for Family Health (SFH) and seek to partner with them and other specialized community groups to socially market condoms in the program area. PFD will promote condom usage, and other relevant prevention messages among migrant workers and other mobile populations in the Delta region. PFD’s home-based care team will also promote management of STIs and encourage community members to know their status as a first step in preventing the spread of HIV.

Target population: The focus population for this activity will be youth (in/out of school youth), HCT clients, and TB DOTS patients. Both Akwa Ibom and Delta states have many characteristics that contribute to accelerating the HIV/AIDS epidemic, including high numbers of unemployed youth who may engage in transactional sex. PFD/DC will focus prevention efforts on reaching young people both before they begin risky behaviors and after. In addition, prevention messages will be targeted to pregnant women since they also risk transmission to their unborn child.

Key legislative issues: Coordination meetings held at the LGA level with representation from local government assists in keeping local governments updated on the scope of the epidemic in their area and make them better advocates for strengthening barriers to prevention at the state level. CAMP staff will supplement these meetings with quarterly state level task force meetings to explore ways to achieve greater economies of scale and harmonization of approaches.

Program Emphasis: This activity includes major emphasis on information, education, and communication with minor emphasis on community mobilization and training. These activities will also address gender equity issues by providing equitable access to prevention services for men and women.

| Mechanism: HHS/Centers for Disease Control & Prevention |
| Program Area: Sexual Prevention: AB |
| Program Budget Code: 02 |
| Planned Funds: $90,000 |
Activity Narrative: ICAP-CU will be a new partner in the program area of Abstinence/Be Faithful (AB) in COP08. ICAP-CU will implement its AB programming activities in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached (thereby improving the effectiveness of this messaging) through a balanced portfolio of prevention activities including condoms and other prevention. Through the involvement of ICAP-CU as a new partner in this activity, PEPFAR Nigeria will extend its reach with AB services as ICAP-CU will be active in six states (Akwa Ibom, Benue, Cross River, Gombe, Kaduna, and Kogi) by the end of COP08.

ICAP-CU is currently providing prevention messages for positives (funded under care) to its large population of adults, adolescents and children, and will add on AB messaging to these prevention activities for increased balanced messaging.

In addition, ICAP-CU will target activities to HIV-negative persons in its catchment areas in order to minimize their risk behaviors and contribute to an overall reduction in HIV prevalence. A key age group for AB activities is youth/young adults aged 15-24 years as this encompasses the highest prevalence age group. The 2005 ANC survey in Nigeria indicates that among age cohorts in Nigeria, the 20-29 year old age group has the highest HIV prevalence (4.9% compared to a national prevalence of 4.4%). In addition, the 2005 National HIV/AIDS and Reproductive Health Survey (NARHS) demonstrated a low risk perception (28%) among the general population and significant reports of transactional sex (11%) among young women aged 15-29 years. This age cohort for both men and women represents the working age group in Nigeria; it is expected that a combination of prevention messaging approaches will ensure they are reached with prevention interventions.

In COP08 ICAP-CU will implement this activity at both the facility and community levels utilizing a combination of multiple strategies in this implementation, including community awareness campaigns, peer education models, peer education plus activities, and workplace activities (specifically Greater Involvement of People with HIV/AIDS, or GIPA). Activities conducted at the local level by ICAP-CU will be reinforced through national level mass media campaigns by other USG partners such as the successful Zip-Up campaign. AB messages will be balanced with concurrent condoms and other prevention messaging where appropriate and will be integrated with other PEPFAR services being provided at 25 hospital networks and their surrounding communities which will serve as the platform for ICAP-CU prevention activities in the coming year in six states. The goal of the program is to be focused on the communities targeted and to cover those communities with messages conveyed in multiple fora. Utilizing such a methodology, a large number of people will be reached with messages received via one method or another, but the target group will be those individuals that will have received AB messaging: (1) on a regular basis and (2) via at least three of the four strategies ICAP-CU will employ (community awareness campaigns, peer education models, per education plus activities, and workplace programs). The target for this intensive AB messaging campaign is 4,800 individuals. In addition, age appropriate abstinence only messaging and secondary abstinence messaging will be conveyed to 2,400 children and adolescents, particularly focused on those orphans and vulnerable children receiving both facility and home based support. A total of 375 health care providers, counselors, and peer educators will be trained to conduct effective prevention interventions inclusive of AB messaging.

ICAP-CU collaborates with several community based organizations (CBOs), faith based organizations (FBOs), and PLWHA support groups at its facilities and surrounding communities in other PEPFAR programming activities. These CBOs, FBOs and support groups will also serve as appropriate partners in the dissemination of ABC messaging to other PLWHA utilizing the peer education model, and to wider audiences through the peer education plus model and community awareness campaigns. The community and peer education plus activities will be organized through CBOs and FBOs under the supervision of ICAP-CU and will include activities such as drama presentations, musical events, and road shows/rallies. To address stigma issues and in compliance with the GIPA model, the ICAP-CU will include peer educators from the pool of those receiving treatment at facilities who are living openly and positively will be trained using the peer education model on dissemination of ABC messaging. They will serve as peer educators to extended family members and members of their support groups. These trained PLWHA will in turn reach individual cohorts of at least 10 other persons from among their social peers. With 50 facilities (including PMTCT sites), this will serve as an effective tool for reaching individuals in at least as many communities with balanced ABC messages.

A community awareness strategy will also be employed to serve the catchment areas of the hospital facilities which will be linked with community mobilization efforts promoting HCT. During static and mobile HCT services, counselors will be disseminating balanced ABC messages to recipient communities and clients through focused group discussions and interpersonal communication. With an HCT target of 112,500 clients getting counseled, tested and receiving their results, a minimum of this many clients will receive balanced ABC messaging through this approach. The key messages that will be conveyed are delay in sexual debut, secondary abstinence, mutual fidelity, prompt and complete treatment of all STIs and promotion of need to ascertain HIV serostatus through HCT.

ICAP-CU will also implement the peer education model targeting job peers who are healthcare workers. Healthcare workers at each site will be trained (the exact number will vary based on facility size) using established national peer education curricula and each will be requested to form peer groups of approximately 10 members from the healthcare worker community for dissemination of balanced ABC messaging. It is anticipated that these health conduits for age appropriate prevention messaging not only for their work peers but also for their social peers and for all clients with whom they come in contact.

A focus of the program in COP08 will be improvement of the integration of prevention activities into the HIV care and treatment settings; specifically, healthcare providers and lay counselors in care and treatment settings will be trained to appropriately deliver integrated ABC prevention messages and incorporate the messages into routine clinic visits using IEC materials and job aids. An appropriate balance of abstinence...
Activity Narrative: and be faithful, and correct/consistent condom use education will be tailored to the needs and social situation of each individual client in its presentation. In addition to the integration of such services into the HIV-specific treatment setting, prevention activities will be assimilated into other points of service in each health facility (general outpatient clinics, emergency services, etc.), particularly into reproductive health services including, family planning counseling, sexually transmitted infection management and counseling, and risk-reduction counseling.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
ICAP-CU AB activities emphasize integration of prevention activities with treatment and care services. Use of the community awareness campaigns, the peer educator model, and peer education plus activities (community drama, dance events, etc.) allows dissemination of AB messaging, including integration with condom messaging, from society-attributed sources of credible information – healthcare workers and PLWHA. This program will contribute to the Global HIV/AIDS Strategy by reaching 4,800 people with AB messaging and 2,400 people with abstinence only messaging in a comprehensive approach. The activities will also address issues of stigma and discrimination through the education of individuals and communities reached.

LINKS TO OTHER ACTIVITIES:
AB activities relate to HCT (5550.08), by increasing awareness of HIV. It also relates to care and support activities (5552.08) through dissemination of information by home based care providers and ultimately by decreasing demand on care services through decreased prevalence. Linkages also exist to condoms and other prevention (9208.08) as a complementary prevention strategy and to OVC programming (5547.08) by targeting orphans and vulnerable children.

POPULATIONS TARGETED:
Key populations targeted are youth, OVC, PLWHA, adults accessing HCT services at either static or mobile within catchment areas of the treatment sites, support group members and immediate families of PLWHA.

EMPHASIS AREAS:
Emphasis areas include human capacity development, workplace programs and gender.

AB activities promote a rights based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Reduction of stigma and discrimination are also key to the program.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP09, YWCA will be scaling up activities to two additional states, Anambra and Plateau states, and will be reaching 16,364 people with the standard minimum AB activities package, as recommended in the National Prevention Plan. YWCA will also be providing grants to an additional 5 community-based and faith-based organizations (CBOs and FBOs) in COP09 in addition to building their capacity in grants management and AB programming. YCARE project volunteers will be trained in COP09 to support HIV prevention in houses of worship and market places, and in the peer education plus (PEP) model that includes the use of drama, songs, and HIV debates. Helping Each other Act Responsibly Together (HEART) Health club will be initiated in schools. While YWCA will continue to provide skills acquisition trainings, including bead making, tie-dying, and basic computer skills through its vocational schools programs. YWCA will reach 7,740 individuals through abstinence only and will provide training to 50 persons in COP09.

ACTIVITY DESCRIPTION:
The focus of Y-Care activities will be in four of Nigeria’s six geopolitical zones (southwest, south-south, southeast, and north-central) and focused primarily in four states (Lagos, Anambra, Rivers, and Plateau). Y Care is designed to allow a rapid scale-up of activities and is anticipated to reach 16,364 people with prevention programs.

The main goal of the Y-CARE Project is to build the HIV programmatic capacity of CBOs and FBOs in Lagos, Anambra, Plateau and Rivers. To achieve this, CBOs and FBOs with successful track records and experience in reaching and providing services to the target populations are encouraged to become involved in the program and to consider applying for small grants from Y-CARE. To enhance the management of funds, the financial capacity of these organizations will be strengthened. Organizations not yet capable of managing their own funds but able to mount successful programs will have their funds managed directly by YWCA until they are able to assume full management.

CBOs/FBOs will be key partners in Y-CARE. They will participate in capacity building training to enhance their capacity to provide HIV/AIDS prevention programs. In addition, they will develop concept papers to implement the Y-CARE prevention protocols. Because the majority of CBOs and FBOs have limited experience in implementing such programs, YWCA will focus primarily on their experience in implementing similar projects and/or working with the target population. In addition, YWCA will consider the number of years in operation, the number of paid staff members and volunteers, the annual budget, and how each organization is managed to assess their potential to successfully implement a proposed project. Additionally, site visits will be conducted by staff to verify information received in written form and to better assess additional capacity building needs organizations may have. Selected projects will work with National YWCA staff to modify protocols to fit with local needs.

Addressing the value of women will be a key component of Y-CARE. Workshops will include discussions of women’s roles in their family and community, and the gender norms that constrain women. Peer health educators will use exercises to help build women’s and girls’ self esteem, and, as appropriate peer health educators will also teach income generating skills, such as jewelry making. Building of self esteem and economic empowerment of women and girls have been key activities of YWCA of Nigeria for a number of years.

This project will emphasize dissemination of messages centered on AB prevention targeted at girls, women, and their partners. Abstinence messages will encourage girls to delay sexual activity debut while “Be Faithful” messages will discourage women and their partners from having multiple sexual partners.

When teaching women and youth in churches, prevention outreach will be consistent with church teachings, yet accurate in regards to HIV transmission, prevention and care. This will be an important element in gaining the support of church leadership for the program. Clergy who are interested in actively promoting HIV prevention will receive accurate information on HIV/AIDS for their outreach activities to their congregations through sermons and community programs.

When working with youth in schools, Helping Each other Act Responsibly Together (HEART) health clubs will be initiated in schools and houses of worship. Members of health clubs will reach their peers during the course of the project. HEART club members will be involved in peer education plus activities (dramas, songs and HIV debates). HIV prevention will also include a component of economic empowerment for women and girls. One major problem for women and girls in Nigeria is their vulnerability related to finances/income, which contributes to their continued low status in society. Their low status also makes it difficult for Nigerian women and girls to be firm about their sexual decisions and to effectively negotiate condom use in sexual relationships.

When working with the women in market places, volunteers will conduct their trainings around the market schedule. Because many women take their children to the markets with them, HIV prevention outreach to these women will include separate age appropriate activities for the children. The HIV prevention program will also include guidance on caring for children. When working with women in polygamous marriages, volunteers will modify HIV prevention messages to be culturally relevant to polygamous family life. For example, faithfulness will be discussed with consideration for their husband’s other wives.

The Y-CARE Project will emphasize decision making about sexual behavior, the importance of delaying sexual debut, and looking for a partner who is willing to be mutually faithful. Trained peer health educators will provide information on relationship skills so that youth can learn to identify equitable relationships and be able to negotiate with their partners once they are in a relationship. For women who have partners, the peer health educators will focus on faithfulness to one partner. AB activities in Lagos, Anambra, Rivers, and Plateau states will help women build relationship and communication skills to improve their ability to negotiate safer sex in the relationship. Women at high risk, such as those in discordant relationships, will be taught other prevention measures.
**Activity Narrative:** CBOs and FBOs will be responsible for the implementation and supervision of projects, including project monitoring and evaluation and budget management. The CBOs and FBOs will submit quarterly project reports to YWCA regional offices, which will detail the progress of their programs and standardized data collection results.

**PROJECT CONTRIBUTIONS**
At the end of the three year project it is expected that 16,364 individuals will have benefited directly from the project through YWCA collaboration with CBOs and FBOs through peer education and outreach activities.

**NETWORKING/LINKAGES**
Through networking with other USG funded HIV programs, Y Care will actively refer individuals to other USG-sponsored HIV testing, treatment and care programs that will complement Y Care activities to enhance service integration and ensure that people living with HIV receive the care and support that they need and deserve.

**TARGET POPULATION FOR Y-CARE**
The target populations for this project are girls, women and their partners.

**EMPHASIS AREAS OF ACTIVITY:**
This project will provide emphasis on dissemination of messages centered on AB prevention targeted at girls, women and their partners. Abstinence messages will encourage girls to delay sexual activity while Be Faithful messages will discourage women and their partners from having multiple sexual partners.

Activity Narrative: The SCMS objective is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers not only the procurement but also: the shipment, distribution and delivery of sexual prevention related commodities; information, education and communication (IEC) and related materials developed for the promotion of abstinence (A), be faithful(f)/fidelity promoting initiatives and other prevention (OP) activities; and other supply chain management related activities. It also covers technical assistance (TA) and systems strengthening (SS) activities provided to PEPFAR partners to strengthen or build their supply chain management capacity within their respective programs.

In COP09, SCMS will procure sexual prevention related commodities; AB and OP commodities (not including condoms), IEC and promotional materials, and products for the management of sexually transmitted infections (STIs) for the Department of Defense (DOD). Through its efforts in this program area, SCMS works towards ensuring uninterrupted availability of needed commodities for AB (for the encouragement and promotion of safer sexual behaviors ultimately targeting the general population) and OP interventions.

The present budget will cover the costs of commodities as well as logistical and administrative services from the field office for the coordination and management of procurements by SCMS. SCMS will support DoD in product selection in accordance with the minimum package of AB and OP interventions for appropriate targeting of the military and civilian populations reached through DOD’s sexual prevention programming.

SCMS will assist in quantification and forecasting of requirements, and will support the development of long term supply plans (considering in country stocks and anticipated consumption rates) for stock management and delivery planning.

SCMS will identify suitable sources of supply, both internationally and nationally. SCMS will work with IPs in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and/or associated services, such as maintenance service.

SCMS will coordinate with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by NAFDAC, SCMS will make suitable recommendations, including waiver applications, where appropriate. SCMS will take the lead in communicating with manufacturers on registration gaps in Nigeria.

SCMS procurement leverages global spending to provide the best value and offers clients certainty of competitive prices and international quality standards. SCMS procurement strategy includes the purchase of generic drugs, whenever possible, the pooling of procurement for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries, and negotiating long term contracts with suppliers.

DoD requests for sexual prevention materials will be addressed to the SCMS field office directly.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry, as required. SCMS will take the lead and further streamline the customs clearance process as appropriate, including management of the CC1, CC2 or CC3 duty exemption forms. SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Where appropriate, commodities procured and imported by SCMS will be supplied through the SCMS Regional Distribution Center (RDC) in Ghana. The warehousing of commodities in the RDC is a critical component of the SCMS technical solution. The use of the RDC will significantly reduce lead time and provide an important buffer between supply from manufacturers and demands from PEPFAR programs in Nigeria. The RDC will also ensure that shipment quantities do not overwhelm their recipients in country, which is an increasing challenge in the context of program scale up. The RDC concept also brings an increased flexibility in stock management, thus reducing risk of stock obsolescence or need for emergency replenishments, toward important cost savings. Finally, the RDC approach serves regional and national sustainability, as the RDC is designed to be a commercially viable entity, available to other health (and non-health) programs, whose benefit will last beyond SCMS. Where possible and appropriate, SCMS will road freight from the RDC Ghana to Abuja; a mode of delivery that will provide significant savings over airfreight.

Delivery arrangements will be negotiated with DOD; SCMS will either deliver to a central location or to point of services, as needed. When local warehousing is needed, SCMS will continue to explore viable options and make use of its recently acquired cross-docking facility and long term warehouse facility (which will be acquired in COP 09). For in country distribution where necessary, SCMS will competitively source for and utilize the service of an efficient and safe in-country courier services operator.

SCMS provides TA and SS services in all areas of the supply chain, including product selection, quantification and forecasting, supply planning, procurement, warehousing, customs clearance and delivery. In COP09, SCMS will provide TA and SS services to DoD, including the training of individuals in the use of the ProQ or Quantimed forecasting and pipeline supply planning tools. SCMS will continue to provide TA and SS services to DoD based on the recommendations that came out of a supply chain system’s assessment carried out in COP07.

SCMS will provide the USG team with regular reports on supplies and equipment, as well as monthly financial reports. In COP 09, supply chain support teams (SCSTs; to be made up of technical SCMS staff and Government of Nigeria or implementing partner [IP] staff, as appropriate) will be constituted by SCMS to work with the IPs in providing their trained logisticians with the capacity to monitor and support the performance of the supply chains at various levels. Using standardized indicators of logistics performance, the SCSTs will track performance of the supply chains and provide an early warning system to identify
Activity Narrative: impending or imminent supply chain breakdowns and act to forestall these. By developing methodologies and tools for conducting these activities, SCMS will work with GoN and IPs to establish and institutionalize this activity, thereby building the capacity to identify these problems and resolve them before service delivery is compromised.

In addition, an automated web-based procurement tracking database will ensure that the USG team and IPs have adequate visibility on SCMS procurement status by providing easy access to accurate and up to date information on procurement. Further procurement automation and harmonization will also be facilitated through linkages with the LHPMIP system.

Under this program area, SCMS does not have targets of its own but supports DoD reaching their prevention planned targets.

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

The Catholic Secretariat of Nigeria (CSN) SUCCOUR Project provides comprehensive HIV prevention and OVC care and support services. During COP 09 CSN will continue to provide training support to all 13 arch/diocese across 10 states. Coverage areas of the activity are: Awka, Onitsha and Nnewi Archdioceses (Anambra), Bauchi Diocese (Bauchi), Calabar and Ogoja Archdiocese (Cross River), Abakaliki Diocese (Ebonyi), Enugu Diocese (Enugu), Kano Archdiocese (Kano), Jalingo Diocese (Taraba), Lokoja Diocese (Kogi), Ijebu Ode (Ogun) and Lagos Archdiocese (Lagos). The dioceses were selected based on their experience in managing HIV/AIDS programmes, and can rapidly scale up to provide comprehensive HIV prevention and OVC care and support services over a one year period.

SUCCOUR prevention programs will implement AB activities in line with the National Prevention Plan using behavioral change strategies to ensure that the target population is reached with AB messages using at least four AB strategies. These are (a) peer education model where “faithful house” (marital counseling with five models) for married couples, “choose life” (with four modules) for youths, and support group for PLWHA (who will also receive referral to counselors for adequate and correct information on preventive measures); (b) community awareness where AB messaging will be given during mass; (c) peer education plus model where schools form anti AIDS clubs, drama, games, and quizzes and use the activities to give prevention messages and (d) school based approach.

This activity has the following components: 1) organizational and programmatic capacity strengthening of CSN and partner (Arch)dioceses; and 2) promotion of behaviors that reduce the risk of HIV infection among by youth and young adults in target communities.

Organisational and programmatic capacity strengthening of CSN and partner (Arch) dioceses: Each one of the following trainings—central advocacy training; central “Faithful house” training, central “choose life” training, central OVC protection, and central home-based care/OVC support training—will take place at the national level. Subsequently, a step down training will reach from the diocesan level to parish volunteers and home-based care teams. These volunteers will be recruited by the 13 diocesan teams with the active collaboration of the parish priests. 180 volunteers will be trained.

Behaviours that reduce risk of HIV infection adopted by youth and young adults in target communities. This activity includes advocacy visits to 13 Arch/Bishops and 65 community leaders. Muslim leaders and Imams will also be targeted. Through Sunday sermons and short seminars, the SUCCOUR Project will empower parents and adults to support young people to abstain from sex and equip them with skills that will help them adopt healthy life choices. People will be reached with Abstinence and Be faithful messages through priests, parish action volunteers, men, women, and youth church societies. The 13 diocesan teams will sensitize the major men and women societies in the church, Catholic Men Organization (CMO) and Catholic Women Organization (CWO) with monthly talks and seminars. Each of these has about 80 persons at monthly meetings. 160 adults will monthly receive this sensitization and will reach 5 young people in their households with AB messages. The AB activities will be structured in such a way that each person is reached with at least three AB services: Peer education, community awareness campaign, a school based approach, and peer education plus. Sensitization of clergy and religious leaders will also be carried out. 20 priests per partner arch/diocese will be sensitized during sensitization seminars reaching a total of 260 priests. Each priest will reach 500 people at mass each week over the course of the year. These 130,000 individuals are not hearing a one-off message, but are hearing the message from trusted advisors, continuously over time.

Funding will also go to the development and distribution of IEC materials. Posters, handbills and pamphlets with HIV Prevention messages will also be used to reach the targeted audience. Abstinence clubs will be established for adolescents in the communities, while singles and couples forums will reach unmarried and married adults, respectively. Youth peer educators for adolescents and youth church societies. The 13 diocesan teams will provide support and counseling to their peers and to organize regular HIV/AIDS awareness activities. The abstinence clubs established in schools will be provided with books and IEC materials to establish an information corner, to include such materials as posters, handbills and pamphlets with HIV Prevention messages. A monthly stipend will support the activities of abstinence clubs in selected parishes and schools from the diocesan budgets in the form of a small grant. Funding will go to community recreational activities. 13 arch/diocesan teams will organize a football tournament,” Choose Life Football Cup” and cultural dance/drama competition for youth. At each of these events, 300 persons will be reached with AB messages through talks, songs and the distribution of IEC materials.

Adolescents and unmarried adults totaling 840 individuals already trained at a “Choose Life” seminar will reach 19,500 persons with abstinence messages only. 13 couples (one from each partner diocese) will be trained centrally with the Faithful House curriculum. The program is a catalyst to happy and lasting marriages that prevent HIV infection using the concept of “Faithful House”. Each trained couple will cascade the training for another five couples. Each of the 13 partner arch/dioceses will be supported to train 15 couples (30 individuals) in marital counseling, totaling 195 couples (390 individuals) trained in AB prevention (the Faithful House curriculum) during a five day training program with additional monthly follow-up over 6 months. The trained couples will train a minimum of five couples each totaling 975 couples (1950 individuals). Therefore, 2,366 individuals will receive comprehensive marital counseling training. Parents and especially fathers/husbands will be provided with information and resources to enable them to offer gender-sensitive information and play an active role in educating their children and friends on AB.

Subsequently, refresher training would be conducted for the 13 partners who will be supported to initiate youth activities in two primary and two secondary schools with Anti-AIDS youth clubs. These clubs are designed to decrease stigma and discrimination against PLWHA.

1,040 young people attending schools will receive repeated and concentrated training in “A” only. Of these, 520 will be from secondary schools where they will be trained in secondary abstinence and a similar number from primary schools that will be trained in primary abstinence. Each member of the club will on the average reach 15 other school attending youths with community mobilization+. IEC and peer education...
Activity Narrative: education/counseling service, and a total of 15,600 youths reached with three “A” strategies. The Family/Human Life Unit of the CSN, which focuses on promoting human dignity, strengthening family values in accordance with the principles of Catholic Social Teaching, and educating youth in preparation for wholesome family life, will bring to bear its expertise in “AB” behaviour change programming through peer education and life skills building. The Youth Animation Unit of the Church will facilitate linkages to the vast network of Catholic youth organizations to increase peer outreach and youth involvement. AB prevention trainings will be conducted for 300 PLWHA, who are serving or have leadership potential to serve as Support Group leaders. Those trained will counsel and communicate information about AB prevention to support groups, households and communities. Each leader will reach 50 people, for a total of 15,000 people reached. Those willing to disclose their status as part of AB prevention will be supported with additional training and support. Each of these support group participants will receive community mobilization, peer education and vulnerability reduction strategies, and active recruitment and involvement of 13 PLWHA (one per diocese) will be encouraged among the partner dioceses in line with the GIPA principle.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
The SUCCOUR project will contribute to prevention of new infections through Abstinence and Be faithful strategies to reach 25,000 persons and 15,000 persons to be reached with abstinence only strategies within the national response.

POPULATIONS BEING TARGETED:
Target populations of the A/B Prevention messages include adults, children and young people between the ages of 15-24 years, PLWHA, HIV/AIDS affected families, and community leaders. This includes both girls and boys from primary school through university students, as well as adults of both genders. Other target groups include the Catholic clergy and laity, who will be reached with abstinence programs that include behavior change communication, building life skills, youth support clubs, and awareness outreach through extracurricular activities.

Direct targets include delivery of AB services through outreach programs to 25,000 individuals, 15,000 of which will benefit from A-specific services through the clergy, catechists and peers; and 4506 individuals receiving training.

LINKAGES AND SYNERGIES WITH OTHER USG SOURCES: All cases of HIV will be referred to AIDSRelief (AR) or other IPs. Monitoring tools developed in the CRS 7D/SUN Projects will be used. The new PEPFAR reporting guidelines will be incorporated in the M&E tools. The series of mentoring using the present SUN/7D experience and capacity building processes aimed at institutional strengthening will be conducted. Experience will be leveraged from the CRS/7D project.

EMPHASIS AREAS: Gender issues mainstreaming into partner capacity strengthening is essential to addressing some of the disparity that has placed women at greater disadvantage. The SUCCOUR project will promote the active participation of both men and women through the Women’s, Men’s and Youth societies, ensuring they are adequately represented in stages of planning and implementation. Prevention activities will target both sexes with behavior change communication promoting healthier concept of maleness among youth. This will reduce the vulnerability of women and girls to abuse, sexual coercion, rape, and sex trafficking. Meaningful Involvement of People Living with HIV/AIDS (MIPA) with increased participation of people living with HIV/AIDS in program design and implementation contributes to the reduction of stigma and discrimination and ensures that programs are sensitive to the needs of the target population. 1,500 persons will be trained in HIV stigma reduction strategies. By establishing a symbiotic relationship with support groups in communities, the dioceses will be able to refer clients to these support groups and also call on members of the support groups to participate in providing counseling and home based care services, as well as to share their expertise during trainings. The level of involvement of PLWHA in a diocesan program will be used to assess the performance of the dioceses for qualification to receive grants.

Activity Narrative: ACTIVITY DESCRIPTION:
This activity represents the “fully-loaded” costs of a full-time Nigerian technical advisor for sexual prevention, funded via the AB budget line, and the fully-loaded costs of his full-time technical and administrative support staff which includes one program officer, two program assistants and an administrative assistant. The strategic shift undertaken by the National Prevention TWG to mandate a minimum package of prevention services requires a significant level of programmatic guidance and oversight for the partners, and the robust integrated prevention team provides the technical leadership required for an appropriate response. Oversight, supervision, mentoring, and capacity-building needs are significant and burdensome for the wide portfolio of prevention partners. The entire prevention team contributes to meeting these needs by making regular supervision visits to the field—twice monthly by technical advisors and program officers, and monthly by the support staff.

The sexual prevention team’s responsibilities include: 1) representing the USG in technical discussions with the GON, 2) overseeing technical aspects of the program, including program management and oversight of partners to ensure high-quality and accountable programs, 3) interfacing with O/GAC Technical working groups, and 4) participating in the USG prevention working group. As USAID has the technical lead for this program area within the USG team, this fourth responsibility is key to ensuring a harmonized, consistent and relevant technical approach across USG Agencies and amongst all partners implementing sexual prevention programs. The prevention advisor spends 100% of his time advising in this program area and does not have primary program responsibilities in any other program area.

The budget represents the loaded costs for this (AB) sexual prevention team, with the exception of ICASS costs (see another submission in this program area) and IT Tax costs, which are captured under the USAID Agency M&S line.

Activity Narrative: The funds requested to support USAID’s Annual Program Statement (APS No. 620-08-002: Support for Civil Society Organizations/Faith Based Organizations Network to Provide HIV/AIDS Prevention, Care and Support Services) for this program area are required for awards made under this open solicitation.

Additive funding resources are required for new awards that are in progress and will be partially funded using COP08 funds. These applications have passed both the concept paper and full application reviews by the Technical Evaluation Committee (TEC) and are in the final stages of negotiation, with awards expected in early 2009. Details of these awards are still procurement sensitive; however awards are being negotiated with new local partners that will be awarded as Prime partners, partners whose prevention activities will continue throughout the COP09 funding period.

Second year funding resources are required to fund applications selected for award during the COP08 program period, but which are currently being negotiated. These applications have passed both the concept paper and full application reviews by the TEC and are in the final stages of negotiation, with awards expected in early 2009. Details of these awards are still procurement sensitive. However, these same partners will continue with activities throughout the COP09 funding period.

In conjunction with the open APS, a solicitation for concept papers is expected to be announced in February 2009. Resources will be required for the first year of funding for these applications which will be selected during the COP09 program period.

Funds that will be required to implement and continue these awards under the Sexual Prevention program areas are estimated at $495,000.

One of the cornerstones of the CSO/FBO APS is support to national/regional-level agencies that have many chapters or branches that can in turn reach out to community-based organizations. This will allow local programs to reach deep into communities and help the Emergency Plan in Nigeria expand its reach. The CSO/FBO APS was also created to build the capacity of local organizations working in HIV/AIDS because a significant number of Nigerian organizations are new, have little organizational capacity, and often lack linkages with other programs. The CSO/FBO APS will only fund applicants that have clear plans to build their own technical, organizational, and administrative capacities and clear linkages with other programs.

Community participation in HIV/AIDS prevention programs often provides a strong foundation for sustainable prevention interventions. The CSO/FBO APS will support rapid scale up of the reach and scope of existing prevention activities implemented by NGOs with larger networks or partners that enter into strong consortia. Grantees under the CSO/FBO APS will implement several of the following activities, depending upon their capacity and speciality: 1) scale-up skills-based HIV prevention education, with the involvement of parents and guardians, especially for younger youth and girls; 2) stimulate broad community dialogue on healthy norms, avoiding risk behaviors, and the importance of finding out one’s HIV status; 3) reinforce the protecting authority of parents and other primary caregivers; 4) address sexual coercion and exploitation of vulnerable groups, particularly young girls; 5) strengthen early prevention interventions based on abstinence until marriage for at-risk youth; 6) promote the image of successful, respected men as upstanding and faithful; and 7) find supportive leaders and role models at all levels who will promote being faithful and discourage coercion, alcohol abuse, and cross-generational sex. Messages that highlight the benefits of abstinence until marriage, and fidelity in marriage will also be integrated into counseling services. APS partners seeking C&OP programming support will also be expected to comply with the National Prevention guidelines for appropriate service delivery of condoms and risk-reduction messaging and interventions in line with the minimum package. Targeted outreach to MARPS will be expected. Applications from groups with the capacity and programming ability to provide a balanced prevention activity will also be encouraged.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: As has been the case with the APS in the past, targets are negotiated with each awardee based on the proposed program and demographic/geographic area during award negotiations and in accordance with specified minimum cost per targets. After being approved by the TEC, OGAC is copied on the award memo to the Contracts Officer to ensure that appropriate targets and associated costs have been negotiated. Targets and related awardee information will be uploaded into COPRS at that time.

Scaling up of prevention, involvement of PLWHAs and youth, and encouraging peer educators to work together with community health care providers will contribute directly to the interest of the US Global HIV/AIDS Strategy. The programs will increase the reach of prevention programs into rural areas in high prevalence states with a focus on underserved populations, while stimulating the demand for other HIV/AIDS related services offered by GoN and other USG partners.

This activity substantially contributes to Nigeria’s 5-Year Strategy by emphasizing youth, especially young women, and couples as a priority population for C&OP interventions; and developing strong links between prevention programs and other care and treatment programs.

LINKS TO OTHER ACTIVITIES: All partners will implement activities across the spectrum of program areas and are expected to provide clear linkages between their own activities. The grantees will be expected to link with multi-media activities, whenever possible, and to build on the new local partners to the current mix of partners providing prevention, care and treatment in Nigeria.

The overarching focus of the APS has been to bring new local partners to the current mix of partners providing prevention, care, and treatment in Nigeria. It has been successful in many ways; however, challenges related to local partners’ management capacity have slowed the process and have created uncertainties about their ability to implement in the accountable and transparent manner the USG requires of recipients. Therefore a project (Leadership, Management, and Sustainability [LMS]) added to the portfolio during COP07, will assist with improved management, accountability, transparency, and other capacity building activities. LMS will guide new partners through the solicitation and award process, as well
Activity Narrative: as assist them to put accountable and transparent systems in place that allow their first year of implementation to proceed smoothly and ensure rapid achievement of results. Although the CTOs and activity managers for these new local partners remain within the USAID technical team, LMS is a key member of the extended team and provides invaluable support in developing the capacity of the new awardees. All of the local partners applying for APS funds can benefit from the management support being provided by LMS. In addition, LMS can provide technical assistance specifically in the area of Condom and Other Prevention programing, as many local partners may not have this type of institutional capacity at the time of award.

POPULATIONS BEING TARGETED: Final applications are subject to negotiation, but illustrative examples of targeted populations include: out-of-school youth; most at risk populations, religious and community leaders and opinion makers; commercial businesswomen; and community-based support groups.

KEY LEGISLATIVE ISSUES ADDRESSED: Illustrative examples of key legislative issues that have been proposed contain activities that will address male norms and behaviors, increase women’s rights, reduce violence and coercion, increase the use of volunteers, and decrease stigma and discrimination.

EMPHASIS AREAS: All awards resulting from the APS will be to local partners or have strong roots in the community and therefore all will have a major emphasis on Community Mobilization/Participation and Local Organization Capacity Building. The service delivery component of these awards will have a key focus on information, education, and communication in the community and will build linkages with other sectors and initiatives.

Activity ID: 26028.09
Activity System ID: 26028
Activity Narrative: The Lift Above Poverty Organization LAPO Health and Partners Fight Against HIV/AIDS (LIFT) program is envisioned as a 3-year $8 million partnership between LAPO Health and Partners for Development (PfD). Together with local implementing agencies, the LIFT program will build a sustainable platform for HIV prevention activities and provide direct service provision to orphans and vulnerable children (OVC) through support groups of people living with HIV/AIDS (PLWHA) and OVC and their caregivers. The program will train 500 individuals in promoting HIV/AIDS prevention through abstinence and/or being faithful (A&B). LIFT’s focus on HIV prevention and care for orphans addresses both causes and effects of the HIV epidemic in Nigeria. HIV prevalence rates remain high due in part to risky and trans-generational sexual practices. Many youth, especially young women, engage in transactional sex, and women head of households often turn to commercial sex to support their families. There are three major target groups for LIFT activities; PLWHAs, OVC caregivers and other affected persons, and OVCs. An anticipated 18,045 (7,000 male, 11,022 female) will be reached through community outreach that promotes HIV/AIDS prevention through A&B. Through HIV prevention and micro credit activities to adult PLWHA and OVC, LIFT will mitigate the role of poverty in increasing HIV/AIDS prevalence.

HIV prevention efforts have in the past primarily focused on HIV-negative individuals; however, changes in the risk behaviors of HIV-infected individuals are likely to have larger effects on the spread of HIV than comparable changes in the risk behaviors of HIV-negative individuals. These “Prevention for Positives” efforts aim to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers, as well as to protect the health of infected individuals. Helping people living with HIV adopt safer behaviors is an important part of a comprehensive prevention approach. Recognizing that HIV/AIDS care and treatment settings serve as strategic entry points for reaching large numbers of HIV-infected people, in COP 09, LIFT will continue to support a clinic-based, provider-delivered intervention to help HIV-infected patients prevent the spread of HIV to their sex partners and children, and to help them protect their own health. LIFT will at the same time provide a community based approach linking PLWHA in the communities to services at the facilities.

LIFT will continue reaching adults with age and situation-appropriate A&B and condom and other prevention (C&OP) messages, as well as specific prevention messaging and services targeting HIV positive persons in support groups. Economic strengthening interventions that will tie together all other interventions in a support group. LIFT will use income generating activities as a platform to expand the delivery of HIV/AIDS prevention messages while increasing household and community resources available for the care and support of PLWHA and OVC. Using grants to its local implementing agencies (IAs), LIFT will issue micro-loans to borrower groups of PLWHA for income generating activities and grants for individuals to complete skills-acquisition training. The borrowers at the community level will act as a PLWHA support group as well as providing support to each other in their business efforts. These small groups will serve as a platform for HIV/AIDS prevention activities and referral services.

LIFT will provide training to healthcare providers in selected sites to provide routine care and treatment to HIV-positive patients and deliver important health information and preventive medical care, such as treatment for sexually transmitted infections (STIs) and some family planning services. Healthcare providers will be supported to assess each patient’s risk and give targeted prevention recommendations that encourage sex partners to get tested, disclose their HIV status to sex partners, abstain from sex or reduce the number of sex partners or fidelity to one partner, consistently use condoms during sex, be aware of the potential consequences of having sex without a condom, reduce alcohol use as it affects adherence and increases risky behavior, and to adhere to antiretrovirals and other medication.

In addition to the clinical based prevention with positives messaging and services, LIFT will work through support groups to provide a community based intervention that, in tandem with the facility based intervention will provide a continuum of care for PLWHA and persons affected by AIDS (FABAs). The community based interventions within the support groups, in accordance with the National Prevention Strategy, will provide AB and C&OP activities in an integrated manner to reach individuals with a minimum of three strategies. LIFT’s suite of strategies for its AB interventions will target PLWHAs and their partners, older OVC, and other youth in their communities with community awareness campaigns that will include rallies and interpersonal communication, and peer education models using age peers among OVC, other youth, and PLWHA. A curriculum based approach using Early Start Support Groups (ESSG), Young Life Support Groups (YLSG) or Teen Life Support Groups (TLSG), as appropriate will be adopted for OVC. Essential life skills trainings will be provided as part of this curriculum. Activities that address vulnerability issues, especially for PLWHAs and older OVC, such as microfinance and skills acquisition will also be adopted.

C&OP strategies will include interpersonal communications, referrals to counseling and testing, condom messaging and distribution, balanced ABC messaging as appropriate, peer education models around PLWHAs, OVC and other affected people, use of support groups as condom service outlets, referrals to medical services, and linkage to microfinance and skills acquisition. Under the supervision of prevention counselors, PLWHAs will be trained as peer educators, providing STI counseling and referrals to medical services to their peers within their microfinance support groups. LAPO and its IAs will coordinate HIV/AIDS activities in the support groups through the use of trained HIV/AIDS prevention counselors who will serve as discussion facilitators and expert references on topics related to HIV/AIDS prevention for each of the target audiences in the support groups in which they work. Prevention counselors will mentor peer educators among the PLWHA and OVC caregivers, who will disseminate A&B prevention messages broadly in the community and refer support group members to additional services, including HIV testing and counseling, prevention of mother-to-child transmission (PMTCT) services for pregnant members, and other services.

The activity will address HIV risks for OVC and other youth, OVC care givers, and prevention from re-infection for PLWHAs.

Contributions to Overall Program Strategy. This activity will contribute to the Emergency Plan Five-Year Strategy in preventing new HIV infections among most at risk populations and vulnerable youth, especially
Activity Narrative: OVCs, as well as their care givers. HIV prevention programming will target the primary vectors of the epidemic (PLWHAs) with various strategies and services to meet their needs and engender behavior change. It is hoped that successes recorded in addressing this target population directly will engender a reduction in the rate of new transmissions and significantly help to contain and control the epidemic. This activity is linked to treatment, care and support.

| Program Budget Code: | 02 |
| Planned Funds: | $165,000 |
Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

In COP 09, the NELA Consortium AIDS Initiatives in Nigeria (NECAIN) will provide HIV prevention messages on abstinence and be faithful (AB) to 7,500 youth and couples (3,000 males and 4,500 females) in 8 states in the 6 geopolitical zones of Nigeria: Osun in southwest, Adamawa and Borno in northeast, Kebbi and Jigawa in northwest, Nasarawa in north-central, Edo in south-south, and Ebonyi in southeast. 5,625 (75%) of the targets will be youth, while 1875 (25%) will be couples (counted individually). HIV prevention services will be provided at the community level through the consortium’s 3 multiplier organizations and their 24 local partners (including community-based, faith-based, and non-governmental organizations [CBOs, FBOs, NGOs]).

The consortium is made up of the Network on Ethics/Human Rights Law, HIV/AIDS - Prevention, Support and Care (NELA), the Federation of Muslim Women’s Associations in Nigeria (FOMWAN), the Society for Women on AIDS Africa Nigeria (SWAAN) and the Civil Society Network on HIV/AIDS in Nigeria (CiSHAN), North Central Zone.

Understanding the pattern of sexual behavior among the target populations has been and will continue to be the key to identifying the drivers of the HIV pandemic in project communities, and determining which strategies will best address the needs identified. The 2005 HIV/AIDS sentinel survey showed that youth aged 15 to 24 years have a higher than national average of HIV prevalence. A 2007 Nasarawa NGO Forum report corroborated this and revealed a high prevalence of HIV among youths in Karu and Keffi Local Government Areas (LGAs). The specific findings are as follows: 75% of in-school youth and 86% of out-of-school youths, aged 15-24 years have inadequate HIV prevention knowledge, about 48% of in-school girls and 77% of out-of-school boys had unprotected sex at least once in the 6 months preceding the study, between 19 and 25% of girls reported having unprotected sex for fear of losing their boyfriends, 21% of girls 15-24 years reported having more than one sexual partner at the time of the study, and about 51% of young couples believe HIV prevention messages should not target couples, while 24% of couples believe infidelity exists among couples (Nasarawa NGO forum report November 2007).

The drivers of the epidemic among in-school-youths in the NECAIN project states, as indicated in reports from LGAs and NGOs in NECAIN project states include early sexual debut among girls for fear of losing their boyfriends, peer influence for both boys and girls, and trans-generational sex (especially between students and their teachers to ensure success in examinations), and cultural norms that make it impossible for parents to discuss sex with their children. An additional driver of the epidemic in Edo State is the trafficking of persons for prostitution.

To address the drivers of the epidemic among in-school youth, NECAIN will scale up existing HIV prevention education for behavior change with a focus on primary and secondary abstinence, and provide information about correct and consistent use of condoms with the active involvement of young people, their parents and guardians. Strategies that will be employed include a school-based approach (curricular and non curricular based), peer education models using age peers, peer education plus models using sports activities, drama and role models, and a ‘vulnerability issues’ approach that provides training on essential life skills. These strategies will be complemented with national mass media campaigns and information, education, and communication (IEC) materials produced by the project. All activities that will be undertaken for each strategy will stress the benefits of abstinence until marriage and mutual fidelity thereafter. The project will also arrange educational seminars for parents in schools to provide information on abstinence and emotional support for their children. Such seminars will also equip parents and guardians with the skills to guide young people towards healthy and responsible decision-making and safer sex behavior.

The drivers of the epidemic among out-of-school youth are drug and alcohol abuse, cultism, and trans-generational sex. An additional driver of the epidemic in Edo State is the trafficking of persons for sex work. To address the drivers of the epidemic among out-of-school youth, NECAIN will use the following strategies: community awareness campaigns (interpersonal and focused small-group discussions, rallies and community dialogues), peer education models (age-related, job-related, and social peers), the peer education plus model (sports activities, use of role models, dance and drama), and focused attention on vulnerability issues (including essential life skills training). Where indicated, NECAIN will refer out-of-school students and their teachers to ensure success in examinations), and cultural norms that make it impossible for parents to discuss sex with their children. Such seminars will also equip parents and guardians with the skills to guide young people towards healthy and responsible decision-making and safer sex behavior.

The drivers of the epidemic among couples include: low risk perception, multiple sexual partners, widow inheritance practice, lack of women’s decision-taking power on sexual issues, and continued risky behavior of males in the general population. The 2003 NARHS reported that men and women in all geo-political zones of Nigeria engage in extra marital sexual relationships. The lowest reported figures were those from the northwest (1.8% of female and 5.8% of male respondents), while the highest reported percentages were in the south-south region (20.9% of female and 34.2% of male respondents). The study also reported the prevalence of transactional sex among females and males across all the geopolitical zones; these figures ranged from 2.8% of female and 2.9% of male respondents in the northwest and 15.3% of female and 21.4% of male respondents in the south-south.

The strategies to be employed to reach couples will be multi-level, as this approach is needed to change social behaviors. NECAIN will employ the following strategies to address the issue of multiple sexual partners among couples: community awareness campaigns (rallies, focused small-group discussions, interpersonal communications, and community dialogues), peer education models (age- and job-related peers), and peer education plus model (use of role models), to be complemented with national mass media campaigns and IEC materials developed by the project. All activities will be tailored to increase risk perception among concurrent partners. NECAIN has in the past involved the community, and will continue to involve the community and other stakeholders in constructing appropriate messages that will be tailored to the pattern or types of sexual partnerships in communities.
Activity Narrative: To address the issues of gender inequality in taking decisions about sex, the project will employ a ‘vulnerability issues’ strategy. Activities will include training in essential life skills and the referral of women to other IPs that provide services for income generation and economic empowerment. NECAIN local partners have already established linkages for these services.

The above strategies will be implemented through educational activities in churches and mosques. The multipliers' networks and branches will facilitate educational programs with an emphasis on faithfulness in marriage and the promotion of respectful images of men and women that are upstanding and faithful. Educational activities will also include the use of role models at all levels. Activities will also promote being faithful to spouses, discouraging coercion and alcohol abuse and cross-generational sex. These strategies will be complemented with national mass media campaigns and IEC materials with messages that focus on fidelity in marriage.

Religious leaders will be trained to conduct participatory workshops, deliver sermons, and provide peer support and counseling to church members on mutual monogamy and HIV prevention. All faith based activities will be integrated into existing male and female group activities in churches or mosques. The project will continue to work with the 800 peer educators already trained on the project; 600 to work with in- and out-of-school youth and 200 to work with couples. Each trained peer educator, both for in-school or out-of-school youth and for couples, will recruit a cohort of peers to work with over time, and will reach each of the cohorts with at least three AB strategies. The project has developed reporting formats that will serve as a means of verification for counting individuals reached, and will continue to modify these as needed to ensure accurate reporting of activities.

The project will work in collaboration with prevention programs that distribute condoms for the prevention with positives (PWP) programs. A linkage has already been established with Society for Family Health (SFH) for the distribution of condoms to clients on the project. The project has also established linkages with organizations working in the area of HIV counseling and testing for clients reached with the various prevention messages.

Table 3.3.02: Activities by Funding Mechanism

| Mechanism ID: | 9407.09 | Mechanism: | USAID Track 2.0 AED  
| Prime Partner: | Academy for Educational Development | Workplace |
| Funding Source: | GHCS (State) | USG Agency: | U.S. Agency for International Development |
| Budget Code: | HVAB | Program Area: | Sexual Prevention: AB |
| Activity ID: | 25610.09 | Program Budget Code: | 02 |
| Activity System ID: | 25610 | Planned Funds: | $450,000 |
Activity Narrative: In COP09, AED will continue its focus on strategic HIV prevention interventions targeted at reaching specific workplace populations. AED’s activities (ABC) under sexual prevention are designed to support prevention among working adults and equip them to promote prevention with their children and partners. In COP09 AED will train 60 healthcare workers from the 5 targeted condom service outlets to promote HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful.

With 66 million individuals participating in Nigeria’s public and private sector labor force and HIV/AIDS prevalence of 3.7%, 3.5%, 3.1% amongst transport workers, police force and armed forces and with prevalence of over 30% among female sex workers (IBBSS 2007), the workplace is an ideal setting for effectively addressing HIV/AIDS through sensitization programs, prevention messages, and linkages to care and treatment for a large percentage of Nigerians infected and affected by HIV/AIDS.

AED SMARTWork in COP09 will focus on reaching each targeted population with a minimum of three interventions in the workplace. Intervention strategies will aim at reducing number of sexual partners, promoting consistent condom use and seeking treatment for STIs. IBBSS 2007 revealed that among predominantly male occupational groups (transport workers, armed forces and police), multiple partnerships are quite common while condom use with girlfriends was lowest, reported by police at 45% and transport worker at 45.4%. Although syphilis levels were low across the board (0.8%), transport workers returned the highest prevalence among all groups, at 1.7%. Stereotypical characteristics of the target audience include male dominance, physical strength, virility, and risk taking. Other associated risk factors, such as drug and alcohol use among this target audience (road transport and oil workers in particular) often play a role in diminishing inhibitions, which can lead to unprotected sexual intercourse and also contributes to sexual violence. In addition, high mobility and long periods away from their families, limited access to health care services and condom availability and lack of information about risky behavior, risk perception and risk personalization places this target population at increased risk of STIs, including HIV.

AED will continue to pursue interventions that encourage youth to delay sexual debut until marriage, engage in secondary abstinence and reduce sexual risk taking while recognizing that abstinence is the only certain way to avoid HIV infection. Interventions targeting sexually active adults at higher risk of HIV-infection will encourage behavior change to reduce the number of casual sexual partnerships and promote marital fidelity. AED will reach out to PLWHA through promotion of their enrollment in and adherence to PMTCT programs and/or promoting abstinence and consistent condom use with sexual partners to prevent re-infection.

AED will strengthen interactions and key referrals between health care facilities and the community as part of sexual prevention activities in the workplace programs. Sub-partners (NIBUCAA, NUPENG, NURTW, NUCFRLANPE, SSANU and NUCFRLANME) will target enterprise workers with a “B+C” prevention interventions. AED will work with the unions the small and medium enterprises to identify the right strategy and mix of interventions pooling from a broad range of identified best practices.

AED will conduct Community/Enterprise Awareness campaigns to clarify strategies and activities of the SMARTWork approach and educate the management of each enterprise. These meetings will take place prior to launching program activities in each establishment in order to build awareness for HIV/AIDS issues and to answer any concerns participants may have. Enterprises and unions will be encouraged to undertake HIV/AIDS program outreach activities within their host communities and reach out to workers family members with necessary information and education on HIV/AIDS. Capacity building activities may vary based on individual partner/enterprise needs. AED will support each enterprise and partner to conduct a series of two-day seminars for the community on: abstinence and being faithful; interpersonal communications; community mobilization methods; peer education strategies; linking programs with counseling, testing and care and treatment centers; and efforts at partner reduction, mutual fidelity and condom usage. Each enterprise will conduct at least one community outreach during the period and 20,455 individuals will be reached with A&B in COP09.

AED/SMARTWork will assist each partner enterprise to establish a team whose members represent various aspects of the workplace and who share a commitment to addressing HIV/AIDS, with skills to “sell” the program to others in the workplace. The planning committee will include men and women from all departments and levels in the enterprise, as well as workers living with HIV/AIDS. The joint-management labor committee ensures that differences are taken into account and policies and programs can be developed that work for all areas of the workforce. AED will work with these committees to identify appropriate persons to represent the diverse interests and needs of the workforce. AED will conduct a three-day capacity building training for members of the HIV/AIDS Planning Committee. The training will include all aspects of HIV/AIDS policy and program development and equip committee members with the ability and the practical work that faces the day by day management of the enterprise’s HIV/AIDS workplace program. AED will continue to provide technical support to the HIV/AIDS Planning Committee members of the enterprises in sensitizing all the employees in the company’s key locations about basic HIV/AIDS prevention and transmission information, voluntary counseling and testing, workplace issues related to stigma and discrimination, and mainstreaming HIV programs in the workplace.

Peer educator (PEs) volunteers will be identified and trained to conduct informal education and training activities for their co-workers. AED will provide technical assistance to enterprises and unions in selecting appropriate staff to participate in a three-day peer educators training. A staff-to-peer educator ratio of 10:1 will facilitate the informal small group and one-on-one discussions on HIV/AIDS and safer sex practices. Peer educators will answer questions, distribute materials and provide an environment of greater awareness and understanding about HIV/AIDS. Training will be facilitated by the core-trainers already trained for each partner using the SMARTWork workplace PE training curriculum. In COP09, 150 PEs will be trained.

Under condom distribution and other prevention activities, the key messages will include partner reduction, consistent and correct of condoms, and prompt diagnosis and adequate treatment of STIs. AED will continue to support partners through the process of condom procurement and storage, along with...
**Activity Narrative:** establishing a stronger collaboration with Society for Family Health to ensure a consistent condom supply. NIBUCAA and the five unions will be trained and retrained in best practices for condom distribution, storage and usage within the scope of prevention and sensitization activities. These activities include but are not limited to condom procurement and distribution, as well as making condoms readily accessible and available through peer education activities. There will be a two-day training on condom logistics and negotiating skills at 20 workplaces in COP09. Participants will be disaggregated by sex, social peers and grade levels from all the units and departments in each enterprise. This will be facilitated by AED, SFH and NIBUCAA. Condom distribution points will be set up by the various SMEs and workplaces. Overall, 13,836 individual will be reached through the PEs in COP09.

AED will provide TA to NIBUCAA and the five unions in the adaptation/production of relevant IEC/BCC materials to reinforce messages on abstinence, faithfulness and/or consistent and correct condom use. AED will continue the distribution of an extensive catalogue of behavior change tools and materials for the workplace that enables immediate implementation of activities and important leveraging of existing resources for use by the workers.

Two-day adaptation training will be organized for union-partners in conjunction with NIBUCAA for review and selection of existing BCC materials for reproduction and distribution by the partners. Three representatives will be selected from each partner organization for this training. Trainings will be conducted in line with the National BCC Strategy and facilitated by a consultant and a graphic artist with support from AED and NIBUCAA staff.

Dissemination strategies include: the distribution of materials at workshops, seminars, company-level presentations; special events, such as World AIDS Day Campaigns, Workers Day; and the integration of HIV/AIDS preventive messages into workplace newsletters, journals and other periodicals.

AED project will continue to encourage the parents to be active supporters of youths’ health choices by addressing improved knowledge, attitudes, communication and other parenting skills, and by supporting an integrated approach to promoting a healthy lifestyle for young people. Youth focused awareness creation activities including lectures, drama and a mascot will focus on behavior change, risk reduction and adoption of safer sex practices. AED will further assist enterprises’ developmental initiatives, such as family days. Family days are employer-sponsored events for employees to gather together to celebrate the enterprise’s annual achievements. AED will work with the partners to assist the HIV/AIDS Planning Committees at each enterprise level to plan and implement family days.

Greater Involvement of People Living with HIV/AIDS (GIPA) is critical to halting and reversing the HIV epidemic in Nigeria; thus AED/SMARTWork will mainstream GIPA into workplace HIV/AIDS programs. The involvement of PLWHA in program development and policy making will improve the relevance, acceptability and effectiveness of the program. During workshops and trainings, PLWHA’s participation in workplace HIV/AIDS programs will assist in changing perceptions and provide valuable experience and knowledge. For those who choose to disclose, open acknowledgement of their sero-status can help demolish myths and misconceptions about HIV/AIDS and PLWHAs. It may also encourage other HIV-infected workers to combat fear and shame by disclosing their status. PLWHA will also be advocates for the development of HIV/AIDS policy as well as law and policy reforms. The partners and enterprises including the 50 SMEs will be encouraged to continue to engage qualified PLWA as staff members.

**CONTRIBUTION TO OVERALL PROGRAM AREA**

The program and activities implemented will increase the reach of ABC interventions into the most at risk population (Long Distance Drivers and other itinerant workers). This AED-SMARTWork prevention program through union partners and NIBUCAA whose capacity has been developed, will contribute further to strengthening and expanding the GON’s response to HIV/AIDS epidemic in the workplace and increase the chances of meeting the PEPFAR’s goal of preventing over a million new infections.

**POPULATION BEING TARGETED:**

Population targeted in these ABC prevention activities will not only focus on employees alone but also on families of employees and other community members where the enterprise is sited.

**KEY LEGISLATIVE ISSUES:**

Key legislative issues will address gender inequalities as regards sex, workplace norms and risky behavior injurious to health and increase access to information and services for men and women.

**EMPHASIS AREAS:**

AED-SMARTWork will focus service delivery on information, education and communication, promoting abstinence, mutual fidelity, condom usage and capacity building in the workplace and build linkages with other prevention initiatives.

</table>
In COP 08, LMS is supporting the provision of comprehensive AIDS care and treatment services at 17 secondary and 22 primary healthcare (PHC) feeder health care facilities in 6 states; Kogi, Niger, Adamawa, Taraba, Kebbi, and Kwara. In COP 09, the LMS AIDS Care and Treatment project will build on activities initiated in COP 08 and expand to 2 additional secondary facilities in states where LMS is currently working. HIV/AIDS services will be further decentralized and strengthened at an additional 10 PHC sites within the local government areas (LGAs) for a total of 51 sites (19 comprehensive care and treatment [CCT], 32 PHC) providing AIDS care and prevention services in COP09.

In COP09, the presence of LMS at 19 CCT secondary facilities offers the opportunity to serve at least 19 LGA catchment populations with AB programs. AB programs will be further decentralized to remote communities through a network of 32 PHC health facilities. In COP09, LMS will have established strong community HIV services in all project LGAs through its partnerships with faith-based, community-based, and non-governmental organizations (FBOs, CBOs, NGOs) and school teachers, which will provide an effective vehicle for the delivery of comprehensive AB services.

In COP 09, LMS AB programs will promote low-risk behaviors among in-school and out-of-school youth aged 15 to 24 years. The project will target most-at-risk populations (MARPs), such as transport workers, unemployed service men and women, men who have sex with men (MSM), and persons living with HIV/AIDS (PLWHA), from LMS-supported facility-based support groups. AB messages will be packaged using themes on primary abstinence and delay of sexual debut for younger youth, secondary abstinence among unmarried youth and unmarried mobile adults, HIV counselling and testing (HCT) for everyone, and mutual fidelity for spouses/partners. The most effective channels for targeting the various groups will be explored. LMS will also develop promotional materials, such as T-shirts, caps, exercise books, and pens to reinforce the messages of information, education, and communication (IEC) materials. The project will develop and/or adapt community training manuals that educators for each of the above target groups. Peer education manuals used by Family Health International (FHI) and Society for Family Health (SFH) will be incorporated into the LMS AB training manuals. The LMS AB manual will include the following topics: basic knowledge on transmission and prevention of STIs and HIV; benefits and process of knowing one’s HIV status through counseling and testing; setting personal goals and values for life; building skills; gender inequalities that promote HIV/STI transmission and how to minimize them; sexual violence; trans-generational sex; secondary abstinence; and alcohol and substance abuse. Peer education materials will inform mentors to educate the targeted population. Other IEC materials, including audio visual materials leveraged from other implementing partners (IPs) will be distributed and discussed during community seminars. LMS will build skills of CBOs, FBOs, community leaders and other gatekeepers in supported LGAs to address social or cultural practices, such as polygamy, widow inheritance etc., which affect AB choices and increase the likelihood of risky behaviors. The interpersonal communication systems proven effective in the past will be strengthened through FBOs and CBOs already in the targeted communities. LMS will ensure that all targets are reached with a minimum of three prevention intervention strategies as required by the national prevention plan minimum package recommendation.

LMS will collaborate with other IPs, such as SFH and CEDPA, to build upon existing AB messaging and mass media campaigns. LMS will also work with HIV/AIDS clubs in 19 secondary schools and 6 tertiary institutions in 6 states, to promote such ABC messages as abstinence, mutual fidelity, delay of sexual debut, partner reduction, and gender and social issues that increase vulnerability to HIV transmission. Youth-friendly sexually-transmitted infection (STI) and HIV prevention services will be established at convenient locations within the LMS project LGAs to be managed by the trained youth peer educators. In COP 09, 250 persons will be trained to reach 49,091 persons (28,000 males and 21,091 females) directly with AB messaging in 6 states.

In COP 09, the LMS condoms and other prevention activities will be implemented at 51 facility-based sites (19 CCT facilities and 32 PHC) and through community mobilization of targeted MARPs in project-supported LGAs in 6 States. Local CBOs, FBOs and NGOs will be supported to train peer educators among brothel-based female commercial sex workers and their clients, MSM, long distance truck drivers, out-of-school youth, incarcerated persons, uniformed service men, and PLWHA. Peer educators will be supported to conduct weekly sessions for their target/peer groups to discuss accurate information about correct and consistent condom use as a means of reducing but not eliminating the risk of transmitting HIV and other sexually transmitted infections (STIs), HIV prevention among known HIV positive partners, prompt and complete treatment of STIs, the importance of HCT, partner reduction, partner testing and mutual faithfulness as methods of risk reduction. The project will leverage male condoms and lubricants from SFH and female condoms from UNFPA and other sources for distribution to the peer educators who will act as distribution points for their groups. In addition, LMS will collaborate with condom social marketing companies to ensure a steady flow of condoms to the project supported communities.

LMS will ensure that condoms are available at all supported health facilities for distribution to PLWHA as part of the “prevention with positives” (PwP) strategy. This will prevent re-infection among PLWHA and limit transmission to others. Condoms will also be given to discordant couples to limit transmission to the uninfected partner while promoting family parents’ survival. The prevention with positives strategy will include provision of condoms and information on correct and consistent use, discordant couples, and prevention of super-infection in couples that are both positive.

LMS will adopt a phased peer education program in 19 project facility communities in 6 States. The first phase will include: advocacy visits, community mobilization, village square meetings, and group discussions. The second phase will include: distribution of condoms and IEC materials; identification of peer groups; training of peer educators among targeted groups in HIV counseling, HIV education, life building...
Activity Narrative: skills; organizing prevention education/awareness events; and facilitating group discussions in communities using the developed peer education manual. The third phase will be focused towards sustainability of the program by collaborating with CBOs, FBOs and local NGOs and trained peer educators from the targeted groups, to strengthen their capacity to continue to build upon initiated prevention activities. LMS will support 6 mobile community outreach teams, one in each project state, to engage in community-wide prevention activities, such as: facilitating group discussions; disseminating culturally appropriate messages on prevention, partner reduction, inter-generational sex, mutual fidelity, and stigma reduction; promoting access to HCT for targeted MARPS; and distributing condoms and culturally specific IEC materials leveraged from other IPs. To ensure appropriate condom messaging, mobile teams will be provided with penile models for demonstration of correct condom use. Clients accessing the mobile IEC or HCT services will be linked to treatment, care and support programs at supported health facilities. An already established referral system that ensures a linkage between mobile outreach teams and the facility will be strengthened for this purpose. LMS will train mobile teams in systems management, referral systems, and patient tracking.

In COP 09, 320 persons from 190 outlets will be trained to reach 32,727 (18,654 males and 14,073 females) directly with other prevention information and messages for correct and consistent condom use, and prompt and complete treatment of STIs. Ten million condoms will be distributed from 51 outlets and 5 mobile units, targeting MARPs groups.

To ensure uniform and consistent data collection and effective monitoring and evaluation (M&E), LMS will use nationally harmonized registers and HIMIS tools to capture, manage, and report relevant data. The program will utilize participatory M&E for its internal evaluation. Focus-group discussions and semi-structured interviews will be used for the baseline study and program monitoring. Data quality will be ensured through the adaptation of the Winrock Means of Verification (MOV) tool.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
AB activities will contribute to the USG PEPFAR plan by reaching 49,091 persons with AB messages and 32,727 with condoms and other prevention programs. This program will help to strengthen the capacity of community based resources to serve the wider interest of improving the lives of families and contribute to reducing new infections in Nigeria.

LINKS TO OTHER ACTIVITIES:
Sexual prevention links to activities in Adult Care and Support, TB/HIV, Counseling & Testing, OVC, and PMTCT.

POPULATIONS BEING TARGETED:
This activity focuses on the needs of adults and youth from LGA catchment areas in the 19 project supported sites, with a focus on in- and out-of-school youth, teachers, young women and men reporting multiple partners, OVC, PLWHA, and MARPS (incarcerated persons, transport workers, sex workers). Prevention with positives will form an integral part of this activity with special focus on discordant couples and positive pregnant women.

EMPHASIS AREAS:
Emphasis will be placed on community mobilization, participation and the training of peer educators to increase access to ABC messages. Emphasis will also be placed on messages that address social or cultural practices which can hinder wise ABC choices and increase the likelihood of risky behaviors.

| Prime Partner: | US Centers for Disease Control and Prevention | USG Agency: | HHS/Centers for Disease Control & Prevention |
| Funding Source: | GHCS (State) | Program Area: | Sexual Prevention: AB |
| Budget Code: | HVAB | Program Budget Code: | 02 |
| Activity ID: | 9833.25969.09 | Planned Funds: | $94,574 |

#### Activity System ID: 25969

#### Activity Narrative:

**ACTIVITY DESCRIPTION:**

This Sexual Transmission activity relates directly to all Nigeria AB and Condoms/Other Prevention COP09 activities as part of the USG technical oversight role. The USG team, through the HHS/CDC Global AIDS Program (GAP) office in Nigeria, has one full time staff position for HIV Sexual Transmission, which was previously approved in COP07. The budget includes funding for 1.25 FSN salary, funding for required domestic travel, training funds and allocated minor support costs. This staff member will be supervised by a Senior Prevention Manager funded across the CDC agency prevention programs as noted above. Funds are not requested in COP09 for international TA as this is understood to be funded by the HQ operational plan (HOP).

This HHS/CDC HIV Sexual Transmission program specialist will work in close coordination with the USAID and DoD prevention staff and directly provide quality assurance and program monitoring to all HHS-supported implementing partners with prevention activities in the area of sexual transmission programming including: University of Maryland-ACTION, Harvard SPH-APIN, Columbia University SPH-ICAP, Catholic Relief Services-IDSRelief, Population Council, Partners for Development, IFESH, ECEWS, Africare, APIN, LLC and CDC RFA awards in COP09. HHS/CDC prevention staff will also assist USAID staff in joint monitoring visits of Family Health International-GHAIN, CEDPA, Society for Family Health, Population Council, Christian AID, Catholic Relief Services-7 Dioceses, Winrock International, Hope Worldwide South Africa, Hope Worldwide Nigeria, Food for Hungry, LMS Associates, LMS Leader, Pro Health, YWCA, C-Change, NELA, GECHAAN, CSN, Community Reach, AIDSTAR, AED Workplace and USAID APS awards for COP09. USAID and CDC prevention staff will provide assistance as needed to the U.S. Department of Defense program with the Nigerian Ministry of Defence. The strategic shift undertaken by the National Prevention TWG to mandate a minimum package of prevention services requires a significant level of programmatic guidance and oversight for the partners, and the robust integrated prevention team provides the technical leadership required for an appropriate response. The sexual prevention team’s responsibilities include: 1) representing the USG in technical discussions with the GON, 2) overseeing technical aspects of the program, including program management and oversight of partners to ensure high-quality and accountable programs, 3) interfacing with OGAC technical working groups, and 4) participating in the USG prevention working group.

HHS/CDC, DoD and USAID prevention staff will also provide technical support and capacity development to new partners undertaking prevention of sexual transmission activities through the New Partner Initiative as well as provide support to the Government of Nigeria at the national and state levels to promote Nigeria’s national prevention guidelines.

ICASS and CSCS charges related to this position are funded under M&S in compliance with COP09 guidance.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS: Peer educators will be trained within support groups to support prevention for positive (PwP) strategies and within communities to deliver “peer education plus” strategies for youth and adults using role models and dramas, games and quizzes. The “Choose Life” curriculum will be used for peer education for in- and out-of-school youth. Four individuals per diocese from the 13 dioceses will be trained as peer educators centrally. Step down training will be conducted at diocesan level for 20 people per diocese. The peer educators trained per diocese (24 each) will reach 10 out-of-school youths through the Catholic Youths Organization of Nigeria (CYON) structure in the churches and 10 in-school youths using the curriculum. In all, 12,480 youths will be reached using this activity with A messages only. Trainings will be conducted for 20 individuals per diocese from the 13 arch/dioceses (260 individuals) to deliver accurate Prevention messages. They will reach 422 people at masses on Sunday per month during the COP year. Thus, 65,832 individuals will be reached with prevention messages from trusted advisors continuously over the year.

Faithful house training will be conducted for 195 couples (390 individuals); 15 couples per diocese. Those trained will be supported to provide training for 5 couples each. 975 couples or 1950 individuals will be trained in this step-down. Each couple trained will reach out to 5 other couples over a five month period. A total of 4,875 couples or 9,750 individuals will have undergone training in one year. Faithful House participants will also serve as role models and peer mentors to 2 individuals monthly to provide these individuals with prevention messages through interpersonal communication.

Anti-AIDS clubs will be initiated in two primary and two secondary schools as part of a school-based approach, with each club having 20 members. Each member will reach 10 individuals per quarter. Post-test clubs will be formed that will offer AB information through interpersonal communication (IPC) and focus group discussions to all who have undergone counseling and testing services. Prevention services will be integrated into existing home based care delivery. 26,000 people will be reached with AB information during home-based care and counseling conducted by Parish AIDS Volunteers (PAVs). In each of these households, 2 individuals will be reached with AB messages; thus, 52,000 people will receive prevention services through IPC and group discussion approaches. 20 youth and adults will access AB services in established health information centers for a total of 3120 youth and 3120 adults reached. A total of 65,682 individuals will receive AB services through outreach programs; 33,280 of whom will benefit from A-specific activities through clergy, catechists and peer educators. 1,001 individuals will be trained in AB program areas.

COP 09 ACTIVITY DESCRIPTION:
During COP09, CRS 7 Dioceses (7D) will support in capacity building of Catholic Secretariat of Nigeria (CSN) to conduct workshops and trainings for clergy and laity who will provide marital counseling, deliver accurate and consistent prevention messages as CSN will be enabled to continue developing accurate, target-specific and “faith sensitive” information, education, communication (IEC) and behavioral change communication (BCC) materials and to sensitize clergy, catechists, and laity, including Imams and other Muslims leaders on AB prevention in six additional archdioceses. CRS 7D will tailor its AB activities to be in line with the National Prevention Plan using behavioral change strategies to ensure that individuals are reached with an overlap of at least three (3) AB strategies. The strategies include: peer education model, community awareness campaigns, the “peer education plus” model, work place programs, messages targeting vulnerability issues, and a school based approach.

The key anchors will be: (a) community awareness where AB messaging will be given during mass; (b) peer education model using the “Faithful House” curriculum for married couples, “Choose Life” curriculum for in and out of school youths and support group under prevention for positives; (c) a peer education plus model using drama, games, and quiz activities to give prevention messages; and (d) a school based approach through the formation of anti-AIDS clubs in schools.

AB messages will continue to be delivered during Sunday mass services. Trainings will be conducted for 20 individuals per diocese from the 13 archdioceses (260 individuals) on delivery of targeted and accurate Prevention messages. They will be expected to reach 422 people at masses on Sunday per month during the COP year. Thus, 65,832 individuals will be reached and will be receiving prevention messages from trusted advisors, continuously over the year.

The 13 partner archdioceses will each be supported to conduct Faithful House training for 15 couples each (195 couples or 390 individuals) using existing trainers in the diocese. Those trained during a five day training program will be followed up over a period of 6 months. These couples will each subsequently conduct step down training for five more couples. 975 couples (1950 individuals) will be reached during the step down training. These 975 couples will reach out to five new couples each in a period of 5 months totaling 4,875 couples who in turn will reach out to another five couples. Thus 4,875 couples (9,750 individuals) will receive comprehensive marital counseling training. The faithfull house approach has a goal to build happy and lasting marriages that prevent HIV infection using the concept of a “Faithful House.” The same couples within the “Faithful House cluster” where the message of “Faithful House” will be reinforced through guided prevention messages promoted by trained parish priests.

Each of the 1950 individuals (or 975 couples) trained within the first six months will become role models to 2 peers per month for the rest of the year. They will reach them with comprehensive prevention messages. 23,400 individuals will be reached with this model. Husbands will play an active role in educating their children and friends on AB. CRS 7D will encourage each of the 4875 couples (9,750 individuals) enrolled in the program to dialogue with at least four of their children on “A-specific messages. In this way, 19,500 children will be reached with A-specific prevention messages and tips to prevent sexual abuse. This will be an activity under peer education plus model. Thus the minimum package for those within the faithful house cluster will include peer education approach, peer education plus and sermons from the pulpit during Sunday mass.

Anti-AIDS club will be initiated in two primary and two secondary schools per diocese with a membership of 20 persons per club. 1,040 individuals will be club members, each of whom is expected to reach additional
Activity Narrative: peers through interpersonal communication. Individuals in secondary schools will be trained in primary and secondary abstinence and those in primary schools will be trained in primary abstinence. These pupils/youth will also be reached through activities such as games, drama, and quiz/information competitions between schools in the parishes and communities, and at quarterly meetings as part of peer education plus strategies. The “Choose Life” curriculum will be used for peer education for both in- and out-of-school youth. 4 individuals per diocese from the 13 diocese will be trained as peer educators centrally. Step down training will be conducted at diocesan level for 20 people per diocese. The peer educators trained per diocese (24 each) will reach 10 out of school youths through the CYON structure in the churches and 10 in school youths using the curriculum. The curriculum has 5 modules, one module per month for five (5) months. This will be repeated for the next 5 months for another set of youths by the peer educators. 12,480 youths will be reached using this activity with A messages only.

Trainings will be conducted centrally on AB Prevention for two PLWHA support group leaders per diocese. They will conduct a step down training for 20 PLWHA (SG+ leaders) in each of their diocese and these people will in turn counsel and communicate information about AB Prevention in support groups, households, and communities. Each individual trained will reach 50 people in the various support groups. 26,000 individuals would be reached with AB messages. Status disclosure will be encouraged and those willing will be supported with additional training and logistics.

Vulnerability reduction strategies will also be utilized to support 50 PLWHA per diocese through income generation activities and other sources of micro finance. Active recruitment and involvement of 1 PLWHA per diocese will be encouraged among the 13 partner dioceses.

HCT will form an entry point for AB prevention through the HCT centers with formation and management of Post Test Clubs for those tested. These post test clubs will offer messages on AB during pre- and post-test counseling through interpersonal communication (IPC) and focus group discussions. Refreshment and transport subsidies will be offered to participants plus Post Test Information Packs and materials. 40 people will become member of the Post Test clubs per quarter in each diocese.

Home-based care and counseling conducted by Parish AIDS Volunteers (PAVs) will include AB information sessions for 26,000 palliative care clients (from SG+ members) and their households. These sessions will include correct and accurate information about condoms. PAVs will reach two people in each household with AB information for an anticipated 52,000 people reached.

The 13 partner dioceses will be supported to manage Health Information Centers that provide AB services to youth and adults. This support will include provision of refreshments and visual media materials, such as projector and laptop for AB education purposes. Periodic “Youth Days” and “Couples Days” (one per quarter) will be conducted at these centers for ongoing outreach to youth, adults and couples. 20 youth and a similar number of adults will access AB services monthly in each center giving a total of 3,120 youths and 3,120 adults reached. 6,240 people will be reached. It is hoped that these couples or youth will then enroll in one of the more intensive AB programs and become more involved.

CRS 7D will integrate with SUN OVC and collaborate with other projects like AIDSRelief to provide services. The SUN/OVC project offers IGA to OVC caregivers some of whom are in the SG and receiving other AB messages, even though they are not being funded directly.

CRS will provide support to 260 parishes on BCC activities. Advocacy to government agencies will be undertaken to develop partnerships through engagement of LGA and the Catholic Youth Organization of Nigeria (CYON). Support will be given to 10 LGA leaders and 10 CYON leaders for AB prevention in the archdioceses. These leaders will each reach 100 people for a total of 1,000 people reached with Abstinence messages and an equal number with “B” information. Altogether, 26,000 people will be reached indirectly.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
AB activities in the 13 Archdioceses will encourage youth to adopt behavior that will reduce the risk of HIV infection, such as delaying sexual debut until marriage and promoting social/community norms that favor AB. Correct and accurate information on condoms will be given to adults and to sexually active youth in the Archdioceses. Adults and youth will be motivated to adopt partner reduction behaviors.

LINKS TO OTHER ACTIVITIES:
AB prevention strategies in the 13 Archdioceses relate to HCT, Prevention of Mother to Child Transmission (PMTCT), and Orphan and Vulnerable Children (OVC) activities.

POPULATIONS BEING TARGETED:
Target populations of the AB Prevention messages include: adults, children and youths, PLWHA, HIV and AIDS-affected families, communities and community leaders. Included are both girls and boys from primary school through university, out-of-school youth, and adults of both genders, with activities specifically tailored for pregnant women. Men will also be targeted.

Direct targets of AB services will be 65,682 individuals, 33,280 of these will benefit from A-specific messages and 1,014 individuals will be reached. Coverage areas will include Kaduna and Kafanchan Archdioceses (Kaduna), Minna Diocese (Niger), Jos Archdiocese (Plateau), Lafia Diocese (Nasarawa), Makurdi and Otukpo Dioceses (Benue), Idah Diocese (Kogi), Benin A/diocese (Edo), Abuja A/diocese (FCT) and 3 arch/dioceses to be created out of the present arch/dioceses we are working with. 6 additional arch/dioceses to benefit from AB activities will be indicated by the Catholic Secretariat of Nigeria.

EMPHASIS AREAS:
Emphasis will be on human capacity development. This activity will increase gender equity in programming through specific targeting of young girls and women. Male norms that encourage reducing multiple partners will be emphasized while involvement of PLWHA will assist in reducing stigma and discrimination.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Food For the Hungry (FH) conducted a Mid-Term Evaluation in April 2008 and will implement the recommendations from the evaluation in COP 09. The evaluation found that sub-partners are able to reach large numbers of youth using the cascade method; all aspects of the project were found to have strong curricula and good monitoring systems. FH is reducing targets to improve quality of the project in consonance with the national prevention strategy that specifies a minimum of 3 interventions to reach a target. Each promoter will train and supervise 10 Youth-to-Youth (Y2Y) groups consisting of 10 leader youth (LY) each. The LY will each work with 10 beneficiary youth (BY). The lead agency will employ a training specialist to assist all partners in improving the quality of training, especially at the lower levels of the structure. In addition, the lead agency will employ an M&E specialist to provide specific support to all project partners. The sexual abuse prevention component of the curriculum will be removed as recommended by the evaluation report. An identified need to concentrate more on abstinence skills has led to a revision of the FH Choose Life curriculum to include more skills training and skill building exercises.

ACTIVITY DESCRIPTION:
FH, a Track 1 ABY partner, implements activities in Nigeria as part of a multi-country program. This activity supports FH’s Nigeria program, which it implements through three major sub partners: Beacon of Hope (Christian Reformed World Relief Committee) who is the lead agency in Nigeria, the Salvation Army and the Nazarene Compassionate Ministries. FH currently supports activities in 13 states where Nazarene, Salvation Army and TEKAN member churches exist. During COP 09 when the 3rd cohort starts, the number of states will be reduced to eight in order to provide efficient and better supervision. Another partner, Operation Blessing, a media organization, produces public service announcements (PSAs) that reinforce abstinence and faithfulness (AB) messages for radio and TV throughout Nigeria.

FH will continue AB awareness meetings, consisting of focus group discussions and presentations back to the community/group, to reinforce abstinence and faithfulness as ways to prevent the spread of HIV. Youth and adults interested in further participation in the program will be identified to participate in these community awareness campaigns of the program.

Youth-to-Youth (Y2Y) groups aim to increase the commitment of individuals to abstinence before marriage and faithfulness in marriage. Each Y2Y group in the third cohort, starting 1 January 2009, will consist of ten LY per the recommendation of the Mid-Term Evaluation. Promoters, using the age-graded Choose Life curricula will train the LY for at least twelve sessions to be peer educators. Each LY shares what he/she learns with a group of ten peers (BY). Trained promoters and on-site co-promoters assist, coach and mentor the LY through the Y2Y groups and as they share with their peers. Each youth is encouraged to have a mentor who is invited to a Y2Y group session to learn more about AB and his/her role as mentor. A discussion guide is available to help them as they meet together to discuss the topics covered in the Choose Life curriculum. The curriculum includes essential life skills and, while promoting AB, provides accurate information on condoms to youth 15 years and older. The Choose Life curriculum will be revised to emphasize and help youth build skills for abstinence more effectively. Through the barrier analysis survey and BEHAVE Framework, key determinants that help and/or hinder abstinence and faithfulness were identified. These are addressed in the activities to help participants change their behavior. Culturally appropriate materials help guide the Y2Y discussions that address issues relating to relationships, sex, sexual abuse and coercion, HIV and AIDS and its impact on the community. Through these small-group discussions and the multiplier effect of the LY, the Y2Y groups promote AB as healthy and desirable sexual choices. The curricula include guidance and encouragement to continue meeting as accountability groups after completion of the manuals. Strategies used in these activities are the peer education model, curricula based approach, interactive and participatory learning through games and dramas (peer education model plus), the use of role models and addressing vulnerability issues through essential life skills training and gender roles. These strategies plus the community awareness campaigns are part of minimum package of the national prevention strategy for youth trained and youth reached with AB messages.

FH’s faithfulness training emphasizes faithfulness to married men and women between the ages of 15-49. The faithfulness training utilizes a culturally appropriate and evidence-based curriculum of nine sessions, Keys to a Healthy Relationship, to guide small group interactions that promote messages about fidelity in marriage and responsible behavior. To implement this, FH holds training of trainers (TOT) workshops that engage married adults and influential religious and community leaders in discussions on relationships, sex, sexual abuse and coercion, HIV and AIDS and its impact on the community. The trainers teach married couples or those in long-term committed relationships in their churches, mosques and communities. The formation of accountability groups is encouraged. The strategies for these activities include peer education model, curricula based approach, use of role models and addressing vulnerability issues through the promotion of healthy relationships between married men and women.

To ensure consistent and high quality implementation of activities, FH uses a wide range of evidence based M&E tools that include barrier analysis survey, BEHAVE Framework, knowledge, attitude and practice (KAP) surveys, quality improvement verification checklists and post-tests. FH will employ a training specialist and an M & E specialist to improve the training and use and effectiveness of these tools.

The impact the Y2Y groups and faithfulness training have on communities continues to be tremendous. These programs encourage discussion and dialogue within the family and larger community about various social issues related to HIV and AIDS.

CONTRIBUTION TO OVERALL PROGRAM AREA:
Through these activities, FH will promote AB to youth and adults as a means of reducing the spread of HIV and AIDS. FH will work alongside its faith-based and community partners to train 8,100 LY and influential adults to promote HIV and AIDS prevention through abstinence and/or being faithful and to reach 16,188 youth and adults with AB messages. FH will reach its targets by implementing activities with 414 churches, schools and other community organizations. These targets include people from both the 2nd and 3rd cohort of the centrally funded project because cohort 2 will end in December 2008 and cohort 3 will begin in
Activity Narrative: January 2009.

LINKS TO OTHER ACTIVITIES:
FH’s goal is to integrate its program into the lives of the churches, schools and communities where it works. Therefore, it works to promote community acceptance of AB as healthy sexual choices and as social norms. FH integrates these messages into other program activities with its partners and builds their capacities to continue promotion of AB when this project ends. As there are currently no direct links with other USAID/PEPFAR activities, FH’s partners will seek and the USG prevention team will help to actively promote linkages with implementing partners involved in other activities that will improve the response to HIV and AIDS. With funds from other donors, HCT is offered at the faithfulness TOTs and promoters’ training.

POPULATIONS BEING TARGETED:
FH targets unmarried youth between the ages of 10-24 years and married men and women aged 15-49 years. This is based on the National HIV/AIDS & Reproductive Health Survey (NARHS) of 2003 that found the median age of first sex was 16.9 years for females and 19.8 years for males. The NARHS survey also found that sex with a non-marital partner was highest in women aged 20-24 years (15.1%) and in men aged 25-29 (36.6%) followed closely by those in the 20-24 age group (34.9%). The 2005 Sentinel Survey found the highest prevalence of HIV in the 25-29 age group (4.9%) closely followed by those 20-24 years (4.7%).

EMPHASIS AREAS:
Emphasis areas include human capacity development and gender equality.

Training and human capacity development is central to the program. The aim is to build the capacity of youth to abstain from sex outside of marriage and to be faithful within marriage. Staff, promoters, co-promoters, leader youth and faithfulness trainers will continue to be trained to develop skills in program implementation, facilitation, counseling and monitoring.

Gender equality continues to be addressed through the Y2Y groups and faithfulness training. The curricula used in these activities are very intentional in promoting equality between males and females. They address issues such as sexual abuse, violence and coercion. This training also addresses the stigma that exists within Nigerian society towards those with HIV and AIDS.

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

In COP 08, the program was located in Lagos state at 4 sites (Epe, Ikorodu, Badagry and Shomolu Local Government Areas), with 14 schools and 1 Community Based Organization (CBO) reached. In COP09, the program will still be present in these 4 sites in Lagos state with all the schools and CBOs maintained.

ACTIVITY DESCRIPTION
Hope WorldWide South Africa (HWW) in COP08 reached a total of 9,506 individuals with AB messages and 7,334 youths with abstinence only messages. In COP09, HWW will reach 8,803 individuals (6,148 males and 3,655 females) with AB messages and 5,060 individuals with abstinence only messages. Lagos State has factors that make young people susceptible to HIV infection; among these are the cosmopolitan nature of the state with a large number of people of different lifestyles and backgrounds, ever-present media that presents sexual images and risky lifestyles to impressionable youth who are at risk of engaging in early unprotected sexual activities, and a large population that includes many with disposable incomes and many more without. The drivers of the epidemic are similar in the four sites where HWW’s AB program activities are active; as discovered through experience sharing activities, major factors that make young people vulnerable to getting infected are: high levels of poverty, especially among young girls, many of whom find alternative means to make ends meet (for example, many of them associate themselves with ‘Okada’ riders for free transportation to school and sometimes from school back home, which puts pressure on them from the older Okada riders to exchange this gesture for sex); too much idle time for youth, especially after school hours, beyond the range of parental supervision, which leads to engagement in risky behaviors (e.g., visiting boy/girl friends where they are prone to sexual pressure); economic pressures to work in risky setting, such as that found in Badagry, a border town, where there is a high level of sexual networking and many young boys and girls are encouraged to work at the border to work and to support their family, which makes them prone to early sexual initiation and therefore at greater risk of becoming infected); and the number of large urban festivals, such as the annual ‘Kayo-kayo’ festival in Epie that takes place during Eid-el Kabir, in which many young people find an opportunity to explore sexual activities.

In COP09, HWW will address the risk faced by young people between the ages of 10-18 years, who are the primary target population, and their families and communities (the secondary target), through abstinence and “be faithful” program (AB) activities. For the primary target, HWW plans to use community awareness campaigns with young people engaged in focused small-group discussions (FGDs). This will provide youth an opportunity to assess risk levels, personal risk factors and other factors that make them susceptible within their communities. Through these discussions, participants will become aware of many factors that could make them vulnerable to getting infected not only with HIV but also with other sexually transmitted infections (STIs). Since most in this age group are in secondary school, a school-based curriculum approach will also be utilized to provide the necessary skills to handle social pressure and to refuse sexual advances. This will complement the effort of the small group discussions and reinforce messages on abstinence. Through extra-curricular activities, such as HIV club formation, peer educators will provide information on factors that expose young people to HIV and how they can prevent themselves from getting infected.

For those who might be sexually active or have already initiated sex, messages on condoms will be provided so as equip them with options to prevent HIV or other STI infections, and/or unwanted pregnancies.

Early sexual debut can place adolescents at increased risk of unintended pregnancy, HIV, and other STIs. Youth who initiate sexual activity early are more likely to have sex with high-risk partners or multiple partners and are less likely to use condoms. Many factors affect the timing of first sex. A World Health Organization review of studies in 53 countries found that common protective factors include positive relationships with parents and teachers, and spiritual beliefs that decrease the likelihood of early sex. Common risk factors included engaging in other hazardous behaviors and having friends who are sexually active (Broadening the Horizon: Balancing Protection and Risk for Adolescents. Geneva: World Health Organization, 2002). Hence, principals, teachers, and parents will be engaged and encouraged to support the community action teams (CAT; Anti-AIDS Clubs) that have been formed to sustain the program in schools and in communities. Advocacy visits will be carried out to principals and Community Development Associations to encourage parents to support their children in practicing the abstinence skills they have acquired, and to address issues that may make young people susceptible to sexual exploitation. Balanced ABC messages will be provided during community outreach activities. Men As Partners (MAP) methodology will be added to strengthen messages and help individual parents or adults to assess risk levels and behaviors that promote the spread of the epidemic. During MAP sessions, information on proper and consistent use of condoms will be provided and this will help in adopting positive behaviors. HWW will use a parenting curriculum developed under this program to enrich the parenting skills of parents.

In COP09, the program will ensure refresher trainings for peer educators. Refresher training will further equip teachers with skills to promote greater abstinence skills in their students and how to better counsel students regarding sexuality and adolescent health. 50 individuals will benefit from this training. It is anticipated that newly trained teachers on curriculum based activities under this program in Badagry local government area will step down the skills to selected students, who in turn will form local program monitoring teams. In COP 09, the community based youth friendly centre that was established through HWW’s Public-Private Partnership with Petrobras (an Oil servicing Company) will provide services to the youth in Epe. The resource centre will increase positive engagement of learners and provide information on HIV and adolescent health. IEC materials developed and produced under the AB program will also be made available.

Significant changes have been recorded due to activities of CAT members and trained peer educators. In 2008, most CAT members in all the 4 sites volunteered to reach the Orphans and Vulnerable Children (OVC) through OVC kids clubs in their respective communities. At kids clubs, 10-12 year old OVC are reached with abstinence messages. The Men As Partners (MAP) approach continues to be employed to engage unmarried young people and parents through workshops in schools, churches and communities to...
Activity Narrative:
address norms/behaviors surrounding masculinity, early sexual debut, and cross-generational and transactional sex. Those that have been trained as peer educators under this methodology continue to counsel and refer victims of sexual abuse and violence. Local CAT monitoring teams have been formally introduced to communities to promote community response against sexual and physical violence. In COP09, 10 MAP workshops, with a total attendance of 150 will be conducted and men will be invited to participate and encouraged to join the CAT. HIV testing will be promoted during community, school, church and clinic-based sessions through voluntary HIV counseling and testing (HCT) campaigns that are expected to reach 1,056 people with HCT messages. Individuals from churches, schools and the community at large will be encouraged to voluntarily be tested and make decisions about faithfulness and abstinence. Where sexually active young people are identified, referrals will be made to collaborative HCT centers for testing and other service points for comprehensive programming.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
AB activities provided in Lagos (Ikorodu, Epe, Badagry and Shomolu) will contribute considerably to the overall Emergency Plan AB target for Nigeria, as the sites chosen are semi-urban areas where it is believed that youth engage in risky sexual behavior. Efforts will be made to work with indigenous CBOs, FBOs and schools to strengthen behavior change in youth, community commitment, and reduction of gender-based violence. Community Development Associations, Market Women Groups and other groups will be mobilized to create a more supportive environment for the practice of abstinence and fidelity.

LINKS TO OTHER ACTIVITIES
HWW AB activities related to counseling and testing will be realized in collaboration with government-owned health centers and other programs that provide HIV testing. Vulnerable individuals will be referred to these centers for counseling and testing. AB activities will work together with the OVC program to provide curriculum-based abstinence skills to OVC at camps organized for OVC. Recently, as a result of the prevention work being done among in-school youth, the program facilitated an establishment of a Community-Based Youth Friendly Resource Centre in Epe with funding from Patroleo Brasileiro Nigeria Limited (Petrobras). The program will leverage this resource to continue to provide access to abstinence information and skills for young people.

POPULATIONS BEING TARGETED
The primary target audiences under this program are young unmarried people (boys and girls aged 10-18 years) and adult men and women of reproductive age.

KEY LEGISLATIVE ISSUES ADDRESSED
The program addresses stigma and discrimination and gender issues by addressing male norms and behaviors, reducing violence and sexual coercion.

EMPHASIS AREAS
Program activities include a major emphasis on training in which a structured curriculum is used to provide trainings on delivery of abstinence skills to selected individuals. These trained individuals step down the acquired skills to their peers in their respective communities. Another emphasis area is community mobilization and participation, in which communities are mobilized with support of the gate keepers. Community dialogues are used to engage community leaders and to assist them to mobilize their wards for action. The program has minor emphasis on the development of a network/linkages/referral system and IEC development.

Table 3.3.02: Activities by Funding Mechanism

| Mechanism ID: | 5267.09 | Mechanism: USAID Track 2.0 CEDPA |
| Prime Partner: | Centre for Development and Population Activities | USG Agency: U.S. Agency for International Development |
| Funding Source: | GHCS (State) | Program Area: Sexual Prevention: AB |
| Budget Code: | HVAB | Program Budget Code: 02 |
| Activity ID: | 9759.24875.09 | Planned Funds: $939,500 |
| Activity System ID: | 24875 | |
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

CEDPA will continue to strengthen institutional capacity of its selected implementing agencies (IAs) to develop sustainable programs within the same states as under COP08. These activities will involve: developing organizational management system and leadership skills of IAs to optimize their ability to effectively address stigma and discrimination in the communities through training of faith and community leaders; developing peer education activities for improved advocacy for foster care and support to people living with HIV/AIDS (PLWHA); facilitating the formation and strengthening of networks of community peer groups and linkages to treatment outlets, communication centers, HCT centers, ART sites, and vocational training centers; supporting women by linking them to sexual and reproductive health services provided by CEDPA in family planning programs, improved referrals for PMTCT and ANC; and increasing young girls and women access to comprehensive sexual information and prevention services through community outreach, focus group discussions (FGDs), peer education, and peer counseling.

ACTIVITY DESCRIPTION:
In COP 09, CEDPA’s Abstinence and Be Faithful (AB) and HIV prevention through behavior change beyond abstinence and be faithful (C&OP) components will be maintained in 20 states namely: FCT, Bauchi, Edo, Enugu, Kano, Anambra, Cross River, Lagos, Kogi, Imo, Niger, Benue, Taraba, Adamawa, Sokoto, Zamfara, Kebbi, Nassarawa, Katsina, and Akwa Ibom. CEDPA’s AB minimum package is composed of community awareness campaigns, peer education, and school based approach for youths. In line with the National Prevention Plan’s guidance on Minimum Prevention Package, each individual will be reached with a minimum of the three intervention strategies. CEDPA will ensure that each beneficiary is reached through community awareness, peer education and one other targeted strategy within the year.

Community awareness campaigns will be used as an entry point to all community-based HIV prevention activities. Trained peer facilitators and educators will organize and conduct AIDS awareness seminars at the community level to sensitize the public about HIV prevention and the need to participate actively in care and support activities. Such seminars will be held during religious gatherings, traditional ceremonies, and sports events. Focus group discussions and community dialogues will be organized for key community stakeholders, such as civic and traditional leaders.

Peer education models will be used to reach out to PLWHA groups, age, and job peers. These will include targeted HIV prevention activities for PLWA support group members, okada drivers (commercial bike riders), and youth groups within church and Muslim communities.

Age appropriate messaging and non-curricular based approach will be used to target in-school youth with abstinence and be faithful messages through the formation of anti-AIDS clubs and drama activities. Trained peer educators will facilitate the implementation of these activities.

CEDPA will ensure that each beneficiary is reached with a minimum of three interventions (i.e., community awareness campaigns, peer education models and school-based approaches). Messages will emphasize partner reduction and faithfulness to one partner or mutual fidelity, and discourage inter-generational and multiple sex partnerships. Intensive community mobilization and sensitization will reach underserved rural and hard-to-reach communities.

The AB program will reach 42,705 people with the minimum package of AB interventions, of which 14,947 individuals will be reached with abstinence only interventions. CEDPA will train 1,500 peer educators and facilitators to disseminate information on AB through a systematic community-based approach. CEDPA’s prevention training manual includes topics such as basic facts on HIV/AIDS and life skills (e.g., negotiation skills and assertiveness). Training will take a minimum of five days. AB activities will include counseling, mentoring, peer support, information sharing, and provision of technical guidance and support to all the IAs spearheaded by the Anglican Communion AIDS program (ACAP) and the AIDS Program for Muslim Ummah (APMU), a project of the Nigerian Supreme Council for Islamic Affairs as multiplier organizations. CEDPA’s AB prevention strategic approach involves a series of interrelated interventions (community mobilization, advocacy, targeted inter-personal communication, capacity enhancement of individual and community groups) directed at different levels of society to enhance individual behavior change in a supportive environment.

AB program activities under CEDPA’s Positive Living (PL) project are implemented at the individual, family, and community levels. At the individual level, activities promote development of life skills that: support practicing abstinence by young people and adults in low risk settings; encourage delay of sexual debut; denounce intergenerational sex, rape, and incest; and promote counseling and other means of interpersonal communication techniques. At the family level, services will be provided by peer educators during home visits and will focus on couples counseling to promote mutual fidelity/partner reduction/elimination of casual sex relationships, HCT, and prevention in discordant relationships. Community-wide prevention programs will be provided by pastors, imams, peer educators, teachers, and parents. These programs will include messaging from the Church pulpit or at the Mosque, messaging through club activities, and through in-school peer education and out-of-school youth prevention programs that address sexual development, reproductive health and promotion of secondary abstinence particularly for at-risk out-of-school youth through alternative livelihood opportunities. Community-based approaches will promote collaboration with other implementing partners and credible teachers’ union.

CEDPA’s C&OP program activities will complement the AB programs. The C&OP minimum package is composed of: community outreach activities, peer education, and provision of STI management. Community outreach activities will precede other C&OP interventions that include counseling and testing, condom messages and distribution, youth peer education, and STI counseling for affected individuals. Trained peer facilitators and educators will organize and conduct community outreach activities while healthcare workers will provide syndromic management and STI treatment services at CEDPA triage centers. All C&OP activities will be coupled with information about abstinence as well as the importance of HIV counseling and testing, partner reduction, and mutual faithfulness as methods of risk reduction. Information on correct and
Activity Narrative: consistent condom use will be provided at condom distribution outlets and healthcare facilities.

AIDS awareness seminars at the community level will be organized for most at risk populations (MARPs; e.g., commercial sex workers, long distance truck drivers, market women, and okada drivers) and married couples to sensitize the public about HIV prevention and the need to participate actively in care and support activities.

The primary target group for the peer education model will be out-of-school youth, okada drivers, and leaders of organized groups of the MARPs in the community. These will include targeted HIV prevention activities for PLWHA support group members and youth groups within the church and Muslim communities.

C&OP will augment the basic care and support (BC&S) component of PL and enhance the capacity of Primary Health Care and other referral facilities in project communities to diagnose and treat STIs by providing laboratory equipment, such as specimen bottles, reagents, consumables, etc. These facilities will serve as referral centers for diagnosis and treatment of STIs and will be considered service outlets for C&OP. PL will build on past achievements by continuing to target long distance truck drivers, migrant workers, out of school youth, orphans and vulnerable children (OVC), PLWHA and clients of commercial sex workers. Healthcare providers trained under BC&S and TB/HIV program areas will deliver prevention messages on routine clinical days during risk-reduction counseling, family planning counseling, and sexually transmitted infection management and counseling. Condoms will be distributed at every treatment facility. This activity is a key component of the PL strategy and encompasses provision of information and access to correct and consistent condom use, prevention of HIV transmission among discordant couples, promotion of HCT, partner reduction, and mutual faithfulness as methods of risk reduction. PL will reach 28,705 persons, train 1,500 peer educators, distribute 3,000,000 condoms and open 413 condom distribution outlets.

Peer educators, including teachers, PLWHA, and parents (trained in AB) will be trained to act as condom distributors and provide prevention options for people at risk who cannot practice AB. Options include support for PLWHA to disclose their sero-status to sexual partners and significant others, proper nutrition and boosting body immunity, prevention of pregnancy among PLWHA, PMTCT and early diagnosis and treatment of STI. Peer Educators will hold discussions in homes, communities and workplaces with their peers focusing on prevention for positives during one-on-one and group discussions in support group meetings, where they will distribute condoms, facilitate support group discussions, and act as peer buddies to ensure and maintain behavior change, as appropriate.

Using standardized forms, project M&E Officers will collect data on an ongoing basis and compile data monthly, including numbers and demographic characteristics of clients reached and messages provided. This will provide timely information for effective decision making. ABC M&E activities will develop sustainable capacity at CEDPA’s subpartner levels to collect relevant data.

POPULATIONS TARGETED:
AB activities will target young people in school, and out-of-school youth PLWHA, religious leaders and the general population. Teachers and parents are targeted to act as change agents.

C&OP will focus on most at risk populations (MARPs; e.g., long distance truck drivers, migrant workers, out of school youth, PLWHAs, clients of commercial sex workers), sexually active men and women, and adolescent girls and boys in the general population. Prevention for Positives will target mainly discordant couples. Pregnant positive women will be mobilized and referred for PMTCT services.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
AB emphasizes human capacity development through training, task-shifting and volunteer retention and therefore enhances sustainability. This contributes to increasing sustainability through capacity development of 41 indigenous organizations.

Condom and Other Prevention activities of PL will contribute to PEPFAR’s 5 year strategic plan for Nigeria by reaching high risk population with information and services that enhance risk reduction abilities. These activities will contribute to averting new HIV infections. PL will promote active participation of PLWHA by encouraging disclosure of sero-status and protection of their sexual partners.

LINKS TO OTHER ACTIVITIES:
ABC activities relate to HCT, BC&S, and HKID. Public-private partnerships and collaboration with local business groups will also be explored. To ensure the comprehensiveness of CEDPA’s prevention services, individuals identified in the program will be linked to the micro credit finance project under BC&S, HVOP, and other implementing partners like Maximizing Agricultural Revenue and Key Enterprises in Targeted Sites (MARKETS), WINROCK, and healthcare facilities for medical care.

EMPHASIS AREAS:
PL promotes a rights-based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Traditional gender norms of male dominance, female subservience and gender inequality in sexual relationships as well as stigma and discrimination reduction are all addressed through this program. Commodities procurement and distribution, particularly of condoms, will be an area of emphasis. The program will address increasing gender equity in HIV programs through education and family-based dialogues and promoting male norms and behaviors that encourage HIV prevention such as creating awareness on reduction in number of sexual partners, and equal power sharing between males and females, and testing before marriage, particularly for those who practice polygamy.

Table 3.3.02: Activities by Funding Mechanism

- **Mechanism ID:** 7143.09
- **Prime Partner:** Pact, Inc.
- **Funding Source:** GHCS (State)
- **Budget Code:** HVAB
- **Activity ID:** 18182.24882.09
- **Activity System ID:** 24882

- **Mechanism:** USAID Track 2.0 FS Community Reach
- **USG Agency:** U.S. Agency for International Development
- **Program Area:** Sexual Prevention: AB
- **Program Budget Code:** 02
- **Planned Funds:** $182,500
Activity Narrative: Pact, through its Community REACH project will continue to provide a mechanism for rapidly providing assistance, through grants, to local organizations that include but are not limited to non-governmental (NGO), community-based (CBO) and faith-based (FBO) organizations that have the potential to support both the USG objectives and those of the Government of Nigeria (GoN) in HIV prevention programming. In order to work towards sustainability, Pact would emphasize host country organizational capacity building and technical assistance as important elements of an effective sub-grant program. COP09 funding is provided in the sexual transmission prevention program area but as a result of this emphasis, indicator targets and reporting are to be found in the health systems strengthening program area.

In COP 09, Community Reach will address key gaps in abstinence, be faithful, and condom and other prevention (ABC) programming in Nigeria, such as: low capacity of local partners to implement scale-up programs; lack of a comprehensive package to promote abstinence, fidelity and related changes in communities and social norms; lack of FBO and CBO organizational capacity to implement high quality ABC prevention programming that will bring about effective behavior change interventions with harmonized messaging; poor coverage of rural areas with prevention programming; inadequate monitoring and supervision skills of implementing partners; weak linkages between facility and community-based partners; too few programs that address the needs of adolescents, particularly females; and a paucity of programs that address youth who are transitioning from abstinence to becoming sexually active.

In COP08, ABC partners provided a recommended minimum package of services from a pool of established best practices to reach a target. These best practices include: the peer education model; “PEP plus” model; curriculum and non-curriculum based school programs, community awareness campaigns; and interventions that address age-appropriate income generation activities and essential life skills, among others. In COP08, partners utilized a minimum of three of these interventions to reach a target and these were reinforced with mass media activities. The minimum package of services ensures that the intended behavior change outcomes are achieved and provides a proxy tool for measuring targets reached with ABC services.

In order to both increase the capacity of local organizations to deliver HIV services and to expand the ability of the USG/Nigeria team to meet its PEPFAR goals for COP 09, the USG/Nigeria team has determined that it is necessary to add an additional capacity-building model to its current portfolio.

PACT will continue to mobilize and support community-based responses to ABC programming through an effective and transparent grant award and administration system for the provision of responsive, fast-track grant-making assistance to organizations responding to identified gaps in the ABC prevention program of Nigeria. PACT will also provide HIV/AIDS implementers with access to financial resources and high quality technical expertise to assist in achieving and effectively reporting results while complying with USG financial and administrative requirements and build sustainability through provision of technical assistance to local sub-grantees in their capacity to deliver quality ABC services at the grassroots level. The PACT Community REACH program aims to strengthen referrals and linkages for increased access to ABC programs through capacity-building of sub-grantees, fostering sustainability, and documenting evidence-based best practices, lessons learned and new approaches, tools, and methodologies by engaging with local sub-grantees and creating economic advancement opportunities through the active engagement of private or business sectors in workforce development for persons affected by HIV/AIDS and other caregivers.

PACT/Community REACH’s ABC program will also continue to focus on quickly mobilizing local/indigenous civil society organizations (CSOs), NGOs, and FBOs in the Southeast, North Central and South-South geopolitical regions of Nigeria to play essential roles in filling the gaps identified in the ABC Prevention services and provide grants to these grassroots organizations for comprehensive ABC services delivery according to OGAC guidance and in line with the government of Nigeria HIV Prevention Plan and the Nigeria strategic framework. Capacity building and service delivery capacity support will be provided to these organizations to enable them to be sustainable and able to directly access donor funding. PACT/Community Reach will identify, map and provide grants to established CSOs formed from ongoing prevention program efforts and provide technical support to enhance their ability to continue providing behavior maintenance activities in their rural communities.

Specific programmatic gaps that PACT/Community REACH will address include: mobilization of funding and sub-granting to these organizations for ABC services provision; and assistance to indigenous CSOs, CBOs and FBOs to develop strong program skills, with the ultimate goal of graduating these local sub-partners to becoming prime partners themselves. PACT/Community REACH in COP 09 will support 250 local/indigenous CSOs, CBOs and FBOs identified in the South-South, South East and North Central geo-political zones of Nigeria with capacity building and/or small grants.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
This program will contribute to PEPFAR goal of capacity development and system strengthening of local and indigenous organizations for provision and sustenance of HIV prevention activities. It also contributes to increased coverage and reach of the PERPFAR prevention program to the most in need (rural areas and grass root populations).

LINKS TO OTHER ACTIVITIES
Activities will be linked to Human Capacity Development, Gender, HCT, PMTCT, TB HIV, treatment, care and SI.

POPULATIONS BEING TARGETED
The target populations for these activities will include individuals in the rural areas reached by local and grass root indigenous organizations offering ABC prevention services in these rural areas. Population will include men, women, youths, children and PLWHAs in the rural areas.

Activity System ID: 24929

Mechanism: USAID Track 2.0 SFH

USG Agency: U.S. Agency for International Development

Program Area: Sexual Prevention: AB

Program Budget Code: 02

Planned Funds: $4,325,000
Activity Narrative: The key modification in COP 09 is the merging of Abstinence and Be faithful (AB) activities with the Condoms and other Prevention (C&OP) program. This activity relates to HIV counseling and testing (HCT), TB-HIV, and orphans and vulnerable children (OVC) programming. Society for Family Health’s (SFH’s) goal for sexual prevention activities is to contribute to a reduction in HIV prevalence among young people aged 15-24 years and among most-at-risk populations (MARPs). SFH priority target groups for COP 09 are: out-of-school youth, transport workers (TWs), uniformed service-men (USM), brothel and non-brothel based female sex workers (FSWs) and people living with HIV and AIDS (PLWHAs). Other target groups include in-school youth, students of tertiary institutions, and workers reached through workplace interventions. The key drivers of the HIV epidemic include soaring levels of commercial, transactional and cross generational sex, multiple and concurrent partnerships, low risk perception, high incidences of STIs, and skewed gender relations, power imbalances, and poverty.

In a Nigeria 2005 sentinel survey, youth aged 15 to 24 years were shown to have a higher than national average HIV prevalence. Although the proportion of 15-19 year olds who have never had sex has risen, many youth still engage in risky behavior. The Alliance Survey (IBBSS) survey reveals that multiple partnerships were common among the armed forces (37.3%), police (29.4%) and TWs (37.9%). Condom use at last sex with girlfriends was higher among the armed forces (64.7%) than among police and TWs (45.4% and 45% respectively). The IBBSS also revealed that reported condom use was very high among brothel- and non-brothel-based FSW in all commercial sex transactions; however, their reported condom use with boyfriends was far lower.

In COP 09, SFH will continue its focus on addressing drivers of the HIV epidemic with interventions that provide MARP’s with information and skills needed to reduce their vulnerability through increased risk perception, improved self efficacy, and negotiation skills for condom use. Societal factors, such as social and cultural norms, practices, beliefs and laws that stigmatize and disempower certain female populations and act as barriers to essential HIV prevention messages, will be addressed through agenda setting, advocacy, and community mobilization and sensitization. At community level, strategies will facilitate the enhancement of communities’ willingness and readiness for change, the induction of social norms that reinforce risk avoidance, and empowerment of communities’ effort to prevent HIV. SFH has worked in 181 sites and 537 communities of male and female high risk groups to date.

SFH will implement a minimum package prevention services for AB and C&OP programming that includes communication strategies, peer education plus (PEP) models, the Voice for Humanity approach, community awareness and outreach, and a school-based approach for AR, and the PEP model, specific population awareness campaigns, and community outreach for C&OP programming. SFH will continue its programming in all 32 sites covered in COP08. SFH will reach 196,591 persons with AB messages, of which 112,400 persons will be reached with abstinence only messages. An additional 1,656 persons will be trained to reach 131,061 persons with condom related interventions.

The PEP model is an evidence-based, cost effective and scalable approach to HIV programming. This 12-month intervention package targets specific at-risk groups, including female sex workers, out-of-school youth, uniformed servicemen, and transport workers. The PEP model is centered on peer education and integrates other elements (such as the formation and nurturing of community-based organizations [CBOs]) into a single unified program. The ‘Plus’ in the model refers to a non-peer approach that includes a mix of drama, information, education and communication (IEC) material distribution, work with influencers and gatekeepers, provision of HIV counseling and testing (HCT) services, and linkages to treatment sites for STIs, TB and other HIV related service. In COP 09, SFH will maintain most of the community level activities in COP 08. Within the AB program area, the key messages are delay in sexual debut, secondary abstinence, and mutual fidelity.

The Voice for Humanity (VFH) BCC approach addresses the uniqueness of typical rural settings in which access to modern information technology (print, electronic and internet access) is low, literacy levels - including the knowledge of HIV prevention measures - are low, and learning occurs via oral tradition in closely knit small groups often facilitated by community leaders. In such settings, new ideas are disseminated in the form of story telling, folk songs and parables to aid comprehension. The BCC method adopted by the VFH programme uses these channels to deliver messages using a solar powered digital audio device in small group settings, with a community facilitator trained and able to respond to concerns and make necessary clarifications. This helps to quickly clear misconceptions and learning. Pre-recorded messages help ensure consistency of messages. One critical challenge faced by SFH programs was its inability to reach female out-of-school youth (FOSY) between 15 and 23, particularly in rural areas. Many have completed secondary school, some have only a primary education, while others are non-literate. Although the majority are single, many in the northern regions are divorced and engage in transactional sex. In line with the SFH strategy to increase and improve participation of FOSY in community HIV prevention efforts, the VFH approach was piloted in Kano, Kaduna, Jos, and Bauchi in COP07 and scaled up to 10 states in COP08. SFH will continue to deploy the 10 select states identified for COP09 in FY09. The VFH listening devices will be used to provide ABC messages to young girls primarily, and other community members in Pidgin English and Hausa languages for wider reach. In COP09, 220 persons will be trained to deploy these devices to reach about 11,000 male and female youth.

Community awareness and outreach activities targeting male social norms will continue to be implemented among the general population to address continuing risky behaviors related to multiple and concurrent sexual relationships. In COP09, SFH will train 64 persons to deploy customized flip charts to reach 25,600 men and women in the general population with mutual fidelity messages through interpersonal communication (IPC) strategies. The target population will also be reached with community drama/road-shows, IEC distribution, and HCT outreach. A national mass media campaign will be aired to provide AB messages in a reinforcing and complementary manner.

To sustain the abstinence program in Nigeria, SFH will continue its in-school youth program that provides young people with information, skills, and services to reduce their vulnerability and risk. This is conducted
Activity Narrative: through the National Youth Service Scheme (NYSC) HIV program. NYSC corps members will be trained as peer educator trainers (PETs) to reach students of secondary schools with abstinence messages. Trained PETs conduct interactive forums and special events (e.g., dance dramas) and distribute IEC materials among targeted in-school youth. SFH will continue its work in 12 selected tertiary institutions from COP08 using a non-curriculum based peer led intervention. SFH will expand its activities within the selected institutions in COP09 and continue to support anti-AIDS clubs to conduct outreach programs as part of a comprehensive prevention package to address risk reduction, knowledge of HIV status, gender related violence and rape, and trans-generational and transactional sex. Reinforcing this intervention will be special events (shows, drama, seminars), IEC material, campus radio jingles, print media, and HCT outreach.

Within the C&OP components, key messages are partner reduction (concurrent and/or serial), consistent condom use, and prompt treatment of all STIs. The PEP model will be used to provide information and model behavior skills for the adoption of safer sexual practices relevant to consistent condom use, mutual fidelity, partner reduction, knowledge of HIV status, and prompt and complete treatment of all STIs and TB. SFH will maintain its program of engaging with the Nigerian prisons to provide prevention messages, HCT and referrals for prison staff and inmates. A baseline assessment of sexual and reproductive health knowledge and behavior will be completed in FY08. Peer education activities will continue among prison staffs and inmates. Through the sexual prevention program, SFH will continue to provide linkages to HCT, STI, TB and other HIV related services. Clients will be referred to identified USG, Global Fund, and Government of Nigeria treatment and care sites, as well as support groups for psychosocial support.

Under the specific population awareness campaign, SFH will utilize the Priorities for Local AIDS Control Efforts, (PLACE) approach to identify potentially high transmission areas and specific venues for effective AIDS prevention programs activities. In COP 08, PLACE was implemented in 10 states and will be maintained in COP09, with expansion to more sites within the same states. This component will continue to target street based sex workers and their clients with messages on partner reduction, reduction in alcohol consumption, condom use, and knowledge of HIV status. SFH will engage individuals and groups in IPC campaigns, distribute IEC materials, and sponsor special events to reach target populations with condom related messages. Through PLACE, SFH ensures easy product accessibility and availability at high risk sites. Moonlight HCT services will continue to be provided at specific sites. Prevention activities among PLWHAs will continue in FY09 in accordance with national guidelines for secondary prevention among discordant couples, prevention of re-infection, prevention of opportunistic infections and provision of basic care kits. In COP09, SFH will identify and select 2 new support groups per SFH region. In each support group, 2 PLWHAs will be trained as IPC facilitators to continue monthly IPC sessions using the new IPC guide at support group meetings to reach 6,400 persons. IPC facilitators will also conduct community mobilization activities aimed at stigma and discrimination reduction around SFH intervention sites. SFH will continue to provide IEC materials and condoms to the PLWHAs.

Community outreach will include condom distribution and promotion through social marketing. It will also include education on HIV and condom use through pamphlets, brochures and other promotional material available at the community level. This intervention will make condoms available at all times to those who need it. It will also seek to improve coverage and quality of coverage, access and equity of access to men and women for male and female condoms.

In addition to the minimum package, SFH will continue to prioritize increasing faith-based organization (FBO) capacity to participate as full partners in HIV prevention efforts by engaging with umbrella bodies of selected Christian and Islamic groups to develop faith based responses and implementation of strategic plans. In COP08, SFH engaged 4 FBO partners to reach youth and married couples with AB messages. FBO activities will continue with program implementation in 2 select states per health zone. Religious leaders will be trained to integrate HIV messages into their sermons. 120 youth within the congregation will be trained as peer educators to facilitate peer education sessions. Other interventions will include HCT outreach, IEC material distribution, and special events (e.g., youth and couple conferences).

Program evaluation will utilize participatory monitoring and evaluation and other intervention specific evaluations to inform program design. Focus group discussions and semi-structured interviews will be used for the baseline study and program monitoring.

SFH's program specifically focuses on gender by increasing female youth involvement and participation in community HIV prevention programs, and through the VFH strategy. Another component of the gender strategy includes messages on alcohol and substance abuse reduction as associated with gender based violence and risky behavior. Referrals will be provided for women to access reproductive health services, income generating activities and social support systems. For women to achieve greater control over their protection from HIV and unintended pregnancy, SFH will market and distribute female condoms as a dual protection method. The female condom project funded by Oxfam Novib will be piloted in 3 states in COP 09 (Lagos, Edo and Delta). SFH will collaborate with UNDP and GoN to increase demand, access and availability of female condoms.

Target Population
This activity targets both street-based and brothel-based FSWs and their clients, transport workers, uniformed servicemen, male and female in-school and out-of-school youths, gatekeepers and religious authority figures in the community and PLWHAs.

Links to other activities
This component is linked to HCT, policy and systems strengthening, orphans and vulnerable children programming, and TB-HIV. SFH will continue to reinforce partner reduction messages, promote HIV counseling, and testing, create awareness about the links between TB and HIV and referral to ARV services.

Key legislative Issues
This activity will address gender equity in programming through interventions targeting young girls.
Activity Narrative: Interventions will also address male norms and behaviors that put both men and women at risk as well as stigma and discrimination against PLWHA.

Emphasis areas
This activity places major emphasis on community mobilization and participation, capacity building for community based organizations while minor emphasis is placed on workplace programs.

Activity System ID: 24889
**Activity Narrative:** In COP 09 the Global HIV/AIDS Initiative Nigeria (GHAIN) will provide sexual prevention services, which include Abstinence, Be faithful, and Condom use (AB & C) and Other Prevention by further strengthening and supporting current implementing agencies across the country. In COP09, a combination of intervention strategies will be employed by GHAIN such that every individual within the targeted groups will be reached with a minimum of three interventions in line with the National Prevention Plan (NPP) minimum package guidelines. Abstinence only sexual prevention programs will be tailored to address 5,000 in-and-out of school youth under the age of 15. GHAIN’s sexual prevention strategies will include peer education (age peers), focus group discussions (FGDs), and non curricula based approach (e.g., drama and HIV clubs) as part of the minimum package. GHAIN will identify a minimum of 120 persons drawn from all project locations and equip them with peer education and FGD skills as well as support them to form HIV clubs. Peer education will equip selected volunteers to provide their peers with correct and complete information on HIV/AIDS prevention while the FGDs and clubs will serve as avenues for message reinforcement and sensitization activities using the ‘enter-educate’ approach.

Sexual prevention programs with the “Be faithful to one partner” theme will target 12,727 adults using religious gatherings (rallies), the identification of role models, and mass media approaches. In order to achieve the above target and also contribute to the overall goal of reducing the incidence and impact of HIV and AIDS in Nigeria, GHAIN will disseminate information on the importance of HIV counseling and testing, partner reduction and mutual fidelity as methods of risk reduction. Faith-based community leaders and organizations will be targeted with on-going advocacy to ensure that they reinforce correct and consistent messages regarding HIV/AIDS prevention and stigma and discrimination, as well as promote health seeking behaviors and address social norms and inequalities that increase vulnerability to HIV/AIDS. Religious leaders will be mobilized and trained based on the GHAIN developed training and preaching content guide. This will enhance their capacities to deliver HIV-related guided sermons weekly at churches and mosques.

Strategies for other prevention interventions include: FGDs, counseling and testing, condom messaging and distribution, balanced ABC messaging, job (Female Sex Workers and clients, and road transport workers) and social (Men who have Sex with Men - MSM) peer education, and income generating activities. The strategy will also involve creating linkages to mobile counseling and testing (CT) and referrals to high quality STI treatment services.

Peer educators will be used to reach most-at-risk populations (MARPs). This will be supported by targeted audio and print educational materials and community outreach activities. Focus group discussions will reinforce messages on the importance of correct and consistent condom use during every sexual encounter with commercial and non-regular partners known to be HIV-positive, and with commercial and regular partners whose status is unknown. Information regarding the critical role of HIV counseling and testing as a risk-reduction strategy, the development of skills for vulnerable persons, the relationship between alcohol, injecting drugs and HIV and AIDS, and the message that condoms do not protect against all STIs will also be provided.

GHAIN will ensure that condoms are made available at over 88 sites, including counseling and testing sites and brochures, by strengthening partnerships with the Society for Family Health (SFH) and United Nations Fund for Population Activities (UNFPA) to obtain and distribute condoms. In addition, the project will explore possibilities of additional product support from the Global Fund for Aid, TB, and Malaria (GFATM), DFID and other sources.

PLWHA, transport workers and men having sex with men (MSM) will be targeted for comprehensive programming that includes programs in being faithful condom use and other prevention (OP) programs will be. Prevention with Positives’ will be an important focus of sexual prevention programs in COP09. Information will be reinforced on the importance of correct and consistent condom use during every sexual encounter. GHAIN will train 165 persons on components of the above listed minimum package strategies to promote HIV/AIDS prevention among MARPs, and a total of 69,545 persons will be reached through specific population awareness, peer education models, workplace programs, provision of STI management, and messages/interventions on vulnerability issues.

Experience has shown that individual behavioral-focused interventions are more effective when combined with broader structural change at community and societal level. Through social mobilization and active community participation, the program will address norms affecting the behavior of women/girls and men/boys and inequalities between male and female roles that increase vulnerability to HIV/AIDS. GHAIN will also mobilize communities to address norms/behaviors on cross generational and transactional sex, promote increased male involvement in prevention activities, and timely health seeking behaviors. Issues of stigma and discrimination will also be addressed in the intervention. Through community dialogue sessions, members of target communities will exchange information face-to-face, share personal stories and experiences, honestly express perspectives, clarify positions and responses to such HIV/AIDS issues as stigma and discrimination, sexual transmission, medical transmission, and prevention of HIV within positive populations. The major output of the community dialogue would be a critical mass of advocates in each community who are well versed in HIV/AIDS and are working towards the reduction and elimination of new HIV cases as well as stigma that fuels the epidemic. In addition, community based organizations (CBOs), non-governmental organizations (NGOs), and influential individuals in the community will be supported to provide age- and context-appropriate information with the aim of creating an enabling environment for sustained behavior change. This will be supported by ongoing mentorship, and provision of technical assistance to build local capacity to design and manage innovative HIV/AIDS programs.

GHAIN’s secondary sexual prevention strategy will involve the utilization of multi media to support the primary activities. This will entail the development and execution of multi-media campaigns, development and distribution of SBC materials, and advocacy, capacity building, referrals, and monitoring and evaluation of activities, as well as mentorship to implementing agencies.
Activity Narrative:
Referrals and networks will be strengthened to ensure effective expanded access to clinical services for MARPs, including referral for diagnosis and treatment of sexually transmitted infections (STI), TB (DOTS Centers), reproductive health/family planning/PMTCT integrated services, and linking prevention services for HIV-positive individuals to HIV treatment and care services, including counseling and testing.

COP 09 GHAIN activities will be guided by both the National Prevention Plan and National Behavior Change Communication Strategy.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
GHAIN will contribute to the overall United States Government (USG) strategic plan of building the capacity of local organizations by working with local NGOs to carry out sexual prevention (SP) activities with MARPs and other targeted groups in the general population. GHAIN will focus on building the capacity of local implementing agencies to effectively carry out sustainable HIV prevention activities among MARPs, including development and dissemination of strategic behavior communication materials, community mobilization, condom use programs, peer education activities, counseling services, and referrals and linkages, among other activities. The SP activities will in turn contribute to generating demands for counseling and testing (CT) and prevention of mother to child transmission (PMTCT) services, which serve as entry points for other services, such as antiretroviral treatment (ART) and palliative care. GHAIN will provide support for the integration of appropriate reproductive health messages into SP programs for the uniformed services and their dependants using non-PEPFAR funds.

LINKS TO OTHER ACTIVITIES
As in all SP programs, activities will continue to be linked to other relevant services available in the community. GHAIN IAs will work with the mobile counseling and testing team of GHAIN to locate and strategically introduce services at areas identified to have concentrations of MARPs. People who test positive will be referred for continued care along the continuum of care model. The referral coordinators of GHAIN will record contact details of positive clients while maintaining strict confidentiality, for the purposes of continued counseling, palliative care and contact tracking for tuberculosis (TB) screening and ART services, if eligible. GHAIN will ensure high quality SP data through a sound information system that precludes double counting and ensures accountability.

POPULATIONS BEING TARGETED
Beneficiaries of SP activities include youth (in and out of school), married couples, young adults, transport workers, female sex workers, MSM, and PLWHAs.

KEY LEGISLATIVE ISSUES ADDRESSED
SP activities will take into consideration gender issues related to HIV/AIDS programs through providing equal quality prevention services without discrimination against sex, nationality, religion, creed, etc., as well as a concerted effort to increase male involvement in HIV/AIDS activities. Strategic efforts will be made to tailor prevention messages to match environmental requirements of target audiences. The activity will help address male norms and behaviors while reducing violence and coercion toward females, through vigorous campaigns to educate people on the benefits of couples’ counseling and testing (CT) and mutual disclosure of HIV status.

EMPHASIS AREAS
Sexual prevention interventions will de-glamorize social norms that promote high-risk practices such as having multiple sex partners and sugar mummies and daddies (i.e., trans-generational sex). This will be done by promoting images of successful, honorable and respected role models from within the communities as being faithful to their partners. Role models will be identified and supported to promote fidelity and discourage norms that promote coercion, cross generational sex, alcohol and substance abuse. While emphasis will be placed on fidelity and condom promotion and distribution for MARPs, abstinence will be stressed among in-school youth. Communication activities will also be geared towards social mobilization to strengthen existing social, economic and political structures within the communities with an emphasis on: training, information, education and communication; local organizational capacity development; interpersonal communication/counseling; condom distribution; and STI management. GHAIN will continue to strengthen the developed exit/sustainability plan for implementing agencies, both at the country and program level, and at the individual implementing agency level to customize organizational specific plans and schedules.

Nigeria Page 307
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

AB targets have been adjusted per notional targets for 2009 and C&OP targets have been adjusted per notional targets for 09. There will be an increase in number of motor park service points from 6 to 12, and new Bio Behavioral Surveillance data is cited.

ACTION COP 09 sexual prevention activities will continue to provide prevention services to 9,545 youth and young adults (4772 males and 4773 females) through Abstinence/Be Faithful (AB) activities and 46,364 individuals through condoms and other prevention (C&OP) activities. ACTION will implement its AB programming in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals through a balanced portfolio of AB prevention activities. Through the involvement of ACTION as a partner in this activity, PEPFAR Nigeria will extend its reach with AB services into focused communities in six states (Plateau, FCT, Benue, Kaduna, Kano and Edo). In COP08, ACTION reached over 10,000 individuals using a combination of abstinence and/or being faithful prevention messaging approaches. A key age group for AB activities is youth/young adults aged 15-24 years, as this is the highest prevalence age group. Many young adults are in tertiary educational institutions where they can be accessed for appropriate AB messages. Through its other program areas, ACTION reaches a large population of HIV-positive adults, adolescents and children through care and treatment services. HIV-affected partners and family members of these clients will also be reached with prevention with positives (PwP) services.

ACTION will focus AB activities at tertiary educational institutions (polytechnical schools and universities) located in cities where individuals reached with AB messages who test positive can be referred or linked to care and treatment facilities, as necessary. ACTION will work principally at educational institutions but will have spill over to the community through a combination of multiple strategies in line with the Government of Nigeria/U.S. Government (GON/USG) minimum care package. These will include: community awareness campaigns specifically focusing on small group discussions (SGD) organized within departments; a school based approach that will leverage existing curricula developed jointly by the Federal Ministry of Education and the Society for Family Health; and peer education plus activities focusing on drama groups. The curriculum will be used to train lecturers and guidance counselors to provide AB messages routinely in their teaching. Peer education plus activity dance drama performances are being developed through the target groups. These dramas will have culturally and age group relevant scripts written by a professional consultant using input from the SGD. Content will be piloted for acceptability and accurateness of the messages before performances are carried out at these institutions. ACTION will continue to collaborate with the International Institute of Christian Studies (IICS), an NGO that has worked with the Nigerian Federal Ministry of Education and has implemented effective AB services in secondary schools in Nigeria.

Activities conducted at the local level by ACTION will be reinforced through national mass media campaigns by other USG partners, such as the successful Zip-Up campaign. AB messages will be balanced with condoms and other prevention messaging, where appropriate and will be integrated with other PEPFAR program area services in proximal areas. The goal of the program is to saturate targeted communities with messages conveyed in multiple fora. Utilizing such a methodology, a large number of people will be reached with messages received via one method or another, but the target group will be those individuals that will have received AB messaging on a regular basis and via the three strategies ACTION will employ (community awareness campaigns, school based programming and peer education plus activities). The target for this intensive AB messaging campaign is 9,545 individuals. A total of 500 persons made up of teachers, guidance counselors, school health care workers, and peer educators will be trained to conduct effective prevention interventions inclusive of AB messaging from 166 outlets. Another focus of the program in COP09 will be improvement of the linkages between appropriately balanced ABC services, condoms and other prevention activities, HIV counseling and testing, and HIV treatment activities. The incorporation of HIV AB messages by lecturers who have access to this age group on a regular basis will institutionalize the AB services. In addition, prevention activities will be incorporated into points of health care service in each institution, including family planning counseling, sexually transmitted infection management and counseling, and risk-reduction counseling.

ACTION will also provide C&OP activities for 46,364 most-at-risk persons (MARPs; 23,182 males and 23,182 Females) and support 60 community based condom outlets in locations frequented by MARPs, such as bars, brothels and truck stops in addition to the hospital based outlets co-located at HCT/antiretroviral treatment (ART) clinics. Sites are located in states that have been selected based on the National ARV Scale-Up Plan with the goal of universal access to expanded prevention services and linkages to wraparound services (e.g., family planning). At the health care facility level this will complement prevention with positives (PwP) activities supported under basic care and support programming. Prevention services will take place in community settings, including: skills development centers, truck stops, markets, and OVC centers targeting out-of-school youth. ACTION will complement mobile HCT with prevention services by supporting NGOs to establish HCT and other prevention program sites at locales where transactional and intergenerational sex are common, using five mobile HCT vans based out of Action's regional offices. The 2007 Integrated Bio Behavioral Surveillance Survey (IBBSS) for Nigeria revealed an alarming National HIV Prevalence of 7.4 and 30.2 for brothel and non-brothel-based female sex workers. ACTION will expand prevention programs in collaboration with experienced community-based organizations (CBOs) and peer educators to reach commercial sex workers (CSWs) and other individuals along the Benin-Lagos transport corridor, including truck drivers and those who engage in transactional sex at overnight motor parks. It is anticipated that seroprevalence among this group exceeds 20%. The number of targeted truck stops will be increased from 6 to 12. ACTION also targets out-of-school youth via community centers and OVC programs. Condoms and other prevention programming will be balanced with AB prevention messaging for youth in these settings.

In COP09, ACTION will build on COP08 activities at the community level utilizing a combination of strategies, including community outreach campaigns, peer education models, and sexually transmitted infection (STI) screening, management, and treatment. Peer education strategies will focus on Greater Involvement of People with HIV/AIDS (GIPA). The goal of the program is to cover target communities with messages conveyed in multiple fora so as to reach the specific target groups with C&OP messaging on a
Activity Narrative:

ACTION will enhance services for MARPs testing HIV-negative by coupling post-test counseling with targeted behavior change interventions that address individual risk. Individual counseling will include abstinence/mutual faithfulness messages, promotion/instruction regarding correct and consistent condom use, information education communications (IEC) materials, and linkages to family planning services. Community outreach through collaboration with PLWHA support groups will ensure that IEC materials and counseling messages are culturally acceptable. Group counseling will be carried out in supportive settings to discuss and promote HIV prevention behaviors, including avoidance of STIs, recognition and seeking early treatment for STI symptoms, and reduction of alcohol/illicit drug use. Condom promotion and distribution will be coupled with prevention information about abstinence and mutual faithfulness, behavioral change communication, and risk reduction education using peer educators. Sixty stationary condom distribution points at locales frequented by MARPs (such as bars serving truck drivers) will be established and maintained along with those situated within ART facilities.

Building on the successful models employed in COP 07 and 08, mobile HCT vans will be utilized for the provision of syndromic STI services in conjunction with HCT services targeting truck stops and night spots frequented by MARPs. This service will be provided by community health extension workers (CHEWs) following standard operating procedures for syndromic STI management and will include treatment for syphilis, gonorrhea, and chlamydia. Program staff will work with sites to ensure appropriate linkage/referrals to STI care.

PwP strategies targeting HIV-positive persons will also be included in this package of services for MARPs using approaches and materials developed through USG Nigeria. ACTION will support risk reduction and safer sex promotion activities among HIV-positive clients, partners, and members of their households. The comprehensive package of prevention interventions will include provider and counselor delivered prevention messages, family planning counseling, STI management, and treatment, and of partners and children. Lay counselors and peer educators will be mobilized for more in-depth counseling on key prevention issues such as: sexual risk reduction, disclosure, adherence, reduction of alcohol consumption, and partner testing. Condoms and information on proper condom use will be available to all patients attending ACTION supported ARV clinics. ACTION supported sites will integrate prevention with positives (PwP) activities including: adherence counseling; syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and behavioral counseling to achieve risk reduction; counseling and testing of family members and sex partners; counseling for discordant couples; and IEC materials and provider delivered messages on disclosure.

Site/regional level trainings for CHEWS in STI syndromic management will be carried out by ACTION program staff. Peer educators and PLWHAs will be trained by ACTION program staff and CBO subcontractors using a curriculum developed by SFH focusing on truck stop and commercial sex settings as well as a manual on interpersonal communications jointly developed by ACTION and SFH. General training will include risk stratification, disclosure and couple counseling, proper condom use, and syndromic STI management training for health care workers. The direct training target is 380 persons.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:

ACTION AB activities emphasize integration of prevention activities with treatment and care services. Use of the community awareness campaigns, school based programs, and peer education plus activities (community drama, dance events, etc.) allows dissemination of AB messaging, including integration with condom messaging, from socially-credible sources of information (educators, healthcare workers and related populations of PLWHA). This program will contribute to the global HIV/AIDS strategy by reaching 11,480 people with AB messaging and 5,740 people with abstinence only messaging in a comprehensive approach. As high risk and “bridge” populations contribute to HIV transmission, C&OP activities will support the Nigerian Federal Ministry of Health (FMHO), and emergency plan goal of reducing new infections and thus decreasing the overall disease burden of HIV in Nigeria by enhancing HCT with targeted prevention messages and interventions. Targeted efforts to promote correct and consistent condom use and STI management for MARPs can reduce the risk of HIV infection. The activities will also address issues of stigma and discrimination through the education of individuals and communities.

LINKS TO OTHER ACTIVITIES:

AB and C&OP activities relate to HCT, basic care and support (through dissemination of information by home based care providers), OVC programming (through specific targeting), and SI. A challenge of this program is to successfully link identified HIV-positive individuals with services. The populations being targeted often do not access services via traditional treatment venues. The program will create a means to strengthen linkages and will identify through the hub and spoke model innovative strategies for creating access to treatment in convenient venues. Targeting MARPs will help to identify persons who need referral into care, ARV services and prevention for positives counseling, which will be an important component of post-test counseling of HIV-positive persons as part of HCT services and the basic package of care. Balanced prevention messages targeting behavior change will complement HCT for all, irrespective of HIV status. OVCs will be taught family life and sexual initiation delay/abstinence negotiation skills.

POPULATIONS TARGETED:

AB will be targeted at youth (particularly university and polytechnic students), teachers, and adults accessing HCT services, while C&OP targets MARPs (commercial sex workers and their clients, prisoners, out-of-school youth, and mobile populations such as truck drivers). The other major focus is school-based youth. ACTION will provide technical assistance to SFH in the training of doctors, nurses, other health care workers in the public sector as well as PLWHA and peer educators who will focus on the special prison population, which faces additional stigma.

EMPHASIS AREAS:
Activity Narrative: Emphasis will be on human capacity development for AB and C&OP activities, promote a rights based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Reduction of stigma and discrimination are also key features of the program. Community development through linkages with CBOs and PLWHA support groups are also emphasized.

Activity Narrative: Emphasis will be on human capacity development for AB and C&OP activities, promote a rights based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Reduction of stigma and discrimination are also key features of the program. Community development through linkages with CBOs and PLWHA support groups are also emphasized.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

As we have now split the APIN+/Harvard activities between Harvard University and APIN, Ltd., our activity narratives are amended to reflect activities that will be performed specifically by the efforts of Harvard through the APIN+ Program as opposed to APIN, Ltd. (which has submitted a separate narrative under the name APIN). In addition, APIN will be taking over all activities of the Nigerian Institute of Medical Research (NIMR), Lagos University Teaching Hospital, Onikan Women's Hospital, and Mushin General Hospital; thus, those sites and their respective partners will drop out of the Harvard numbers and will be reflected in the APIN narrative.

NARRATIVE:

In COP09, Harvard will continue to provide sexual prevention programming activities in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached, thereby improving the effectiveness of this messaging, through a balanced portfolio of prevention activities including abstinence and be faithful messaging (HAVAB) along with condoms and other prevention (HVOP). By the end of COP08, Harvard will have assisted PEPFAR Nigeria in extending its reach of ABC services to 9 states, including Benue, Borno, Enugu, Kaduna, Lagos, Ogun, Plateau and Yobe. Through its other program areas, Harvard has a large population of HIV-positive clients to whom it is already providing age appropriate ABC messaging and prevention with positives (PwP) services, which include STI screening and management, condom provision, sexual risk reduction, disclosure, adherence, reduction of alcohol consumption, and testing of sex partners and children in the HIV clinic setting. In addition, Harvard will target activities to HIV negative persons in its catchment areas in order to minimize their risk behaviors and contribute to an overall reduction in HIV prevalence.

In COP09, Harvard will implement ABC activities at both the facility and community levels by utilizing the minimum prevention package strategy as contained in the National Prevention Plan. This package includes: community outreach campaigns; peer education; infection control activities; and STI management/treatment. The goal of the program is to focus on targeted communities for saturation with messages conveyed in multiple forums. Utilizing such methodology, a large number of people will be reached with messages received via one method or another, but the target group will be those individuals that will have received HVOP messaging on a regular basis and via at least 3 of the 4 strategies Harvard will employ.

HAVAB activities conducted at the local level by Harvard will be reinforced through national level mass media campaigns by other USG partners, such as the successful Zip-Up campaign. HVAB messages promoting abstinence, mutual fidelity, and addressing issues of concurrent and multiple sexual partnerships will be balanced with condoms and other prevention messaging, where appropriate, and will be integrated with treatment and care services at 66 sites and implemented by 2 stand-alone HCT providers.

Youth or young adults aged 15-24 years represent a key age group for HVAB activities, as they are the highest prevalence age group (2005 ANC survey). In addition, the 2005 National HIV/AIDS and Reproductive Health Survey (NARHS) demonstrated a low risk perception (28%) among the general population and significant reports of transactional sex (11%) among young women aged 15-29 years. Harvard will reach these beneficiaries through community awareness campaigns, peer education models, and ‘peer education plus’ activities.

Harvard collaborates with community-based organizations (CBO) and with persons living with HIV/AIDS (PLWHA) support groups at its facilities and surrounding communities in other PEPFAR programming activities. These support groups and CBO also serve as appropriate partners in the dissemination of ABC messaging to other PLWHA using the peer education model, and to wider audiences through the peer education plus model and community awareness campaigns. These support groups provide key community linkages for prevention of mother-to-child transmission (PMTCT), palliative care and antiretroviral treatment (ART) services. Support group activities will inform potential HIV-infected individuals (funded under basic care and support [BC&S]), as well as community outreach to high risk populations to encourage HCT and healthy behaviors, such as partner notification and condom use. For HIV-negative individuals, trained counselors will provide education on HIV/AIDS transmission, risks, and risk reduction strategies, including HIV testing. To address stigma issues and in compliance with the GIPA principle, approximately 10 PLWHA from the pool of those receiving treatment at facilities who are living openly and positively will be trained using the peer education model to disseminate ABC messages. They will serve as peer educators to extended family members and members of their support groups. These trained PLWHA will in turn reach individual cohorts of at least 10 other persons from among their social peers. With 63 facilities (including PMTCT sites), this will serve as an effective tool for reaching individuals in at least as many communities with balanced ABC messages.

A community awareness strategy will also be employed to serve the catchment areas of the hospital facilities, which will be linked with community mobilization efforts promoting HCT. During static and mobile HCT services, counselors will disseminate balanced ABC messages to recipient communities and clients through focused, small-group discussions and interpersonal communication. The key messages that will be conveyed are delay in sexual debut, secondary abstinence, mutual fidelity, prompt and complete treatment of all STIs, and promotion of need to ascertain HIV serostatus through HCT.

Several Harvard sites target most-at-risk populations (MARPs), including outpatient STI patients, border traders, military personnel, young male market agents, and motor mechanics. A prevention program for young male market agents has been established and implemented through the Association for Reproductive Family Health (ARFH) NGO. HaitAIIDS, a community based-NGO in the poor community of Tudun Wada in Jos, has an established community HCT center, which currently provides prevention messages, condoms and HCT to 150 community members per month. Prevention activities at these clinics provide risk-tailored educational materials and distribute condoms. In addition to comprehensive counseling on HIV prevention and risk reduction, HIV-infected individuals identified through this activity are referred for palliative care and evaluation for ART eligibility. An emphasis on reaching high-risk men also enhances prevention efforts and facilitates access to their partners. This funding will support
Activity Narrative: the implementation of behavioral interventions for MARP at stand-alone HCT centers, the development of educational prevention materials developed by ARFH and HaltAIDS and referral for STD diagnosis and treatment. Where appropriate, Harvard will build site capacity for STI syndromic management. Additionally, in Jos, we collaborate with Mashiah Foundation, a faith based organization which provides palliative care services for HIV-infected women and OVC. Mashiah also conducts mobile community outreach for HCT and provides ABC prevention messaging to the populations that it serves.

Harvard will also use the peer education model to target job peers who are healthcare workers. Healthcare workers at each site will be trained using established National peer education curricula and each will be requested to form peer groups of approximately 10 members from the healthcare worker community for dissemination of balanced ABC messaging. It is anticipated that these healthcare workers will continually serve as conduits for age appropriate prevention messaging not only for their work peers, but also for their social peers and all clients with whom they come in contact.

A focus of the program in COP09 will be continued improvement of the integration of prevention activities into the HIV care and treatment settings. Healthcare providers and lay counselors in these settings will be trained to appropriately deliver integrated ABC prevention messages and incorporate the messages into routine clinic visits using IEC materials and job aids. An appropriate balance of ABC will be tailored to the needs and social situation of each individual client in its presentation. Additionally, prevention activities will be incorporated into other points of service in each health facility (general outpatient clinics, emergency services, etc.), particularly into reproductive health services, including, family planning counseling, STI management and counseling, and risk-reduction counseling. Harvard supported sites will integrate prevention with positives (PwP) activities including: adherence counseling; syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and behavioral counseling to achieve risk reduction; counseling and testing of family members and sex partners; counseling for discordant couples; and IEC materials and provider delivered messages on disclosure. These interventions will be implemented using the recently adapted HIV Prevention in Care and Treatment Settings Prevention Package.

This funding will be also used to support the procurement and distribution of written prevention messages and condoms. These materials will provide patients and clients with HIV prevention information using the “ABC” model, including information about healthy behaviors, safer sexual practices, PMTCT, and condom usage. Prevention messages will also include information about other STIs. Condoms will be offered to all individuals at all sites and will be procured by Harvard from the Society for Family Health (SFH).

The target for the AB messaging campaign is 4,355 individuals. The target for the intensive campaign activity in other prevention strategies is 35,106 individuals. Additional staffing and training of counselors will also be provided by this funding, including a dedicated fulltime staff person. This activity will provide support for training of 366 individuals in AB messaging and 324 in condom and other prevention promotion.

 EMPHASIS AREAS

ABC programming emphasizes local organization capacity building, human capacity development, and efforts to increase gender equity in HIV/AIDS programs. These activities also promote a rights-based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Reduction of stigma and discrimination are also key components of the program. Through ABC activities, we place major emphasis on community mobilization and participation as an element of outreach for prevention efforts. We place major emphasis on training, infrastructure, and human resources in order to build the capacity of counselors and providers in a full range of prevention strategies. We also place emphasis on IEC as an essential element of outreach to high-risk populations, and on developing networks for linking these activities to HCT, PMTCT, and other ART activities to serve as a source of prevention information. Emphasis areas also include military populations (activities at 68 Military Hospital and Military Hospital Ikoyi, Lagos).

These activities address gender equity issues by providing equitable access to prevention services for men and women. In some cases, our activities seek to target men who may be at high risk for HIV in order to promote condom use as a means of prevention and access to services for their sexual partners. Male-targeted counseling seeks to address male norms and behaviors in order to encourage safer sexual practices. Strong prevention programs that accommodate the array of societal and cultural norms can also help reduce stigma and discrimination. Providing services at the community level will serve as an important platform from which general HIV/AIDS information can be provided and risk reduction strategies discussed.

POPULATIONS TARGETED:

Key populations targeted are the healthcare community in treatment facilities, PLWHA, youth and adults accessing HCT services, high-risk populations, and support group members and immediate families of PLWHA. Other target populations include discordant couples, and religious leaders. Targeting these populations is important to encourage safe sexual practices, HCT, and other prevention measures. Health care workers will also be targeted for training on the most effective prevention measures for various risk groups.

CONTRIBUTION TO OVERALL PROGRAM AREA

These prevention activities are consistent with PEPFAR’s goals for Nigeria, which aim to support a number of prevention strategies as a comprehensive prevention package. In order to be maximally effective, the prevention messages developed at different sites will be tightly targeted to various high-risk groups that they serve. Furthermore, these activities are consistent with the PEPFAR 5-year strategy, which seeks to scale-up prevention services, build capacity for long-term prevention programs, and encourage testing and targeted outreach to high-risk populations. The establishment of networks and referral systems from prevention efforts at the community level to PMTCT and HIV care and treatment will help facilitate the scale-up of the overall program. Additionally, as part of our sustainability building efforts, Harvard will provide technical assistance and support for APIN to assume program management responsibility for all ABC activities. This will include the implementation of a plan to transition site oversight, management, and
Activity Narrative: training over to APIN. The goal of such efforts is to provide for greater assumption of responsibility for management and implementation of PEPFAR programming by Nigerian nationals through an indigenous organization.

LINKS TO OTHER ACTIVITIES:
ABC activities relate to HCT, by increasing awareness of HIV. They also relate to Adult Care and Treatment and Pediatric Care and Treatment activities through dissemination of information by home-based care providers and ultimately by decreasing demand on care services through decreased prevalence. Linkages also exist to OVC programming by targeting OVC. These activities are also linked to TB-HIV activities in that prevention messaging will be disseminated to individuals who are provided with HCT in a TB setting. Through training of personnel, these activities also link to Human Capacity Development. As certain activities focus on gender-related issues, this program area also links to Gender.

**Activity Narrative:** ACTIVITY DESCRIPTION

This activity represents funding for a contracted Nigerian program officer for activities in the area of Sexual Prevention. The program officer spends 100% of her efforts in AB and Other Prevention. The budget includes one FSN salary at 100% effort, overhead charges, funding required for domestic travel, training funds and allocated minor support costs. This funding also includes support for a TA visit for two weeks of in-country support by a seasoned prevention expert from the U.S. Department of Navy HIV Prevention Program and/or one of the U.S. Military HIV Research Program's PEPFAR Programs in Uganda, Kenya, Tanzania or HQ.

The prevention program officer will work as a member of the USG Prevention Technical Working Group, as well as serve on the U.S. Department of Defense – Nigerian Ministry of Defense (NMOD) Prevention Working Group. The prevention program officer’s responsibilities also include: 1) representing the DOD-NMOD in technical discussions with the GON and 2) overseeing relevant technical aspects of the program, including program management and oversight of the 20 DOD-NMOD PEPFAR site prevention programs. The prevention program officer will work with other Implementing Partners and the USG team to ensure a harmonized approach that is consistent among partners and with the GON national guidelines. The prevention officer will also continue to support the GON in developing and implementing national prevention guidelines (e.g., National Condom Strategy).

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008
Addition of new epidemiological data
Revision of targets and emphasis areas

ACTIVITY DESCRIPTION:
Epidemiologic evidence indicates that throughout the world men and women in the military are amongst the most susceptible sub-populations to sexually transmitted infections (STIs), including HIV. In many African countries, uniformed services report HIV prevalence rates higher than national averages. In Cameroon, Nigeria’s neighbor to the east, an HIV rate of 6.2% was reported in 1993 among the military compared to 2% in the general population. In Malawi, it has been reported that 25% to 50% of army officers are already HIV positive.

HIV prevalence figures are unavailable in the public domain for Nigeria's over 150,000 armed forces. However, in 2007, the Nigerian Ministry of Health implemented an Integrated Biological and Behavioral Surveillance Survey (IBBSS) among high-risk groups, which included the Nigerian Armed Forces. This survey sampled 1861 personnel from military barracks located in six states. The study showed that while multiple partnerships are common among the armed forces, many do not consider themselves at risk of HIV. HIV prevalence rates vary across states, with armed forces in FCT reported at 1.1% while in Anambra the HIV prevalence rate among armed forces personnel was 7.6% (IBBSS 2007). Among the predominantly male occupational groups (armed forces, police, and transport workers), armed forces personnel consistently displayed a higher level of knowledge related to HIV risk (from 49 to 58 percent responding correctly to five knowledge-related questions). Of the groups represented in the study, HIV prevalence among the armed forces was consistently low, possibly due to the high reported condom use with commercial partners.

Based on this evidence, the US Department of Defense (DOD), in partnership with the Nigerian Military, will continue to provide prevention, care and treatment to Nigerian service members and the surrounding civilian community, which constitutes approximately 75% of the military's patient load. In COP09, the DOD–Nigerian Ministry of Defense (NMOD) HIV Program will continue to provide comprehensive AB and C prevention services to 20 military facilities and their surrounding communities. In line with the National Prevention Strategy, DOD will support the provision of a minimum of three interventions, which will include community awareness, 'Peer Education Plus' education and one other targeted strategy within the year that will be drawn from a combination of workplace and vulnerability programs. The planned activities which will be implemented to achieve these strategies, are outlined below.

In COP09, the program will continue to strengthen the DOD-NMOD partnership with the Armed Forces Programme on AIDS Control (APFAC), an existing structure that coordinates prevention services for Nigerian Armed Forces. The DOD will support APFAC in the training of 100 peer educators and 30 trainer-of-trainers on HIV/AIDS prevention by promoting abstinence, being faithful to one’s partner, correct and consistent condom use, and effects of alcohol and drug use can have on sexual decision-making and how this relates to HIV/AIDS prevention.

Training will be conducted to promote skills and information on AB and C during pre-deployment and recruitment training. Prevention messaging will also include alcohol use, gender, sexual coercion, and violence. HIV counseling and testing (HCT) and other related referrals will be made to the nearest military site providing HIV/AIDS/STI related services. An estimated 6,500 military and civilian personnel will be reached by peer educators with programming on HIV/AIDS prevention through AB and C.

DOD will continue to support APFAC to improve and reproduce Information, Education and Communication (IEC) materials to encourage and reinforce AB and C messages and information among military personnel. Materials will be vetted through DOD and the USG Prevention Technical Working Group prior to reproduction. These materials will be expected to reach 50,000 people, including both military and civilians. However, these individuals are not counted towards DOD’s AB or C targets since distribution of materials may not be sufficient to consider a target "reached."

Another strategy is to increase the knowledge and build the capacity of HIV/AIDS prevention through abstinence among in-school youth in military barracks. Utilizing existing infrastructure, teachers and indigenous organizations will provide abstinence and sexuality life skills-based training and education to approximately 2,500 in-school youth. Efforts will focus on recruiting teachers to be trained. Funding will support logistics (e.g., manual production of materials), training, and support for each military school to conduct abstinence-only HIV/AIDS programming. A total of 100 teachers will be trained in the AB curriculum that provides abstinence only messaging and skills that foster youth empowerment and knowledge sharing to reach in-school youth. Training expanded to reach out-of-school youth will incorporate being faithful to one’s partner and condom messages, as appropriate. Out-of-school youth will be accessed via youth centers, religious centers, recreational venues, and “mammy markets.” This activity will reach 3,200 out of school youth with skills and being faithful, and condom use, as appropriate. In addition, income-generating skills will be incorporated into the out-of-school AB and C training.

DOD will continue to expand efforts with military based religious communities in order to reinforce AB messaging, awareness and education and will support training through the Directorate of Islamic Affairs and Directorate of Christian Services to reach 40 Imams and Priests from its 20 sites on HIV/AIDS education and prevention. These Imams and Priests will attend related forums, workshops, and activities. They will provide AB related information on a continuous basis to an estimated number of 5,500 persons, which will include military personnel, their families and other civilians and clergy.

In collaboration with APFAC and the Society for Family Health, DOD-NMOD will continue to help to strengthen the distribution of male condoms to sites and within sites. In COP 08, targeted condom service outlets were expanded to a total of 20 sites, which will be maintained throughout COP09. DOD, in
**Activity Narrative:** collaboration with the Ministry of Health, will supply female condoms to all sites. Through prior prevention activities in COP08, female military and civilian personnel exhibited strong demand for female-initiated prevention strategies, which included female condoms. In partnership with the Ministry of Health and AFPAC, DOD-NMOD will also provide information, training and skills to approximately 200 total persons (10 persons each site) on male and female condom use at 20 sites. A total of 100,000 across the 20 sites will be reached and have access to male and female condom related information, training and skills.

The DOD will also strengthen the capacity of existing groups, such as the Officers’ Wives Clubs (OWCs) to conduct AB and C related activities as well as risk-reduction awareness and education activities. These OWCs have unique access to senior military officers, personnel wives, “Magajias” (women who control the barrack accommodation blocks and mammy markets) and other females within and around the barrack communities. The OWCs will implement outreach events and training activities within these 20 barracks to reach 100 women at each site, totaling estimated 2,000 women and additional 500 individuals including military personnel, their families and other civilians located within and around the barracks.

DOD-NMOD will support Barrack Health Committees to develop, incorporate and implement AB and condom related activities into their yearly work plans. In addition, these 20 site-based HIV/AIDS Committees will be supported to provide gender and male involvement related activities during military officers/rank and file mess social recreation activities to reach 2,000 adult males across the sites.

Another component is to strengthen HIV prevention through STI management within NMOD. Activities will include improved quality of training, counseling, diagnosis and treatment services for approximately 2,000 military personnel, dependents and civilians in and around the barracks communities. Services include diagnosis and treatment (with Pen G, ceftriaxone, azithromycin, acyclovir) for syphilis (treponema pallidum), gonorrhea, chlamydia and herpes simplex virus. AB and C prevention messaging and condoms will be offered to all those receiving STI diagnoses and treatment. All individuals diagnosed with STIs will be referred to HCT and strongly encouraged to participate in regular testing.

All components will include specific efforts to include people living with HIV/AIDS (PLWHA) in activity planning and implementation. Several PLWHA support group members have already been active in HIV prevention activities within the military barracks; this partnership has helped to reduce stigma and discrimination in the military community. This partnership will be further enhanced by the provision of support to build the capacity of 10 of these PLWHA support groups, especially in the areas of leadership, project design, management and income generating activities and businesses.

In addition, DOD will provided technical support to AFPAC and EPIC to continue implementing a micro-finance loan program. In COP08, 100 representatives from the 3 barrack PLWHA support groups benefited from this program and in COP09 these groups will receive ongoing support to continue providing income generating activities to their members and other interested individuals within and around the military communities.

AB and C messages will also be provided to individuals accessing HCT, Care and Support, ARV and PMTCT services at military sites. Male and female condoms are provided free of charge.

In order to procure activity related commodities, $150,000 was put into SCMS ($75,000 each from AB and Other Prevention funding lines).

By the end of COP09, the DOD will support 20 NMOD sites in Edo, Benue, Cross River, Rivers, Delta, Enugu, FCT, Kaduna, Lagos, Oyo, Plateau, Sokoto, Kano, Imo, and Anambra.

**CONTRIBUTION TO THE OVERALL PROGRAM AREA:**
In conjunction with other DOD activities, and those of other partners, this activity will contribute to the provision of a comprehensive HIV and AIDS prevention package for the military population, civilian employees, their dependents and the communities surrounding military sites. This activity will contribute to the PEPFAR overall aim of reducing HIV infection rates in Nigeria.

**LINKS TO OTHER ACTIVITIES:**
This activity relates to activities in PMTCT, Condoms and Other Prevention, Counseling and Testing, Care and Support, TB/HIV, OVC, and ARV Services.

**POPULATIONS TARGETED:**
This activity targets the military, civilian employees, their dependents, and the communities surrounding military sites. In particular, this activity targets in- and out-of-school youth and youth drafted into formal military service.

**EMPHASIS AREAS:**
These activities focus on military populations, and gender, as specific programming is designed to reach female military personnel and civilians as well as address male norms.

### Table 3.3.02: Activities by Funding Mechanism

- **Mechanism ID:** 5268.09
- **Prime Partner:** Winrock International
- **Funding Source:** GHCS (State)
- **Budget Code:** HVAB
- **Activity ID:** 9766.24960.09
- **Activity System ID:** 24960
- **Mechanism:** USAID Track 2.0 Winrock AIM
- **USG Agency:** U.S. Agency for International Development
- **Program Area:** Sexual Prevention: AB
- **Program Budget Code:** 02
- **Planned Funds:** $522,500
Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

Abstinence and Be Faithful (AB) activities will focus on behavior change, risk reduction, partner reduction, and a reduction in dependency on transactional sex work among brothel based commercial sex workers (CSWs) through provision of income generating activities (IGA) aimed at providing alternative income and motivation for leaving sex work. The AIM Project will continue to implement AB activities in partnership with indigenous organizations (non-governmental, community-based, and faith-based organizations [NGOs, CBOs, FBOs]). In conformity with the recommended AB prevention strategy, CSW will be reached with a minimum package of three services from a pool of established best practices. The three strategies selected by the AIM project for the HIV prevention include community awareness campaigns, peer education and on-the-job support for peer educators, interventions addressing vulnerability issues such as IGAs, and essential life skills. These activities are aimed at reinforcing HIV prevention messages and services towards behavior change.

The AIM Project will continue to strengthen the capacity of its indigenous partner NGO/CBO/FBOs to implement HIV prevention services and facilitate behavior change among 2600 CSWs in its 15 PEPFAR states. Winrock AIM project expansion strategy responds to the HIV/AIDS epidemic by aiming at saturation, which is guided by prevalence and concentration of target population. The AIM project targets CSWs and out-of-school youth within selected communities. Priority is given to states with high HIV prevalence and a significant number of CSW and out-of-school youth. The fifteen states selected are: Adamawa, Anambra, Bauchi, Benue, Borno, Cross River, Edo, Imo, Kano, Lagos, Nassarawa, Niger, Oyo, Plateau and FCT.

Community Awareness Campaigns: The AIM Project will facilitate focus group discussions (FGDs) to assess the prevailing knowledge, attitude, behavior and practices (KABP) of sex workers towards HIV prevention within their communities. Community dialogues will be conducted to provide reinforcing messages on HIV prevention. AB messages will be collected or reproduced from other USAID implementing partners (IPs), such as Society for Family Health (SFH), and be disseminated to at least 2600 CSWs in the 15 states. Community awareness activities will also address issues of stigma and discrimination as well as the need for greater involvement of people living with HIV/AIDS (PLWHA) into all productive spheres of the community. Gender roles and vulnerability to HIV transmission as well as its impact on individuals, families and communities will also be addressed through the community awareness activities.

Peer Education (PE): At least 150 volunteer/former CSWs will be identified and trained as peer educators using the SFH and Government of Nigeria (GON) approved peer education (PE) model to encourage and sustain behavior change among CSWs. The volunteer/former CSWs will be trained on HIV prevention and interpersonal communication skills to promote accurate information on HIV transmission and prevention, partner reduction, correct and consistent condom usage, and life skills. Peer educators will visit CSWs regularly on a one-on-one basis to discuss, educate and disseminate HIV prevention messages. In addition to the training provided using the PE model, a standard set of HIV prevention messages will be provided to each peer educator, which will serve as guidance to ensure that each CSW receives similar, appropriate, accurate and balanced prevention messages. Each peer educator will monitor and report on their activities monthly. Furthermore, in view of the needs of this target group, peer educators will access and provide condoms during their visits and make referrals to other fixed condom outlets around the brothel.

Vulnerability Issues: The AIM Project will support IGAs to promote alternatives to commercial sex. Under this strategy, the AIM partners will train 2600 CSWs on vocational skills towards alternative means of sustaining livelihoods, such as bead making, tailoring, hairdressing, and food processing. The sex workers will also be trained in basic business skills that include how to record income and expenses, determine profit, set prices for their sale items, and encourage savings. Of the 2600 sex workers trained, sex workers who demonstrate a commitment to dropping out of the sex trade will receive small in-kind grants of up to $200 designed to stimulate an alternative quality for an income generating grant will be referred to micro-finance institutions to access micro-loan services. Winrock International will facilitate the access of this micro-loan through training on business plan development and orientation on how to manage micro-loans. All 2600 CSW trained will receive essential life skills training that will include communication skills, decision making, problem solving, and condom negotiation in order to build their self esteem and to sustain behavior change. The AIM Project will collaborate with other USAID/PEPFAR partners and GON agencies to provide CSWs access to STI management, treatment, care and support services.

Condoms and Other Preventions: In COP 09, the AIM Project plans to reach individuals with balanced ABC messages in its 15 PEPFAR states. The AIM Project in partnership with indigenous NGO/CBO/FBOs will use several prevention strategies focused on behavior change, adoption of safer sex practices and provision of condom education among out-of-school-youth (OSY), particularly barbers and hairstylists. In the northern part of Nigeria, the project will reach out to tradition barbers (“Wanzamai”) and provide them the HIV prevention services.

The AIM Project partners will be encouraged to conduct advocacy visits to key community stakeholders, including barbers, hairdresser and traditional barber associations, community, religious and political leaders to create an enabling environment for project implementation and ensure community participation and ownership of the project.

Through its local partners, the AIM Project will implement the condoms and other prevention program by providing a minimum package of three services from the GON National HIV/AIDS Prevention Plan of 2007, and the HIV/AIDS National Strategic Framework for Action 2005–2009 and established best practices for behavior change communication (BCC). The three strategies selected by the AIM Project for the HIV prevention includes: (1) specific population awareness campaigns; (2) structured peer education based on GON approved training curriculum, refresher trainings and on-the-job support for peer educators; and (3) community outreach that promote balanced ABC messaging, condom messaging and distribution.
**Activity Narrative:** AIM Project will utilize the following three strategies to implement behavior change activities and the adoption of safer sex practices amongst 13,000 barbers, hairstylists and traditional barbers.

Specific Population Awareness Campaigns: AIM partners will facilitate focus group discussions (FGDs) to obtain baseline data and assess the prevailing knowledge, attitude, behavior and practices (KABP) regarding HIV prevention within their communities. In addition, community dialogues will be conducted to provide reinforcing messages on HIV prevention. Appropriate information, education and communication (IEC) materials for out-of-school youth will be collected or reproduced from other USAID IPs and disseminated to at least 13,000 OSY in the selected 15 states. In addition to the balanced ABC prevention strategy, issues of stigma and discrimination, and greater involvement of PLWHA into all productive spheres of the community will be addressed.

Peer Education Model: AIM Project will select at least 300 barbers, hairstylists and traditional barbers to be trained as volunteer peer educators using the GON approved peer education curriculum. These barbers and hairstylist will be trained on interpersonal communication to promote HIV prevention that includes negotiation, assertiveness, decision making, problem solving, condom messaging, and facts and myths of HIV/AIDS. They will also be role models and positive peer models. Age appropriate prevention messages will be disseminated to reach at least 13,000 barbers, hairstylists and other out-of-school youth. Each peer educators will monitor and report on their activities monthly. Furthermore, in view of the needs of this target group, peer educators will access and provide condoms during their visits and make referrals to AIM project existing fixed condom service outlets (e.g., barber shops and hair salons).

Community Outreach: The AIM Project will encourage beneficiaries to go for counseling and testing services. In addition to balanced ABC messages, beneficiaries will receive condon demonstrations and distributions. AIM Project will acquire condoms from USAID IPs, such as SFH, that will be supplied to the partners for distribution through at least 150 fixed condom outlets (barbershops and hairdressing salons) in the 15 states through focal persons and peer educators in barbershops, hairstylist salons and other appropriate service outlets. The AIM Project anticipates acquiring about 90,000 units of condoms from SFH.

**POPULATIONS BEING TARGETED**
Targeted populations include commercial sex workers and out-of-school youth (particularly barbers, hairdressers, and traditional barbers).

**CONTRIBUTION TO OVERALL PROGRAM AREA**
The AIM Project will increase capacity of NGO/CBO/FBOs and communities to disseminate accurate information on HIV/AIDS prevention and the number of individuals trained to disseminate balanced ABC HIV Prevention messages, and consequently contribute in building HIV/AIDS competent communities.

**LINKS TO OTHER ACTIVITIES**
AIM project’s AB and C&OP activities are linked to OVC activities and to other PEPFAR USG Partners’ activities to ensure strong referrals to comprehensive prevention, care and treatment services.

</table>
Activity Narrative: Rivers and Cross River are two out of six states within the south-south geo-political region of Nigeria with high oil exploration and tourism activities. The south south geo-political region is most negatively impacted by the HIV/AIDS pandemic. The National AIDS and Reproductive Health Survey (NARHS 2005) revealed that this region had the highest prevalence of transactional sex and multiple sexual relationships with marital and non-marital partners. This region also had the highest number of individuals who had sex with non marital partners in 12 months preceding the survey. Two-thirds of women located in this region had more than one sexual partner in 12 months preceding the survey. The south-south region also had the highest rate of non-marital non-cohabiting sexual relationship in the country, including both heterosexual relationships and men who have sex with men (MSM). In addition, the south-south region has the worst stigma and discrimination national figures for family and non-family members who are living with HIV/AIDS. In the Nigerian Sentinel Survey of 2005, the south-south region had the second highest rate of HIV prevalence (following the north-central region).

Drivers of the HIV epidemic in the south-south region include high levels of transactional sex, poverty, cross generational sex, multiple partnering, oil glut and attendant liquidity, tourism, social insecurity, high cost of living, and cultural practices and festivals that encourage transactional sex (e.g., the New Yam Festival). Secondary school-based studies in the region indicate that 22.6% of sexually active female adolescents had multiple sexual partners, with age at sexual debut at 14 years. Cross River State, with its rapid emergence of tourist spots (the Tinapa free trade zone and resort, for example) is likely to show increased sexual networking. In Rivers state, only 6.2% of sexually active individuals consistently and correctly use condoms with their partners. High risk behaviors have been found in the Niger Delta region, with about half of 15 to 22 years engaged in casual sex with commercial sex workers (CSWs) without condom. Peer pressure influence to engage in sex, unfavorable socio-cultural factors, gender norms, and low socioeconomic status are identified risk factors for early sexual debut, multiple partnerships and cross generational sexual activity in this region. Early sexual debut was common among uneducated female rural dwellers.

In view of the above, Pro Health International (PHI) seeks to establish sustainable behavior change among the target population of youth (15 – 25 years of age) in Rivers and Cross River states of the south-south region. Specific targeted behaviors include: delayed sexual debut, being faithful to one partner; and correct and consistent use of condoms. This will be done through messages on abstinence and fidelity in addition to facilitating increased knowledge of HIV/AIDS, risky sexual behaviors and risk personalization, and also through instituting interventions that encourage community-based normative changes to provide a congenial environment needed for sustained behavior change.

The behavior change objectives will be achieved using the minimum package intervention strategies of peer education, community- and school-based HIV clubs, and interpersonal communications targeting out-of-school and in-school youth with abstinence/be faithful (AB) messaging. Small group discussions, rallies and advocacy interventions at the community level and the formation of community based organizations will be used to address normative changes to support behavior change.

Pro Health’s condoms and other protection (C&OP) strategy for COP09 is a peer-led, containment strategy targeted at PLWHAs within the community based on the premise that preventing a positive person from transmitting the virus is the most effective way to avert new infections through sexual transmission. The HARPIN sexual prevention program for COP 09 will have 4 intervention components; peer education plus (PEP); interpersonal communication; formation of community based HIV clubs; and community awareness campaigns/rallies targeting out-of-school in line with the minimum package as recommended by the National Prevention Plan. Peer education trainers (PETs) will be identified and trained with the Society for Family Health (SFH) PEP manual for out-of-school youth. Other in house trainings on volunteer management, advocacy and communication for social change, adolescent psychology, cultural and social studies, financial and administrative management will complement the PEP training. These trainings are geared towards building peer education specialists who will be trained to reach twenty seven thousand two hundred and seventy three (27,273) of their peers (13,637 males and 13,636 females).

Peer educators will organize small discussion groups of their peers to discuss topics related to personal life and experiences. These discussion groups will be branded ‘Club ABC’ and develop later into community based organizations (CBOs). Peers will be reached individually with interpersonal communication as well. Local CBOs already involved in HIV/AIDS prevention will also be engaged in reaching the community.

The second component is peer education for in-school youth. They will be reached with the UNICEF Peer Education training manual, small group discussions, and school based HIV/AIDS clubs. 5 schools in each LGA will engage in the peer education program. Support from the State Ministry of Education will ensure that schools with ongoing interventions are prioritized. PETs will train PEs who will then reach peers with AB messages. In addition, peers will be required to form small discussion groups around HIV/AIDS topics and issues relating to personal life and experiences. At about the sixth month of the program, the in-school peers and peer educators will then form a school based club branded as ‘High Flyers Club’. In all, one thousand (1000) peer educators will be trained to reach twenty seven thousand two hundred and seventy three (27,273) of their peers (13,637 males and 13,636 females).

The third component involves advocacy for community level normative change, community participation and stigma reduction, with the consent and participation of relevant stakeholders. The state ministries of health, education, youth and sport, and social welfare will be informed and their consent and support sought to engender acceptability and participation. The local government councils will be visited to advocate support, commitment and eventual ownership of the program. Traditional leaders will be visited to canvas their support and permission to reach people with the programs. Other stakeholders in the community will be visited to rally their support and seek avenues through which the whole community can be reached.
Activity Narrative: Two advocacy officers (AOs) will utilize avenues, such as town meetings, trade union meetings, church services and gatherings, youth meetings, women groups, interest groups and other meetings within the community to facilitate discussions about stigma and discrimination against people living with HIV/AIDS (PLWHAs). These meetings will provide an atmosphere for open discussions on HIV/AIDS in the communities. The AOs will provide information on the magnitude of the HIV/AIDS problem and the community’s ability to fight it. The AOs will additionally stimulate community discussions on cultural issues that fuel the HIV pandemic (e.g., sexual coercion, cross-generational sex, transactional sex and sexual abuse) through focused discussion group sessions, interpersonal communications, and other mechanisms. These meetings will target communities that are in close proximity to Pro Health International’s (PHI) service provision points.

The fourth component will foster behavior change among PLWHAs to avert new infections. PLWHAs will be supported to adopt safer sexual behaviors as part of a comprehensive prevention approach. HARPIN will target PLWHAs and other youth in their communities with awareness campaigns that include rallies and interpersonal communication, peer education models using PLWA peer groups and age appropriate balanced ABC messaging and referrals to medical services. PLWHAs will be trained as PEs to provide information on various topics, including positive living, nutrition education, treatment education and adherence, sexually-transmitted infection (STI) counseling, and referrals to medical services, including HIV counseling and testing, PMTCT services and management of opportunistic infections. Trained PLWA will reach other PLWA/high risk persons with messages. There will be rallies in collaboration with other support groups aimed at reducing stigma and discrimination associated with HIV/AIDS. Advocacy visits will be made to relevant stakeholders and opinion leaders to introduce and solicit their support for the project. A total of 9,697 PLWA (4,849 males and 4,848 females) will be reached through 100 trained PLWHAs.

Recognizing that HIV/AIDS care and treatment settings serve as strategic entry points for reaching large numbers of HIV-infected people, the HARPIN project will continue to engender linkages between community-based prevention efforts targeting PLWA and clinic-based, provider-delivered intervention to help prevent the spread of HIV and also protect the health of PLWA. Training will be provided to healthcare providers in selected sites to provide routine care and treatment to HIV-positive patients and deliver important health information and preventive medical care, including treatment and/or referrals for STIs and family planning services. Health care providers will be supported to assess patients’ risk and provide targeted prevention recommendations, which encourage sex partners to get tested, disclose HIV status to sex partners, abstain from sex or reduce the number of sex partners or maintain fidelity to one partner, use of condoms during each sex act and appreciate the consequences of having sex without a condom, and understand the relationship between alcohol use and how it affects adherence and increased risky behavior. Cross referrals will be provided between facility-based interventions and the community-based interventions to provide a continuum of care for PLWA, expand program reach, and encourage and sustain behavior change. One condom outlet for PLWA will be established for each of the six local government areas where this intervention will be implemented.

Contribution to overall program area:
The HARPIN Project’s activities will address specific behaviors among youth with the aim of attaining positive and sustained behavior change in terms of primary/secondary abstinence practice, faithfulness to partners and correct and consistent use of condoms. The AB program will specifically provide knowledge of abstinence skills amongst youth, while prevention with positives interventions will contribute to containment of the disease by reducing transmission, re-infection or increased viral load among PLWA. This will contribute to strengthening and expanding the capacity of the GON’s response to HIV/AIDS epidemic and achievement of PERFAR goals of preventing 1,145,545 new infections.

Population being targeted:
Two primary population groups will be targeted in these sexual prevention activities. The first group will include young men and women (15-24 years old) while their corresponding figures-of-influence (parents, teachers and religious leaders) will be our secondary target. The second primary target group consists of PLWHAs, while their discordant sexual partners will be the secondary target audience in this category.

Emphasis area:
The emphasis areas for this program area are human capacity building and gender balance. Emphasis will be on building local capacity to ensure sustainability. CBOs within the community will be involved in programs to improve their knowledge and exposure in program design and implementation.

Key legislative issues:
Key legislative issues addressed include stigma and gender, with an emphasis on community norms that discourage stigma on PLWA and enhance women’s ability to access and utilize information on HIV/AIDS.

Link To Other Activities
The AB and C&OP activities carried out under PHI are linked with the organization’s PMTCT activities and free healthcare efforts (with other funding).

Activity Narrative: USAID Nigeria is negotiating a new award which will provide integrated OVC programming. As is the practice when making new awards, OGAC will be informed when the award is ready, and the partner(s) and targets will be uploaded into COPRS. The targets developed for this activity are notional, as they may be subject to change during the course of the award negotiation, but the program as proposed is on a scale to potentially reach about 1,400 OVC and to provide support and training to 1,000 caregivers.

This element of the new activity will focus on providing AB prevention messages for OVCs and their caregivers in four states (Kaduna, Kano, Bauchi and Niger) to expand services of care and support and referral to treatment for children affected or infected by HIV and AIDS. This activity will collaborate with community OVC programs and FBOs to adapt and pilot an HIV prevention program for young adolescents prior to sexual debut (estimated 12 to 16 years). The proposed model program is abstinence-based and with condom and other prevention services as appropriate for age given to older OVCs and their caregivers.

Through its support to OVCs, the activity will facilitate organizational capacity building in prevention programs for a core local partner who will gradually transit to be the prime partner. It will work with already developed and successful child protection committees, train peer educators among them to reach their peers with abstinence message as well as facilitate adults/child communication between care givers and OVCs. Community Protection Committees (CPC) will also be used to reach children of HIV-affected families and will expand outreach to improve access to prevention of mother to child transmission services (PMTCT), economic strengthening and OVC services.

The activity will strengthen the capacity of indigenous organizations to respond to HIV/AIDS in their communities; provide quality comprehensive prevention services for AIDS OVCs. The minimum package intervention approach as defined in the national prevention plan will be utilized for reaching these OVCs and their caregivers.

This prevention intervention will also include educational activities that relate to 1) Trust Building and Group Cohesion; 2) Risks and Values; 3) Educate Yourself: Obtaining Information; 4) Educate Yourself: Examining Consequences; 5) Build Skills: Communication; 6) Information about Sexual Health; 7) Attitudes and Skills for Sexual Health; 8) Review and Community Project. Overall the program will help youth assess the short- and long-term impact of their decisions on themselves, their families, and their communities, help develop decision-making skills, develop communication skills, learn basic facts about HIV/AIDS, sexual health, condoms and other contraceptives, and learn refusal skills. The educational methods include in-school curricular activities and extra curricular activities including the PEP model. While the focus of the program is on HIV/AIDS, it is also involves a comprehensive education program that covers many topics including knowledge about risks associated with other sexually transmitted infections, teen pregnancy, violence, alcohol, and other drug use.

The partner will work with community groups that are trained and experienced in identifying vulnerable children and families, provide a strategic starting point for a project that will work with community-based systems to effectively reach OVC. The activity will complement the services of local agencies by reaching children and families that may not have access to HIV prevention services or lack opportunities to access information on HIV prevention. Issues of stigma through awareness activities, peer advocates, and support groups will be addressed. Linkages will be sought for nutritional and educational support with USG supported wrap-around activities.

CONTRIBUTION TO OVERALL PROGRAM AREA: This activity program area focus is on strengthening the capacity of families and communities to provide prevention services to OVCs and their care givers. These activities contribute to the USG’s PEPFAR strategy of preventing HIV for an identified vulnerable group and are also consistent with the National HIV Prevention plan.

LINKS TO OTHER ACTIVITIES: Linkages will be established with HIV/AIDS treatment centers and community care and support program to ensure that OVC and caregivers stay alive and in good health, to counseling and testing centers to enable family members to receive necessary support and to reduce the increase in numbers of HIV+ children.

POPULATION BEING TARGETED: This activity will target girl and boy OVC and families affected by HIV/AIDS. It will provide services to OVC, caregivers of OVC and other children/siblings living in OVC households in community settings using existing established and accepted organizations as service providers. In addition, religious and community leaders, leaders of women’s organizations will be trained to combat stigma in their work.

EMPHASIS AREAS: The activity includes an emphasis on local organization capacity development and community mobilization, education and training. The program will aim to support equal numbers of males and female OVC and address economic and education factors that limit access to services of either gender.

New/Continuing Activity: New Activity

Page 326
Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

This activity also relates to activities in ARV and HCT.

In line with the provisions of the PEPFAR/CDC COP 08 funding requirements, Population Council (PC) will provide abstinence/be faithful (AB) and other prevention (OP) services to male Most At-Risk Populations (MARPs) through community awareness campaigns, peer education models, school based curricula, including a ‘Men as Partners’ curriculum that stresses male involvement in prevention activities and explores definitions of gender roles, and other services, such as HIV counselling and testing (HCT), and sexually-transmitted infection (STI) management. This shall be provided through a multi-partnership with Action Health Incorporated (AHI), Africa Regional Sexuality Resource Center (ARSRC), Alliance Rights Nigeria (ARN), and The Independent Project (TIP). The overall framework of the program targets the male MARPs in Lagos, Ibadan (Oyo State), and Abuja (FCT).

In COP08, Population Council initiated the Men’s Health Network (MHN), a consortium of three key partners, including AHI, ARSRC, and ARN. To ensure the long term sustainability of the project, MHN is structured as a multi-donor social franchising model utilizing both private and public service delivery points to provide STI, HCT, and targeted condom/lubricant provisioning to high risk men (MARMs), particularly men who have sex with men (MSM). During COP08, the project identified and trained 24 service providers in three intervention locations – Lagos, Ibadan (Oyo), and Abuja (FCT) – with skills development, certified training in STI syndromic management, and HCT. Concurrently, a network of key opinion leaders (KOLs) functioned as peer educators to stimulate demand for clinical services among MARM/MSM. In addition, a peer education and diversity training curriculum was developed using the ‘Men as Partners’ approach and delivered in an age/gender specific manner to MARM/MSM, as well as adolescent boys and girls for AB prevention. A minimum of 18 KOLs were trained and deployed across the 3 sites. By the end of COP08, the project successfully delivered AB prevention using the proscribed minimum package to 16,000 beneficiaries. The condom and other prevention (C&OP) minimum package was delivered to 10,000 beneficiaries.

In COP 09, Pop Council’s sexual prevention activity is limited to 3 sites and consists of several inter-related components: 1) the promotion of abstinence and fidelity for male adolescents and targeting MSM with “be faithful” messages, as part of a comprehensive male involvement curriculum addressing homophobia and violence; 2) increasing demand for and availability of condoms and other prevention activities, including STI management to MSM and their male and female partners; 3) providing clinic and community-based HIV care and treatment to MSM in a culturally and gender-sensitive manner; and 4) supporting a network of opinion leaders to advocate on behalf of MSM for increased awareness and sensitivity among service providers, community-leaders, and police, toward increased access and utilization of HIV prevention and STI management.

Nigeria has a population of approximately 140 million people with an adult HIV prevalence of 3.1% (UNAIDS July 2008 estimate). MARPS continue to serve as “reservoirs” of the HIV infection, thereby fuelling the epidemic in Nigeria. This group includes female sex workers (FSW), MSM, injection drug users (IDU), long distance truckers, uniformed professionals, and others whose practices and social networks put them increased risk of contracting and spreading sexually-transmitted infections (STIs).

The 2007 IBBSS shows varied overall HIV prevalence among MARPS with MSM having the second highest prevalence of 13.5% (25% in Lagos) compared to 25% among FSW. MSM are a particularly at-risk population in Nigeria. The MSM community is socially stigmatized and receives scant services to promote healthy sexual behavior and HIV/STI prevention. In Nigeria, nearly all informational education messages focus on heterosexual transmission of STI/HIV, and MSM are not sensitized to their own risk for contracting an STI. In addition, health professionals are largely unaware of their special needs. It is therefore paramount to include MSM in programs to prevent HIV/AIDS, since they are at high risk for HIV/STIs but are historically ignored by prevention campaigns and limited in their access to sexual health services.

The AB component of this intervention will include raising community awareness targeting MARPs including MSM, as well as young people in general with generic community dialogues, peer education through the use of social networks, and additional peer education through the use of role models. Project activities include: conducting male involvement peer education sessions at the community level targeting young adolescents with ‘AB’ messages; conducting peer education sessions at the community level targeting MSM with ‘B Only’ messages; conducting male involvement peer education sessions at the community level targeting young adolescents with ‘A only’ messages; developing a male involvement AB curriculum using AB prevention messages and gender roles, sexual rights, violence mitigation/avoidance training targeting adolescent boys; and training key opinion leaders (KOLs) in male involvement AB curriculum and management of peer education sessions.

In COP09, the project will reach 13,182 men and women with AB community outreach activities comprised of the minimum AB package. At the end of COP09, 3,295 individuals will be reached through abstinence only messages. KOLs among the MSM will be trained as both peer educators and role models, and as facilitators to map MSM social networks. Population Council has developed a comprehensive behavioral change communication (BCC) model comprising ‘Men as Partners’ (MAP) curriculum, which will also explore behavior change and safe sex practices through small group discussions, inter-personal communications, and community dialogues. A total of 48 individuals will be trained to promote MAP AB messaging through a gender-sensitive curriculum aimed to reduce male gender roles promoting violence, alcohol consumption/abuse, and sexual risk-taking. A beneficiary is considered ‘reached’ upon having participated in three of the following planned activities: community awareness campaign; peer education models; school-based approaches; peer education plus; and/or workplace programming.

The C&OP component of this intervention will include: activities to increase demand for prevention activities among MSM in Nigeria; the identification and mapping of 9 social support networks; identification, training and support of 27 opinion leaders promoting prevention and care-seeking behavior through BCC messages;
Activity Narrative: identification of 27 MSM-friendly provider networks offering services to MSMs; and the creation and support of 9 outlets to distribute and promote the correct and consistent use of condoms and lubricants to persons engaged in high-risk behaviors. This program will train healthcare providers to provide HCT, STI management, and condom and lubricant distribution in a gender sensitive manner. It will also engage the mass media in promoting men’s health through TV and radio jingles. Quality assurance and quality improvement for STI syndromic management will be performed among public and private laboratories affiliated with the project, although no direct laboratory funding is provided under this agreement.

Population Council will aim to deliver these services through a comprehensive community HIV prevention package, in which clients receive IEC materials, condom and lubricants, interpersonal communications, and STI services, while community awareness sessions will also include focused small group discussions (SGDs), dialogues, workshops (MAP), and consolidation of ABC messages. In addition, 9,848 individuals will have been reached through local-language community outreach that promotes HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful; 27 individuals will have been trained in local languages to promote HIV prevention through behavior changes beyond abstinence and/or being faithful; and 2500 clients will have been treated for STIs using nationally approved syndromic management guidelines. A beneficiary is considered ‘reached’ with OP activities upon having participated in three of the following planned activities: community awareness campaigns; community outreach that provides condoms and lubricants; peer education models; workplace programming; and STI syndromic management and provision of pre-packaged STI therapies.

The AB and C&OP components to this program provide a vital linkage to onward referral services for OP program areas, specifically for men engaged in high risk practices. Access to quality HCT, STI and other health services will improve through the establishment of an MSM-friendly network of healthcare providers. In the first year, three public and private sector clinics were selected and shaped into MSM-friendly clinics. In subsequent years, the project will expand by 25% per year in terms of number of clinics and cities. Policy-level interventions are not specified in this activity; however, significant engagement with NACA, CISHAN, and complementary donors is essential to gradually move forward with rights-based agendas to support protection of services to MSM.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
These activities contribute to the COP09 targets by reaching at least 13,182 individuals through community outreach that promotes HIV/AIDS prevention through abstinence and/or being faithful individuals and 9,848 individuals through other behavior change beyond abstinence and/or being faithful. This is consistent with PEPFAR’s 5-year Strategy for averting new infections in Nigeria.

LINKS TO OTHER ACTIVITIES:
This activity relates to Counseling and Testing and ARV. This service will also complement HCT services for those who ultimately test HIV negative. Through this program as well as basic care and support, Population Council will ensure access to quality HCT, STI and other health services through the establishment of an MSM-friendly network of healthcare providers.

POPULATIONS BEING TARGETED:
This activity will target adolescent and key opinion leaders (KOLs) and youth, as well as female sex workers (FSW), MSM, injection drug users (IDU), long distance truckers, and uniformed professionals. This program will train healthcare providers to provide HCT, STI management and condoms and lubricant distribution in a gender sensitive manner. It will also target males (both in- and out-of-school) within and around the target group communities, such as male spouses, friends, neighbors, and fiancés.

EMPHASIS AREA:
An emphasis area for this activity is human capacity development through a comprehensive community HCT package in which clients receive IEC materials, condom and lubricants, interpersonal communications, and STI services. Messages are reinforced through community awareness sessions, focused small group discussions, community dialogues, and workshops such as the MAP activity. Other emphasis areas include gender and reduction of stigma and discrimination.

COVERAGE AREAS:
Lagos, Oyo, FCT, Rivers and Imo states

Activity Narrative: Gembu Centre for HIV/AIDS Advocacy Nigeria’s (GECHAAN) The New Tomorrow’s Project (TNTP) is presently operating in Sardauna Local Governance Area (LGA) in Taraba State. By the end of COP 08, TNTP will have conducted surveys and advocacy meetings in three additional sites—Gashaka, Kurmi and Bali in Taraba State—preparatory for expansion to these 3 LGAs in COP 09.

GECHAAN will expand its prevention program into three additional LGAs in 2009, namely, Gashaka, Kurmi and Bali. GECHAAN will work with LGA council officials and traditional councils to mobilize support for the project in their communities. TNTP prevention awareness creation activities will utilize community discussion forums, such as village meeting sessions and ‘core encounter’ support group sessions to disseminate HIV prevention messages and also to discuss community norms and social structures that increase risky sexual behavior. Other community awareness campaigns will include focus group discussions, rallies, and community dialogues in all the project sites. Mass media strategies, such as the “Voices of Hope” will be used to reinforce messages. TNTP will produce TV and Radio jingles that will be aired weekly to reach a wide range of viewers and listeners in the project sites. Additionally, experts in the field of HIV/AIDS will be invited to discuss relevant topics or issues on HIV/AIDS prevention messages on the weekly broadcasts. Using this medium, advertisements regarding the organization and its services will also be aired.

GECHAAN will emphasize HIV prevention education with women, youth and couples. GECHAAN will extend the abstinence clubs initiative that has already started in Sardauna LGA secondary schools and communities, and will also conduct youth prevention activities in the expanded project sites. In community forums, youth will have the opportunity to spend time with adult and youth role models to discuss their concerns and effective HIV prevention methods. Parents will be encouraged to become role models and will be provided with skills to facilitate meaningful parent/child communication sessions in their homes. Such support will come from workshop trainings and IEC materials to enable parents to communicate more easily, accurately and effectively with their children on HIV/AIDS. Education seminars will also be provided for Islamic Religious Knowledge (IRK) and Christian Religious Knowledge (CRK) teachers on HIV/AIDS prevention messages. This will help strengthen moral values in schools in our service areas and lead to the formation of Religious Teachers Association on HIV/AIDS prevention. This has already begun in Sardauna LGA. TNTP will also collaborate with National Youth Service Corps and similar groups to strengthen the fight against HIV prevention in our service areas among youth.

Only individuals reached with three intervention strategies will be counted as being reached in accordance with the national prevention plan minimum package. These interventions will include curricula/non-curricula based approach, peer education (PE), and the ‘peer education plus’ (PEP) model.

Youth prevention messages will focus on: the importance of abstinence in preventing HIV transmission among unmarried individuals; deciding to delay sexual activity until marriage; development of skills among unmarried individuals for practicing abstinence; and the adoption of social and community norms that support delaying sex until marriage and discourage/denounce forced sexual activity among unmarried individuals.

Be faithful messages targeting married adults and couples will be focused on: the importance of being faithful and the role of fidelity in reducing the transmission of HIV among individuals in sexual relationships; elimination of casual sex and multiple sexual partnerships; developments of skills for sustaining marital fidelity; the adoption of social and community norms supportive of marital fidelity and partner reduction using strategies that respect and respond to local customs and norms; and adoption of community social norms that denounce forced sexual activity in marriage or in long-term partnerships.

GECHAAN will also organize seminars and/or trainings on micro finance, positive alternative sources of livelihood, skills acquisition, and essential life skills training for target groups in the project sites.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: The GECHAAN project will contribute to prevention of new infections through Abstinence and Be faithful strategies that reach 12,500 persons (5,150 males and 7,350 females), 7,000 persons (2,750 males and 4,250 females) will be reached with abstinence only strategies within the national response. GECHAN will provide training to 1,200 individual in COP09.

POPULATIONS BEING TARGETED: Target populations of the A/B Prevention messages include women, couples and youths, PLWHA, OVC and HIV/AIDS affected families, and community leaders.

LINKAGES: This program is linked to HCT, treatment and care, and home based care. The ‘core encounter support group forum’ for PLWHAs will also link with facility based services for prevention with positive interventions. This program will also work in synergy with its OVC component to provide prevention services to orphans and vulnerable children.

EMPHASIS AREAS: An emphasis area will be community forums that discuss norms and behaviors that will contribute to gender equity in accessing services and address some of the disparities that have placed women at greater disadvantage. Prevention activities will target both sexes with behavior change communication that promotes healthier concepts of maleness among the youth. This will reduce the vulnerability of women and girls to abuse, sexual coercion and also discourage multiple sexual partnerships. Effective parent/child communication will be emphasized as well.

Activity Narrative: This is a new activity which relates to other activities in the USG AB program.

Nigeria’s HIV epidemic may be classified as ‘generalized’ but has marked unequal high prevalence among different subgroups, thus displaying the characteristics of a concentrated epidemic, largely among most-at-risk populations (MARPs). Youth aged 15 to 24 years in Nigeria have a higher than national average HIV prevalence rates (ANC sentinel survey, 2005). Research shows a significant increase in the proportion of 15-19 year olds who have never had sex; among males the proportion significantly increased from 77% to 83.0% and for females those who report never having had sex went from 73.0% to 80.1%. However, many youth still engage in risky behavior and about a third of males and 10% of females reported having sex with non-marital partners.

The Hope WorldWide Nigeria (HWWN) abstinence and be faithful (AB) program will target young people and adolescents aged 10-18 years for abstinence skills access and learning, and other information that will assist them in making healthy sexual choices to prevent HIV infection. Under this program, orphans and vulnerable children (OVC) who fall within the age bracket will benefit by learning skills to prevent HIV and other sexually transmitted infections (STIs) and have the opportunity to train as peer educators. This program will enhance self esteem of the target audience and help them acquire life skills and reinforce the values of abstaining from sex until marriage.

In COP09, the program will be implemented in six States in Nigeria namely, Federal Capital Territory-Abuja, Cross River, Delta, Lagos, Osun and Oyo. This effort will be delivered in partnership through capacity strengthening of the following implementing agencies (IAs): Initiative for People’s Good Health (IPG- Ugep Cross River State), Positive Development Foundation (PDF- Calabar, Cross River State), Neighborhood Care Outreach (NCO- Calabar South, Cross River State), Integrated Development Initiative (IDI- Ikom, Cross River State), Counseling for Youths And Teenagers On HIV/AIDS in Nigeria (COYATOHAN- Oyo, Lagos), Living Hope Care (LIHOC- Ilesa, Osun state), Community of Women Living with HIV/AIDS (NCW+ Amuwo Odofin, Lagos), Positive Life Organization of Nigeria (PLON- Yaba, Lagos), and The International Church of Christ (ICOC- Lagos, Delta & Oyo), as multiplier organizations.

ACTIVITY DESCRIPTION

The first phase of activities under this program involve capacity building of IAs to provide quality comprehensive HIV prevention services to the target population. HWWN in COP09 will provide IAs with training in utilizing the following prevention methodologies and skills: abstinence curriculum; improved parenting; facilitation skills update; community mobilization; and Men As Partners methodology (MAP). The existing abstinence curriculum addresses personal and character issues, dating and marriage, peer issues, and social pressures. Gender-based violence, rape, and intensive 8-hour youth project. These participatory youth discussions follow discussion guides and are led by trained facilitators. In view of the major role that parents play in the lives of young people, IA staff will be trained on how to deliver parenting curriculum to create opportunities for parents and guardians to improve communication with their children, and to create a supportive environment for young people to sustain positive behavior. Each of the training sessions will hold for 5 days. Secondary audiences will include those individuals whose behavior makes young people susceptible to sexual exploitation, such as adults in the communities. Additionally, societal norms and practices can also make adolescents and young people susceptible to sexual exploitation and HIV infection. The MAP methodology is designed to engage men in discussion with a view to addressing issues of masculinity, gender and sexual/domestic violence. Training on MAP methodology will be provided to IA staff to engage men in discussions in the communities during implementation of program activities. The training will hold for 3 days.

Based on the assessment carried out and uniqueness of each community, IAs will implement activities under the minimum package that better address the needs of their target population in their various communities. As part of HWWN’s effort to implement activities and ensure program sustainability in line with PEPFAR principles, each of these IAs will conduct advocacy visits in their respective communities and engage leaders in community dialogue, and small-group discussions will be organized to engage the target population to assess risk levels and risk factors. This community awareness campaign will be followed by training of peer educators among the target population, the formation of AIDS awareness clubs in schools, and information dissemination activities in communities and churches to equip young people with abstinence skills. It is expected that these peer educators will reach out to their peers to sustain the messages delivered. OVCs between the ages 10 and 18 years under the ACCORD project will be reached and given the opportunity to train as peer educators to reach their counterparts with abstinence information and skills. In COP09, 26 people will be trained as trainers of trainers (TOT); these people will be selected from the IAs and Child Care Forum (CCF) under the ACCORD project. The TOTs will train 240 OVC as peer educators for a total of 266 peer educators trained. In order to serve those who might be sexually active, messages on condoms will be provided to equip them with information and skills to avoid infection with HIV or other STIs and/or unwanted pregnancies. With these 3 approaches (Community Awareness Campaign, School Curricula Based approach and Condom Messaging) HWWN with partners will reach 10,961 individuals (4,748 males and 6,213 females) and 1,312 parents/adults making a total of 12,273 people (5,332 males and 6,941 females) in this reporting year.

To create an environment supportive of the messages and sustenance of positive behavior by young people, advocacy visits will be carried out to parents, principals and other community leaders to give support to peer education clubs formed to sustain the program effort. Parents will be engaged in small group discussions on faithfulness and impediments to conjugal fidelity, and how these affect children’s behavior. Balanced ABC messages will be provided to strengthen faithfulness in marriages and thereby provide an enabling environment for young people to model their protective behaviors. Implementing agencies will apply the MAP methodology to address gender issues that surround domestic violence, masculinity, and coerced sex. 43 MAP workshops will be organized in this reporting year.

16 seminars will be organized to create opportunities for children to express how they feel about their communication with their parents and caregivers. Also, different fora will be organized for games that involve both children and parent/caregivers in a supportive atmosphere to explore improved
Activity Narrative: communications between parents and their children. Improved communication at home will assist adolescents to sustain positive behaviors, thereby preventing new infections among the target audience. Information Education Communication (IEC) materials will be distributed to reinforce messages.

HIV testing will be promoted in schools, churches and during support group sessions for parents and caregivers through voluntary HIV counseling and testing (HCT) campaigns to encourage knowledge of status, abstinence and fidelity. Individuals within the most-at-risk populations (MARPs) will be identified and referred to existing health centers for counseling and testing, and those testing positive will then be referred for treatment and care. International Church of Christ (ICOC), a multiplier organization, will be supported in the establishment of resource centres in Lagos and Ibadan, where youth and adults will be mobilized to utilize the facilities. At the centre, information on HIV and adolescent health will continue to be provided and IEC materials developed and produced under the AB program.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
AB activities provided in Cross River, Delta, Lagos, FCT, Osun and Oyo States will contribute considerably to the overall Emergency Plan prevention targets for Nigeria and to a strengthened populace with behaviors that impact positively on their communities and in a reduction in gender-based violence. Child Care forums (CCFs), Community Development Associations (CDAs), Parent-Teachers Association (PTAs) and other groups will be mobilized to create a more supportive normative environment for the practice of abstinence and fidelity.

LINKS TO OTHER ACTIVITIES
HWNN's AB activities related to HCT will be realized in collaboration with government-owned health centers and other programs that provide HIV testing to complement the effort of campaign. Vulnerable individuals will be referred to these centres for counseling and testing. AB activities will work together with the OVC program to provide curriculum-based abstinence skills to OVC at camps and Kids Clubs, and at the same time empower caregivers with parenting skills to better communicate with their children, especially on sexual and reproductive health issues.

POPULATIONS BEING TARGETED
The primary target audiences under this program are adolescent boys and girls aged 10-18 years, including OVC of that age. Others are adult men and women (parents and caregivers).

KEY LEGISLATIVE ISSUES ADDRESSED
The program addresses stigma and discrimination and gender issues by addressing male norms and behaviors to reduce violence and sexual coercion.

EMPHASIS AREAS
Program activities include a major emphasis on training in which a structured curriculum is used to deliver abstinence and parenting skills to targeted audience by trained staff. These trained individuals will then step down the acquired skills to their peers in their respective communities. The program has a minor emphasis on development of networks, linkages, and referral systems and IEC development.

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

In COP08 AIDSRelief (AR) is providing support to 31 Local Partner Treatment Facilities (LPTFs) and 10 satellite sites. In COP09 Sexual Prevention services will be offered through 34 local partner treatment facilities (LPTF), 19 satellite sites, and 1 community based program in 16 states including Abuja, Adamawa, Anambra, Benue, Ebonyi, Edo, Enugu, FCT, Imo, Kaduna, Kano, Kogi, Nassarawa, Ondo, Plateau, and Taraba. All HIV programs supported by AR promote abstinence until marriage, and mutual fidelity within marriage. AR does not finance, promote or distribute condoms. In line with its HIV Policy, however, AR does provide age-appropriate, complete and accurate information about condoms to its partners as part of its HIV activities. AR will implement its AB programming activities in line with the overall PEPFAR Nigeria goal of providing prevention services to individuals reached through a balanced portfolio of prevention activities. Through the involvement of AR as a partner in this activity, PEPFAR Nigeria will extend its reach with AB services in more states and communities. AR will provide full and accurate information on prevention services. In COP 09, AR will dedicate a staff to focus on sexual prevention activities.

The program will support local partner treatment facility (LPTF) activities targeting HIV+ clients, their families and communities who access care at these points of service. Prevention priorities will include behavior change for risk reduction and risk avoidance and counseling and testing. All AR supported LPTFs will provide education and training to patients and community health volunteers on secondary prevention. This includes encouraging appropriate status disclosure according to OGAC and national guidelines, counseling for zero-discordant couples, risk reduction and adherence to ART, and training for health workers and peer outreach workers. Programs will include reducing societal stigma through appropriate health education at facility and community levels and reducing gender based violence. There will be structured peer education curriculum that includes systematic training, refresher training, and training on essential life skills. In addition, age appropriate abstinence only messaging and secondary abstinence messaging will be conveyed to adolescents, especially orphans and vulnerable children receiving both facility and home based support. AR through this program will cover the communities with AB messages conveyed through multiple media. Through this methodology, a large number of people will be reached with messages via one method or another; however, in line with the National Minimum Prevention Package requirements, the counted group will be those individuals that would have received AB messaging: on a regular basis and via the three strategies AR will employ (community awareness campaigns, peer education models and peer education plus activities). AR anticipates reaching 6,591 people (2,636 male and 3,955 female) directly through community awareness campaigns, peer education models and peer education plus activities; indirect beneficiaries are those who receive messages via other multiple media.

Data from the 2005 ANC Survey and the National HIV/AIDS and Reproductive Health Survey indicate a high level of infection among 15 to 29 year olds together with a low level of risk perception (28%). AR will incorporate messages that address behavior change, reduction of number of sexual partners, trans-generational and transactional sex, sexually transmitted infections (STIs), and drug abuse into its services. The strong community and adherence programs developed by LPTFs in the AR program will continue to serve as the foundation for outreach to communities. In COP09, the program will continue to ensure that all sites provide education to patients and community health volunteers on secondary prevention. Couple centered prevention will also be emphasized. Prevention activities will include distribution of patient education materials, community sensitization, increased couple testing, promotion of LPTF couple support groups, and advocacy for risk reduction strategies for discordant relationships. High risk reduction measures will include treatment of STIs and to a lesser extent interventions on drug abuse. Couples will be treated at LPTFs or other referral centers that offer specialized treatment for STIs, where necessary. AIDSRelief will provide full and accurate information on HIV prevention to all patients, as appropriate. AR sites will integrate prevention with positives (PwP) activities including: adherence counseling; syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and behavioral counseling to achieve risk reduction; counseling and testing of family members and sex partners; counseling for discordant couples; IEC materials on disclosure. These interventions will be implemented using the recently adapted HIV Prevention in Care and Treatment Settings Prevention Package, which includes several training packages and job aids.

Fidelity in relationships will be promoted through information, education and communication (IEC) materials and enlisting the support of religious leaders in community-led peer education plus activities, such as drama groups. A family-centered approach will provide opportunities to maximize prevention messaging to all family members. Linkages with CRS’ OVC program will further promote messages that emphasize abstinence and fidelity and the avoidance of high risk behaviors. AR will explore with its faith-based partners opportunities for extending these messages into faith-based schools and developing peer educators in schools. AR will draw on culturally appropriate prevention messaging material for these activities. AR will enhance capacity development and partnership with the Federal government, State governments, Local governments, CBO, and women’s groups. Special messages targeting the males will be emphasized. AR will implement its AB services while providing full and accurate information on other prevention services in the area.

Training will be an integral part of this program and will be directed at facility staff, community level staff and religious leaders. A total of 180 people (60 facility staff plus 120 community volunteers and religious leaders) will be trained and given skills to be able to promote abstinence and being faithful messages to patients, their families and communities.

Strategic information (SI) is crosscutting in all program areas. AIDSRelief SI activities will incorporate program level reporting to enhance the effectiveness and efficiency of both paper-based and computerized patient monitoring and management (PMM) systems, assure data quality and continuous quality improvement, and promote data use for program decision making across all LPTFs. In COP09, AR will carry out site visits to provide technical assistance that will ensure continued quality data collection, data entry, data validation and analysis, and dissemination of findings across a range of stakeholders. It will provide relevant, LPTF-specific technical assistance to develop specific data quality improvement plans. It will also capture and report on individuals reached with abstinence and be faithful prevention messages using...
Activity Narrative: relevant data collection tools and the PMM system.

Sustainability lies at the heart of the AR program, and is based on durable therapeutic programs and health systems strengthening. AR will focus on the transition of the management of care and treatment activities to indigenous organizations by actively using its extensive linkages with faith based groups and other key stakeholders to develop a transition plan that is appropriate to the Nigerian context. The plan will be designed to ensure the continuous delivery of quality HIV care and treatment, and all activities will continue to be implemented in close collaboration with the Government of Nigeria to ensure coordination, information sharing and long term sustainability. For the transition to be successful, sustainable institutional capacity must be present within the indigenous organizations and LPTFs they support; therefore, AR will strengthen the selected indigenous organizations according to their assessed needs, while continuing to strengthen the health systems of the LPTFs. This capacity strengthening will include human resource support and management, financial management, infrastructure improvement, and strengthening of health management information systems.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
AR Sexual Prevention activities emphasize the integration of prevention activities with treatment and care services. Use of community awareness campaigns, the peer educator model, and peer education plus activities (community drama, dance events, etc.) allows dissemination of Sexual Prevention messaging. This activity contributes to the USG target of preventing 1,145,545 new infections by 2009 through the promotion of AB and A-only messaging in a comprehensive approach.

LINKS TO OTHER ACTIVITIES
Sexual prevention activities will be linked to HCT, basic care and support (through dissemination of information by home based care providers and ultimately by decreasing demand on care services through decreased prevalence), ARV services, ARV drugs, OVC, TB/HIV, laboratory services, and SI activities.

The program will also seek to link up with other CBOs/FBOs that serve the same geographic areas, as well as partners working in other sectors, wherever possible to collaborate on meeting the needs of the community. It also will seek to link the various cadres of government (Federal, State and Local government) and seek effective collaboration with relevant NGOs.

POPULATIONS TARGETED:
Key populations targeted are the healthcare community in treatment facilities, PLWHA, youths and adults accessing HCT services, support group members and family members of PLWHA.

KEY LEGISLATIVE ISSUES ADDRESSED
AB activities promote a rights based approach to prevention with positives and other vulnerable members of society and equal access to information and services. The activities will also address issues of stigma and discrimination through the education of individuals and communities reached.

EMPHASIS AREAS
This activity has an emphasis on training and community mobilization.

As a result of the Nigerian Federal Ministry of Health (FMOH)'s HIV/AIDS Division's (HAD) mandate, which is national in scope, the funded activities will be implemented in a way that covers the entire country in COP09; however, HAD will focus most of the activities on underserved populations in Nigeria. With this funding, HAD will build the capacity of its staff at the National, State and Local Government levels to lead an integrated health sector response. HAD staff capacity will be improved through a comprehensive training in integrated program management that will ensure that sexual prevention program related trainings, supervision, service provision and quality assurance activities are carried out in line with nationally and internationally acceptable standards. Through this grant, HAD will also ensure that the National Prevention Technical Working Group (TWG) meets as scheduled in their operational plan. HAD will also facilitate the distribution and dissemination of the Prevention Standard Operation Procedures (SOP) and Guidelines to ensure they are understood and adhered to by prevention service providers across Nigeria. HAD will also develop a mechanism for feedback on both documents from end users.

Expected outcomes of this technical approach will include: improved capacity through routine site visits by HAD staff at all levels; improved advisory functions by the Prevention Technical Working Group; and adherence to national standards for prevention service provision by all service providers.

HAD will achieve these outcomes through a three-pronged approach of: 1) Training national, state, and local government level staff; enabling and facilitating meetings of the Prevention TWG; and the development of SOPs, guidelines, training curricula, and manuals. Specifically, training of HAD staff at the National, State and Local Government Levels will focus on supervisory and monitoring skills following a gap analysis and development of appropriate training programs. This will be followed by adaptation of existing supervisory and monitoring tools. HAD will enable and facilitate meetings of the Prevention TWG and work in collaboration with the TWG to visit service delivery sites and collate and analyze supervisory reports to serve as a basis for advisory functions of the TWG. The inactive National HIV/AIDS partners’ forum will be reactivated to meet on a biannual basis. HAD will develop SOPs, guidelines, training curriculum and manuals for program areas that currently do not have such manuals. HAD will also disseminate and distribute these materials to end users (service providers) through national and state level workshops. HAD will also ensure that feedback is received from the end-users, articulated and forwarded to the appropriate TWG to enhance their coordination function.

**Human Capacity Development**

Estimated amount of funding that is planned for Human Capacity Development $60,000

**Activity Narrative:**

As a result of the Nigerian Federal Ministry of Health (FMOH)’s HIV/AIDS Division’s (HAD) mandate, which is national in scope, the funded activities will be implemented in a way that covers the entire country in COP09; however, HAD will focus most of the activities on underserved populations in Nigeria. With this funding, HAD will build the capacity of its staff at the National, State and Local Government levels to lead an integrated health sector response. HAD staff capacity will be improved through a comprehensive training in integrated program management that will ensure that sexual prevention program related trainings, supervision, service provision and quality assurance activities are carried out in line with nationally and internationally acceptable standards. Through this grant, HAD will also ensure that the National Prevention Technical Working Group (TWG) meets as scheduled in their operational plan. HAD will also facilitate the distribution and dissemination of the Prevention Standard Operation Procedures (SOP) and Guidelines to ensure they are understood and adhered to by prevention service providers across Nigeria. HAD will also develop a mechanism for feedback on both documents from end users.

Expected outcomes of this technical approach will include: improved capacity through routine site visits by HAD staff at all levels; improved advisory functions by the Prevention Technical Working Group; and adherence to national standards for prevention service provision by all service providers.

HAD will achieve these outcomes through a three-pronged approach of: 1) Training national, state, and local government level staff; enabling and facilitating meetings of the Prevention TWG; and the development of SOPs, guidelines, training curricula, and manuals. Specifically, training of HAD staff at the National, State and Local Government Levels will focus on supervisory and monitoring skills following a gap analysis and development of appropriate training programs. This will be followed by adaptation of existing supervisory and monitoring tools. HAD will enable and facilitate meetings of the Prevention TWG and work in collaboration with the TWG to visit service delivery sites and collate and analyze supervisory reports to serve as a basis for advisory functions of the TWG. The inactive National HIV/AIDS partners’ forum will be reactivated to meet on a biannual basis. HAD will develop SOPs, guidelines, training curriculum and manuals for program areas that currently do not have such manuals. HAD will also disseminate and distribute these materials to end users (service providers) through national and state level workshops. HAD will also ensure that feedback is received from the end-users, articulated and forwarded to the appropriate TWG to enhance their coordination function.

Activity Narrative:  

ACTIVITY DESCRIPTION:
This activity relates to HCT, PMTCT, Basic Care and Support, TB/HIV, and Strategic Information.

IFESH will continue its COP08 Abstinence/Be Faithful (AB) and other sexual prevention programs in COP09. These will be implemented in line with PEPFAR Nigeria guidance for providing a comprehensive package of prevention services to individuals through a balanced portfolio of activities. IFESH’s goal is to contribute to a reduction in HIV prevalence among youth, particularly in the most-at-risk age group of 15-24 year olds, promote mutual fidelity among married adults, and encourage safe sexual practices. The 2005 ANC survey in Nigeria indicates that among age cohorts in Nigeria, the 20-29 year old age group has the highest HIV prevalence. In addition, the 2005 National HIV/AIDS and Reproductive Health Survey (NARHS) demonstrated a low risk perception (28%) among the general population and significant reports of transactional sex (11%) among young women aged 15-29 years.

In COP09, IFESH will continue its implementation of AB programming in underserved areas in Nigeria and will couple these activities with condoms and other prevention programs, as well as linkages to counseling and testing services, where appropriate. This activity will be implemented at the community level and will be reinforced through national level mass media campaigns by other USG partners, such as the successful Zip-Up campaign.

In-school youth will be targeted with AB messaging using the non curricula school-based activities, peer education, and peer education plus strategies. These are derived from the recommended national minimum package for sexual prevention activities. Abstinence clubs will be formed in schools and activities such as film and game shows/quiz contests on AB messaging will be conducted. A total of 30 peer educators selected from four schools will be trained in AB messaging and will work closely with IFESH to improve program quality. For an individual to be counted as having been reached, (s)he must have received all three listed interventions.

Priority populations to be targeted by AB and other prevention messaging, will be out-of-school youth, persons living with HIV/AIDS (PLWHAs), transport workers, orphans and vulnerable children (OVC) receiving home based support, and clients accessing HCT services. These target groups will be reached with a minimum of three strategies selected from the following: community awareness campaigns, HCT outreach, STI counseling or management, condom messaging/distribution, and peer education models. Out-of-school youth will be reached through community outreach and community youth groups. PLWHAs and OVCs will be reached through support groups, and transport workers will be reached at their motor parks through their unions. IFESH will implement this activity at both the facility and community levels with messages conveyed in multiple fora. Each person will be reached with messages in appropriate dose and intensity, delivered on a regular basis to stimulate behavior change.

As a component of community based programming, messages will be communicated through local drama presentations and singers drawn from the community. Information imparted will include the basics of HIV prevention, especially condoms and other prevention (COP) and performers will be encouraged to build prevention themes into their songs to promote sexual partner reduction and consistent condom use. A total of 70 persons, including but not limited to health care workers, peer educators, teachers, religious leaders and community volunteers will be trained in COP messaging. Community outreach will target most-at-risk individuals with the purpose of limiting further infections. Doctors and counselors in STI, ante-natal care (ANC) and postnatal clinics will distribute condoms and conduct prevention-with-positives advocacy messages (i.e., HCT for family members and sex partners, counseling for discordant couples, counseling on healthy lifestyles and positive living, prevention messages, and IEC materials on disclosure). For HIV negative individuals, trained counselors will provide education on HIV/AIDS transmission, risk behaviors, and risk reduction strategies, including condom use.

Condoms will be procured from Society for Family Health (SFH) for all IFESH sites. The provision of condoms will be accompanied by individual and/or group counseling and demonstrations from experienced counselors on their proper use. Information, education and communication (IEC) materials tailored to address the unique risks that individuals from high risk groups face and the correct and consistent use of condoms will also be provided in all sites and all points of service within those sites.

A complete prevention package of materials utilizing both AB and COP programming will be distributed at all HCT sites and at all points of service in health care facilities where IFESH is working. This will include AB IEC materials and condoms. IFESH will target communities where registered clients live for the purpose of community and school based AB messaging in order to continue to reinforce messages provided in the facility setting.

There will be continued evaluation of current sexual prevention activities within communities that will be used to guide specific activities to be conducted under each strategy in the target communities. Gaps in programming identified in COP08 will be addressed within and contribute to a comprehensive and harmonized national program. AB messages will be balanced with concurrent condoms and other prevention messaging where appropriate, and will be integrated with services provided by IFESH in a total of 34 sites (20 HCT sites including facility-based, 10 DOTS sites, and four schools) and surrounding communities in two states (Imo and Rivers). The program will be designed to achieve maximum coverage for these communities with balanced ABC messaging. Individuals will be reached on a regular basis with a minimum of three of the listed prevention strategies IFESH will employ.

The target for this intensive prevention campaign is 2,273 persons (1,200 males and 1,073 females) for AB messaging and 4,242 (2,400 males and 1,842 females) persons for COP messaging. All in all, age appropriate abstinence only messaging and secondary abstinence messaging will be conveyed to 1,000 children and adolescents (600 males and 400 females), particularly focused on in-school youth and OVC receiving home based support. A total of 100 people will be trained in the two program areas.

CONTRIBUTION TO OVERALL PROGRAM AREA:
Activity Narrative: IFESH activities are in line with the PEPFAR vision of enhancing indigenous capacity to provide integrated HIV/AIDS services from the community to the national level, and in the process strengthen the health care system and the capacity of local development partners. These prevention activities are consistent with PEPFAR’s five year goals for Nigeria, which plan to prevent 1,145,545 new infections through a number of prevention strategies including (but not limited to) condoms and other prevention to specific high risk groups.

In order to be maximally effective, the prevention messages developed at different sites will be targeted to the various high risk groups that they serve. These activities are in line with the PEPFAR 5 year strategy, which seeks to scale up prevention services, build capacity for long term prevention programs and target outreach to promote correct and consistent use of condoms with MARPs to reduce the risk of HIV infection.

The continuation of IFESH-supported services in HCT and PMTCT as well as STI management will help facilitate the scale up of the overall program, and increase utilization of these services, expected to result from other prevention and outreach initiatives.

LINKS TO OTHER ACTIVITIES:
This activity relates to HCT, PMTCT, basic care and support, TB/HIV, and strategic information. Prevention for positives counseling, including promotion of condom use will be an important component of post-test counseling in STI clinics. Prevention for positives counseling will be incorporated into counseling for persons receiving antiretroviral (ARV) treatment. This service will also complement HCT services for those who ultimately test HIV-negative. Through this program as well as basic care and support, IFESH will ensure access to STI treatment.

POPULATIONS BEING TARGETED:
This activity focuses on discordant couples, STI patients, TB patients, PMTCT patients, PLWHA, and youth. Training will also be focused on healthcare workers, counselors, and volunteers.

EMPHASIS AREA:
An emphasis area for this activity is human capacity development in order to build the organizational capacity of HCT service outlets to provide a full range of prevention strategies, including correct and consistent use of condoms to persons attending these centers. Other emphasis areas include gender and local organization capacity building.

COVERAGE AREAS:
Rivers and Imo states

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:
In COP09, the Harvard School of Public Health (Harvard) plans to move over four of its PEPFAR supported sites to APIN, Ltd (APIN). The sites include Lagos University Teaching Hospital (LUTH), Nigerian Institute of Medical Research (NIMR), Onikan Women’s Hospital (OWH), and Mushin General Hospital (MGH). The activity narrative reflects the transfer of targets from Harvard to APIN. The activities will build on the structure and systems put in place through Harvard. APIN will maintain a strong collaboration with Harvard University. Since HVAB and HVOP activities are combined, the narratives for the 2 corresponding sections have been merged.

During COP08, APIN assumed management responsibility for 2 sites (Sacred Heart Catholic Hospital in Lantoro, Ogun State and Primary Health Center-Iru on Victoria Island, Lagos) and is adding 4 additional sites (LUTH, NIMR, OWH, and MGH) during COP09. APIN will continue sexual prevention programming activities at all 6 sites in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached, thereby improving the effectiveness of this messaging, through a balanced portfolio of prevention activities, including abstinence and be faithful messaging (AB) along with condoms and other prevention (C&OP; ABC in combination). APIN will assist PEPFAR Nigeria in extending its reach of ABC services through the APIN supported sites. Through its other program areas, APIN has a large population of HIV-positive adults, adolescents and children to which it is already providing services; this group forms part of the core target population for age appropriate ABC messaging that is provided by APIN through its prevention with positives (PwP) activities including sexually-transmitted infection (STI) screening and management/treatment. The goal of the program is to focus on targeted communities and saturate those communities with messages conveyed in multiple large and small number of people will be reached with messages received via one method or another; however, the target group will be those individuals that will have received C&OP messaging: (1) on a regular basis; and, (2) via at least 3 of the 4 strategies employed by APIN.

AB activities conducted at the local level by APIN will be reinforced through national-level mass media campaigns by other USG partners, such as the successful Zip-Up campaign. AB messages promoting abstinence and mutual fidelity, and addressing issues of concurrent and multiple sexual partnerships will be balanced with concurrent condoms and other prevention messaging, where appropriate and will be integrated with treatment and care services in our 6 sites.

A key age group for AB activities is youth/young adults aged 15-24 years as this encompasses the highest prevalence age group. This age cohort, for both men and women, represents the working age group in Nigeria; it is expected that a combination of prevention messaging approaches will ensure they are reached with appropriate interventions.

APIN will collaborate with community-based organizations (CBOs) and PLWHA support groups at its facilities and surrounding communities in other PEPFAR programming activities. These support groups will utilize peer education model and community awareness campaigns to disseminate ABC messaging to other PLWHA and to wider audiences. Support group activities will include the dissemination of prevention information for HIV-infected individuals (funded under basic care and support) as well as community outreach to high-risk populations to encourage HIV counseling and testing (HCT) and healthy behaviors, including recommendations for partner notification and condom use. For HIV-negative individuals, trained counselors will provide education on HIV/AIDS transmission, risks, and risk reduction strategies including HIV testing.

A community awareness strategy will also be employed to serve catchment areas of the hospital facilities, which will be linked with community mobilization efforts promoting HCT. During static and mobile HCT services, counselors will be disseminating balanced ABC messages to recipient communities and clients through focused group discussions and interpersonal communication. Key messages that will be conveyed include: delay in sexual debut, secondary abstinence, mutual fidelity, prompt and complete treatment of all STIs, and promotion of need to ascertain HIV serostatus through HCT.

APIN sites will target most at risk populations (MARPs), including outpatient STI patients, border traders, young male market agents, and motor mechanics. APIN’s HCT site at PHC-Iru on Victoria Island serves the Kuramo area, a community with a large number of MARPs where most residents are sex- and bar-workers, and have HIV prevalence greater than 60%. Prevention activities at these clinics provide condoms and educational materials targeting the risks faced by this population in particular. In addition to comprehensive counseling on HIV prevention and risk reduction, HIV-infected individuals identified through this activity will be referred for palliative care and evaluation for ART eligibility. An emphasis on men with high-risk behaviors through these community-based efforts will also enhance prevention efforts and facilitate access to their partners.

A focus of the program in COP09 will be continued improvement of the integration of prevention activities into the HIV care and treatment settings; specifically, healthcare providers and lay counselors in care and treatment settings will be trained to appropriately deliver integrated ABC prevention messages and incorporate the messages into routine clinic visits using IEC materials and job aids. An appropriate balance of AB will be tailored to the needs and social situation of each individual client in its presentation. In addition to the integration of such services into the HIV-specific treatment setting, prevention activities will be assimilated into other points of service in each health facility (general outpatient clinics, emergency services, etc.), particularly into reproductive health services including family planning counseling, STI...
**Activity Narrative:** Management and counseling, and risk-reduction counseling.

This funding will also be used to support the procurement and distribution of written prevention messages and condoms. The materials will provide patients and clients with HIV prevention information using the "ABC" model, including information about healthy behaviors, safer sexual practices, PMTCT, and condom usage. Prevention messages will also include information about other STIs. Condoms will be offered to all individuals at all sites and will be provided to APIN by the Society for Family Health (SFH).

The target for the AB messaging campaign is 3,645 individuals. In addition, age-appropriate abstinence only messaging and secondary abstinence messaging will be conveyed to children and adolescents, particularly focused on those orphans and vulnerable children receiving both facility- and home-based support. The target for this intensive activity campaign (condom and other prevention) is 7,197 individuals. Additional staffing and training of counselors will also be provided by this funding, including a dedicated full-time staff person. This activity will provide support for training of 112 individuals in AB messaging. An additional 99 individuals will be trained to promote HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful, including condom promotion and STD prevention.

**EMPHASIS AREAS**

ABC programming emphasizes local organization capacity building, human capacity development and efforts to increase gender equity in HIV/AIDS programs. These activities also promote a rights-based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Reduction of stigma and discrimination are also key to the program. Through ABC activities, we place major emphasis on community mobilization and participation, as an element of outreach for prevention efforts. Additionally, we place major emphasis on training as well as infrastructure and human resources in order to build the capacity of counselors and providers in a full range of prevention strategies. We also reinforce that information, education and communication are essential elements of outreach to high-risk populations, and that developing networks for linking these activities to HCT, PMTCT, and other ART activities serves as a source of prevention information.

These activities address gender equity issues by providing equal access to prevention services for men and women. In some cases, our activities seek to target men who may be at high risk for HIV in order to promote condom use as a means of prevention and access to services for their sexual partners. Male-targeted counseling seeks to address male norms and behaviors in order to encourage safer sexual practices. Strong prevention programs that accommodate the array of societal and cultural norms can also help reduce stigma and discrimination. The provision of such services at the community level will serve as an important platform from which general HIV/AIDS information can be provided and risk reduction strategies discussed.

**POPULATIONS TARGETED:**

Key populations targeted are the healthcare community in treatment facilities, PLWHA, youths and adults accessing HCT services at either static or mobile within catchment areas of the treatment sites, high-risk populations, support group members and immediate families of PLWHA. Other target populations include discordant couples, pregnant women and religious leaders. Targeting these populations is important to encourage safe sexual practices, HCT and other prevention measures. Health care workers will also be targeted for training on the most effective prevention measures for various risk groups.

**CONTRIBUTION TO OVERALL PROGRAM AREA**

These prevention activities are consistent with PEPFAR's goals for Nigeria, which aim to support a number of prevention strategies as a comprehensive prevention package. In order to be maximally effective, the prevention messages developed at different sites will be tightly targeted to various high-risk groups that they serve. Furthermore, these activities are consistent with the PEPFAR 5-year strategy, which seeks to scale-up prevention services, build capacity for long-term prevention programs, and encourage testing and targeted outreach to high-risk populations. The establishment of networks and referral systems from prevention efforts at the community level to PMTCT and HIV care and treatment will help facilitate the scale-up of the overall program. Additionally, the long term sustainability of the prevention portfolio is more assured as APIN, a Nigerian organization, assumes management responsibility for more sites previously managed by Harvard.

**LINKS TO OTHER ACTIVITIES:**

ABC activities relate to HCT, by increasing awareness of HIV. They also relate to adult and pediatric care and support activities through dissemination of information by home-based care providers and ultimately by decreasing demand on care services through decreased prevalence. Linkages also exist to OVC programming by targeting OVC. The provision of such services at the community level will serve as an important platform from which general HIV/AIDS information can be provided and risk reduction strategies discussed. This program area also links to Strategic Information (SI) as all progress will be monitored by the SI programming and to Gender as specific programs will be targeted to be gender-appropriate.

- **Program Area:** Sexual Prevention: AB
- **Program Budget Code:** 02
- **Planned Funds:** $50,000
**Activity Narrative:**

**ACTIVITY DESCRIPTION**

In COP 08, Abstinence & Be Faithful (AB) services were provided to 2,000 individuals in 25 service outlets in Lagos Rivers and Bayelsa states. Sixty (60) people were trained, including teachers, religious leaders, students, and other peer educators. Condoms and other prevention services were provided at 23 sites, 4,286 most at risk persons (MARPs) were reached, and 100 peer educators were trained on the use of advocacy tool kits.

In COP 09, Africare will be consolidating the implementation of its sexual transmission prevention programming activities in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached, and improving the effectiveness of the prevention messages, through a balanced portfolio of prevention activities including messages on abstinence and being faithful, distribution of condoms and support for other forms of prevention. The program aims to: promote abstinence, fidelity and related community and social norms; implement the minimum prevention package of services within the targeted populations; develop a comprehensive prevention package of services for persons engaged in high-risk behaviors; and integrate these services into care and treatment settings and other health related settings.

AB messages will continue to promote abstinence, including delay of sexual debut or secondary abstinence, and fidelity (including partner reduction and mutual fidelity), while addressing related social and community norms. The target population for AB programming will be: TB DOTS patients, uniformed service personnel, incarcerated persons, transport workers, and in-school and out-of-school youth. Four strategically chosen sites will be added to the existing 25 service outlets, which will result in a total of 29 outlets for AB services in COP 09. In addition, age/culturally appropriate abstinence only messages and secondary abstinence messages will be conveyed to 500 children and young adults, particularly focused on in-school youths and orphans/vulnerable children receiving home based support, and through peer education in schools. These services will be integrated with the HCT and OVC programs as well as the palliative care and TB/HIV programs, and appropriate messages will be given in support group settings as part of prevention for positives activities. Out of school youth will be targeted to receive AB messages at vocational training centers. The program will contribute to the reduction of new infections by reaching 2,273 individuals (1,000 male and 1,273 female) with intensive AB services. 1,137 of these will be reached with abstinence messages alone. Where appropriate, AB programs will be implemented alongside C&OP services at Africare-supported facilities and communities.

Twelve persons will be trained in AB messages and programming. This number includes teachers, religious leaders, students, and peer educators. Those who were trained in the preceding year will be given refresher training. All trained individuals will receive training materials and job aids as reference materials. The capacity building of health teachers, religious leaders, students, and peer educators will ensure sustainability and ongoing community activities.

A comprehensive prevention package that will include IEC materials for both AB and C&OP programs and condoms will be distributed to all HCT sites and at all points of service in supported health facilities. Africare will continue to target communities where registered clients live in order to reinforce messages provided in the facility setting. As a component of the community based and school based programs, AB messages will be integrated into games and sports activities. Activities highlighting role models, drama presentations and film shows will be organized for in- and out-of-school youth. The peer education model will be used to organize formal peer groups that will then actively develop AB messaging campaigns for their peers through the formation of school Anti-AIDS clubs and HIV/AIDS Committees.

C&OP activities will be implemented at facility and community levels utilizing a combination of strategies aimed at saturating focus communities with messages conveyed in multiple fora. Condoms and other prevention (C&OP) programs will be provided at 30 outlets (16 health facilities, 5 stand alone HCT sites, 5 workplaces, and 4 brothels). An anticipated 4,242 individuals will be reached with C&OP programs that promote correct and consistent condom use, referral to HIV Counseling & Testing (HCT) sites, referral into STI management, and messages aimed at reducing other risks of persons engaged in high-risk behaviors. C&OP programming will focus on at-risk (out of school) youth, long distance drivers and other mobile populations, targeted alcohol users, women engaged in prostitution and transactional sex relationships (both brothel-based and non-brothel-based), incarcerated populations, PLWHAs, and members of the uniformed services. It is expected that a combination of sexual prevention message approaches will ensure clients are effectively reached with prevention interventions. In line with the National guidelines for a minimum prevention package, individuals will be reached with a minimum of three interventions that will include community awareness campaigns, peer education models and school or work based activities, as appropriate.

Bridge populations, including students in institutions of higher learning who are involved in transactional sex or high end commercial sex work, will be targeted for sexual prevention activities through campus based outreach programs aimed at providing education, condoms and peer support.

Africare will follow existing methodology for measuring achievements in AB programming, through program officers dedicated to providing oversight and guidance on prevention activities under AB and C&OP programs. Members of the National Youth Services Corps (NYSC) will be actively recruited as peer education trainers and supported in collaboration with the states and UNICEF to work alongside program officers.

Trained health care workers, counselors and peer educators will provide the comprehensive Prevention with Positives (PwP) package, including counseling on partner disclosure, family planning and STI management, partner testing, risk reduction and adherence counseling, and correct consistent condom use to infected individuals. Africare will participate in the development of the National prevention with positives training manual and its implementation across the sites. Prevention for positives packages for those living positively with HIV will be included in care services and will involve activities such as HCT for family members and sex partners, counseling for discordant couples, counseling on healthy lifestyles and positive living, prevention
Activity Narrative: messages and IEC materials on disclosure.

For HIV negative individuals, education on HIV/AIDS transmission, risks, and risk reduction strategies including correct and consistent condom use will be provided.

C&OP activities will include condom distribution, education on correct and consistent use of condoms, and referral/provision of STI diagnosis and syndromic management of STIs. As a component of the community outreach strategy, Africare will support drama presentations, film shows and conduct road shows on a regular basis in the targeted communities. This strategy will be closely linked to the peer education model strategy as community groups will be organized and will help guide the development of community events. Peer educators will also work one-on-one with community members to provide education on condom use and to distribute condoms. Africare will discuss avenues of addressing sexual activities in the prisons with the authorities.

Africare’s C&OP workplace strategy will focus on the formal work sector and brothel-based commercial sex workers as well non-brothel settings like beer parlours and night clubs where transactional sex may occur under the influence of alcohol. Free condoms will be given at these locations. Using a peer education approach, Africare will select peer facilitators from these locations and train them to provide HIV prevention messages to their peers and patrons on a routine basis. The key messages will include correct and consistent condom use in all sex acts, prompt and complete treatment of STIs and testing for HIV. Advocacy with brothel, beer parlour and night clubs owners will be carried out to support the female sex workers in enforcing a 100% condom use policy in their establishments and to encourage patrons on condoms use. Workplace strategies focused on the organized sector will also include training of peer educators to promote condom use. In addition, Africare will work with the management of the organizations to identify strategic centralized mechanisms to reach their employees with COP messages and condom distribution.

Africare will train 37 new peer educators made up of community group members, health care workers, counselors and volunteers in appropriate provision of condom and other prevention services. Peer educators will be trained on the use of advocacy tool kits including IEC materials, condoms and job aids. They will also be taught participatory monitoring and evaluation to enable them to monitor their progress against project objectives. Health care workers, counselors and home based care volunteers will be trained on condom use and syndromic STI diagnosis and treatment.

Condoms will be procured from Society for Family Health (SFH) for all Africare sites. Condom provision will be accompanied by individual and/or group counseling and demonstrations on proper use. Culturally appropriate IEC materials tailored to address the unique risks that individuals from high risk groups face and the correct and consistent use of condoms will also be provided through the community groups, peer groups, and in all Africare-supported health facilities.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
This activity area will contribute to the overall PEPFAR goals of preventing further new infections and reducing HIV incidence and prevalence rates in Nigeria. It will also help to lay the foundation for more sustainable HIV intervention programs in Nigeria through a focus on community based responses.

LINKS TO OTHER ACTIVITIES
This activity will be integrated with counseling and testing, basic care and support, TB/HIV, OVC, PMTCT, and strategic information. Prevention for positives counseling to include condom use will be an important component of post-test counseling in the STI clinics and in follow up care and support activities. This service will also complement HCT services for those who ultimately test HIV negative. Through this program as well as basic care and support, Africare will ensure access to STI treatment.

POPULATIONS BEING TARGETED
The focus population for this activity will be youth (in/out of school), HCT clients, TB DOTS patients, the uniformed service personnel, incarcerated persons, and transport workers, commercial sex workers. It will also target community leaders, brothel and night club owners and management of corporate organizations.

KEY LEGISLATIVE ISSUES ADDRESSED
Project activities will increase gender equity in young adults. Male involvement would be specifically addressed through the Union of transport workers and the Market men/Butchers associations who would receive intensive advocacy and campaigning in sexual prevention through HCT-linked outreach activities. High risk urban dwelling male youth will be reached through continuing advocacy and sensitization at stadium and sports arena outreach activities on weekends when they gather for scheduled sports activities. The program will reach out to religious organizations and leaders to provide culturally and religiously appropriate sexual prevention messages and emphasize the need to reduce the instance of cross generational sex.

EMPHASIS AREAS
This activity includes major emphasis on information, education, and communication with minor emphasis on community mobilization and training.

COVERAGE AREAS
Sites are located in states chosen based upon high prevalence in the most recent 2005 HIV sero-survey and geo-political distribution. These states include Rivers and Bayelsa (South-South zone) and Lagos (South West zone).

- **Mechanism:** USAID Track 2.0 FS C-Change
- **USG Agency:** U.S. Agency for International Development
- **Program Area:** Sexual Prevention: AB
- **Program Budget Code:** 02
- **Planned Funds:** $337,500
Activity Narrative: In COP 09, the C-Change program (previously known as PHDC) will fill identified gaps in the mass media approach to prevention of sexual transmission of HIV in Nigeria, build capacity of USG Implementing Partners to implement BCC program strategies targeted at abstinence, being faithful, and condoms and other prevention (ABC) services and increase the reach of the prevention program while ensuring that BCC strategies are informed by available epidemiologically relevant and target specific data.

C-Change will conduct a strategic assessment of the current communication programming situation in country and a needs assessment that will include a review of BCC materials. C-Change will build capacity of individual USG prevention partners to appropriately design and implement their own outreach activities and to produce information, education, and communication (IEC) materials in support of their prevention objectives using effective messaging and BCC strategies. Assisted implementing partners (IPs) will develop and implement behavior change interventions to address appropriate ABC messages to the youth of Nigeria. Messages will focus on abstinence, delay of sexual debut, and secondary abstinence. Messaging will be age specific and culturally appropriate and will target in- and out-of-school youth under the age of 15. C-Change will train 180 individuals from IP project sites in peer education skills. Trained peer educators will be provided with assistance in coordinating peer education clubs in schools and communities. Activities of the peer education clubs will increase knowledge and build capacity of other club members. Trained peer educators will also focus on strengthening the capacity of the peer education clubs to develop guidelines for operation and detailed responsibilities of members. Peer educators will target most-at-risk populations (MARP), including persons living with HIV/AIDS (PLWHAs), in- and out-of-school youth, as well as couples.

The 180 core ABC peer educators will reach out to an additional 32,840 youth through peer education activities. Peer educators will use materials and strategies developed by C-Change in collaboration with USG IPs to reinforce behavioral change and risk reduction messages. C-Change will assist IPs to reinforce messages at the community level through the use of electronic media and various innovative communication channels, appropriate to the community, such as drama and local folkloric genres. The sexual prevention program will also be strengthened through the initiation of a national level behavioral change communication (BCC) strategy and through enhanced behavior change via mass media activities that reinforce other USG-funded interpersonal communications and community-based outreach activities.

C-Change will build capacity of IPs to implement BCC programs using strategies that respect and respond to local customs, and social and community norms. Programming is expected to: support delay of sexual debut; develop skills in unmarried individuals for practicing abstinence and negotiation for safe sex while transiting from abstinence; address coerced sexual activity and transactional sex; emphasize the importance of faithfulness in reducing the transmission of HIV; support partner reduction; and develop skills for sustaining marital fidelity. This will entail development of the 'Be faithful' messaging component of sexual prevention activities of IPs to target couples using mass media, print, and religious and community gatherings, including counseling service provision. C-Change will train 120 individuals from IP project sites who will reach out to 21,894 individuals with developed messages and materials (including audio visual aids) targeted at fidelity, partner reduction and messages that focus on HIV counseling and testing to reduce incidence of HIV and AIDS. C-Change will assist IPs in targeting community and traditional leaders and organizations by focusing on messages to be promoted during planned advocacy visits and community intervention programs. C-Change will work with IPs to develop thematic messages that are culturally appropriate and acceptable as well as explore activities that are favorable for the faith based settings. Messages will also promote linkages to other program areas, including counseling and testing, STI treatment and other facility based services.

C-Change will assist IPs to address the mobilization of communities to address norms and behaviors on cross generational and transactional sex, promote increased male involvement in prevention activities and improved health seeking behaviors. Also addressed in the intervention will be: issues of stigma and discrimination; promoting behavioral change among non-renumerated blood donations; and promoting injection safety. C-Change will adhere to recommendations made in the National Prevention Plan and National Behavior Change Communication Strategy and utilize a balanced AB+C approach in its interventions. C-Change will collaborate with the National Agency for the Control of AIDS (NACA) and national media to ensure sustainability and support of NACA BCC efforts. C-Change will also provide technical assistance to the BCC committee of the National Prevention Technical Working Group and support BCC activities in the wider public health (FMoH) programming.

C-Change will ensure data quality and continuous quality improvement of activities by encouraging IPs to develop effective peer education activity monitoring forms and build capacity in monitoring and evaluation of communication programs through periodic monitoring and supportive supervision site visits to verify planned implementation as well as to provide technical assistance that will ensure continued quality data collection

CONTRIBUTIONS TO OVERALL PROGRAM AREA
C-Change’s contribution to the overall sexual prevention activities will be by building technical capacities of implementing partners to review and develop strategies for working with different target audiences including MARPs and other segments of the general population, resulting in more sustainable prevention programming.

LINKS TO OTHER ACTIVITIES
These activities will be linked to community program development, HCT, Gender, HCT, PMTCT, Blood Safety, Injection Safety, TB HIV, treatment, care and SI.

POPULATIONS BEING TARGETED
Targeted populations for this activity include: staff of implementing agencies, MARPs, young people, couples, religious organizations and media organizations.

KEY LEGISLATIVE ISSUES ADDRESSED
The activity will help address male norms and behaviors, and community norms and values while
Activity Narrative: emphasizing benefits of reducing violence and coercion through messaging delivered through such activities as couple counseling and testing.

EMPHASIS AREAS
This activity will emphasize Behavior Change Communication with a focus on strategy and message development directed at sexual prevention.

Mechanism ID: 7405.09
Prime Partner: John Snow, Inc.
Funding Source: GHCS (State)
Budget Code: HVAB
Activity ID: 16991.24924.09
Activity System ID: 24924

Mechanism: USAID Track 2.0 FS AIDSTAR
USG Agency: U.S. Agency for International Development
Program Area: Sexual Prevention: AB
Program Budget Code: 02
Planned Funds: $2,145,000
Activity Narrative: ACTIVITY DESCRIPTION:
AIDSTAR will be required to identify and build planning and managerial capacity of local partners as well as strengthen local technical capacity to deliver high-quality comprehensive AB prevention programs and services aimed at promoting partner reduction and preventing transactional sex.

Specific activities will entail the identification and building the capacity of indigenous faith-based and community-based organizations (FBOs and CBOs) to provide high quality prevention programming that will bring about effective behavior change as it relates to reduction of multiple sexual partners and transactional sex. In addition, AIDSTAR will undertake community based activities to facilitate normative changes that enhance the practice of abstinence and mutual fidelity. These activities will address adults, and men in particular, with messages that promote fidelity, discourage male norms that encourage risky behaviors, encourage partner reduction through risk reduction messages and personal risk perceptions skills. Activities will also focus on unmarried young men and women across the board who are at high risk owing to contextual factors (domestic workers, street vendors, etc.). Messages will be tailored to each target group. Activities to prevent transactional sex and or protect youth involved in transactional sexual relationships will focus on skills based HIV education for vulnerable young women and young men with broad based community activities that create supportive normative environment for the practice of abstinence and fidelity. Influencers of young people, including parents, teachers, religious leaders and community leaders will also be reached. These interventions will be reinforced with mass media activities that highlight the importance of mutual fidelity, risk behavior reduction and avoidance of transactional sex. AIDSTAR will concentrate activities in areas that will be identified through secondary analysis of national behavioral data generated through the Project SEARCH data triangulation exercise and the NARHS* survey.

AIDSTAR will utilize a minimum package of interventions identified from a pool of best practices in the national prevention plan to provide high quality prevention interventions for the population group identified. These interventions include: peer education interventions, peer education plus models, workplace programs, community awareness campaigns, school based program approaches, intervention programs to address issues of vulnerability, provision of STI management, and infection control measures in clinical settings. The national prevention plan 2007-2009 recommends that a minimum of three of these interventions be used to reach each target while mass media activities will serve as reinforcement. The AIDSTAR prevention program will build capacity of community-based, faith-based, and other non-governmental organizations (CBOs, FBOs and NGOs) to provide this minimum package intervention for the specific population groups. Technically this will entail familiarizing the organizations with the minimum package modules and adopting a program approach that ensures delivery of the package.

AIDSTAR will reach 97,500 individuals utilizing minimum package interventions that promote abstinence and/or being faithful (AB) with 32,500 individuals reached through interventions that promotes abstinence only (a subset of total reached with AB). 500 individuals will be trained to promote HIV/AIDS prevention programs and 25 organizations will receive capacity building toward high quality prevention programs for identified high risk population.

AIDSTAR will document and disseminate best practices; successful and innovative approaches with lessons learned and share these with their implementing agencies as well as other partners within the PEPFAR program in Nigeria. In COP 09, a particular focus will be on lessons learned on effective approaches for improving linkages between clinical services and community based services to provide basis for strengthening the prevention with positives programs and other specific interest high risk groups programs.

Implementation will be through NGOs, CBOs and FBOs whose capacity has been built by AIDSTAR and who have the capacity for rapid scale up. Within the initial 6 months of implementation, capacity-building for provision of prevention (AB) services for identified FBOs and CBOs will be carried out, followed by development of materials on prevention of cross generational and transactional sex. AIDSTAR interventions will be in line with national priority plan and national prevention plan.

Geographic location will be negotiated with the GON with South-South, South-East and North-Central states considered as prime regions for selection, considering gaps in the PEPFAR response and based on the location of identified high risk groups from review of behavioral surveillance data of prevalence among these groups.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
The programs and activities implemented will increase the reach of AB interventions into epidemiologically important populations to better address gaps in coverage and to better address specific behaviors within underserved populations. This AIDSTAR prevention program, delivered through implementing agencies, will contribute to strengthening and expanding the capacity of the Nigerian response to the HIV/AIDS epidemic and increasing the prospects of meeting the Emergency Plan’s goal of preventing 1,145,545 new infections.

LINKS TO OTHER ACTIVITIES
This activity also links with OVC and SI activities (i.e., the Project SEARCH activity for data informed program design).

POPULATIONS BEING TARGETED:
Populations targeted in these AB activities will include younger unmarried men and women and their corresponding figures-of-influence (parents, teachers and religious leaders) and adult males to better address issues around cross-generational and transactional sex.

KEY LEGISLATIVE ISSUES ADDRESSED:
Key legislative issues will address male norms and behaviors, and increased equity and access to information and services for women.

EMPHASIS AREAS:

"Visit the [link](https://www.aidstar.org) for more detailed information on AIDSTAR's activities and contributions."
**Activity Narrative:** The service delivery component will focus on information, education, and communication in the community and will build linkages with other sectors and initiatives.

Activity Narrative: THIS IS A CONTINUATION OF COP08

The COP08 intervention strategy delivered an intensive set of abstinence/be faithful (AB) interventions to a highly targeted group of beneficiaries (i.e., adolescent girls and their male partners), promoted protective male norms and behaviors, and linked communities and service delivery points through direct referral. The AB package consists of community awareness campaigns, peer education, social support activities, curricula- and non-curricula-based programs, and mass media activities. Community awareness campaigns are realized through small group discussions, interpersonal communications, and community dialogues. Trained community advocates reach target groups through their gatekeepers in different places in the communities to provide HIV prevention messages. Peer education is accomplished through the safe spaces youth clubs (SSYC) model consisting of a series of 14 modules led by trained peer mentors and reinforced by social peers of lay religious leaders supporting abstinence and delay in marriage. Social support activities include life skills training, savings mobilization, and income generation. Curricula- and non-curricula-based approaches incorporate secular topics of HIV/AIDS prevention, reproductive health, hygiene, and life-skills in Islamiya school curricula and after-school activities. Mass media activities use radio spots/jingles and phone-in radio discussion slots to stimulate public dialogue and debate on early marriage, vulnerability of young girls, protective practices of men, and risk reduction through AB.

This intervention is being carried out through 4 local partners (Adolescent Health and Information Projects [AHIP], Federation of Muslim Women Association of Nigeria [FOMWAN], Islamic Education Trust [IET] and African Health Project [AfrHP]) in Adamawa, Bauchi, Benue, Borno, FCT, Kano, Nassarawa and Niger States. Faith-based organizations (AHIP, FOMWAN and IET) reach target groups and members of the communities with AB messages while AfrHP is involved in condom messaging and other prevention activities.

In COP09, activities will include the above strategies to reach the target groups (young women 10-24 years), their gatekeepers (their husbands and parents) and stakeholders (community and religious leaders and women leaders) with AB messages, such that three messages overlap to reach targeted beneficiaries.

The peer health methodology that was introduced in COP07 as Safe Space Youth Clubs (SSYCs) with an initial 24 clubs and expanded to 124 clubs in COP08 will be maintained and further expanded to 150 clubs in COP09. The curriculum of the clubs takes 6 months to complete, and the best of the graduating young women will have acquired knowledge and skills to become mentors of succeeding new clubs. The activities of these clubs will reach young women 10-24 years old who are in-school or out-of-school, single, married, divorced, widowed or separated and who in most cases have few economic opportunities, life-skills, or knowledge of reproductive health, HIV/AIDS, and STI issues. The contents of the SSYCs curriculum include strong HIV prevention messages (AB), condom messages, pre-marital counseling, leadership, skills development, and financial literacy that will equip the young women with income generating skills and savings mobilization. Concurrently, members of the clubs will be reached with HIV counseling, interpersonal communications, and condom messages among other messages.

The second strategy by which the target groups will be reached with HIV prevention messages involves community awareness campaigns through small group discussions, interpersonal communications and community dialogues. Youth who are out-of-school, married, divorced, or separated and those who are not members of SSYCs will be reached through HIV prevention messages by community advocates (5 in each state; 60 in the network) who were not selected as mentors in each of the project states.

In the project states, target groups also participate actively in Islamiya schools that operate in the evenings as well as in after-school activities. The community advocates are teachers in these schools. Target groups will be reached with HIV/AIDS prevention, reproductive health, and hygiene messages. This will form a forum where members of the SSYCs will network with those who are not members of the clubs and consequently share their experiences and knowledge of the HIV prevention.

This strategy involves reaching target groups with prevention messages that include social support, life skills training, saving mobilization and income generation. Members of SSYCs will be given training on “Financial Literacy” – an Islamic method of teaching the young methods of business acumen and knowledge of meeting their needs and generating income. When members graduate with the necessary skills they will be able to form smaller clubs that will be independent and sustainable.

It is intended that a member of the club will be able to share accurate knowledge of HIV prevention with at least 3 of her peers in schools, within the family and in their communities such that the activities of these clubs will be able to reach 23,386 beneficiaries (5,386 males and 18,000 females) with an intensive AB package and 2,400 ‘A-only’ messages (600 males and 1,800 females).

The training of local organizations personnel will take place at two levels. Population Council will set up a training coordinating unit in the program support department of its office to carry out training of trainers. This will facilitate the training of the project officers, community advocates and mentors in the necessary skills which enable them to handle step-down training at the community level. The mentors will be equipped with the right skills to lead members of the girls’ clubs in HIV prevention messages, leadership and skills development. Through this training, local partners will acquire skills and competency that will enable them to be able to seek funding independently from USG and other sources, as well as to serve as a profit center for HIV/AIDS prevention activities. 400 individuals will be trained to promote HIV/AIDS prevention through AB messaging.

Population Councils Condoms and Other Prevention activity will contribute to the Emergency Plan Five-Year Strategy in preventing new HIV infections among vulnerable youth, especially male counterparts of the target groups of the project (young women aged 10-24 years). These males include in-school, out-of-school, husbands of young women, and those engaged to be married and who are most at risk and/or underserved, by promoting the delay of sexual initiation and abstinence to reduce HIV prevalence or avert infection.
Activity Narrative: In COP08, community advocates have been sensitized on condom messages and use, and referral points have been identified for condom distribution in the eight project states. Youth clubs have also been established. In COP09, the following strategies will be adopted in the implementation of C&OP activities:

1) Community outreach focusing on HIV counseling, training on the use of condoms and condom messaging and distribution
2) Peer health education among males of different age groups in the communities
3) Specific population awareness campaigns directed to males in communities
4) Provision of STI management and training on STI syndromic management

Twenty community advocates will be trained to promote HIV/AIDS prevention through C&OP messaging and will be trained on HIV counseling to facilitate referral of male contacts to designated referral points in the different communities. In COP07 and COP08 an average of 8 referral points were identified in each of the project states by the focal officers and community advocates who have been working with the local partner (AfHP). The COP09 activity will be a continuation of the COP08 community mobilization. In all the communities where Population Council targets young women 10-24 years of age, there are males of the same category who are spouses or close associates of these women and the older men who have relationship with the girls. The trained community advocates will be meeting these young men with HIV prevention (AB) and correct condom use messages, thus providing balanced ABC messages.

There will also be a step-down training for males in mosques and churches by the trained community advocates and the trained males will reach their peers in mosques after the Friday prayers. Muslim marriages and special occasions (usually religious occasions) will provide forums for ABC messages among males of the same peer group. The behavior change communications component of the project will develop information, education and communication materials that will facilitate the community mobilization on condom and other prevention among the males at the community level.

The third strategy targets specific population awareness campaigns at the various locations of the project states. African Health Project will sensitize the referral points and other locations that are close to where these men live and will form the initial opening of public private sector condom outlets. A total of 400,000 condoms have been requested from USAID/PEPFAR for distribution in the project locations (64 condom service outlets). The community and religious leaders will be reached with other prevention messages through this strategy. Community advocates will be trained to organize community meetings in strategic locations of each state in the form of “days of dialogues,” which was used in COP06 and COP07 to reach these leaders. Consequently, a community environment conducive to open discussions on sexuality and HIV prevention will be provided.

AfHP will collaborate with AHIP and other clinics in the project states to train clinic personnel in each of the 8 project states on syndromic management of STIs such that the services of comprehensive treatment of STIs will reach many contacts in the states. This will facilitate the existence of a friendly clinic in each of the 8 states where correct education on the use of condom could be given to referred contacts. Activities at the clinics will include STI counseling for affected individuals. This is another strategy to reach contacts with condom and other prevention messages.

Through the above strategies, the number of individuals to be reached through community outreach that promotes HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful will be 15,591 (12,000 males and 3,591 females). The strategies will ensure that at least three messages overlap on the males to be counted in the communities.

Target Populations
In COP07 and COP08, the activities addressed HIV risks for men both as gatekeepers to reach young girls with information and resources to prevent HIV, but also as MARPs who place married young girls at risk for HIV. In COP09, condom and other prevention activities will target males around the communities of the target groups. These are men who are spouses, friends, neighbours and fiancés of the target groups and they greatly influence the initiation of sexual intercourse among the young women. These males are both in-school and out-of-school and some are older men who pose the risk of multiple sex partners to the young women. In most of the project states, there is a culture of male suitors meeting with their prospective future brides in specific locations in the communities, mostly in the evenings. The activity will explore this practice to reach these males with HIV prevention messages by using the SSYCs members to train the girls in attendance who can consequently reaching the males. The activity will also reach out to community and religious leaders who will facilitate advocacy at the community level and this will go a long way toward reducing socio-cultural barriers to the interventions. Public dialogues and IEC materials will address behavior change beyond abstinence and/or being faithful, including targeting those behaviors that increase risk for HIV transmission, such as engaging in casual sexual encounters, engaging in sex in exchange for money or favors, or having sex with an HIV-positive partner.

This activity will contribute to the Emergency Plan Five-Year Strategy in preventing new HIV infections among vulnerable youth—especially unmarried adolescent girls and those engaged to be married—who are most at risk and underserved by promoting the delay of sexual initiation and abstinence to reduce HIV prevalence or avert infection.

Links to Other Activities
This project increases demand and creates linkages for ART, HCT, and PMTCT services by partner IPs through education, promotion and referral by community advocates.

Program Evaluation
In order to assess the level of achievement of objectives of the project and to collect relevant information on lessons learned that will facilitate further studies and interventions in the project region an endline evaluation will be conducted in COP09. The planning, fieldwork and the data analysis as well as report...
Activity Narrative: generation and dissemination will be carried out in the last half of the COP year.

| Activity ID: | 15656.25281.09 | Planned Funds: | $50,000 |
Activity System ID: 25281
Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

Activity Description
ECEWS is a continuing partner in the program area of Sexual Prevention in COP09. In COP 08 ECEWS provided sexual prevention services to individuals, including MARPs in 35 sites (14 facility-based and 21 community sites) in Akwa Ibom and Cross River states. In COP 09, ECEWS will expand its services to Abia State. ECEWS will implement its sexual prevention activities in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached (thereby improving the effectiveness of the prevention messaging) through a balanced portfolio of prevention activities in Abstinence, Be faithful (AB) and Condoms and Other Prevention (C&OP). Through the involvement of ECEWS as a partner in this activity, PEPFAR Nigeria will further its development of an integrated comprehensive prevention portfolio. In COP09 ECEWS will continue to provide community outreach to individuals identified as high risk for HIV and direct them to counseling and testing while promoting prevention through activities other than abstinence and be faithful messages. This activity will focus on condom use promotion among most at risk populations and referral to ECEWS supported and/or other local PEPFAR-supported HCT sites. Condoms and other prevention materials will be provided in 25 sites (7 sites developed under COP07 and 18 sites developed under COP08) targeting 7,576 most at risk persons (MARPs) which include STI patients, PLWHA, incarcerated populations, youth, police, customs workers, immigration workers and commercial sex workers in Akwa Ibom and Cross River states.

ECEWS' goal for its new activities in the AB program is to contribute to a reduction in HIV prevalence among youths, particularly in the at-risk age group of 15-24 year olds, and to promote mutual fidelity among married adults. The 2005 ANC survey in Nigeria reported that among age cohorts in Nigeria, the 20-29 year old age group has the highest HIV prevalence. In addition, the 2005 National HIV/AIDS and Reproductive Health Survey (NARHS) demonstrated that 69% of the general population perceive themselves to be at no risk, while an additional 28% perceive themselves to be at low risk of contracting HIV. The survey also demonstrated significant reports of transactional sex (11%) among young women aged 15-29 years. It is expected that a combination of prevention messaging approaches will ensure they are effectively reached with prevention interventions. This activity will be implemented at the community level and will be reinforced through national level mass media campaigns by other USG partners such as the successful Zip-Up campaign of Society for Family Health (SFH).

ECEWS will implement AB programming in underserved areas in Nigeria and will couple these activities with condoms and other prevention program services and with counseling and testing program services. The implementation of the AB activities will utilize a combination of multiple strategies, including community awareness campaigns, peer education models, peer education plus activities, and a school-based approach in line with the National minimum prevention package requirement. The target group will be those individuals who will have received AB messaging: (1) on a regular basis and (2) via at least three of the four strategies ECEWS will employ (community awareness campaigns, peer education models, peer education plus activities, and school based activities). The police and other uniformed service men, incarcerated persons, and in-school and out-of-school youth will be reached with AB messages. The target for this intensive AB messaging campaign is 2,273 individuals. In addition, age appropriate abstinence only messaging and secondary abstinence messaging will be conveyed to 1,000 children and adolescents, particularly focused on in-school youth as well as orphans and vulnerable children (OVC) receiving home based support. ECEWS will implement C&OP activities at both facility and community levels utilizing a combination of multiple strategies, including community outreach campaigns, specific population awareness, peer education models, work place program and STI management in line with the National minimum prevention package requirement. The goal of the program is to focus on the communities targeted and saturate them with messages conveyed in multiple fora. Utilizing such a methodological, a large number of individuals will be reached with messages received via one method or another, but the target group will be those individuals that will have received condom/other prevention messaging: (1) on a regular basis and (2) via all three of the strategies ECEWS will employ (community awareness campaigns, peer education models, and STI management/treatment). The target for this intensive C&OP activity campaign is 7,576 individuals. These will comprise 1,000 commercial sex workers, clients in STI clinics, uniformed personnel and out of school youth. In addition, ECEWS will support its partners to integrate Prevention with Positives (PwP) activities into care and treatment settings. The PwP package will include counseling for status disclosure, partner testing, discordance, adherence to ART, risk reduction, safer sex & pregnancy, and STI management.

Community outreach programs will target most at risk individuals with the purpose of preventing geographical spread. As a component of the community based programming, messages shall be communicated through local dramas and singers that are found in the brothel clubs, parks, gardens and barracks. Community members will be taught the basics of HIV prevention, especially C&OP and encouraged to weave prevention themes into their songs promoting partner reduction and consistent condom use. Health care providers and counselors in STI clinics will be trained to distribute condoms and include condom use promotion in target groups. Prevention with positives activities include HCT for family members and sex partners, counseling for discordant couples, counseling on status disclosure, healthy lifestyles and positive living, prevention messages and IEC materials. For HIV negative individuals, trained counselors will provide education on HIV/AIDS transmission, risks and other information about the disease, and provide risk reduction strategies including condom use. ECEWS will incorporate syndromic STI diagnosis and treatment into its prevention portfolio, thereby improving compliance with treatment as referrals are avoided.

This funding year will include periodic assessments that will be used to guide specific activities to be conducted under each strategy in the target communities. Efforts will be made to identify gaps in AB programming so that ECEWS can work effectively within and contribute to a comprehensive and harmonized national program. AB messages will be balanced with concurrent condom and other prevention messaging, where appropriate and will be integrated with services provided by ECEWS in a total of 30 sites (25 sites inclusive of condom and other prevention activities and 10 schools) in 3 states (Akwa Ibom, Cross River and Abia states). AB messaging will only be provided to 20 target community sites, including...
Activity Narrative: FBOS/CBOs, and A-only messaging will be prioritized in 10 school based sites in Akwa Ibom, Cross River and Abia states

C&OP and AB programming will be prioritized in communities identified through a COP07 and COP08 supported community assessment that mapped out areas of high sexual networking (barracks, parks, markets, gardens, and brothels). ECEWS will expand its advocacy activities with owners and managers (including chairladies of commercial sex workers) of relevant establishments to enable access to the sex workers and to introduce the peer education program. Using a model tested in Thailand and South Africa, ECEWS will work with brothel owners to encourage 100% condom use. Free condoms will be given to brothels, and sex workers will be advised to insist on condom use with each client. ECEWS will continue to select peer facilitators from each brothel and train them to provide HIV prevention messages to their peers on a daily basis. Key messages will include correct and consistent condom use in all sex acts, prompt and complete treatment of STIs and testing for HIV. Community advocacy with brothel owners will be primarily to support the sex workers in enforcing a "no rubber no show" policy in their establishments. Peer facilitators will be taught participatory monitoring and evaluation to enable them to monitor their progress against collective objectives. In addition, a yearly survey will be conducted on the outcome of activities.

In COP 09 a total of 20 counselors, teachers, peer educators, religious leaders will be trained to conduct effective prevention interventions inclusive of AB messaging. Retraining will also be conducted for 30 individuals previously trained under COP 08. For C&OP, a total of 10 individuals will be trained in addition to 50 individuals trained in COP 08. Review meetings and retraining will be conducted for a total of 60 individuals in condoms and other prevention activities.

ECEWS also has experience in conducting school based approaches to HIV education and under this program will serve 10 schools in its communities. School based programs will include interactive learning activities that will include life skill acquisition and HIV education.

Condoms will be procured from Society for Family Health (SFH) for all ECEWS sites. The provision of condoms will be accompanied by individual and/or group counseling and demonstrations from experienced counselors on their proper use. Information, education and communication (IEC) materials tailored to address the unique risks that individuals from high risk groups face and information on correct and consistent use of condoms will also be provided in all sites at all points of service within those sites.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
ECEWS is in line with the PEPFAR vision to enhance indigenous capacity to provide integrated HIV/AIDS services from the community to the national level, and in this process to strengthen the health care system and local implementing partners. These prevention activities are consistent with PEPFAR’S five year goals for Nigeria, which plan to prevent 1,145,545 new infections through a number of prevention strategies including (but not limited to) condoms and other prevention to specific high risk groups. In order to be maximally effective, the prevention messages developed at different sites will be tightly targeted to the various high risk groups that they serve. Furthermore, these activities are in line with the PEPFAR 5 year strategy which seeks to scale up prevention services, build capacity for long term prevention programs and target outreach to promote correct and consistent use of condoms with MARPs to reduce the risk of HIV infection for these populations with the purpose of limiting the spread of the virus. The ECEWS-supported services in prevention outreach initiatives help facilitate the scale up of the overall program, and increase utilization of HCT and STI management services.

LINKS TO OTHER ACTIVITIES:
This activity will be integrated with Counseling and Testing, Care and Support, and TB/HIV. ECEWS will collaborate with community based organizations (CBOs), faith based organizations (FBOs), and PLWHA support groups in the communities in which it will be conducting other PEPFAR programmatic activities. The support groups will also serve as appropriate partners in the dissemination of ABC messaging to other PLWHA utilizing the peer education model. The CBOs and FBOs will serve as appropriate partners in reaching wider audiences through the peer education plus model and community awareness campaigns conducted under the supervision of ECEWS and will include activities such as drama presentations, musical events, and road shows/rallies.

POPULATIONS BEING TARGETED:
The focus population for AB activities will be In and Out-of-School Youth. It will also target community/religious leaders and parents. C&OP will target discordant couples, general outpatients and STI patients, PLWHA, incarcerated populations, youth, police, customs workers, immigration workers and commercial sex workers.

Activity Description

ECEWS is a continuing partner in the program area of Sexual Prevention in COP09. In COP 08 ECEWS provided sexual prevention services to individuals, including MARPs in 35 sites (14 facility-based and 21 community sites) in Akwa Ibom and Cross River states. ECEWS will implement its sexual prevention activities in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached (thereby improving the effectiveness of the prevention messaging) through a balanced portfolio of prevention activities in Abstinence, Be faithful (AB) and Condoms and Other Prevention (C&OP). Through the involvement of ECEWS as a partner in this activity, PEPFAR Nigeria will further its development of an integrated comprehensive prevention portfolio. In COP09 ECEWS will continue to provide community outreach to individuals identified as high risk for HIV and direct them to counseling and testing while promoting prevention through activities other than abstinence and be faithful messages. This activity will focus on condom use promotion among most at risk populations and referral to ECEWS supported and/or other local PEPFAR-supported HCT sites. Condoms and other prevention activities will be provided in 25 sites (7 sites developed under COP07 and 18 sites developed under COP08) targeting 7,576 most at risk persons (MARPs) which include STI patients, PLWHA, incarcerated populations, youth, police, customs workers, immigration workers and commercial sex workers in Akwa Ibom and Cross River states.

ECEWS’ goal for its new activities in the AB program is to contribute to a reduction in HIV prevalence among youths, particularly in the at-risk age group of 15-24 year olds, and to promote mutual fidelity among married adults. The 2005 ANC survey in Nigeria reported that among age cohorts in Nigeria, the 20-29 year old age group has the highest HIV prevalence. In addition, the 2005 National HIV/AIDS and Reproductive Health Survey (NARHS) demonstrated that 69% of the general population perceive themselves to be at no risk, while an additional 28% perceive themselves to be at low risk of contracting HIV. The survey also demonstrated significant reports of transactional sex (11%) among young women aged 15-29 years. It is expected that a combination of prevention messaging approaches will ensure they are effectively reached with prevention interventions. This activity will be implemented at the community level and will be reinforced through national level mass media campaigns by other USG partners such as the successful Zip-Up campaign of Society for Family Health (SFH).

ECEWS will implement AB programming in underserved areas in Nigeria and will couple these activities with condoms and other prevention program services and with counseling and testing program services. The implementation of the AB activities will utilize a combination of multiple strategies, including community awareness campaigns, peer education models, peer education plus activities, and a school-based approach in line with the National minimum prevention package requirement. The target group will be those individuals who will have received AB messaging: (1) on a regular basis and (2) via at least three of the four strategies ECEWS will employ (community awareness campaigns, peer education models, peer education plus activities, and school based activities). The police and other uniformed service men, incarcerated persons, and in-school and out-of-school youth will be reached with AB messages. The target for this intensive AB messaging campaign is 2,273 individuals. In addition, age appropriate abstinence only messaging and secondary abstinence messaging will be conveyed to 1,000 children and adolescents, particularly focused on in-school youth as well as orphans and vulnerable children (OVC) receiving home based support. ECEWS will implement C&OP activities at both facility and community levels utilizing a combination of multiple strategies, including community outreach campaigns, specific population awareness, peer education models, work place program and STI management in line with the National minimum prevention package requirement. The goal of the program is to focus on the communities targeted and saturate them with messages conveyed in multiple fora. Utilizing such a methodology, a large number of people will be reached with messages received via one method or another, but the target group will be those individuals that will have received condom/other prevention messaging: (1) on a regular basis and (2) via all three of the strategies ECEWS will employ (community awareness campaigns, peer education models, and STI management/treatment). The target for this intensive C&OP activity campaign is 7,576 individuals. These will comprise 1,000 commercial sex workers, clients in STI clinics, uniformed personnel and out of school youth. In addition, ECEWS will support its partners to integrate Prevention with Positives (PwP) activities into care and treatment settings. The PwP package will include counseling for status disclosure, partner testing, discordance, adherence to ART, risk reduction, safer sex & pregnancy, and STI management.

Community outreach programs will target most at risk individuals with the purpose of preventing geographical spread. As a component of the community based programming, messages shall be communicated through local dramas and singers that are found in the brothel clubs, parks, gardens and barracks. Community members will be taught the basics of HIV prevention, especially C&OP and encouraged to weave prevention themes into their songs promoting partner reduction and consistent condom use. Health care providers and counselors in STI clinics will be trained to distribute condoms and include condom use promotion in targeted prevention with positives activities include HCT for family members and sex partners, counseling for discordant couples, counseling on status disclosure, healthy lifestyles and positive living, prevention messages and IEC materials. For HIV negative individuals, trained counselors will provide education on HIV/AIDS transmission, risks and other information about the disease, and provide risk reduction strategies including condom use. ECEWS will incorporate syndromic STI diagnosis and treatment into its prevention portfolio, thereby improving compliance with treatment as referrals are avoided.

This funding year will include periodic assessments that will be used to guide specific activities to be conducted under each strategy in the target communities. Efforts will be made to identify gaps in AB programming so that ECEWS can work effectively within and contribute to a comprehensive and harmonized national program. AB messages will be balanced with concurrent condom and other prevention messaging, where appropriate and will be integrated with services provided by ECEWS in a total of 30 sites (25 sites inclusive of condom and other prevention activities and 10 schools) in 3 states (Akwa Ibom, Cross River and Abia states). AB messaging only will be provided to 20 target community sites, including....
Activity Narrative: FBOs/CBOs, and A-only messaging will be prioritized in 10 school based sites in Akwa Ibom, Cross River and Abia states

C&OP and AB programming will be prioritized in communities identified through a COP07 and COP08 supported community assessment that mapped out areas of high sexual networking (barracks, parks, markets, gardens, and brothels). ECEWS will expand its advocacy activities with owners and managers (including chairladies of commercial sex workers) of relevant establishments to enable access to the sex workers and to introduce the peer education program. Using a model tested in Thailand and South Africa, ECEWS will work with brothel owners to encourage 100% condom use. Free condoms will be given to brothels, and sex workers will be advised to insist on condom use with each client. ECEWS will continue to select peer facilitators from each brothel and train them to provide HIV prevention messages to their peers on a daily basis. Key messages will include correct and consistent condom use in all sex acts, prompt and complete treatment of STIs and testing for HIV. Community advocacy with brothel owners will be primarily to support the sex workers in enforcing a "no rubber no show" policy in their establishments. Peer facilitators will be taught participatory monitoring and evaluation to enable them to monitor their progress against collective objectives. In addition, a yearly survey will be conducted on the outcome of activities.

In COP 09 a total of 20 counselors, teachers, peer educators, religious leaders will be trained to conduct effective prevention interventions inclusive of AB messaging. Retraining will also be conducted for 30 individuals previously trained under COP 08. For C&OP, a total of 10 individuals will be trained in addition to 50 individuals trained in COP 08. Review meetings and retraining will be conducted for a total of 60 individuals in condoms and other prevention activities.

ECEWS also has experience in conducting school based approaches to HIV education and under this program will serve 10 schools in its communities. School based programs will include interactive learning activities that will include life skill acquisition and HIV education.

Condoms will be procured from Society for Family Health (SFH) for all ECEWS sites. The provision of condoms will be accompanied by individual and/or group counseling and demonstrations from experienced counselors on their proper use. Information, education and communication (IEC) materials tailored to address the unique risks that individuals from high risk groups face and information on correct and consistent use of condoms will also be provided in all sites at all points of service within those sites.

Contributions to Overall Program Area:

ECEWS is in line with the PEPFAR vision to enhance indigenous capacity to provide integrated HIV/AIDS services from the community to the national level, and in this process to strengthen the health care system and local implementing partners. These prevention activities are consistent with PEPFAR’s five year goals for Nigeria, which plan to prevent 1,145,545 new infections through a number of prevention strategies including (but not limited to) condoms and other prevention to specific high risk groups. In order to be maximally effective, the prevention messages developed at different sites will be tightly targeted to the various high risk groups that they serve. Furthermore, these activities are in line with the PEPFAR 5 year strategy which seeks to scale up prevention services, build capacity for long term prevention programs and target outreach to promote correct and consistent use of condoms with MARPs to reduce the risk of HIV infection for these populations with the purpose of limiting the spread of the virus. The ECEWS-supported services in prevention outreach initiatives help facilitate the scale up of the overall program, and increase utilization of HCT and STI management services.

Links to other activities:

This activity will be integrated with Counseling and Testing, Care and Support, and TB/HIV. ECEWS will collaborate with community based organizations (CBOs), faith based organizations (FBOs), and PLWHA support groups in the communities in which it will be conducting other PEPFAR programmatic activities. The support groups will also serve as appropriate partners in the dissemination of ABC messaging to other PLWHA utilizing the peer education model. The CBOs and FBOs will serve as appropriate partners in reaching wider audiences through the peer education plus model and community awareness campaigns conducted under the supervision of ECEWS and will include activities such as drama presentations, musical events, and road shows/rallies.

Populations being targeted:

The focus population for AB activities will be In and Out-of-School Youth. It will also target community/religious leaders and parents. C&OP will target discordant couples, general outpatients and STI patients, PLWHA, incarcerated populations, youth, police, customs workers, immigration workers and commercial sex workers.

Activity Narrative: THIS IS A CONTINUATION OF COP08

The COP08 intervention strategy delivered an intensive set of abstinence/be faithful (AB) interventions to a highly targeted group of beneficiaries (i.e., adolescent girls and their male partners), promoted protective male norms and behaviors, and linked communities and service delivery points through direct referral. The AB package consists of community awareness campaigns, peer education, social support activities, curricula- and non-curricula-based programs, and mass media activities. Community awareness campaigns are realized through small group discussions, interpersonal communications, and community dialogues. Trained community advocates reach target groups through their gatekeepers in different places in the communities to provide HIV prevention messages. Peer education is accomplished through the safe spaces youth clubs (SSYC) model consisting of a series of 14 modules led by trained peer mentors and reinforced by social peers of lay religious leaders supporting abstinence and delay in marriage. Social support activities include life skills training, savings mobilization, and income generation. Curricula- and non-curricula-based approaches incorporate secular topics of HIV/AIDS prevention, reproductive health, hygiene, and life-skills in Islamiya school curricula and after-school activities. Mass media activities use radio spots/jingles and phone-in radio discussion slots to stimulate public dialogue and debate on early marriage, vulnerability of young girls, protective practices of men, and risk reduction through AB.

This intervention is being carried out through 4 local partners (Adolescent Health and Information Projects [AHIP], Federation of Muslim Women Association of Nigeria [FOMWAN], Islamic Education Trust [IET] and African Health Project [AfrHP]) in Adamawa, Bauchi, Borno, Kano, Nassarawa and Niger States. Faith-based organizations (AHIP, FOMWAN and IET) reach target groups and members of the communities with AB messages while AfrHP is involved in condom messaging and other prevention activities.

In COP09, activities will include the above strategies to reach the target groups (young women 10-24 years), their gatekeepers (their husbands and parents) and stakeholders (community and religious leaders and women leaders) with AB messages, such that three messages overlap to reach targeted beneficiaries.

The peer health methodology that was introduced in COP07 as Safe Space Youth Clubs (SSYCs) with an initial 24 clubs and expanded to 124 clubs in COP08 will be maintained and further expanded to 150 clubs in COP09. The curriculum of the clubs takes 6 months to complete, and the best of the graduating young women will have acquired knowledge and skills to become mentors of succeeding new clubs. The activities of these clubs will reach young women 10-24 years old who are in-school or out-of-school, single, married, divorced, widowed or separated and who in most cases have few economic opportunities, life-skills, or knowledge of reproductive health, HIV/AIDS, and STI issues. The contents of the SSYCs curriculum include strong HIV prevention messages (AB), condom messages, pre-marital counseling, leadership, skills development, and financial literacy that will equip the young women with income generating skills and savings mobilization. Concurrently, members of the clubs will be reached with HIV counseling, interpersonal communications, and condom messages among other messages.

The second strategy by which the target groups will be reached with HIV prevention messages involves community awareness campaigns through small group discussions, interpersonal communications and community dialogues. Youth who are out-of-school, married, divorced, or separated and those who are not members of SSYCs will be reached through HIV prevention messages by community advocates (5 in each state; 60 in the network) who were not selected as mentors in each of the project states.

In the project states, target groups also participate actively in Islamiya schools that operate in the evenings as well as in after-school activities. The community advocates are teachers in these schools. Target groups will be reached with HIV/AIDS prevention, reproductive health, and hygiene messages. This will form a forum where members of the SSYCs will network with those who are not members of the clubs and consequently share their experiences and knowledge of the HIV prevention.

This strategy involves reaching target groups with prevention messages that include social support, life skills training, saving mobilization and income generation. Members of SSYCs will be given training on “Financial Literacy” – an Islamic method of teaching the young methods of business acumen and knowledge of meeting their needs and generating income. When members graduate with the necessary skills they will be able to form smaller clubs that will be independent and sustainable.

It is intended that a member of the club will be able to share accurate knowledge of HIV prevention with at least 3 of her peers in schools, within the family and in their communities such that the activities of these clubs will be able to reach 23,386 beneficiaries (5,386 males and 18,000 females) with an intensive AB package and 2,400 ‘A-only’ messages (600 males and 1,800 females).

The training of local organizations personnel will take place at two levels. Population Council will set up a training coordinating unit in the program support department of its office to carry out training of trainers. This will facilitate the training of the project officers, community advocates and mentors in the necessary skills which enable them to handle step-down training at the community level. The mentors will be equipped with the right skills to lead members of the girls’ clubs in HIV prevention messages, leadership and skills development. Through this training, local partners will acquire skills and competency that will enable them to be able to seek funding independently from USG and other sources, as well as to serve as a profit center for HIV/AIDS prevention activities. 400 individuals will be trained to promote HIV/AIDS prevention through AB messaging.

Population Councils Condoms and Other Prevention activity will contribute to the Emergency Plan Five-Year Strategy in preventing new HIV infections among vulnerable youth, especially male counterparts of the target groups of the project (young women aged 10-24 years). These males include in-school, out-of-school, husbands of young women, and those engaged to be married and who are most at risk and/or underserved, by promoting the delay of sexual initiation and abstinence to reduce HIV prevalence or avert infection.
Activity Narrative: In COP08, community advocates have been sensitized on condom messages and use, and referral points have been identified for condom distribution in the eight project states. Youth clubs have also been established. In COP09, the following strategies will be adopted in the implementation of C&OP activities:

1) Community outreach focusing on HIV counseling, training on the use of condoms and condom messaging and distribution
2) Peer health education among males of different age groups in the communities
3) Specific population awareness campaigns directed to males in communities
4) Provision of STI management and training on STI syndromic management

Twenty community advocates will be trained to promote HIV/AIDS prevention through C&OP messaging and will be trained on HIV counseling to facilitate referral of male contacts to designated referral points in the different communities. In COP07 and COP08 an average of 8 referral points were identified in each of the project states by the focal officers and community advocates who have been working with the local partner (AfrHP). The COP09 activity will be a continuation of the COP08 community mobilization. In all the communities where Population Council targets young women 10-24 years of age, there are males of the same category who are spouses or close associates of these women and the older men who have relationship with the girls. The trained community advocates will be meeting these young men with HIV prevention (AB) and correct condom use messages, thus providing balanced ABC messages.

There will also be a step-down training for males in mosques and churches by the trained community advocates and the trained males will reach their peers in mosques after the Friday prayers. Muslim marriages and special occasions (usually religious occasions) will provide forums for ABC messages among males of the same peer group. The behavior change communications component of the project will develop information, education and communication materials that will facilitate the community mobilization on condom and other prevention among the males at the community level.

The third strategy targets specific population awareness campaigns at the various locations of the project states. African Health Project will sensitize the referral points and other locations that are close to where these men live and will form the initial opening of public private sector condom outlets. A total of 400,000 condoms have been requested from USAID/PEPFAR for distribution in the project locations (64 condom service outlets). The community and religious leaders will be reached with other prevention messages through this strategy. Community advocates will be trained to organize community meetings in strategic locations of each state in the form of ‘days of dialogues,’ which was used in COP06 and COP07 to reach these leaders. Consequently, a community environment conducive to open discussions on sexuality and HIV prevention will be provided.

AfrHP will collaborate with AHIP and other clinics in the project states to train clinic personnel in each of the 8 project states on syndromic management of STIs such that the services of comprehensive treatment of STIs will reach many contacts in the states. This will facilitate the existence of a friendly clinic in each of the 8 states where correct education on the use of condom could be given to referred contacts. Activities at the clinics will include STI counseling for affected individuals. This is another strategy to reach contacts with condom and other prevention messages.

Through the above strategies, the number of individuals to be reached through community outreach that promotes HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful will be 15,591 (12,000 males and 3,591 females). The strategies will ensure that at least three messages overlap on the males to be counted in the communities.

Target Populations
In COP07 and COP08, the activities addressed HIV risks for men both as gatekeepers to reach young girls with information and resources to prevent HIV, but also as MARPs who place married young girls at risk for HIV. In COP09, condom and other prevention activities will target males around the communities of the target groups. These are men who are spouses, friends, neighbours and fiancé of the target groups and they greatly influence the initiation of sexual intercourse among the young women. These males are both in-school and out-of-school and some are older men who pose the risk of multiple sex partners to the young women. In most of the project states, there is a culture of male suitors meeting with their prospective future brides in specific locations in the communities, mostly in the evenings. The activity will explore this practice to reach these males with HIV prevention messages by using the SSYCs members to train the girls in venues who can consequently reaching the males. The activity will also reach out to community and religious leaders who will facilitate advocacy at the community level and this will go a long way toward reducing socio-cultural barriers to the interventions. Public dialogues and IEC materials will address behavior change beyond abstinence and/or being faithful, including targeting those behaviors that increase risk for HIV transmission, such as engaging in casual sexual encounters, engaging in sex in exchange for money or favors, or having sex with an HIV-positive partner.

This activity will contribute to the Emergency Plan Five-Year Strategy in preventing new HIV infections among vulnerable youth—especially unmarried adolescent girls and those engaged to be married—who are most at risk and underserved by promoting the delay of sexual initiation and abstinence to reduce HIV prevalence or avert infection.

Links to Other Activities
This project increases demand and creates linkages for ART, HCT, and PMTCT services by partner IPs through education, promotion and referral by community advocates.

Program Evaluation
In order to assess the level of achievement of objectives of the project and to collect relevant information on lessons learned that will facilitate further studies and interventions in the project region an endline evaluation will be conducted in COP09. The planning, fieldwork and the data analysis as well as report...
**Activity Narrative:** generation and dissemination will be carried out in the last half of the COP year.

**New/Continuing Activity:** Continuing Activity

| Activity System ID: 24922 | }
Activity Narrative: In COP 09, the C-Change program (previously known as PHDC) will fill identified gaps in the mass media approach to prevention of sexual transmission of HIV in Nigeria, build capacity of USG Implementing Partners to implement BCC program strategies targeted at abstinence, being faithful, and condoms and other prevention (ABC) services and increase the reach of the prevention program while ensuring that BCC strategies are informed by available epidemiologically relevant and target specific data.

C-Change will conduct a strategic assessment of the current communication programming situation in country and a needs assessment that will include a review of BCC materials. C-Change will build capacity of individual USG prevention partners to appropriately design and implement their own outreach activities and to produce information, education, and communication (IEC) materials in support of their prevention objectives using effective messaging and BCC strategies. Assisted implementing partners (IPs) will develop and implement behavior change interventions to address appropriate ABC messages to the youth of Nigeria. Messages will focus on abstinence, delay of sexual debut, and secondary abstinence. Messaging will be age specific and culturally appropriate and will target in- and out-of-school youth under the age of 15. C-Change will train 180 individuals from IP project sites in peer education skills. Trained peer educators will be provided with assistance in coordinating peer education clubs in schools and communities. Activities of the peer education clubs will increase knowledge and build capacity of other club members. Trained peer educators will also focus on strengthening the capacity of the peer education clubs to develop guidelines for operation and detailed responsibilities of members. Peer educators will target most-at-risk populations (MARPts), including persons living with HIV/AIDS (PLWHAs), in- and out-of-school youth, as well as couples.

The 180 core ABC peer educators will reach out to an additional 32,840 youth through peer education activities. Peer educators will use materials and strategies developed by C-Change in collaboration with USG IPs to reinforce behavioral change and risk reduction messages. C-Change will assist IPs to reinforce messages at the community level through the use of electronic media and various innovative communication channels, appropriate to the community, such as drama and local folkloric genres. The sexual prevention program will also be strengthened through the initiation of a national level behavioral change communication (BCC) strategy and through enhanced behavior change via mass media activities that reinforce other USG-funded interpersonal communications and community-based outreach activities.

C-Change will build capacity of IPs to implement BCC programs using strategies that respect and respond to local customs, and social and community norms. Programming is expected to: support delay of sexual debut; develop skills in unmarried individuals for practicing abstinence and negotiation for safe sex while transiting from abstinence; address coerced sexual activity and transactional sex; emphasize the importance of faithfulness in reducing the transmission of HIV; support partner reduction; and develop skills for sustaining marital fidelity. This will entail development of the ‘Be faithful’ messaging component of sexual prevention activities of IPs to target couples using mass media, print, and religious and community gatherings, including counseling service provision. C-Change will train 120 individuals from IP project sites who will reach out to 21,894 individuals with developed messages and materials (including audio visual aids) targeted at fidelity, partner reduction and messages that focus on HIV counseling and testing to reduce incidence of HIV and AIDS. C-Change will assist IPs in targeting community and traditional leaders and organizations by focusing on messages to be promoted during planned advocacy visits and community intervention programs. C-Change will work with IPs to develop thematic messages that are culturally appropriate and acceptable as well as explore activities that are favorable for the faith based settings. Messages will also promote linkages to other program areas, including counseling and testing, STI treatment and other facility based services.

C-Change will assist IPs to address the mobilization of communities to address norms and behaviors on cross generational and transactional sex, promote increased male involvement in prevention activities and improved health seeking behaviors. Also addressed in the intervention will be: issues of stigma and discrimination; promoting behavioral change around embracing non-remunerated blood donations; and promoting injection safety. C-Change will adhere to recommendations made in the National Prevention Plan and National Behavior Change Communication Strategy and utilize a balanced AB+C approach in its interventions. C-Change will collaborate with the National Agency for the Control of AIDS (NACA) and national media to ensure sustainability and support of NACA BCC efforts. C-Change will also provide technical assistance to the BCC committee of the National Prevention Technical Working Group and support BCC activities in the wider public health (FMoH) programming.

C-Change will ensure data quality and continuous quality improvement of activities by encouraging IPs to develop effective peer education activity monitoring forms and build capacity in monitoring and evaluation of communication programs through periodic monitoring and supportive supervision site visits to verify planned implementation as well as to provide technical assistance that will ensure continued quality data collection

CONTRIBUTIONS TO OVERALL PROGRAM AREA
C-Change’s contribution to the overall sexual prevention activities will be by building technical capacities of implementing partners to review and develop strategies for working with different target audiences including MARPs and other segments of the general population, resulting in more sustainable prevention programming.

LINKS TO OTHER ACTIVITIES
These activities will be linked to community program development, HCT, Gender, HCT, PMTCT, Blood Safety, Injection Safety, TB HIV, treatment, care and SI.

POPULATIONS BEING TARGETED
Targeted populations for this activity include: staff of implementing agencies, MARPs, young people, couples, religious organizations and media organizations.

KEY LEGISLATIVE ISSUES ADDRESSED
The activity will help address male norms and behaviors, and community norms and values while
**Activity Narrative:** emphasizing benefits of reducing violence and coercion through messaging delivered through such activities as couple counseling and testing.

**EMPHASIS AREAS**
This activity will emphasize Behavior Change Communication with a focus on strategy and message development directed at sexual prevention.

**New/Continuing Activity:** Continuing Activity

**Continuing Activity:** 16927

Activity Narrative: As a result of the Nigerian Federal Ministry of Health (FMoH)'s HIV/AIDS Division's (HAD) mandate, which is national in scope, the funded activities will be implemented in a way that covers the entire country in COP09; however, HAD will focus most of the activities on underserved populations in Nigeria. With this funding, HAD will build the capacity of its staff at the National, State and Local Government levels to lead an integrated health sector response. HAD staff capacity will be improved through a comprehensive training in integrated program management that will ensure that sexual prevention program related trainings, supervision, service provision and quality assurance activities are carried out in line with nationally and internationally acceptable standards. Through this grant, HAD will also ensure that the National Prevention Technical Working Group (TWG) meets as scheduled in their operational plan. HAD will also facilitate the distribution and dissemination of the Prevention Standard Operation Procedures (SOP) and Guidelines to ensure they are understood and adhered to by prevention service providers across Nigeria. HAD will also develop a mechanism for feedback on both documents from end users.

Expected outcomes of this technical approach will include: improved capacity through routine site visits by HAD staff at all levels; improved advisory functions by the Prevention Technical Working Group; and adherence to national standards for prevention service provision by all service providers.

HAD will achieve these outcomes through a three-pronged approach of: 1) Training national, state, and local government level staff; enabling and facilitating meetings of the Prevention TWG; and the development of SOPs, guidelines, training curricula, and manuals. Specifically, training of HAD staff at the National, State and Local Government Levels will focus on supervisory and monitoring skills following a gap analysis and development of appropriate training programs. This will be followed by adaptation of existing supervisory and monitoring tools. HAD will enable and facilitate meetings of the Prevention TWG and work in collaboration with the TWG to visit service delivery sites and collate and analyze supervisory reports to serve as a basis for advisory functions of the TWG. The inactive National HIV/AIDS partners’ forum will be reactivated to meet on a biannual basis. HAD will develop SOPs, guidelines, training curriculum and manuals for program areas that currently do not have such manuals. HAD will also disseminate and distribute these materials to end users (service providers) through national and state level workshops. HAD will also ensure that feedback is received from the end-users, articulated and forwarded to the appropriate TWG to enhance their coordination function.

Activity ID: 15667.25291.09

Activity System ID: 25291
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP 08, Abstinence & Be Faithful (AB) services were provided to 2,000 individuals in 25 service outlets in Lagos Rivers and Bayesia states. Sixty (60) people were trained, including teachers, religious leaders, students, and other peer educators. Condoms and other prevention services were provided at 23 sites, 4,286 most at risk persons (MARPs) were reached, and 100 peer educators were trained on the use of advocacy tool kits.

In COP 09, Africare will be consolidating the implementation of its sexual transmission prevention programming activities in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached, and improving the effectiveness of the prevention messages, through a balanced portfolio of prevention activities including messages on abstinence and being faithful, distribution of condoms and support for other forms of prevention. The program aims to: promote abstinence, fidelity and related community and social norms; implement the minimum prevention package of services within the targeted populations; develop a comprehensive prevention package of services for persons engaged in high-risk behaviors; and integrate these services into care and treatment settings and other health related settings.

AB messages will continue to promote abstinence, including delay of sexual debut or secondary abstinence, and fidelity (including partner reduction and mutual fidelity), while addressing related social and community norms. The target population for AB programming will be: TB DOTS patients, uniformed service personnel, incarcerated persons, transport workers, and in-school and out-of-school youth. Four strategically chosen sites will be added to the existing 25 service outlets, which will result in a total of 29 outlets for AB services in COP 09. In addition, age/culturally appropriate partner reduction and secondary abstinence messages will be conveyed to 500 children and young adults, particularly focused on in-school youths and orphans/vulnerable children receiving home based support, and through peer education in schools. These services will be integrated with the HCT and OVC programs as well as the palliative care and TB/HIV programs, and appropriate messages will be given in support group settings as part of prevention for positives activities. Out of school youth will be targeted to receive AB messages at vocational training centers. The program will contribute to the reduction of new infections by reaching 2,273 individuals (1,000 male and 1,273 female) with intensive AB services. 1,137 of these will be reached with abstinence messages alone. Where appropriate, AB programs will be implemented alongside C&OP services at Africare-supported facilities and communities.

Twelve persons will be trained in AB messages and programming. This number includes teachers, religious leaders, students, and peer educators. Those who were trained in the preceding year will be given refresher training. All trained individuals will receive training materials and job aids as reference materials. The capacity building of health teachers, religious leaders, students, and peer educators will ensure sustainability and ongoing community activities.

A comprehensive prevention package that will include IEC materials for both AB and C&OP programs and condoms will be distributed to all HCT sites and at all points of service in supported health facilities. Africare will continue to target communities where registered clients live in order to reinforce messages provided in the facility setting. As a component of the community based and school based programs, AB messages will be integrated into games and sports activities. Activities highlighting role models, drama presentations and film shows will be organized for in- and out-of-school youth. The peer education model will be used to organize formal peer groups that will then actively develop AB messaging campaigns for their peers through the formation of school Anti-AIDS clubs and HIV/AIDS Committees.

C&OP activities will be implemented at facility and community levels utilizing a combination of strategies aimed at saturating focus communities with messages conveyed in multiple fora. Condoms and other prevention (C&OP) programs will be provided at 30 outlets (16 health facilities, 5 stand alone HCT sites, 5 workplaces, and 4 brothels). An anticipated 4,242 individuals will be reached with C&OP programs that promote correct and consistent condom use, referral to HIV Counseling & Testing (HCT) sites, referral into STI management, and messages aimed at reducing other risks of persons engaged in high-risk behaviors. C&OP programming will focus on at-risk (out of school) youth, long distance drivers and other mobile populations, targeted alcohol users, women engaged in prostitution and transactional sex relationships (both brothel-based and non-brothel-based), incarcerated populations, PLWHA, and members of the uniformed services. It is expected that a combination of prevention messages approaches will ensure clients are effectively reached with prevention interventions. In line with the National guidelines for a minimum prevention package, individuals will be reached with a minimum of three interventions that will include community awareness campaigns, peer education models and school or work based activities, as appropriate.

Bridge populations, including students in institutions of higher learning who are involved in transactional sex or high end commercial sex work, will be targeted for sexual prevention activities through campus based outreach programs aimed at providing education, condoms and peer support.

Africare will follow existing methodology for measuring achievements in AB programming, through program officers dedicated to providing oversight and guidance on prevention activities under AB and C&OP programs. Members of the National Youth Services Corps (NYSC) will be actively recruited as peer education trainers and supported in collaboration with the states and UNICEF to work alongside program officers.

Trained health care workers, counselors and peer educators will provide the comprehensive Prevention with Positives (PwP) package, including counseling on partner disclosure, family planning and STI management, partner testing, risk reduction and adherence counseling, and correct consistent condom use to infected individuals. Africare will participate in the development of the National prevention with positives training manual and its implementation across the sites. Prevention for positives packages for those living positively with HIV will be included in care services and will involve activities such as HCT for family members and sex
Activity Narrative: partners, counseling for discordant couples, counseling on healthy lifestyles and positive living, prevention messages and IEC materials on disclosure.

For HIV negative individuals, education on HIV/AIDS transmission, risks, and risk reduction strategies including correct and consistent condom use will be provided.

C&OP activities will include condom distribution, education on correct and consistent use of condoms, and referral/provision of STI diagnosis and syndromic management of STIs. As a component of the community outreach strategy, Africare will support drama presentations, film shows and conduct road shows on a regular basis in the targeted communities. This strategy will be closely linked to the peer education model strategy as community groups will be organized and will help guide the development of community events. Peer educators will also work one-on-one with community members to provide education on condom use and to distribute condoms. Africare will discuss avenues of addressing sexual activities in the prisons with the authorities.

Africare’s C&OP workplace strategy will focus on the formal work sector and brothel-based commercial sex workers as well non-brothel settings like beer parlours and night clubs where transactional sex may occur under the influence of alcohol. Free condoms will be given at these locations. Using a peer education approach, Africare will select peer facilitators from these locations and train them to provide HIV prevention messages to their peers and patrons on a routine basis. The key messages will include correct and consistent condom use in all sex acts, prompt and complete treatment of STIs and testing for HIV. Advocacy with brothel, beer parlour and night clubs owners will be carried out to support the female sex workers in enforcing a 100% condom use policy in their establishments and to encourage patrons on condoms use. Workforce strategies focused on the organized sector will also include training of peer educators to promote condom use. In addition, Africare will work with the management of the organizations to identify strategic centralized mechanisms to reach their employees with COP messages and condom distribution.

Africare will train 37 new peer educators made up of community group members, health care workers, counselors and volunteers in appropriate provision of condom and other prevention services. Peer educators will be trained on the use of advocacy tool kits including IEC materials, condoms and job aids. They will also be taught participatory monitoring and evaluation to enable them to monitor their progress against project objectives. Health care workers, counselors and home based care volunteers will be trained on condom use and syndromic STI diagnosis and treatment.

Condoms will be procured from Society for Family Health (SFH) for all Africare sites. Condom provision will be accompanied by individual and/or group counseling and demonstrations on proper use. Culturally appropriate IEC materials tailored to address the unique risks that individuals from high risk groups face and the correct and consistent use of condoms will also be provided through the community groups, peer groups, and in all Africare-supported health facilities.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
This activity area will contribute to the overall PEPFAR goals of preventing further new infections and reducing HIV incidence and prevalence rates in Nigeria. It will also help to lay the foundation for more sustainable HIV intervention programs in Nigeria through a focus on community based responses.

LINKS TO OTHER ACTIVITIES
This activity will be integrated with counseling and testing, basic care and support, TB/HIV, OVC, PMTCT, and strategic information. Prevention for positives counseling to include condom use will be an important component of post-test counseling in the STI clinics and in follow up care and support activities. This service will also complement HCT services for those who ultimately test HIV negative. Through this program as well as basic care and support, Africare will ensure access to STI treatment.

POPULATIONS BEING TARGETED
The focus population for this activity will be youth (in/out of school), HCT clients, TB DOTS patients, the uniformed service personnel, incarcerated persons, and transport workers, commercial sex workers. It will also target community leaders, brothel and night club owners and management of corporate organizations.

KEY LEGISLATIVE ISSUES ADDRESSED
Project activities will increase gender equity in young adults. Male involvement would be specifically addressed through the Union of transport workers and the Market men/Butchers associations who would receive intensive advocacy and campaigning in sexual prevention through HCT-linked outreach activities. High risk urban dwelling male youth will be reached through continuing advocacy and sensitization at stadium and sports arena outreach activities on weekends when they gather for scheduled sports activities. The program will reach out to religious organizations and leaders to provide culturally and religiously appropriate sexual prevention messages and emphasize the need to reduce the instance of cross generational sex.

EMPHASIS AREAS
This activity includes major emphasis on information, education, and communication with minor emphasis on community mobilization and training.

COVERAGE AREAS
Sites are located in states chosen based upon high prevalence in the most recent 2005 HIV sero-survey and geo-political distribution. These states include Rivers and Bayelsa (South-South zone) and Lagos (South West zone).

USG Agency: HHS/Centers for Disease Control & Prevention
Program Area: Sexual Prevention: Other sexual prevention
Program Budget Code: 03
Planned Funds: $254,715
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP09, the Harvard School of Public Health (Harvard) plans to move over four of its PEPFAR supported sites to APIN, Ltd (APIN). The sites include Lagos University Teaching Hospital (LUTH), Nigerian Institute of Medical Research (NIMR), Onikan Women’s Hospital (OWH), and Mushin General Hospital (MGH). The activity narrative reflects the transfer of targets from Harvard to APIN. The activities will be built on the structure and systems put in place through Harvard. APIN will maintain a strong collaboration with Harvard University. Since HVAB and HVOP activities are combined, the narratives for the 2 corresponding sections have been merged.

During COP08, APIN assumed management responsibility for 2 sites (Sacred Heart Catholic Hospital in Lantoro, Ogun State and Primary Health Center-Iru on Victoria Island, Lagos) and is adding 4 additional sites (LUTH, NIMR, OWH, and MGH) during COP09. APIN will continue sexual prevention programming activities at all 6 sites in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached, thereby improving the effectiveness of this messaging, through a balanced portfolio of prevention activities, including abstinence and sexual behavior change (ABC) along with condoms and other prevention (C&OP). ABC initiatives in Nigeria in extending its reach of ABC services through the APIN supported sites. Through its other program areas, APIN has a large population of HIV-positive adults, adolescents and children to which it is already providing services; this group forms part of the core target population for age appropriate ABC messaging that is provided by APIN through its prevention with positives (PwP) activities including sexually-transmitted infection (STI) screening and management, condom provision, sexual risk reduction, disclosure, adherence, reduction of alcohol consumption, and testing of sex partners and children in the HIV clinic setting. In addition, APIN will target activities to HIV-negative persons in its catchment areas in order to minimize their risk behaviors and contribute to an overall reduction in HIV prevalence.

In COP09, APIN will implement ABC activities at both the facility and community levels utilizing the minimum prevention package strategy as contained in the National Prevention Plan. This package includes: 1) community outreach campaigns; 2) peer education; 3) infection control activities; and 4) STI management/treatment. The goal of the program is to focus on targeted communities and saturate those communities with messages conveyed in multiple large reaches. A large number of people will be reached with messages received via one method or another; however, the target group will be those individuals that will have received C&OP messaging: (1) on a regular basis; and, (2) via at least 3 of the 4 strategies employed by APIN.

AB activities conducted at the local level by APIN will be reinforced through national-level mass media campaigns by other USG partners, such as the successful Zip-Up campaign. AB messages promoting abstinence and mutual fidelity, and addressing issues of concurrent and multiple sexual partnerships will be balanced with concurrent condoms and other prevention messaging, where appropriate and will be integrated with treatment and care services in our 6 sites.

A key age group for AB activities is youth/young adults aged 15-24 years as this encompasses the highest prevalence age group. This age cohort, for both men and women, represents the working age group in Nigeria; it is expected that a combination of prevention messaging approaches will ensure they are reached with appropriate interventions.

APIN will collaborate with community-based organizations (CBOs) and PLWHA support groups at its facilities and surrounding communities in other PEPFAR programming activities. These support groups will utilize peer education model and community awareness campaigns to disseminate ABC messaging to other PLWHA and to wider audiences. Support group activities will include the dissemination of prevention information for HIV-infected individuals (funded under basic care and support) as well as community outreach to high-risk populations to encourage HIV counseling and testing (HCT) and healthy behaviors, including recommendations for partner notification and condom use. For HIV-negative individuals, trained counselors will provide education on HIV/AIDS transmission, risks, and risk reduction strategies including HIV testing.

A community awareness strategy will also be employed to serve catchment areas of the hospital facilities, which will be linked with community mobilization efforts promoting HCT. During static and mobile HCT services, counselors will be disseminating balanced ABC messages to recipient communities and clients through focused group discussions and interpersonal communication. Key messages that will be conveyed include: delay in sexual debut, secondary abstinence, mutual fidelity, prompt and complete treatment of all STIs, and promotion of need to ascertain HIV serostatus through HCT.

APIN sites will target most at risk populations (MARPs), including outpatient STI patients, border traders, young male market agents, and motor mechanics. APIN’s HCT site at PHC-Iru on Victoria Island serves the Kuramo area, a community with a large number of MARPs where most residents are sex- and bar-workers, and have HIV prevalence greater than 60%. Prevention activities at these clinics provide condoms and educational materials targeting the risks faced by this population in particular. In addition to comprehensive counseling on HIV prevention and risk reduction, HIV-infected individuals identified through this activity will be referred for palliative care and evaluation for ART eligibility. An emphasis on men with high-risk behaviors through these community-based efforts will also enhance prevention efforts and facilitate access to their partners.

A focus of the program in COP09 will be continued improvement of the integration of prevention activities into the HIV care and treatment settings; specifically, healthcare providers and lay counselors in care and treatment settings will be trained to appropriately deliver integrated ABC prevention messages and incorporate the messages into routine clinic visits using IEC materials and job aids. An appropriate balance of ABC will be tailored to the needs and social situation of each individual client in its presentation. In addition to the integration of such services into the HIV-specific treatment setting, prevention activities will be assimilated into other points of service in each health facility (general outpatient clinics, emergency services, etc.), particularly into reproductive health services including family planning counseling. STI
Activity Narrative: management and counseling, and risk-reduction counseling.

This funding will also be used to support the procurement and distribution of written prevention messages and condoms. The materials will provide patients and clients with HIV prevention information using the “ABC” model, including information about healthy behaviors, safer sexual practices, PMTCT, and condom usage. Prevention messages will also include information about other STIs. Condoms will be offered to all individuals at all sites and will be provided to APIN by the Society for Family Health (SFH).

The target for the AB messaging campaign is 3,645 individuals. In addition, age-appropriate abstinence only messaging and secondary abstinence messaging will be conveyed to children and adolescents, particularly focused on those orphans and vulnerable children receiving both facility- and home-based support. The target for this intensive activity campaign (condom and other prevention) is 7,197 individuals. Additional staffing and training of counselors will also be provided by this funding, including a dedicated full-time staff person. This activity will provide support for training of 112 individuals in AB messaging. An additional 99 individuals will be trained to promote HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful, including condom promotion and STD prevention.

EMPHASIS AREAS
ABC programming emphasizes local organization capacity building, human capacity development and efforts to increase gender equity in HIV/AIDS programs. These activities also promote a rights-based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Reduction of stigma and discrimination are also key to the program. Through ABC activities, we place major emphasis on community mobilization and participation, as an element of outreach for prevention efforts. Additionally, we place major emphasis on training as well as infrastructure and human resources in order to build the capacity of counselors and providers in a full range of prevention strategies. We also reinforce that information, education and communication are essential elements of outreach to high-risk populations, and that developing networks for linking these activities to HCT, PMTCT, and other ART activities serves as a source of prevention information.

These activities address gender equity issues by providing equal access to prevention services for men and women. In some cases, our activities seek to target men who may be at high risk for HIV in order to promote condom use as a means of prevention and access to services for their sexual partners. Male-targeted counseling seeks to address male norms and behaviors in order to encourage safer sexual practices. Strong prevention programs that accommodate the array of societal and cultural norms can also help reduce stigma and discrimination. The provision of such services at the community level will serve as an important platform from which general HIV/AIDS information can be provided and risk reduction strategies discussed.

POPULATIONS TARGETED:
Key populations targeted are the healthcare community in treatment facilities, PLWHA, youths and adults accessing HCT services at either static or mobile within catchment areas of the treatment sites, high-risk populations, support group members and immediate families of PLWHA. Other target populations include discordant couples, pregnant women and religious leaders. Targeting these populations is important to encourage safe sexual practices, HCT and other prevention measures. Health care workers will also be targeted for training on the most effective prevention measures for various risk groups.

CONTRIBUTION TO OVERALL PROGRAM AREA
These prevention activities are consistent with PEPFAR's goals for Nigeria, which aim to support a number of prevention strategies as a comprehensive prevention package. In order to be maximally effective, the prevention messages developed at different sites will be tightly targeted to various high-risk groups that they serve. Furthermore, these activities are consistent with the PEPFAR 5-year strategy, which seeks to scale-up prevention services, build capacity for long-term prevention programs, and encourage testing and targeted outreach to high-risk populations. The establishment of networks and referral systems from prevention efforts at the community level to PMTCT and HIV care and treatment will help facilitate the scale-up of the overall program. Additionally, the long term sustainability of the prevention portfolio is more assured as APIN, a Nigerian organization, assumes management responsibility for more sites previously managed by Harvard.

LINKS TO OTHER ACTIVITIES:
ABC activities relate to HCT, by increasing awareness of HIV. They also relate to adult and pediatric care and support activities through dissemination of information by home-based care providers and ultimately by decreasing demand on care services through decreased prevalence. Linkages also exist to OVC programming by targeting OVC. The provision of such services at the community level will serve as an important platform from which general HIV/AIDS information can be provided and risk reduction strategies discussed. This program area also links to Strategic Information (SI) as all progress will be monitored by the SI programming and to Gender as specific programs will be targeted to be gender-appropriate.

New/Continuing Activity: Continuing Activity

Continuing Activity: 22512
**Emphasis Areas**

- Gender
  * Addressing male norms and behaviors
  * Increasing gender equity in HIV/AIDS programs
- Health-related Wraparound Programs
  * Family Planning

**Human Capacity Development**

Estimated amount of funding that is planned for Human Capacity Development: $32,000

**Public Health Evaluation**

**Food and Nutrition: Policy, Tools, and Service Delivery**

**Food and Nutrition: Commodities**

**Economic Strengthening**

**Education**

**Water**

**Program Budget Code:** 03

**Planned Funds:** [Blank]
Activity Narrative: ACTIVITY DESCRIPTION:
These funds are to be used by the award recipients of the FY09 HHS/CDC RFA, with emphasis on local implementing partners, to implement the prevention of sexual transmission portfolio, specifically in the condoms and other prevention program, in new underserved areas in Nigeria. This will provide community outreach to an estimated 3,500 individuals identified as high risk for acquiring HIV and direct them into counseling and testing while promoting prevention through activities that include abstinence, being faithful, and appropriate and consistent use of condom messaging. The activities will focus on condom use in high risk populations and intervention or referral for sexually transmitted infection (STI) syndromic management, interventions regarding development of prevention skills, such as negotiating safer sex, and linkages to the provision of HIV counseling and testing (HCT) services. Community activities to engage most-at-risk populations (MARPS) will be supported through this award. The activities will focus on identifying MARPS and individuals who test positive within the local PEPFAR network of HCT/PMTCT (prevention of mother-to-child transmission)/DOTS (direct observed treatment for TB) services. Clients will be the focus of messages aimed at reducing HIV transmission in high risk populations, including correct and consistent condom-use messages. Existing support groups or associations of People Living With HIV/AIDS (PLWHA) will have access to condoms and be targeted with ‘prevention for positives’ messages (funded under care) and skills on positive living, to reduce transmission and re-infection. This activity will provide referrals to basic care and support services as well as anti-retroviral treatment services for those identified to be in need.

This activity will provide training to PLWHA as peer educators and lay counselors to promote HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful. This RFA will strengthen the developed sustainability plan both at program and country level and will collaborate with other existing implementing partners to build capacity and reach proposed indicators.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
This activity will increase local capacity to provide prevention services to most-at-risk populations.

LINKS TO OTHER ACTIVITIES:
This activity also relates to activities in Basic Care and Support, TB/HIV, HCT, and antiretroviral treatment. This activity provides community outreach to individuals identified as high risk for acquiring HIV and directs them into counseling and testing. Pregnant women who test positive will be referred to PMTCT services, and others will be referred into HIV treatment services as well as care and support services, as appropriate.

EMPHASIS AREAS:
This activity has an emphasis on gender equity and addresses male norms and behaviors.

TARGET POPULATION:
This activity will target MARPs, HIV positive pregnant women, and PLWHA.

COVERAGE AREAS will be determined when awarded and will reach underserved expansion states.

***The USG Nigeria team is proposing estimated targets in the narratives and not in the target tables in the COPRS for open solicitations for USAID APS and CDC RFAs. These solicitations have not been awarded at this time and targets will only be finalized and reflected in the target tables of COPRS after negotiations have been concluded and the award has been made.

Activity Narrative: The funds requested to support USAID's Annual Program Statement APS No. 620-08-002: Support for Civil Society Organizations/Faith Based Organizations Network to Provide HIV/AIDS Prevention, Care and Support Services) for this program area are required for awards made under this open solicitation.

Additive funding resources are required for new awards that are in progress and will be partially funded using COP08 funds. These applications have passed both the concept paper and full application reviews by the Technical Evaluation Committee (TEC) and are in the final stages of negotiation, with awards expected in early 2009. Details of these awards are still procurement sensitive; however awards are being negotiated with new local partners that will be awarded as Prime partners, partners whose prevention activities will continue throughout the COP09 funding period.

Second year funding resources are required to fund applications selected for award during the COP08 program period, but which are currently being negotiated. These applications have passed both the concept paper and full application reviews by the TEC and are in the final stages of negotiation, with awards expected in early 2009. Details of these awards are still procurement sensitive. However, these same partners will continue with activities throughout the COP09 funding period.

In conjunction with the open APS, a solicitation for concept papers is expected to be announced in February 2009. Resources will be required for the first year of funding for these applications which will be selected during the COP09 program period.

Funds that will be required to implement and continue these awards under the Sexual Prevention program areas are estimated at $495,000.

One of the cornerstones of the CSO/FBO APS is support to national/regional-level agencies that have many chapters or branches that can in turn reach out to community-based organizations. This will allow local programs to reach deep into communities and help the Emergency Plan in Nigeria expand its reach. The CSO/FBO APS was also created to build the capacity of local organizations working in HIV/AIDS because a significant number of Nigerian organizations are new, have little organizational capacity, and often lack linkages with other programs. The CSO/FBO APS will only fund applicants that have clear plans to build their own technical, organizational, and administrative capacities and clear linkages with other programs.

Community participation in HIV/AIDS prevention programs often provides a strong foundation for sustainable prevention interventions. The CSO/FBO APS will support rapid scale up of the reach and scope of existing prevention activities implemented by NGOs with larger networks or partners that enter into strong consortia. Grantees under the CSO/FBO APS will implement several of the following activities, depending upon their capacity and speciality: 1) scale-up skills-based HIV prevention education, with the involvement of parents and guardians, especially for younger youth and girls; 2) stimulate broad community dialogue on healthy norms, avoiding risk behaviors, and the importance of finding out one’s HIV status; 3) reinforce the protecting authority of parents and other primary caregivers; 4) address sexual coercion and exploitation of vulnerable groups, particularly young girls; 5) strengthen early prevention interventions based on abstinence until marriage for at-risk youth; 6) promote the image of successful, respected men as upstanding and faithful; and 7) find supportive leaders and role models at all levels who will promote being faithful and discourage coercion, alcohol abuse, and cross-generational sex. Messages that highlight the benefits of abstinence until marriage, and fidelity in marriage will also be integrated into counseling services. APs partners seeking C&OP programming support will also be expected to comply with the National Prevention guidelines for appropriate service delivery of condoms and risk-reduction messaging and interventions in line with the minimum package. Targeted outreach to MARPS will be expected. Applications from groups with the capacity and programming ability to provide a balanced prevention activity will also be encouraged.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: As has been the case with the APS in the past, targets are negotiated with each awardee based on the proposed program and demographic/geographic area during award negotiations and in accordance with specified minimum cost per targets. After being approved by the TEC, OGAC is copied on the award memo to the Contracts Officer to ensure that appropriate targets and associated costs have been negotiated. Targets and related awardee information will be uploaded into COPRS at that time.

Scaling up of prevention, involvement of PLWHAs and youth, and encouraging peer educators to work together with community health care providers will contribute directly to the interest of the US Global HIV/AIDS Strategy. The programs will increase the reach of prevention programs into rural areas in high prevalence states with a focus on underserved populations, while stimulating the demand for other HIV/AIDS related services offered by GoN and other USG partners.

This activity substantively contributes to Nigeria’s 5-Year Strategy by emphasizing youth, especially young women, and couples as a priority population for C&OP interventions; and developing strong links between prevention programs and other care and treatment programs.

LINKS TO OTHER ACTIVITIES: All partners will implement activities across the spectrum of program areas and are expected to provide clear linkages between their own activities. The grantees will be expected to link with multi-media activities, whenever possible, and to build on the new local partners to the current mix of partners providing prevention, care and treatment in Nigeria.

The overarching focus of the APS has been to bring new local partners to the current mix of partners providing prevention, care, and treatment in Nigeria. It has been successful in many ways; however, challenges related to local partners’ management capacity have slowed the process and have created uncertainties about their ability to implement in the accountable and transparent manner the USG requires of recipients. Therefore a project (Leadership, Management, and Sustainability [LMS]) added to the portfolio during COP07, will assist with improved management, accountability, transparency, and other capacity building activities. LMS will guide new partners through the solicitation and award process, as well...
Activity Narrative: as assist them to put accountable and transparent systems in place that allow their first year of implementation to proceed smoothly and ensure rapid achievement of results. Although the CTOs and activity managers for these new local partners remain within the USAID technical team, LMS is a key member of the extended team and provides invaluable support in developing the capacity of the new awardees. All of the local partners applying for APS funds can benefit from the management support being provided by LMS. In addition, LMS can provide technical assistance specifically in the area of Condom and Other Prevention programming, as many local partners may not have this type of institutional capacity at the time of award.

POPULATIONS BEING TARGETED: Final applications are subject to negotiation, but illustrative examples of targeted populations include: out-of-school youth; most at risk populations, religious and community leaders and opinion makers; commercial businesswomen; and community-based support groups.

KEY LEGISLATIVE ISSUES ADDRESSED: Illustrative examples of key legislative issues that have been proposed contain activities that will address male norms and behaviors, increase women’s rights, reduce violence and coercion, increase the use of volunteers, and decrease stigma and discrimination.

EMPHASIS AREAS: All awards resulting from the APS will be to local partners or have strong roots in the community and therefore all will have a major emphasis on Community Mobilization/Participation and Local Organization Capacity Building. The service delivery component of these awards will have a key focus on information, education, and communication in the community and will build linkages with other sectors and initiatives.

**Activity Narrative:** Pact, through its Community REACH project will continue to provide a mechanism for rapidly providing assistance, through grants, to local organizations that include but are not limited to non-governmental (NGO), community-based (CBO) and faith-based (FBO) organizations that have the potential to support both the USG objectives and those of the Government of Nigeria (GoN) in HIV prevention programming. In order to work towards sustainability, Pact would emphasize host country organizational capacity building and technical assistance as important elements of an effective sub-grant program. COP09 funding is provided in the sexual transmission prevention program area but as a result of this emphasis, indicator targets and reporting are to be found in the health systems strengthening program area.

In COP 09, Community Reach will address key gaps in abstinence, be faithful, and condom and other prevention (ABC) programming in Nigeria, such as: low capacity of local partners to implement large-scale programs; lack of a comprehensive package to promote abstinence, fidelity and related changes in communities and social norms; lack of FBO and CBO organizational capacity to implement high quality ABC prevention programming that will bring about effective behavior change interventions with harmonized messaging; poor coverage of rural areas with prevention programming; inadequate monitoring and supervision skills of implementing partners; weak community-based partners; too few programs that address the needs of adolescents, particularly females; and a paucity of programs that address youth who are transitioning from abstinence to becoming sexually active.

In COP08, ABC partners provided a recommended minimum package of services from a pool of established best practices to reach a target. These best practices include: the peer education model; “PEP plus” model; curriculum and non-curriculum based school programs, community awareness campaigns; and interventions that address age-appropriate income generation activities and essential life skills, among others. In COP08, partners utilized a minimum of three of these interventions to reach a target and these were reinforced with mass media activities. The minimum package of services ensures that the intended behavior change outcomes are achieved and provides a proxy tool for measuring targets reached with ABC services.

In order to both increase the capacity of local organizations to deliver HIV services and to expand the ability of the USG/Nigeria team to meet its PEPFAR goals for COP 09, the USG/Nigeria team has determined that it is necessary to add an additional capacity-building model to its current portfolio.

PACT will continue to mobilize and support community-based responses to ABC programming through an effective and transparent grant award and administration system for the provision of responsive, fast-track grant-making assistance to organizations responding to identified gaps in the ABC prevention program of Nigeria. PACT will also provide HIV/AIDS implementers with access to financial resources and high quality technical expertise to assist in achieving and effectively reporting results while complying with USG financial and administrative requirements and build sustainability through provision of technical assistance to local sub-grantees in their capacity to deliver quality ABC services at the grassroots level. The PACT Community REACH program aims to strengthen referrals and linkages for increased access to ABC programs through capacity-building of sub-grantees, fostering sustainability, and documenting evidence-based best practices, lessons learned and new approaches, tools, and methodologies by engaging with local sub-grantees and creating economic advancement opportunities through the active engagement of private or business sectors in workforce development for persons affected by HIV/AIDS and other caregivers.

PACT/Community REACH’s ABC program will also continue to focus on quickly mobilizing local/indigenous civil society organizations (CSOs), NGOs, and FBOs in the Southeast, North Central and South-South geopolitical regions of Nigeria to play essential roles in filling the gaps identified in the ABC Prevention services and provide grants to these grassroots organizations for comprehensive ABC services delivery according to OGAC guidance and in line with the government of Nigeria HIV Prevention Plan and the Nigerian strategic framework. Capacity building and service delivery capacity support will be provided to these organizations to enable them to be sustainable and to provide HIV/AIDS implementers with access to financial resources and high quality technical expertise to assist in achieving and effectively reporting results while complying with USG financial and administrative requirements and build sustainability through provision of technical assistance to local sub-grantees in their capacity to deliver quality ABC services at the grassroots level. The PACT Community REACH program aims to strengthen referrals and linkages for increased access to ABC programs through capacity-building of sub-grantees, fostering sustainability, and documenting evidence-based best practices, lessons learned and new approaches, tools, and methodologies by engaging with local sub-grantees and creating economic advancement opportunities through the active engagement of private or business sectors in workforce development for persons affected by HIV/AIDS and other caregivers.

PACT/Community REACH will identify, map and provide grants to established CSOs formed from ongoing prevention program efforts and provide technical support to enhance their ability to continue providing behavior maintenance activities in their rural communities.

Specific programmatic gaps that PACT/Community REACH will address include: mobilization of funding and sub-granting to these organizations for ABC services provision; and assistance to indigenous CSOs, CBOs and FBOs in the Southeast, North Central and South-South geopolitical regions of Nigeria to play essential roles in filling the gaps identified in the ABC Prevention services and provide grants to these grassroots organizations for comprehensive ABC services delivery according to OGAC guidance and in line with the government of Nigeria HIV Prevention Plan and the Nigerian strategic framework. Capacity building and service delivery capacity support will be provided to these organizations to enable them to be sustainable and to provide HIV/AIDS implementers with access to financial resources and high quality technical expertise to assist in achieving and effectively reporting results while complying with USG financial and administrative requirements and build sustainability through provision of technical assistance to local sub-grantees in their capacity to deliver quality ABC services at the grassroots level. The PACT Community REACH program aims to strengthen referrals and linkages for increased access to ABC programs through capacity-building of sub-grantees, fostering sustainability, and documenting evidence-based best practices, lessons learned and new approaches, tools, and methodologies by engaging with local sub-grantees and creating economic advancement opportunities through the active engagement of private or business sectors in workforce development for persons affected by HIV/AIDS and other caregivers.

**CONTRIBUTIONS TO OVERALL PROGRAM AREA**

This program will contribute to PEPFAR goal of capacity development and system strengthening of local and indigenous organizations for provision and sustenance of HIV prevention activities. It also contributes to increased coverage and reach of the PEPFAR prevention program to the most in need (rural areas and grass root populations).

**LINKS TO OTHER ACTIVITIES**

Activities will be linked to Human Capacity Development, Gender, HCT, PMTCT, TB HIV, treatment, care and SI.

**POPULATIONS BEING TARGETED**

The target populations for these activities will include individuals in the rural areas reached by local and grass root indigenous organizations offering ABC prevention services in these rural areas. Population will include men, women, youths, children and PLWHAs in the rural areas.

**New/Continuing Activity:** New Activity

Nigeria Page 378
Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

This activity also relates to activities in ARV and HCT.

In line with the provisions of the PEPFAR/CDC COP 08 funding requirements, Population Council (PC) will provide abstinence/be faithful (AB) and other prevention (OP) services to male most-at-risk populations (MARPs) through community awareness campaigns, peer education models, school based curricula, including a ‘Men as Partners’ curriculum that stresses male involvement in prevention activities and explores definitions of gender roles, and other services, such as HIV counseling and testing (HCT) and sexually-transmitted infection (STI) management. This shall be provided through a multi partnership with Action Health Incorporated (AHI), Africa Regional Sexuality Resource Center (ARSRC), Alliance Rights Nigeria (ARN), and The Independent Project (TIP). The overall framework of the program targets the male MARPS in Lagos, Ibadan (Oyo State), and Abuja (FCT).

In COP08, Population Council initiated the Men’s Health Network (MHN), a consortium of three key partners, including AHI, ARSRC, and ARN. To ensure the long term sustainability of the project, MHN is structured as a multi-donor social franchising model utilizing both private and public sector service delivery points to provide STI, HCT, and targeted condom/lubricant provisioning to high risk men (MARMs), particularly men who have sex with men (MSM). During COP08, the project identified and trained 24 service providers in three intervention locations – Lagos, Ibadan (Oyo), and Abuja (FCT) – with skills development, certified training in STI syndromic management, and HCT. Concurrently, a network of key opinion leaders (KOLs) functioned as peer educators to stimulate demand for clinical services among MARM/MSM. In addition, a peer education and diversity training curriculum was developed using the ‘Men as Partners’ approach and delivered in an age/gender specific manner to MARM/MSM, as well as adolescent boys and girls for AB prevention. A minimum of 18 KOLs were trained and deployed across the 3 sites. By the end of COP08, the project successfully delivered AB prevention using the proscribed minimum package to 16,000 beneficiaries. The condom and other prevention (C&OP) minimum package was delivered to 10,000 beneficiaries.

In COP 09, Pop Council’s sexual prevention activity is limited to 3 sites and consists of several inter-related components: 1) the promotion of abstinence and fidelity for male adolescents and targeting MSM with “be faithful” messages, as part of a comprehensive male involvement curriculum addressing homophobia and violence; 2) increasing demand for and availability of condoms and other prevention activities, including STI management to MSM and their male and female partners; 3) providing clinic and community-based HIV care and treatment to MSM in a culturally and gender-sensitive manner; and 4) supporting a network of opinion leaders to advocate on behalf of MSM for increased awareness and sensitivity among service providers, community leaders, and police, toward increased access and utilization of HIV prevention and STI management.

Nigeria has a population of approximately 140 million people with an adult HIV prevalence of 3.1% (UNAIDS July 2008 estimate). MARPS continue to serve as “reservoirs” of the HIV infection, thereby fuelling the epidemic in Nigeria. This group includes female sex workers (FSW), MSM, injection drug users (IDU), long distance truckers, uniformed professionals, and others whose practices and sexual networks put them increased risk of contracting and spreading sexually-transmitted infections (STIs).

The 2007 IBBSS shows varied overall HIV prevalence among MARPS with MSM having the second highest prevalence of 13.5% (25% in Lagos) compared to 25% among FSW. MSM are a particularly at-risk population in Nigeria. The MSM community is socially stigmatized and receives scant services to promote healthy sexual behavior and HIV/STI prevention. In Nigeria, nearly all informational education messages focus on heterosexual transmission of STI/HIV, and MSM are not sensitized to their own risk for contracting an STI. In addition, health professionals are largely unaware of their special needs. It is therefore paramount to include MSM in programs to prevent HIV/AIDS, since they are at high risk for HIV/STIs but are historically ignored by prevention campaigns and limited in their access to sexual health services.

The AB component of this intervention will include raising community awareness targeting MARPs including MSM, as well as young people in general with generic community dialogues, peer education through the use of social networks, and additional peer education through the use of role models. Project activities include: conducting male involvement peer education sessions at the community level targeting young adolescents with ‘AB’ messages; conducting peer education sessions at the community level targeting MSM with ‘B Only’ messages; conducting male involvement peer education sessions at the community level targeting young adolescents with ‘A only’ messages; developing a male involvement AB curriculum using AB prevention messages and gender roles, sexual rights, violence mitigation/avoidance training targeting adolescent boys; and training key opinion leaders (KOLs) in male involvement AB curriculum and management of peer education sessions.

In COP09, the project will reach 13,182 men and women with AB community outreach activities comprised of the minimum AB package. At the end of COP09, 3,295 individuals will be reached through abstinence only messages. KOLs among the MSM will be trained as both peer educators and role models, and as facilitators to map MSM social networks. Population Council has developed a comprehensive behavioral change communication (BCC) model comprising ‘Men as Partners’ (MAP) curriculum, which will also explore behavior change and safe sex practices through small group discussions, inter-personal communications, and community dialogues. A total of 48 individuals will be trained to promote MAP AB messaging through a gender-sensitization curriculum aimed to reduce male gender roles promoting violence, alcohol consumption/abuse, and sexual risk-taking. A beneficiary is considered ‘reached’ upon having participated in three of the following planned activities: community awareness campaign; peer education models; school-based approaches; peer education plus; and/or workplace programming.

The C&OP component of this intervention will include: activities to increase demand for prevention activities among MSM in Nigeria; the identification and mapping of 9 social support networks; identification, training and support of 27 opinion leaders promoting prevention and care-seeking behavior through BCC messages;
**Activity Narrative:** Identification of 27 MSM-friendly provider networks offering services to MSMs; and the creation and support of 9 outlets to distribute and promote the correct and consistent use of condoms and lubricants to persons engaged in high-risk behaviors. This program will train healthcare providers to provide HCT, STI management, and condom and lubricant distribution in a gender sensitive manner. It will also engage the mass media in promoting men’s health through TV and radio jingles. Quality assurance and quality improvement for STI syndromic management will be performed among public and private laboratories affiliated with the project, although no direct laboratory funding is provided under this agreement.

Population Council will aim to deliver these services through a comprehensive community HIV prevention package, in which clients receive IEC materials, condom and lubricants, interpersonal communications, and STI services, while community awareness sessions will also include focused small group discussions (SGDs), dialogues, workshops (MAP), and consolidation of ABC messages. In addition, 9,848 individuals will have been reached through local-language community outreach that promotes HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful; 27 individuals will have been trained in local languages to promote HIV prevention through behavior changes beyond abstinence and/or being faithful; and 2500 clients will have been treated for STIs using nationally approved syndromic management guidelines. A beneficiary is considered ‘reached’ with OP activities upon having participated in three of the following planned activities: community awareness campaigns; community outreach that provides condoms and lubricants; peer education models; workplace programming; and STI syndromic management and provision of pre-packaged STI therapies.

The AB and C&OP components to this program provide a vital linkage to onward referral services for OP program areas, specifically for men engaged in high risk practices. Access to quality HCT, STI and other health services will improve through the establishment of an MSM-friendly network of healthcare providers. In the first year, three public and private sector clinics were selected and shaped into MSM-friendly clinics. In subsequent years, the project will expand by 25% per year in terms of number of clinics and cities. Policy-level interventions are not specified in this activity; however, significant engagement with NACA, CISHAN, and complementary donors is essential to gradually move forward with rights-based agendas to support protection of services to MSM.

**CONTRIBUTIONS TO OVERALL PROGRAM AREA:**
These activities contribute to the COP09 targets by reaching at least 13,182 individuals through community outreach that promotes HIV/AIDS prevention through abstinence and/or being faithful individuals and 9,848 individuals through other behavior change beyond abstinence and/or being faithful. This is consistent with PEPFAR’s 5-year Strategy for averting new infections in Nigeria.

**LINKS TO OTHER ACTIVITIES:**
This activity relates to Counseling and Testing and ARV. This service will also complement HCT services for those who ultimately test HIV negative. Through this program as well as basic care and support, Population Council will ensure access to quality HCT, STI and other health services through the establishment of an MSM-friendly network of healthcare providers.

**POPULATIONS BEING TARGETED:**
This activity will target adolescent and key opinion leaders (KOLs) and youth, as well as female sex workers (FSW), MSM, injection drug users (IDU), long distance truckers, and uniformed professionals. This program will train healthcare providers to provide HCT, STI management and condoms and lubricant distribution in a gender sensitive manner. It will also target males (both in- and out-of-school) within and around the target group communities, such as male spouses, friends, neighbors, and fiancés.

**EMPHASIS AREA:**
An emphasis area for this activity is human capacity development through a comprehensive community HCT package in which clients receive IEC materials, condom and lubricants, interpersonal communications, and STI services. Messages are reinforced through community awareness sessions, focused small group discussions, community dialogues, and workshops such as the MAP activity. Other emphasis areas include gender and reduction of stigma and discrimination.

Activity Narrative:

Rivers and Cross River are two out of six states within the south-south geo-political region of Nigeria with high oil exploration and tourism activities. The south south geo-political region is most negatively impacted by the HIV/AIDS pandemic. The National AIDS and Reproductive Health Survey (NARHS 2005) revealed that this region had the highest prevalence of transactional sex and multiple sexual relationships with marital and non-marital partners. This region also had the highest number of individuals who had sex with non marital partners in 12 months preceding the survey. Two-thirds of women located in this region had more than one sexual partner in 12 months preceding the survey. The south-south region also had the highest rate of non-marital non-cohabiting sexual relationship in the country, including both heterosexual relationships and men who have sex with men (MSM). In addition, the south-south region has the worst stigma and discrimination national figures for family and non-family members who are living with HIV/AIDS.

In the Nigerian Sentinel Survey of 2005, the south-south region had the second highest rate of HIV prevalence (following the north-central region).

Drivers of the HIV epidemic in the south-south region include high levels of transactional sex, poverty, cross generational sex, multiple partnering, oil glut and attendant liquidity, tourism, social insecurity, high cost of living, and cultural practices and festivals (e.g., the New Yam Festival). Secondary school-based studies in the region indicate that 22.6% of sexually active female adolescents had multiple sexual partners, with age at sexual debut at 14 years. Cross River State, with its rapid emergence of tourism (the Tinapa free trade zone and resort, for example) is likely to show increased sexual networking. In Rivers state, only 6.2% of sexually active individuals consistently and correctly use condoms with their partners. High risk behaviors have been found in the Niger Delta region, with about half of 15 to 22 years engaged in casual sex with commercial sex workers (CSWs) without condom. Peer pressure influence to engage in sex, unfavorable socio-cultural factors, gender norms, and low socioeconomic status are identified risk factors for early sexual debut, multiple partnerships and cross generational sexual activity in this region. Early sexual debut was common among uneducated female rural dwellers.

In view of the above, Pro Health International (PHI) seeks to establish sustainable behavior change among the target population of youth (15 – 25 years of age) in Rivers and Cross River states of the south-south region. Specific targeted behaviors include: delayed first sex; limited sexual partners; and correct and consistent use of condoms. This will be done through messages on abstinence and fidelity in addition to facilitating increased knowledge of HIV/AIDS, risky sexual behaviors and risk personalization, and also through instituting interventions that encourage community-based normative changes to provide a congenial environment needed for sustained behavior change.

The behavior change objectives will be achieved using the minimum package intervention strategies of peer education, community- and school-based HIV clubs, and interpersonal communications targeting out-of-school and in-school youth with abstinence/be faithful (AB) messaging. Small group discussions, rallies and advocacy interventions at the community level and the formation of community based organizations will be used to address normative changes to support behavior change.

Pro Health’s condoms and other protection (C&OP) strategy for COP09 is a peer-led, containment strategy targeted at PLWHAs within the community based on the premise that preventing a positive person from transmitting the virus is the most effective way to avert new infections through sexual transmission. The HARPIN sexual prevention program for COP 09 will have 4 intervention components; peer education plus (PEP); interpersonal communication; formation of community based HIV clubs; and community awareness campaigns/rallies targeting out-of-school in line with the minimum package as recommended by the National Prevention Plan. Peer education trainers (PETs) will be identified and trained with the Society for Family Health (SFH) PEP manual for out-of-school youth. Other in house trainings on volunteer management, advocacy and communication for social change, adolescent psychology, cultural and social studies, financial and administrative management will complement the PEP training. These trainings are geared towards building peer education specialists within and build the requisite environmental framework for achieving sustainable behavior change through the minimum package for sexual prevention. PETs will select 5 out of school peer education groups (PEG) in each LGA using a participatory approach at open community meetings. The out of school PEGs will be trained for a period of 6 months and then be required to reach their peers.

Peer educators will organize small discussion groups of their peers to discuss topics related to personal life and experiences. These discussion groups will be branded ‘Club ABC’ and develop later into community based organizations (CBOs). Peers will be reached individually with interpersonal communication as well. Local CBOs already involved in HIV/AIDS prevention will also be engaged in reaching the community.

The second component is peer education for in-school youth. They will be reached with the UNICEF Peer Education training manual, small group discussions, and school based HIV/AIDS clubs. 5 schools in each LGA will engage in the peer education program. Support from the State Ministry of Education will ensure that schools with ongoing interventions are prioritized. PETs will then train PEs who will reach peers with AB messages. In addition, peers will be required to form small discussion groups around HIV/AIDS topics and issues relating to personal life and experiences. At about the sixth month of the program, the in-school peers and peer educators will then form a school based club branded as ‘High Flyers Club’. In all, one thousand (1000) peer educators will be trained to reach twenty seven thousand two hundred and seventy three (27,273) of their peers (13,637 males and 13,636 females).

The third component involves advocacy for community level normative change, community participation and stigma reduction, with the consent and participation of relevant stakeholders. The state ministries of health, education, youth and sport, and social welfare will be informed and their consent and support sought to engender acceptability and participation. The local government councils will be visited to advocate support, commitment and eventual ownership of the program. Traditional leaders will be visited to canvas their support and permission to reach people with the programs. Other stakeholders in the community will be visited to rally their support and seek avenues through which the whole community can be reached.
Activity Narrative: Two advocacy officers (AOs) will utilize avenues, such as town meetings, trade union meetings, church services and gatherings, youth meetings, women groups, interest groups and other meetings within the community to facilitate discussions about stigma and discrimination against people living with HIV/AIDS (PLWHAs). These meetings will provide an atmosphere for open discussions on HIV/AIDS in the communities. The AOs will provide information on the magnitude of the HIV/AIDS problem and the community’s ability to fight it. The AOs will additionally stimulate community discussions on cultural issues that fuel the HIV pandemic (e.g., sexual coercion, cross-generational sex, transactional sex and sexual abuse) through focused discussion group sessions, interpersonal communications, and other mechanisms. These meetings will target communities that are in close proximity to Pro Health International’s (PHI) service provision points.

The fourth component will foster behavior change among PLWHAs to avert new infections. PLWHAs will be supported to adopt safer sexual behaviors as part of a comprehensive prevention approach. HARPIN will target PLWHAs and other youth in their communities with awareness campaigns that include rallies and interpersonal communication, peer education models using PLWA peer groups and age appropriate balanced ABC messaging and referrals to medical services. PLWHAs will be trained as PEs to provide information on various topics, including positive living, nutrition education, treatment education and adherence, sexually-transmitted infection (STI) counseling, and referrals to medical services, including HIV counseling and testing, PMTCT services and management of opportunistic infections. Trained PLWA will reach other PLWA/high risk persons with messages. There will be rallies in collaboration with other support groups aimed at reducing stigma and discrimination associated with HIV/AIDS. Advocacy visits will be made to relevant stakeholders and opinion leaders to introduce and solicit their support for the project. A total of 9,697 PLWA (4,849 males and 4,848 females) will be reached through 100 trained PLWHAs.

Recognizing that HIV/AIDS care and treatment settings serve as strategic entry points for reaching large numbers of HIV-infected people, the HARPIN project will continue to engender linkages between community based prevention efforts targeting PLWA and clinic-based, provider-delivered intervention to help prevent the spread of HIV and also protect the health of PLWA. Training will be provided to healthcare providers in selected sites to provide routine care and treatment to HIV-positive patients and deliver important health information and preventive medical care, including treatment and/or referrals for STIs and family planning services. Health care providers will be supported to assess patients’ risk and provide targeted prevention recommendations, which encourage sex partners to get tested, disclose HIV status to sex partners, abstain from sex or reduce the number of sex partners or maintain fidelity to one partner, use of condoms during each sex act and appreciate the consequences of having sex without a condom, and understand the relationship between alcohol use and how it affects adherence and increased risky behavior. Cross referrals will be provided between facility based interventions and the community based interventions to provide a continuum of care for PLWA, expand program reach, and encourage and sustain behavior change. One condom outlet for PLWHAs will be established for each of the six local government areas where this intervention will be implemented.

Contribution to overall program area:
The HARPIN Project’s activities will address specific behaviors among youth with the aim of attaining positive and sustained behavior change in terms of primary/secondary abstinence practice, faithfulness to partners and correct and consistent use of condoms. The AB program will specifically provide knowledge of abstinence skills amongst youth, while prevention with positives interventions will contribute to containment of the disease by reducing transmission, re-infection or increased viral load among PLWA. This will contribute to strengthening and expanding the capacity of the GON’s response to HIV/AIDS epidemic and achievement of PERFAR goals of preventing 1,145,545 new infections.

Population being targeted:
Two primary population groups will be targeted in these sexual prevention activities. The first group will include young men and women (15-24 years old) while their corresponding figures-of-influence (parents, teachers and religious leaders) will be our secondary target. The second primary target group consists of PLWHAs, while their discordant sexual partners will be the secondary target audience in this category.

Emphasis area:
The emphasis areas for this program area are human capacity building and gender balance. Emphasis will be on building local capacity to ensure sustainability. CBOs within the community will be involved in programs to improve their knowledge and exposure in program design and implementation.

Key legislative issues:
Key legislative issues addressed include stigma and gender, with an emphasis on community norms that discourage stigma on PLWHA and enhance women’s ability to access and utilize information on HIV/AIDS.

Link To Other Activities
The AB and C&OP activities carried out under PHI are linked with the organization’s PMTCT activities and free healthcare efforts (with other funding).

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

Abstinence and Be Faithful (AB) activities will focus on behavior change, risk reduction, partner reduction, and a reduction in dependency on transactional sex work among brothel based commercial sex workers (CSWs) through provision of income generating activities (IGA) aimed at providing alternative income and motivation for leaving sex work. The AIM Project will continue to implement AB activities in partnership with indigenous organizations (non-governmental, community-based, and faith-based organizations [NGOs, CBOs, FBOs]). In conformity with the recommended AB prevention strategy, CSW will be reached with a minimum package of three services from a pool of established best practices. The three strategies selected by the AIM project for the HIV prevention include community awareness campaigns, peer education and on-the-job support for peer educators, interventions addressing vulnerability issues such as IGA, and essential life skills. These activities are aimed at reinforcing HIV prevention messages and services towards behavior change.

The AIM Project will continue to strengthen the capacity of its indigenous partner NGO/CBO/FBOs to implement HIV prevention services and facilitate behavior change among 2600 CSWs in its 15 PEPFAR states. Winrock AIM project expansion strategy responds to the HIV/AIDS epidemic by aiming at saturation, which is guided by prevalence and concentration of target population. The AIM project targets CSWs and out-of-school youth within selected communities. Priority is given to states with high HIV prevalence and a significant number of CSW and out-of-school youth. The fifteen states selected are: Adamawa, Anambra, Bauchi, Benue, Borno, Cross River, Edo, Imo, Kano, Lagos, Nassarawa, Niger, Oyo, Plateau and FCT.

Community Awareness Campaigns: The AIM Project will facilitate focus group discussions (FGDs) to assess the prevailing knowledge, attitude, behavior and practices (KABP) of sex workers towards HIV prevention within their communities. Community dialogues will be conducted to provide reinforcing messages on HIV prevention. AB messages will be collected or reproduced from other USAID implementing partners (IPs), such as Society for Family Health (SFH), and be disseminated to at least 2600 CSWs in the 15 states. Community awareness activities will also address issues of stigma and discrimination as well as the need for greater involvement of people living with HIV/AIDS (PLWHA) into all productive spheres of the community. Gender roles and vulnerability to HIV transmission as well as its impact on individuals, families and communities will also be addressed through the community awareness activities.

Peer Education (PE): At least 150 volunteer/former CSWs will be identified and trained as peer educators using the SFH and Government of Nigeria (GON) approved peer education (PE) model to encourage and sustain behavior change among CSWs. The volunteer/former CSWs will be trained on HIV prevention and interpersonal communication skills to promote accurate information on HIV transmission and prevention, partner reduction, correct and consistent condom usage, and life skills. Peer educators will visit CSWs regularly on a one-on-one basis to discuss, educate and disseminate HIV prevention messages. In addition to the training provided using the PE model, a standard set of HIV prevention messages will be provided to each peer educator, which will serve as guidance to ensure that each CSW receives similar, appropriate, accurate and balanced prevention messages. Each peer educator will monitor and report on their activities monthly. Furthermore, in view of the needs of this target group, peer educators will access and provide condoms during their visits and make referrals to other fixed condom outlets around the brothel.

Vulnerability Issues: The AIM Project will support IGAs to promote alternatives to commercial sex. Under this strategy, the AIM partners will train 2600 CSWs on vocational skills towards alternative means of sustaining livelihoods, such as bead making, tailoring, hairdressing, and food processing. The sex workers will also be trained in basic business skills that include how to record income and expenses, determine profit, set prices for their sale items, and encourage savings. Of the 2600 sex workers trained, sex workers who demonstrate a commitment to dropping out of the sex trade will receive small in-kind grants of up to $200 designed to stimulate an alternative source of income. The source of income generating grant will be referred to micro-finance institutions to access micro-loan services. Winrock International will facilitate the access of this micro-loan through training on business plan development and orientation on how to manage micro-loans. All 2600 CSW trained will receive essential life skills training that will include communication skills, decision making, problem solving, and condom negotiation in order to build their self esteem and to sustain behavior change. The AIM Project will collaborate with other USAID/PEPFAR partners and GON agencies to provide CSWs access to STI management, treatment, care and support services.

Condoms and Other Preventions: In COP 09, the AIM Project plans to reach individuals with balanced ABC messages in its 15 PEPFAR states. The AIM Project in partnership with indigenous NGO/CBO/FBOs will use several prevention strategies focused on behavior change, adoption of safer sex practices and provision of condom education among out-of-school-youth (OSY), particularly barbers and hairstylists. In the northern part of Nigeria, the project will reach out to tradition barbers (“Wanzamai”) and provide them the HIV prevention services. The AIM Project partners will be encouraged to conduct advocacy visits to key community stakeholders, including barbers, hairdresser and traditional barber associations, community, religious and political leaders to create an enabling environment for project implementation and ensure community participation and ownership of the project.

Through its local partners, the AIM Project will implement the condoms and other prevention program by providing a minimum package of three services from the GON National HIV/AIDS Prevention Plan of 2007, and the HIV/AIDS National Strategic Framework for Action 2005–2009 and established best practices for behavior change communication (BCC). The three strategies selected by the AIM Project for the HIV prevention includes: (1) specific population awareness campaigns; (2) structured peer education based on GON approved training curriculum, refresher trainings and on-the-job support for peer educators; and (3) community outreach that promote balanced ABC messaging, condom messaging and distribution.
**Activity Narrative:** AIM Project will utilize the following three strategies to implement behavior change activities and the adoption of safer sex practices amongst 13,000 barbers, hairstylists and traditional barbers.

Specific Population Awareness Campaigns: AIM partners will facilitate focus group discussions (FGDs) to obtain baseline data and assess the prevailing knowledge, attitude, behavior and practices (KABP) regarding HIV prevention within their communities. In addition, community dialogues will be conducted to provide reinforcing messages on HIV prevention. Appropriate information, education and communication (IEC) materials for out-of-school youth will be collected or reproduced from other USAID IPs and disseminated to at least 13,000 OSY in the selected 15 states. In addition to the balanced ABC prevention strategy, issues of stigma and discrimination, and greater involvement of PLWHA into all productive spheres of the community will be addressed.

Peer Education Model: AIM Project will select at least 300 barbers, hairstylists and traditional barbers to be trained as volunteer peer educators using the GON approved peer education curriculum. These barbers and hairstylist will be trained on interpersonal communication to promote HIV prevention that includes negotiation, assertiveness, decision making, problem solving, condom messaging, and facts and myths of HIV/AIDS. They will also be role models and positive peer models. Age appropriate prevention messages will be disseminated to reach at least 13,000 barbers, hairstylists and other out-of-school youth. Each peer educators will monitor and report on their activities monthly. Furthermore, in view of the needs of this target group, peer educators will access and provide condoms during their visits and make referrals to AIM project existing fixed condom service outlets (e.g., barber shops and hair salons).

Community Outreach: The AIM Project will encourage beneficiaries to go for counseling and testing services. In addition to balanced ABC messages, beneficiaries will receive condom demonstrations and distributions. AIM Project will acquire condoms from USAID IPs, such as SFH, that will be supplied to the partners for distribution through at least 150 fixed condom outlets (barbershops and hairdressing salons) in the 15 states through focal persons and peer educators in barbershops, hairstylist salons and other appropriate service outlets. The AIM Project anticipates acquiring about 90,000 units of condoms from SFH.

**POPULATIONS BEING TARGETED**
Targeted populations include commercial sex workers and out-of-school youth (particularly barbers, hairdressers, and traditional barbers).

**CONTRIBUTION TO OVERALL PROGRAM AREA**
The AIM Project will increase capacity of NGO/CBO/FBOs and communities to disseminate accurate information on HIV/AIDS prevention and the number of individuals trained to disseminate balanced ABC HIV Prevention messages, and consequently contribute in building HIV/AIDS competent communities.

**LINKS TO OTHER ACTIVITIES**
AIM project’s AB and C&OP activities are linked to OVC activities and to other PEPFAR USG Partners’ activities to ensure strong referrals to comprehensive prevention, care and treatment services.

**New/Continuing Activity:** Continuing Activity
**Continuing Activity:** 13174

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:
As we have now split the APIN+/Harvard activities between Harvard University and APIN, Ltd., our activity narratives are amended to reflect activities that will be performed specifically by the efforts of Harvard through the APIN+ Program as opposed to APIN, Ltd. (which has submitted a separate narrative under the name APIN). In addition, APIN will be taking over all activities of the Nigerian Institute of Medical Research (NIMR), Lagos University Teaching Hospital, Onikan Women's Hospital, and Mushin General Hospital; thus, those sites and their respective patients will drop out of the Harvard numbers and will be reflected in the APIN narrative.

NARRATIVE:
In COP09, Harvard will continue to provide sexual prevention programming activities in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals reached, thereby improving the effectiveness of this messaging, through a balanced portfolio of prevention activities including abstinence and be faithful messaging (HVAB) along with condoms and other prevention (HVOP). By the end of COP08, Harvard will have assisted PEPFAR Nigeria in extending its reach of ABC services to 9 states, including Benue, Borno, Enugu, Kaduna, Lagos, Ogun, Plateau and Yobe. Through its other program areas, Harvard has a large population of HIV-positive clients to whom it is already providing age appropriate ABC messaging and prevention with positives (PwP) services, which include STI screening and management, condom provision, sexual risk reduction, disclosure, adherence, reduction of alcohol consumption, and testing of sex partners and children in the HIV clinic setting. In addition, Harvard will target activities to HIV negative persons in its catchment areas in order to minimize their risk behaviors and contribute to an overall reduction in HIV prevalence.

In COP09, Harvard will implement ABC activities at both the facility and community levels by utilizing the minimum prevention package strategy as contained in the National Prevention Plan. This package includes: community outreach campaigns; peer education; infection control activities; and STI management/treatment. The goal of the program is to focus on targeted communities for saturation with messages conveyed in multiple forums. Utilizing such methodology, a large number of people will be reached with messages received via one method or another, but the target group will be those individuals that will have received HVOP messaging on a regular basis and via at least 3 of the 4 strategies Harvard will employ.

HVAB activities conducted at the local level by Harvard will be reinforced through national level mass media campaigns by other USG partners, such as the successful Zip-Up campaign. HVAB messages promoting abstinence, mutual fidelity, and addressing issues of concurrent and multiple sexual partnerships will be balanced with condoms and other prevention messaging, where appropriate, and will be integrated with treatment and care services at 66 sites and implemented by 2 stand-alone HCT providers.

Youth or young adults aged 15-24 years represent a key age group for HVAB activities, as they are the highest prevalence age group (2005 ANC survey). In addition, the 2005 National HIV/AIDS and Reproductive Health Survey (NARHS) demonstrated a low risk perception (28%) among the general population and significant reports of transactional sex (11%) among young women aged 15-29 years. Harvard will reach these beneficiaries through community awareness campaigns, peer education models, and ‘peer education plus’ activities.

Harvard collaborates with community-based organizations (CBO) and with persons living with HIV/AIDS (PLWHA) support groups at its facilities and surrounding communities in other PEPFAR programming activities. These support groups and CBO also serve as appropriate partners in the dissemination of ABC messaging to other PLWHA using the peer education model, and to wider audiences through the peer education plus model and community awareness campaigns. These support groups provide key community linkages for prevention of mother-to-child transmission (PMTCT), palliative care and antiretroviral treatment (ART) services. Support group activities will inform and educate HIV-infected individuals (funded under basic care and support [BC&S]), as well as community outreach to high risk populations to encourage HCT and healthy behaviors, such as partner notification and condom use. For HIV-negative individuals, trained counselors will provide education on HIV/AIDS transmission, risks, and risk reduction strategies, including HIV testing. To address stigma issues and in compliance with the GIPA principle, approximately 10 PLWHA from the pool of those receiving treatment at facilities who are living openly and positively will be trained using the peer education model to disseminate ABC messages. They will serve as peer educators to extended family members and members of their support groups. These trained PLWHA will in turn reach individual cohorts of at least 10 other persons from among their social peers. With 63 facilities (including PMTCT sites), this will serve as an effective tool for reaching individuals in at least as many communities with balanced ABC messages.

A community awareness strategy will also be employed to serve the catchment areas of the hospital facilities, which will be linked with community mobilization efforts promoting HCT. During static and mobile HCT services, counselors will disseminate balanced ABC messages to recipient communities and clients through focused, small-group discussions and interpersonal communication. The key messages that will be conveyed are delay in sexual debut, secondary abstinence, mutual fidelity, prompt and complete treatment of all STIs, and promotion of need to ascertain HIV serostatus through HCT.

Several Harvard sites target most-at-risk populations (MARPs), including outpatient STI patients, border traders, military personnel, young male market agents, and motor mechanics. A prevention program for young male market agents has been established through the Association for Reproductive Family Health (ARFH) NGO. HaltAIDS, a community based-NGO in the poor community of Tudun Wada in Jos, has an established community HCT center, which currently provides prevention messages, condoms and HCT to 150 community members per month. Prevention activities at these clinics provide risk-tailored educational materials and distribute condoms. In addition to comprehensive counseling on HIV prevention and risk reduction, HIV-infected individuals identified through this activity are referred for palliative care and evaluation for ART eligibility. An emphasis on reaching high-risk men also enhances prevention efforts and facilitates access to their partners. This funding will support...
Activity Narrative: the implementation of behavioral interventions for MARP at stand-alone HCT centers, the development of educational prevention materials developed by ARFH and HaltAIDS and referral for STD diagnosis and treatment. Where appropriate, Harvard will build site capacity for STI syndromic management. Additionally, in Jos, we collaborate with Mashiah Foundation, a faith based organization which provides palliative care services for HIV-infected women and OVC. Mashiah also conducts mobile community outreach for HCT and provides ABC prevention messaging to the populations that it serves.

Harvard will also use the peer education model to target job peers who are healthcare workers. Healthcare workers at each site will be trained using established National peer education curricula and each will be requested to form peer groups of approximately 10 members from the healthcare worker community for dissemination of balanced ABC messaging. It is anticipated that these healthcare workers will continually serve as conduits for age appropriate prevention messaging not only for their work peers, but also for their social peers and all clients with whom they come in contact.

A focus of the program in COP09 will be continued improvement of the integration of prevention activities into the HIV care and treatment settings. Healthcare providers and lay counselors in these settings will be trained to appropriately deliver integrated ABC prevention messages and incorporate the messages into routine clinic visits using IEC materials and job aids. An appropriate balance of ABC will be tailored to the needs and social situation of each individual client in its presentation. Additionally, prevention activities will be incorporated into other points of service in each health facility (general outpatient clinics, emergency services, etc.), particularly into reproductive health services, including, family planning counseling, STI management and counseling, and risk-reduction counseling. Harvard supported sites will integrate prevention with positives (PwP) activities including: adherence counseling; syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and behavioral counseling to achieve risk reduction; counseling and testing of family members and sex partners; counseling for discordant couples; and IEC materials and provider delivered messages on disclosure. These interventions will be implemented using the recently adapted HIV Prevention in Care and Treatment Settings Prevention Package.

This funding will be also used to support the procurement and distribution of written prevention messages and condoms. These materials will provide patients and clients with HIV prevention information using the “ABC” model, including information about healthy behaviors, safer sexual practices, PMTCT, and condom usage. Prevention messages will also include information about other STIs. Condoms will be offered to all individuals at all sites and will be procured by Harvard from the Society for Family Health (SFH).

The target for the AB messaging campaign is 4,355 individuals. The target for the intensive campaign activity in other prevention strategies is 35,106 individuals. Additional staffing and training of counselors will also be provided by this funding, including a dedicated fulltime staff person. This activity will provide support for training of 366 individuals in AB messaging and 324 in condom and other prevention promotion.

EMPHASIS AREAS
ABC programming emphasizes local organization capacity building, human capacity development, and efforts to increase gender equity in HIV/AIDS programs. These activities also promote a rights-based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Reduction of stigma and discrimination are also key components of the program. Through ABC activities, we place major emphasis on community mobilization and participation as an element of outreach for prevention efforts. We place major emphasis on training, infrastructure, and human resources in order to build the capacity of counselors and providers in a full range of prevention strategies. We also place emphasis on IEC as an essential element of outreach to high-risk populations, and on developing networks for linking these activities to HCT, PMTCT, and other ART activities to serve as a source of prevention information. Emphasis areas also include military populations (activities at 68 Military Hospital and Military Hospital Ikoyi, Lagos).

These activities address gender equity issues by providing equitable access to prevention services for men and women. In some cases, our activities seek to target men who may be at high risk for HIV in order to promote condom use as a means of prevention and access to services for their sexual partners. Male-targeted counseling seeks to address mate selection and sexual practices. Strong prevention programs that accommodate the array of societal and cultural norms can also help reduce stigma and discrimination. Providing services at the community level will serve as an important platform from which general HIV/AIDS information can be provided and risk reduction strategies discussed.

POPULATIONS TARGETED:
Key populations targeted are the healthcare community in treatment facilities, PLWHA, youth and adults accessing HCT services, high-risk populations, and support group members and immediate families of PLWHA. Other target populations include and religious leaders. Targeting these populations is important to encourage safe sexual practices, HCT, and other prevention measures. Health care workers will also be targeted for training on the most effective prevention measures for various risk groups.

CONTRIBUTION TO OVERALL PROGRAM AREA
These prevention activities are consistent with PEPFAR’s goals for Nigeria, which aim to support a number of prevention strategies as a comprehensive prevention package. In order to be maximally effective, the prevention messages developed at different sites will be tightly targeted to various high-risk groups that they serve. Furthermore, these activities are consistent with the PEPFAR 5-year strategy, which seeks to scale-up prevention services, build capacity for long-term prevention programs, and encourage testing and targeted outreach to high-risk populations. The establishment of networks and referral systems from prevention efforts at the community level to PMTCT and HIV care and treatment will help facilitate the scale-up of the overall program. Additionally, as part of our sustainability building efforts, Harvard will provide technical assistance and support for APIN to assure program management responsibility for all ABC activities. This will include the implementation of a plan to transition site oversight, management, and
**Activity Narrative:** training over to APIN. The goal of such efforts is to provide for greater assumption of responsibility for management and implementation of PEPFAR programming by Nigerian nationals through an indigenous organization.

**LINKS TO OTHER ACTIVITIES:**
ABC activities relate to HCT, by increasing awareness of HIV. They also relate to Adult Care and Treatment and Pediatric Care and Treatment activities through dissemination of information by home-based care providers and ultimately by decreasing demand on care services through decreased prevalence. Linkages also exist to OVC programming by targeting OVC. These activities are also linked to TB-HIV activities in that prevention messaging will be disseminated to individuals who are provided with HCT in a TB setting. Through training of personnel, these activities also link to Human Capacity Development. As certain activities focus on gender-related issues, this program area also links to Gender.

**Program Area:** Sexual Prevention: Other sexual prevention

**Program Budget Code:** 03

**Planned Funds:** $1,530,018
Activity Narrative:

ACTION COP 09 sexual prevention activities will continue to provide prevention services to 9,545 youth and young adults (4772 males and 4773 females) through Abstinence/Be Faithful (AB) activities and 46,364 individuals through condoms and other prevention (C&OP) activities. ACTION will implement its AB programming activities in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals through a balanced portfolio of AB prevention activities. Through the involvement of ACTION as a partner in this activity, PEPFAR Nigeria will extend its reach with AB services into focused communities in six states (Plateau, FCT, Benue, Kaduna, Kano and Edo). In COP08, ACTION reached over 10,000 individuals using a combination of abstinence and/or being faithful prevention messaging approaches. A key age group for AB activities is youth/young adults aged 15-24 years, as this is the highest prevalence age group. Many young adults are in tertiary educational institutions where they can be accessed for appropriate AB messages. Through its other program areas, ACTION reaches a large population of HIV-positive adults, adolescents and children through care and treatment services. HIV-affected partners and family members of these clients will also be reached with prevention with positives (PwP) services.

ACTION will focus AB activities at tertiary educational institutions (polytechnical schools and universities) located in cities where individuals reached with AB messages who test positive can be referred or linked to care and treatment facilities, as necessary. ACTION will work principally at educational institutions but will have spill over to the community through a combination of multiple strategies in line with the Government of Nigeria/U.S. Government (GON/USG) minimum care package. These will include: community awareness campaigns specifically focusing on small group discussions (SGD) organized within departments; a school based approach that will leverage existing curricula developed jointly by the Federal Ministry of Education and the Society for Family Health; and peer education plus activities focusing on drama groups. The curriculum will be used to train lecturers and guidance counselors to provide AB messages routinely in their teaching. Peer education plus activity dance drama groups are widespread in the targeted age group. These dramas will have culturally and age group relevant scripts written by a professional consultant using input from the SGD. Content will be piloted for acceptability and accurateness of the messages before performances are carried out at these institutions. ACTION will continue to collaborate with the International Institute of Christian Studies (IICS), an NGO that has worked with the Nigerian Federal Ministry of Education and has implemented effective AB services in secondary schools in Nigeria.

Activities conducted at the local level by ACTION will be reinforced through national mass media campaigns by other USG partners, such as the successful Zip-Up campaign. AB messages will be balanced with condoms and other prevention messaging, where appropriate and will be integrated with other PEPFAR program area services in proximal areas. The goal of the program is to saturate targeted communities with messages conveyed in multiple fora. Utilizing such a methodology, a large number of people will be reached with messages received via one method or another, but the target group will be those individuals who will have received AB messaging on a regular basis and via the three strategies ACTION will employ (community based awareness campaigns, school based programming and peer education plus activities). The target for this intensive AB messaging campaign is 9,545 individuals. A total of 500 persons made up of teachers, guidance counselors, school health care workers, and peer educators will be trained to conduct effective prevention interventions inclusive of AB messaging from 166 outlets. Another focus of the program in COP09 will be improvement of the linkages between appropriately balanced ABC services, condoms and other prevention activities, HIV counseling and testing, and HIV treatment activities. The incorporation of HIV AB messages by lecturers who have access to this age group on a regular basis will institutionalize the AB services. In addition, prevention activities will be incorporated into points of health care service in each institution, including family planning counseling, sexually transmitted infection management and counseling, and risk-reduction counseling.

ACTION will also provide C&OP activities for 46,364 most-at-risk persons (MARPs; 23,182 males and 23,182 Females) and support 60 community based condom outlets in locations frequented by MARPs, such as bars, brothels and truck stops in addition to the hospital based outlets co-located at HCT/antiretroviral treatment (ART) clinics. Sites are located in states that have been selected based on the National ARV Scale-Up Plan with the goal of universal access to HCT and expansion of prevention services and linkages to wraparound services (e.g., family planning). At the health care facility level this will complement prevention with positives (PwP) activities supported under basic care and support programming. Prevention services will take place in community settings, including: skills development centers, truck stops, markets, and OVC centers targeting out-of-school youth. ACTION will complement mobile HCT with prevention services by supporting NGOs to establish HCT and other prevention program sites at locales where transactional and intergenerational sex are common, using five mobile HCT vans based out of Action’s regional offices. The 2007 Integrated Bio Behavioral Surveillance Survey (IBBSS) for Nigeria revealed an alarming National HIV Prevalence of 37.4 and 30.2 for brothel and non-brothel-based female sex workers. ACTION will expand prevention programs in collaboration with experienced community based organizations (CBOs) and peer educators to reach commercial sex workers (CSWs) and other individuals along the Benin-Lagos transport corridor, including truck drivers and those who engage in transactional sex at overnight motor parks. It is anticipated that seroprevalence among this group exceeds 20%. The number of targeted truck stops will be increased from 6 to 12. ACTION also targets out-of-school youth via community centers and OVC based arming. Condoms and other prevention programming will be balanced with AB prevention messaging for youth in these settings.

In COP09, ACTION will build on COP08 activities at the community level utilizing a combination of strategies, including community outreach campaigns, peer education models, and sexually transmitted infection (STI) screening, management, and treatment. Peer education strategies will focus on Greater Involvement of People with HIV/AIDS (GIPA). The goal of the program is to cover target communities with messages conveyed in multiple fora so as to reach the specific target groups with C&OP messaging on a.
Activity Narrative:

regular basis via the three key strategies employed (community outreach campaigns, peer education models, STI screening/management/treatment). ACTION employs a dedicated program officer to oversee these prevention activities.

ACTION will enhance services for MARPs testing HIV-negative by coupling post-test counseling with targeted behavior change interventions that address individual risk. Individual counseling will include abstinence/mutual faithfulness messages, promotion/instruction regarding correct and consistent condom use, information education communication (IEC) materials, and linkages to family planning services. Community outreach through collaboration with PLWHA support groups will ensure that IEC materials and counseling messages are culturally acceptable. Group counseling will be carried out in supportive settings to discuss and promote HIV prevention behaviors, including avoidance of STIs, recognition and seeking early treatment for STI symptoms, and reduction of alcohol/illicit drug use. Condom promotion and distribution will be coupled with prevention information about abstinence and mutual faithfulness, behavioral change communication, and risk reduction education using peer educators. Sixty stationary condom distribution points at locales frequented by MARPs (such as bars serving truck drivers) will be established and maintained along with those situated within ART facilities.

Building on the successful models employed in COP 07 and 08, mobile HCT vans will be utilized for the provision of syndromic STI services in conjunction with HCT services targeting truck stops and night spots frequented by MARPs. This service will be provided by community health extension workers (CHEWs) following standard operating procedures for syndromic STI management and will include treatment for syphilis, gonorrhea, and chlamydia. Program staff will work with sites to ensure appropriate linkage/referrals to STI care.

PwP strategies targeting HIV-positive persons will also be included in this package of services for MARPs using approaches and materials developed through USG Nigeria. ACTION will support risk reduction and safer sex promotion activities among HIV-positive clients, partners, and members of their households. The comprehensive package of prevention interventions will include provider and counselor delivered prevention messages, family planning counseling, STI management, and treatment, and counseling of partners and children. Lay counselors and peer educators will be mobilized for more in-depth counseling on key prevention issues such as: sexual risk reduction, disclosure, adherence, reduction of alcohol consumption, and partner testing. Condoms and information on proper condom use will be available to all patients attending ACTION supported ARV clinics. ACTION supported sites will integrate prevention with positives (PwP) activities including: adherence counseling; syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and behavioral counseling to achieve risk reduction, counseling and testing of family members and sex partners; counseling for discordant couples; and IEC materials and provider delivered messages on disclosure.

Site/regional level trainings for CHEWS in STI syndromic management will be carried out by ACTION program staff. Peer educators and PLWHAs will be trained by ACTION program staff and CBO subcontractors using a curriculum developed by SFH focusing on truck stop and commercial sex settings as well as a manual on interpersonal communications jointly developed by ACTION and SFH. General training will include risk stratification, disclosure and couple counseling, proper condom use, and syndromic STI management training for health care workers. The direct training target is 380 persons.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:

ACTION AB activities emphasize integration of prevention activities with treatment and care services. Use of the community awareness campaigns, school based programs, and peer education plus activities (community drama, dance events, etc.) allows dissemination of AB messaging, including integration with condom messaging, from socially-credible sources of information (educators, healthcare workers and related populations of PLWHA). This program will contribute to the global HIV/AIDS strategy by reaching 11,480 people with AB messaging and 5,740 people with abstinence only messaging in a comprehensive approach. As high risk and “bridge” populations contribute to HIV transmission, C&OP activities will support the Nigerian Federal Ministry of Health (FMoH), and emergency plan goal of reducing new infections and thus decreasing the overall disease burden of HIV in Nigeria by enhancing HCT with targeted prevention messages and interventions. Targeted efforts to promote correct and consistent condom use and STI management for MARPs can reduce the risk of HIV infection. The activities will also address issues of stigma and discrimination through the education of individuals and communities.

LINKS TO OTHER ACTIVITIES:

AB and C&OP activities relate to HCT, basic care and support (through dissemination of information by home based care providers), OVC programming (through specific targeting), and SI. A challenge of this program is to successfully link identified HIV-positive individuals with services. The populations being targeted often do not access services via traditional treatment venues. The program will create a means to strengthen linkages and will identify through the hub and spoke model innovative strategies for creating access to treatment in convenient venues. Targeting MARPs will help to identify persons who need referral into care, ARV services and prevention for positives counseling, which will be an important component of post-test counseling of HIV-positive persons as part of HCT services and the basic package of care. Balanced prevention messages targeting behavior change will complement HCT for all, irrespective of HIV status. OVCs will be taught family life and sexual initiation delay/abstinence negotiation skills.

POPULATIONS TARGETED:

AB will be targeted at youth (particularly university and polytechnic students), teachers, and adults accessing HCT services, while C&OP targets MARPs (commercial sex workers and their clients, prisoners, out-of-school youth, and mobile populations such as truck drivers). The other major focus is school-based youth. ACTION will provide technical assistance to SFH in the training of doctors, nurses, other health care workers in the public sector as well as PLWHA and peer educators who will focus on the special prison population, which faces additional stigma.

EMPHASIS AREAS:
**Activity Narrative:** Emphasis will be on human capacity development for AB and C&OP activities, promote a rights based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Reduction of stigma and discrimination are also key features of the program. Community development through linkages with CBOs and PLWHA support groups are also emphasized.

### Table 3.3.03: Activities by Funding Mechanism

- **Mechanism ID:** 552.09
- **Prime Partner:** Family Health International
- **Funding Source:** GHCS (State)
- **Budget Code:** HVOP
- **Activity ID:** 3236.24892.09

- **Mechanism:** USAID Track 2.0 GHAIN
- **USG Agency:** U.S. Agency for International Development
- **Program Area:** Sexual Prevention: Other sexual prevention
- **Program Budget Code:** 03
- **Planned Funds:** $2,295,000

**Activity System ID:** 24892
**Activity Narrative:** In COP 09 the Global HIV/AIDS Initiative Nigeria (GHAIN) will provide sexual prevention services, which include Abstinence, Be faithful, and Condom use (AB & C) and Other Prevention by further strengthening and supporting current implementing agencies across the country. In COP09, a combination of intervention strategies will be employed by GHAIN such that every individual within the targeted groups will be reached with a minimum of three interventions in line with the National Prevention Plan (NPP) minimum package guidelines.

Abstinence only sexual prevention programs will be tailored to address 5,000 in-and-out of school youth under the age of 15. GHAIN’s sexual prevention strategies will include peer education (age peers), focus group discussions (FGDs), and non curricula based approach (e.g., drama and HIV clubs) as part of the minimum package. GHAIN will identify a minimum of 120 persons drawn from all project locations and equip them with peer education and FGD skills as well as support them to form HIV clubs. Peer education will equip selected volunteers to provide their peers with correct and complete information on HIV/AIDS prevention while the FGDs and clubs will serve as avenues for message reinforcement and sensitization activities using the ‘enter-educate’ approach.

Sexual prevention programs with the “Be faithful to one partner” theme will target 12,727 adults using religious gatherings (rallies), the identification of role models, and mass media approaches. In order to achieve the above target and also contribute to the overall goal of reducing the incidence and impact of HIV and AIDS in Nigeria, GHAIN will disseminate information on the importance of HIV counseling and testing, partner reduction and mutual fidelity as methods of risk reduction. Faith-based community leaders and organizations will be targeted with on-going advocacy to ensure that they reinforce correct and consistent messages regarding HIV/AIDS prevention and stigma and discrimination, as well as promote health seeking behaviors and address social norms and inequalities that increase vulnerability to HIV/AIDS. Religious leaders will be mobilized and trained based on the GHAIN developed training and preaching content guide. This will enhance their capacities to deliver HIV-related guided sermons weekly at churches and mosques.

Strategies for other prevention interventions include: FGDs, counseling and testing, condom messaging and distribution, balanced ABC messaging, job (Female Sex Workers and clients, and road transport workers) and social (Men who have Sex with Men - MSM) peer education, and income generating activities. The strategy will also involve creating linkages to mobile counseling and testing (CT) and referrals to high quality STI treatment services.

Peer educators will be used to reach most-at-risk populations (MARPs). This will be supported by targeted audio and print educational materials and community outreach activities. Focus group discussions will reinforce messages on the importance of correct and consistent condom use during every sexual encounter with commercial and non-regular partners known to be infected or uncertain of their partners whose status is unknown. Information regarding the critical role of HIV counseling and testing as a risk-reduction strategy, the development of skills for vulnerable persons, the relationship between alcohol, injecting drugs and HIV and AIDS, and the message that condoms do not protect against all STIs will also be provided.

GHAIN will ensure that condoms are made available at over 88 sites, including counseling and testing sites and brochures, by strengthening partnerships with the Society for Family Health (SFH) and United Nations Fund for Population Activities (UNFPA) to obtain and distribute condoms. In addition, the project will explore possibilities of additional product support from the Global Fund for AID, TB, and Malaria (GFATM), DFID and other sources.

PLWHA, transport workers and men having sex with men (MSM) will be targeted for comprehensive programming that includes programs in being faithful condom use and other prevention (OP) programs will be. ‘Prevention with Positives’ will be an important focus of sexual prevention programs in COP09. Information will be reinforced on the importance of correct and consistent condom use during every sexual encounter. GHAIN will train 165 persons on components of the above listed minimum package strategies to promote HIV/AIDS prevention among MARPs, and a total of 69,545 persons will be reached through specific population awareness, peer education models, workplace programs, provision of STI management, and messages/interventions on vulnerability issues.

Experience has shown that individual behavioral-focused interventions are more effective when combined with broader structural change at community and societal level. Through social mobilization and active community participation, the program will address norms affecting the behavior of women/girls and men/boys and inequalities between male and female roles that increase vulnerability to HIV/AIDS. GHAIN will also mobilize communities to address norms/behaviors on cross generational and transactional sex, promote increased male involvement in prevention activities, and timely health seeking behaviors. Issues of stigma and discrimination will also be addressed in the intervention. Through community dialogue sessions, members of target communities will exchange information face-to-face, share personal stories and experiences, honestly express concerns, express ideas and responses to such HIV/AIDS issues as stigma and discrimination, sexual transmission, medical transmission, and prevention of HIV within positive populations. The major output of the community dialogue would be a critical mass of advocates within each community who are well versed in HIV/AIDS and are working towards the reduction and elimination of new HIV cases as well as stigma that fuels the epidemic. In addition, community based organizations (CBOs), non-governmental organizations (NGOs), and influential individuals in the community will be supported to provide age- and context-appropriate information with the aim of creating an enabling environment for sustained behavior change. This will be achieved through mentoring, and provision of technical assistance to build local capacity to design and manage innovative HIV/AIDS programs.

GHAIN’s secondary sexual prevention strategy will involve the utilization of multi media to support the primary activities. This will entail the development and execution of multi-media campaigns, development and distribution of SBC materials, and advocacy, capacity building, referrals, and monitoring and evaluation of activities, as well as mentorship to implementing agencies.
Activity Narrative:

Referrals and networks will be strengthened to ensure effective expanded access to clinical services for MARPs, including referral for diagnosis and treatment of sexually transmitted infections (STI), TB (DOTS Centers), reproductive health/family planning/PMTCT integrated services, and linking prevention services for HIV-positive individuals to HIV treatment and care services, including counseling and testing.

COP 09 GHAIN activities will be guided by both the National Prevention Plan and National Behavior Change Communication Strategy.

CONTRIBUTIONS TO OVERALL PROGRAM AREA

GHAIN will contribute to the overall United States Government (USG) strategic plan of building the capacity of local organizations by working with local NGOs to carry out sexual prevention (SP) activities with MARPs and other targeted groups in the general population. GHAIN will focus on building the capacity of local implementing agencies to effectively carry out sustainable HIV prevention activities among MARPs, including development and dissemination of strategic behavior communication materials, community mobilization, condom use programs, peer education activities, counseling services, and referrals and linkages, among other activities. The SP activities will in turn contribute to generating demands for counseling and testing (CT) and prevention of mother to child transmission (PMTCT) services, which serve as entry points for other services, such as antiretroviral treatment (ART) and palliative care. GHAIN will also provide support for the integration of appropriate reproductive health messages into SP programs for the uniformed services and their dependents using non-PEPFAR funds.

LINKS TO OTHER ACTIVITIES

As in all SP programs, activities will continue to be linked to other relevant services available in the community. GHAIN IAs will work with the mobile counseling and testing team of GHAIN to locate and strategically introduce services at areas identified to have concentrations of MARPs. People who test positive will be referred for continued care along the continuum of care model. The referral coordinators of GHAIN will record contact details of positive clients while maintaining strict confidentiality, for the purposes of continued counseling, palliative care and contact tracking for tuberculosis (TB) screening and ART services, if eligible. GHAIN will ensure high quality SP data through a sound information system that precludes double counting and ensures accountability.

POPULATIONS BEING TARGETED

Beneficiaries of SP activities include youth (in and out of school), married couples, young adults, transport workers, female sex workers, MSM, and PLWHAs.

KEY LEGISLATIVE ISSUES ADDRESSED

SP activities will take into consideration gender issues related to HIV/AIDS programs through providing equal quality prevention services without discrimination against sex, nationality, religion, creed, etc., as well as a concerted effort to increase male involvement in HIV/AIDS activities. Strategic efforts will be made to tailor prevention messages to match environmental requirements of target audiences. The activity will help address male norms and behaviors while reducing violence and coercion toward females, through vigorous campaigns to educate people on the benefits of couples' counseling and testing (CT) and mutual disclosure of HIV status.

EMPHASIS AREAS

Sexual prevention interventions will de-glamorize social norms that promote high-risk practices such as having multiple sex partners and sugar mummies and daddies (i.e., trans-generational sex). This will be done by promoting images of successful, honorable and respected role models from within the communities as being faithful to their partners. Role models will be identified and supported to promote fidelity and discourage norms that promote coercion, cross generational sex, alcohol and substance abuse. While emphasis will be placed on fidelity and condom promotion and distribution for MARPs, abstinence will be stressed among in-school youth. Communication activities will also be geared towards social mobilization to strengthen existing social, economic and political structures within the communities with an emphasis on: training, information, education and communication; local organizational capacity development; interpersonal communication/counseling; condom distribution; and STI management. GHAIN will continue to strengthen the developed exit/sustainability plan for implementing agencies, both at the country and program level, and at the individual implementing agency level to customize organizational specific plans and schedules.

  - **USG Agency:** U.S. Agency for International Development
  - **Program Area:** Sexual Prevention: Other sexual prevention
  - **Program Budget Code:** 03
  - **Planned Funds:** $244,000
**Activity Narrative:** ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

This activity also relates to activities in Health Systems Strengthening, Gender, and Human Capacity development.

During COP 08, LMS provided NGOs with technical assistance to develop successful program concept papers and competitive proposals. In COP 09, LMS will expand its support by building the capacity of emerging local organizations to acquire funds, set up systems that will place them in good stead to pass USG pre-audit requirements, and become better positioned to effectively manage funds and improve health outcomes. Furthermore, LMS will support new awardees during their implementation and will ensure that accountable and sustainable programs are built, and that awardees are capable of maintaining their new relationships with the USG team through a communication plan. As informed by an in-depth assessment of each awardee’s organizational needs, which will be synchronous with USG PEPFAR requirements, LMS will provide technical assistance focused on building capacity in: project management; information collection, management, reporting and dissemination systems; developing concept papers and successful proposals; effective financial management systems; designing forums for sharing best practices; and developing and maintaining constructive, informed working relationships with USG in the Emergency Plan context. LMS will continue building the capacity of faith-based and community-based organizations (FBOs and CBOs) to implement high-quality prevention programming that will enable them to achieve results, monitor and evaluate their activities, and sustain their activities for the long term.

Nigerian civil society organizations (CSOs) provide an array of services to communities through networks across the different regions of Nigeria. Some of their services include sexual prevention, palliative care and support, while a smaller number also provide HIV/AIDS treatment and HIV/AIDS-TB integrated care. Funding from the Condoms and Other Prevention line will support those potential groups and programs that show promise for provision of condoms and other prevention activities but which need guidance for understanding and implementing these services in line with the PEPFAR guidelines and expectations (e.g., challenges around planning condom distributions or uncertainties over how to ensure and monitor the provision of the minimum prevention package). CSO leadership, legitimacy and longstanding involvement in responding to the pandemic at the community level has attracted special recognition of the Emergency Plan. Some reputable FBOs, NGOs and CBOs capable of contributing significantly to the achievement of Emergency Plan targets and goals have been identified by the USG team in Nigeria. However, a good number of these, especially the nascent organizations, are limited by a number of challenges, such as low technical expertise, inadequate organizational capacity, and inefficient management systems. LMS experience working with the organizations in the past 12 months shows that some of these organizations, once past the proposal stage, struggle to remain competitive in later rounds and in many instances have stalled at the pre-award audit stage. To ensure that organizations meet the requirements that will enable them to receive funding from either USG or other donor agencies, LMS will provide technical assistance to 50 nascent local organizations from at least 25 states in Nigeria and train 100 individuals who provide prevention services in six geo-political regions in Nigeria.

The key legislative issues that sexual prevention activity will address under the gender categories are male norms and behaviors that affect the program in the selected organizations in addition to the establishment of a well articulated process that will encourage and increase gender equity from planning through to the implementation, monitoring and evaluation of prevention programs that the CSOs manage.

Sexual prevention activities are linked to Health Systems Strengthening, Gender, and Human Capacity development. LMS will train Individuals in HIV-related institutional capacity building and provide technical assistance that will lead to effective services, improved health systems and outcomes.

Activity Narrative: The key modification in COP 09 is the merging of Abstinence and Be faithful (AB) activities with the Condoms and other Prevention (C&OP) program. This activity relates to HIV counseling and testing (HCT), TB-HIV, and orphans and vulnerable children (OVC) programming. Society for Family Health’s (SFH’s) goal for sexual prevention activities is to contribute to a reduction in HIV prevalence among youth aged 15-24 years and among most-at-risk populations (MARPs). SFH priority target groups for COP 09 are: out-of-school youth, transport workers (TWs), uniformed service-men (USM), brothel and non-brothel based female sex workers (FSWs) and people living with HIV and AIDS (PLWHAs). Other target groups include in-school youth, students of tertiary institutions, and workers reached through workplace interventions. The key drivers of the HIV epidemic include soaring levels of commercial, transactional and cross generational sex, multiple and concurrent partnerships, low risk perception, high incidences of STIs, and skewed gender relations, power imbalances, and poverty.

In a Nigeria 2005 sentinel survey, youth aged 15 to 24 years were shown to have a higher than national average HIV prevalence. Although the proportion of 15-19 year olds who have never had sex has risen, many youth still engage in risky behavior. The 2007 Integrated Bio-Behavioral Surveillance Survey (IBBSS) reveals that multiple partnerships were common among the armed forces (37.3%), police (29.4%) and TWs (37.9%). Condom use at last sex with girlfriends was higher among the armed forces (64.7%) than among police and TWs (45.4% and 45% respectively). The IBBSS also revealed that reported condom use was very high among brothel- and non-brothel-based FSW in all commercial sex transactions; however, their reported condom use with boyfriends was far lower.

In COP 09, SFH will continue its focus on addressing drivers of the HIV epidemic with interventions that provide MARPs with information and skills needed to reduce their vulnerability through increased risk perception, improved self efcacy, and negotiation skills for condom use. Societal factors, such as social and cultural norms, practices, beliefs and laws that stigmatize and discriminate certain female populations and act as barriers to essential HIV prevention messages, will be addressed through agenda setting, advocacy, and community mobilization and sensitization. At community level, strategies will facilitate the enhancement of communities’ willingness and readiness for change, the induction of social norms that reinforce risk avoidance, and empowerment of communities’ effort to prevent HIV. SFH has worked in 181 sites and 537 communities of male and female high risk groups to date.

SFH will implement a minimum package prevention services for AB and C&OP programming that includes communication strategies, peer education plus (PEP) models, the Voice for Humanity approach, community awareness and outreach, and a school-based approach for AR, and the PEP model, specific population awareness campaigns, and community outreach for C&OP programming. SFH will continue its programming in all 32 sites covered in COP08. SFH will train 12,484 persons who will reach 196,591 persons with AB messages, of which 112,400 persons will be reached with abstinence only messages. An additional 1,656 persons will be trained to reach 131,061 persons with condom related interventions.

The PEP model is an evidence-based, cost effective and scalable approach to HIV programming. This 12-month intervention package targets specific at-risk groups, including female sex workers, out-of-school youth, uniformed servicemen, and transport workers. The PEP model is centered on peer education and integrates other elements (such as the formation and nurturing of community-based organizations (CBOs)) into a single unified program. The ‘Plus’ in the model refers to a non-peer approach that includes a mix of drama, information, education and communication (IEC) material distribution, work with influencers and gatekeepers, provision of HIV counseling and testing (HCT) services, and links to treatment sites for STIs, TB and other HIV related service. In COP 09, SFH will maintain most of the community level activities in COP 08. Within the AB program area, the key messages are delay in sexual debut, secondary abstinence, and mutual fidelity.

The Voice for Humanity (VFH) BCC approach addresses the uniqueness of typical rural settings in which access to modern information technology (print, electronic and internet access) is low, literacy levels - including the knowledge of HIV prevention measures - are low, and learning occurs via oral tradition in closely knit small groups often facilitated by community leaders. Messages are disseminated in the form of story telling, folk songs and parables to aid comprehension. The BCC method adopted by the VFH programme uses these channels to deliver messages using a solar powered digital audio device in small group settings, with a community facilitator trained and able to respond to concerns and make necessary clarifications. This helps to quickly clear misconceptions and facilitates learning. Pre-recorded messages help ensure consistency of messages. One critical challenge faced by SFH programs was its inability to reach female out-of-school youth (FOSY) between 15 and 23, particularly in rural areas. Many have completed secondary school, while others are non-literate. Although the majority are single, many in the northern regions are divorced and engage in transactional sex. In line with the SFH strategy to increase and improve participation of FOSY in community HIV prevention efforts, the VFH approach was piloted in Kano, Kaduna, Jos, and Bauchi in COP07 and scaled up to 10 states in COP08. SFH will continue to deploy community listening groups directly in the 10 selected states in FY09. The VFH listening devices will be used to provide ABC messages to young girls primarily, and other community members in Pidgin English and Hausa languages for wider reach. In COP09, 220 persons will be trained to deploy these devices to reach about 11,000 male and female youth.

Community awareness and outreach activities targeting male social norms will continue to be implemented among the general population to address continuing risky behaviors related to multiple and concurrent sexual relationships. In COP09, SFH will train 64 persons to deploy customized flip charts to reach 25,600 men and women in the general population with mutual fidelity messages through interpersonal communication (IPC) strategies. The target population will also be reached with community drama/roadshows, IEC distribution, and HCT outreach. A national mass media campaign will be aimed to provide AB messages in a reinforcing and complementary manner.

To sustain the abstinence program in Nigeria, SFH will continue its in-school youth program that provides young people with information, skills, and services to reduce their vulnerability and risk. This is conducted through the National Youth Service Scheme (NYSC) HIV program. NYSC corps members will be trained as peer educator trainers (PETs) to reach students of secondary schools with abstinence messages. Trained PETs conduct interactive forums and special events (e.g., dance dramas) and distribute IEC materials...
Activity Narrative: among targeted in-school youth. SFH will continue its work in 12 selected tertiary institutions from COP08 using a non-curriculum based peer led intervention. SFH will expand its activities within the selected institutions in COP09 and continue to support anti-AIDS clubs to conduct outreach programs as part of a comprehensive prevention package to address risk reduction, knowledge of HIV status, gender related violence and rape, and trans-generational and transactional sex. Reinforcing this intervention will be special events (shows, drama, seminars), IEC material, campus radio jingles, print media, and HCT outreach.

Within the C&OP components, key messages are partner reduction (concurrent and/or serial), consistent condom use, and prompt treatment of all STIs. The PEP model will be used to provide information and model behavior skills for the adoption of safer sexual practices relevant to consistent condom use, mutual fidelity, partner reduction, knowledge of HIV status, and prompt and complete treatment of all STIs and TB. SFH will maintain its program of engaging with the Nigerian prisons to provide prevention messages, HCT and referrals for prison staff and inmates for care and treatment. A baseline assessment of sexual and reproductive health knowledge and behavior will be completed in FY08. Peer education activities will continue among prison staffs and inmates. Through the sexual prevention program, SFH will continue to provide linkages to HCT, STI, TB and other HIV related services. Clients will be referred to identified USG, Global Fund, and Government of Nigeria treatment and care sites, as well as support groups for psychosocial support.

Under the specific population awareness campaign, SFH will utilize the Priorities for Local AIDS Control Efforts, (PLACE) approach to identify potentially high transmission areas and specific venues for effective AIDS prevention programs activities. In COP 08, PLACE was implemented in 10 states and will be maintained in COP09, with expansion to more sites within the same states. This component will continue to target street based sex workers and their clients with messages on partner reduction, reduction in alcohol consumption, condom use, and knowledge of HIV status. SFH will engage individuals and groups in IPC campaigns, distribute IEC materials, and sponsor special events (ladies night, shows) to reach target populations with condom related messages. Through PLACE, SFH ensures easy product accessibility and availability at high risk sites. Moonlight HCT services will continue to be provided at specific sites. Prevention activities among PLWHAs will continue in FY09 in accordance with national guidelines for secondary prevention among discordant couples, prevention of re-infection, prevention of opportunistic infections and provision of basic care kits. In COP09, SFH will identify and select 2 new support groups per SFH region. In each support group, 2 PLWHAs will be trained as IPC facilitators to continue monthly IPC sessions using the new IPC guide at support group meetings to reach 6,400 persons. IPC facilitators will also conduct community mobilization activities aimed at stigma and discrimination reduction around SFH intervention sites. SFH will continue to provide IEC materials and condoms to the PLWHAs.

Community outreach will include condom distribution and promotion through social marketing. It will also include education on HIV and condom use through pamphlets, brochures and other promotional material available at the community level. This intervention will make condoms available at all times to those who need it. It will also seek to improve coverage and quality of coverage, access and equity of access to men and women for male and female condoms

In addition to the minimum package, SFH will continue to prioritize increasing faith-based organization (FBO) capacity to participate as full partners in HIV prevention efforts by engaging with umbrella bodies of selected Christian and Islamic groups to develop faith based responses and implementation of strategic plans. In COP08, SFH engaged 4 FBO partners to reach youth and married couples with AB messages. FBO activities will continue with program implementation in 2 select states per health zone. Religious leaders will be trained to integrate HIV messages into their sermons and 120 youth within the congregation will be trained as peer educators to facilitate peer education sessions. Other interventions will include HCT outreach, IEC material distribution, and special events (e.g., youth and couple conferences).

Program evaluation will utilize participatory monitoring and evaluation and other intervention specific evaluations to inform program design. Focus group discussions and semi-structured interviews will be used for the baseline study and program monitoring.

SFH’s program specifically focuses on gender by increasing female youth involvement and participation in community HIV/sexual prevention programs activities. Another component of the gender strategy includes messages on alcohol and substance abuse reduction as associated with gender based violence and risky behavior. Referrals will be provided for women to access reproductive health services, income generating activities and social support systems. For women to achieve greater control over their protection from HIV and unintended pregnancy, SFH will market and distribute female condoms as a dual protection method. The female condom project funded by Oxfam Novib will be piloted in 3 states in COP 09 (Lagos, Edo and Delta). SFH will collaborate with UNDP and GoN to increase demand, access and availability of female condoms.

Target Population
This activity targets both street-based and brothel-based FSWs and their clients, transport workers, uniformed servicemen, male and female in-school and out-of-school youths, gatekeepers and religious authority figures in the community and PLWHAs.

Links to other activities
This component is linked to HCT, policy and systems strengthening, orphans and vulnerable children programming, and TB-HIV. SFH will continue to reinforce partner reduction messages, promote HIV counseling, and testing, create awareness about the links between TB and HIV and referral to ARV services.

Key legislative Issues
This activity will address gender equity in programming through interventions targeting young girls. Interventions will also address male norms and behaviors that put both men and women at risk as well as stigma and discrimination against PLWHA.
Activity Narrative: Emphasis areas
This activity places major emphasis on community mobilization and participation, capacity building for community based organizations while minor emphasis is placed on workplace programs

Program Area: Sexual Prevention: Other sexual prevention
Program Budget Code: 03
Planned Funds: $939,500
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

CEDPA will continue to strengthen institutional capacity of its selected implementing agencies (IAs) to develop sustainable programs within the same states as under COP08. These activities will involve: developing organizational management system and leadership skills of IAs to optimize their ability to effectively address stigma and discrimination in the communities through training of faith and community leaders; developing peer education activities for improved advocacy for foster care and support to people living with HIV/AIDS (PLWHA); facilitating the formation and strengthening of networks of community peer groups and linkages to treatment outlets, communication centers, HCT centers, ART sites, and vocational training centers; supporting women by linking them to sexual and reproductive health services provided by CEDPA in family planning programs, improved referrals for PMTCT and ANC; and increasing young girls and women access to comprehensive sexual information and prevention services through community outreach, focus group discussions (FGDs), peer education, and peer counseling.

ACTIVITY DESCRIPTION:
In COP 09, CEDPA’s Abstinence and Be Faithful (AB) and HIV prevention through behavior change beyond abstinence and be faithful (C&OP) components will be maintained in 20 states namely: FCT, Bauchi, Edo, Enugu, Kano, Anambra, Cross River, Lagos, Kogi, Imo, Niger, Benue, Taraba, Adamawa, Sokoto, Zamfara, Kebbi, Nassarawa, Katsina, and Akwa Ibom. CEDPA’s AB minimum package is composed of community awareness campaigns, peer education, and school based approach for youths. In line with the National Prevention Plan’s guidance on Minimum Prevention Package, each individual will be reached with a minimum of the three intervention strategies. CEDPA will ensure that each beneficiary is reached through community awareness, peer education and one other targeted strategy within the year.

Community awareness campaigns will be used as an entry point to all community-based HIV prevention activities. Trained peer facilitators and educators will organize and conduct AIDS awareness seminars at the community level to sensitize the public about HIV prevention and the need to participate actively in care and support activities. Such seminars will be held during religious gatherings, traditional ceremonies, and sports events. Focus group discussions and community dialogues will be organized for key community stakeholders, such as civic and traditional leaders.

Peer education models will be used to reach out to PLWHA groups, age, and job peers. These will include targeted HIV prevention activities for PLWA support group members, okada drivers (commercial bike riders), and youth groups within church and Muslim communities.

Age appropriate messaging and non-curricular based approach will be used to target in-school youth with abstinence and be faithful messages through the formation of anti-AIDS clubs and drama activities. Trained peer educators will facilitate the implementation of these activities.

CEDPA will ensure that each beneficiary is reached with a minimum of three interventions (i.e., community awareness campaigns, peer education models and school-based approaches). Messages will emphasize partner reduction and faithfulness to one partner or mutual fidelity, and discourage inter-generational and multiple sex partnerships. Intensive community mobilization and sensitization will reach underserved rural and hard-to-reach communities.

The AB program will reach 42,705 people with the minimum package of AB interventions, of which 14,947 individuals will be reached with abstinence only interventions. CEDPA will train 1,500 peer educators and facilitators to disseminate information on AB through a systematic community-based approach. CEDPA’s prevention training manual includes topics such as basic facts on HIV/AIDS and life skills (e.g., negotiation skills and assertiveness). Training will take a minimum of five days. AB activities will include counseling, mentoring, peer support, information sharing, and provision of technical guidance and support to all the IAs spearheaded by the Anglican Communion AIDS program (ACAP) and the AIDS Program for Muslim Ummah (APMU), a project of the Nigerian Supreme Council for Islamic Affairs as multiplier organizations. CEDPA’s AB prevention strategic approach involves a series of interrelated interventions (community mobilization, advocacy, targeted inter-personal communication, capacity enhancement of individual and community groups) directed at different levels of society to enhance individual behavior change in a supportive environment.

AB program activities under CEDPA’s Positive Living (PL) project are implemented at the individual, family, and community levels. At the individual level, activities promote development of life skills that: support practicing abstinence by young people and adults in low risk settings; encourage delay of sexual debut; denounce intergenerational sex, rape, and incest; and promote counseling and other means of interpersonal communication techniques. At the family level, services will be provided by peer educators during home visits and will focus on couples counseling to promote mutual fidelity/partner reduction/elimination of casual sex relationships, HCT, and prevention in discordant relationships. Community-wide prevention programs will be provided by pastors, imams, peer educators, teachers, and parents. These programs will include messaging from the Church pulpit or at the Mosque, messaging through club activities, and through in-school peer education and out-of-school youth prevention programs that address sexual development, reproductive health and promotion of secondary abstinence particularly for at-risk out-of-school youth through alternative livelihood opportunities. Community-based approaches will promote collaboration with other implementing partners and credible teachers’ union.

CEDPA’s C&OP program activities will complement the AB programs. The C&OP minimum package is composed of: community outreach activities, peer education, and provision of STI management. Community outreach activities will precede other C&OP interventions that include counseling and testing, condom messages and distribution, youth peer education, and STI counseling for affected individuals. Trained peer facilitators and educators will organize and conduct community outreach activities while healthcare workers will provide syndromic management and STI treatment services at CEDPA triage centers. All C&OP activities will be coupled with information about abstinence as well as the importance of HIV counseling and testing, partner reduction, and mutual faithfulness as methods of risk reduction. Information on correct and
Activity Narrative: consistent condom use will be provided at condom distribution outlets and healthcare facilities.

AIDS awareness seminars at the community level will be organized for most at risk populations (MARPs; e.g., commercial sex workers, long distance truck drivers, market women, and okada drivers) and married couples to sensitize the public about HIV prevention and the need to participate actively in care and support activities.

The primary target group for the peer education model will be out-of-school youth, okada drivers, and leaders of organized groups of the MARPs in the community. These will include targeted HIV prevention activities for PLWHA support group members and youth groups within the church and Muslim communities.

C&OP will augment the basic care and support (BC&S) component of PL and enhance the capacity of Primary Health Care and other referral facilities in project communities to diagnose and treat STIs by providing laboratory equipment, such as specimen bottles, reagents, consumables, etc. These facilities will serve as referral centers for diagnosis and treatment of STIs and will be considered service outlets for C&OP. PL will build on past achievements by continuing to target long distance truck drivers, migrant workers, out of school youth, orphans and vulnerable children (OVC), PLWHA and clients of commercial sex workers. Healthcare providers trained under BC&S and TB/HIV program areas will deliver prevention messages on routine clinic days during risk-reduction counseling, family planning counseling, and sexually transmitted infection management and counseling. Condoms will be distributed at every treatment facility. This activity is a key component of the PL strategy and encompasses provision of information and access to correct and consistent condom use, prevention of HIV transmission among discordant couples, promotion of HCT, partner reduction, and mutual faithfulness as methods of risk reduction. PL will reach 28,705 persons, train 1,500 peer educators, distribute 3,000,000 condoms and open 413 condom distribution outlets.

Peer educators, including, teachers, PLWHA, and parents (trained in AB) will be trained to act as condom distributors and provide prevention options for people at risk who cannot practice AB. Options include support for PLWHA to disclose their sero-status to sexual partners and significant others, proper nutrition and boosting body immunity, prevention of pregnancy among PLWHA, PMTCT and early diagnosis and treatment of STI. Peer Educators will hold discussions in homes, communities and workplaces with their peers focusing on prevention for positives during one-on-one and group discussions in support group meetings, where they will distribute condoms, facilitate support group discussions, and act as peer buddies to ensure and maintain behavior change, as appropriate.

Using standardized forms, project M&E Officers will collect data on an ongoing basis and compile data monthly, including numbers and demographic characteristics of clients reached and messages provided. This will provide timely information for effective decision making. ABC M&E activities will develop sustainable capacity at CEDPA’s subpartner levels to collect relevant data.

POPULATIONS TARGETED:
AB activities will target young people in school, and out-of school youth PLWHA, religious leaders and the general population. Teachers and parents are targeted to act as change agents.

C&OP will focus on most at risk populations (MARPs; e.g., long distance truck drivers, migrant workers, out of school youth, PLWHAs, clients of commercial sex workers), sexually active men and women, and adolescent girls and boys in the general population. Prevention for Positives will target mainly discordant couples. Pregnant positive women will be mobilized and referred for PMTCT services.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
AB emphasizes human capacity development through training, task-shifting and volunteer retention and therefore enhances sustainability. This contributes to increasing sustainability through capacity development of 41 indigenous organizations.

Condom and Other Prevention activities of PL will contribute to PEPFAR’s 5 year strategic plan for Nigeria by reaching high risk population with information and services that enhance risk reduction abilities. These activities will contribute to averting new HIV infections. PL will promote active participation of PLWHA by encouraging disclosure of sero-status and protection of their sexual partners.

LINKS TO OTHER ACTIVITIES:
ABC activities relate to HCT, BC&S, and HKID. Public-private partnerships and collaboration with local business groups will also be explored. To ensure the comprehensiveness of CEDPA’s prevention services, individuals identified in the program will be linked to the micro credit finance project under BC&S, HVOP, and other implementing partners like Maximizing Agricultural Revenue and Key Enterprises in Targeted Sites (MARKETS), WINROCK, and healthcare facilities for medical care.

EMPHASIS AREAS:
PL promotes a rights-based approach to prevention among positives and other vulnerable members of society and equal access to information and services. Traditional gender norms of male dominance, female subservience and gender inequality in sexual relationships as well as stigma and discrimination reduction are all addressed through this program. Commodities procurement and distribution, particularly of condoms, will be an area of emphasis. The program will address increasing gender equity in HIV programs through education and family-based dialogues and promoting male norms and behaviors that encourage HIV prevention such as creating awareness on reduction in number of sexual partners, and equal power sharing between males and females, and testing before marriage, particularly for those who practice polygamy.

**Table 3.3.03: Activities by Funding Mechanism**

- **Mechanism ID:** 1561.09
- **Prime Partner:** US Centers for Disease Control and Prevention
- **Funding Source:** GHCS (State)
- **Budget Code:** HVOP
- **Activity ID:** 5370.25972.09
- **Activity System ID:** 25972

- **Mechanism:** HHS/CDC Track 2.0 Agency Funding
- **USG Agency:** HHS/Centers for Disease Control & Prevention
- **Program Area:** Sexual Prevention: Other sexual prevention
- **Program Budget Code:** 03
- **Planned Funds:** $51,696
**Activity Narrative:**

This Sexual Transmission activity relates directly to all Nigeria AB and Condoms/Other Prevention COP09 activities as part of the USG technical oversight role. The USG team, through the HHS/CDC Global AIDS Program (GAP) office in Nigeria, has one full time staff position for HIV Sexual Transmission, which was previously approved in COP07. The budget includes funding for 1.25 FSN salary, funding for required domestic travel, training funds and allocated minor support costs. This staff member will be supervised by a Senior Prevention Manager funded across the CDC agency prevention programs as noted above. Funds are not requested in COP09 for international TA as this is understood to be funded by the HQ operational plan (HOP).

This HHS/CDC HIV Sexual Transmission program specialist will work in close coordination with the USAID and DoD prevention staff and directly provide quality assurance and program monitoring to all HHS-supported implementing partners with prevention activities in the area of sexual transmission programming including: University of Maryland-ACTION, Harvard SPH-APIN, Columbia University SPH-ICAP, Catholic Relief Services-AIDSRelief, Population Council, Partners for Development, IFESH, ECEWS, Africare, APIN, LLC and CDC RFA awards in COP09. HHS/CDC prevention staff will also assist USAID staff in joint monitoring visits of Family Health International-GHAIN, CEDPA, Society for Family Health, Population Council, Christian Aid, Catholic Relief Services-7 Dioceses, Winrock International, Hope Worldwide South Africa, Hope Worldwide Africa, Food for Hungry, LMS Associates, LMS Leader, Pro Health, YWCA, C-Change, NELA, GECHAAN, CSN, Community Reach, AIDSTAR, AED Workplace and USAID APS awards for COP09. USAID and CDC prevention staff will provide assistance as needed to the U.S. Department of Defense program with the Nigerian Ministry of Defence. The strategic shift undertaken by the National Prevention TWG to mandate a minimum package of prevention services requires a significant level of programmatic guidance and oversight for the partners, and the robust integrated prevention team provides the technical leadership required for an appropriate response. The sexual prevention team’s responsibilities include: 1) representing the USG in technical discussions with the GON, 2) overseeing technical aspects of the program, including program management and oversight of partners to ensure high-quality and accountable programs, 3) interfacing with OGAC technical working groups, and 4) participating in the USG prevention working group.

HHS/CDC, DoD and USAID prevention staff will also provide technical support and capacity development to new partners undertaking prevention of sexual transmission activities through the New Partner Initiative as well as provide support to the Government of Nigeria at the national and state levels to promote Nigeria’s national prevention guidelines.

ICASS and CSCS charges related to this position are funded under M&S in compliance with COP09 guidance.

**Table 3.3.03: Activities by Funding Mechanism**

| Mechanism ID: 9407.09 | Mechanism: USAID Track 2.0 AED Workplace |
| Prime Partner: Academy for Educational Development | USG Agency: U.S. Agency for International Development |
| Funding Source: GHCS (State) | Program Area: Sexual Prevention: Other sexual prevention |
| Budget Code: HVOP | Program Budget Code: 03 |
| Activity ID: 25632.09 | Planned Funds: $450,000 |
| Activity System ID: 25632 |
Activity Narrative: In COP09, AED will continue its focus on strategic HIV prevention interventions targeted at reaching specific workplace populations. AED’s activities (ABC) under sexual prevention are designed to support prevention among working adults and equip them to promote prevention with their children and partners. In COP09 AED will train 60 healthcare workers from the 5 targeted condom service outlets to promote HIV/AIDS prevention through other behavior change beyond abstinence and/or being faithful.

With 66 million individuals participating in Nigeria’s public and private sector labor force and HIV/AIDS prevalence of 3.7%, 3.5%, 3.1% amongst transport workers, police force and armed forces and with prevalence of over 30% among female sex workers (IBBS 2007), the workplace is an ideal setting for effectively addressing HIV/AIDS through sensitization programs, prevention messages, and linkages to care and treatment for a large percentage of Nigerians infected and affected by HIV/AIDS.

AED SMARTWork in COP09 will focus on reaching each targeted population with a minimum of three interventions in the workplace. Intervention strategies will aim at reducing number of sexual partners, promoting consistent condom use and seeking treatment for STIs. IBBS 2007 revealed that among predominantly male occupational groups (transport workers, armed forces and police), multiple partnerships are quite common while condom use with girlfriends was lowest, reported by police at 45% and transport worker at 45.4%. Although syphilis levels were low across the board (0.8%), transport workers returned the highest prevalence among all groups, at 1.7%. Stereotypical characteristics of the target audience include male dominance, physical strength, virility, and risk taking. Other associated risk factors, such as drug and alcohol use among this target audience (road transport and oil workers in particular) often play a role in diminishing inhibitions, which can lead to unprotected sexual intercourse and also contributes to sexual violence. In addition, high mobility and long periods away from their families, limited access to health care services and condom availability and lack of information about risky behavior, risk perception and risk personalization places this target population at increased risk of STIs, including HIV.

AED will continue to pursue interventions that encourage youth to delay sexual debut until marriage, engage in secondary abstinence and reduce sexual risk taking while recognizing that abstinence is the only certain way to avoid HIV infection. Interventions targeting sexually active adults at higher risk of HIV-infection will encourage behavior change to reduce the number of casual sexual partnerships and promote marital fidelity. AED will reach out to PLWHAs through promotion of their enrollment in and adherence to PMTCT programs and/or promoting abstinence and consistent condom use with sexual partners to prevent re-infection.

AED will strengthen interactions and key referrals between health care facilities and the community as part of sexual prevention activities in the workplace programs. Sub-partners (NIBUCAA, NUPENG, NURTW, NUCFFRLAM(MP) will target each workplace with “A +B +C” prevention interventions. AED will work with the unions the small and medium enterprises to identify the right strategy and mix of interventions pooling from a broad range of identified best practices.

AED will conduct Community/Enterprise Awareness campaigns to clarify strategies and activities of the SMARTWork approach and educate the management of each enterprise. These meetings will take place prior to launching program activities in each establishment in order to build awareness for HIV/AIDS issues and to answer any concerns participants may have. Enterprises and unions will undertake HIV/AIDS program outreach activities within their host communities and reach out to workers family members with necessary information and education on HIV/AIDS. Capacity building activities may vary based on individual partner/enterprise needs. AED will support each enterprise and partner to conduct a series of two-day seminars for the community on: abstinence and being faithful; interpersonal communications; community mobilization methods; peer education strategies; linking programs with counseling, testing and care and treatment centers; and efforts at partner reduction, mutual fidelity and condom usage. Each enterprise will conduct at least one community outreach during the period and 20,455 individuals will be reached with A&B in COP09.

AED/SMARTWork in COP09 will focus on reaching each targeted population with a minimum of three interventions in the workplace. Intervention strategies will aim at reducing number of sexual partners, promoting consistent condom use and seeking treatment for STIs. IBBS 2007 revealed that among predominantly male occupational groups (transport workers, armed forces and police), multiple partnerships are quite common while condom use with girlfriends was lowest, reported by police at 45% and transport worker at 45.4%. Although syphilis levels were low across the board (0.8%), transport workers returned the highest prevalence among all groups, at 1.7%. Stereotypical characteristics of the target audience include male dominance, physical strength, virility, and risk taking. Other associated risk factors, such as drug and alcohol use among this target audience (road transport and oil workers in particular) often play a role in diminishing inhibitions, which can lead to unprotected sexual intercourse and also contributes to sexual violence. In addition, high mobility and long periods away from their families, limited access to health care services and condom availability and lack of information about risky behavior, risk perception and risk personalization places this target population at increased risk of STIs, including HIV.

AED will continue to pursue interventions that encourage youth to delay sexual debut until marriage, engage in secondary abstinence and reduce sexual risk taking while recognizing that abstinence is the only certain way to avoid HIV infection. Interventions targeting sexually active adults at higher risk of HIV-infection will encourage behavior change to reduce the number of casual sexual partnerships and promote marital fidelity. AED will reach out to PLWHAs through promotion of their enrollment in and adherence to PMTCT programs and/or promoting abstinence and consistent condom use with sexual partners to prevent re-infection.

AED will strengthen interactions and key referrals between health care facilities and the community as part of sexual prevention activities in the workplace programs. Sub-partners (NIBUCAA, NUPENG, NURTW, NUCFFRLAM(MP) will target each workplace with “A +B +C” prevention interventions. AED will work with the unions the small and medium enterprises to identify the right strategy and mix of interventions pooling from a broad range of identified best practices.

AED will conduct Community/Enterprise Awareness campaigns to clarify strategies and activities of the SMARTWork approach and educate the management of each enterprise. These meetings will take place prior to launching program activities in each establishment in order to build awareness for HIV/AIDS issues and to answer any concerns participants may have. Enterprises and unions will undertake HIV/AIDS program outreach activities within their host communities and reach out to workers family members with necessary information and education on HIV/AIDS. Capacity building activities may vary based on individual partner/enterprise needs. AED will support each enterprise and partner to conduct a series of two-day seminars for the community on: abstinence and being faithful; interpersonal communications; community mobilization methods; peer education strategies; linking programs with counseling, testing and care and treatment centers; and efforts at partner reduction, mutual fidelity and condom usage. Each enterprise will conduct at least one community outreach during the period and 20,455 individuals will be reached with A&B in COP09.
Activity Narrative: establishing a stronger collaboration with Society for Family Health to ensure a consistent condom supply. NIBUCAA and the five unions will be trained and retrained in best practices for condom distribution, storage and usage within the scope of prevention and sensitization activities. These activities include but are not limited to condom procurement and distribution, as well as making condoms readily accessible and available through peer education activities. There will be a two-day training on condom logistics and negotiating skills at 20 workplaces in COP09. Participants will be disaggregated by sex, social peers and grade levels from all the units and departments in each enterprise. This will be facilitated by AED, SFH and NIBUCAA. Condom distribution points will be set up by the various SMEs and workplaces. Overall, 13,636 individual will be reached through the PEs in COP09.

AED will provide TA to NIBUCAA and the five unions in the adaptation/production of relevant IEC/BCC materials to reinforce messages on abstinence, faithfulness and/or consistent and correct condom use. AED will continue the distribution of an extensive catalogue of behavior change tools and materials for the workplace that enables immediate implementation of activities and important leveraging of existing resources for use by the workers.

Two-day adaptation training will be organized for union-partners in conjunction with NIBUCCA for review and selection of existing BCC materials for reproduction and distribution by the partners. Three representatives will be selected from each partner organization for this training. Trainings will be conducted in line with the National BCC Strategy and facilitated by a consultant and a graphic artist with support from AED and NIBUCCA staff.

Dissemination strategies include: the distribution of materials at workshops, seminars, company-level presentations; special events, such as World AIDS Day Campaigns, Workers Day; and the integration of HIV/AIDS preventive messages into workplace newsletters, journals and other periodicals.

AED project will continue to encourage the parents to be active supporters of youths’ health choices by addressing improved knowledge, attitudes, communication and other parenting skills, and by supporting an integrated approach to promoting a healthy lifestyle for young people. Youth focused awareness creation activities including lectures, drama and a mascot will focus on behavior change, risk reduction and adoption of safer sex practices. AED will further assist enterprises’ developmental initiatives, such as family days. Family days are employer-sponsored events for employees to gather together to celebrate the enterprise’s annual achievements. AED will work with the partners to assist the HIV/AIDS Planning Committees at each enterprise level to plan and implement family days.

Greater Involvement of People Living with HIV/AIDS (GIPA) is critical to halting and reversing the HIV epidemic in Nigeria; thus AED/SMARTWork will mainstream GIPA into workplace HIV/AIDS programs. The involvement of PLWHA in program development and policy making will improve the relevance, acceptability and effectiveness of the program. During workshops and trainings, PLWHA’s participation in workplace HIV/AIDS programs will assist in changing perceptions and provide valuable experience and knowledge. For those who choose to disclose, open acknowledgement of their sero-status can help demolish myths and misconceptions about HIV/AIDS and PLWHAs. It may also encourage other HIV-infected workers to combat fear and shame by disclosing their status. PLWHA will also be advocates for the development of HIV/AIDS policy as well as law and policy reforms. The partners and enterprises including the 50 SMEs will be encouraged to continue to engage qualified PLWHA as staff members.

CONTRIBUTION TO OVERALL PROGRAM AREA
The program and activities implemented will increase the reach of ABC interventions into the most at risk population (Long Distance Drivers and other itinerant workers). This AED-SMARTWork prevention program through union partners and NIBUCAA whose capacity has been developed, will contribute further to strengthening and expanding the GON’s response to HIV/AIDS epidemic in the workplace and increase the chances of meeting the PEPFAR’s goal of preventing over a million new infections.

POPULATION BEING TARGETED:
Population targeted in these ABC prevention activities will not only focus on employees alone but also on families of employees and other community members where the enterprise is sited.

KEY LEGISLATIVE ISSUES:
Key legislative issues will address gender inequalities as regards sex, workplace norms and risky behavior injurious to health and increase access to information and services for men and women.

EMPHASIS AREAS:
AED-SMARTWork will focus service delivery on information, education and communication, promoting abstinence, mutual fidelity, condom usage and capacity building in the workplace and build linkages with other prevention initiatives.

Activity Narrative: ACTIVITY DESCRIPTION:
This is a new activity for LMS Associate, comprised of abstinence/be faithful (AB) and other sexual prevention (HVOP) programs. It links to activities in Adult Care and Support, TB/HIV, Counseling & Testing, OVC, and PMTCT.

In COP 08, LMS is supporting the provision of comprehensive AIDS care and treatment services at 17 secondary and 22 primary healthcare (PHC) feeder health care facilities in 6 states; Kogi, Niger, Adamawa, Taraba, Kebbi, and Kwara. In COP 09, the LMS AIDS Care and Treatment project will build on activities initiated in COP 08 and expand to 2 additional secondary facilities in states where LMS is currently working. HIV/AIDS services will be further decentralized and strengthened at an additional 10 PHC sites within the local government areas (LGAs) for a total of 51 sites (19 comprehensive care and treatment [CCT], 32 PHC) providing AIDS care and prevention services in COP09.

In COP 09, the presence of LMS at 19 CCT secondary facilities offers the opportunity to serve at least 19 LGA catchment populations with AB programs. AB programs will be further decentralized to remote communities through a network of 32 PHC health facilities. In COP 09, LMS will have established strong community HIV services in all project LGAs through its partnerships with faith-based, community-based, and non-governmental organizations (FBOs, CBOs, NGOs) and school teachers, which will provide an effective vehicle for the delivery of comprehensive AB services.

In COP 09, LMS AB programs will promote low-risk behaviors among in-school and out-of-school youth aged 15 to 24 years. The project will target most-at-risk populations (MARPS), such as transport workers, uniformed service men and women, men who have sex with men (MSM), and persons living with HIV/AIDS (PLWHA), from LMS-supported facility-based support groups. AB messages will be packaged using themes on primary abstinence and delay of sexual debut for younger youth, secondary abstinence among unmarried youth, and unmarried and mobile adults, HIV counselling and testing (HCT) for everyone, and mutual fidelity for spouses/partners. The most effective channels for targeting the various groups will be explored. LMS will also develop promotional materials, such as T-shirts, caps, exercise books, and pens to reinforce the messages of information, education, and communication (IEC) materials. The project will develop and/or adapt community training manuals that will be used for each of the above target groups. Peer education manuals used by Family Health International (FHI) and Society for Family Health (SFH) will be incorporated into the LMS AB training manuals. The LMS AB manual will include the following topics: basic knowledge on transmission and prevention of STIs and HIV; benefits and process of knowing one’s HIV status through counseling and testing; setting personal goals and values for life; building life skills; gender inequalities that promote HIV/STI transmission and how to minimize them; sexual violence; trans-generational sex; secondary abstinence; and alcohol and substance abuse. Peer education materials will inform men and women about the targeted population. Other IEC materials, including audio visual materials leveraged from other implementing partners (IPs) will be distributed and discussed during community seminars. LMS will build skills of CBOs, FBOs, community leaders and other gate keepers in supported LGAs to address social or cultural practices, such as polygamy, widow inheritance etc., which affect AB choices and increase the likelihood of risky behaviors. The interpersonal communication systems proven effective in the past will be strengthened through FBOs and CBOs already in the targeted communities. LMS will ensure that all targets are reached with a minimum of three prevention intervention strategies as required by the national prevention plan minimum package recommendation.

LMS will collaborate with other IPs, such as SFH and CEDPA, to build upon existing AB messaging and mass media campaigns. LMS will also work with HIV/AIDS clubs in 19 secondary schools and 6 tertiary institutions in 6 states, to promote such ABC messages as abstinence, mutual fidelity, delay of sexual debut, partner reduction, and gender and social issues that increase vulnerability to HIV transmission. Youth-friendly sexually-transmitted infection (STI) and HIV prevention services will be established at convenient locations within the LMS project LGAs to be managed by the trained youth peer educators. In COP 09, 250 persons will be trained to reach 49,091 persons (28,000 males and 21,091 females) directly with AB messaging in 6 states.

In COP 09, the LMS condoms and other prevention activities will be implemented at 51 facility-based sites (19 CCT facilities and 32 PHC) and through community mobilization of targeted MARPS in project-supported LGAs in 6 States. Local CBOs, FBOs and NGOs will be supported to train peer educators among brothel-based female commercial sex workers and their clients, MSM, long distance truck drivers, out-of-school youth, incarcerated persons, uniformed service men, and PLWHA. Peer educators will be supported to conduct weekly sessions for their target/peer groups to discuss accurate information about correct and consistent condom use as a means of reducing but not eliminating the risk of transmitting HIV and other sexually transmitted infections (STIs), HIV prevention among known HIV positive partners, prompt and complete treatment of STIs, the importance of HCT, partner reduction, partner testing and mutual faithfulness as methods of risk reduction. The project will leverage male condoms and lubricants from SFH and female condoms from UNFPA and other donors, for distribution to the peer educators, who will act as distribution points for their groups. In addition, LMS will collaborate with condom social marketing companies to ensure a steady flow of condoms to the project supported communities.

LMS will ensure that condoms are available at all supported health facilities for distribution to PLWHA as part of the “prevention with positives” (PwP) strategy. This will prevent re-infection among PLWHA and limit transmission to others. Condoms will also be given to discordant couples to limit transmission to the uninfected partners that may promote family relations' survival. The prevention with positives strategy will include provision of condoms and information on correct and consistent use, discordant couples, and prevention of super infection in couples that are both positive.

LMS will adopt a phased peer education program in 19 project facility communities in 6 States. The first phase will include: advocacy visits, community mobilization, village square meetings, and group discussions. The second phase will include: distribution of condoms and IEC materials; identification of peer groups; training of peer educators among targeted groups in HIV counseling, HIV education, life building
Activity Narrative: skills; organizing prevention education/awareness events; and facilitating group discussions in communities using the developed peer education manual. The third phase will be focused towards sustainability of the program by collaborating with CBOs, FBOs and local NGOs and trained peer educators from the targeted groups, to strengthen their capacity to continue to build upon initiated prevention activities. LMS will support 6 mobile community outreach teams, one in each project state, to engage in community-wide prevention activities, such as: facilitating group discussions; disseminating culturally appropriate messages on prevention, partner reduction, inter-generational sex, mutual fidelity, and stigma reduction; promoting access to HCT for targeted MARPS; and distributing condoms and culturally specific IEC materials leveraged from other IPs. To ensure appropriate condom messaging, mobile teams will be provided with penile models for demonstration of correct condom use. Clients accessing the mobile IEC or HCT services will be linked to treatment, care and support programs at supported health facilities. An already established referral system that ensures a linkage between mobile outreach teams and the facility will be strengthened for this purpose. LMS will train mobile teams in systems management, referral systems, and patient tracking.

In COP 09, 320 persons from 190 outlets will be trained to reach 32,727 (18,654 males and 14,073 females) directly with other prevention information and messages for correct and consistent condom use, and prompt and complete treatment of STIs. Ten million condoms will be distributed from 51 outlets and 5 mobile units, targeting MARPs groups.

To ensure uniform and consistent data collection and effective monitoring and evaluation (M&E), LMS will use nationally harmonized registers and HIMIS tools to capture, manage, and report relevant data. The program will utilize participatory M&E for its internal evaluation. Focus-group discussions and semi-structured interviews will be used for the baseline study and program monitoring. Data quality will be ensured through the adaptation of the Winrock Means of Verification (MOV) tool.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
AB activities will contribute to the USG PEPFAR plan by reaching 49,091 persons with AB messages and 32,727 with condoms and other prevention programs. This program will help to strengthen the capacity of community based resources to serve the wider interest of improving the lives of families and contribute to reducing new infections in Nigeria.

LINKS TO OTHER ACTIVITIES:
Sexual prevention links to activities in Adult Care and Support, TB/HIV, Counseling & Testing, OVC, and PMTCT.

POPULATIONS BEING TARGETED:
This activity focuses on the needs of adults and youth from LGA catchment areas in the 19 project supported sites, with a focus on in- and out-of–school youth, teachers, young women and men reporting multiple partners, OVC, PLWHA, and MARPS (incarcerated persons, transport workers, sex workers). Prevention with positives will form an integral part of this activity with special focus on discordant couples and positive pregnant women.

EMPHASIS AREAS:
Emphasis will be placed on community mobilization, participation and the training of peer educators to increase access to ABC messages. Emphasis will also be placed on messages that address social or cultural practices which can hinder wise ABC choices and increase the likelihood of risky behaviors.

Activity Narrative: USAID Nigeria is negotiating a new award which will provide integrated HIV prevention programming for a targeted most-at-risk population of men who have sex with men (MSM). As is the practice when making new awards, OGAC will be informed when the award is ready, and the partner(s) and targets will be uploaded into COPRS. The proposed program will build and strengthen institutional and technical capacity of five local MSM organizations in the FCT, Lagos, Cross Rivers, Rivers and Kano states to deliver high-quality comprehensive AB prevention programs and services targeting Men having Sex with Men (MSM). Lagos and FCT will be targeted to start programs in COP 09 with expansion to Rivers, Kano and Cross River state planned for later years.

Nigeria with national prevalence of 3.4% (FMOH 2007) and prevalence exceeding 5% in some states has a concentrated epidemic. HIV/AIDS prevalence of 3.7%, 3.5%, 3.1% amongst transport workers, police force and armed forces and with prevalence of over 30% among female sex workers (IBBSS 2007), reveals unequal distribution among different population subgroups. The highest prevalence amongst high risk groups including MSMs at 13.5% emphasizes the need to target this particular group with HIV sensitization programs, prevention messages, and linkages to care and treatment. IBBSS 2007 revealed that half of the MSM surveyed could not correctly identify ways to prevent sexual transmission of HIV. Over 70% used oil based lubricants. Multiple sexual partnerships (insertive and receptive) are common among MSM while over 50% engaged in transactional sex. MSM were not more likely to have used condom at last transactional anal sex with a man (58%) compared to a non commercial sex partner (53%). Only 34% of reporting MSM have ever been tested for HIV in Nigeria.

The proposed program will deliver HIV services as well as undertake multiple level capacity development approach to simultaneously respond to unmet need for prevention, community based care and support HIV services to MSM in Nigeria. Past efforts have worked through rather with MSM grassroots organizations and services were provided under umbrella of most at risk population.

The new partner in COP09 will focus on MSM populations with a minimum of three interventions in the 5 states mentioned above. Intervention strategies will aim at reducing number of sexual partners, promoting consistent condom use in all sexual acts, encouraging the use of water based lubricants, providing adequate treatment of STIs and offering sex education.

Specific activities will entail building the capacity of indigenous MSM organizations to provide high quality prevention programming that will bring about effective behavior change as it relates to reduction of multiple sexual partners and transactional sex as well as with messages promoting fidelity, encouraging partner reduction through risk reduction messages and personal risk perceptions skills; utilization of Peer Outreach & Community Mobilization activities, establishing Condom/lubricant outlets, Community Centers, Online – outreach and web resources, conducting trainings/Events and IEC materials development.

Activities will also focus on male and female partners of MSM who are at high risk owing to contextual factors, with messages refined for each group. Activities to prevent transactional sex or protect MSM involved in transactional sexual relationships will focus on skills based HIV education for vulnerable young women and young men with broad based community care and support activities that facilitate access to treatment and adherence counseling services for MSM. These interventions will be reinforced with mass media activities that highlight importance of mutual fidelity, risk behavior reduction and safe sexual practices. The program will concentrate activities in areas that will be identified through secondary analysis of national behavioral data generated through the project SEARCH and NARHS PLUS survey.

The MARP prevention program will in COP 09 build capacity of local MSM networks to provide the minimum package intervention for the MSM population groups. Technically this will entail familiarizing the organizations with the minimum package modules and adopting a program approach that ensures delivery of the package as stated by the National Prevention Plan.

The project anticipates reaching 28,000 MSM with AB messages and services and 22,000 MSM with community and facility services including adherence and prevention with positive services for identified positive MSM utilizing minimum package interventions that provide comprehensive balanced prevention interventions. 17 outreach coordinators and 70 Peer educators will be trained in COP 09 to MSM population in Lagos and FCT.

The new partner will document and disseminate best practices; successful and innovative approaches with lessons learned and share these with their implementing agencies as well as other partners within the PEPFAR program in Nigeria. In COP 09, particular interest on lessons learned will focus on effective approaches for improving organizational and technical capacity of local lesbian, gay, bisexual, transsexual/men who have sex with men organizations.

Implementation will be through local organizations whose capacities will have been built by the prime and have been identified to have capacity for rapid scale up. Within the initial 6 months of implementation, capacity-building for provision of prevention (AB) services for the groups will be carried out followed by development of IEC materials for MSM. The overall programmatic intervention will be in line with national priority plan and national prevention plan.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
The programs and activities implemented will fill critical gap in the reach of HIV interventions into epidemiologically important population to better address gaps in coverage and to better address specific behaviors within underserved populations. This MARP prevention program, delivered through implementing agencies whose capacity has been built, will contribute to strengthening and expanding the capacity of the GO’s response to the HIV/AIDS epidemic and increasing the prospects of meeting the Emergency Plan’s goal of preventing 1,145,545 new infections.

LINKS TO OTHER ACTIVITIES
The AB and C/OP activities implemented under the proposed activity will be linked with care and support...
**Activity Narrative:** activities, as well as with the other prevention partners.

**POPULATIONS BEING TARGETED:**
Populations targeted in these activities will include MSM and their partners (male and female).

**KEY LEGISLATIVE ISSUES ADDRESSED:**
Key legislative issues will address increasing equity and access to information and services for MSM.

**EMPHASIS AREAS:**
The service delivery component will focus on information, education, and communication in the community and will build linkages with other sectors and initiatives.

**New/Continuing Activity:** New Activity

**Continuing Activity:**

Activity Narrative: ACTIVITY NARRATIVE:

The SCMS objective is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers not only the procurement but also: the shipment, distribution and delivery of sexual prevention related commodities; information, education and communication (IEC) and related materials developed for the promotion of abstinence (A), be faithful(B)/fidelity promoting initiatives and other prevention (OP) activities; and other supply chain management related activities. It also covers technical assistance (TA) and systems strengthening (SS) activities provided to PEPFAR partners to strengthen or build their supply chain management capacity within their respective programs.

In COP09, SCMS will procure sexual prevention related commodities; AB and OP commodities (not including condoms), IEC and promotional materials, and products for the management of sexually transmitted infections (STIs) for the Department of Defense (DOD). Through its efforts in this program area, SCMS works towards ensuring uninterrupted availability of needed commodities for AB (for the encouragement and promotion of safer sexual behaviors ultimately targeting the general population) and OP interventions.

The present budget will cover the costs of commodities as well as logistical and administrative services from the field office for the coordination and management of procurements by SCMS. SCMS will support DoD in product selection in accordance with the minimum package of AB and OP interventions for appropriate targeting of the military and civilian populations reached through DOD’s sexual prevention programming.

SCMS will assist in quantification and forecasting of requirements, and will support the development of long term supply plans (considering in country stocks and anticipated consumption rates) for stock management and delivery planning.

SCMS will identify suitable sources of supply, both internationally and nationally. SCMS will work with IPs in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and/or associated services, such as maintenance service.

SCMS will coordinate with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by NAFDAC, SCMS will make suitable recommendations, including waiver applications, where appropriate. SCMS will take the lead in communicating with manufacturers on registration gaps in Nigeria.

SCMS procurement leverages global spending to provide the best value and offers clients certainty of competitive prices and international quality standards. SCMS procurement strategy includes the purchase of generic drugs, whenever possible, the pooling of procurement for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries, and negotiating long term contracts with suppliers.

DoD requests for sexual prevention materials will be addressed to the SCMS field office directly.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry, as required. SCMS will take the lead and further streamline the customs clearance process as appropriate, including management of the CC1, CC2 or CC3 duty exemption forms. SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Where appropriate, commodities procured and imported by SCMS will be supplied through the SCMS Regional Distribution Center (RDC) in Ghana. The warehousing of commodities in the RDC is a critical component of the SCMS technical solution. The use of the RDC will significantly reduce lead time and provide an important buffer between supply from manufacturers and demands from PEPFAR programs in Nigeria. The RDC will also ensure that shipment quantities do not overwhelm their recipients in country, which is an increasing challenge in the context of program scale up. The RDC concept also brings an increased flexibility in stock management, thus reducing risk of stock obsolescence or need for emergency replenishments, toward important cost savings. Finally, the RDC approach serves regional and national sustainability, as the RDC is designed to be a commercially viable entity, available to other health (and non-health) programs, whose benefit will last beyond SCMS. Where possible and appropriate, SCMS will road freight from the RDC Ghana to Abuja; a mode of delivery that will provide significant savings over airfreight.

Delivery arrangements will be negotiated with DOD; SCMS will either deliver to a central location or to point of services, as needed. When local warehousing is needed, SCMS will continue to explore viable options and make use of its recently acquired cross-docking facility and long term warehouse facility (which will be acquired in COP 09). For in country distribution where necessary, SCMS will competitively source for and utilize the service of an efficient and safe in-country courier services operator.

SCMS provides TA and SS services in all areas of the supply chain, including product selection, quantification and forecasting, supply planning, procurement, warehousing, customs clearance and delivery. In COP09, SCMS will provide TA and SS services to DoD, including the training of individuals in the use of the ProQ or Quantimed forecasting and pipeline supply planning tools. SCMS will continue to provide TA and SS services to DoD based on the recommendations that came out of a supply chain system’s assessment carried out in COP07.

SCMS will provide the USG team with regular reports on supplies and equipment, as well as monthly financial reports. In COP 09, supply chain support teams (SCSTs; to be made up of technical SCMS staff and Government of Nigeria or implementing partner [IP] staff, as appropriate) will be constituted by SCMS to work with the IPs in providing their trained logisticians with the capacity to monitor and support the performance of the supply chains at various levels. Using standardized indicators of logistics performance, the SCSTs will track performance of the supply chains and provide an early warning system to identify
Activity Narrative: impending or imminent supply chain breakdowns and act to forestall these. By developing methodologies and tools for conducting these activities, SCMS will work with GoN and IPs to establish and institutionalize this activity, thereby building the capacity to identify these problems and resolve them before service delivery is compromised.

In addition, an automated web-based procurement tracking database will ensure that the USG team and IPs have adequate visibility on SCMS procurement status by providing easy access to accurate and up to date information on procurement. Further procurement automation and harmonization will also be facilitated through linkages with the LHPMIP system.

Under this program area, SCMS does not have targets of its own but supports DoD reaching their prevention planned targets.

Prime Partner: To Be Determined

USG Agency: U.S. Agency for International Development

Program Area: Sexual Prevention: Other sexual prevention

Program Budget Code: 03

Planned Funds:
Activity Narrative: USAID Nigeria is negotiating a new award which will provide integrated OVC programming. As is the practice when making new awards, OGAC will be informed when the award is ready, and the partner(s) and targets will be uploaded into COPRS. The targets developed for this activity are notional, as they may be subject to change during the course of the award negotiation, but the program as proposed is on a scale to potentially reach about 1,400 OVC and to provide support and training to 1,000 caregivers.

This element of the new activity will focus on providing AB prevention messages for OVCs and their caregivers in four states (Kaduna, Kano, Bauchi and Niger) to expand services of care and support and referral to treatment for children affected or infected by HIV and AIDS. This activity will collaborate with community OVC programs and FBOs to adapt and pilot an HIV prevention program for young adolescents prior to sexual debut (estimated 12 to 16 years). The proposed model program is abstinence-based and with condom and other prevention services as appropriate for age given to older OVCs and their caregivers.

Through its support to OVCs, the activity will, facilitate organizational capacity building in prevention programs for a core local partner who will gradually transit to be the prime partner. It will work with already developed and successful child protection committees, train peer educators among them to reach their peers with abstinence message as well as facilitate adults/ child communication between care givers and OVCs. Community Protection Committees (CPC) will also be used to reach children of HIV-affected families and will expand outreach to improve access to prevention of mother to child transmission services (PMTCT), economic strengthening and OVC services.

The activity will strengthen the capacity of indigenous organizations to respond to HIV/AIDS in their communities; provide quality comprehensive prevention services for AIDS OVCs. The minimum package intervention approach as defined in the national prevention plan will be utilized for reaching these OVCs and their caregivers.

This prevention intervention will also include educational activities that relate to: 1) Trust Building and Group Cohesion; 2) Risks and Values; 3) Educate Yourself: Obtaining Information; 4) Educate Yourself. Examining Consequences; 5) Build Skills: Communication; 6) Information about Sexual Health; 7) Attitudes and Skills for Sexual Health; 8) Review and Community Project. Overall the program will help youth assess the short- and long-term impact of their decisions on themselves, their families, and their communities, help develop decision-making skills, develop communication skills, learn basic facts about HIV/AIDS, sexual health, condoms and other contraceptives, and learn refusal skills. The educational methods include in-school curricular activities and extra curricular activities including the PEP model. While the focus of the program is on HIV/AIDS, it is also involves a comprehensive education program that covers many topics including knowledge about risks associated with other sexually transmitted infections, teen pregnancy, violence, alcohol, and other drug use.

The partner will work with community groups that are trained and experienced in identifying vulnerable children and families, provide a strategic starting point for a project that will work with community-based systems to effectively reach OVC. The activity will complement the services of local agencies by reaching children and families that may not have access to HIV prevention services or lack opportunities to access information on HIV prevention. Issues of stigma through awareness activities, peer advocates, and support groups will be addressed. Linkages will be sought for nutritional and educational support with USG supported wrap-around activities.

CONTRIBUTION TO OVERALL PROGRAM AREA: This activity program area focus is on strengthening the capacity of families and communities to provide prevention services to OVCs and their care givers. These activities contribute to the USG’s PEPFAR strategy of preventing HIV for an identified vulnerable group and are also consistent with the National HIV Prevention plan.

LINKS TO OTHER ACTIVITIES: Linkages will be established with HIV/AIDS treatment centers and community care and support program to ensure that OVC and caregivers stay alive and in good health, to counseling and testing centers to enable family members to receive necessary support and to reduce the increase in numbers of HIV+ children.

POPULATION BEING TARGETED: This activity will target girl and boy OVC and families affected by HIV/AIDS. It will provide services to OVC, caregivers of OVC and other children/siblings living in OVC households in community settings using existing established and accepted organizations as service providers. In addition, religious and community leaders, leaders of women’s organizations will be trained to combat stigma in their work.

EMPHASIS AREAS: The activity includes an emphasis on local organization capacity development and community mobilization, education and training. The program will aim to support equal numbers of males and female OVC and address economic and education factors that limit access to services of either gender.

Activity Narrative:
This activity represents funding for a contracted Nigerian program officer for activities in the area of Sexual Prevention. The program officer spends 100% of her efforts in AB and Other Prevention. The budget includes one FSN salary at 100% effort, overhead charges, funding required for domestic travel, training funds and allocated minor support costs. This funding also includes support for a TA visit for two weeks of in-country support by a seasoned prevention expert from the U.S. Department of Navy HIV Prevention Program and/or one of the U.S. Military HIV Research Program’s PEPFAR Programs in Uganda, Kenya, Tanzania or HQ.

The prevention program officer will work as a member of the USG Prevention Technical Working Group, as well as serve on the U.S. Department of Defense – Nigerian Ministry of Defense (NMOD) Prevention Working Group. The prevention program officer’s responsibilities also include: 1) representing the DOD-NMOD in technical discussions with the GON and 2) overseeing relevant technical aspects of the program, including program management and oversight of the 20 DOD-NMOD PEPFAR site prevention programs. The prevention program officer will work with other Implementing Partners and the USG team to ensure a harmonized approach that is consistent among partners and with the GON national guidelines. The prevention officer will also continue to support the GON in developing and implementing national prevention guidelines (e.g., National Condom Strategy).

- **Program Area:** Sexual Prevention: Other sexual prevention
- **Program Budget Code:** 03
- **Planned Funds:** $140,000
Activity Narrative:

**ACTIVITY DESCRIPTION:**
This activity relates to HCT, PMTCT, Basic Care and Support, TB/HIV, and Strategic Information.

IFESH will continue its COP08 Abstinence/Be Faithful (AB) and other sexual prevention programs in COP09. These will be implemented in line with PEPFAR Nigeria guidance for providing a comprehensive package of prevention services to individuals through a balanced portfolio of activities. IFESH’s goal is to contribute to a reduction in HIV prevalence among youth, particularly in the most-at-risk age group of 15-24 year olds, promote mutual fidelity among married adults, and encourage safe sexual practices. The 2005 ANC survey in Nigeria indicates that among age cohorts in Nigeria, the 20-29 year old age group has the highest HIV prevalence. In addition, the 2005 National HIV/AIDS and Reproductive Health Survey (NARHS) demonstrated a low risk perception (28%) among the general population and significant reports of transactional sex (11%) among young women aged 15-29 years.

In COP09, IFESH will continue its implementation of AB programming in underserved areas in Nigeria and will couple these activities with condoms and other prevention programs, as well as linkages to counseling and testing services, where appropriate. This activity will be implemented at the community level and will be reinforced through national level mass media campaigns by other USG partners, such as the successful Zip-Up campaign.

In-school youth will be targeted with AB messaging using the non curricula school-based activities, peer education, and peer education plus strategies. These are derived from the recommended national minimum package for sexual prevention activities. Abstinence clubs will be formed in schools and activities such as film and game shows/quiz contests on AB messaging will be conducted. A total of 30 peer educators selected from four schools will be trained in AB messaging and will work closely with IFESH to improve program quality. For an individual to be counted as having been reached, (s)he must have received all three listed interventions.

Priority populations to be targeted by AB and other prevention messaging, will be out-of-school youth, persons living with HIV/AIDS (PLWHAs), transport workers, orphans and vulnerable children (OVC) receiving home-based support, and clients accessing HCT services. These target groups will be reached with a minimum of three strategies selected from the following: community awareness campaigns, HCT outreach, STI counseling or management, condom messaging/distribution, and peer education models. Out-of-school youth will be reached through community outreach and community youth groups. PLWHAs and OVCs will be reached through support groups, and transport workers will be reached at their motor parks through their unions. IFESH will implement this activity at both the facility and community levels with messages conveyed in multiple fora. Each person will be reached with messages in appropriate dose and intensity, delivered on a regular basis to stimulate behavior change.

As a component of community-based programming, messages will be communicated through local drama presentations and singers drawn from the community. Information imparted will include the basics of HIV prevention, especially condoms and other prevention (COP) and performers will be encouraged to build prevention themes into their songs to promote sexual partner reduction and consistent condom use. A total of 70 persons, including but not limited to health care workers, peer educators, teachers, religious leaders, and community volunteers will be trained in COP messaging. Community outreach will target most-at-risk individuals with the purpose of limiting further infections. Doctors and counselors in STI, ante-natal care (ANC) and postnatal clinics will distribute condoms and conduct prevention-with-positives advocacy messages (i.e., HCT for family members and sex partners, counseling for discordant couples, counseling on healthy lifestyles and positive living, prevention messages, and IEC materials on disclosure). For HIV negative individuals, trained counselors will provide education on HIV/AIDS transmission, risk behaviors, and risk reduction strategies, including condom use.

Condoms will be procured from Society for Family Health (SFH) for all IFESH sites. The provision of condoms will be accompanied by individual and/or group counseling and demonstrations from experienced counselors on their proper use. Information, education, and communication (IEC) materials tailored to address the unique risks that individuals from high risk groups face and the correct and consistent use of condoms will also be provided in all sites and all points of service within those sites.

A complete prevention package of materials utilizing both AB and COP programming will be distributed at all HCT sites and at all points of service in health care facilities where IFESH is working. This will include AB IEC materials and condoms. IFESH will target communities where registered clients live for the purpose of community and school based AB messaging in order to continue to reinforce messages provided in the facility setting.

There will be continued evaluation of current sexual prevention activities within communities that will be used to guide specific activities to be conducted under each strategy in the target communities. Gaps in programming identified in COP08 will be addressed within and contribute to a comprehensive and harmonized national program. AB messages will be balanced with concurrent condoms and other prevention messaging where appropriate, and will be integrated with services provided by IFESH in a total of 34 sites (20 HCT sites including facility-based, 10 DOTS sites, and four schools) and surrounding communities in two states (Imo and Rivers). The program will be designed to achieve maximum coverage for these communities with balanced ABC messaging. Individuals will be reached on a regular basis with a minimum of three of the listed prevention strategies IFESH will employ.

The target for this intensive prevention campaign is 2,273 persons (1,200 males and 1,073 females) for AB messaging and 4,242 (2,400 males and 1,842 females) persons for COP messaging. All in all, age appropriate abstinence only messaging and secondary abstinence messaging will be conveyed to 1,000 children and adolescents (600 males and 400 females), particularly focused on in-school youth and OVC receiving home-based support. A total of 100 people will be trained in the two program areas.

**CONTRIBUTION TO OVERALL PROGRAM AREA:**
This activity relates to HCT, PMTCT, Basic Care and Support, TB/HIV, and Strategic Information.
Activity Narrative: IFESH activities are in line with the PEPFAR vision of enhancing indigenous capacity to provide integrated HIV/AIDS services from the community to the national level, and in the process strengthen the health care system and the capacity of local development partners. These prevention activities are consistent with PEPFAR's five year goals for Nigeria, which plan to prevent 1,145,545 new infections through a number of prevention strategies including (but not limited to) condoms and other prevention to specific high risk groups.

In order to be maximally effective, the prevention messages developed at different sites will be targeted to the various high risk groups that they serve. These activities are in line with the PEPFAR 5 year strategy, which seeks to scale up prevention services, build capacity for long term prevention programs and target outreach to promote correct and consistent use of condoms with MARPs to reduce the risk of HIV infection.

The continuation of IFESH-supported services in HCT and PMTCT as well as STI management will help facilitate the scale up of the overall program, and increase utilization of these services, expected to result from other prevention and outreach initiatives.

LINKS TO OTHER ACTIVITIES:
This activity relates to HCT, PMTCT, basic care and support, TB/HIV, and strategic information. Prevention for positives counseling, including promotion of condom use will be an important component of post-test counseling in STI clinics. Prevention for positives counseling will be incorporated into counseling for persons receiving antiretroviral (ARV) treatment. This service will also complement HCT services for those who ultimately test HIV-negative. Through this program as well as basic care and support, IFESH will ensure access to STI treatment.

POPULATIONS BEING TARGETED:
This activity focuses on discordant couples, STI patients, TB patients, PMTCT patients, PLWHA, and youth. Training will also be focused on healthcare workers, counselors, and volunteers.

EMPHASIS AREA:
An emphasis area for this activity is human capacity development in order to build the organizational capacity of HCT service outlets to provide a full range of prevention strategies, including correct and consistent use of condoms to persons attending these centers. Other emphasis areas include gender and local organization capacity building.

COVERAGE AREAS:
Rivers and Imo states

Budget Code: HVOP
Activity ID: 21686.26809.09
Activity System ID: 26809

Program Budget Code: 03
Planned Funds: $90,000
Activity Narrative: This activity is linked to counseling and testing, basic care and support, TB/HIV, OVC, strategic information, and PMTCT.

In COP 08, Partners for Development (PFD) worked collaboratively with their sub-partner, the faith-based organization (FBO) Daughters of Charity (DC) to provide services aimed at preventing transmission of HIV/AIDS through two project sites: 1) the Assumption Clinic in Warri, Delta State; and 2) Catholic VCT Center, Ikot Ekpene, Akwa Ibom state. Targets for COP08 abstinence, be faithful, and condoms and other prevention (ABC) programming included reaching 4,091 individuals (2,000 males and 2,091 females) with AB prevention messages and 2,727 (1,527 males and 1,250 females) with other behavior change prevention messages from 2 outlets, and 2,000 individuals reached through abstinence only. These activities were implemented under the “Counseling, Care and Anti-retro Viral Mentoring Program” or CAMP, the name of PFD’s CDC-funded project.

In COP 09, CAMP will support the government of Nigeria in providing timely, accessible, factual and balanced ABC programming in line with the overall PEPFAR Nigeria goal to deliver a comprehensive package of prevention services to targeted individuals and motivation to practice preventive behavior, build self-efficacy, and create an enabling environment for sustaining HIV prevention behavior change. Messages and materials will focus on: increasing risk perception of HIV and AIDS; increasing demand for HIV testing and appropriate application of AB prevention strategy; delaying sexual debut; and reducing the number of sexual partners. This is of particular importance, as it has been reported that risk perception among Nigerians remains low, with 67% perceiving themselves not to be at risk of contracting HIV, and 29% assuming they are at low risk of contracting the virus (2005 National HIV/AIDS and Reproductive Health Survey).

CAMP prevention will focus on creating an enabling environment for sustaining HIV prevention behavior change through providing timely, accessible, factual and relevant HIV prevention information, and ensuring effective communication and motivation among stakeholders and targeted populations to practice preventive behavior and build their self-efficacy. Messages and materials will focus on increasing risk perception of HIV and AIDS; increasing demand for HIV testing; increasing self efficacy for the appropriate application of AB prevention strategy; and delaying sexual debut and reducing the number of sexual partners.

AB behavioral change communication programming will be implemented primarily through the following strategies: community awareness campaigns; peer education model; “peer education plus” model; and a school-based approach. In line with the National Prevention Plan’s guidance on a minimum prevention package, an individual will only be counted as reached after receiving AB messaging through at least three of the above listed strategies. For the condom and other prevention (C&OP) programming, PFD’s minimum prevention intervention package will include: 1) community outreach; 2) specific population awareness campaigns; 3) peer education model; and 4) provision of STI management. Individuals will be counted as having been reached when they have received C&OP messaging through at least 3 of these strategies. The CAMP prevention team will be coordinated by a Prevention Officer who will mobilize 60 prevention volunteers from the membership of various community-based organizations (CBOs) active in and around the two project sites. These volunteers will be trained to educate their peers in ABC messaging, although in practice 30 volunteers will specialize in AB message delivery and 30 others will specialize in condoms and prevention messages. The AB prevention volunteers will be drawn primarily from CBOs active with church and primary school groups and the condoms and other prevention volunteers will be drawn primarily from with unemployed youth and transport workers groups. The CAMP project will use almost exclusively a community outreach approach for transmitting prevention message that will be supplemented by complementary clinical based and counseling and testing service providers that will reinforce and expand upon prevention messages.

HIV prevention team members will be self-nominated from local support groups of people infected and affected by HIV/AIDS, as well as any interested members of communities groups linked to the CAMP catchment areas. These individuals will be trained by CAMP Program Officers to promote AB messages as well as C&OP messages, as appropriate to the population they are targeting. Training will emphasize routine counseling and testing for couples and individuals, and AB prevention as normative in their communities. These teams will adapt the Society for Family Health (SFH) behavior change communication (BCC) materials and work with local support groups to translate material into their community’s language.

Prevention teams will pay advocacy visits to the traditional community gatekeepers for access to the women, men and youth in each targeted locality, and organize community mobilization events with relevant HIV prevention messages for each group. These volunteers working with high risk groups will be coached to link the target population to condom outlets and appropriate testing/counseling and follow-up services (i.e., PMTCT, counseling for discordant couples, etc.) as well as sexually-transmitted infection (STI) treatment and care.

The AB prevention team will target 4,091 individuals with a subset reached with A only message activities (i.e., messages delivered to school groups up to the age of 13). A only messaging starts with an awareness talk in small group discussions facilitated by the Prevention Officer, followed up by peer education outreach by volunteer students trained as peer educators, and by a dance/drama presentations with an A message theme. AB messages will be delivered in secondary schools following the same first two steps and including a sporting or cultural event accompanied by an AB theme.

Condom and other prevention messages will target 2,727 individuals among those considered to be high risk groups — unemployed youth, transport workers, STI patients, persons living with HIV/AIDS (PLWHAs), and pregnant women. Messages will be reinforced at multiple fora such as small group discussions (including ante-natal care talks given at health facilities), interpersonal communication and social events, followed by mobile counseling and testing, condom distribution and follow-up prevention information for positives. Educational messages will cover the importance of partner reduction and STI prevention and treatment.
Activity Narrative: CAMP will utilize the recently adapted national prevention with positives (PwP) training package across all supported sites. In HIV counseling and testing (HCT), prevention of mother-to-child transmission (PMTCT), and adult care and treatment settings, clinical staff and community workers will encourage patients to promote testing and counseling for their sex partners. During each encounter with a positive person during the CAMP program, CAMP staff will support the integration of prevention into care and treatment settings, including family planning counseling and services, identification and treatment of STIs, and prevention counseling, provided by lay counselors. The C&OP portion of this activity will include provider- and lay counselor-delivered prevention messages promoting correct and consistent condom use during every sexual encounter. Also, condom use will be encouraged during family planning counseling as a method of dual protection and as part of STI management for reducing STI transmission and acquisition. These prevention messages and interventions will be delivered during risk-reduction counseling, family planning counseling, and STI management and counseling. CAMP staff will work with patients to encourage them to reduce alcohol and limit all other risky behavior and activities that affect their ability to adhere well to their ART regime, and adherence to the full course of any other medication the client is taking.

Program Officers will meet with prevention teams monthly to plan community outreach projects, address concerns, and provide any relevant or needed training in communication skills. Prevention team members will be trained to report on delivery of behavior change communication (BCC) methodology. Delivery of the MARCH methodology will be tracked and reported on by CAMP Prevention Project Officers. Focus will be placed on verifying the basic prevention package of at least 3 interventions per target reached in both AB and C&OP prevention components.

Contribution to overall program area: PFD/DC's activities are consistent with the PEPFAR 5-year strategy, which seeks to scale-up prevention services, build capacity for long-term prevention programs, and encourage testing and targeted outreach to high-risk populations. The establishment of networks and referral systems from prevention efforts at the community level to PMTCT and HIV care and treatment will help facilitate the scale-up of the overall program.

Links to other activities: This activity is linked to counseling and testing, basic care and support, TB/HIV, OVC, strategic information, and PMTCT. PFD will procure condoms from Society for Family Health (SFH) and seek to partner with them and other specialized community groups to socially market condoms in the program area. PFD will promote condom usage, and other relevant prevention messages among migrant workers and other mobile populations in the Delta region. PFD's home-based care team will also promote management of STIs and encourage community members to know their status as a first step in preventing the spread of HIV.

Target population: The focus population for this activity will be youth (in/out of school youth), HCT clients, and TB DOTS patients. Both Akwa Ibom and Delta states have many characteristics that contribute to accelerating the HIV/AIDS epidemic, including high numbers of unemployed youth who may engage in transactional sex. PFD/DC will focus prevention efforts on reaching young people both before they begin risky behaviors and after. In addition, prevention messages will be targeted to pregnant women since they also risk transmission to their unborn child.

Key legislative issues: Coordination meetings held at the LGA level with representation from local government assists in keeping local governments updated on the scope of the epidemic in their area and make them better advocates for strengthening barriers to prevention at the state level. CAMP staff will supplement these meetings with quarterly state level task force meetings to explore ways to achieve greater economies of scale and harmonization of approaches.

Program Emphasis: This activity includes major emphasis on information, education, and communication with minor emphasis on community mobilization and training. These activities will also address gender equity issues by providing equitable access to prevention services for men and women.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

This activity also relates to activities in AB, Care and Support, ARV services, HCT, OVC and PMTCT.

In COP08, ICAP programming has expanded support from 10 to an additional 18 hospitals for a total of 28 hospital networks, located in 6 states (Akwa Ibom, Benue, Cross River, Gombe, Kaduna, Kogi). In COP08, ICAP implemented a balanced portfolio of prevention activities in abstinence, be faithful and condom and other prevention (COP) programming in line with the overall PEPFAR Nigeria goal of providing a comprehensive package of prevention services to individuals. ICAP implemented these activities at both the facility and community levels utilizing a combination of strategies, including community outreach campaigns, peer education models, a school-based approach (non-curricula based), infection control activities, sexual transition infection (STI) management and treatment, and workplace activities (specifically, Greater Involvement of People with HIV/AIDS, or GIPA).

In COP09, ICAP will provide support to a total of 30 hospital networks (28 existing and 2 new): these facilities will serve as the platform for ICAP prevention activities in the coming year. ICAP will continue to support abstinence (primary & secondary), risk reduction, and safe sex promotion activities among 30,152 individuals (10,251 males and 19,901 females). Targeted populations include: people living with HIV/AIDS (PLWHA), out-of-school youth, transport workers, and people affected by AIDS. They will receive abstinence, be faithful, and condom/other prevention messaging on a regular basis via activities such as community outreach campaigns, peer education models, non-curricula based school approach, infection control, STI management/treatment, workplace and skills acquisition, and essential life skills training. Individuals who are counted as reached will have received at least 3 of these interventions in line with the minimum prevention package requirement of the National Prevention Plan.

ICAP will reach out of school youth in targeted communities with messages of delaying sexual debut or adopting secondary abstinence through focused small-group discussions, and inter-personal communication strategies, non-curricula school based approaches, and essential life skills training. ICAP will encourage PLWHAs and care givers to engage in productive income generating activities by providing training on essential life skills and referring PLWHAs to other partners who provide services not available through ICAP. ICAP will continue to support PLWHA peer health educators to help other PLWHAs acquire skills for positive living.

ICAP will implement a peer education model that targets job peers who are healthcare workers. Healthcare workers at each site will be trained (the exact number will vary based on facility size) using established national peer education curricula and each will be requested to form peer groups of approximately 10 members from the healthcare worker community with a particular focus on infection control practices in the workplace. Health and allied care providers will be encouraged to adopt positive attitudes and behaviors, including safe practices to reduce their risk of exposure. Facilities will be assisted to implement standard operating procedures (SOPs) for post-exposure prophylaxis, should exposure occur.

In COP 09, ICAP will continue to support the provision of correct, timely and appropriate information and skills that will assist people in different audience groups to adopt safe sex and risk reducing behaviors for primary and secondary prevention.

ICAP will use available communication tools and aids to provide a comprehensive package of “prevention with positives” (PwP) activities in all supported networks and linked communities. BCC materials review workshops in partnership with community based organizations will be conducted in all the ICAP supported regions. This will provide an opportunity to assess the impact of existing BCC materials, receive inputs of community members and train an estimated 410 facility and community based health care providers and counselors on prevention counseling. Contents will include partner counseling and testing, disclosure, dual protection, linkage to existing family planning and childspacing services, personal hygiene, safe water use, and healthy lifestyle. Culturally acceptable materials developed from these meetings will be pre-tested and produced for use by ICAP-supported facilities and partners.

ICAP will also facilitate the distribution of at least 800,000 condoms through its 19 CBOs/NGOs (Tulsi Chanrai Foundation, GHAC, GAWON, Rekindle Hope) to enable HIV positive and high risk negative individuals to adopt dual protection choices. These condoms will be obtained from Society for Family Health.

ICAP will build capacities of health care workers in patient education and supportive counseling to reduce the burden of STIs, improve health seeking behaviors and linkages to diagnosis and treatment services for both STIs and HIV/AIDS, and educate HIV positive patients on risk reduction, skills development for practicing sexual abstinence and/or correct and consistent use of male or female condoms, and healthy life planning. Referral linkages for STI management will also be strengthened as a component of preventive services. Support groups, peer educators, local non-governmental and community-based organizations (NGOs and CBOs) in each hospital network will be equipped to conduct prevention activities for HIV-positive persons, their partners and households.

COP09 capacity building activities will also target both health care providers in ICAP supported sites as well as staff of CBOs/NGOs / FBOs with special focus on those who have access to most at risk populations (MARPs: i.e. youth, commercial sex workers, and persons involved in trans-generational transactional sex). Patient education and supportive behavioral change counseling activities will target all individuals accessing ICAP supported facilities, especially at large with a special focus on MARPs. As part of targeting MARPs, ICAP will develop youth focused programs highlighting youth friendly behavioral intervention approaches intending to empower young people.

ICAP will train a total of 620 health care workers (including 154 on AB messages and 466 on other prevention) at facility and community levels to deliver appropriate BCC messages during routine clinic visits using tools and job aids, and provide referrals to HIV infected individual to enter care and treatment services. Care providers will be equipped with the requisite skill to discuss prevention, disclosure to partners and negotiation of safer sex. Training geared towards counseling HIV positive individuals will be

Activity Narrative: based on a standardized Nigeria-specific prevention for positives curriculum. This will be augmented by building the capacity of at least 19 local CBOs, NGOs and support groups, to conduct activities to promote identified BCC strategies across their communities.

In COP09, all ICAP supported treatment sites will integrate prevention counseling and services for people living with HIV (PwP activities) including: adherence counseling; syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and behavioral counseling to achieve risk reduction; counseling and testing of family members and sex partners; counseling for discordant couples; IEC materials and provider delivered messages on disclosure into HIV care and treatment clinics. In addition family planning counseling and services, identification and treatment of STIs, and prevention counseling will be offered. Other services such as prevention messages, promoting correct and consistent condom use will be promoted. These interventions will be implemented using the recently adapted HIV Prevention in Care and Treatment Settings Prevention Package, which includes several training packages and job aids. Support groups will be assisted with patient education materials to build and support their skills on addressing prevention topics. ICAP will provide effective support for communication and behavioral change in partner notification practices, through training and modifications to care delivery. ICAP will assist facilities to institute a new model of partner notification that offers rapid HIV testing to partners and utilizes peer health educators and community based mechanisms to provide prevention counseling and referral to partners.

ICAP will continue to harness its partnerships with CBOs and link to communities through peer health educators, mother-to-mother support groups and other community liaisons. Identified community, faith-based and non-governmental partners will be provided assistance to conduct community outreach activities including community dialogues, community rallies and other community mobilization approaches through innovative approaches to disseminate information and promote discussions around safe sex behaviors, risk reduction approaches, promote abstinence and partner reduction in selected audiences/target groups. Prevention programs for MARPs will remain a priority in COP09. This will include youth targeted through the youth friendly program. Trained staff of CBOs will also address behavior change in the areas of stigma, gender empowerment, male involvement in HIV care and treatment and other related issues during community dialogues. Targeted and culturally acceptable sexual prevention messages will be delivered by CBOs during outreach activities at market places, work places, churches, mosques, and schools, and reinforce balanced ABC messages in support groups.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
These activities contribute to the COP09 targets by focusing on reaching at least 30,152 HIV positive persons especially women and their household members by promoting the adoption of positive attitudes and behaviors consistent with PEPFAR's 5-Year Strategy for averting new infections in Nigeria. ICAP will also reach a total of 4091 individuals (1,677 males and 2,414 females) with abstinence/be faithful messages.

LINKS TO OTHER ACTIVITIES:
This activity also relates to activities in AB, Care and Support, ARV services, HCT, OVC and PMTCT.

POPULATIONS BEING TARGETED:
HIV positive persons, especially women, their partners, adolescent children and other household members will be supported to adopt positive attitudes and behaviors to reduce the transmission of HIV, and promote positive living among infected and affected persons. Health care providers will also be targeted. Facility based care providers and community based care organizations, including program managers and care providers will be trained to provide quality focused BCC activities that will promote the adoption and practice of positive behaviors. Most-at-risk populations (including HIV-negative individuals), such as out of school youth, commercial sex workers, and persons involved in transacational/transgenerational sex will also be targeted for sexual prevention activities.

EMPHASIS AREAS
Areas of emphasis include human capacity development and local organization capacity building. Advocacy will be intensified to target men in communities where ICAP supported sites exist, to encourage men’s support to vulnerable partners and involvement in HIV treatment and care, and HIV counseling and testing. In addition, women will be empowered with knowledge and communication skills so as to make informed decisions. Support groups will occasionally be segregated by sex to enable participants to speak freely on sensitive issues and find solutions that are most appropriate for them. This activity will promote gender equity, especially among vulnerable groups of women and youth, by facilitating the availability of client education programs. The program will also contribute to the reduction of stigma and discrimination among care providers towards HIV-positive clients.

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

- Addition of new epidemiological data
- Revision of targets and emphasis areas

ACTIVITY DESCRIPTION:
Epidemiologic evidence indicates that throughout the world men and women in the military are amongst the most susceptible sub-populations to sexually transmitted infections (STIs), including HIV. In many African countries, uniformed services report HIV prevalence rates higher than national averages. In Cameroon, Nigeria’s neighbor to the east, an HIV rate of 6.2% was reported in 1993 among the military compared to 2% in the general population. In Malawi, it has been reported that 25% to 50% of army officers are already HIV positive.

HIV prevalence figures are unavailable in the public domain for Nigeria’s over 150,000 armed forces. However, in 2007, the Nigerian Ministry of Health implemented an Integrated Biological and Behavioral Surveillance Survey (IBBSS) among high-risk groups, which included the Nigerian Armed forces. This survey sampled 1861 personnel from military barracks located in six states. The study showed that while multiple partnerships are common among the armed forces, many do not consider themselves at risk of HIV. HIV prevalence rates vary across states, with armed forces in FCT reported at 1.1% while in Anambra the HIV prevalence rate among armed forces personnel was 7.6% (IBBSS 2007). Among the predominantly male occupational groups (armed forces, police, and transport workers), armed forces personnel consistently displayed a higher level of knowledge related to HIV risk (from 49 to 58 percent responding correctly to five knowledge-related questions). Of the groups represented in the study, HIV prevalence among the armed forces was consistently low, possibly due to the high reported condom use with commercial partners.

Based on this evidence, the US Department of Defense (DOD), in partnership with the Nigerian Military, will continue to provide prevention, care and treatment to Nigerian service members and the surrounding civilian community, which constitutes approximately 75% of the military’s patient load. In COP09, the DOD–Nigerian Ministry of Defense (NMOD) HIV Program will continue to provide comprehensive AB and C prevention services to 20 military facilities and with support of the National Prevention Strategy, DOD will support the provision of a minimum of three interventions, which will include community awareness, ‘Peer Education Plus’ education and one other targeted strategy within the year that will be drawn from a combination of workplace and vulnerability programs. The planned activities which will be implemented to achieve these strategies, are outlined below.

In COP09, the program will continue to strengthen the DOD-NMOD partnership with the Armed Forces Programme on AIDS Control (AFPAC), an existing structure that coordinates prevention services for Nigerian Armed Forces. The DOD will support AFPAC in the training of 100 peer educators and 30 trainer-of-trainers on HIV/AIDS prevention by promoting abstinence, being faithful to one’s partner, correct and consistent condom use, and effects of alcohol and drug use can have on sexual decision-making and how this relates to HIV/AIDS prevention.

Training will be conducted to promote skills and information on AB and C during pre-deployment and recruitment training. Prevention messengers will also include alcohol use, gender, sexual coercion, and violence. HIV counseling and testing (HCT) and other related referrals will be made to the nearest military site providing HIV/AIDS/STI related services. An estimated 6,500 military and civilian personnel will be reached by peer educators with programming on HIV/AIDS prevention through AB and C.

DOD will continue to support AFPAC to improve and reproduce Information, Education and Communication (IEC) materials to encourage and reinforce AB and C messages and information among military personnel. Materials will be vetted through DOD and the USG Prevention Technical Working Group prior to reproduction. These materials will be expected to reach about 50,000 people, including both military and civilians. However, these individuals are not counted towards DOD’s AB or C targets since distribution of materials may not be sufficient to consider a target “reached.”

Another strategy is to increase the knowledge and build the capacity of HIV/AIDS prevention through abstinence among in-school youth in military barracks. Utilizing existing infrastructure, teachers and indigenous organizations will provide abstinence and sexuality life skills-based training and education to approximately 2,500 in-school youth. Efforts will focus on recruiting teachers to be trained. Funding will support logistics (e.g., manual production of materials), training, and support for each military school to conduct abstinence-only HIV/AIDS programming. A total of 100 teachers will be trained in the AB curriculum that provides abstinence only messaging and skills that foster youth empowerment and knowledge sharing to reach in-school youth. Training expanded to reach out-of-school youth will incorporate being faithful to one’s partner and condom messages, as appropriate. Out-of-school youth will be accessed via youth centers, religious centers, recreational venues, and “mammy markets.” This activity will reach 3,200 out of school youth with skills and being faithful and condom use, as appropriate. In addition, income-generating skills will be incorporated into the out-of-school AB and C training.

DOD will continue to expand efforts with military based religious communities in order to reinforce AB messaging, awareness and education and will support training through the Directorate of Islamic Affairs and Directorate of Christian Services to reach 40 Imams and Priests from its 20 sites on HIV/AIDS education and prevention. These Imams and Priests will conduct related forums, workshops, and activities. They will provide AB related information on a continuous basis to an estimated number of 5,500 people, which will include military personnel, their families and other civilians and clergy.

In collaboration with AFPAC and the Society for Family Health, DOD-NMOD will continue to help to strengthen the distribution of male condoms to sites and within sites. In COP 08, targeted condom service outlets were expanded to a total of 20 sites, which will be maintained throughout COP09. DOD, in
Activity Narrative: collaboration with the Ministry of Health, will supply female condoms to all sites. Through prior prevention activities in COP08, female military and civilian personnel exhibited strong demand for female-initiated prevention strategies, which included female condoms. In partnership with the Ministry of Health and AFPAC, DOD-NMOD will also provide information, training and skills to approximately 200 total persons (10 persons each site) on male and female condom use at 20 sites. A total of 100,000 across the 20 sites will be reached and have access to male and female condom related information, training and skills.

The DOD will also strengthen the capacity of existing groups, such as the Officers’ Wives Clubs (OWCs) to conduct AB and C related activities as well as risk-reduction awareness and education activities. These OWCs have unique access to senior military officers, personnel wives, “Magajias” (women who control the barrack accommodation blocks and mammy markets) and other females within and around the barrack communities. The OWCs will implement outreach events and training activities within these 20 barracks to reach 100 women at each site, totaling estimated 2,000 women and additional 500 individuals including military personnel, their families and other civilians located within and around the barracks.

DOD-NMOD will support Barrack Health Committees to develop, incorporate and implement AB and condom related activities into their yearly work plans. In addition, these 20 site-based HIV/AIDS Committees will be supported to provide gender and male involvement related activities during military officers/rank and file mess social recreation activities to reach 2,000 adult males across the sites.

Another component is to strengthen HIV prevention through STI management within NMOD. Activities will include improved quality of training, counseling, diagnosis and treatment services for approximately 2,000 military personnel, dependents and civilians in and around the barracks communities. Services include diagnosis and treatment (with Pen G, ceftriaxone, azithromycin, acyclovir) for syphilis (treponema pallidum), gonorrhea, chlamydia and herpes simplex virus. AB and C prevention messaging and condoms will be offered to all those receiving STI diagnoses and treatment. All individuals diagnosed with STIs will be referred to HCT and strongly encouraged to participate in regular testing.

All components will include specific efforts to include people living with HIV/AIDS (PLWHA) in activity planning and implementation. Several PLWHA support group members have already been active in HIV prevention activities within the military barracks; this partnership has helped to reduce stigma and discrimination in the military community. This partnership will be further enhanced by the provision of support to build the capacity of 10 of these PLWHA support groups, especially in the areas of leadership, project design, management and income generating activities and businesses.

In addition, DOD will provided technical support to AFPAC and EPIC to continue implementing a microfinance loan program. In COP08, 100 representatives from the 3 barrack PLWHA support groups benefited from this program and in COP09 these groups will receive ongoing support to continue providing income generating activities to their members and other interested individuals within and around the military communities.

AB and C messages will also be provided to individuals accessing HCT, Care and Support, ARV and PMTCT services at military sites. Male and female condoms are provided free of charge.

In order to procure activity related commodities, $150,000 was put into SCMS ($75,000 each from AB and Other Prevention funding lines).

By the end of COP09, the DOD will support 20 NMOD sites in Edo, Benue, Cross River, Rivers, Delta, Enugu, FCT, Kaduna, Lagos, Oyo, Plateau, Sokoto, Kano, Imo, and Anambra.

CONTRIBUTION TO THE OVERALL PROGRAM AREA:
In conjunction with other DOD activities, and those of other partners, this activity will contribute to the provision of a comprehensive HIV and AIDS prevention package for the military population, civilian employees, their dependents and the communities surrounding military sites. This activity will contribute to the PEPFAR overall aim of reducing HIV infection rates in Nigeria.

LINKS TO OTHER ACTIVITIES:
This activity relates to activities in PMTCT, Condoms and Other Prevention, Counseling and Testing, Care and Support, TB/HIV, OVC, and ARV Services.

POPULATIONS TARGETED:
This activity targets the military, civilian employees, their dependents, and the communities surrounding military sites. In particular, this activity targets in- and out-of-school youth and youth drafted into formal military service.

EMPHASIS AREAS:
These activities focus on military populations, and gender, as specific programming is designed to reach female military personnel and civilians as well as address male norms.

New/Continuing Activity: New Activity
Continuing Activity:
Program Area Narrative:

Nigeria's effort at prevention of medical transmission of HIV has undergone tremendous growth since PEPFAR support. The Government of Nigeria (GON) has equally focused more attention and emphasis on blood and injection safety.

Blood Safety

The 2003 sero-prevalence sentinel survey found a 5.1% HIV prevalence among women who had received blood transfusions compared to 4.8% prevalence among those who had never received blood transfusions. Reliable information regarding suspected transmission of HIV through infected blood is currently not available. A baseline survey of blood transfusion practices in the country conducted by the GON in March 2007 confirmed a severely limited infrastructure for blood banking. With USG support, the capacity for developing safe blood transfusion systems in Nigeria has been strengthened at the national level. However, this national level capacity is noted to be significantly underutilized by the country. In COP08 USG/Nigeria worked to improve blood collection techniques and utilization at the facility level, develop linkages between facilities and the national system, and strengthen the National Blood Transfusion System (NBTS). In COP09, these activities will be sustained. It is expected that this will result in the screening of 66,000 units of blood for the four transfusion transmissible infections (TTIs) (HIV I and II, hepatitis B, hepatitis C, and syphilis) with ELISA in NBTS centers, and the training of 1,398 health workers across 188 sites.

The USG/Nigeria's strategies for COP08 blood safety activities are based on extensive dialogue with the technical working group and OGAC and are in line with the USG/Nigeria 5-year plan. The strategies will continue in COP09. The last TA assessment observed clear national policy, overall excellent quality of service but low coverage and utilization of the NBTS centers. A major barrier to scale-up was the disconnect between hospital blood services and the NBTS. Other gaps noted were lack of skills in blood donor recruitment, limited blood banking expertise and insufficient haemovigilance. The identified strategies for COP08 and COP09 are: community blood drives for voluntary non remunerated donors; service linkages between the NBTS and hospitals; the use of a national donor questionnaire nationwide to screen all donors and develop a database; and training and capacity building of service providers.

In COP09 USG/Nigeria is emphasizing improved donor identification and blood collection practices at the facility level in line with NBTS guidelines. A transition from family replacement and paid donors to voluntary non-remunerated donors (VNRD) in USG-supported sites, just being implemented in COP08, will be continued and strengthened by NBTS and facility-based partners as they work to harmonize standards of practice for donor criteria with the NBTS guidelines. In COP09, 29 USG-supported sites identified in COP08 to develop blood banking capacity and linkages to nearby NBTS zonal centers will continue to be supported. The ongoing NBTS hospital linkage is a significant change to the Nigerian system. Pre- and post-donation counseling, with
appropriate deferment of high risk donors and offering of voluntary HIV counseling and testing, will be conducted at the facility level, thereby capturing a population of most at risk persons as determined by donor screening questionnaire results. QA processes for rapid testing will be done in line with HCT QA processes at the site level. Additionally, NBTS has engaged with facilities to retain samples of facility-collected units for transport to NBTS for ELISA testing and feedback to the management of the health facilities on prevalence rates of the four TTIs to enhance migration to VNRD.

The NBTS will develop a logistics system to support these facilities for their transfusion needs, facilitated by technical assistance provided by SCMS and the USG medical transmission and logistics TWGs. The NBTS will work to identify other non-PEPFAR facilities in the catchment areas of zonal centers to develop similar partnerships. Donor blood collection will migrate from mostly hospital-based and fragmented to centralized NBTS coordinated and regulated.

This activity will utilize the already existing USG IPs' counseling and lab staff and will leverage relationships between the facilities and community where they work to also scale up voluntary blood donation, coordinated jointly with NBTS, the facilities, and surrounding communities. Blood obtained from blood drives and those from family donors at the facilities shall be collected according to NBTS guidelines and will be taken by the NBTS for ELISA screening. The NBTS will develop a courier system to regularly collect this unscreened blood and deliver screened blood to these sites based on quantities of blood needed. This linkage will be supported by hotlines at NBTS centers where participating facilities can make requests for screened blood. NBTS centers and associated mobile outreach clinics are now increasingly better staffed and support from USG has leveraged additional GON funds.

In COP08 the lead technical implementing partner, Safe Blood for Africa Foundation (SBFAF), provided technical support to the NBTS and other implementing partners (IPs) for capacity building in program development and implementation of blood safety activities at national and site specific levels. SBFA developed a national training plan consistent with NBTS policy. Participating staff from USG-supported hospitals, USG IPs, and NBTS were trained on phlebotomy, donor recruitment and counseling, lab screening and blood banking, use of blood and hemovigilance, medical waste management, quality assurance/quality control (QA/QC) for HIV serologic testing, and transport and logistics for blood safety. In line with the GON national training guidelines, several of these trainings were developed as training of trainers (TOT). In COP09, master trainers will step down training to staff in their respective health facilities. SBFA will lead development of standardized training manuals and production of educational materials and job aids, and will continue to roll out TOT trainings. The NBTS will take the lead as coordinator of blood safety activities and will host joint quarterly meetings with stakeholders in which USG partners will actively participate for programmatic review. IPs will support the establishment of hospital transfusion committees in health facilities to further improve the facility-based communication and knowledge on appropriate blood transfusion practices.

The NBTS donor questionnaire will be administered to all donors to screen out high risk donors and ensure that only low risk clientele donate blood. USG supported sites will also maintain a comprehensive database on their blood transfusion services. Data from this database and the screening questionnaires shall be routinely communicated to the NBTS in order to maintain a national database.

Proper waste management will be promoted through collaboration with injection safety activities, the use of biohazard bags and sharp containers, and the repair/utilization of incinerators at USG/Nigeria supported sites. The SCMS procurement role will be expanded to support the NBTS in the purchase of supplies needed for the realization of a functional national system.

Injection Safety

A 2004 GON injection safety assessment which was supported by the USG showed that an average of 4.9 injections was given per person per year. The assessment also showed that safety boxes were not used in three-fifths of the facilities surveyed, two handed recapping was observed in 76% of observed injections, 45% of providers had at least one needle stick injury in the last one year and 94% of these providers were not offered HIV post exposure prophylaxis. These findings cut across all geo-political zones of Nigeria. Since that time the USG has supported an expanded injection safety program to respond to these challenges through the activities of a lead technical partner – Making Medical Injections Safer (MMIS) – and 6 other IP.

The USG/Nigeria strategy for COP09 injection safety activities will continue to be based on the three part strategy of WHO/Safe Injection Global Network (SIGN). These three SIGN strategies target behavior change of both health workers and patients, procurement of needed safe injection commodities and facilitation of appropriate healthcare waste management. USG/Nigeria has added training and capacity building of healthcare workers and waste handlers as a fourth strategy to improve injection practices and occupational safety. In COP09 a total of 6,000 healthcare providers will be trained on injection safety and healthcare waste management while 299 facilities will be reached with injection safety activities.

In COP07 a national policy on injection safety and healthcare waste management was developed with USG support. The USG also supported the development and adaptation of the “Do No Harm” training curriculum by the GON. Infection prevention committees were inaugurated at facility levels to provide on-site supportive supervision and ensure post exposure prophylaxis. MMIS provided technical support to the GON and other key stakeholders (e.g. Nursing and Midwifery Council, schools of health technology, Medical and Dental Council of Nigeria) in curriculum review and inclusion of updated safe injection issues into pre-service and refresher trainings to ensure sustainability. Advocacy efforts were intensified for the use of retractable and non re-use syringes through an identified Injection Safety Champion. Advocacy efforts have also resulted in the Federal Ministry of Environment (FMOE) budgeting for healthcare waste management.

Injection safety activities are linked with Blood Safety, TB/HIV, HCT, Lab Infrastructure and ART services. In spite of the success in the USG-supported facilities with injection safety programs, there is need for substantial scale-up of this activity in conjunction with the continued scale-up and scale-out of healthcare services in Nigeria. This is highlighted by the wide geographical spread of the country and the need for policy implementation at the grassroots level. In COP09 emphasis will continue to be on consolidating the gains achieved to date and integrating the policy into the national health plan. Scale-up of the injection safety
program will continue with local government area (LGA) coverage as part of the LGA coverage plan long implemented by MMIS, facility saturation for other IPs, and a greater focus on sustainable healthcare waste management throughout Nigeria.

In COP08, there was a strategic delineation of responsibilities among implementing partners. This will continue in COP09 to ensure efficiency and quality of injection safety activities. MMIS will continue to work at both national and facility levels. It will provide expertise in the area of training by conducting regular TOTs and supportive supervision to other IPs. It will take the lead on production and distribution of educational materials and job aids. MMIS will also procure and distribute seed commodities to other IPs such as safety boxes and retractable needles/syringes. Through MMIS, USG/Nigeria will support community mobilization to promote oral medication instead of injectable medication through collaboration with community based organizations and the mass media. Collaboration with the GON on collection and tracking of consumption data will also be a focus.

In COP08, all other IPs were required to provide a minimum package of injection safety activities at facility level. This minimum injection safety package will include: training of all health workers and waste handlers; utilization of safety boxes in all units of the health facility; promotion of awareness of injection safety and healthcare waste management policy; establishment of infection control committees at tertiary and secondary facilities; and the provision of color-coded bin liners at waste generation points for segregation of waste. By conducting these activities in every department of facilities that IPs support will achieve “facility saturation,” i.e., healthcare injection safety practices and waste management will be implemented facility-wide. In COP09, emphasis will be on supportive supervision of all sites and appropriate health care waste management.

The USG supported the GON (through the FMOE) in the development of National Healthcare Waste Management Policy, Plan and Guidelines in COP07 and COP08. In COP09, all IPs will work to implement this plan. In addition, IPs will support the states they are in to adapt and implement the plan as well as renovation and reactivation of incinerators for proper disposal of safety boxes and other infectious medical waste at facility and LGA levels.

Sustainability plans will include increasing efforts to develop public private partnership for health care waste management and involvement of private health practitioners in injection safety programs. This effort was pilot tested in two LGAs in Lagos State in COP07. Lessons learned have informed scale up of this activity in Lagos State in COP08. Advocacy to other states in Nigeria to emulate Lagos State best practices will be focused on in COP09. Advocacy to the GON in COP08 has yielded government supported injection safety training in non-PEPFAR states. It has also yielded an enabling environment for local production of auto disabled syringes. Technical support for local production of safety boxes will be intensified in COP09.

Male Circumcision
Both anecdotal evidence a recent report by UNAIDS and WHO (Male circumcision: Global trends and determinants of prevalence, safety and acceptability, February 2007) suggest that over 90% of Nigerian males are circumcised. As part of the new emphasis on male circumcision as a means of preventing HIV infection, USG/Nigeria will conduct a desk review in COP09 to document prevalence of male circumcision. The desk review, which will be funded in Strategic Information, will document the incidence and safety of methods used in Nigeria from previous research and qualitative findings. Results from the desk review will be used to direct future programming in this area and develop strategies to enhance coverage and promote safe male circumcision practices.

Table 3.3.04: Activities by Funding Mechanism

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

- In COP08, SBFAF will assist the National Blood Transfusion Service (NBTS) to develop a Blood Safety Training Manual. In COP09, SBFAF will assist the NBTS to train a pool of master trainers in the country.
- Another key activity in COP09 will be SBFAF’s active role in the advocacy for the NBTS to achieve the status of an autonomous agency or commission.

This activity is jointly funded through CDC and USAID. The narrative incorporates the scope of activities in this joint project, in the two narratives the target for number of people trained is divided in order to avoid duplication of targets. The Safe Blood for Africa Foundation (SBFAF) is providing technical assistance services in Nigeria in the prevention program area of Medical Transmission/Blood Safety (BS). SBFAF activities reinforce the National Blood Transfusion Service’s (NBTS) long-term strategy. SBFAF assists the NBTS in implementing its primary objective of migrating fragmented hospital-based blood services to centralized national blood services nationwide. A key feature of this program is the development of a nationwide voluntary donor recruitment system (VNDR – voluntary nonremunerated blood donation). The NBTS zonal and state centers are primarily supported by VNDR. SBFAF will continue to provide technical support to NBTS in the VNDR system.

The VNDR system is highly dependent on building a network of repeat donors. Currently, the NBTS has an aggressive plan to expand the blood collection from the current level of less than 15% of the nation’s needs to over 90% by 2016. The Nigeria Club 25, SBFAF's youth wing in Nigeria, is not currently supported under the PEPFAR program; however, SBFAF has continued to run the program because of its significance to the donor pool. Members of Club 25 and youth between 18-25 years of age make up approximately half of the NBTS donor pool. Additionally, repeat donor members of Club 25 have an HIV prevalence rate of 0.01% compared to approximately 3.1% in the general public. This is primarily because members of the club have pledged to donate blood regularly and as such adhere to the club's health guidelines which include living a risk-free lifestyle. This same group of young adults aged 18-25, if fully dedicated to the cause, will continue to be donors for several decades. The World Health Organization (WHO) guidance for blood banks stresses the need to maintain as large a repeat donor base as possible – it is more reliable, cheaper to maintain, and safer.

Capacity-building is one of the key mechanisms to achieving the objectives of the NBTS long-term strategy. SBFAF has conducted a robust training program that has strengthened the NBTS. In COP08, SBFAF activities have been primarily focused on: capacity-building for blood safety activities at all NBTS centers and focal USG-supported hospitals in Nigeria; support of NBTS in developing and implementing a hospital blood bank exchange and distribution system; and promotion of coordinated blood safety activities across all partners. These activities will be sustained in COP09. SBFAF will utilize standardized training modules that are appropriate to the various levels of trainees and approved by NBTS. SBFAF will train nurses and medical laboratory scientists in USG-supported hospitals and hospitals within NBTS catchment areas to recruit VNDR from the ranks of current family replacement donors. SBFAF will also train these personnel in blood collection and donor care, as well as in counseling, including appropriate utilization of the NBTS pre-donation screening questionnaire, leading to improved screening of all donors in all facilities. Training on appropriate blood use, dangers of TTIs, the risks associated with family replacement/remunerated donors and appropriate clinical use of blood will be maintained. SBFAF will continue its TA to establish a more appropriate blood safety program in USG-supported hospitals in Nigeria in COP09. A total of 720 unique individuals will be trained in COP09 by the jointly funded project.

SBFAF has facilitated the development of an NBTS/hospital blood exchange program through training in logistics and cold chain management with an emphasis on improved storage and handling. This training was first introduced in COP07 to NBTS and USG-supported facilities' drivers and medical laboratory scientists. The NBTS/hospital blood exchange program put a system in place whereby NBTS centers develop and implement a delivery system with hospitals, including focal USG-supported hospitals, which have appropriate blood banking facilities in place. NBTS centers pick-up unscreened blood units that the hospitals have appropriately collected and stored, and transport these units back to NBTS centers where they are screened for the 4 transfusion transmissible infections (TTIs) of HIV I and II, Hepatitis B, Hepatitis C and Syphilis using ELISA techniques. In addition to collecting unscreened units, NBTS delivers to the hospitals their requested order of screened units of blood for banking and use at the facilities. Furthermore, NBTS also provides monthly feedback on prevalence rates of the 4 TTIs found in the blood units collected by the facility. This is intended to facilitate improvement of donor prescreening and deferral. This program has already commenced at selected facilities with each USG treatment partner and will be expanded as NBTS absorption capacity improves. The goal is that 80% of blood transfusions that occur at these hospitals will be with NBTS-screened blood units, while only 20% will be emergency transfusions whereby the hospital will screen the donated blood on site using rapid test kits. Given that only a fraction of facilities are capable of piloting such an exchange program with NBTS in the initial year, all other facilities were supported to improve their collection practices and on site lab screening practices, including utilizing the blood donor setting as another point of service for HCT for deferred blood donors. This support activity will continue in COP09.

Technical support will be given to NBTS to develop IEC materials and advocacy packages for medical professionals. The Government of Nigeria has made efforts to increase accessibility to safe blood through establishment of more NBTS centers. There are presently 11 centers which will increase to 17 in COP09 via the GON efforts and funding. SBFAF will continue to provide TA in the infrastructural developments of the new centers to ensure uniform quality nationwide. SBFAF will also continue to work in 33 outlets in Akwa Ibom State.

SBFAF will continue to assist the NBTS in its monitoring and evaluation program. Bi-annual technical audits of the NBTS centers will be done to ensure quality of services and laboratory processes. SBFAF and the NBTS will introduce the principles of quality management processes with site-specific written Standard Operating Procedures, proper maintenance logs of equipment, validation of processes and a secure method of record keeping.

SBFAF has worked with the NBTS through the National Technical Committee to develop a National Blood
Activity Narrative: Policy. In COP09, entrenching the policy into law and advocacy to make the NBTS autonomous will be pursued in collaboration with other USG policy partners. This will significantly improve NBTS regulatory capabilities. It is NBTS’s intent to regulate and institute consistent blood banking standards and practices on a national basis. SBFAF will continue to strengthen the technical and managerial capacity of the NBTS through its TA program to ensure its sustainable, independent operation and increased leadership role in the safety of Nigeria’s healthcare system.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: SBFAF blood safety activities will contribute to COP09 overall Emergency Plan for blood safety targets for Nigeria. Activities will increase VNRD, create an enabling environment, and improve access to quality blood transfusion systems and practices. Technical support by SBFAF in linkages and synergies between the NBTS and service outlets will improve the quality of blood transfusion practices in Nigeria. The NBTS/USG supported hospital blood exchange program will also improve access to safe blood. This activity will be primarily conducted through technical assistance to the NBTS and the hospital monitoring and evaluation program and through training to facility staff. Monitoring and evaluation activities will determine the number of blood units screened by NBTS and the number of outlets adhering to the appropriate use of guidelines and SOPs provided through regular audits at these outlets at 6 month intervals. PEPFAR BS indicators will be reported.

LINKS TO OTHER ACTIVITIES: SBFAF VNRD activities have direct links to counseling and testing, human capacity development and system strengthening activities.

POPULATIONS BEING TARGETED: Low risk populations targeted to become regular VNRD include youth groups, adult men and women. SBFAF will assist the NBTS to engage with organizations such as faith-based organizations (FBOs), business/private sector, community and religious leaders. SBFAF training activities and capacity building will target government health workers and other health care providers.

KEY LEGISLATIVE ISSUES ADDRESSED: Key issue being addressed by SBFAF activities is to entrench the national blood policy into law and advocacy to make the NBTS autonomous.

EMPHASIS AREAS: This program includes major emphasis on blood safety training in all areas of the program. Emphasis is also being expended in the area of blood policy and legislation. Community Mobilization and Supportive Supervision will be areas of minor emphasis.

| Budget Code: HMBL | Program Budget Code: 04 |
| Activity ID: 6490.28543.09 | Planned Funds: $40,000 |
Activity System ID: 28543
Activity Narrative: ACTIVITY DESCRIPTION:
ICAP-CU has supported 12 hospital networks in Kaduna and Cross River States to improve safe blood practices and reduce medical transmission of HIV and other infections. In COP08 ICAP-CU plans to expand into 13 additional hospital networks in six states (Kaduna, Gombe, Cross River, Benue, Akwa Ibom and Kogi), resulting in a total of 25 facilities receiving support through ICAP-CU. Blood transfusions occur at all 25 of these facilities.

In COP08, ICAP-CU will work closely with the National Blood Transfusion Service (NBTS) and Safe Blood for Africa Foundation (SBFA) in all aspects of its blood safety program. ICAP-CU will support the NBTS in implementing its primary objective of migrating fragmented hospital-based blood services to centralized NBTS-based blood services nationwide. A key feature of this program is the development of a nationwide voluntary donor recruitment system. NBTS, through its collaborative efforts, will work with ICAP-CU and its supported facilities, will provide TA for blood donation drives held by these ICAP-CU supported hospital facilities. In addition, SBFA will train nurses and medical laboratory scientists in these facilities to recruit repeat voluntary blood donors from the ranks of current family replacement donors. In this plan ICAP-CU will be instrumental in working with hospital management and staff at all comprehensive sites to develop buy-in for the NBTS blood services program, to create support of blood donor organizations, and to strengthen hospital and community focused blood drive activities. Health facilities will be supported by ICAP-CU to work with the local Red Cross on community sensitization and blood drives.

ICAP-CU will also work through local community based organizations and support groups to increase demand and awareness on safe blood practices. These local organizations will be supported to promote safe blood donor drives and activities in their communities. They will also be supported to sensitize the hospitals and communities on the need for voluntary blood donation. ICAP-CU will support the production and distribution of IEC/BCC materials obtained from NBTS and SBFA to promote the need for voluntary non-remunerated blood donation. In addition, ICAP-CU will work closely with facility management to establish blood transfusion committees to oversee blood use based on national algorithms and standards in the health facilities.

ICAP-CU will facilitate the development of an NBTS/hospital blood exchange program at 5 health facilities that will be selected based on proximity to a zonal NBTS office, availability of blood banking facilities, support infrastructure and other resources. This linkage will include regular delivery of donated units of blood to NBTS for screening in conjunction with a regular delivery of screened units of blood to the facility. NBTS will pick up unscreened blood units that these 5 hospitals have appropriately collected and stored and will transport these units back to NBTS centers where they will be screened for the 4 transfusion transmissible infections (TTIs) of HIV I and II, hepatitis B, hepatitis C and syphilis using ELISA techniques. In addition to collecting unscreened units, NBTS will deliver these 5 hospitals their requested order of screened units for blood banking and use at the facilities. NBTS will also provide monthly feedback on rates of the 4 TTIs found by ELISA screening of blood units collected by each facility. It is expected that at these 5 blood banking facilities a total of 4170 transfusions will take place. ICAP-CU will work to ensure that 80% of blood transfusions that occur at these hospitals will be with NBTS-screened blood units, while only 20% will be emergency transfusions whereby the hospital will screen the donors on site using rapid test kits only. Therefore, approximately 3,340 units of blood will be collected and sent to the nearest NBTS centers for ELISA screening as outlined.

ICAP-CU will work with all 25 of its hospitals that do blood transfusions to ensure appropriate facility-level collection of blood. Directed and voluntary donors will be prescreened with the NBTS donor screening questionnaire and donors will be deferred as necessary based on their responses. 10,400 blood donors will be screened using the HCT testing algorithm, thereby utilizing the blood donor setting as another point of service for HCT during predonation. A PEPFAR-supported evaluation of the current emergency-based transfusion system will provide insight into rates of TTIs, including HIV, that go undetected in emergency screened blood.

ICAP-CU will identify appropriate staff for training by SBFA who, in turn, will utilize standardized training modules that are appropriate to the various levels of trainees and approved by NBTS. Through this relationship 26 laboratory staff and other health care workers involved in blood transfusion services at ICAP-CU supported sites will be trained by SBFA. In order to avoid double counting, these 26 targets are counted under the SBFA blood safety narrative. For core TOT modules developed by SBFA, ICAP-CU will conduct step down training to 225 laboratory, allied health workers and hospital management staff involved in blood transfusion services at their sites.

Other activities for COP08 include infection prevention services to reduce occupational hazards, provision of contaminated waste and sharps collection and disposal units, and infection prevention equipment such as disposable and surgical gloves, disposable syringes, respiratory masks, and gowns. Quality assurance (QA)/Quality Improvement (QI) management systems will be put in place to ensure the quality of the rapid HIV testing at all sites. All sites will be provided with copies of the National Blood Policy, operational guidelines for blood transfusion, SOPs and job aids to support blood safety activities. This activity also includes partnerships and support to the following sub recipients for program activities: local red cross/red crescent organizations and HARHL Trust Nigeria.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
As part of a comprehensive package of services and its contribution to the national strategic plan, ICAP-CU considers it essential to prevent HIV transmission in health care settings and to increase blood transfusion safety.

In COP08, ICAP-CU will support the training of health care workers to provide quality safe blood services, and will increase the availability of support personal protective equipment like hand gloves, lab coats, face shield and protective goggles to ensure that the lab staff are adequately protected. 10,400 donors will be prescreened according to National guidelines and 3,340 units of blood will be sent to NBTS to screen for 4 TTIs to ensure safe blood transfusion at ICAP-CU’s supported sites in line with the National Blood...
Activity Narrative: Transfusion policy on blood and blood product safety.

LINKS TO OTHER ACTIVITIES:
This activity is linked to Counseling and Testing (5550.08) as directed donors and voluntary donors will be provided with full HCT services prior to blood donation. This activity is closely linked to Injection Safety (6819.08) where ICAP-CU also plans to train laboratory and allied health workers at all its supported sites. With linkage to Lab (5544.08), lab-based activities will support safe blood activities at all ICAP-CU-supported sites through training, supervision, equipment maintenance and supplies.

POPULATIONS BEING TARGETED:
This activity targets health care workers at both public and private health sectors responsible for safe blood activities in all ICAP-CU-supported health facilities. Targeted also are all persons 18 years of age and above and family replacement donors.

EMPHASIS AREAS
This activity includes emphasis on institutional capacity development for blood safety which includes training of lab staff and provision of equipment. This activity will also increase awareness and build skills around safe blood issues at facility and community levels, reducing stigma and discrimination among health care workers. It is expected to also promote awareness about safe blood practices in the communities and indirectly increase the number of volunteers available for blood donations.

**Activity Narrative:** ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

It has been estimated that 5% -10% of HIV infections worldwide are transmitted through the transfusion of contaminated blood and blood products. In order to reduce the HIV epidemic due to unsafe blood transfusions, this activity will continue to support the Government of Nigeria to implement the national blood policy in USG-supported treatment sites. This activity involves institutional capacity development for blood safety, universal safety precautions in handling blood and blood products, good laboratory practice and management of medical wastes contaminated with blood or blood products.

By the end of COP08, GHAIN would have supported 30 sites and upgraded 4 model blood banks to acceptable standards. During COP09, this activity will continue to provide support for 30 GHAIN-supported ART sites. GHAIN will continue to support the sites empowered as model blood banks to prescreen blood donors using the national donor questionnaire. Donors deferred will be offered full HCT. The collected blood will be sent to the nearest National Blood Transfusion Service (NBTS) center for screening by ELISA. It is hoped that 12,480 units of blood will be collected and about 80% of this (10,100 units), will be screened for the four transmission transmissible infections (TTIs) through this linkage with the NBTS. These sites will, in addition, conduct blood drives in collaboration with the NBTS. Blood collected from such donor drives will be screened by the NBTS and distributed to sites for use. Pilot samples of blood screened with rapid test kits for emergency transfusion will be sent to the NBTS centers for retesting by ELISA. All screening services will be linked to pre and post test counseling services at each site. The National blood donor questionnaire will continue to be used to screen all donors and the data submitted to the nearest NBTS center as part of the national database.

This activity will continue to encourage blood donor drives in collaboration with NBTS centers and to promote the principles of centralized blood transfusion services, voluntary non-remunerated blood donation as opposed to paid donors/family replacement, and universal safety precautions. It will result in a reduction in unnecessary transfusions, exposure to blood, and accidental injury/contamination. Additionally this activity will provide essential consumables and services that protect the health worker from contacting infections, especially HIV and hepatitis. These universal precaution materials include personal protective equipment such as hand gloves, laboratory coats and other consumables which will continue to be provided for the sites. In addition, each site will continue to make provisions for referral of staff for access to Post Exposure Prophylaxis (PEP), which will be provided within the same health facilities, in case the need arises.

GHAIN will support clinical meetings and seminars to medical professionals in supported sites to promote rational use of blood and blood products. This will facilitate behavior change and compliance with the National Blood Policy. Retraining and supportive supervision of health workers trained in COP08 will also be done. A total of 28 health workers and waste handlers will be trained.

In order to maintain high quality laboratory results, GHAIN will continue to institute an aggressive QA/QC program that involves on-site quarterly monitoring, retraining and proficiency in testing for the TTIs.

**CONTRIBUTIONS TO OVERALL PROGRAM AREA**

Blood safety will contribute to the overall program area by preventing transmission of HIV through transfusion of blood and blood products. It will also contribute towards strengthening quality control systems on the use of HIV test kits in the PEPFAR program.

**LINKS TO OTHER ACTIVITIES**

Blood safety activity also relates to activities in HVCT, MTCT, and Adult and Pediatric care and treatment. All deferred blood donors will be offered full HCT services after prescreening with the blood donor questionnaire and the data are captured. Positive clients from emergency screening will be referred for ART services using the GHAIN referral network system. GHAIN will continue to collaborate with other partners to work with the National Blood Transfusion Service to develop a sustainable logistics plan for continuous availability of voluntary non-remunerated blood donors (VNRBD) and fully screened blood so that facility-level emergency screening will be minimal.

**POPULATIONS BEING TARGETED**

Blood safety activity targets youths, adult men and women who are potential blood donors. It will also target health care workers for appropriate use of blood.

**EMPHASIS AREAS**

Major emphasis will be placed on human capacity building to link services with the NBTS on blood safety issues. Minor emphasis will be placed on commodity and equipment procurement (test kits, equipment and laboratory consumables), supporting emergency blood screening, and quality assurance/quality improvement.

**New/Continuing Activity:** New Activity

Activity Narrative: Track 1 and 2 funds are combined for this activity.

ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY NARRATIVE:
The SCMS objective is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers the procurement, shipment, distribution and delivery of blood safety related commodities as well as other supply chain management related activities. It also covers technical assistance (TA) and system strengthening (SS) activities provided to PEPFAR Implementing Partners (IPs) and to the Department of Defense (DoD) to strengthen or build their supply chain management capacity within their respective programs.

In COP09, SCMS will procure, for the National Blood Transfusion Service (NBTS) and DoD, safe blood related commodities needed for the collection, testing, preparation and distribution of blood and blood components. Examples of such commodities are blood bags, laboratory reagents, and testing diagnostic kits for the detection of HIV, syphilis, and hepatitis B and C. SCMS will also procure commodities needed for the disposal of contaminated products.

Through its continuous support to and strengthening of commodity security in PEPFAR programs, SCMS works towards ensuring uninterrupted availability of needed commodities to the target populations of blood donors and blood or blood components’ recipients in the general population.

The present budget will cover the cost of commodities as well as logistical and administrative services from the field office for the coordination and management of the procurements undertaken by SCMS for the support of all IPs active in blood/medical safety. In COP09, SCMS will procure blood safety commodities and requested technical assistance (TA) for the National Blood Transfusion Service and DoD, each of which has attributed specific funds to SCMS for these services: DoD, $10,000, and NBTS, $1,000,000. The budget also supports the cost of TA and SS. SCMS will assist in quantification and forecasting of requirements and will support the development of long term supply plans (considering in country stocks and anticipated consumption rates) for stock management and delivery planning.

SCMS will support the NBTS and DoD in the following areas of the supply chain cycle: product selection in accordance with the Nigerian National Blood Policy and Operational guidelines for blood transfusion practices, Federal Government of Nigeria’s (GON) HIV testing algorithm, marketing authorization status (GON NAFDAC registration), and GON importation regulation. SCMS will also be responsible for ensuring that commodities procured meet eligibility criteria under the USG acquisition rules and regulations, including source and origin waivers and approvals by the US Food and Drug Administration or other relevant stringent drug regulatory authorities.

SCMS will identify suitable sources of supply both internationally and nationally. SCMS will work with implementing partners (IPs) in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and/or associated services (i.e., maintenance service). SCMS will coordinate with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by NAFDAC, SCMS will make suitable recommendations including waiver applications where appropriate. SCMS will take the lead to communicate with manufacturers on registration gaps in Nigeria.

SCMS procurement leverages global spend to provide best value and offers clients certainty of competitive prices and international quality standards. The SCMS procurement strategy is articulated around buying generics whenever possible, pooling procurements for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries and negotiating long term contracts with suppliers. IPs and DoD’s requests for blood safety related commodities will be addressed and coordinated with the SCMS field office directly in line with explicit guidance from the Prevention Technical Working Group (TWG) and the USG PEPFAR team to ensure complementarities with the priorities identified.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry as required. SCMS will take the lead and further streamline the customs clearance process as appropriate including management of the various duty exemption forms (CC1, CC2, CC3). SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Where appropriate, commodities procured and imported by SCMS will be supplied through the SCMS Regional Distribution Center (RDC) in Ghana. The warehousing of commodities in the RDC is a critical component of the SCMS technical solution. The use of the RDC will significantly reduce lead times and provide an important buffer between the supply from manufacturers and demands from the PEPFAR programs in Nigeria. The RDC also ensures that SCMS’s recipients in-country, an increasing challenge in the context of program scale-up. The RDC concept also brings an increased flexibility in stock management, thus reducing risk of stock obsolescence or need for emergency replenishments, resulting in important savings. Finally, the RDC approach serves regional and national sustainability, as the RDC is designed to be a commercially viable entity, available to other health (and non-health) programs, whose benefit will last beyond SCMS. Where possible and appropriate, SCMS will road freight from the RDC in Ghana to Abuja; this mode of delivery will provide significant savings over airfreight.

Delivery arrangements will be negotiated with NBTS and DoD; SCMS will either deliver to a central location or to points of service as needed. When local warehousing is needed, SCMS will continue to explore viable options make use of its recently acquired cross-docking facility and the long term warehouse facility (which will be acquired in COP09). For in-country distribution where necessary, SCMS will competitively source for and utilize the service of an efficient and safe in-country courier services operator.

SCMS will also assist IPs to monitor/report on stock levels and usage through the deployment of pipeline
Activity Narrative:

SCMS will provide TA and SS services to IPs including the training of staff in the use of the ProQ or Quantimed forecasting and pipeline supply planning tools. SCMS will continue to provide TA and SS services to DoD based on the recommendations that came out of the supply chain systems assessment carried out in COP07.

SCMS will provide the USG team with regular reports on supplies and equipments as well as monthly financial reports. In COP09, Supply Chain Support Teams (SCSTs) (to be made up of technical SCMS staff and GoN or IP staff as appropriate) will be constituted by SCMS to work with the IPs in providing their trained logisticians with the capacity to monitor and support the performance of the supply chains at various levels. Using standardized indicators of logistics performance, the SCSTs will track performance of the supply chains and together, act as an early warning system to identify impending or imminent supply chain breakdowns and act to forestall these. By developing methodologies and tools for conducting these activities, SCMS will work with GoN and IPs to establish and institutionalize this activity, thereby building the capacity to identify these problems and resolve them before service delivery is compromised. In addition, an automated web based procurement tracking database will ensure that the USG team and IPs have adequate visibility on SCMS procurement status by providing an easy access to accurate and up to date information on procurement.

Under this program area, SCMS does not have targets of its own, but supports NBTS and DoD to reach their blood safety planned targets.

EMPHASIS AREA:

Activity Narrative: ACTIVITY DESCRIPTION:
This is a continuing activity. This activity relates directly to all Nigeria HHS Medical Transmission Blood Safety COP09 activities (see activity references in the narrative below).

The USG team, through the HHS/CDC Global AIDS Program (GAP) Office in Nigeria has one full time staff position to support Medical Transmission prevention activities with 75% of time allocated to Blood Safety and 25% of time allocated to Safe Injection (6817.09 for a more detailed description of safe injection responsibilities). The budget includes FSN salary, funding for required domestic and international travel, training funds and allocated support costs. Funds are not requested in COP09 for international TA as this is understood to be funded by the HQ operational plan (HOP). This staff member will be supervised by a Senior Prevention Manager funded across the CDC agency prevention programs.

The HIV Medical Transmission Prevention local staff member works in close coordination with the USAID HIV Medical Transmission Prevention staff and directly provides quality assurance and program monitoring or coordination to HHS-supported implementing partners with Blood Safety activities including: University of Maryland-ACTION, Harvard SPH, Columbia University SPH-ICAP, Catholic Relief Services-AIDSRelief, the Nigeria Ministry of Health National Blood Transfusion Service, and the Safe Blood for Africa Foundation. This position will also work with USAID staff on joint monitoring visits of non-HHS PEPFAR partners such as FHI-GHAIN and give technical assistance to the DoD Safe Blood program as requested. HIV medical transmission staff will also monitor procurements made through SCMS for Safe Blood activities.

The HHS/CDC staff member provides technical support and capacity development to new partners selected through Requests for Applications (RFAs), the New Partner Initiative and to the Government of Nigeria at the national and state levels to promote Nigeria national guidelines related to blood safety. Technical assistance through the HIV Medical Transmission TWG will be provided as need to the Department of Defense and USAID partners with Blood Safety activities. Under this activity the staff member will provide direct or indirect monitoring and support to over 230 Emergency Plan supported sites in COP09.

ICASS and CSCS charges related to this position are funded under M&S in compliance with COP09 guidance.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

- In COP08, SBFAF will assist the National Blood Transfusion Service (NBTS) to develop a Blood Safety Training Manual. In COP09, SBFAF will assist the NBTS to train a pool of master trainers in the country.
- Another key activity in COP09 will be SBFAF’s active role in the advocacy for the NBTS to achieve the status of an autonomous agency or commission. This activity is jointly funded through CDC and USAID. The narrative incorporates the scope of activities in this joint project, in the two narratives the target for number of people trained is divided in order to avoid duplication of targets. The Safe Blood for Africa Foundation (SBFAF) is providing technical assistance services in Nigeria in the prevention program area of Medical Transmission/Blood Safety (BS). SBFAF activities reinforce the National Blood Transfusion Service’s (NBTS) long-term strategy. SBFAF assists the NBTS in implementing its primary objective of migrating fragmented hospital-based blood services to centralized national blood services nationwide. A key feature of this program is the development of a nationwide voluntary donor recruitment system (VNDR – voluntary non-remunerated blood donation). The NBTS zonal and state centers are primarily supported by VNDR. SBFAF will continue to provide technical support to NBTS in the establishment of new centers and the VNDR system.

The VNDR system is highly dependent on building a network of repeat donors. Currently, the NBTS has an aggressive plan to expand the blood collection from the current level of less than 15% of the nation’s needs to over 90% by 2016. The Nigeria Club 25, SBFAF’s youth wing in Nigeria, is not currently supported under the PEPFAR program; however, SBFAF has continued to run the program because of its significance to the donor pool. Members of Club 25 and youth between 18-25 years of age make up approximately half of the NBTS donor pool. Additionally, repeat donor members of Club 25 have an HIV prevalence rate of 0.01% compared to approximately 3.1% in the general public. This is primarily because members of this club have pledged to donate blood regularly and as such adhere to the cluttered and usages which include living a risk-free lifestyle. This same group of young adults aged 18-25, if fully dedicated to the cause, will continue to be donors for several decades. The World Health Organization (WHO) guidance for blood banks stresses the need to maintain as large a repeat donor base as possible – it is more reliable, cheaper to maintain, and safer.

Capacity-building is one of the key mechanisms to achieving the objectives of the NBTS long-term strategy. SBFAF has conducted a robust training program that has strengthened the NBTS. In COP08, SBFAF activities have been primarily focused on: capacity-building for blood safety activities at all NBTS centers and focal USG-supported hospitals in Nigeria; support of NBTS in developing and implementing a hospital blood bank exchange and distribution system; and promotion of coordinated blood safety activities across all partners. These activities will be sustained in COP09. SBFAF will utilize standardized training modules that are appropriate to the various levels of trainees and approved by NBTS. SBFAF will train nurses and medical laboratory scientists in USG-supported hospitals to develop and implement a delivery system with hospitals, including focal USG-supported hospitals, which are screened for the 4 transfusion transmissible infections (TTIs) of HIV I and II, Hepatitis B, Hepatitis C and Syphilis using ELISA techniques. In addition to collecting unscreened units, NBTS delivers to the hospitals their requested order of screened units of blood for banking and use at the facilities. Furthermore, NBTS also provides monthly feedback on prevalence rates of the 4 TTIs found in the blood units collected by the facility. This is intended to facilitate improvement of donor pre-screening and deferral. This program has already commenced at selected facilities with each USG treatment partner and will be expanded as NBTS absorbs 45% of by improvements. The goal is that 80% of hospitals will be with NBTS-screened blood units, while only 20% will be emergency transfusions whereby the hospital will screen the donated blood on site using rapid test kits. Given that only a fraction of facilities are capable of piloting such an exchange program with NBTS in the initial year, all other facilities were supported to improve their collection practices and on site lab screening practices, including utilizing the blood donor setting as another point of service for HCT for deferred blood donors. This support activity will continue in COP08.

Training Manual. In COP09, SBFAF will assist the NBTS to train a pool of master trainers in the country. This training was first introduced in COP07 to NBTS and USG-supported facilities’ drivers and medical laboratory scientists. The NBTS/hospital blood exchange program put a system in place whereby NBTS centers develop and implement a delivery system with hospitals, including focal USG-supported hospitals, which have appropriate blood banking facilities in place. NBTS centers pick up unscreened blood units that the hospitals have appropriately collected, stored and transport these units back to NBTS centers where they are screened for the 4 transfusion transmissible infections (TTIs) of HIV I and II, Hepatitis B, Hepatitis C and Syphilis using ELISA techniques. In addition to collecting unscreened units, NBTS delivers to the hospitals their requested order of screened units of blood for banking and use at the facilities. Furthermore, NBTS also provides monthly feedback on prevalence rates of the 4 TTIs found in the blood units collected by the facility. Capacity-building is one of the key mechanisms to achieving the objectives of the NBTS long-term strategy. SBFAF has conducted a robust training program that has strengthened the NBTS. In COP08, SBFAF activities have been primarily focused on: capacity-building for blood safety activities at all NBTS centers and focal USG-supported hospitals in Nigeria; support of NBTS in developing and implementing a hospital blood bank exchange and distribution system; and promotion of coordinated blood safety activities across all partners. These activities will be sustained in COP09. SBFAF will utilize standardized training modules that are appropriate to the various levels of trainees and approved by NBTS. SBFAF will train nurses and medical laboratory scientists in USG-supported hospitals to develop and implement a delivery system with hospitals, including focal USG-supported hospitals, which have appropriate blood banking facilities in place. NBTS centers pick up unscreened blood units that the hospitals have appropriately collected, stored and transport these units back to NBTS centers where they are screened for the 4 transfusion transmissible infections (TTIs) of HIV I and II, Hepatitis B, Hepatitis C and Syphilis using ELISA techniques. In addition to collecting unscreened units, NBTS delivers to the hospitals their requested order of screened units of blood for banking and use at the facilities. Furthermore, NBTS also provides monthly feedback on prevalence rates of the 4 TTIs found in the blood units collected by the facility. This is intended to facilitate improvement of donor pre-screening and deferral. This program has already commenced at selected facilities with each USG treatment partner and will be expanded as NBTS absorbs 45% of by improvements. The goal is that 80% of hospitals will be with NBTS-screened blood units, while only 20% will be emergency transfusions whereby the hospital will screen the donated blood on site using rapid test kits. Given that only a fraction of facilities are capable of piloting such an exchange program with NBTS in the initial year, all other facilities were supported to improve their collection practices and on site lab screening practices, including utilizing the blood donor setting as another point of service for HCT for deferred blood donors. This support activity will continue in COP09.

Technical support will be given to NBTS to develop IEC materials and advocacy packages for medical professionals. The Government of Nigeria has made efforts to increase accessibility to safe blood through establishment of more NBTS centers. There are presently 11 centers which will increase to 17 in COP09 via the GON efforts and funding. SBFAF will continue to provide TA in the infrastructural developments of the new centers to ensure uniform quality nationwide. SBFAF will also continue to work in 33 outlets in Akwa Ibom State by the jointly funded project.

SBFAF will continue to assist the NBTS in its monitoring and evaluation program. Bi-annual technical audits of the NBTS centers will be done to ensure quality of services and laboratory processes. SBFAF and the NBTS will introduce the principles of quality management processes with site-specific written Standard Operating Procedures, proper maintenance logs of equipment, validation of processes and a secure method of record keeping.

SBFAF has worked with the NBTS through the National Technical Committee to develop a National Blood
Activity Narrative: Policy. In COP09, entrenching the policy into law and advocacy to make the NBTS autonomous will be pursued in collaboration with other USG policy partners. This will significantly improve NBTS regulatory capabilities. It is NBTS’s intent to regulate and institute consistent blood banking standards and practices on a national basis. SBFAF will continue to strengthen the technical and managerial capacity of the NBTS through its TA program to ensure its sustainable, independent operation and increased leadership role in the safety of Nigeria’s healthcare system.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: SBFAF blood safety activities will contribute to COP09 overall Emergency Plan for blood safety targets for Nigeria. Activities will increase VNRD, create an enabling environment, and improve access to quality blood transfusion systems and practices. Technical support by SBFAF in linkages and synergies between the NBTS and service outlets will improve the quality of blood transfusion practices in Nigeria. The NBTS/USG supported hospital blood exchange program will also improve access to safe blood. This activity will be primarily conducted through technical assistance to the NBTS and the hospital monitoring and evaluation program and through training to facility staff. Monitoring and evaluation activities will determine the number of blood units screened by NBTS and the number of outlets adhering to the appropriate use of guidelines and SOPs provided through regular audits at these outlets at 6 month intervals. PEPFAR BS indicators will be reported.

LINKS TO OTHER ACTIVITIES: SBFAF VNRD activities have direct links to counseling and testing, human capacity development and system strengthening activities.

POPULATIONS BEING TARGETED: Low risk populations targeted to become regular VNRD include youth groups, adult men and women. SBFAF will assist the NBTS to engage with organizations such as faith-based organizations (FBOs), business/private sector, community and religious leaders. SBFAF training activities and capacity building will target government health workers and other health care providers.

KEY LEGISLATIVE ISSUES ADDRESSED: Key issue being addressed by SBFAF activities is to entrench the national blood policy into law and advocacy to make the NBTS autonomous.

EMPHASIS AREAS: This program includes major emphasis on blood safety training in all areas of the program. Emphasis is also being expended in the area of blood policy and legislation. Community Mobilization and Supportive Supervision will be areas of minor emphasis.

**Activity Narrative:** Track 1 and 2 funds are combined for this activity.

**ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:**

**ACTIVITY NARRATIVE:**
The SCMS objective is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers the procurement, shipment, distribution and delivery of blood safety related commodities as well as other supply chain management related activities. It also covers technical assistance (TA) and system strengthening (SS) activities provided to PEPFAR Implementing Partners (IPs) and to the Department of Defense (DoD) to strengthen or build their supply chain management capacity within their respective programs.

In COP09, SCMS will procure, for the National Blood Transfusion Service (NBTS) and DoD, safe blood related commodities needed for the collection, testing, preparation and distribution of blood and blood components. Examples of such commodities are blood bags, laboratory reagents, and testing diagnostic kits for the detection of HIV, syphilis, and hepatitis B and C. SCMS will also procure commodities needed for the disposal of contaminated products.

Through its continuous support to and strengthening of commodity security in PEPFAR programs, SCMS works towards ensuring uninterrupted availability of needed commodities to the target populations of blood donors and blood or blood components’ recipients in the general population.

The present budget will cover the cost of commodities as well as logistical and administrative services from the field office for the coordination and management of the procurements undertaken by SCMS for the support of all IPs active in blood/medical/safety. In COP09, SCMS will procure blood safety commodities and requested technical assistance (TA) for the National Blood Transfusion Service and DoD, each of which has attributed specific funds to SCMS for these services: DoD, $10,000, and NBTS, $1,000,000. The budget also supports the cost of TA and SS. SCMS will assist in quantification and forecasting of requirements and will support the development of long term supply plans (considering in country stocks and anticipated consumption rates) for stock management and delivery planning.

SCMS will support the NBTS and DoD in the following areas of the supply chain cycle: product selection in accordance with the Nigerian National Blood Policy and Operational guidelines for blood transfusion practices, Federal Government of Nigeria’s (GON) HIV testing algorithm, marketing authorization status (GON NAFDAC registration), and GON importation regulation. SCMS will also be responsible for ensuring that commodities procured meet eligibility criteria under the USG acquisition rules and regulations, including source and origin waivers and approvals by the US Food and Drug Administration or other relevant stringent drug regulatory authorities.

SCMS will identify suitable sources of supply both internationally and nationally. SCMS will work with implementing partners (IPs) in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and/or associated services (i.e., maintenance service). SCMS will coordinate with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by NAFDAC, SCMS will make suitable recommendations including waiver applications where appropriate. SCMS will take the lead to communicate with manufacturers on registration gaps in Nigeria.

SCMS procurement leverages global spend to provide best value and offers clients certainty of competitive prices and international quality standards. The SCMS procurement strategy is articulated around buying generics whenever possible, pooling procurements for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries and negotiating long term contracts with suppliers. IPs and DoD’s requests for blood safety related commodities will be addressed to and coordinated with the SCMS field office directly in line with explicit guidance from the Prevention Technical Working Group (TWG) and the USG PEPFAR team to ensure complementarities with the priorities identified.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry as required. SCMS will take the lead and further streamline the customs clearance process as appropriate including management of the various duty exemption forms (CC1, CC2, CC3). SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Where appropriate, commodities procured and imported by SCMS will be supplied through the SCMS Regional Distribution Center (RDC) in Ghana. The warehousing of commodities in the RDC is a critical component of the SCMS technical solution. The use of the RDC will significantly reduce lead times and provide an important buffer between the supply from manufacturers and demands from the PEPFAR programs in Nigeria. The RDC also ensures that the recipients in country, an increasing challenge in the context of program scale-up. The RDC concept also brings an increased flexibility in stock management, thus reducing risk of stock obsolescence or need for emergency replenishments, resulting in important savings. Finally, the RDC approach serves regional and national sustainability, as the RDC is designed to be a commercially viable entity, available to other health (and non-health) programs, whose benefit will last beyond SCMS. Where possible and appropriate, SCMS will road freight from the RDC in Ghana to Abuja; this mode of delivery will provide significant savings over airfreight.

Delivery arrangements will be negotiated with NBTS and DoD; SCMS will either deliver to a central location or to points of service as needed. When local warehousing is needed, SCMS will continue to explore viable options make use of its recently acquired cross-docking facility and the long term warehouse facility (which will be acquired in COP09). For in-country distribution where necessary, SCMS will competitively source for and utilize the service of an efficient and safe in-country courier services operator.

SCMS will also assist IPs to monitor/report on stock levels and usage through the deployment of pipeline systems.
Activity Narrative: databases. Additionally SCMS will monitor product safety and tracking for recalls (pharmacovigilance). SCMS provides TA and SS services in all areas of the supply chain including product selection, quantification and forecasting, supply planning, procurement, warehousing, customs clearance and delivery. In COP09, SCMS will provide TA and SS services to IPs including the training of staff in the use of the ProQ or Quantimed forecasting and pipeline supply planning tools. SCMS will continue to provide TA and SS services to DoD based on the recommendations that came out of the supply chain systems assessment carried out in COP07.

SCMS will provide the USG team with regular reports on supplies and equipments as well as monthly financial reports. In COP09, Supply Chain Support Teams (SCSTs) (to be made up of technical SCMS staff and GoN or IP staff as appropriate) will be constituted by SCMS to work with the IPs in providing their trained logisticians with the capacity to monitor and support the performance of the supply chains at various levels. Using standardized indicators of logistics performance, the SCSTs will track performance of the supply chains and together, act as an early warning system to identify impending or imminent supply chain breakdowns and act to forestall these. By developing methodologies and tools for conducting these activities, SCMS will work with GoN and IPs to establish and institutionalize this activity, thereby building the capacity to identify these problems and resolve them before service delivery is compromised. In addition, an automated web based procurement tracking database will ensure that the USG team and IPs have adequate visibility on SCMS procurement status by providing an easy access to accurate and up to date information on procurement.

Under this program area, SCMS does not have targets of its own, but supports NBTS and DoD to reach their blood safety planned targets.

Activity System ID: 24857

Mechanism: HHS/CDC Track 1.0 MoH NBTS

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Biomedical Prevention: Blood Safety

Program Budget Code: 04

Planned Funds: $3,500,000
Activity Narrative: ACTIVITY UNCHANGED FROM FY2008:

The National Blood Transfusion Centre presently operates in 11 centers in Nigeria; 1 headquarters, 6 Zonal Centers, 1 Armed Forces Center and 3 State Centers. In the COP08 and COP09, 6 additional state centers will be opened by the Government of Nigeria and a total of 66,000 units of blood will be collected and screened. This is based on the quarterly reports on the numbers of blood units collected monthly in the past one year from all the Zonal Centers. This target value will be composed of units of blood obtained from voluntary non-remunerated donors through donor drives and from hospitals under the hospitals linkage program.

NBTS activities will be primarily focused on voluntary non-remunerated blood donations with extensive mobile community outreach activities by all the centers. There is also continued emphasis on linkages with hospitals to encourage them to send units of blood collected from family replacement donors to the NBTS for centralized ELISA screening. The goal of the hospitals linkage program is to ensure that all blood units are properly screened for HIV I and II, Hepatitis B, Hepatitis C and Syphilis using ELISA techniques and to promote the conversion of family replacement donors to voluntary, non-remunerated blood donors. Cold chain is preserved by a 24-hour power supply augmented by standby generators at all the centers and solar power systems dedicated to the blood banks in 6 centers. The NBTS in addition will deliver to the hospitals their requested order of screened units for blood banking and use at the facilities. NBTS will also provide monthly feedback on rates of the four TTIs found by ELISA screening of blood units collected by the facility. This will facilitate improvement of donor prescreening and deferral.

The Nigerian National Blood Transfusion Service is based on a centralized system with 6 Zonal blood screening centers set up at the first phase of the project, as follows; Abuja serves as headquarters covering Federal Capital Territory and adjoining states of Nasarawa and Niger with a population of 7.2 million. Kaduna serves the North-West Zone comprising of 7 states with population of 35.8 million while Owerri serves the South-East Zone which has 5 states with population of 16.4 million. Ibadan serves the South-West Zone comprising of 6 states with population of 27.6 million. Maiduguri covers North-East Zone with 6 states having a population of 18.2 million. Jos covers North-Central Zone comprising of 6 states with population of 18.2 million. Port Harcourt is desily the South-South Zone of 6 states and population of 21.0 million has Benin City as its Zonal Center. Lokoja is a State Center complementing the Zonal Center in Jos while the Nangere-Potiskum Center complements the North-East Zonal Center in Maiduguri. The Abeokuta State Center complements the Zonal Center in Ibadan while the Sokoto Center will complement the center in Kaduna (North-West). The Calabar Center is to complement the South-South Zonal Center in Benin City.

An aggressive donor recruitment campaign is in progress to educate the populace about the importance of voluntary blood donations to blood safety and adequacy. The campaigns are carried out mostly in tertiary educational institutions and to faith based organizations via mass media (TV, radio), sensitization talks, road shows and one-on-one recruitment. Young persons are targeted to become regular blood donors through regular education and counseling and reinforcing messages about living healthy lifestyles that reduce the risk of contracting HIV and other Transfusion Transmissible Infections (TTIs). The youth recruitment program relies substantially on the establishment of youth donor associations such as local Club 25 and Lifesavers Club. Other youth NGOs like the Rotaract Club (Junior Rotarians) also have committed blood donor programs. Walk-in donors are also encouraged during emergencies. Donor retention programs will be intensified in COP09 through routine follow up and improved donor care.

The National Blood Transfusion Service will also embark on regular training of medical personnel in the catchments areas on the appropriate use of blood and blood products using a standard training module which will be regularly updated. A total number of 278 staff will be trained by the end of COP09. Training will be conducted on core basic knowledge and logistics/cold chain management for NBTS staff and hospitals staff in USG PEPFAR supported sites and other collaborating hospitals under the hospitals linkage program. NBTS will employ different cadres of medical and administrative professionals per center (physicians, donor recruiters, nurses, phlebotomists, counselors and laboratory scientists) who will be trained as master trainers and conduct step down trainings within their NBTS centers and at catchment hospitals. NBTS in collaboration with Safe Blood for Africa Foundation (SBFAF) conducts other trainings for blood safety.

Formal referral linkages exist between the NBTS Centers to appropriate treatment facilities for HIV and other TTI reactive donors. The National Blood Transfusion Service is developing a quality management protocol for the assessment of the program at regular intervals. A biannual technical audit of all NBTS centers is conducted with technical support from SBFAF. Standard operating guidelines for all processes and procedures carried out within the service have been developed. Regular scheduled and unscheduled monitoring and evaluation, using a standard checklist, will complement quality management efforts. A National blood policy was adopted and launched in COP06, and a legislative back up bill is currently being considered by the National Assembly. A ten-year strategic plan drawn in collaboration with SBFAF is in place to direct implementation of the program. As part of Government of Nigeria (GON) commitment to the blood safety project, an additional six centers will be established bringing the total number to 17 centers nationwide.

CONTRIBUTIONS TO OVERALL PROGRAM AREA Safe blood supply in our communities will result in significant reduction in the transmissions of HIV and other TTIs from unsafe blood transfusions. This contributes immensely to PEPFAR’s 5 year strategic plan to reduce HIV infections through the provision of safe blood and the implementation of safe blood interventions in the country.

LINKS TO OTHER ACTIVITIES This activity links with HVCT and ARV. The NBTS Centers work closely with the State Action Committees on AIDS (SACAs) in the various zones to promote HIV/AIDS prevention, education and strategies. NBTS also works in collaboration with SBFAF, which serves as its technical partner.
**Activity Narrative:** POPULATIONS BEING TARGETED The main target populations for regular voluntary blood donor recruitments are the youths between the ages of 18 and 30 years. Many of the youths are in tertiary educational institutions within the catchments areas. There is a very active population of donors from the faith-based organizations and the general population is also targeted.

KEY LEGISLATIVE ISSUES ADDRESSED Key legislative issues addressed include gender, stigma and discrimination and volunteers. NBTS activities will help to increase gender equity in voluntary blood donations through counseling messages targeted to the populace. An estimate of the donor data at the centers indicates a low patronage by women (male:female~4:1).

**EMPHASIS AREAS** The major emphasis areas to be targeted in 2009 will be community mobilization and participation for voluntary non-remunerated blood donation and strengthening of the hospitals linkage program. Other areas of emphasis are training of appropriate staff (donor recruiters, laboratory scientists, quality officers and donor care officers), and establishing an infrastructure for screening, cold chain maintenance and banking safe blood in Nigeria.

**New/Continuing Activity:** Continuing Activity

**Continuing Activity:** 13046

### Table 3.3.04: Activities by Funding Mechanism

- **Mechanism ID:** 544.09
- **Prime Partner:** Harvard University School of Public Health
- **Funding Source:** GHCS (State)
- **Budget Code:** HMBL
- **Activity ID:** 6491.24890.09
- **Mechanism:** HHS/HRSA Track 2.0 Harvard SPH
- **USG Agency:** HHS/Health Resources Services Administration
- **Program Area:** Biomedical Prevention: Blood Safety
- **Program Budget Code:** 04
- **Planned Funds:** $40,913
Activity System ID: 24890
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The blood safety (HMBL) activity supports infrastructure and capacity development for blood safety training and equipment, blood bank screening for HIV and other transfusion transmissible infections (TTIs: HIV, HBV, HCV and syphilis), high-quality blood bank and transfusion practices, support of counseling and lab personnel and their training on universal safety precautions (UP) and good lab practices, waste management, and QA/QC for HIV serologic testing. At the end of COP08, capacity for high-quality blood transfusion services at 7 Harvard-supported ARV centers will be increased through linkages between blood banks at the sites and National Blood Transfusion Service (NBTS) Zonal Centers. In COP09, these same sites will be supported for effective compliance with the National Blood policy. The policy emphasizes the use of voluntary blood donors, screening for 4 TTIs with ELISA techniques before transfusion and centrally coordinated blood banking services through the NBTS.

In COP09, Harvard will continue to work closely with the NBTS and Safe Blood for Africa Foundation (SBFAF) in all aspects of its blood safety program. Harvard supports the NBTS’ primary objective of migrating fragmented hospital-based blood services to a nationwide voluntary nonremunerated donor recruitment system (VNRD). At Harvard-supported facilities, NBTS will provide TA for blood donation drives and SBFA will train nurses and medical lab scientists in recruitment strategies to create repeat voluntary blood donors from current family replacement donors. In this plan, Harvard will be instrumental in working with hospital management and staff at all comprehensive sites to participate in the NBTS blood services program to create support of blood donor organizers and to strengthen health facility and community focused blood drive activities. All Harvard sites with blood transfusion services (7) will be technically supported so that donors are screened with the national pre-donation questionnaire. Donors deferred after administration of the questionnaire will be offered HCT using the National testing algorithm. Data on patients provided with HCT through these activities will be captured through Harvard SI activities.

Linkages to NBTS Zonal Centers will occur through strengthening of ongoing collaborations. Harvard works with secondary and tertiary facilities that do blood transfusions, some of which are already utilizing a combination of ELISA and rapid tests for the 4 TTIs and blood screening practices to NBTS. Harvard, NBTS and SBFA will continue promoting the benefits of NBTS-screening to the management and hematology departments of these facilities. Harvard will continue to facilitate the development of an NBTS/hospital blood exchange programs at 7 health facilities that was selected in COP08, based on supportive management, proximity to a zonal NBTS office, availability of blood banking facilities, lab infrastructure and other resources. This linkage will include regular delivery of donated blood to NBTS for screening along with a regular delivery of screened blood back to the facility. In addition to collecting unscreened units, NBTS will deliver the requested order of screened units for blood banking and use at the facilities to these 7 hospitals. NBTS will also provide monthly feedback on rates of the 4 TTIs found by ELISA screening. It is expected that through the linkage with the NBTS blood banking system, rapid testing in the blood donor setting will occur in emergencies only. The goal of the NBTS hospital linkage is to limit emergency transfusion with rapid test kits to less than 20% of all transfusions in the hospital. Harvard and its supported facilities will establish and coordinate a regular QA/QC program to ensure that HCT in the blood donor setting meets national and international standards. It is expected that these improvements in the donor screening and blood collection practices will result in the safe collection of 3,500 units of blood. 2,800 (80% of total units of blood) units of blood will be sent to NBTS for screening.

Harvard will identify appropriate staff (50) for training by SBFA who, in turn, will utilize standardized training modules approved by NBTS and appropriate to the various levels of trainees. Subsequently, Harvard will support a total of 140 doctors, nurses, and lab workers at supported sites to be trained via step down training.

QA/QC activities will include site M&E and personnel trainings on proficiency in HIV testing, UP, and good lab practices. All sites will be provided with copies of the National Blood Policy, operational guidelines for blood transfusion, SOPs and job aids to support blood safety activities.

This activity will promote the principles of UP, such as the reduction of unnecessary exposure to blood, accidental injury/contamination as well as the essential consumables and services that protect health care workers (HCWs) from contracting infections, especially HIV. Harvard will support clinical meetings and seminars of medical professionals to promote rational use of blood and blood products.

EMPHASIS AREAS:
HMBL activities emphasize upgrading the infrastructure of participating hospitals, laboratories, and blood banks through training and minor renovations to effectively link up with the NBTS and contribute to the nationally coordinated blood banking system. In order to develop human capacity, there will also be emphasis on in-service training of lab workers and public health personnel in the implementation of recruitment of voluntary non-remunerated blood donors. This will also be achieved through QA and supportive supervision of trained staff. SI will be emphasized in the collection of data surrounding transfusions done at the site level. Lastly, this program will develop the capacity of local organizations (blood banks in hospitals) to change the practice of fragmented hospital based services and the use of paid/family replacement donors to participate in national blood safety activities. Awareness about safe blood practices will be promoted in the communities and indirectly increase the number of volunteers available for blood donations.

POPULATIONS BEING TARGETED:
HMBL activities target adults, specifically blood donors aged 18 and above. Additionally, it targets public HCWS and laboratory workers for compliance with the national blood policy, training in HIV testing techniques and proper UP in the handling of blood specimens.

CONTRIBUTION TO OVERALL PROGRAM AREA:
HMBL will provide support for 7 service outlets at tertiary health care facilities for improved blood screening.
**Activity Narrative:**

Activities. Individuals will be trained in counseling and testing and blood bank safety protocols. Linkages will be created with the NBTS. The emphasis on infrastructure building within this program is consistent with the PEPFAR 5-year goal of providing technical assistance for the development of site-specific blood safety policies, protocols and guidelines. Furthermore, it is consistent with the goal of ensuring a safe, effective and nationally coordinated blood program that provides blood free of the four TTIs.

Additionally, as part of the program’s sustainability building efforts, Harvard will provide technical assistance and support for APIN to assume program management responsibility for HMBL activities. This will include the implementation of a plan to transition site oversight, management and training over to APIN. The goal of such efforts is to provide for greater assumption of responsibility for management and implementation of PEPFAR programming by Nigerian nationals through an indigenous organization.

**LINKS TO OTHER ACTIVITIES:**

HMBL activities relate to activities in counseling and testing. All blood donors will be screened with donor questionnaires and deferred donors provided with full HCT. The UP processes at the blood bank screening centers also enhance blood bank workers’ knowledge on best practices for high quality HIV testing and the proper procedures for handling blood specimens throughout the blood banking protocol. TTI positive donors are linked to care and treatment. HMBL activities also relate to activities in Adult Care and Treatment, Pediatric Care and Treatment, PMTCT, TB/HIV, ART Services and OVC.

HMBL is linked to HMIN activities and to HLAB through the promotion of universal safety precautions, good laboratory practices, and proper waste management for biohazardous materials. Both areas are linked to Human Capacity Development (HCD) and Health Systems Strengthening (OHSS) by training workers and building the overall capacity at the sites.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activities will be focused on supportive supervision of 32 hub sites to encourage linkage with NBTS Zonal Centers and adoption of NBTS recommended practices as well as on-site refresher training complementing training provided by NBTS and SBFA.

ACTIVITY DESCRIPTION:

AIDS Care and Treatment in Nigeria (ACTION) will support the USG effort to assist the Nigerian National Blood Transfusion Service (NBTS) in the development of a nationally-coordinated blood program to ensure a safe and adequate blood supply by supporting 32 hospital blood banks to utilize screened blood from NBTS Zonal Centers for their transfusion needs. These activities will be facilitated through the provision of laboratory consumables and supplies, supportive supervision, and on-site refresher training utilizing curricula developed by NBTS and Safe Blood for Africa Foundation (SBFA). For their emergency transfusions as an interim measure, sites will be supported to utilize the NBTS standard donor screening questionnaire, provide full HCT services to deferred donors, and encouraged to screen all emergency donors for the four transfusion transmitted infections (TTIs) (HIV I and II, syphilis, hepatitis B, and hepatitis C) in accordance with NBTS policies. The blood banks will also be supported to carry out proper universal precautions, good laboratory practice, waste management, and QA/QC for all serological testing. Approximately 32 facilities supported by ACTION and carrying out blood transfusion services will be supported to utilize the NBTS donor screening questionnaire, provide pre-donation counseling, and implement standardized blood collection methods. Safe injection program area resources will be leveraged to facilitate proper universal precautions and waste management.

In COP09, ACTION will work closely with NBTS and SBFA in all aspects of its blood safety program. ACTION will support the NBTS in implementing its primary objective of migrating fragmented hospital-based blood services to centralized NBTS-based blood services nationwide. A key feature of this program is the development of a nationwide voluntary donor recruitment system. ACTION will work with NBTS Centers to implement blood drives at supported facilities and surrounding communities. To assist in the development of efficient national coordinated and centralized donor recruitment, blood screening, and distribution systems in accordance with the Nigerian National Blood ACTIVITY sites involved in the provision of blood transfusion services and supported as model blood banks in COP08 will be followed up to sustain blood safety activities. Blood banks will be supported to professionally screen and bleed donors. These blood units will be sent to NBTS centers for screening with ELISA techniques for the 4 TTIs. NBTS will return safe blood units to the model blood banks and give return data on the rate of TTI on the screened blood units. A total of 9600 units of blood is targeted for the hospital linkage program in these 4 blood banks.

Recognizing that the transition to full reliance upon the NBTS Centers for all blood products will take some time, sites will be supported to follow NBTS policy in the identification and collection of blood from all donors including blood for emergency transfusions. Procedures for emergency donors at the site will mirror NBTS Center procedures to the extent possible. This will include the use of the NBTS donor screening questionnaire for all donors deferred as necessary based on responses, and the provision of standard HCT services to deferred donors using the National HIV rapid testing algorithm. In order to maintain high quality laboratory results, ACTION will include the blood bank in its laboratory QA/QC program that involves on-site quarterly monitoring and retraining as well as selective retesting and proficiency panels for all serologic testing.

This activity will promote the principles of Universal Safety Precautions, such as the reduction of unnecessary exposure to blood, accidental injury/contamination as well as the essential consumables and services that protect health care workers from contracting infections, especially HIV. Proper waste management will be encouraged through the use of biohazard bags, suitable sharps containers, and the use of incinerators. In addition, each site will have in place a Post-Exposure Prophylaxis (PEP) protocol and starter kits in the event of an occupational exposure (described under the ARV services narrative).

Staff will be trained at sites by SBFA who in turn will utilize standardized training modules that are appropriate to the various levels of trainees and approved by NBTS. In order to avoid double counting, training targets are counted under the SBFA blood safety narrative. ACTION will complement this activity during supportive supervision visits to the 32 supported sites by providing refresher training for 3 staff per site for a total of 96 direct training targets. Clinical seminars for medical doctors on appropriate use of blood will also be supported.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:

Activities in this program area will support PEPFAR and GON goals to avert new infections through ensuring that all blood transfused at selected facilities are HIV free by instituting safe blood activities at all sites. Screening for TTIs will provide information on prevalence among blood donors and guide future policy formulation on TTI screening. ACTION activities will support the implementation of GON operational guidelines for blood transfusion practice in Nigeria and actualization of a well coordinated and centralized blood supply system in the country, while the QA program will serve as a mechanism to measure and evaluate the success of the intervention strategy.

LINKS TO OTHER ACTIVITIES:

This activity is linked to HCT as deferred donors will be provided with full HCT services. This activity is also linked to infection control activities under injection safety as a post exposure prophylaxis policy will be instituted, universal precaution supplies including safe disposal containers will be provided, and training will be conducted. Linkages to laboratory infrastructure also exist. Strategies for HIV positive donor referral to clinical ARV facilities will promote treatment access goals and provide encouragement of donors to have HIV testing done. SI will support data gathering related to blood donations.

POPULATIONS BEING TARGETED:

The target populations are blood donors, laboratory workers, physicians and blood donor organizers at...
**Activity Narrative:** public facilities who will be the focus of capacity development and voluntary blood donations.

**Emphasis Areas:**
An emphasis area for this activity is organizational capacity building as capacity around blood donor drives and blood banking services in facilities are strengthened. This activity will increase awareness and build skills around safe blood issues at facility and community levels. It is expected to also promote awareness about safe blood practices in the communities and to indirectly increase the number of volunteers available for blood donations.

ACTIVITY NARRATIVE:
In COP09, the Department of Defense (DOD) HIV Program, in collaboration with the Nigerian Ministry of Defence (NMOD), will continue to support blood safety activities to strengthen NMOD’s support and use of the National Blood Transfusion Service (NBTS) as started under COP08. The DOD will conduct activities in four sites. The 4 sites were selected due to their proximity to an NBTS regional blood screening site.

This activity has three components. Working closely with the NBTS, the first component is to support blood drive activities across four military sites. By promoting and facilitating access to the NBTS, the military will support the recruitment of voluntary, non-remunerated blood donors among the barracks community and beyond. Another objective is to increase the number of first-time donors and the proportion of military and civilian personnel who are regular donors. This will be facilitated by frequent blood drives at the sites so military personnel will not have to travel to NBTS to donate. The NMOD will also encourage senior military officers to promote regular blood donation during officer professional development seminars. All donors will be screened with the national blood donor questionnaire and the data remitted to the NBTS. Deferred donors will be offered HCT and data captured under HVCT. Step-down training will be conducted at each site. A total of 36 health personnel will be trained through this step down training. This includes topics such as donor recruitment and management, blood collection, as well as in counseling, including appropriate utilization of the NBTS pre-donation screening questionnaire, leading to improved screening of all donors in all facilities. Training on the risks associated with family replacement/ remunerated donors and appropriate clinical use of blood, universal precautions, good clinical and laboratory practices, testing for transfusion-transmissible infections, and other such topics will also be covered. DOD will support clinical meetings and seminars of medical professionals to promote rational use of blood and advocate implementation of the national blood policy. QC/QA will be instituted for all processes involved in this activity. All sites will be provided with copies of the National Blood Policy, operational guidelines for blood transfusion, SOPs and job aids to support blood safety activities.

This activity will support four NMOD sites in Lagos, Kaduna, Oyo and the FCT. It is expected that an average of 100 units of blood from each of these sites will be screened through linkages with the NBTS making a total of 400 units of blood.

This activity will also promote the principles of Universal Safety Precautions, such as the reduction of occupational exposure to blood, accidental injury/contamination as well as the essential consumables and services that protect health care workers from contracting infections, especially HIV. These universal precaution materials will include personal protective equipment such as hand gloves, laboratory coats, masks, and other essential consumables for each site. Additionally, each site will make provisions for the referral of staff for access to post exposure prophylaxis (PEP) when needed. PEP will be provided through ART drugs activities. Proper waste management will be encouraged at each site through the use of biohazard bags, suitable sharps containers, and the use of incinerators.

CONTRIBUTION TO OVERALL PROGRAM AREA:
This activity will contribute to the USG target of preventing new infections through prevention of medical transmission of HIV by ensuring the supply of a safe and screened national blood supply. This activity will also contribute to GON and PEPFAR training goals by training military personnel in blood safety. This activity will help to establish routine referrals to the NBTS for blood banking services.

LINKS TO OTHER ATIVITIES:
This activity will be linked to PMTCT (MTCT), HCT (HVCT), Injection Safety (HMIN), Lab (HLAB), ART services (HTXS), and TB/HIV (HVTB). All donors at the collaborating centers will be screened with the national blood donor questionnaires and deferred donors offered full HCT services. The DOD will also establish linkages with other partners to ensure access to the full range of blood safety activities including Safe Blood for Africa and the NBTS.

POPPULATIONS BEING TARGETED:
This activity targets military and civilian personnel who are involved in blood collection, storage and
Activity Narrative: transfusion. The activity also targets the broader barracks community to increase the number of voluntary non-remunerated blood donors.

EMPHASIS AREA
This activity targets military populations and health workers in military health institutions.

Mechanism: HHS/CDC RFA TBD

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Biomedical Prevention: Blood Safety

Program Budget Code: 04

Planned Funds: [ ]

.
Activity Narrative: ACTIVITY DESCRIPTION:
The FY09 HHS/CDC RFA in medical transmission will be a sole source solicitation for the Nigerian National Blood Transfusion Service (NBTS). This award will enable the continued funding partnership between the PEPFAR program and the NBTS after the completion of the current Track 1.0 mechanism. This will allow for continued improvements in creating a safe blood supply for Nigeria. Specific activities may include increased efforts in voluntary blood donation drives, increased collaborative relationships with hospital facilities that conduct blood transfusions, improved data collection on blood transfusion practices, and continued policy and system strengthening activities related to the collection, screening and dissemination of a safe blood supply. This activity will involve regular and periodic reporting on EP and Nigeria's blood safety program indicators to the USG and GON, analysis of data, dissemination of results and providing feedback to the relevant stakeholders. This RFA will also focus on capacity building for staff involved in NBTS and blood transfusion activities.

CONTRIBUTION TO OVERALL AREA:
This activity will enhance blood safety program implementation through support to the NBTS. This will allow for continued strengthening of the Nigerian NBTS after the conclusion of the Track 1.0 award mechanism.

LINKS TO OTHER ACTIVITIES:
This activity is linked to counseling and testing, laboratory services, and injection safety.

EMPHASIS AREAS: This activity has an emphasis in capacity building for staff.

TARGET POPULATION: This target population will be health care workers for training and advocacy in appropriate transfusion practices.

New/Continuing Activity: New Activity

Continuing Activity:

</table>
**Activity Narrative:** This activity will support the linkage of AIDSRelief (AR) supported Local Partner Treatment Facilities (LPTF) and their satellite sites to the National Blood Transfusion Service (NBTS) zonal centers across the country. In COP09, AR will be supporting 34 LPTFs and 19 satellite sites in 18 states (Abia, Adamawa, Anambra, Benue, Delta, Eboti, Edo, Enugu, FCT, Imo, Kaduna, Kano, Kogi, Nasarawa, Ondo, Plateau, Rivers and Taraba). Blood transfusions occur at all 34 LPTFs.

In COP09, AR will continue to work closely with the National Blood Transfusion Service (NBTS) and Safe Blood for Africa Foundation (SBFA) in all aspects of its blood safety program. AR will support the NBTS in implementing its primary objective of migrating from hospital-based blood services to centralized NBTS-based blood services nationwide. A key feature of this program is the development of a nationwide voluntary donor recruitment system. NBTS, through linkages its zonal centers will develop with AR and its supported facilities, will provide TA for blood donation drives held by these AR-supported hospital facilities. In addition, SBFA will train nurses and medical laboratory scientists in these facilities to recruit repeat voluntary blood donors from the ranks of current family replacement donors. In this plan, AR will be instrumental in working with hospital management and staff at all LPTFs to develop buy-in for the NBTS blood services program, to create support for blood donor organizers, and to strengthen health facility and community-focused blood drive activities. AIDSRelief will draw upon its unique position in working with mainly faith-based facilities to facilitate blood donation activities within parishes of communities. AR will support the distribution of IEC/BCC materials obtained from NBTS and SBFA to promote the need for voluntary non-remunerated blood donation. In addition, AR will work closely with LPTFs to establish blood transfusion committees to oversee blood use based on national algorithms and standards in the health facilities.

Under this activity AR will continue the linkage of 5 AR-supported LPTF to proximal zonal NBTS centers in Jos, Kaduna and Owerri. This linkage will include regular delivery of donated units of blood to NBTS for screening in conjunction with a regular delivery of screened units of blood to the facility. NBTS will pick up unscreened blood units that these 5 hospitals have appropriately collected and stored and will transport these units back to NBTS centers where they will be screened for the 4 transfusion transmissible infections (TTIs) of HIV I and II, hepatitis B, hepatitis C and syphilis using ELISA techniques. In addition to collecting unscreened units, NBTS will deliver to these 5 hospitals their requested order of screened units for blood banking and use at the facilities. NBTS will also provide monthly feedback on rates of the 4 TTIs found by ELISA screening of blood units collected by each facility. It is expected that at these 5 blood banking facilities a total of 1,125 transfusions will take place. AR will work to ensure that 80% of blood transfusions that occur at these hospitals will be with NBTS-screened blood units, while only 20% will be emergency transfusions whereby the hospital will screen the donors on site using rapid test kits only. Therefore, at least 900 units of blood will be collected and sent to the nearest NBTS centers for ELISA screening as outlined.

AR will work with the 34 LPTFs that do blood transfusions to ensure appropriate facility-level collection of blood. Directed and voluntary donors will be prescreened with the NBTS donor screening questionnaire and donors will be deferred as necessary based on their responses. Deferred donors will be offered HCT. At least 450 blood donors will be screened using the National HCT testing algorithm, thereby utilizing the blood donor setting as another point of service for HCT during pre-donation. A PEPFAR-supported evaluation of the current emergency-based transfusion system will provide insight into rates of TTIs, including HIV, that go undetected in emergency screened blood.

This activity will support personnel capacity development through SBFA-conducted blood safety training in line with NBTS approved standardized training curricula appropriate to various levels of trainees. Through this mechanism AR will identify 40 laboratory staff and other health care workers involved in blood transfusion services at supported sites that will be trained by SBFA. In order to avoid double counting, these 40 targets are counted under the SBFA blood safety narrative. For core Training of Master Trainers (TOT) modules developed by SBFA, AR will conduct step-down training to 80 laboratorians, allied health workers and hospital management staff involved in blood transfusion services at their sites.

In addition to institutional capacity building for blood safety activities, AR will support the implementation of universal precautions, good laboratory practice, and waste management. This activity will promote the principles of universal safety precautions and the reduction of occupational exposure to blood, and accidental injury/contamination. Essential consumables and services that protect the health worker from contacting infections, especially HIV, will be provided. These universal precaution materials include personal protective equipment, such as hand gloves, laboratory coats, and other consumables (e.g., methylated-spirit, hypochlorite solutions, antibacterial soaps, etc.), which will be provided to sites. Other equipment to be provided will include centrifuges, thermometers, pipettes, and HIV rapid test kits. In addition, each site will establish clearly defined procedures for healthcare workers, other staff, and patients to access post-exposure prophylaxis (PEP). Proper waste management will be encouraged through the use of biohazard bags, suitable sharps containers and the use of incinerators. AR will also support clinical meetings and seminars to promote rational use of blood and blood products and reduce unnecessary transfusions.

In order to maintain high quality laboratory results, AR will continue its aggressive QA/QC program that involves on-site quarterly monitoring, retraining, and proficiency in rapid HIV testing. Monitoring and evaluation of the AIDSRelief blood safety program will be consistent with the NBTS national plan. There will be evaluations of transfusion committee activities, infection control practices, waste management systems, and use of standard operating procedures for donor screening and blood collection. On-site TA with more frequent follow-up monitoring visits will be provided to address weaknesses when identified during routine monitoring visits.

Sustainability lies at the heart of the AR program, and is based on durable therapeutic programs and health systems strengthening. In COP09, AR will focus on the transition of the management of care and treatment activities to indigenous organizations by actively using its extensive linkages with faith based groups and other key stakeholders to develop a transition plan that is appropriate to the Nigerian context. The plan will be designed to ensure the continuous linkage with the National Blood Transfusion Service for access to
Activity Narrative: safe blood, and that all activities facilitate effective coordination, information sharing and long term sustainability. For the transition to be successful, sustainable institutional capacity must be present within the indigenous organizations and LPTFs they support; therefore, AR will strengthen the selected indigenous organizations according to their assessed needs, while continuing to strengthen the health systems of the LPTFs. This capacity strengthening will include human resource support and management, financial management, infrastructure improvement, and strengthening of health management information systems.

CONTRIBUTION TO OVERALL PROGRAM AREA:
This activity contributes to USG and GON prevention efforts through the prevention of medical transmission of HIV by ensuring a supply of safe and screened blood for blood transfusions. This activity will continue to establish mechanisms for linkages with NBTS centers for blood banking services, while providing the logistics and training to AR health facilities to effectively collect and store blood. Donor drives in the faith based communities for VNRD will be done in collaboration with the NBTS. This also contributes to the overall goal of GON to establish an effective and nationally coordinated and regulated blood program.

LINKS TO OTHER ACTIVITIES:
This activity is linked to HCT, PMTCT, care and treatment services, OVC, laboratory services, AB, injection safety, and SI. AR activities in blood safety relate to HCT since HCT services will be made available to deferred donors. Injection safety is linked thru universal precautions equipment and laboratory equipment. This activity is most immediately linked to laboratory services to strengthen the collection, testing and storage of blood units at LPTFs. Through transfusion committees and trainings AR will strengthen the links with other LPTF health services to ensure that these activities benefit from a screened, safe blood supply which will also promote program sustainability.

POPULATIONS BEING TARGETED:
This activity targets health care providers, particularly laboratory staff including laboratory assistants and phlebotomists. This activity also targets doctors and nurses. AR mainly works with faith-based rural facilities that serve rural populations who would otherwise have limited or no access to these services. Adults 18 years and above in these communities will be targeted as voluntary non-remunerated blood donors.

EMPHASIS AREAS
This activity has an emphasis on training and institutional capacity building

Activity Narrative: ACTIVITY DESCRIPTION

AIDSRelief (AR) local partner treatment facilities (LPTFs) consist largely of primary healthcare institutions located within communities that are poor and underserved in all areas of social infrastructure including healthcare. A proportion of HIV infections are still transmitted within these healthcare facilities through unsafe injection practices. In COP08, AR supported specific safe injection activities at 31 LPTFs and 10 satellite clinics in the 16 states of Abia, Adamawa, Anambra, Benue, Ebonyi, Edo, Enugu, FCT, Imo, Kaduna, Kano, Kogi, Nasarawa, Ondo, Plateau and Taraba. In COP09, AR will expand to support safe injection activities at a total of 53 sites (34 LPTF and 19 satellite sites) in a total of 18 states of Abia, Adamawa, Anambra, Benue, Delta, Ebonyi, Edo, Enugu, FCT, Imo, Kaduna, Kano, Kogi, Nasarawa, Ondo, Plateau Rivers and Taraba. In setting and achieving COP09 targets, consideration has been given to modulating AR’s rapid COP07 scale-up plans in other programs in order to concomitantly work towards continuous quality improvement.

AR injection safety activities encompass the training of infection control personnel from each supported facility on universal precautions and medical waste management. Healthcare workers trained in collaboration with John Snow Inc./Making Medical Injections Safer (JSI/MMIS) will step down the training to ensure sustainability and behavioral change. It is expected that a total of 120 personnel will be trained. This step down training to other LPTF staff, including nurses, doctors, laboratory staff, hospital cleaners, laundry workers and waste managers, will include topics such as proper techniques for giving injections, drawing blood, dispensing blood into laboratory bottles for laboratory testing, and disposal of used needles, sharps and other materials contaminated by blood and other biohazardous materials. AR will obtain and use MMIS supplied manuals to conduct follow-up on-site training at AR-supported LPTFs. Behavioral change communication (BCC) activities will be carried out to reduce unnecessary use of injections. In COP09, AR will work with MMIS to provide supportive supervision to all trained AR supported facilities.

AR will collaborate with JSI/MMIS to supply and distribute single-use needles, safety boxes, and personal protective equipments to all AR-supported LPTFs. This activity will provide retractable needles and syringes, sharps containers, and liquid hand washing soap in LPTF wards, clinic rooms, laboratory work stations, and strategic areas to encourage their use. This activity will also provide personal protective equipment (PPE) for health workers and ancillary hospital staff who come into contact with sharps and contaminated materials. AR will work with each LPTF to improve access to water at each hand washing point. For sustainability purposes, AR will ensure that these activities are integrated within each facility’s overall infection prevention and control and workplace safety programs. AR will also support post-HIV exposure prophylaxis (PEP) programs at all sites.

Health care waste management will also be supported in this activity. Incinerators will be repaired and fueled where they are available and constructed where there are no incinerators.

In COP09, AR will strengthen its program for Continuous Quality Improvement (CQI) to improve and institutionalize quality interventions. CQI specialists and laboratorians will conduct team site visits at least quarterly during which there will be evaluations of infection control practices, waste management procedures, proper record keeping, and use of standard operating procedures for injection safety.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
This activity contributes to the USG Nigeria target of preventing 1,145,545 new HIV infections through the prevention of medical transmission of HIV. Planned institutional and human capacity building and the provision of safe injection commodities/PPE will reduce occupational hazards and unnecessary exposure of health workers and ancillary staff to blood borne pathogens.

LINKS TO OTHER ACTIVITIES
AIDSRelief activities in injection safety relate to activities in ARV services, PMTCT, laboratory services, basic care and support, TB/HIV, OVC, blood safety, and SI to ensure that healthcare providers and ancillary staff under all these programs adhere to the principles of infection prevention and control including injection safety.

POPULATIONS BEING TARGETED
This activity will mainly target healthcare providers including doctors, laboratory workers, nurses, pharmacists. Ancillary staff, who may not have direct patient contact but handle or manage biohazardous materials, will also be targeted.

KEY LEGISLATIVE ISSUES ADDRESSED
Through the increased knowledge gained by healthcare workers and laypersons via IEC/BCC these activities will result in a reduction in unsafe injection practices and unnecessary demand for injection. This activity addresses issues of stigma and discrimination as the services will reduce stigma and discrimination associated with HIV status in the health care facility setting and better care of PLWHA.

EMPHASIS AREAS
This activity has an emphasis on training on universal safety precautions, supportive supervision and appropriate health care waste management.

This activity represents the “fully-loaded” costs of a full-time Nigerian program officer for medical transmission. This is a continuing position. The program officer for medical transmission provides technical and programmatic support to the USG partners in the areas of safe injection, blood safety, and generalized health care waste management. The program officer’s responsibilities include: 1) representing the USG in technical discussions with the GON with guidance from the Prevention Senior Advisor, 2) overseeing technical aspects of the program, including program management and oversight of partners to ensure high-quality and accountable programs, 3) interfacing with O/GAC technical working groups, and 4) interfacing with the USG/Nigeria prevention team. This officer spends 50% of his time advising in the safe injection program area and 50% of his time advising in the blood safety program areas, however all his direct costs are captured in this program area. The budget represents the loaded costs for this staffer, with the exception of ICASS costs (see another submission in this program area) and IT Tax costs, which are captured under the USAID Agency M&S line.

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008

ACTIVITY DESCRIPTION:
From COP05 through COP08, the Department of Defense (DOD) HIV Program, in collaboration with the Nigerian Ministry of Defense (NMOD), received support for injection safety through John Snow Incorporated (JSI)/Making Medical Injection Safer (MMIS) including training and the provision of auto-disable (AD) syringes and sharp boxes. In order to strengthen injection safety practices in the Nigerian Military, the DOD will further expand infection prevention/safety activities during COP09. Activities will support capacity building/training, safe and effective waste management systems, ensuring availability of safe injection equipment and the promotion of oral alternatives. Activities will be conducted at 20 existing DOD sites.

The DOD will continue to collaborate with JSI/MMIS in the areas of training and commodities procurement. JSI/MMIS will train DOD master trainers personnel (TOT) centrally and these master trainers will step down trainings at various DOD sites utilizing the JSI/MMIS curriculum for the step down trainings. At least 20 military health care personnel (e.g., physicians, nurses, pharmacists, sanitarians) will be trained. All safety protocols will be reviewed and distributed.

To supplement the limited supply of commodities that are provided by MMIS, the DOD will procure (via the Supply Chain Management System) commodities that are required for safe injections/needle handling and disposal; $10,000 has been allocated to SCMS for this activity. Depending on site inventories and needs, commodities may include disposable syringes, respiratory masks, surgical gloves, waste/sharps collection units and other safe injection equipment. Commodities will be provided to all 20 military sites.

Another component of this activity is to reprint or adapt existing educational materials (e.g., pamphlets, brochures) on injection safety that have been produced in COP06-COP08 by other partners such as IHVN. Materials will be distributed at trainings and will be posted in relevant locations (e.g., laboratories, pharmacies) at the 20 sites. Materials will include a poster on procedures for post-exposure prophylaxis. Materials will also aim to reduce prescription of unnecessary injections.

The final aspect of this activity will be to assess each site’s healthcare waste (HCW) management system. As necessary, renovations and construction of incinerators will be conducted, using WHO specifications to ensure that HCW are treated and disposed of appropriately.

By the end of COP09, the DOD will support 20 NMOD sites in Edo, Benue, Borno, Cross River, Rivers, Delta, Enugu, FCT, Kaduna, Lagos, Oyo, Plateau, Sokoto, Kano, Imo, and Anambra (16 states and FCT).

CONTRIBUTION TO OVERALL PROGRAM AREA:
This activity will contribute to the prevention of new infections and reduction of occupational hazard exposures among military and civilian personnel by promoting injection safety. Thus, the activities will contribute to the overall PEPFAR goal of prevention of medical transmission through injection safety.

LINKS TO OTHER ATIVITIES:
This activity relates to activities in MTCT, HVCT, HMBL, HLAB, HTXS and HVTB.

POPULATIONS BEING TARGETED:
This activity primarily targets military and civilian health care personnel who are involved in handling needles and/or blood from patients and/or handle waste disposal.

EMPHASIS AREAS:
This activity has an emphasis on military populations and universal precaution.

ACTIVITY DESCRIPTION:
From COP05 through COP07, the Department of Defense (DOD) HIV Program, in collaboration with the Nigerian Ministry of Defense (NMOD), received support for injection safety through John Snow Incorporated (JSI)/Making Medical Injection Safer (MMIS) including the provision of training and sharp boxes. In order to strengthen injection safety practices in the Nigerian Military, the DOD will further expand infection prevention/safety activities during COP08. Activities will support capacity building/training, safe and effective waste management systems, ensuring availability of safe injection equipment and the promotion of safe injections. Activities will be conducted at 14 existing DOD sites and six new expansion sites in COP08.

The DOD will continue to collaborate with JSI/MMIS in the areas of training and commodities procurement. JSI/MMIS will train DOD master trainers personnel (TOT) centrally and these master trainers will step down trainings at various DOD sites utilizing the JSI/MMIS curriculum for the step down trainings. At least 60 military health care personnel (e.g., physicians, nurses, pharmacists, sanitarians) will be re-trained or trained. All safety protocols will be reviewed and distributed. To ensure sustainability, the cadre of staff trained as trainers will conduct regular biannual refresher trainings across the 20 sites.

To supplement the limited supply of commodities that are provided by MMIS, the DOD will procure (via the Supply Chain Management System) commodities that are required for safe injections/needle handling and disposal. Depending on site inventories and needs, commodities may include disposable syringes, respiratory masks, surgical gloves, waste/sharps collection units and other safe injection equipment. Commodities will be provided to all 20 military sites.

Another component of this activity is to reprint or adapt existing educational materials (e.g., pamphlets, brochures) on injection safety that have been produced in COP06 and COP07 by other partners such as IHVN. Materials will be distributed at trainings and will be posted in relevant locations (e.g., laboratories, pharmacies) at the 20 sites. Materials will include a poster on procedures for post-exposure prophylaxis. Materials will also aim to reduce unnecessary injections.
**Activity Narrative:** The last component of this activity includes an assessment of each site’s waste management system. As necessary, renovations of waste-disposal pits will be conducted to ensure that pits are built to safety standards (e.g., proper depth, width, sealed correctly). In the few sites that have incinerators, renovations may be conducted, if necessary.

By the end of COP08, the DOD will support 20 NMOD sites in Edo, Benue, Borno, Cross River, Rivers, Delta, Enugu, FCT, Kaduna, Lagos, Oyo, Plateau, Sokoto, Kano, Imo, Anambra, and Niger (16 states and FCT).

**CONTRIBUTION TO OVERALL PROGRAM AREA:**
This activity will contribute to the prevention of new infections and reduction of occupational hazard exposures among military and civilian personnel by promoting injection safety. Thus, the activities will contribute to the overall PEPFAR goal of prevention medical transmission through injection safety.

**LINKS TO OTHER ATIVITIES:**
This activity relates to activities in MTCT (3246.08), HVCT (3241.08), HMBL (5388.08), HLAB (3244.08), HTXS (3243.08) and HVTB (3240.08).

**POPULATIONS BEING TARGETED:**
This activity primarily targets military and civilian health care personnel who are involved in handling needles and/or blood from patients and/or handle waste disposal.

**EMPHASIS AREAS:**
This activity has an emphasis on local organization capacity building and human capacity development.

**New/Continuing Activity:** Continuing Activity

Funding Source: GHCS (State)

Budget Code: HMIN

Activity ID: 6818.25216.09

Activity System ID: 25216

Program Area: Biomedical Prevention: Injection Safety

Program Budget Code: 05

Planned Funds: $90,010
Activity Narrative: By the end of COP08, 450 health workers in 28 Harvard- and APIN-supported sites will have been trained in injection safety. In COP09, Harvard will continue performing HMIN activities in 28 sites in 9 states (Benue, Borno, Enugu, Kaduna, Lagos, Ogun, Oyo, Plateau, Yobe). This activity provides the initiation of an intensive training program in injection safety procedures for health care workers (HCWs) at the sites. As Harvard scales up HIV/AIDS care and treatment activities, we aim to also build capacity to provide such care in a medically safe environment. This includes education on appropriate practices to diminish the risks of medical transmission and adoption of policies that address the risks of HIV medical transmission and methods that can be used to mitigate these risks. In this vein, at all Harvard sites, a minimum package of safe injection activities is provided, which includes needle disposal containers, vacutainers, and basic educational materials for staff. Harvard also provides ongoing training efforts in universal protection (UP) that have been a part of the continuing education of HCWs.

In COP08, trainings focused on scale-up to facility saturation, reaching workers from every section of the hospital facility. In order to build the human resource capacity of each site for these activities, at least one workshop on injection safety procedures was conducted in each site. Harvard collaborated with JSI/MMIS in the development of the training plan and delivered by JSI/MMIS in COP08 with a standard curriculum developed and approved by the GON were utilized in step-down trainings for other HCWs at these 28 sites. Workers who attended the workshop included physicians, nurses, laboratory workers, community HCWs involved in Home Based Care (HBC), laundry workers, and administrative personnel. Site-based waste managers and handlers were also provided with training on safe waste management techniques. At this workshop, the protocol for safe needle handling and disposal was reviewed. For COP09, Harvard will target HCWs at sites who were not provided with training during COP08.

As a part of the LGA coverage plan for Plateau State, secondary and tertiary health care facilities will be targeted for training efforts. Trained personnel at these sites will engage in step-down trainings to build capacity in this area for associated primary health care centers. A total of 280 people will be trained. The funding for this activity will also support the procurement of color-coded bin liners for segregation of infectious wastes and autoclave containers at 28 Harvard sites.

The funding will also support the distribution of educational materials and posters on injection safety for relevant locations at all 28 sites. Harvard will collaborate with local distributors. Sites will be provided job aids and IEC materials to encourage behavior change and sustainability. Training activities for each of the 28 sites will be accompanied by the sharing of safe injection SOPs at each site. Supportive supervision will be provided to all the sites with technical support from MMIS. Harvard aims to build networks among sites and involve the Plateau State Ministry of Health to allow the continued roll out of training, services, and best practices in a sustainable manner.

For both HMBL and HMIN, UP materials will include personal protective equipment such as gloves, lab coats, masks, and other essential consumables for each site. Additionally, each site will make provisions for the referral of staff for access to post-exposure prophylaxis (PEP), as needed. PEP will be provided through ART drug activities. Proper waste management will be encouraged at each site through the use of biohazard bags and suitable sharps containers. Incinerators will be repaired or constructed as applicable.

EMPHASIS AREAS:
Through HMIN activities, emphasis is placed on staff training and capacity development of Harvard-supported sites. This activity will provide the basis for a workplace program through professional medical associations that will ensure that the care and treatment of HIV-infected patients and safe handling of specimens, with minimal risk to HCWs. In COP09, emphasis will also be on supportive supervision of these sites to sustain the gains achieved in COP08 and appropriate health care waste management.

Stigma and discrimination has also been reported in healthcare settings in Nigeria. As HIV care and treatment programs have been initiated, the training of all levels of HCWs in UP and the risks of medical transmission have helped reduce the stigma and discrimination in these settings due to fear of occupational hazard. Emphasis areas also include military populations, through supportive supervision; training/retraining for staff and renovation of the incinerator at 68 Military Hospital and Military Hospital Ikoroi, Lagos.

POPULATIONS BEING TARGETED:
All levels of HCWs that handle needles and/or blood from patients will be involved in the HMIN training efforts. In addition, heads of service and administrators need to be aware of the policies put in place to limit medical transmission of HIV. Furthermore, these activities will indirectly target the general population, who will be provided with safer injection practices, which are designed to prevent transmission of HIV.

CONTRIBUTION TO OVERALL PROGRAM AREA:
HMIN activities will contribute to the reduction of medical transmission of HIV and other blood-borne diseases by following UP measures, as well as proper waste management. It will likely improve the quality of health care and reduce stigma and barriers to comprehensive medical care for PLWHAs by addressing concerns of HCWs and other hospital staff. As the overall program continues to scale-up, there will be an increasing number of patients at each site with needs other than ART; well-trained staff in injection safety will be a necessity. The adoption of practices and policies to address the risks of HIV medical transmission is important for maintaining a high-quality comprehensive HIV/AIDS care and treatment program and in preventing new infections.

Additionally, as part of our sustainability building efforts, Harvard will provide technical assistance and support for APIN to assume program management responsibility for our HMIN activities. This will include the implementation of a transition plan of site oversight, management and training over to APIN. The goal of such efforts is to provide for greater assumption of responsibility for management and implementation of PEPFAR programming by Nigerian nationals through an indigenous organization.

LINKS TO OTHER ACTIVITIES:
HMIN activities relate to activities in Adult Care and Treatment (HTXS and HBHC), Pediatric Care and...
Activity Narrative: Treatment (PDTX and PDCS), PMTCT (MTCT), TB/HIV (HVTB), ART Services (HTXS) and OVC (HKID). HCWs involved in these programs will benefit from the training program in HMIN and the adoption of safe needle and needle stick injury policies and PEP protocol.

HMIN activities are also linked to HMBL and to HLAB through the promotion of universal safety precautions, good laboratory practices, and proper waste management for biohazardous materials. Both areas are linked to Human Capacity Development (HCD) and Health Systems Strengthening (OHSS) by training workers and building the overall capacity at the sites.

Activity Narrative:

ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:
78 sites, as supported during COP08, will be maintained. These sites provide direct medical service (either PMTCT or ARV or Adult/Pediatric C&S). Emphasis in COP09 will be supportive supervision of these sites and health care waste management. Training activity principally addressing infection control and proper waste management will focus on the retraining at existing sites due to limited funds.

In COP08, ACTION supported 78 sites in 23 states (Akwa Ibom, Anambra, Bauchi, Benue, Cross Rivers, Delta, Edo, FCT, Gombe, Imo, Jigawa, Kaduna, Kano, Katsina, Kogi, Kwara, Lagos, Nasarawa, Niger, Ogun, Osun, Plateau, Sokoto) with injection safety programming. In COP09, ACTION will continue to collaborate with JSI/MMIS to provide safe injection programming to 78 ACTION-supported sites in the 23 states. In COP08, JSI provided initial training and seed commodities to sites, while ACTION provided step down training and ongoing commodity procurement and management for all sites. An ACTION program officer is dedicated to the oversight of this program area with the support of regionally based medical and nursing program officers. The focus of this activity is to reduce exposure to blood borne pathogens, particularly HIV, and the incidence of medical transmission of these pathogens.

Health care workers targeted for this activity included physicians, nurses, community health extension workers (CHEWs), laboratory workers, and waste handlers. In COP08, ACTION supported follow-up and step down site level trainings to physicians and nurses from the inpatient wards, clinics, labor and delivery, and the surgical theaters. In addition, HCT counselors performing rapid tests, laboratory scientists, blood bank staff, and waste handlers were trained. Training topics included BCC strategies to reduce unnecessary medical injections, safe injection practices, proper handling and disposal of syringes and sharps, infection control policies and practices, universal precautions, use of personal protective equipment (PPE), protocol for post-exposure prophylaxis (PEP), and appropriate waste segregation, handling, and disposal. Standard curricula and IEC materials developed by JSI/MMIS and approved by the GON were utilized. In addition, training materials developed in the context of the OVC program that address issues of stigma and irrational fear related to “fear of contagion” were included with the goal that informed health care providers and CHEWs will help inform others in the health care and community setting of what the true risks are rather than the widely held beliefs prevalent in the community that contribute to stigmatization. A total of 240 health workers and waste handlers will be trained in COP09. Sites were also provided with job aids and IEC materials to encourage behavior change and sustainability. Emphasis in COP09 will be supportive supervision of injection safety activities and implementation of appropriate healthcare waste management. A follow-up of trainees and on site retraining based on performance evaluation at sites will be the focus. IHVN will ensure that sites implement infection control plans including waste management practices which were developed in COP08. Master trainers will be used to facilitate supportive supervision at these sites.

ACTION will continue to provide personal protective commodities and will take on the new role of logistic supplier of recurrent stocks of injection safety commodities for all sites. ACTION will supply color coded bin liners for waste segregation and universal precaution supplies including gloves, eye shields, boots, and aprons. Commodities and disposables will be procured, warehoused, and distributed by ACTION. They will be provided to sites based upon a pull system using a site level inventory control system linked to the ACTION warehouse logistics management information system. The current system can be easily harmonized with a national or PEFPAR-wide logistics management information system and inventory control system once implemented. ACTION will intensify advocacy so that the sites will be able to take over procurement of some of the commodities. In addition, ACTION will support safe health care waste management by supporting construction or repair of existing incinerators at sites.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
This activity will contribute to the reduction of medical transmission of HIV and other blood-borne diseases by following universal precaution measures, as well as proper waste management. It will likely improve the quality of health care and reduce stigma and barriers to comprehensive medical care for PLWHA by addressing concerns of health workers and other hospital staff. Overall this will contribute to the USG goal for Nigeria of the prevention of 1,145,545 new HIV infections by 2010 in Nigeria.

LINKS TO OTHER ACTIVITIES:
This activity is linked to laboratory services, PMTCT, ART services, blood safety, HCT, and SI. Health care workers involved in these programs will benefit from the training program in injection safety and the adoption of a safe needle, needle stick policy, and PEP protocol, all which will improve the safety for workers involved in these other programmatic activities.

POPULATIONS BEING TARGETED:
Doctors, nurses, laboratory scientists, other health care workers and waste handlers are targeted for training and services in the public sector.

KEY LEGISLATIVE ISSUES ADDRESSED:
This activity addresses issues of stigma and discrimination as the services will reduce stigma and discrimination associated with HIV status in the health care facility setting.

EMPHASIS AREAS:
The emphasis area for this activity is training as nearly all supported personnel are technical experts who focus on development of training materials, SOPs and the provision of training at the site level. A secondary emphasis area is commodity procurement as supplies for safe disposal will be procured and supplied.

ACTIVITY DESCRIPTION:
In COP07, ACTION supported 46 sites in 13 states (Anambra, Edo, FCT, Nassarawa, Kogi, Niger, Kano, Cross Rivers, Bauchi, Benue, Rivers, Delta, and Lagos) with injection safety programming. In COP08, ACTION will collaborate with JSI/MMIS to provide safe injection programming to 106 ACTION-supported sites in 23 states (Akwa Ibom, Anambra, Bauchi, Benue, Cross Rivers, Delta, Edo, FCT, Gombe, Imo,
Activity Narrative: Jigawa, Kaduna, Kano, Katsina, Kogi, Kwara, Lagos, Nasarawa, Niger, Ogun, Osun, Plateau, Sokoto). In COP06 and COP07, JSI procured commodities for all sites while ACTION and JSI divided sites by state in the provision of training and commodity management. Under COP08, JSI will provide initial training and seed commodities to all sites, while ACTION will provide step down training and ongoing commodity procurement and management for all sites. An ACTION program officer is dedicated to oversight of this program area with the support of regionally based medical and nursing program officers. The focus of this activity is to reduce exposure to blood borne pathogens, particularly HIV, and the incidence of medical transmission of these pathogens.

Health care workers targeted for this activity include physicians, nurses, community health extension workers (CHEWs), laboratory workers, and waste handlers. JSI will be responsible for conducting initial training at the site level; this will include both the training of new sites and the retraining of existing sites. ACTION will support follow-up and step down site level trainings to train an average of 8 additional staff per site for a direct training target of 848. Physicians and nurses from the inpatient wards, clinics, labor and delivery, and the surgical theater will be targeted. In addition, HCT counselors performing rapid tests, laboratory scientists, blood bank staff, and waste handlers will be trained. Training topics will include BCC strategies to reduce unnecessary medical injections, safe injection practices, proper handling and disposal of syringes and sharps, infection control policies and practices, universal precautions, use of personal protective equipment (PPE), protocol for post-exposure prophylaxis (PEP, see ART services), and appropriate waste segregation, handling, and disposal. Standard curricula and IEC materials developed by JSI/MMIS and approved by the GON will be utilized. In addition, training materials developed in the context of the OVC program that address issues of stigma and irrational fear related to "fear of contagion" will be included with the goal that informed health care providers and CHEWs will help inform others in the health care and community setting of what the true risks are rather than the widely held beliefs prevalent in the community that contribute to stigmatization. Sites will also be provided job aids and IEC materials to encourage behavior change and sustainability.

While JSI, the main procuring IP will provide a seed stock of all commodities, ACTION will continue to provide personal protective commodities and will take on the new role of logistic supply of recurrent stocks of injection safety commodities for all sites. ACTION will supply color coded bin liners for waste segregation and universal precaution supplies including gloves, eye shields, boots, and aprons. Commodities and disposables will be procured, warehoused and distributed by ACTION. They will be provided to sites based upon a pull system using a site level inventory control system linked to the ACTION warehouse logistics management information system. The current system can be easily harmonized with a national or PEPFAR-wide logistics management information system and inventory control system once implemented. In addition, ACTION will support safe health care waste management by supporting repair of existing incinerators at sites.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: This activity will contribute to the reduction of medical transmission of HIV and other blood-borne diseases by following universal precaution measures, as well as proper waste management. It will likely improve the quality of health care and reduce stigma and barriers to comprehensive medical care for PLWHA by addressing concerns of health workers and other hospital staff. Overall this will contribute to the USG goal for Nigeria of the prevention of 1,145,545 new HIV infections by 2010 in Nigeria.

LINKS TO OTHER ACTIVITIES: This activity is linked to laboratory services (3256.08), PMTCT (3257.08), ART services (3255.08), blood safety (3258.08), HCT (5426.08) and SI (3253.08). Health care workers involved in these programs will benefit from the training program in injection safety and the adoption of a safe needle, needle stick policy and PEP protocol, all which will improve the safety for workers involved in these other programmatic activities.

POPULATIONS BEING TARGETED: Doctors, nurses, laboratory scientists, other health care workers and waste handlers are targeted for training and services in the public sector.

KEY LEGISLATIVE ISSUES ADDRESSED: This activity addresses issues of stigma and discrimination as the services will reduce stigma and discrimination associated with HIV status in the health care facility setting.

EMPHASIS AREAS: The emphasis area for this activity is training as nearly all supported personnel are technical experts who focus on development of training materials, SOPs and the provision of training at the site level. A secondary emphasis area is commodity procurement as supplies for safe disposal will be procured and supplied.

Activity ID: 9776.24891.09
Activity System ID: 24891

Mechanism: USAID Track 2.0 GHAIN
USG Agency: U.S. Agency for International Development
Program Area: Biomedical Prevention: Injection Safety
Program Budget Code: 05
Planned Funds: $175,000
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

HIV infections are known to be transmitted through unsafe injection practices and medical waste disposal. This program area supports training, waste-management systems, advocacy, and other activities to promote medical injection safety. By the end of COP08, GHAIN would have conducted injection safety activities in 60 comprehensive sites in 36 states and FCT. In COP 09, GHAIN will continue to support injection safety activities in these facilities. A total of 240 health workers and waste handlers will be trained. With technical assistance from John Snow Inc. / Making Medical Injection Safer (JSI/MMIS) project, GHAIN will continue to apply all four major technical approaches of making injection safer to create an enabling environment for health workers to provide quality services to clients without fear of medical accidents and infections. The approaches will include on-site refresher trainings and capacity building, behavioral change communication (BCC)/advocacy, procurement and supply of safe injection equipment, and health care waste management.

GHAIN will continue to support JSI/MMIS and other USG policy partners in their efforts towards ensuring behavior change of the communities through dissemination of the injection safety policy at the state level of government, while focusing on ensuring behavior change of the health workers and clients towards making medical injection safer in its supported health facilities. Strategic behavior communication (SBC) materials produced by JSI/MMIS on injection safety will continue to be distributed to all GHAIN supported sites. GHAIN will procure and supply safe injection equipment and other day-to-day consumables to GHAIN supported sites within the limits of the available funding. GHAIN will continue to advocate to the facilities to utilize the universal safety precautions in the disposal of medical waste, including use of sharp boxes, and to support incineration of such medical waste through repairs, maintenance and provision of running costs for existing incinerator facilities. Where incinerators are not available, GHAIN will construct incinerators according to WHO standards. Health workers will continue to be encouraged to utilize the knowledge and skills gained from the universal safety precaution and post exposure prophylaxis will be provided through the ART unit. In each facility supported for injection safety activities, GHAIN will continue to focus on facility saturation so that the entire health facility is injection safety compliant.

CONTRIBUTIONS TO OVERALL PROGRAM AREA

Injection safety will contribute to the overall program by preventing biomedical transmission of HIV and other blood borne pathogens. Such activities will also improve the safety of the healthcare provider thus leading to reduction of stigma to clients and making the clients feel safe and access the health system for care and treatment of AIDS. This will result in an increase in the uptake of Counseling and Testing (CT), Palliative Care (PC), Antiretroviral Therapy (ART), Prevention of Mother to Child Transmission (PMTCT) and laboratory services, leading towards target achievement in all areas.

LINKS TO OTHER ACTIVITIES

The GHAIN Injection safety program will relate to activities in Medical Transmission/Blood Safety, Sexual Prevention activities, PMTCT, Counseling and Testing; Adult and Pediatric care and treatment services. The linkages of all the above components will ensure compliance with principles of universal precautions and impact not only the quality of care given to clients but also care and occupational safety of the health care worker.

POPULATIONS BEING TARGETED

GHAIN in collaboration with JSI/MMIS will continue to provide injection safety on-site refresher trainings and service aids to health care workers such as public health workers, doctors, nurses, pharmacists, laboratory workers and waste handlers at the various points of service where such sharps are used, including counseling and testing units, laboratory, phlebotomy rooms, wards, labor rooms, delivery rooms and immunization clinics among others. Education on proper handling and use of sharps, including disposal methods, will continue to be extended to health workers and clients outside the HIV/AIDS care arena to enable them carry on such practices both in the health facility and even in their homes. This will add value to the home based care of patients.

KEY LEGISLATIVE ISSUES ADDRESSED

This program shall work to strengthen injection safety procedures across the GHAIN supported facilities which will go a long way in reducing HIV/AIDS related stigma and discrimination amongst healthcare workers. This attitude change will in turn create an enabling environment for clients to access HIV care and treatment services.

EMPHASIS AREAS

Injection safety activity includes major emphasis on procurement of injection safety equipment/consumables and distribution of SBC materials; health care waste management and minor emphasis on capacity building through the training of key health care workers.

---

**Nigeria**
Activity Narrative: ACTIVITY DESCRIPTION:
This activity represents the fully-loaded costs of a full-time Nigerian program officer for biomedical transmission. This is a continuing position.

This activity relates directly to all Nigeria HHS Medical Transmission Injection Safety COP09 activities.

The USG team through the HHS/CDC Global AIDS Program (GAP) Office in Nigeria hired one full-time staff position in FY07 to support Medical Transmission prevention activities with 75% of time allocated to Blood Safety and 25% of time allocated to Safe Injection. The budget includes 25% of one FSN salary, funding for required domestic or international travel, training funds and allocated minor support costs. Funds are not requested in COP09 for international TA as this is understood to be funded by the HQ operational plan (HOP). This staff member will be supervised by a Senior Prevention Manager funded across the CDC agency prevention programs.

The HIV Medical Transmission Prevention staff member will work in close coordination with their USAID HIV Medical Transmission Prevention counterpart and directly provide quality assurance and program monitoring to HHS supported implementing partners with Injection Safety activities: University of Maryland-ACTION, Harvard SPH-APIN, Columbia University, SPH-ICAP, and Catholic Relief Services-AIDSRelief, and Safe Blood for Africa Foundation as well as to USAID-supported partners and the DoD program. The program officer for biomedical transmission provides technical and programmatic support to the USG partners in the areas of safe injection, blood safety, and generalized health care waste management. The program officer's responsibilities include: 1) representing the USG in technical discussions with the GON with guidance from the Senior Prevention Manager, 2) overseeing technical aspects of the program, including program management and oversight of partners to ensure high-quality and accountable programs, 3) interfacing with OGAC technical working groups, and 4) interfacing with the USG/Nigeria prevention team.

These HHS/CDC and USAID HIV Medical Transmission staff members provide technical support and capacity development to new partners selected through RFAs, the New Partner Initiative and to the Government of Nigeria at the national and state levels to promote Nigeria national guidelines related to injection safety. Technical assistance through the HIV Medical Transmission TWG will be provided as needed to all USG partners with Safe Injection activities. Under this activity the staff member will provide direct or indirect monitoring and support to over 700 Emergency Plan supported sites with injection safety activities in COP09.

ICASS and CSCS charges related to this position are funded under M&S in compliance with COP09 guidance.

Continued...
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY NARRATIVE:
The SCMS objective is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers not only the procurement but also the shipment, distribution and delivery of injection safety related commodities as well as other supply chain management related activities. It also covers technical assistance (TA) and system strengthening (SS) activities provided to PEPFAR partners to strengthen or build their supply chain management capacity within their respective programs.

In COP09, SCMS will procure safe injection equipments (including injection devices and safety boxes) and health care waste management equipments such as personal protective gear and incinerators for implementing partners including the Department of Defense (DOD). Through its continuous support to and strengthening of commodity security in PEPFAR programs, SCMS works toward ensuring uninterrupted availability of needed commodities for safe injection practices and adequate disposal of medical wastes to avoid the medical transmission of HIV to health workers and patients working in or attending health care facilities providing HIV/AIDS services, thus ultimately targeting the general population.

The present budget will cover the cost of commodities as well as logistical and administrative services from the field office for the coordination and management of the procurements undertaken by SCMS in this area. SCMS will support the IPs (IHVN, HARVARD, GHAIN, CRS-AR, ICAP and DoD) in the following areas of the supply chain cycle: product selection in accordance with the Federal Government of Nigeria’s (GON) national injection safety and healthcare waste management guidelines, marketing authorization status (NAFDAC registration) and GON importation regulation. SCMS will also be responsible for ensuring that commodities procured meet eligibility criteria under the USG acquisition rules and regulations including source and origin waivers and approvals by the US Food and Drug Administration or other relevant stringent drug regulatory authorities.

SCMS will assist in quantification and forecasting of requirements and will support the development of long term supply plans (considering in country stocks and anticipated consumption rates) for stock management and delivery planning.

SCMS will identify suitable sources of supply both internationally and nationally. SCMS will work with IPs in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and/or associated services (i.e. maintenance service).

SCMS will coordinate with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by NAFDAC, SCMS will make suitable recommendations including waiver applications where appropriate. SCMS will take the lead to communicate with manufacturers on registration gaps in Nigeria.

SCMS procurement leverages global spend to provide best value and offers clients certainty of competitive prices and international quality standards. SCMS procurement strategy is articulated around buying generics whenever possible, pooling procurement for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries and negotiating long term contracts with suppliers. All implementing partners and DoD requests for injection safety related commodities will be addressed to and coordinated with SCMS field office directly, in line with the funds placed in this program area for this purpose. In addition to the $110,000 placed for general use, SCMS will also be responsible for DOD’s allocation of an additional $10,000 for support of their particular activities.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry as required. SCMS will take the lead and further streamline the customs clearance process as appropriate including management of the CC1, CC2 or CC3 duty exemption forms. SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Where appropriate, commodities procured and imported by SCMS will be supplied through the SCMS Regional Distribution Center (RDC) in Ghana. The warehousing of commodities in the RDC is a critical component of the SCMS technical solution. The use of RDCs will significantly reduce lead times and provide an important buffer between the supply from manufacturers and demands from the PEPFAR programs in Nigeria. The RDC also ensure that shipment quantities do not overwhelm their recipients in country, an increasing challenge in the context of program scale up. The RDC concept also brings an increased flexibility in stock management thus reducing risk of stock obsolescence or need for emergency replenishments, resulting in important savings. Finally, the RDC approach serves regional and national sustainability, as the RDC is designed to be a commercially viable entity, available to other health (and non-health) programs, whose benefit will last beyond SCMS. Where possible and appropriate, SCMS will road freight from the RDC Ghana to Abuja, a mode of delivery that will provide significant savings over airfreight.

Delivery arrangements will be negotiated with the partners; SCMS will either deliver to a central location or to point of services as needed. When local warehousing is needed SCMS will continue to explore viable options make use of its recently acquired cross-docking facility and the long term warehouse facility (which will be acquired in COP 09). For in country distribution where necessary, SCMS will competitively source for and utilize the service of an efficient and safe in-country courier services operator.

SCMS will also assist the partners to monitor/report on stock levels and usage through the deployment of Pipeline databases. SCMS provides TA and SS services in all areas of the supply chain including product selection, quantification & forecasting, supply planning, procurement, warehousing, customs clearance and delivery. In COP09, SCMS will provide TA and SS services to the partners including the training of staff in the use of the ProQ or Quantimed forecasting and Pipeline supply planning tools. SCMS will continue to provide TA and SS services them based on the recommendations that came out of a supply chain system’s
Activity Narrative: assessment carried out in COP07.

SCMS will provide the USG team with regular reports on supplies and equipments as well as monthly financial reports. In COP 09, Supply Chain Support Teams (to be made up of technical SCMS staff and GoN or IP staff as appropriate) will be constituted by SCMS to work with the IPs in providing their trained logisticians with the capacity to monitor and support the performance of the supply chains at various levels. Using standardized indicators of logistics performance, the SCSTs will track performance of the supply chains and together, act as an early warning system to identify impending or imminent supply chain breakdowns and act to forestall these. By developing methodologies and tools for conducting these activities, SCMS will work with GoN and IPs to establish and institutionalize this activity thereby building the capacity to identify these problems and resolve them before service delivery is compromised. In addition, an automated web based procurement tracking database will ensure that the USG team and IPs have adequate visibility on SCMS procurement status by providing an easy access to accurate and up to date information on procurement.

Under this program area, SCMS does not have targets of its own but supports all the participating partners including DoD in reaching their prevention planned targets.

EMPHASIS AREA:
Institutional capacity development

Early Funding Narrative (if early funding needed, justify here; must be less than 1,000 characters, including spaces)

ACTIVITY NARRATIVE:
The SCMS activity is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers not only the procurement but also the shipment, distribution and delivery of injection safety related commodities as well as other supply chain management related activities. It also covers technical assistance (TA) and system strengthening (SS) activities provided to PEPFAR partners to strengthen or build their supply chain management capacity within their respective programs.

In COP08, SCMS will procure safe injection equipments such as injection devices and safety boxes as well as health care waste management equipments such as personal protective gear for the Department of Defense (DOD). Through its continuous support to and strengthening of commodity security in PEPFAR programs, SCMS works towards ensuring uninterrupted availability of needed commodities for safe injection practices and adequate disposal of medical wastes to avoid the medical transmission of HIV to health workers and patients working in or attending health care facilities providing HIV/AIDS services, thus ultimately targeting the general population.

The present budget will cover the cost of commodities as well as logistical and administrative services from the field office for the coordination and management of the procurements undertaken by SCMS. SCMS will support the DoD in the following areas of the supply chain cycle: product selection in accordance with the Federal Government of Nigeria’s (FGON) national injection safety and healthcare waste management guidelines, marketing authorization status (NAFDAC registration) and FGON importation regulation. SCMS will also be responsible for ensuring that commodities procured meet eligibility criteria under the USG acquisition rules and regulations including source and origin waivers and approvals by the US Food and Drug Administration or other relevant drug regulatory authorities. SCMS will assist in quantification and forecasting of requirements and will support the development of long term supply plans for stock management and delivery planning.

SCMS will identify suitable sources of supply both internationally and nationally. SCMS will work with IPs in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and/or associated services (i.e. maintenance service).

SCMS will work with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by NAFDAC, SCMS will make suitable recommendations including waiver applications where appropriate. SCMS will take the lead to communicate with manufacturers on registration gaps in Nigeria.

SCMS procurement leverages global spend to provide best value and offers clients certainty of competitive prices and international quality standards. SCMS procurement strategy is articulated around buying generics whenever possible, pooling procurement for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries and negotiating long term contracts with suppliers. The DoD’s requests for injection safety related commodities will be addressed to and coordinated with SCMS field office directly.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry as required. SCMS will take the lead and further streamline the customs clearance process as appropriate including management of the CC1 duty exemption form. SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Delivery arrangements will be determined with the DoD; SCMS will either deliver to a central location or to point of services as needed based on DOD’s programmatic needs.

SCMS will also assist in the monitoring of stock levels and usage through the deployment of Pipeline databases.

SCMS provides TA and SS services in all areas of the supply chain including product selection,
Activity Narrative: quantification & forecasting, supply planning, procurement, warehousing, customs clearance and delivery. SCMS will provide the USG team with regular reports on supplies and equipments as well as monthly financial reports. In addition, an automated web based procurement tracking database will ensure that the USG team and DOD have adequate visibility on SCMS procurement status by providing an easy access to accurate and up to date information on procurement.

Under this program area, SCMS does not have targets of its own but supports DoD reaching their prevention planned targets.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
Overall, SCMS activity contributes to the PEPFAR goal to avert 7 million infections worldwide by procuring and distributing high quality, low cost as well as providing TA and SS to improve existing supply chains and build capacity where needed. SCMS’ activities will contribute to enable the scale up of HIV/AIDS prevention PEPFAR programs in Nigeria to reach national targets of preventing 1,145,545 new infections thus supporting PEPFAR efforts to reduce the impact of HIV/AIDS in Nigeria. SCMS TA and SS activities will build supply chain management capacity as well as strengthen supply chain systems and their operation within the various PEPFAR programs thus contributing to the sustainability of the HIV/AIDS services in Nigeria.

LINKS TO OTHER ACTIVITIES:
Related SCMS activities in other program areas include: PMTCT (#9748.08), AB (#16919.08), Blood safety (#14085.08, #9773.08), Condoms and other prevention activities (#9784.08), Basic health care and support (#9842.08), TB/HIV (#9878.08), Orphans and vulnerable children (#9883.08), Counseling and testing (#6643.08), ARV drugs (#6402.08) and Laboratory infrastructure (#9894.08). Logistics system strengthening efforts will be linked with policy (#5300.08) and strategic information (#6661.08) activities.

Table 3.3.05: Activities by Funding Mechanism

Mechanism ID: 3681.09  
Mechanism: USAID Track 2.0 Safe Injections
Prime Partner: To Be Determined  
USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)  
Program Area: Biomedical Prevention: Injection Safety
Budget Code: HMIN
Activity ID: 26167.09
Activity System ID: 26167
Planned Funds: 
Program Budget Code: 05

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The significant change in MMIS activity from COP08 to COP09 is the expansion strategy to selected sites as directed by USG and GON with inclusion of phlebotomy activities. This will entail implementation of injection safety practices at sites supported by other USG Implementing Partners (IPs) in addition to sites supported by JSI/MMIS only, the Government of Nigeria (GON), faith-based and other private health facilities. MMIS’ support to USG IPs will include IS training and coordination of all USG sites while supplying a limited stock of safe injection commodities and guidance on external procurements of injection safety commodities through alternative procurement systems. Waste management strategies will cover only non-USG sites after training completion. MMIS will also support setting up of support supervision system at sites level.

Making Medical Injection Safer (MMIS) had implemented Injection Safety (IS) programs in five states (Anambra, Edo, Cross River, Lagos, Kano) and the Federal Capital Territory (FCT) since 2004 and individual USG and GON health facilities across another fourteen states (Bauchi, Benue, Nassarawa, Niger, Plateau, Kwara, Ogun, Borno, Delta, Enugu, Kaduna, Katsina, Kebbi and Oyo States) during the FY08. By the end of COP 08, MMIS would have trained a total number of 25,226 health care workers and 10,743 waste handlers. In COP09, MMIS will be conducting injection safety activities primarily in the 5 focal states and FCT. Technical assistance will be provided to other PEPFAR Implementing Partner (IP) supported sites through new and refresher trainings for initial sites and supportive supervision of trainers, health workers, store keepers, and waste handlers. In COP 09, MMIS will expand to 30 new sites in a total of four States.

MMIS will continue to implement in the four major technical areas: human and institutional capacity building; behavioral change of healthcare personnel to promote safe injection practices and the communities to promote oral medication where possible; ensure availability of equipment and supplies; and appropriate healthcare waste management at the 789 previously supported health facilities. In addition MMIS will extend its activities to 30 public health facilities through ad hoc partnership with corresponding IPs and the Government of Nigeria. In COP09, MMIS will provide Injection Safety (IS) training to a total of 5,000 individuals using FMOH adapted WHOAFRO/JSI training curriculum. A training of trainers on supportive supervision will be provided for all IP injection safety staff to enable them to consolidate the gains of the training and ensure behavioral change at implementing sites. All IPs will be encouraged to advocate for and support infection prevention committees at facility levels.

Advocacy and behavior change communication (BCC) efforts include periodic advocacy meetings with policy makers at all levels of healthcare management and dissemination of BCC materials, tools, job aids, posters, and pamphlets to healthcare providers. MMIS will also promote safe injection practices, and oral medication to reduce unnecessary demand for injections. Community outreach activities are expected to foster community engagement on issues of health with emphasis on injection safety issues as it affects communities in Nigeria. In COP08, MMIS trained field staff of the NOA to deliver appropriate injection safety messaging to grassroots organizations. This activity will continue in COP09. MMIS will work to maintain grassroots coalitions and encourage those coalitions to advocate on issues of injection safety with focus on the reduction of the demand for unnecessary injections, ensuring the safety of all necessary injections, and proper healthcare waste management to the relevant health authorities and government.

MMIS will continue to work towards commodity security. MMIS will procure limited stocks of IS commodities such as injection devices and safety boxes through her sub-contractor, PATH (Program for Appropriate Technology). Commodities will be stored at the Government Central Medical Store in Oshodi (Lagos) and distributed by the USAID accredited courier distribution company, SDV, to the focal GON Stores. MMIS will continue to use its tracking system to collect data on consumption and stock levels along the supply chain.

MMIS will support healthcare waste management through provision of seed waste segregation commodities, building infectious waste pits, and encouraging the building of incinerators or use of encapsulation in rural areas for appropriate final disposal options in accordance with WHO standards. We will also support the repair and construction of existing incinerators and provide funds for operation and maintenance whenever possible and where applicable. MMIS will work through the Federal Ministry of Environment and the National Prevention Technical Working Group with other partners to map out the Health Care Waste Management (HCWM) micro-plan for selected health facility sites, and to adapt the national HCWM Plan’s policies and guidelines at the lowest service delivery points. MMIS will facilitate and guide the procurement of injection safe MMC commodities through sub-contractors. All IPs are encouraged to plan for sustainability of the program in their sites.

MMIS will continue to work with the Federal Ministry of Health (FMOH) and other major stakeholders (such as the Nursing and Midwifery Council of Nigeria and Medical and Dental Council of Nigeria). MMIS will also work with training health institutions, such as medical, dental, pharmacy, nursing and midwifery schools and schools of health technology, to review, include, and update safe injection issues in their various curricula. In addition, injection safety training will be part of the continuous medical education taking place at supported sites mentioned above (old or new). A training package for new entrance health workers into the healthcare system has been developed and will be used to reach newly employed health care workers after completion of site trainings.

The National Policy on Injection Safety and Health Care Waste Management will continue to be disseminated widely in COP09. MMIS will perform quarterly monitoring of all sites, including GON and USG supported sites, using the MMIS tools. State MOH and other PEPFAR IPs will participate at state level.
Activity Narrative: meetings to give feedback for service delivery quality improvement.

CONTRIBUTION TO OVERALL PROGRAM AREA.
As MMIS plans to extend coverage to some sites supported by other USG IPs, this integrated HIV/AIDS programming will improve collaboration amongst partners, will maximize the impact, and will contribute to the prevention of 1,145,545 new HIV infections in Nigeria. This will also improve the equity in access to HIV prevention services to the communities most in need, both rural and urban, by reducing the risk of transmission to the community as well as to health care workers. These activities would contribute substantively to NACA’s National HIV Prevention Plan implementation develop strong links between MMIS services and other service providers, such as PEPFAR IPs, National Primary Health Care Development Agency (NPHCDA), UNICEF, the World Bank, WHO, and other organizations working on HIV/AIDS issues. Improved safety in the work environment and implementation of universal precautions among health providers will lead to higher quality of health services and reduction in stigma/discrimination towards PLWHA.

LINKS TO OTHER ACTIVITIES
This activity also relates to activities in HIV Counseling and Testing, Laboratory, Palliative Care, TB/HIV, ART Services and OVC. Health care workers involved in these programs will benefit from the training program in injection safety and the adoption of utilization of single-use syringe and needles, needle stick policy and PEP protocol, all of which will improve the safety for workers involved in these other programmatic activities.

POPULATIONS BEING TARGETED
Targeted population include healthcare workers at focal health facilities; doctors, nurses, pharmacists, laboratory scientists, phlebotomists, community health officers, environmental health officers, store keepers and waste handlers. Religious and community leaders, community-based organizations are also targeted within the communities. In addition, heads of service and administrators need to be aware of the policies put in place to control medical transmission of HIV. Government policy makers, line ministries and National AIDS control program staff are also targeted for advocacy to leverage policy decisions, national guidelines and sustainability issues. Furthermore, these activities will indirectly target the general population on the community outreach program, who will be provided with information on safer injection practices, which are designed to prevent transmission of HIV and promote oral medications.

KEY LEGISLATIVE ISSUES ADDRESSED
Stigma and discrimination also occur in healthcare settings, and this has been reported in Nigeria. As HIV/AIDS treatment and care programs have been expanded, the training of all levels of healthcare providers on universal precautions and the risks of medical transmission have helped reduce the stigma and discrimination that can occur in these settings due to fear of occupational hazard.

EMPHASIS AREAS
Through these activities, major emphasis is placed on training of staff and institutional capacity development. This program will provide the basis for a workplace program through professional medical associations that will ensure that all treatment and laboratory specimens are handled safely, with minimal risk to healthcare providers. Minor emphasis includes policy and guidelines, information, education and communication, commodities procurement and quality assurance, quality improvement and supportive supervision.

ACTIVITY DESCRIPTION:
In Nigeria today, only a small percentage of single use disposable syringes are available for use at health care services centers. This creates a threat of HIV/AIDS transmission through the reuse of syringes which may contain trace quantities of infected blood or through the risk of needle stick. In order to eliminate this threat, the Government of Nigeria has set a mandate for 100% single use autodisposable syringe adoption by mid-2009. It is anticipated that the majority of these will be produced domestically by current syringe manufacturers.

Nigeria currently consumes approximately 600 million syringes per year. The major procurers of syringes in Nigeria include the Ministry of Health, World Health Organization, UNICEF, and teaching hospitals. With the Government of Nigeria behind the conversion, it is anticipated that each of these institutions will begin procuring only single use disposable syringes. There is also unmet demand in the West Africa region.

Major supplies of syringes to Nigeria come from abroad. There are two sites currently producing single use disposable syringes in Nigeria. The first is in Calabar and has a maximum capacity of 90 million annually. The plan for this facility is to scale up to 160 million in the near future. The second site is in Port Harcourt and will be completed soon. It will have a capacity of 150 million annually, with plans for expansion to up to 350 million in the near future. These two facilities alone could be producing over 500 million by 2009.

This program aims to facilitate a comprehensive assessment of potentials for domestic production of autodisposable syringes. This assessment will determine demand and supply for single use disposable syringes in 2009 and afterwards; assess the financial viability and competitiveness of domestic syringe production; analyze the barriers to increased domestic production of syringes (financial, technical assistance, risk, etc.); and understand the points of leverage where donor money can facilitate greater production of quality, single use disposable syringes through the cultivation of public-private partnerships.

Upon completion of this assessment, USAID’s PEPFAR team, in partnership with local manufacturers, banks, and procuring organizations, will design an intervention aimed at meeting the Government of Nigeria’s mandate. Possible solutions include: the establishment of a credit guarantee program through USAID’s Development Credit Authority (DCA) to facilitate financing for the procurement of necessary manufacturing equipment; the leveraging of contacts from the Foreign Commercial Service to link local manufacturers with equipment manufacturers in the US willing to provide credit, technical assistance, and
Activity Narrative: design services directly; the facilitation of advance contracts to secure orders for future production; increased private sector investment for renovation and expansion of current facilities matched with the provision of technical assistance; and increased private sector investment matched with awareness campaigns intending to encourage increased use of single use disposable syringes.

CONTRIBUTION TO OVERALL PROGRAM AREA.
This program will inform the design of any PEPFAR-supported intervention and will enable PEPFAR Nigeria to contribute to the overcoming of existing barriers which discourage the private sector from meeting future demand for single use disposable syringes. It would also contribute substantively to NACA’s 5-year Strategy Framework implementation and contribute to the prevention of 1,145,545 new HIV infections by 2010 in line with the PEPFAR global achievement of the 2,7,10 goals.

LINKS TO OTHER ACTIVITIES
This activity also relates to activities in HIV Counseling and Testing, Laboratory, Palliative Care, TB/HIV, ART Services, Blood Safety and OVC and the adoption of utilization of single syringe and needle stick policy of GON, all which are aimed at improving the safety for workers involved in these other programmatic activities.

EMPHASIS AREAS
Major emphasis is placed on public – private partnership development for Domestic Production of Disposable Syringe.

| USG Agency: | U.S. Agency for International Development |
| Program Area: | Biomedical Prevention: Injection Safety |
| Program Budget Code: | 05 |
| Planned Funds: |  |
Activity Narrative: This activity has been modified in the following ways:

In COP 09, the increased funds for this activity will go toward the credit guarantee for the identified indigenous producers of autodisable syringes. Following an initial assessment of capacity for local production of injection safety products, results of the evaluation/assessment will further inform programming efforts. Sustainability plans will include increasing efforts at public/private partnership for health care waste management and involvement of private health practitioners in injection safety programs within each Local Government Area where public facilities have instituted injection safety programs.

The USAID PEPFAR team will intensify efforts on creating an enabling environment for the use of retractable syringes and the production and utilization of waste boxes. The emphasis will be on entrenchment of the national injection safety policy into law, integration of policy into the national health plan, and the implementation of the policy at facility levels. Efforts will be made to ensure constant and continuous supply of injection safety commodities (retractable needles and syringes, safety boxes, context appropriate incinerators or other waste management systems) to all injection safety program sites in Nigeria through ongoing collaborative logistics system efforts with GON.

Activity Description:

In Nigeria today, only a small percentage of single use disposable syringes are available for use at health care services centers. This creates a threat of HIV/AIDS transmission through the reuse of syringes which may contain trace quantities of infected blood or through the risk of needle stick. In order to eliminate this threat, the Government of Nigeria has set a mandate for 100% single use autodisable disposable syringe adoption by mid-2009. It is anticipated that the majority of these will be produced domestically by current syringe manufacturers.

Nigeria currently consumes approximately 600 million syringes per year. The major procurers of syringes in Nigeria include the Ministry of Health, World Health Organization, UNICEF, and teaching hospitals. With the Government of Nigeria behind the conversion, it is anticipated that each of these institutions will begin procuring only single use disposable syringes. There is also unmet demand in the West Africa region.

Major supplies of syringes to Nigeria come from abroad. There are two sites currently producing single use disposable syringes in Nigeria. The first is in Calabar and has a maximum capacity of 90 million annually. The plan for this facility is to scale up to 160 million in the near future. The second site is in Port Harcourt and will be completed soon. It will have a capacity of 150 million with the goal of scaling up to 350 million in the near future. These two facilities alone could be producing over 500 million by 2009.

While the potential for significant manufacturing of single use disposable syringes is evident, the plans for scaling up are tenuous and yet to be proven commercially viable. Supply and demand assessments based on limited information are not reliable. Without reliable information, any intervention would be risky, unlikely to achieve the desired result of increased domestic production of single use disposable syringes, even potentially hindering future developments that would occur naturally through private sector investment.

This program aims to facilitate a comprehensive assessment of potentials for domestic production of autodisable syringes. This assessment will determine demand and supply for single use disposable syringes in 2009 and afterwards; assess the financial viability and competitiveness of domestic syringe production; analyze the barriers to increased domestic production of syringes (financial, technical assistance, risk, etc); and understand the points of leverage where donor money can facilitate greater production of quality, single use disposable syringes through the cultivation of public-private partnerships.

Upon completion of this assessment, USAID’s PEPFAR team, in partnership with local manufacturers, banks, and procuring organizations, will design an intervention aimed at meeting the Government of Nigeria’s mandate. Possible solutions include: the establishment of a credit guarantee program through USAID’s Development Credit Authority (DCA) to facilitate financing for the procurement of necessary manufacturing equipment; the leveraging of contacts from the Foreign Commercial Service to link local manufacturers with equipment manufacturers in the US willing to provide credit, technical assistance, and design services directly; the facilitation of advance contracts to secure orders for future production; increased private sector investment for renovation and expansion of current facilities matched with the provision of technical assistance; and increased private sector investment matched with awareness campaigns intending to encourage increased use of single use disposable syringes.

Contribution to Overall Program Area.

This program through its comprehensive assessment effort will inform the design of any PEPFAR-supported intervention and will enable PEPFAR Nigeria to contribute to the overcoming of existing barriers which discourage the private sector from meeting future demand for single use disposable syringes. It would also contribute substantively to NACA’s 5-year Strategy Framework implementation and contribute to the prevention of 1,145,545 new HIV infections by 2010 in line with the PEPFAR global achievement of the 2,7,10 goals.

Links to Other Activities

This activity also relates to activities in HIV Counseling and Testing, Laboratory, Palliative Care, TB/HIV, ART Services, Blood Safety and OVC and the adoption of utilization of single syringe and needle stick policy of GON, all which are aimed at improving the safety for workers involved in these other programmatic activities.

Emphasis Areas

Through these activities, major emphasis is placed on public – private partnership development for Domestic Production of Disposable Syringe.
Continuing Activity: 16925

- **USG Agency:** HHS/Centers for Disease Control & Prevention
- **Program Area:** Biomedical Prevention: Injection Safety
- **Program Budget Code:** 05
- **Planned Funds:** $50,000
**Activity Narrative:** ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP09, ICAP will promote biomedical prevention through the promotion of safe injections, directly targeting health care workers at ICAP supported facilities. Specifically, ICAP will emphasize training to build human capacity in safe injections and promote commensurate behavior change through IEC; institute safe injection, provision of commodities, increase community awareness, and strategic linkages with other partners and initiatives like the Making Medical Injections Safer (MMIS) project. ICAP will also collaborate with MMIS to support the government in the development and implementation of health care waste management policy.

While injection is a necessary mode of providing treatment, contraception and immunization, contaminated injections add to the burden of illness. Reused syringes and needles, lack of sterilization, suboptimal collection and disposal of used needles as well as lack of training or standards of procedures lead to the exposure to HIV and other blood borne pathogens.

As a response and in consultation with the Federal Ministry of Health (FMOH) and MMIS, ICAP has implemented the Safe Injection Global Network (SIGN) strategy, an infection prevention strategy to reduce HIV transmission through unsafe injections. In COP08, ICAP supported injection safety in the context of infection prevention and control services at 28 hospital networks in the 6 states of Kaduna, Cross River, Benue, Gombe, Kogi and Akwa Ibom. Injection prevention practices were enhanced and universal precautions were introduced. By the end of COP08, 900 health care providers will be trained on injection safety, including general aspects of universal safety procedures and health care waste management, while advocacy and BCC activities on safe injection are conducted amongst health care workers to enable adoption of safer workplace behaviors.

ICAP in COP09 will continue to focus on these strategies to effect change in injection practices. These include: training to build the capacity of health care providers to provide safe injections advocacy and behavior change communication (BCC) to promote safe injections; improving health care waste management; implementing universal safety precautions, and providing commodities necessary for safe injection and waste disposal.

Training to build human capacity and effect behavior change: Training will be based on the National Training manual adapted from WHO Do-No-Harm curriculum. Trainers trained in COP08 by MMIS have conducted step down trainings. The training focused on safety standards of safe injections procedures, behavior change to prevent unsafe and overuse of injections, consistent practice of universal precautions, and appropriate health care waste management.

In COP09, 100 health care providers from two new health facilities will be trained on infection control in the context of injection safety to enable them adopt safer workplace behaviors. Refresher/update trainings will be conducted for 280 staff across the 28 existing sites.

ICAP will also continue to promote and facilitate behavioral change amongst health workers through supportive supervision, distribution of communication materials (leaflets, posters, reference guides) on safer injection practices, and support to the FMOH to adopt a national health care waste management plan in collaboration with JSI/MMIS. This will also address stigma and discrimination issues that are often generated by fear among health care providers. Behavior change communication activities will facilitate the adoption of safe injection practices among health care providers.

Improve health care waste management: In COP09, ICAP will focus on promoting effective waste management in 30 (28 existing and 2 new) comprehensive secondary health facilities across the 6 states namely, Kaduna, Cross River, Benue, Gombe, Kogi and Akwa Ibom. ICAP will implement these activities by partnering with a local non-governmental organization, HIV/AIDS Restoring Hope and Life (HARHL) Trust. This local NGO has extensive experience in responding to health sector program needs including issues of safe injection, universal safety precautions, and safe blood. In addition, this organization will assist the sites to develop and implement appropriate work plans and policies using the SIGN strategy for ensuring injection safety.

Provide commodities: ICAP will procure color-coded bin liners for segregation of infectious waste and personal protective equipment (i.e. disposable surgical gloves, disposable syringes, respiratory masks and gowns) for these sites. ICAP will also support proper waste management by repairing incinerators in selected sites based on need.

**CONTRIBUTIONS TO OVERALL PROGRAM AREA:**

These activities will contribute to the overall Emergency Plan for prevention of new infections by promoting injection safety. It will also reduce exposure of health care workers to occupational hazards in the supported health services. ICAP will also support effective waste disposal through the repair/purchase of incinerators in need based selected health facilities.

**LINKS TO OTHER ACTIVITIES:**

This activity is closely linked to activities in ART, Palliative Care, OVC, HCT, Lab, and PMTCT to ensure that health workers under all these areas adhere to principles of safe injection and universal precautions. With the linkage to Lab, lab-based activities will support injection safety activities at all ICAP supported sites through training, supervision, equipment maintenance and supplies.

Program Area Narrative:

It is estimated that over 3 million people are infected with HIV in Nigeria. The Nigerian PEPFAR 5-year goal for care and treatment is to reach 1,750,000 people infected by HIV/AIDS with care services and place 350,000 people living with HIV/AIDS (PLWHA) on antiretroviral therapy (ART) by 2009. At the end of COP07, USG/Nigeria had provided care services (excluding TB services) to 269,506 PLWHA and treated 149,091 clients. In COP09, USG/Nigeria partners will provide care and support services to 486,951 adult and 40,187 pediatric clients, and an additional 220,000 people affected by AIDS (55.4% of the 5-year goal). In COP09, PEPFAR implementing partners (IPs) will provide ART services to 269,843 adult clients and 29768 pediatric clients (85.6% of our 5-year goal) at 372 tertiary, secondary, and primary level service delivery sites in 36 States and the Federal Capital Territory (FCT).

USG PEPFAR/Nigeria has increased access to care and treatment for PLWHA, incorporated “prevention with positives” (PwP) services at various service points, and ensured that enrolled clients receive the basic care package. Some IPs are decentralizing services to lower levels of care and improving service provision in the communities, in collaboration with community institutions/structures. In previous COP years, the USG PEPFAR and Government of Nigeria (GoN) Adult Care & Treatment program have concentrated services in the tertiary and secondary levels of care. This has resulted in overburden of these levels of care. In addition, the network, referral and linkage systems, though improving, are still weak and the existing infrastructure and capacity of the health system are inadequate. Less emphasis has been placed on pre-ART care services and programming, which as a low cost per target, and results in high attrition rate.

In COP09, the USG/Nigeria PEPFAR Adult Care and Treatment program will reach targets for the country by (1) continuing the decentralization of care and treatment to Primary Health Care (PHC) levels using the “Hub and Spoke” model developed in collaboration with GON; (2) improving quality of care and treatment services using HIV/QUAL and other quality improvement and assurance (Qi/QA) systems; (3) enhancing networking and referral mechanisms, including patient tracking; (4) supporting task-shifting policy development and implementation, (5) further strengthening linkages between adult and pediatric care and treatment, PMTCT, and OVC programs, nutritional services, and support groups; (6) expanding strategic integration of HIV/AIDS care and treatment services into the routine and existing health systems such that it is beneficial to all patients, including non-HIV infected clients patronizing the health facilities; (7) supporting programming for pre-ART clients aimed at improving retention in care; and (8) promoting health systems strengthening (HSS) activities. These are priority activities and strategies for the Adult Care and Treatment program area in COP09.

The USG/Nigeria Adult Care and Treatment program is comprised of facility-based and Community/Home Based Care (CHBC) activities for HIV-infected adults and people affected by AIDS aimed at extending and optimizing quality of life for HIV-infected individuals from diagnosis through illness. Program activities include the provision of clinical, psychological, social, economic, spiritual, and prevention services. Ensuring continuity of care is a goal of the adult care and treatment program and will require attention to priority areas that include: PwP; nutrition care; pain management and palliative care; procurement and distribution of ARV drugs and Cotrimoxazole (CTX) prophylaxis, early referral and retention in care and treatment; monitoring, reporting, and program evaluation of activities; quality of care and treatment services assurance; task-shifting (i.e., training and deployment of additional categories of care providers to provide care and treatment); centralized procurement mechanism; and strategic geographic concentration of partners’ activities.

ART eligible clients are placed on a first line regimen (2 Nucleoside Reverse Transcriptase Inhibitors [NRTIs] + 1 Non-Nucleoside Reverse Transcriptase Inhibitor [NNRTI], specifically Lamivudine [3TC], Azidothymidine [AZT], and Nevirapine/Efavirenz [NVP/EFV] with alternative of Stavudine [D4T], 3TC, and Tenofovir [TDF]) as outlined in the National ART guidelines, except as otherwise indicated. Through CHBC, USG/Nigeria will continue to emphasize ART adherence in the home setting through education and addressing adherence barriers, utilizing volunteers, peers and buddy systems and pill boxes as reminders for effective drug adherence. In order to strengthen HIV-TB programs, all care and treatment sites are co-locating with TB-DOTS (Directly Observed Treatment Short-course for the tuberculosis) programs. Where co-location is not possible, effective linkages will be facilitated to encourage implementation of the “three Is”; Intensified Case Finding, Infection Control, and Isoniazid Preventive Therapy.

Service provision data are collected by the use of National Patient Management and Monitoring (PMM) forms and ART cards. Most partners have in place electronic systems for information collection and analysis. These databases improve efficiency in service provision including tracking early or missed appointments. Despite a lack of a national task-shifting policy, facilities are
training nurses to triage patients and prioritize access to physician care. Attention is also being paid to ensuring a more manageable physician-to-patient ratio at facilities with secondary and tertiary facilities graduating stable patients to lower level facilities.

Psychological support includes group and individual counseling and culturally-appropriate end-of-life care, bereavement services and effective adherence education and counseling. Spiritual care addresses the major life events that cause people to question their purpose and meaning in life. The interventions are culturally sensitive and include a life review and assessment, involving clergy and spiritual leaders. Social care assists individuals and family members maintain linkages to various social services, including community-based support groups, stigma reduction activities, training and support of caregivers, transportation support, economic empowerment, food support, and/or legal assistance. Prevention services, including Prevention with Positives (PwP), are designed to prevent transmission of HIV to others, as well as protect PLWHAs from re-infection with HIV or infection with other STIs. Existing CHBC teams comprised of health care workers, community volunteers, including PLWHAs, have sufficient skill sets to provide the range of facility, community and home care services. CHBC services are linked to facility services through a coordinated network and referral systems.

The minimum care package of services provided to each PLWHA includes clinical care with a basic care kit and two supportive services delivered at the facility and CHBC levels in accordance with the National ART and Palliative Care Guidelines. Service providers keep records of services offered to clients, while the USG Care & Treatment team conducts supportive supervisory site visits to monitor and evaluate these services periodically. USG PEPFAR/Nigeria will in collaboration with GoN and other stakeholders (Nigeria Medical council, Nursing council, Laboratory council etc) to develop a policy on task shifting allowing other trained cadres of health care workers to provide care, and particularly, treatment to clients.

USG/Nigeria in COP09 will continue close linkages with Global Fund Initiatives. To ensure adequate and appropriate geographic and epidemiologic coverage and retention, USG/Nigeria partners are encouraged to do state expansion where they have a comparative advantage, as we move into the phase of reaching out to Primary Health Care levels to improve access to care.

USG/Nigeria will continue provider initiated testing of inpatients in hospital wards, pregnant women, TB patients, and STI patients as a part of the counseling and testing strategy to improve enrollment and access to care. All ineligible clients for ART will be enrolled in HIV care and wellness programs for regular periodic follow-up and to identify change in ART eligibility status. Linkage of adult programs to OVC programs will be established so that children of enrolled PLWHAs are able to access OVC services in the communities. Strengthening of the support group programs through restructuring of activities and reaching out to non-ART eligible individuals, will further ensure retention of pre-ART clients in care. USG/Nigeria PEPFAR program already has in place “pre-ART” registers for monitoring these Non ART Eligible patients. The care and treatment program also seeks to increase gender equity in programming through counseling and educational messages targeted at vulnerable women and girls. Through gender-sensitive programming and improved quality services, the program will contribute to the reduction in HIV/AIDS stigma and discrimination, and address male norms and behaviors by encouraging men to contribute to care and support in their families.

USG/Nigeria employs point persons for supply chain management, including ARV drugs. These individuals work with implementing partners to keep track of ARV drugs for all USG/Nigeria partners and the GON to ensure adequate stock and maintenance of ARV drugs, supplies, and other commodities. USG/Nigeria also supports strengthening National procurement and distribution systems by investment into the Supply Chain Management System (SCMS) managed by Partnership for Supply Chain Management. This implementing partner serves to provide technical assistance in procurement plans and capacity building of in-country procurement and logistics staff. SCMS will work with the USG Procurement & Logistic team to train implementing partners and site counterparts in drug forecasting and management. USG will utilize SCMS for care commodities, OIs and ARV drug procurement as SCMS increases its services in Nigeria. USG/Nigeria will work closely with GON and the Global Fund to harmonize and institute a nationwide supply chain and logistics management system that will not only cater to ART drugs, but will increase efficiency and effectiveness of distribution of other commodities and supplies, such as OI drugs and Basic Care Kits.

USG/Nigeria will continue to partner with the Clinton Foundation and the Global Fund to utilize opportunities to reduce costs. USG/Nigeria will continue to work towards sustainability by supporting renovation of physical infrastructure, improving laboratory support systems, and ensuring community involvement and ownership of programs. USG/Nigeria will also participate in and support the harmonization process led by GON that is in line with “one national program at all levels”. It will also participate in building the capacity of health care providers as well as facilitate private partnerships with organizations, such as ExxonMobil and Accordia, to increase patient access to care and treatment services. To further strengthen health systems in Nigeria, facilities and partners are encouraged to arrange a mechanism for partial cost-sharing to enable all clients at facilities to have access to laboratory and other services formerly limited only to HIV positive clients.

In keeping with the PEPFAR’s commitment to the “three ones” through alignment with the GON National framework, coordinating authority, and monitoring and evaluation systems, the USG/Nigeria PEPFAR care and treatment program has become an integral part of the National Care and Treatment plan, strategies and program monitoring and evaluation. USG/Nigeria has integrated quality assurance and improvement systems into its existing care and treatment program, and, in collaboration with GON, will continue to monitor and evaluate the COP09 strategies to ensure optimal quality of care, utilizing jointly organized and implemented onsite supportive supervision, HIVQUAL, data reporting systems (monthly data collection, collation and analysis) with feedback through the monthly bulletin developed by the Strategic Information Unit of the PEPFAR Program. The USG/Nigeria Clinical Care meetings and Technical Work Group meetings will continue providing implementing partners with technical assistance, sharing best practices, identifying emerging challenges and developing strategies to address them. QA/QI has been a strong component of the laboratory services in country, which as resulted in most laboratories providing internationally acceptable service level for ART.

The care and treatment training plans for COP09 are aimed at quality assurance and improvement. These include the training, retraining, and mentoring of care and treatment providers using the National Care and Treatment Training Curricula. Additional

Training plans include further expansion of HIVQUAL program for QA/QI. USG/Nigeria will coordinate implementing partners’ activities to train master trainers in good clinical care. All care and treatment training will emphasize pain assessment and management using the National Guideline, which includes the World Health Organization (WHO) step-ladder approach.

PEPFAR/Nigeria has proposed two public health evaluations (PHEs) in COP09: an assessment of barriers to ART initiation among clinically eligible patients (the role of patient- and site- factors in delaying treatment initiation); and an evaluation of patient retention in pre-ART care. A program evaluation of the national Care and Treatment Program will also be conducted in collaboration with the GON to evaluate the quality and outcome of services.

ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS: : Combination of ART, & Care and support Services and narrative.

ACTIVITY DESCRIPTION: ADULT CARE, SUPPORT AND TREATMENT
In COP08, ICAP supported 28 hospital networks and their communities, partnering with community-based organizations (CBOs), faith-based organizations (FBOs), and PLWHA groups to enable people with HIV/AIDS to access clinical care and support as well as laboratory and pharmacy services across the 6 states of Benue, Kaduna, Cross River, Akwa Ibom, Gombe and Kogi.

In COP09, ICAP will continue to provide support to 30 comprehensive facilities which will include 28 existing health facilities networks and expand support to 2 additional new comprehensive health facilities in Akwa Ibom and Gombe States to provide care and support services to 52,310 HIV+ clients and 104,620 PABAs. A total of 28,351 (3,238 new) patients will be enrolled on ART among the HIV positive patients in COP09.

In COP09, ICAP will enable health facilities to provide clinical care, support and treatment to HIV positive persons by supporting: strategic approaches including training; clinical, laboratory and pharmacy services; systems management; procurement of drugs and supplies; and the expansion of support groups and peer health educator programs.

Following National Palliative Care Guidance and USG PC policy, ICAP-supported sites will provide a basic package of care services, including basic care kits, prevention with positives, clinical care (nursing care, pain management, OI and STI treatment and prophylaxis, nutritional assessment and support, lab- baseline hematology, chemistry and CD4 and follow up, OI and STI diagnosis, psychosocial support, home based care and active linkages between hospitals, health centers, and communities. ICAP will provide clinical care with basic care kits plus at least two other supportive services in the domains of psychosocial, spiritual and preventive services to all PLWHA. The activities will be approximately 20% laboratory monitoring and OI diagnostics, 30% OI management and prevention (cotrimoxazole), and 50% Home Based Care and training. Patient education to promote positive living, self-care, and support adherence will be provided. ICAP will support integration of syndromic management of STIs and risk reduction interventions into care.

ICAP will continue to strengthen the HBC teams (doctors, nurses, CHEW, PHEs, members of CBOs). ICAP will expand HBC services to include the provision of domestic support, nursing care, pain management, OI and STI treatment and prophylaxis, nutritional assessment and support, lab- baseline hematology, chemistry and CD4 and follow up, OI and STI diagnosis, psychosocial support, home based care and active linkages between hospitals, health centers, and communities. ICAP will provide clinical care with basic care kits plus at least two other supportive services in the domains of psychosocial, spiritual and preventive services to all PLWHA. The activities will be approximately 20% laboratory monitoring and OI diagnostics, 30% OI management and prevention (cotrimoxazole), and 50% Home Based Care and training. Patient education to promote positive living, self-care, and support adherence will be provided. ICAP will support integration of syndromic management of STIs and risk reduction interventions into care.

ICAP will train, retrain and mentor health care providers on HIV/AIDS care and management. ICAP will enhance adult care and treatment by providing ongoing site-level mentoring and supportive supervision of facility-based staff. Job aids and SOPs will be provided to support and enhance provider skills. ICAP will participate in the USG/GoN joint supervisory sites visits.

ICAP will further strengthen patient appointment and defaulter tracking systems, as well as routine reporting systems for monitoring basic care and support activities. Outreach teams linking hospital programs to primary health centers and communities will be expanded and supported by ICAP network coordinators. In order to improve access to services and retain in care, HIV positive clients will be supported to access health care facilities via community-based transport and support services will facilitate adherence, support patient education, enhance appointment system, and strengthen referral linkages/defaulter tracing programs. ICAP will also expand its successful Peer Health Educator program, enhancing family counseling and testing, defaulter tracking, and inter/intra-facility linkages. ICAP also support the development of patient education materials that encourages retention in care.

In COP09, ICAP will maintain provision of quality focused ART services at 28 existing health networks and scale up services in 2 additional health facilities to provide comprehensive ART services to a total number of 28,351 clients by the end of COP09, out of which 25,516 clients will remain on treatment at the end of the reporting period. ICAP will participate in the yearly National Care and treatment evaluation.

Based on FY08 experience, ICAP will provide support for infrastructural development, program management and systems strengthening, including within-facility linkages, retention of health care workers, Management Information System, and inter-disciplinary partnerships. ICAP will facilitate onsite assistance to strengthen management systems, including ART clinical linkages, patient follow-up, integration of prevention into care and treatment, and involvement of PLWHA; laboratory services. We anticipate increasing need for second-line ART, and will place special emphasis on training and mentoring health care providers to identify treatment failure and initiate second-line regimens when needed. Building on the ICAP-model which emphasizes comprehensive support, capacity-building and local ownership as mechanisms to provide sustainable high-quality HIV/AIDS care and treatment to families and communities, facilities will be supported through enhancement of site-level project management teams (PMTs).

ICAP will prioritize the expansion and decentralization of palliative care services to selected primary health centers (PHC) to reduce the client load on the existing secondary health facility networks. Building on the network of care model, ICAP will scale up care, support and ART drugs refills to PHCs by identifying at least one PHC around each secondary hospital that can provide care and ART drug refills to stable patients. ICAP will also enable the decentralization of existing facility-based support groups, facilitating their expansion into surrounding communities to promote acceptance and ownership, reduce stigma, and increase sustainability. To do this, ICAP will work closely with the state and local governments of the six
Activity Narrative: ICAP supported states to further explore and put in place mechanisms to strengthen the role of PHCs in providing quality ART care and ART drugs refills. ICAP will work closely with established State primary health care development agencies to develop/adapt mechanisms to strengthen the health care systems by leveraging available HIV/AIDS resources. This decentralization will include the development/adaptation of referral protocols (for both “down” and “up” referrals), referral forms/tools, and site supervision tools. Networking and referral linkages between hospital based providers and PHCs will be strengthened. Health Teams in PHCs will be trained on Care and Treatment to encourage task shifting.

This will be a critical element in ICAP’s support to health care cadres through the COP09 program activities. Clinicians at all 30 sites will be assisted to identify ‘most at risk’ HIV-infected patients, enroll them in care and treatment, to perform appropriate clinical and laboratory staging of adults and children, and to provide comprehensive care and support, including the prompt initiation of ART for eligible patients. ICAP will provide follow-on ART/Palliative Care trainings, including ongoing CME and QA activities, for 500 health care workers (including physicians, nurses, counselors, pharmacy, and laboratory personnel) and 100 members of CBOs on palliative care. Onsite clinical mentoring will enhance quality of care and build site-level clinical and management skills for program sustainability. ART reference tools will include pocket guides, dosing cards, posters, and detailed SOPs.

ICAP will continue to work closely with other PEPFAR IPs and GON to ensure compliance with National policies, curricula and guidelines. ICAP will continue to participate in the USG Technical Working Groups to address emerging treatment and care-related topics and further promote harmonization with other IPs and the GON. ICAP will also continue its partnership with SCMS by allocating USD 675,000 of its resources for care, support and treatment related procurements.

ICAP will facilitate linkages through existing and new CBO/NGO or FBOs within the communities to economic empowerment and other programs such as Safe Motherhood and child survival activities. Therapeutic feeding using approved selection and exit criteria will be provided via referrals where possible and directly when no alternatives exist. Facilities and communities will be supported to identify innovative approaches to sustainable food support such as establishment of innovative food banks, linkages with wraparound programs and existing microfinance opportunities. At the community level, HBC, OVC, HCT outreaches, AB messages, patient retention mechanisms and other support services will be subcontracted to non-governmental, community and FBOs. Trained HBC providers, including PLWHA, will be supported to deliver care and support services to stable patients and family members at home.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: By training and retraining at least 600 care providers including PLWHA, ICAP will enhance the delivery of comprehensive basic care and support within national guidelines and protocols via a multidisciplinary family-focused approach. This activity contributes to the USG cumulative targets by reaching at least 52,310 PLWHAs (104,620 persons affected by HIV/AIDS) on care, including 28,351 HIV positive adults on treatment.

LINKS TO OTHER ACTIVITIES: This activity relates to OVC, HCT, PMTCT, LAB, sexual prevention, TB/HIV, Gender, Human capacity development and SI. As expansion of ART services is prioritized to rural areas, ICAP will strengthen referral channels and network mechanisms. TB/HIV linkages will be strengthened where ART and TB DOTS sites are co-located, and co-location of new ARV sites will be actively promoted in TB DOTS stand-alone sites. All HIV infected patients will be screened for TB using the National algorithm while all TB patients will be offered HIV testing. ICAP will also provide onsite assistance with data management and M&E to guide quality improvement. Relationships between secondary hospitals and community-based referral facilities will be strengthened via the use of network coordinators, CBOs and NGOs. Patients not yet eligible for ART will be carefully monitored (via clinical and laboratory monitoring), and will receive OI prophylaxis and other preventive services where indicated. Women who become pregnant will be referred to PMTCT; after delivery mother-baby pairs will be referred for care and treatment/OVC services. All care and treatment clients will receive PwP messaging as appropriate. Partnerships with other IPs will provide opportunities for leveraging resources. Patients and their families will be linked to community-based income-generating activities where available.

POPULATIONS BEING TARGETED: All HIV positive persons including women and their households will be assisted to access care and support. HIV positive persons in the general population will be reached through CBOs and support groups. Persons Affected By HIV/AIDS (PABAs) will also be targeted and enrolled into care under the ICAP family-centered approach as will pregnant women, OVC and TB patients. Facility based care providers and CBOs/FBOs will be trained to provide quality services and facilitate the establishment/strengthening of referral networks. Health care providers in secondary and primary health facilities will be trained to deliver quality ART services.

EMPHASIS AREAS: Areas of emphasis will include quality improvement and system strengthening human capacity development, Gender and other health related wrap around.

This activity will facilitate equitable access to care and support especially to vulnerable groups of women and children. ICAP will advocate for men’s involvement in care and treatment in the community (rallies, community sensitization) for improved inheritance rights for women and children. ICAP will also advocate for stigma and discrimination reduction at the community level. ICAP will emphasize quality assurance/Improvement and clinical systems mentorship as part of its capacity building. ICAP personnel including national and international experts will provide skill and competency-based trainings, CME, and ongoing clinical mentoring to enable onsite staff to provide quality ARV services to patients. Services will also focus on addressing the needs of women to reduce gender inequalities and increase access to ART services. ARV services will facilitate linkages into community and support groups for nutritional support and economic empowerment and other programs such as Safe Motherhood and child survival activities.
Activity Narrative: micro-credit/finance activities.

Early Funding Narrative (if early funding needed, justify here; must be less than 1,000 characters, including spaces)
Early funding is requested for USD 4,009,000 to procure drugs (other than ART), commodities and supplies for currently enrolled in care and treatment patients from the existing 28 facility networks. This is to ensure that orders are placed early to forestall any gaps in supplies and further enhance quality of services provided. In addition, as services for many facilities and CBOs are by subcontract, ICAP is unable to execute subcontracts (which represent an obligation of funding) in a timely manner without such funds.

</table>
Activity Narrative: Several new CDC partners have recently been identified through a competitive funding opportunity announcement as approved under COP08. Many of these partners are new to the PEPFAR and/or CDC planning and implementation processes. The amounts awarded differ significantly from the original proposal amounts submitted by these new partners. The difference now requires the new partners, working in conjunction with the in-country CDC office and interagency technical working groups, to revise the action plans for FY08 and FY09. CDC is currently working closely with the new partners to assure their effective understanding of the PEPFAR planning process and that action plans for FY08 and FY09 COP submissions are in accordance with funding awards as well as PEPFAR goals and objectives. Detailed narrative changes will be submitted in the January 2009 reprogramming submission.

In COP 08, Partners for Development (PFD) worked collaboratively with its sub-partner, the faith-based organization (FBO) Daughters of Charity (DC), to implement activities at two project sites: 1) Assumption Clinic in Warri, Delta State and 2) Catholic VCT Center and primary health care center, Ikot Ekpene, Akwa Ibom State to implement activities under the “Counseling, Care and Antiretroviral Mentoring Program” or CAMP, the name of PFD’s CDC-funded project. This component targeted 400 adults in COP08 needing care through a combination of community-based service provision by peers and community members linked to treatment through health service providers. The model is based on the realization that clinics cannot provide cost-effective, sustained follow-up and care for all infected-individuals, and in order to provide a continuum of care, community resources and volunteers will be required. Using peers and other community members also promotes HIV awareness and helps to reduce the stigma associated with HIV/AIDS. Outreach services are provided through Community-based Organizations (CBO) networks to 10 LGAs. In all activities, CAMP draws upon a network of community-based groups coordinated at LGA level for service provision on a voluntary basis. The LGA coordination meetings include Parish Action Committees which are themselves coalitions of women’s, men’s and youth groups as well as health care service provider representatives. They also include representatives from support groups of People Living with HIV/AIDS (PLWHA) or affected by AIDS. Through these LGA coordination mechanisms, volunteers willing to provide home based care to PLWHA are organized, trained and equipped.

In COP 09, PFD will continue to provide care and treatment services to the same target population and plans to reach 850 newly enrolled adults (making a cumulative total of 1250) with care and support services and 900 through ART. PFD and DC will assist adults who need palliative care through a combination of home visits from community volunteers who have been trained in basic nursing skills plus treatment provided by health service staff employed through the two project sites. An enrolled client will be counted to have received care if they have received clinical care, a basic care kit plus two other supportive services which include prevention counseling, psychosocial counseling, volunteer home visitors and logistic support. CAMP Program Officers will train, mentor, and technicially support community caregivers as they provide services to persons living with HIV/AIDS. 36 home from PLWHA and their caregivers support groups that have been formed through Parish Action Committees and other CBOs. Support group leaders will coordinate their work at the community level which will in turn be coordinated by an LGA level community nurse. They will be given a basic home nursing training course according to the national curriculum in the beginning, plus quarterly refresher classes that serve to keep their interest high and result in higher retention. Assistance with transportation costs will be provided as needed to volunteers. Home volunteers will be coordinated and linked to clinical services through community nurses/health officers supported by a social worker who will also receive training under this component according to the national curriculum for PLWHA caregivers. There will be two levels of training for home volunteers to correspond to different groups of clients: 1) Pre-ART clients who will require PWP services, health education, CD4 default tracking, as well as family counseling/testing and referrals and 2) clients who are on ART or needing significant clinical assistance/treatment (stage 3 and 4) will first be given more advanced home nursing training and work under a clinical staff person’s supervision.

Each enrolled client that receives care and support services from CAMP will be given a basic care kit containing an analgesic (aspirin or paracetemol) and other items including ORS, ITN, water treatment solution and vessel, cotton wool, gloves, soap & IEC materials. The gloves, soap and water treatment solution will be replenished monthly. Home visitors will receive a basic home nursing kit that will contain a thermometer, latex gloves and first aid items. Home visits will be arranged through a referral system organized by an LGA-level volunteer coordinator.

Clients qualifying for care and support will be drawn from a span of intake points such as primary health care outposts, safe motherhood and child survival programs and HCT points. All testing positive will be referred for further medical examinations and lab analysis. ART eligible clients will be placed in ART programs according to National ART Guidelines. Home care capacity of those with chronic and debilitating symptoms will be assessed and those needing assistance from outside their household will be assigned to one of the network of home visitor volunteers. Interface between the home care and clinical care activities will be provided by community nurses who track retention of enrolled clients. Logistic support is organized both by support group leaders who receive training in this area by CAMP personnel and by CBO and health service representatives who have received counseling training (including bereavement counseling). Logistic support includes organizing transportation to ensure that patients can access the clinic-based part of their treatment.

Clients will access clinical care as needed (nursing care, pain management, nutritional assessments and interventions, OI diagnosis prophylaxis and treatment, STI diagnosis & management, lab service-baseline hematology, chemistry, CD4 count and follow up, MP, and pregnancy tests when indicated. Clinical staff provides counseling on the imprortance of adh sets up PLWHA monitoring and reinforcement chains via a community nurse. For treatments and tests, CAMP clinics have access to supply chains organized at the national level by the Daughters of Charity referral center in Kubwa outside Abuja.

Clinical staff will be trained on pain assessment techniques and management according to the National Palliative Care Guideline. They will also receive a nutritional assessment based on guidelines from the DREAM model adopted by Daughters of Charity. This stands for Drug Resource Enhancement Against
Activity Narrative: Aids and Malnutrition. The DREAM model includes an evaluation covering nutritional anthropometric, clinical and laboratory data. Health care providers investigate the clients' nutritional history and decide on the quality and quantity of any supplement to be prescribed. Signs and symptoms such as anorexia, nausea, vomiting and diarrhea are recorded. Anthropometric measurements of weight, height and body mass index (BMI) are also checked.

Three types of counseling services will also be provided. These include prevention counseling and testing with positives and other prevention counseling for family members including discordant couples. PFD and DC will work towards greater access of home based testing for families where one or more member is positive. Couples where one or more partner are HIV+ will receive HIV/STI prevention counseling from this team, according to the national standards for PWP prevention.

A second type of counseling provided will be psychosocial including bereavement and depression counseling. Home visitor volunteers will receive training in how to provide moral support and encouragement as well as bereavement counseling to families where one or more members are PLWHA, and to learn signs of when their clients need referral to appropriate psychological services. Spiritual counseling will be facilitated through participation of FBOs in the volunteer network and their affiliation to various churches who undertake spiritual and more support activities as part of their mandate.

The third type of counseling is linked to clinical care related to adherence to prescribed treatments, particularly ART. This counseling will be given by the attending health service team initially, but home visitor volunteers will be requested to help with follow up and monitoring of adherence.

Home visitor volunteers are also trained in basic home nursing skills and oriented on how/when to refer clients to CAMP clinics for follow up, counseling and testing. Couples where one or more partner are HIV+ will receive HIV/STI prevention counseling from this team. The Adult Care and Treatment team will cover all aspects of home-based, clinic linked care except that of ARV therapy which is covered in a separate component, however the home-based caregiver team.

Contribution to overall program area:
PFD will through its care and treatment activities/services will contribute to PEPFAR/Nigeria goals of providing treatment to 350,000 and care to 1.75 million people. In addition, PFD is contributing to improved access to care and treatment, particularly to underserved areas.

Links to other activities
This component is strongly linked to prevention, HCT, PMTCT, ARV drugs, SI, OVC, Lab infrastructure and services. There is a strong link to the PMTCT component as mothers may need continuing follow up assistance through this adult basic care and treatment component. Adults being cared for through this component will be able to draw upon primary health care programs offered either through CAMP sub-grantee Daughters of Charity, or who are participating in LGA level coordination mechanisms such as Ministry of Health primary care units for prevention of malaria, TB and communicable diseases.

Target populations for this component are HIV/AIDS infected adults their caregivers, and health care workers. PLWHA will be provided with care and treatments through a combination of assistance from home visit volunteers and health service staff employed at the two project sites. The home visit volunteers are recruited and organized by a network of CBOs (particularly support groups) coordinated at the LGA level and overseen by a community nurse who provides interface between home care and facility based care.

Key legislative issues: PLWHA continue to suffer from stigma and discrimination in many areas of society. Those affected should be monitored and reported with data disaggregated by gender. They should be analyzed from a gender perspective since men and women experience these problems disproportionately. Coordination meetings held at the LGA level with representation from local government assists in keeping local governments updated on the scope of problems related to gender-based violence, stigmatization and discrimination suffered by clients of this care and treatment component. This information will make them better advocates for improved policy at the state level and national level.

Emphasis on care and treatment
The main emphasis of this activity is capacity building for improved treatment and care for PLWHA and PABA. This will include integration of care activities with wider malaria prevention and safe motherhood initiatives – both through mainstreaming basic best practices in those areas into training of caregivers for PLWHA as well as using these other programs to enroll PLWHA into the Care and Treatment program as appropriate. Focus will be placed on task shifting through increased delegation of clinical tasks to a wider net of caregivers that have been trained according to national guidelines. This will free up physician's time an enable the clinical/caregiver teams to serve more clients. It will also contribute to the professional development and advancement of various levels of health care providers. PFD will participate in subsequent yearly care and treatment evaluations if requested.

Monitoring and Evaluation
PFD program officers and DC nurse counselors and adherence counselors will work with community volunteers (including adherence guarantees for each HIV patient on Anti-Retro Viral (ARV) drugs) to train them in proper delivery of home-based care. Caregivers will be tasked with monitoring patients in their homes weekly, and providing support as necessary. Community-health workers from CAMP sites will do monthly rounds to see People Living With HIV/AIDS (PLWHA) and offer support to their caregivers. Key support categories such as provision of home based care, preventive prophylaxis, palliative care, and nutritional support will be tracked and reported on with patients disaggregated by gender.

Activity Narrative: In COP09, NEPWHAN will provide adult treatment, care and support services in a to-be-determined number of secondary treatment facilities and primary health care (PHC) centers. These services will take place in 7 states. Through primary and secondary facilities in COP09, NEPWHAN will provide ART services to underserved rural communities to reach 1,490 new patients for a total of 1,490 active adult patients by the end of the year. Comprehensive packages of care and support services will be provided to 2,000 HIV-positive clients (PLWHA) and an additional number of PABAs in the same period.

The package of care services provided to each PLWHA will include one clinical service with the basic care kit and two supportive services including psychological, spiritual, and PwP delivered at the facility, community, and household (home based care) levels in accordance with the PEPFAR and national care and support policies and guidelines. The basic care kit for PLWHAs at sites will include Basic Care Kit (ORS & SSS, LLITN, water treatment solution, water vessel, gloves, soap, condoms and IEC materials); Home-Based Care (client and caregiver training and education in self-care and other HBC services); Clinical Care (basic nursing care, pain management, OI and STIs prophylaxis and treatment, nutritional assessment-weight, height, BMI, micronutrient counseling and supplementation and referrals) Laboratory Services (which will include baseline tests - CD4 counts, histology, OI and STI diagnostics when indicated); Psychological Care (adherence counseling, bereavement counseling, depression assessment and counseling with referral to appropriate services); Spiritual Care (access to spiritual care); Social Care (support groups' facilitation, referrals, and transportation) and Prevention Care (Prevention with Positives). All PLWHAs’ nutritional status will be assessed at contact and on follow-up visits. By doing BMI and plotting on infant growth charts, micronutrients will be provided as necessary, and those diagnosed as severely malnourished will be placed on a therapeutic feeding program through wraparound services as well as direct funding. The activity will procure basic care kits through the SCMS central mechanism and OI drugs will be procured through mechanisms that ensure only NAFDAC approved drugs are utilized.

ART services at sites that are co-located in facilities with TB DOTS centers will have the services integrated to facilitate TB/HIV service linkages. All PLWHA will have CD4 counts and other necessary lab analyses performed at least every 6 months to determine the optimal time and eligibility status to initiate ART and monitor effectiveness/side effects for those on ART. Systematic ART reviews (recommendations for ART modifications) will occur at pre-scheduled times (24-week). PwP activities including: adherence counseling; syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and behavioral counseling to achieve risk reduction; counseling and testing of family members and sex partners; counseling for discordant couples; IEC materials and provider delivered messages on disclosure. Cotrimoxazole prophylaxis will be provided for PLWHAs when CD4 <200 or prior TB or other AIDS defining illnesses. The activity will support a pilot program for cervical cancer screening in HIV positive women.

The partner will collaborate with faith-based organizations (FBOs) to achieve these targets by recruiting volunteers and community-based organizations (CBOs). Through these partnerships clients in care will receive a comprehensive package of community and home based care services. HBC teams comprised of nurses, community health workers and trained volunteers will provide HBC services as well as facilitate support group activities. HBC providers will use HBC kits. Partner will focus on improving pre-ART retention in support groups. Strategies to retain clients in care include intensive home visits by HBC team during the first 6 months of enrolment.

All sites will consolidate on their capacity to provide comprehensive quality ART services through management of OIs and ART, a safe, reliable and secure pharmaceutical supply chain, technologically appropriate lab diagnostics, treatment preparation for patients, their families and supporters and community based support for adherence. This technical and programmatic assistance utilizes on-site mentoring and preceptorship. It also supports the development of site specific work plans and ensures that systems are in place for financial accountability. Partner will adhere to the Nigerian National ART service delivery guidelines including recommended first and second line ART regimens. In addition, partner will collaborate with the Clinton Foundation and Global Fund as appropriate to leverage resources for providing antiretroviral drugs to patients.

Monitoring and evaluation will be carried out by a team of trained volunteers working in the communities who will work with the activity’s data officers and M&E officers. In addition, data generated will be shared with local government areas to allow them to track their clients and provide ongoing support for sustainability. Registers, forms, and other data tools will be replenished as necessary and staff trained in their use. Partner will report on sex distribution of PLWHAs receiving care and support services and the numbers of PLWHAs reached with community home based care. Personnel will be trained in the use of registers for documentation and data reporting.

The activity will continue to strengthen institutional and health worker’s capacity through the training, retraining and mentoring of health service providers to provide care and treatment services at the facility and community levels. 180 doctors, pharmacists, nurses, counselors, and community health extension workers will receive training and onsite mentoring that will allow them to provide comprehensive care. Training will maximize use of all available human resources including a focus on community nursing and community adherence. Care and Treatment trainings will be based on the national curricula. Partner will collaborate with the GoN and other stakeholders to develop task shifting strategies to enable nurses and community health officers to provide ART.

Partner will conduct 2-week intensive didactic and practical trainings preceding site activation followed by regular onsite mentoring. Community volunteers, including PLWHA and religious leaders will be trained to provide peer education, counseling, psychosocial and spiritual counseling, respectively. Partner will use GON/USG recommended standardized training curriculums, manuals and training aides for all trainings. Information, education and communication materials will be provided to enhance these trainings. NEPWHAN partners will work closely with the USG and GoN team to monitor quality improvement at all sites and across the program. XX Health care workers will benefit from these trainings referred to above in HIV Care, Treatment and Support.
Activity Narrative: A key component for successful ART is adherence to therapy at the household and community levels. PLWHA on treatment are encouraged to have a treatment support person such as a family member to whom he/she had disclosed HIV status to improve support in the home and increase adherence. Partner will continue to build and strengthen the community components by using nurses and counselors to link health institutions to communities. Each site will appoint a staff member to coordinate the linkages of patients to all services. This will also build the capacity of sites for better patient tracking, referral coordination, and linkages to appropriate services. These activities will be monitored by the partner’s technical and program management regional teams.

In COP09, the activity will continue to strengthen its expanded the Quality Improvement Program (QIP) consisting of the annual cross sectional Outcomes & Evaluation (O&E) exercise, the GON/USG supported HIVQUAL monitoring and the quarterly Continuous Quality Improvement (CQI) activities in order to improve and institutionalize quality interventions. Patient medical records will be standardized to improve record keeping and continuity of care at all sites. Monitoring and evaluation of the ART program will be consistent with the national plan for patient monitoring. Specialists will conduct team site visits at least quarterly during which there will be evaluations of infection control, the utilization of National PMM tools and guidelines, proper medical record keeping, efficiency of clinic services, referral coordination, and use of standard operating procedures across all disciplines. On-site technical assistance (TA) with more frequent follow-up monitoring visits will be provided to address weaknesses when identified during routine monitoring visits. Some of the data will be used to generate biannual life table analyses that identify factors associated with early discontinuation of treatment. In addition, at each site an annual cross sectional evaluation of program quality shall consist of a 10% random sample of linked medical records, adherence questionnaires and viral loads to examine treatment compliance and viral load suppression for adult patients who have been on treatment for at least 9 months. A similar process will be undertaken for all children who have been on ART for at least 9 months. Each of these activities will highlight opportunities for improvement of clinical practices.

Sustainability lies at the heart of this program, and is based on durable therapeutic programs and health systems strengthening. The activity will focus on the transition of the management of care and treatment activities to indigenous organizations by actively using its extensive linkages with faith based groups and other key stakeholders to develop a transition plan that is appropriate to the Nigerian context. The plan will be designed to ensure the transition delivery of quality HIV care and treatment, and all activities will continue to be implemented in close collaboration with the GON to ensure coordination, information sharing and long term sustainability. For the transition to be successful, sustainable institutional capacity must be present within the indigenous organizations and sites they support; therefore, the activity will strengthen selected indigenous organizations according to their assessed needs to strengthen the health systems of the sites. This capacity strengthening will include human resource support and management, financial management, infrastructure improvement, and strengthening of health management information systems.

The partner will continue to participate in GON harmonization activities and to participate in the USG coordinated clinical working group to address ongoing topics in ARV service delivery.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: This activity will contribute to the expansion of adult care and treatment activities, including effective linkages with HBC providers, will contribute to increased access of such services to underserved rural communities. By providing services to 2,000 Adult PLWHA, the activity will contribute to the overall PEPFAR care and support target of providing these services to 10 million people globally by 2009 and will help accomplish the PEPFAR Nigeria target of placing 1,490 clients on ART by 2009 and will also support the Nigerian government’s universal access to ART by 2010 initiative. This activity contributes to the overall comprehensive HIV and AIDS services by providing the supportive services for all adult PLWHA including those on ART.

LINKS TO OTHER ACTIVITIES: Activities in adult care and treatment are linked to HCT (HVCT), PMTCT (MTCT), ARV drugs (HTX), laboratory (HLAB), OVC (HOVC), Sexual Prevention (HVAB), Medical Prevention (HMBL) (HMN) TB/HIV (HTV) and SI (HVSI) to ensure that PLWHA and their family members have access to a continuum of care. Awardee will continue to collaborate with the XX program of the award to establish networks of community volunteers to support livelihood development program for PLWHA and caregivers requiring such services and support identified child or adolescent headed households to be linked with XX and other OVC programs which will meet the needs of the household. Networks will be created to ensure cross-referrals and sharing of best practices among implementing partner sites for the provision of psychosocial support and community and home based services to PLWHA. Effective synergies will be established with the Global Fund to Fight AIDS, Tuberculosis and Malaria through harmonization of activities with GON and other stakeholders for harmonization of basic care and support services and the standardization of training manuals for community volunteers and providers.

POPULATIONS BEING TARGETED: This activity targets PLWHA, particularly those who qualify for the provision of ART, including PMTCT clients from rural and underserved communities. This activity also targets CBOs and FBOs for capacity building and targets care providers (healthcare professionals and community volunteers) for training.

EMPHASIS AREAS: This activity will include emphasis on human capacity development specifically through in-service training and task-shifting, local organization capacity building for community mobilization and participation, development of networks/linkages/referral systems, and quality assurance/ quality improvement This activity will also ensure gender equity, ensuring access to ART through linkages with PMTCT services, addressing male norms & behaviors, increasing women’s legal rights and access to income & productive resources, and reducing violence and coercion against women. This activity will work with CBOs, networks of PLWHA and FBOs and other USG/GON programs to promote economic strengthening activities; education and safe water initiatives, and create access to food and nutritional services. The extension of this activity into rural and previously underserved communities will contribute to
**Activity Narrative:** the equitable availability of ART services in Nigeria and towards the goal of universal access to ARV services in the country. This activity will improve the quality of life of PLWHA and thus reduce the stigma and discrimination against them.

Activity Narrative: This activity also links with prevention programs.

USAID Nigeria is negotiating a new award which will provide integrated HIV prevention programming for a targeted most-at-risk population of men who have sex with men (MSM). As is the practice when making new awards, OGAC will be informed when the award is ready, and the partner(s) and targets will be uploaded into COPRS. The proposed program will build and strengthen institutional and technical capacity of five local MSM organizations in the FCT, Lagos, Cross Rivers, Rivers and Kano states to deliver high-quality integrated programs and services targeting Men having Sex with Men (MSM). Lagos and FCT will be targeted to start programs in COP 09 with expansion to Rivers, Kano and Cross River state planned for later years.

Nigeria has a generalized national prevalence of 3.4% (FMOH 2007) and some states, with prevalence exceeding 5%, represents a more concentrated epidemic. The higher prevalence rates amongst high risk groups (to include MSMs at 13.5%) emphasizes the need to target this particular group with HIV sensitization programs, prevention messages, and linkages to care and treatment. IBBSS 2007 revealed that half of the MSM surveyed could not correctly identify ways to prevent sexual transmission of HIV. Over 70% used oil based lubricants. Multiple sexual partnerships (insertive and receptive) is common among MSM while over 50% engaged in transactional sex. MSM were not more likely to have used condom at last transactional anal sex with a man (58%) compared to a non commercial sex partner (53%). Only 34% of reporting MSM have ever been tested for HIV in Nigeria.

The proposed program will deliver HIV services as well as undertake multiple level capacity development approach to simultaneously respond to unmet need for prevention, community based care and support HIV services to MSM in Nigeria. Past efforts have worked through rather with MSM grassroots organizations and services were provided under umbrella of most at risk population.

Activities will focus on skills based HIV education for vulnerable young men with broad based community care and support activities that facilitate access to treatment and adherence counseling services for HIV positive MSM. The program will concentrate activities in areas that will be identified through secondary analysis of national behavioral data generated through the project SEARCH and NARHS PLUS survey. The package of care services provided to each PLWHA will include referrals for the provision of clinical services with selected partner clinics that have been sensitized to the particular needs and concerns of sexual minority groups. The program will also provide tailored supportive services including psychological, spiritual, and prevention with positive activities delivered at the facility, community, and household (home based care) levels in accordance with the PEPFAR and national care and support policies and guidelines.

While the overall project anticipates reaching 22,000 MSM with community and facility services including adherence and prevention with positive services for identified positive MSM utilizing minimum package interventions that provide comprehensive balanced prevention interventions.

The new partner will document and disseminate best practices; successful and innovative approaches with lessons learned and share these with their implementing agencies as well as other partners within the PEPFAR program in Nigeria. In COP 09, particular interest on lessons learned will focus on effective approaches for improving organizational and technical capacity of local lesbian, gay, bisexual, transsexual/men who have sex with men organizations.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
The programs and activities implemented will fill critical gap in the reach of HIV interventions into epidemiologically important population to better address gaps in coverage and to better address specific behaviors within underserved populations. This MARP prevention and care program, delivered through implementing agencies whose capacity has been built, will contribute to strengthening and expanding the capacity of the GON’s response to the HIV/AIDS epidemic and increasing the prospects of meeting the Emergency Plan’s goal of preventing 1,145,545 new infections.

LINKS TO OTHER ACTIVITIES
The care and support activities implemented under the proposed activity will be linked with AB and C/OP activities, as well as with the capacity building and policy related partners.

POPULATIONS BEING TARGETED:
Populations targeted in these activities will include MSM and their partners (male and female).

KEY LEGISLATIVE ISSUES ADDRESSED:
Key legislative issues will address increasing equity and access to information and services for MSM.

EMPHASIS AREAS:
The service delivery component will focus on referrals, counseling and psychosocial supports as well as treatment adherence guidance information and communication in the community and will build linkages with other sectors and initiatives.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY DESCRIPTION:
The SCMS objective is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers the procurement but also the shipment, distribution and delivery of medical supplies and equipments used in ARV services including consumables and non medical supplies needed to run ARV services, as well as basic health care and support related commodities for adults including other supply chain management related activities. It also covers technical assistance (TA) and system strengthening (SS) activities provided to PEPFAR Implementing Partners (IPs) and to the Department of Defense (DoD) to strengthen or build their supply chain management capacity within their respective programs.

In COP09, SCMS will procure medical supplies and equipments used in ARV services and other commodities used to extend and optimize the quality of life of HIV infected adults and their families for three IPs and DoD. This also encompasses commodities for the prevention, management and clinical monitoring of opportunistic infections (OI), except tuberculosis (TB), other HIV/AIDS related complications, including malaria, and for the management of sexually transmitted infections (STIs). Example of such commodities are pharmaceuticals (OI drugs, pain killers, opioids), insecticide treated nets, home based care kits, water guard, gloves and therapeutic food. SCMS will also procure other medical and non medical supplies used in treatment and basic health care and support services, including home-based care.

Through its continuous support to and strengthening of commodity security in PEPFAR care programs, SCMS works towards ensuring uninterrupted availability of needed commodities to the target populations of people living with HIV/AIDS and the general population through their families. This will be achieved by assisting the IPs and DoD in quantification, forecasting of requirements and support for the development of long term supply plans (considering in country stocks and anticipated consumption rates) for stock management and delivery planning.

In COP09, SCMS will procure medical supplies and equipments used in ARV services, palliative drugs, care and support commodities and provide requested technical assistance for three IPs and DoD, each of which has allocated specific funds to SCMS for these services: DOD, $300,000 for Adult Care and Support and $1,750,000 for Adult Treatment; Columbia University/ICAP, $150,000 for Adult Care and Support and $675,000 for Adult Treatment; University of Maryland, $287,960 for Adult Care and Support; and URC, $4,500 for Adult Care and Support and $45,000 for Adult Treatment. The budgets will cover the cost of commodities as well as as well as logistical and administrative services from the field office for the coordination and management of the procurements undertaken by SCMS. The budget also supports the cost of TA and SS.

SCMS will support the IPs and DoD in the following areas of the supply chain cycle: product selection in accordance with the Federal Government of Nigeria’s (FGoN) national treatment guidelines, marketing authorization status (NAFDAC registration) and FGON importation regulation. SCMS will also be responsible for ensuring that commodities procured meet eligibility criteria under the USG acquisition rules and regulations including source and origin waivers and approvals by the US Food and Drug Administration or other relevant stringent drug regulatory authorities.

SCMS will assist in quantification and forecasting of requirements and will support the development of long term supply plans for stock management and delivery planning. SCMS will identify suitable sources of supply both internationally and nationally. SCMS will work with IPs in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and associated services (i.e. maintenance service). SCMS will coordinate with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by NAFDAC, SCMS will make suitable recommendations including waiver applications where appropriate. SCMS will take the lead to communicate with manufacturers on registration gaps in Nigeria.

Currently, there are several challenges associated with the procurement of Opportunistic Infections (OI) drugs. A number of key OI medicines are banned from importation into Nigeria and hence by default, need to be procured from local manufacturers. However, the fact that none of locally manufactured products has US FDA or similar stringent drug regulatory authority approval places the PEPFAR IPs in an untenable situation. In COP 09, SCMS will work with the IPs and GoN to identify key OI drugs that are needed and initiate the process of pre-qualification towards identifying local sources. SCMS will also work with GoN towards defining the modalities for use of opioids for pain management by HIV/AIDS programs. SCMS intervention in this area will ensure that required materials for palliative care are available for use of the programs, thus improving the quality of life of PLWHA.

SCMS procurement leverages global spend to provide best value and offers clients certainty of competitive prices and international quality standards. SCMS procurement strategy is articulated around buying generics whenever possible, pooling procurement for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries and negotiating long term contracts with suppliers. IPs and DoD’s requests for basic health care and support related commodities will be addressed to and coordinated with SCMS field office directly.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry as required. SCMS will take the lead and further streamline the customs clearance process as appropriate including management of the CC1, CC2 or CC3 duty exemption forms. SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Where appropriate, commodities procured and imported by SCMS will be supplied through the SCMS Regional Distribution Center (RDC) in Ghana. The warehousing of commodities in the RDC is a critical component of the SCMS technical solution. The use of the RDC will significantly reduce lead times and
Activity Narrative: provide an important buffer between the supply from manufacturers and demands from the PEPFAR programs in Nigeria. The RDC also ensure that shipment quantities do not overwhelm their recipients in country, an increasing challenge in the context of program scale up. The RDC concept also brings an increased flexibility in stock management thus reducing risk of stock obsolescence or need for emergency replenishments, resulting in important savings. Finally, the RDC approach serves regional and national sustainability, as the RDC is designed to be a commercially viable entity, available to other health (and non-health) programs, whose benefit will last beyond SCMS. Where possible and appropriate, SCMS will road freight from the RDC Ghana to Abuja; a mode of delivery that will provide significant savings over airfreight.

Delivery arrangements will be negotiated with URC, ICAP, UMD and DOD; SCMS will either deliver to a central location or to point of services as needed. When local warehousing is needed SCMS will continue to explore viable options make use of its recently acquired cross-docking facility and the long term warehouse facility (which will be acquired in COP 09). For in country distribution where necessary, SCMS will competitively source for and utilize the service of an efficient and safe in-country courier services operator.

SCMS provides TA and SS services in all areas of the supply chain including product selection, quantification & forecasting, supply planning, procurement, warehousing, customs clearance and delivery. In COP09, SCMS will provide TA and SS services to IPs including the training of individuals in the use of the ProQ or Quantimed forecasting and Pipeline supply planning tools. SCMS will continue to provide TA and SS services to DoD based on the recommendations that came out of a supply chain system’s assessment carried out in COP07. By providing training and supporting capacity building of local organization, SCMS addresses the emphasis area of human capacity development.

SCMS will provide the USG team with regular reports on supplies and equipments as well as monthly financial reports. In COP 09, Supply Chain Support Teams (to be made up of technical SCMS staff and GoN or IP staff as appropriate) will be constituted by SCMS to work with the IPs in providing their trained logisticians with the capacity to monitor and support the performance of the supply chains at various levels. Using standardized indicators of logistics performance, the SCSTs will track performance of the supply chains and together, act as an early warning system to identify impending or imminent supply chain breakdowns and act to forestall these. By developing methodologies and tools for conducting these activities, SCMS will work with GoN and IPs to establish and institutionalize this activity thereby building the capacity to identify these problems and resolve them before service delivery is compromised. In addition, an automated web based procurement tracking database will ensure that the USG team and IPs have adequate visibility on SCMS procurement status by providing an easy access to accurate and up to date information on procurement. Further procurement automation and harmonization will also be facilitated through linkages with the LHPMIP system of SCMS.

In COP07, SCMS undertook, under DoD’s request, a feasibility study for a Government Owned Contractor operated (GOCO) warehousing facility to be used by HIV/AIDS Nigerian military and DoD programs. In COP08, SCMS helped define detailed implementation workplan and responsibility for construction of the warehouse, SCMS will provide technical oversight for the construction and managing the equipment of the facility, while the NMoD will finance the construction of the facility, DoD will finance the equipment of the warehouse through COP allocations to SCMS in the range of $750,000. The establishment of a GOCO, as part of SCMS system strengthening to the host government’s supply chain system, will bring a long term solution contributing to the sustainability of the military HIV/AIDS programs in Nigeria. By providing training and supporting capacity building of local organization, SCMS addresses the emphasis area of human capacity development.

Under this program area, SCMS does not have targets of its own but supports PEPFAR IPs and DoD reaching their care planned targets.

EMPHASIS AREA
Human capacity development.

Table 3.3.08: Activities by Funding Mechanism

- **Mechanism ID:** 1561.09
- **Prime Partner:** US Centers for Disease Control and Prevention
- **Funding Source:** GHCS (State)
- **Budget Code:** HBHC
- **Activity ID:** 5365.25973.09
- **Activity System ID:** 25973
- **Activity Narrative:** ACTIVITY DESCRIPTION:
  This care and treatment activity relates directly to all HHS Nigeria Adult Care and Treatment COP09 activities.

  To support and enhance the USG Nigeria Care and Treatment activities, the USG team through the HHS/CDC Global AIDS Program (GAP) Office in Nigeria, has 2 full time staff positions planned that will focus on adult/adolescent palliative care/basic care and support issues. The care and support sub-budget also includes partial funding for two FSN salaries (shared with OVC or pediatric care), for (limited) international and required domestic travel, for training and also for minor support costs. Additionally, to support the USG Nigeria ARV services program, the USG team through the HHS/CDC Global AIDS Program (GAP) Office in Nigeria, has one full time staff position planned for adult ART services that will focus on supporting implementing partner ART issues. The adult treatment sub-budget also includes partial funding for two FSN salaries shared with care and support or pediatric ARV services, funding for (limited) international and required domestic travel, funding for training and also for minor support costs. Funds are not requested in COP08 for international TA as this is understood to be funded by the HQ operational plan (HOP). These staff members will be supervised by a Senior Clinical Services Manager across all Care and Treatment program areas funded under HHS/CDC M&S.

  These HHS/CDC adult care and treatment staff positions will coordinate with the USAID and DoD care and treatment staff and will provide direct quality assurance and program monitoring to HHS supported implementing partners. HHS supported treatment partners include: University of Maryland-ACTION, Harvard University SPH, APIN Ltd, Columbia University-ICAP, Catholic Relief Services-AIDS Relief, Vanderbilt University, University Research Corporation and Partners for Development. The HHS/CDC staff will also assist USAID staff in joint monitoring visits of USAID-supported treatment partners – Family Health International-GHAIN, LMS Associates, CHAN, AIDSTAR and NEPWHAN. USAID and CDC care and treatment staff will provide assistance as needed to the U.S. Department of Defense program with the Nigerian Ministry of Defense. Other partners providing care (but not treatment services) will also receive close monitoring by the CDC care and support staff. These include HHS-supported Africare, ECEWS and IFESH as well as USAID-supported Catholic Relief Services-7 Dioceses, CEDPA, Winrock and NELA.

  The USG care and treatment teams will provide technical support and capacity development to new partners undertaking care and treatment activities through the CDC RFA, USAID APS, and New Partner Initiative activities, as well as provide support to the Government of Nigeria at the National and State levels to promote Nigeria National policies, guidelines, and training activities. It is estimated that the care and treatment staff under this activity will provide monitoring and support to over 370 clinical sites in COP09.

  ICASS and CSCS charges related to these positions are funded under M&S in compliance with COP09 guidance.

### Table 3.3.08: Activities by Funding Mechanism

- **Mechanism ID:** 7405.09
- **Prime Partner:** John Snow, Inc.
- **Funding Source:** GHCS (State)
- **Budget Code:** HBHC
- **Activity ID:** 25669.09
- **Activity System ID:** 25669

- **Mechanism:** USAID Track 2.0 FS AIDSTAR
- **USG Agency:** U.S. Agency for International Development
- **Program Area:** Care: Adult Care and Support
- **Program Budget Code:** 08
- **Planned Funds:** $91,000
Activity Narrative: In COP09 AIDSTAR will provide adult treatment, care and support services to secondary Treatment Facilities and PHC centers. These services will take place in 3 states. Through primary and secondary facilities in COP09, AIDSTAR will provide ART services to underserved rural communities to reach adult patients. The number of patients to be reached will be determined as contract negotiations are finalized and will be reported to OGAC. A comprehensive package of care and support services will be provided to PLWHA and PABAs in the same period.

The package of care services provided to each PLWHA will include one clinical service with the basic care kit and two supportive services including psychological, spiritual, and PwP delivered at the facility, community, and household (home based care) levels in accordance with the PEPFAR and National care and support policies and guidelines. The basic care kit for PLWHAs in AIDSTAR sites include Basic Care Kit (ORS & SSS, LLITN, water treatment solution, water vessel, gloves, soap, condoms and IEC materials); Home-Based Care (client and Caregiver training and education in self-care and other HBC services); Clinical Care (basic nursing care, pain management, OI and STIs prophylaxis and treatment, nutritional assessment- weight, height, BMI, micronutrient counseling and supplementation and referrals) Laboratory Services (which will include baseline tests - CD4 counts, microscopy, chemistry, malarial parasite, OI and STI diagnostics when indicated); Psychological Care (adherence counseling, bereavement counseling, depression assessment and counseling with referral to appropriate services); Spiritual Care (access to spiritual care); Social Care (support groups’ facilitation, referrals, and transportation) and Prevention Care (Prevention with Positives). All PLWHAs’ nutritional status will be assessed at contact and on follow-up visits. By doing BMI and plotting on infant growth charts Micronutrients will be provided as necessary, and those diagnosed as severely malnourished will be placed on a therapeutic feeding program through wraparound services as well as direct funding. AIDSTAR will procure basic care kits through the SCMS central mechanism and OI drugs will be procured through mechanisms that ensure only NAFDAC approved drugs are utilized.

ART services at sites that are co-located in facilities with TB DOTS centers will have the services integrated to facilitate TB/HIV service linkages. All PLWHA will have CD4 counts and other necessary lab analyses performed at least every 6 months to determine the optimal time and eligibility status to initiate ART and monitor for effectiveness/side effects for those on ART. AIDSTAR will continue to work with PwP activities including: adherence counseling; syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and behavioral counseling to achieve risk reduction; counseling and testing of family members and sex partners; counseling for discordant couples; IEC materials and provider delivered messages on disclosure. Cotrimoxazole prophylaxis will be provided for PLWHAs when CD4 <200 or prior TB or other AIDS defining illnesses. AIDSTAR will support a pilot program for cervical cancer screening in HIV positive women.

AIDSTAR will collaborate with faith-based organizations (FBOs) to achieve these targets by recruiting volunteers and community-based organizations (CBOs). Through these partnerships clients in care will receive a comprehensive package of community and home based care services. AIDSTAR HBC teams comprising nurses, community health workers and trained volunteers are supported by AIDSTAR to provide HBC services as well as facilitate support group activities. HBC providers will use HBC kits. AIDSTAR partners will focus on improving pre-ART retention in support groups. Strategies to retain clients in care include intensive home visits by HBC team during the first 6 months of enrolment.

All sites will consolidate on their capacity to provide comprehensive quality ART services through management of OIs and ART, a safe, reliable and secure pharmaceutical supply chain, technologically appropriate lab diagnostics, treatment preparation for patients, their families and supporters and community based support for adherence. This technical and programmatic assistance utilizes on-site mentoring and preceptorship. It also supports the development of site specific work plans and ensures that systems are in place for financial accountability. AIDSTAR partners will adhere to the Nigerian National ART service delivery guidelines including recommended first and second line ART regimens. In addition, AIDSTAR will partner with Clinton Foundation and Global Fund as appropriate to leverage resources for providing antiretroviral drugs to patients.

Monitoring and evaluation will be carried out by a team of trained volunteers working in the communities who work with AIDSTAR data officers and M and E unit officers. In addition, data generated will be shared with local government areas to allow for them to track their clients and provide ongoing support for sustainability. Registers, forms, and other data tools will be provided and replenished as necessary and staff trained in their use AIDSTAR will report on sex distribution of PLWHA's receiving care and support services and the numbers of PLWHAs reached with community home based care. Personnel will be trained in the use of registers for documentation and data reporting.

In COP09 AIDSTAR partners will continue to strengthen institutional and health worker capacity through the training, retraining and mentoring of health service providers to provide care and treatment services at the facility and community levels. Doctors, pharmacists, nurses, counselors, and community health extension workers will receive training and onsite mentoring that will allow them to provide comprehensive care. Training will maximize use of all available human resources including a focus on community nursing and community adherence. Care and Treatment trainings will be based on the national curricula. AIDSTAR will collaborate with the GoN and other stakeholders to develop task shifting strategies to enable nurses and community health officers to provide ART. Training targets will be set as contract negotiations are finalized.

In COP09 AIDSTAR will conduct 2-week intensive didactic and practical trainings preceding site activation followed by regular onsite mentoring. APS 2 will also train community volunteers including PLWHA and religious leaders to provide peer education counseling, psychosocial and spiritual counseling, respectively. AIDSTAR will use GON/USG recommended standardized training curriculums, manuals and training aides for all trainings. Information, education and communication materials will be provided to enhance these trainings. AIDSTAR partners will work closely with the USG and GoN team to monitor quality improvement at all sites and across the program. Health care workers will benefit from these trainings referred to above in HIV Care, Treatment and Support.
Activity Narrative: A key component for successful ART is adherence to therapy at the household and community levels. PLHWA on treatment are encouraged to have a treatment support person such as a family member to whom he/she had disclosed HIV status to improve support in the home and increase adherence. AIDSTAR will continue to build and strengthen the community components by using nurses and counselors to link health institutions to communities. Each site will appoint a staff member to coordinate the linkages of patients to all services. This will also build the capacity of sites for better patient tracking, referral coordination, and linkages to appropriate services. These activities will be monitored by the AIDSTAR technical and program management regional teams.

In COP09, AIDSTAR will continue to strengthen its expanded Quality Improvement Program (QIP) consisting of the annual cross sectional Outcomes & Evaluation (O&E) exercise, the GON/USG supported HIVQual monitoring and the quarterly Continuous Quality Improvement (CQI) activities in order to improve and institutionalize quality interventions. AIDSTAR partners will standardize patient medical records to ensure proper record keeping and continuity of care at all sites. Monitoring and evaluation of the AIDSTAR ART program will be consistent with the national plan for patient monitoring. The specialists will conduct team site visits at least quarterly during which there will be evaluations of infection control, the utilization of National PMM tools and guidelines, proper medical record keeping, efficiency of clinic services, referral coordination, and use of standard operating procedures across all disciplines. On-site technical assistance (TA) with more frequent follow-up monitoring visits will be provided to address weaknesses when identified during routine monitoring visits. Some of the data will be used to generate biannual life table analyses that identify factors associated with early discontinuation of treatment. In addition, at each site an annual cross sectional evaluation of program quality shall consist of a 10% random sample of linked medical records, adherence questionnaires and viral loads to examine treatment compliance and viral load suppression for adult patients who have been on treatment for at least 9 months. A similar process will be undertaken for all children who have been on ART for at least 9 months. Each of these activities will highlight opportunities for improvement of clinical practices.

Sustainability lies at the heart of the AIDSTAR program, and is based on durable therapeutic programs and health systems strengthening. AIDSTAR will focus on the transition of the management of care and treatment activities to indigenous organizations by actively using its extensive linkages with faith based groups and other key stakeholders to develop a transition plan that is appropriate to the Nigerian context. The plan will be designed to ensure the continuous delivery of quality HIV care and treatment, and all activities will continue to be implemented in close collaboration with the Government of Nigeria to ensure coordination, information sharing and long term sustainability. For the transition to be successful, sustainable institutional capacity must be present within the indigenous organizations and sites they support; therefore, AIDSTAR will strengthen the selected indigenous organizations according to their assessed needs, while continuing to strengthen the health systems of the sites. This capacity strengthening will include human resource support and management, financial management, infrastructure improvement, and strengthening of health management information systems.

AIDSTAR will continue to participate in Government of Nigeria (GON) harmonization activities and to participate in the USG coordinated clinical working group to address ongoing topics in ARV service delivery.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
AIDSTAR’s expansion of adult care and treatment activities, including effective linkages with HBC providers, will contribute to increased access of such services to underserved rural communities. By providing services to XXX Adult PLHWA, AIDSTAR will contribute to the overall PEPFAR care and support target of providing these services to 10 million people globally by 2009 and will help accomplish the PEPFAR Nigeria target of placing XXX clients on ART by 2009 and will also support the Nigerian government’s universal access to ART by 2010 initiative. This activity contributes to the overall AIDSTAR comprehensive HIV and AIDS services by providing the supportive services for all adult PLHWA including those on ART.

LINKS TO OTHER ACTIVITIES:
AIDSTAR activities in adult care and treatment are linked to HCT), PMTCT, ARV drugs, laboratory, OVC, Sexual Prevention, Medical Prevention, TB/HIV and SI to ensure that PLHWA and their family members have access to a continuum of care. AIDSTAR will continue to collaborate with the program of the AIDSTAR to establish networks of community volunteers to support livelihood development program for PLHWA and caregivers requiring such services and support identified child or adolescent headed households to be linked with other OVC programs which will meet the needs of the household. Networks will be created to ensure cross-referrals and sharing of best practices among AIDSTAR and other implementing partner sites for the provision of psychosocial support and community and home based services to PLHWA. Effective synergies will be established with the Global Fund to Fight AIDS, Tuberculosis and Malaria through harmonization of activities with GON and other stakeholders for harmonization of basic care and support services and the standardization of training manuals for community volunteers and providers.

POPULATIONS BEING TARGETED:
This activity targets PLHWA, particularly those who qualify for the provision of ART, including PMTCT clients from rural and underserved communities. This activity also targets CBOs and FBOs for capacity building and targets care providers (healthcare professionals and community volunteers) for training.

EMPHASIS AREAS:
This activity will include emphasis on human capacity development specifically through in-service training and task-shifting, local organization capacity building for community mobilization and participation, development of networks/linkages/referral systems, and quality assurance/ quality improvement. This activity will also ensure gender equity, ensuring access to ART through linkages with PMTCT services, addressing male norms & behaviors, increasing women’s legal rights and access to income & productive resources, and reducing violence & coercion against women. AIDSTAR will work with CBOs, networks of PLHWA and FBOs and other USG/GON programs to promote economic strengthening activities; education and safe...

#### Water

Estimated amount of funding that is planned for Water: $8,500

---

**Activity Narrative:** water initiatives, and create access to food and nutritional services. The extension of this activity into rural and previously underserved communities will contribute to the equitable availability of ART services in Nigeria and towards the goal of universal access to ARV services in the country. This activity will improve the quality of life of PLWHA and thus reduce the stigma and discrimination against them.

**Mechanism:** USAID Track 2.0 APS TBD

**USG Agency:** U.S. Agency for International Development

**Program Area:** Care: Adult Care and Support

**Program Budget Code:** 08

**Planned Funds:** [Redacted]
Activity Narrative: ACTIVITY DESCRIPTION:
The funds requested to support USAID's Annual Program Statement (APS No. 620-05-007: Support to Civil Society Organizations/Faith Based Organizations Network to Provide HIV/AIDS Prevention, Care and Support Services) for this program area are required for 3 distinct phases related to awards under this open solicitation: partial first year funding of pending awards, second year funding of pending awards, and new awards that may arise out of the open APS solicitation.

First year funding resources is required for new awards that are in progress and will be partially funded using COP07 funds. These applications have passed both the concept paper and full application reviews by the Technical Evaluation Committee (TEC) and are in the final stages of negotiation, with awards expected in October 2007. Details of these awards are still procurement sensitive; however awards are being negotiated with many new local partners that will be awarded as Prime partners.

Second year funding resources are required for these same partners to continue with activities throughout the COP08 funding period. Three of these expected awards have Basic Care & Support components.

The current APS will be amended to solicit applications to fill specific gaps in the program and will be re-posted in October 2007. Resources will be required to fund initial awards of applications selected during the COP08 program period.

The total funding that will be required covers these 3 phases under the Basic Care and Support program area is $400,000.

One of the cornerstones of the CSO/FBO APS is to reach out to national/regional-level agencies that have many chapters or branches that can in turn, reach out to community-based organizations. This will allow local programs to reach deep into communities and help the Emergency Plan in Nigeria go to scale. The CSO/FBO APS was also created to build the capacity of local organizations working in HIV/AIDS because a significant number of Nigerian organizations are new; have little organizational capacity; and often lack linkages with other programs. The CSO/FBO APS will only fund applicants that have clear plans to build their own technical, organizational, and administrative capacities and linkages with other programs.

Community participation in HIV/AIDS prevention programs often provides a strong foundation for integrating prevention messages into all care and support interventions. The CSO/FBO APS will support rapid scale up of the reach and scope of existing activities implemented by NGOs with larger networks or partners that enter into strong consortia. Grantees under the CSO/FBO APS will implement clinical and hospice care programs through several of the following activities: routine clinical monitoring and assessments through laboratory and clinical evaluations; preventing OI's with isoniazid or cotrimoxazole prophylaxis; providing patients with bed nets, water guard, and other standard home care kit items; nutritional assessment and counseling, and provision of therapeutic feeding to severely malnourished individuals; promotion of personal and household hygiene; assessment and management of HIV-related psychosocial problems; basic nursing care; monitoring of adherence to medications; mental health counseling; family care and support groups, and treatment of HIV-related psychiatric illnesses, such as depression and related anxieties. The CSO/FBO partners will also provide end of life bereavement care for patients and families, as well as succession planning and referrals for orphans and vulnerable children.

Several CSOs/FBOs will also provide spiritual care for individuals in their communities through: life reviews and assessment counseling and life-completion task counseling. It is expected that much of this will be done through community-based groups and support activities that may also work on the development of PLWHA leadership; reducing stigma; providing legal services; assisting in applications for government grants, housing, etc.; and other activities to strengthen affected households and communities.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
As has been the case with the APS in the past, targets are negotiated with each awardee based on the proposed program and geographic area during award negotiations and in accordance with specified minimum cost/targets. After being approved by the TEC, O/GAC is copied on the award memo to the Contracts Officer to ensure that appropriate targets and associated costs have been negotiated. Targets and related awardee information will be uploaded into COPRS at that time.

The programs will increase the reach of care and support programs into rural areas in high prevalence states with a focus on underserved populations.

This activity substantively contributes to Nigeria's 5-Year Strategy by developing strong links between the care and support programs and treatment and prevention programs, while also providing support to new indigenous partners.

LINKS TO OTHER ACTIVITIES:
The care and support partners awarded under the FY 08 APS will implement other activities across the spectrum of program areas and are expected to provide clear linkages between their own activities and programs that implement prevention with positives activities. Partners will also be expected to provide referrals and linkages to malaria initiatives to ensure that patients have access to LLITNs as well as access to safe drinking water. Other referrals will be made to impatient and provincial hospitals when necessary. End of life bereavement activities for patients and families will have strong linkages to succession planning and referrals for orphans and vulnerable children. Grantees will also be expected to strengthen the supply chain for OI drugs and reagents, by supporting or buying into existing supply chain systems.

The overarching focus of the APS has been to bring new local partners to the current mix of partners providing prevention, care, and treatment in Nigeria. It has been successful in many ways, however challenges related to local partners' management capacity have slowed the process and have created uncertainties about their ability to implement in the accountable and transparent manner required by the USG of their recipients. Therefore the Leadership, Management, and Sustainability (LMS) project was
Activity Narrative: added to the portfolio in COP07 specifically to assist with these and other capacity building activities (#9758). They will not only guide new partners through the solicitation and award process, but they will assist them to put accountable and transparent systems in place that allow their first year of implementation to proceed smoothly and to ensure rapid achievement of results. Although the CTO’s and activity managers for these new local partners will remain within the USAID technical team, LMS will be a key member of the extended team and will provide invaluable support in developing the capacity of the new awardees. All of the local partners applying for APS funds can benefit from the management support being provided by LMS. In addition, LMS will provide technical assistance specifically in the Basic Health Care and Support prevention area as many local partners may not have this type of institutional capacity at the time of award.

POPULATIONS BEING TARGETED:
Populations targeted in pending awards include communities reached by PLWA support groups, and faith-based communities reached by Parish Action Committees on AIDS.

EMPHASIS AREAS:
As all awards resulting from the APS are to local partners with strong roots in the community and therefore all will have a major emphasis on Community Mobilization/Participation and Local Organization Capacity Building. The service delivery component of these awards will have a key focus on information, education, and communication in the community and will build linkages with other sectors and initiatives.

### Table 3.3.08: Activities by Funding Mechanism

**Mechanism ID:** 3689.09

**Prime Partner:** Catholic Relief Services

**Funding Source:** GHCS (State)

**Budget Code:** HBHC

**Activity ID:** 5366.24870.09

**Activity System ID:** 24870

**Mechanism:** USAID Track 2.0 CRS 7D TBD

**USG Agency:** U.S. Agency for International Development

**Program Area:** Care: Adult Care and Support

**Program Budget Code:** 08

**Planned Funds:** $1,400,000
**Activity Narrative:** ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In COP09, CRS 7D will provide comprehensive BC&S to 20,000 People Living with HIV (PLHIV) and 60,000 People Affected by HIV/AIDS (PABAs) in 13 arch/dioceses (mega sites) in 8 states of Nigeria. CRS 7D will continue to provide basic health care services in 5 saturated stand-alone and Primary Health Care (PHC) facilities and client households across 251 parishes which are sub-sites from the mega sites totaling 65 PHC sites. Program growth in COP 09 will be focused in 5 saturation parishes in each of the 13 dioceses. The total number of sites (parishes) will not increase in COP09 from COP08.

CRS 7D will continue to involve more PLHIV in the provision of palliative care services through recruitment of HIV+ volunteers and Support Groups composed primarily of PLHIV. Under social support, economic strengthening will be provided to PLHIV and PABAs through individual/group grants and promotion of Savings and Internal Lending Community (SILC) – a CRS program that works with groups to leverage internal savings as a mechanism for raising loan capital for group members. The SG+ members will be expected to pay little intrest for the money they borrow which will eventually form capital for the groups. This approach has been successfully implemented in South Sudan. 500 PAVs and SG+ members will be trained to increase their capacity to provide care, support and prevention in households, communities and PHC facilities.

Staff capacity enhancement will focus on PAV recruitment, motivation and retention. CRS 7D will explore different mechanism of motivating volunteers in COP 09. These may include extension of economic strengthening support through formation of SILC groups or through recognition of the best performing volunteers by offering them awards.

COP 09 ACTIVITY DESCRIPTION:

In COP09, CRS 7D will provide comprehensive BC&S to 20,000 People Living with HIV (PLHIV) who were already tested in the 135 CT service outlets according to FGON Guidelines in 9 states (Kogi, Benue, Plateau, Nassarawa, Niger, Kaduna, Edo, Cross River and Lagos states) including the FCT & registered by sub-partners; and 60,000 People Affected by HIV/AIDS (PABAs) in 13 arch/dioceses. CRS 7D BC&S will continue to provide basic health care services in 5 saturated stand-alone and Primary Health Care (PHC) facilities and client households across 251 parishes which are sub-sites from the mega sites totaling 65 PHC sites. Program growth in COP 09 will be focused in 5 saturation parishes in each of the 13 dioceses. CRS 7D will continue to involve State Ministry of Women Affairs (SMoWA), SMoH, SACA & LGA staff in M&E visit to partners & training. The total number of sites (parishes) will not increase in COP09 from COP08. The program will piggyback on activities of other program within 7D, SUN & AIDS Relief (AR) for delivery of BC&S services to all those that require them. Clients will be linked to nutritional services as identified including leveraging CHAI’s resources.

CRS 7D will continue to support dioceses in developing institutional relationships with at least 5 PHC facilities to provide basic clinical services to PLHIVs including: basic laboratory monitoring for Ols; urine & stool analyses; STI & malaria treatment; basic OI prevention (CPT) & management. Management of Ols will include treating basic Ols including malaria & syndromic management of STIs; LFT for PLHIV, hemoglobin estimates, CD4 count & other advanced HIV disease laboratory diagnostic tests will be referred to AIDSRelief (AR), & other USG IP supported sites, HIV+ pregnant women will be prioritized for CD4 testing & linked to HAART if needed. Clients will also receive PwP services at facilities and in the communities.

For HBC services, CRS 7D will continue to support non-paid PAVs & Support Groups of People Living Positively (SGP+) in the sites to provide non-clinical BC&S Services. In both cases, CRS 7D will continue to involve more PLHIV in the provision of palliative care services through recruitment of HIV+ volunteers & Support Groups composed primarily of PLHIV. CRS 7D will provide a basic preventive self care package including, provision of ITN, water guard, water vessels, soap, ORS & basic first aid materials. Prevention for positives will be incorporated into home visits & support group meetings through targeted messaging on Abstinence & Be Faithful, counseling for discordant couples, & provision of complete & accurate information/referrals for other prevention methods.

Under psychological care, 7D will provide psychosocial & spiritual counseling for PLHIV & PABAs, facilitate SGP+ & adherence counseling. Counseling will address prevention, mental health, disclosure, crisis, bereavement & adherence to all medication including ART, INH & CPT.

Under social support, economic strengthening will be provided to PLHIV & PABAs through individual/group grants & promotion of Savings & Internal Lending Community (SILC) – a CRS program that works with groups to leverage internal savings as a mechanism for raising loan capital for group members. Nutrition & health education emphasizing personal hygiene & proper disposal of waste will continue to be provided.

Under spiritual care, 7D will be sensitive to the culture and rituals of the individuals & communities it interacts with. With the 7D stigma & discrimination curriculum, 7D will train more clergy, traditional & spiritual leaders on how to provide non-stigmatizing care.

7D will collaborate with the CRS SUN & AR programs in planning & providing holistic services to PLHIV & families with infected individuals or OVCs. Mechanisms will be developed that allow the flow of human, material & financial resources among the programs for effective leverage of each program’s comparative advantage. Coherently planning centrally and implementation in project sites will ensure seamless integration for service beneficiaries.

AR & 7D ART & PMTCT sites will also provide palliative care for HIV+ pregnant women, PLHIV & OVC with back & forth linkages among the 3 programs for ART, health, educational, social support & other services.

Through integrated activities among the three programs, PAVs and SGP+ will be given information that will increase their capacity to provide care, support and prevention services in households, communities and PHC facilities. 500 PAVs and SGP+ members will be trained using FGON C&S providers’ manual & CRS HBC manual to increase their capacity to provide care, support and prevention in households, communities and PHC facilities.
Activity Narrative: & PHC facilities. Volunteers will continue to use HBC kits with the following contents 2 kidney dishes, a pair of forceps & scissors, dressings, protective wears – disposable gloves, plastic aprons makintosh, bleach e.g. jik, washing materials e.g. plastic bowl, soap, towel soap container, lotions – calamine, ointment – unscented petroleum jelly & waterguard bottles. Provision will be made to replenish the HBC kit contents after each home visit. Each PHC facility is expected to reach 300 PLHIV with BC&S services. 7D will engage SGP+ & PAVs in capacity building that will promote linkages between SGP+, PAVs & PHC facilities for optimal utilization of health facilities & community resources. Service directories will be placed in strategic places such as SGP+ meeting places & HCT centers.

In COP08 CRS carried out Training of Trainers (TOT) on food security and nutrition for Diocesan staff, who will step down the training to the volunteers to increase their service provision to PLHIV. CRS through collaboration with Clintons Foundation will leverage the supply of fortified nutritional supplements to PLHIV as appropriate. CRS will continue to encourage food security & advocate to the dioceses to support food supplementation to PLHWA, as this has been the practice for the past two years.

Staff capacity enhancement will focus on Partner Staff training, PAV recruitment, motivation & retention FGoN Providers’ manual and CRS HBC C&S manual. CRS 7D will explore different mechanisms of motivating volunteers in COP 09. These may include extension of economic strengthening support through formation of SILC groups or through recognition of the best performing volunteers by offering them awards. For hard to reach areas, CRS 7D will carry out advocacy with diocesan authorities to facilitate PAVs with motorbikes & fuel on days when they carry out home visits. Site hiring practices will be encouraged to draw from experienced PAVs & SGP+. HBC Kits & other necessary tools will continue to be given to volunteers.

One PAV or SGP+ member will be assigned to a PHC center to triage with the PHC facilities & PLHIV & SGP+ to facilitate access to clinical services. S/he will work with Diocesan Action Committee on AIDS (DACA) staff to develop effective patient follow-up & referral mechanisms that bridge the health facility-community gap. 7D will leverage 7D PMTCT & AR sites in the provision of advanced clinical services.

Organizational development support including administration & financial accounting will be given to PHC, SGP+ & partners to position them for effective participation in BC&S service delivery. Transportation & health care costs for caregivers & clients requiring specialized care not obtainable in immediate PHC will be incorporated.

PAVs are trained to effectively collect data using standardized M&E tools & are monitored by DACA staff during home visits and as they fill the forms using the information generated. PLHIV are only counted as direct beneficiaries when they access 1 clinical & at least 2 services from the other domains (psychological, social, spiritual) then supplemental direct if they access only 1 service. Given the diversity of the package of services PLHIV receive from different IPs, double counting of services will be highly probable. To avoid this, 7D in collaboration with other USG IPs will develop a tracking mechanism that follows the different services from AR and other USG supported IPs.

CONTRIBUTIONS TO OVERALL PROGRAM AREA:
These BC&S services will contribute to several of the PEPFAR goals. The goal of mitigating the impact of HIV/AIDS will be achieved by the provision of BC&S services. This activity will also contribute to the goal of providing treatment to HIV+ individuals, as adults who are eligible for ART will be referred for these services.

LINKS TO OTHER ACTIVITIES:
BC&S relates to other HIV/AIDS activities to ensure continuity of care for persons accessing BC&S through the 7D. This activity links with Prevention of Mother to Child Transmission (PMTCT) (#5448.08), Voluntary Counseling & Testing (#5422.08), Abstinence & Be Faithful (#5312.08) and OVC (5407.08) and SI activities (#9913.08) being undertaken by CRS 7D. Given the increased integration of CRS programming, there will also be close links to the activities across program areas being undertaken by CRS AIDSRelief especially their ART activities (#6678.08).

POPULATIONS BEING TARGETED:
The populations to be served include children & youth, PLHIV & their families, caregivers & widows/widowers within the 13 Arch/dioceses, LGA staff, clergy and lay people & health workers. Through linkages with other program areas (PMTCT, VCT, ART), recently diagnosed HIV positive adults (including TB-HIV) in these communities in need of BC&S are also targeted. Pediatric C&S clients will be assisted through a family care approach and referred to the SUN program for additional child-centered services.

EMPHASIS AREAS:
The emphases of the BC&S Program activities are local organization capacity development, training, developing networks, linkages & referral systems. These activities will include an emphasis on reducing stigma associated with HIV status and the discrimination faced by individuals with HIV/AIDS & their family members. HIV prevention will include gender sensitive activities which will address behaviors, social norms & resulting inequalities between men & women that increase the vulnerability to & impact of HIV/AIDS.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS,

Significant changes from COP08 to COP09 for this activity include:

- Reduction of individuals to be served from 80,860 in COP08 to 23,000 in COP09.
- Reduction of the number of implementing agencies from 65 to 41.

As part of the exit strategy, CEDPA intends to:

- Strengthen the organizational management systems and leadership skills of the community based organizations (CBOs) and faith based organizations (FBOs) to optimize the delivery of home based care services at the community level.
- Facilitate formation and/or strengthening networks and linkages of community/home based care services to health care facilities.
- Support women in their care-supporting role by linking them to micro-credit finance opportunities.
- Ensure that women’s practical needs are addressed by involvement of women and young people through greater representation of women groups, PLWHAs and people with gender expertise.
- Enlist support of males within households in the care of PLWHAs.
- Refer back to GHAIN, other implementing partners (IP) and Nigerian government departments all clients recruited in COP 08 for continuation of care and treatment.

The community/home-based services of Positive Living (PL) compliment facility-based care and support provided at secondary and tertiary level hospitals. In COP 09, Basic care and support (BC&S) activities will scale down activities to focus on consolidating structures for care and support delivery and community level referral networks developed in COP 06-08. PL Community Home based Care (CHBC) services will be offered to clients from selected GHAIN-supported ART sites in 20 states namely: FCT, Lagos, Bauchi, Kano, Edo, Cross River, Anambra, Kogi, Niger, Benue, Imo, Enugu, Taraba, Adamawa, Sokoto, Zamfara, Kebbi, Katsina, Nasarawa and Akwa Ibom. A total of 69,000 people will be reached and these will include 23,000 people living with HIV/AIDS (PHA) and 46,000 people affected by AIDS (PABA). At least 41 Primary health care (PHC) facilities will be supported to provide medical care services required for prevention and treatment of opportunistic infections. These facilities are referred to as triage centers where patients who are very sick are stabilized before referral for advanced care and support. CEDPA works in partnership with existing local NGOs/FBO and government owned PHCs in the communities. The facilities are supported with minor renovations, clinical equipment, and essential drugs to act as a one-stop centre for care and support services.

A total of 644 individuals will be trained and these will include 400 home based care (HBHC) volunteers, 164 care coordinators and 80 health care workers. The HBC volunteers will be trained in HIV counseling, care and support for PHA; the care coordinators will be given refresher training in supervisory roles; while the health care workers will be supported to get in-service training in clinical management of OIs. Training of home based care volunteers will be facilitated by CEDPA volunteers will be supervised by health workers who may be doctors, nurses, pharmacists, laboratory scientists or community health officers. HBC volunteers are selected from family members, PLWHAs, community healthcare workers, religious leaders. The HBC volunteers will be trained for a minimum of five days on HIV education, patient care and management of opportunistic infections using the National Guideline on Care and Support. Following the National Care and support Guidance and USG Palliative Care (PC) Policy, Positive Living (PL) will provide a Basic Care Package including clinical care, basic nursing care, provision of basic care kit, prophylaxis and management of opportunistic infections, referrals for laborotary services, nutritional assessments, counseling and adherence support, home-based care (HBC), and active linkages between hospitals, PHCs and communities; and training of healthcare providers and community volunteers. If funds allow, refresher trainings will be provided to all care providers trained in COP08. Trained volunteers will offer psychological and spiritual support to PHA and their families through group and individual counseling.

PL services will reach clients directly generated from communities as identified by HBC volunteers at HIV Counseling and Testing Centres (HCT) and provider intended testing and counseling (PTC) sites. All clients will be assigned to one of three categories and provided appropriate services: those who have just been tested but without major need for medical care will be offered basic care kit, psychosocial and spiritual support, nutritional assessment, prevention with positives (PwP), income generation activities IGA, and those with opportunistic infections will receive intensive adherence counseling, and regular home visits for monitoring and referral. Clients will be attached to specific home-based care teams for follow up. The home care teams, headed by a trained nurse or Community Health Extension Worker (CHEW) (as care coordinators) will conduct regular home visits and/or telephone contact to assess needs and ensure that registered clients are retained in the program. The identified needs will be addressed through counseling and referral to relevant services. The care coordinators will liaise with the referral focal persons at health care facilities to complement client tracking.

Clinical care services will be provided at 41 primary health care facilities (PHC) (at least 2 facilities per state) to complement care and support services offered at ART centers and general health care facilities and utilize an outreach HBC volunteer program will be trained on clinical management of AIDS related infections and the cross referral procedures. PL will enhance the capacity of PHC and other referral facilities in communities to diagnose and treat STIs by providing laboratory equipment such as specimen bottles, reagents, and drugs, while health workers will be trained on syndromic management of STIs where laboratories are not available. These facilities will serve as referral centers to which HBC volunteers and peer educators under PL’s Sexual prevention programs will refer clients for diagnosis and treatment of STIs. Each new client will receive a self-care kit consisting of ORS, insecticide treated net (ITN) and water guard, intimidation (IEC) materials, soap, latex gloves, condom and jerry cans. Basic Care and Support (BC&S) commodities will be purchased through open bidding mechanism from suppliers, after selection and recommendation is carried out by the procurement committee to management. Commodities like ITN, water guard and condoms will be procured from Society for Family Health (SFH). Home care kits containing latex gloves, calamine lotion, vaseline, genetian violet, paracetamol, a pair of scissors, forceps, cotton wool, non sterile gauze, antiseptic soap, soap case, and disinfectant liquid (JIK) provided to HBC volunteers in COP 08 will be replenished regularly to ensure constant supplies needed. The HBC volunteers will link PLWHAs, their families, and...
Activity Narrative: community members to anti-retroviral therapy centres, TB treatment centres, HIV/AIDS related services and social welfare services for orphans and vulnerable children (OVC). CEDPA will work with other partners towards providing nutritional supplements for its clients.

To strengthen the HBC volunteer program and improve quality of care, 2 implementing agencies will be selected in each state and mentored to become coordinating agencies through whom CEDPA will support other smaller IAs and support groups to be referred to as satellite groups. The selected IAs will form a core of hubs consisting of other IAs and support groups that CEDPA has been working with through COP 06-08. CEDPA working closely with PHCs will provide minimum/basic package of care and support services. The basic care package includes provision of Basic Care Kit (ORS, ITN, water guard, cotton wool, gloves, soap, Vaseline, Gentian Violet, methylated spirit); Home-Based Care (Client and caregiver Training and education in self-care); Clinical care (Basic nursing care, pain management, OI and STIs prophylaxis and treatment, Nutritional assessment and referrals, Laboratory services; baseline tests Hematology, MP, OI and STI diagnostics when indicated); Psychological (adherence counseling, Prevention with Positives, Bereavement counseling, Depression Assessment and counsel); Spiritual care. (access to spiritual care); Social supports: (package of care and support services); The coordinating IAs will be linked to the PHC facilities to manage a one-stop center where adults and children (PHA and PABA) will access psycho-social services, HIV prevention information and linkage to medical treatment from the triage centers. The IAs will be encouraged to establish day-care programs where PHA and PABA can share experiences and learn skills for coping with the impact of HIV/AIDS. Referral/Care coordinator attached to each HBC team will meet monthly with representatives of the IA and the facility to redistribute clients for effective management as the need arises.

Local government staff will be involved in the selection of triage centers and the selection of volunteers for sustainability and ownership. CEDPA will continue to participate in the TWG on training manuals, attend quarterly meetings, joint supervisory visits and be available in any other capacity that its presence or assistance may be required by the USG/GON. CEDPA uses a set of community based care and support monitoring tools to report care and support services. These tools include beneficiary household assessment forms, caregiver services forms and client registries and M&E focal persons will be trained in the use of these tools. The M&E Officers at the State level shall provide technical assistance to the CBOs/FBOs on data collection and reporting. The M&E Officers conduct routine monitoring visits to CBOs/FBOs for data quality assurance and advice on quality improvement processes. The State reports shall be collated at the Country Office after conducting routine quality checks on reported service statistics. CEDPA care and support monitoring tools have variables to capture separately clients recruited from GHAIN and non GHAIN sites. Referrals and linkages to ARV treatment will also be supported. Linkages to GHAIN and other USG partners providing care and support at healthcare facilities will be strengthened, to ensure that all PHAs receive community/home-based care services. Care coordinators will be placed in facilities providing ART, VCT, PMTCT and pediatric care and support services to register all those patients who may require HBC services and offer information on follow-up support for PHA. Planning and review meetings will be held regularly with partners to maintain effective referral.

Social-economic support will be provided to 800 individuals in 41 groups enhanced by seed grants between $ 4310- $ 8620 per group and vocational training for income-generation will be maintained in Kano, Benue, Bauchi and Imo states through close monitoring and supervision of on going activities. This activity will be facilitated by partnering with microfinance banks Priority will be given to households headed by children, the elderly, and PLWHAs who lack regular sources of income. Seed grants will be provided to small groups of PLWHAs and their families to invest in small-scale businesses and revolving funds for health care. This activity will benefit an additional 8 groups through re-investment of funds to be disbursed by OCEANIC bank.

POPULATIONS TARGETED: The primary beneficiaries of PL care and support services are PHA and their families. Community volunteers, and caregivers of PHA will be trained. Since women form most of PL’s beneficiaries, extra effort will be taken to reach out to men as community leaders and partners of PHA to increase male involvement in HIV care and support.

CONTRIBUTIONS TO OVERALL PROGRAM AREA: The planned community/home-based care and support interventions will contribute to the overall PEPFAR care and support goal by reaching 23,000 PHA and 46,000 PABAs with community basic care and support services. PL will work with stakeholders at all levels, to strengthen community systems for the provision of quality care to PHA and their families; build community capacity to deliver care and support by training a total of 644 community resource persons and improve the economic capacities of PHA.

LINKS TO OTHER ACTIVITIES: BC&S activities will be linked to CEDPA’s HVTB, HVOP, and HKID programs. Activities will be linked to HBOV, HVOP, HVTB, HKID, HVCT through training PLWHAs on various aspects of HIV prevention and control of OIs. PL will strengthen and consolidate linkages with stakeholders, particularly GHAIN, SFH, and GoN, to provide care and support packages for OVC and establish linkages between HVCT centers and care outlets. This will improve utilization of MTCT, HKID, HVTB, HTXS and HLAB services and enhance community participation in care for PLWHAs and ensure service quality. PL will refer for wrap around activities - social services, food and livelihood opportunities. Girl-headed households will be linked with supportive women’s groups to provide them with psychosocial support and protection. Follow-up supportive supervision will be provided. At each site, PL activities will strengthen linkages to AB and OP prevention activities as integral parts of home-based care for OVC offered by care givers. Those linkages already established will be strengthened with TB/HIV intervention programs, PMTCT services, USG-funded immunization projects and child welfare services.

EMPHASIS AREAS: PL will advocate for reduced stigma and discrimination at all levels, increasing acceptance of PHA within communities. Interventions will increase gender sensitivity in programming by targeting vulnerable young
**Activity Narrative:** girls and women, and promote male involvement in care and support. Emphasis will be placed on capacity building of care providers and implementing agencies.

**New/Continuing Activity:** Continuing Activity

**Continuing Activity:** 13014

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS: Care and treatment narratives were fused.

By the end of COP 08, the Global HIV/AIDS Initiative Nigeria (GHAIN), in collaboration with the Government of Nigeria (GON) and several Faith Based Organizations (FBOs), has supported the provision of antiretroviral therapy (ART) services to over 63,000 HIV infected adults in 112 comprehensive ART sites in 36 states and the FCT. It is estimated that the number of individuals who will have accessed HIV-related palliative care (excluding TB/HIV) at the end of the GHAIN reporting period will be 95,563. In COP 09, GHAIN will continue to provide HIV comprehensive care and treatment services including antiretroviral therapy (ART) to eligible patients through continued support to the existing 112 sites. GHAIN will enroll 5500 new adult patients on ART. Taking into consideration attrition rate, it is estimated that a total of 63,317 adult patients will be on ART by the end of COP 09.

GHAIN will sustain its extensive experience in supporting comprehensive ART services. In addition, GHAIN will strengthen appropriate HIV services at PHC facilities through a decentralized, integrated disease management approach at the LGA level, consistent with a district health management paradigm. To this end, GHAIN will adopt a three-fold strategy 1) on authorities to create a multi stakeholder committee that oversees the implementation of the program in the entire LGA; 2) contract an umbrella CBO to manage a portfolio of community based activities and 3) link community based activities, PHC and comprehensive sites through a strong and well coordinated referral mechanism to actualize the continuum of prevention, treatment, care and support services.

In this model of service delivery, GHAIN will engage relevant stakeholders, especially the NPHCDA and the relevant disease control programs, officials to increase access not only for HIV/AIDS, but also for sexual and reproductive health and TB services in the LGA. This model will promote compliance with care and treatment national guidelines for that level of care, the integration of prevention into care and treatment services, the promotion of adherence and treatment education, clinical monitoring, management of OI and related laboratory services within the framework of available funds and GON policies. GHAIN will also pilot the task shift of ARV refills from comprehensive to PHC facilities, which will be closely monitored in line with national policies and guidelines.

In COP 09, GHAIN will strengthen the capacity of both the public and private sector (where appropriate) sites to implement harmonized quality services with strong focus on adherence, patient retention and ensuring durability of first and second line drugs. This includes the promotion of gender equality and stigma and discrimination reduction activities. 255 health care workers will be re-trained on ART services and the management of opportunistic infections. At the PHC level, community health officers (CHOs), community health extension workers (CHEWs) and nurses will be re-trained using the IMAI tools on relevant aspects of HIV/AIDS services including ARV refill. GHAIN will re-train community pharmacists and will investigate the possibility of engaging with private medical practitioners to support treatment at this level. Laboratory services with CD4+ count testing capacity will be available in all sites. Pregnant women in PMTCT settings who require ART for their own health will be referred and fast tracked into care and treatment services.

Specific focus will be paid to retention of clients not on ART by strengthening our patient tracking system, linkages to support groups and other non ART services. Prevention for Positives will focus on primary and secondary prevention services for all PLWHA. GHAIN will provide or refer PLWHA to preventive care services (IEC, behavioral risk and change counseling, provision of condoms, contraceptive methods, OI prophylaxis, water sanitation, treatment education, ITN, nutritional counseling, micronutrients supplementation), and social services within the community. PLWHA enrolled with GHAIN will be linked to services where trained providers offer the syndromic management of STIs. GHAIN will ensure, within the confines of available funds and GON policies, that comprehensive sites and PHC centers provide facility based basic care and support services in line with the national palliative care guidelines. This includes clinical services (medical assessment, laboratory services including OI prophylaxis and treatment, nutritional assessment, pain and symptom relief), with basic care kit (ITN, water guard, water vessel, latex gloves, soap, condoms and IEC materials with appropriate PwP messaging) and any other two services from the domain of HBC, psychosocial, PWP, and other prevention services, psychosocial support, and end of life care.

GHAIN will continue to provide technical leadership in strengthening pharmacy systems and pharmacists’ capacity to contribute to the delivery of quality HIV/AIDS-related services at all levels of healthcare delivery in Nigeria (tertiary, secondary and primary health care facilities and the communities). GHAIN will re-train pharmacists in all comprehensive ART sites and private pharmacies in pharmaceutical care in HIV/AIDS and best pharmaceutical practices.

Patient management and monitoring will be strengthened in selected sites using GHAIN’s Lafiya Management Information System (LAMIS). The LAMIS software will be used both for backlog as well as real time entry of clinical and logistics management data at the ART clinic, pharmacy, laboratory and medical records points of service. Health care will be re-trained and mentored to routinely use LAMIS. The LAMIS will also be used by facility management for continuous quality assurance/quality improvement, program evaluation and strengthening drug and commodity inventory management. At national level, LAMIS will be used to evaluate the combined efforts of GHAIN supported care and treatment programs, generate important outcome data from patient cohorts, monitor treatment failure, enable program managers and government counterparts to identify priority areas for action and continuously improve the quality of ART service delivery in Nigeria. GHAIN will monitor of the impact of new care and treatment initiatives on service coverage, uptake and quality.

GHAIN will continue to support the national quality assurance/improvement program under the leadership of NACA and the FMOH, including evaluation efforts of the national ART program on all service levels. This will include the improvement of tools like HIVQUAL and the integration of national performance indicators into the HMIS and the LAMIS.

GHAIN will hold regular, scheduled meetings with CEDPA to explore strategic referral approaches to
Activity Narrative: ensuring that all clients attending facility based care in GHAIN supported sites also have access to quality home based care (HBC) services in 20 states where CEDPA operates namely Lagos, FCT, Kano, Cross Rivers, Bauchi, Anambra, Edo, Taraba, Imo, Enugu, Kogi, Adamawa, Benue, Niger, Katsina, Sokoto, Kebbi, Zamfara, Nassaraqa and Akwa Ibom. In States where GHAIN will be providing direct HBC and support, GHAIN will work closely with established facility based PLWHA support groups and care givers to provide HBC as part of an integrated care package to PLWHA in the 8 HAST model focus LGAs. GHAIN will also train 500 PLHA and other volunteers to provide HBC services to PLWHA. The HBC volunteers will also conduct advocacy for and referral to legal support, spiritual support, economic strengthening and shelter. In addition, they will be supported to carry out stigma and discrimination reduction activities, HBC services, psychosocial support, adherence counseling, referrals, contact tracing, basic nursing care, prevention with positives, provision of ITNs and safe water intervention (water guard), etc. HBC providers' kits (mackintosh, scissors, buckets, ITNs, water guard, analgesics, iodine, cotton wool, spirit, forceps, gauze) will be given to trained health care workers, volunteers and PLWHA. GHAIN will establish fora where care providers will meet on a regular basis to motivate each other, share experiences, and discuss various issues including ways of managing stress and other difficult situations. In line with GHAIN's continued support of the UNGASS MIPA principle, GHAIN will ensure that PLWHA participate actively in the planning of meetings and other care and support activities as appropriate.

GHAIN will participate in the joint supervisory visits that will be carried out by the GON/USG. Synergies will continue to be established with the GFATM grant to Nigeria. GHAIN will continue to strengthen its exit/sustainability plan with the health facilities implementing comprehensive care and treatment programs to build their capacity and to customize a specific plan and schedule for each facility.

CONTRIBUTIONS TO OVERALL PROGRAM AREA
The provision of care and treatment services through this program will contribute to strengthening and expanding the capacity of the GON’s response to the HIV/AIDS epidemic and increasing the prospects of meeting the Emergency Plan’s goal of providing life - saving antiretroviral treatment to individuals. Decentralized services at the PHCs centers and community based institution at the LGA level will improve equity in access to HIV care and treatment services and system strengthening at that level.

LINKS TO OTHER ACTIVITIES
The GHAIN adult care and treatment services relate to: TB, HCT and HOP, HIV Drugs, PMTCT, HIV/RH integration program (supported by other non-PEPFAR USAID funds); community services that supports persons on ARV treatment (to encourage adherence; provide information to PLWHA who are not yet on ART; and promote HIV testing, etc); community and home based care services, include vocational training, income-generating activities, social legal protection, training and support of caregivers, etc.; and the multi-directional referral linkages that improve psychosocial support, adherence and reduce treatment failure and resistance.

POPULATIONS BEING TARGETED
This activity targets adult PLWHAs (male and female); TB patients who are HIV positive, pregnant women who are HIV positive and all high risk groups that are HIV positive.

KEY LEGISLATIVE ISSUES ADDRESSED
Task shifting in order to strengthen the capacity of lower level cadres at the PHC level to provide comprehensive care services. Reduction of stigma and discrimination both among health care workers and the general population. Promotion of gender equity in access to the care and treatment programs, by mobilizing both males and females to avail themselves of treatment opportunities.

EMPHASIS AREAS
This activity includes major emphasis on achieving improved access through integrated disease management (HAST approach), quality assurance/quality improvement with supportive supervision and minor emphasis on trainings.

Early Funding Narrative (if early funding needed, justify here; must be less than 1,000 characters, including spaces)
FHI GHAIN requests for early release of funds to meet its unexpectedly longer lead time for procurement of supplies and commodities, infrastructural upgrade and other activities necessary for the maintenance of clients on treatment, care and support during the initial months of the COP 09 period. It will be appreciated if GHAIN receives an early release of at least $3,864,681 (15%) of the funds under this program area for the purposes stated above.

#### Table 3.3.08: Activities by Funding Mechanism

- **Mechanism ID**: 632.09
  - **Prime Partner**: University of Maryland
  - **Funding Source**: GHCS (State)
  - **Budget Code**: HBHC
  - **Activity ID**: 3259.25242.09
  - **Activity System ID**: 25242

- **Mechanism**: HHS/CDC Track 2.0 Univ Maryland
  - **USG Agency**: HHS/Centers for Disease Control & Prevention
  - **Program Area**: Care: Adult Care and Support
  - **Program Budget Code**: 08
  - **Planned Funds**: $7,434,239
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Adult ARV Narrative: 22 PMTCT sites will be upgraded to provide treatment services. Training targets revised. More emphasis on HIVQual and Clinical QA/QI.

Care and Support Narrative: 22 PMTCT sites will be upgraded to provide care services. Training targets revised and highlights use of Master Trainers from 07 and 08 Health System Strengthening programming. Increased emphasis on basic care kits, PwP, home based care and management of acute malnutrition. Narratives merged.

ACTION will provide Care and Support Services to 113,000 HIV+ adults and support services to an additional 226,000 persons affected by AIDS (PABAs) as well as ARV services to 70,953 adults (7,953 new). In COP08 ACTION supported Adult Care and Treatment services at 78 sites (including 42 smaller secondary hospitals or Primary Health Care Centers (PHC) and DOTS satellite sites using the Hub & Spoke model. In COP09, ACTION will continue to provide services in these 78 sites and will upgrade 22 PMTCT sites, the majority of which are small secondary hospitals or comprehensive primary health centers (PHC) to Adult Care and Treatment satellites so that comprehensive services including ART will be provided in a total of 100 sites. These sites will be located in 23 states (Akwa Ibom, Benue, Cross Rivers, Delta, Edo, FCT, Gombe, Imo, Jigawa, Kaduna, Kano, Katsina, Kogi, Kwarai, Lagos, Nasarawa, Niger, Ogun, Osun, Plateau, Sokoto), Sites are chosen jointly with the GON to complement the national scale-up plan being supported by Global Fund (GF) and other IPs. Services at PHC satellite sites are provided using three different strategies to ensure quality of care and network linkages: physician and lab assistant team travels from the “hub” site on selected days; nurse-managed PHCs/DOTS with nurses trained using the IMAI national curriculum; and physician/lab assistant team utilizes mobile site van equipped with CD4 and basic lab equipment to visit PHCs on selected days. An alternative model employs a physician or nurse-led team with transport of samples back to the hub site for lab testing. The vast majority of these sites will also provide Pediatric Care and Treatment services. PMTCT stand-alone points of service (POS) link to adult and pediatric ARV care through utilization of a network PMTCT coordinator based at the hub site. A specific referral SOP is used to ensure that HIV+ pregnant women who require HAART for their own care are linked to an ARV point of service.

In COP 09, ACTION will continue to provide clinical services (pain assessment and management, laboratory, OI prophylaxis/management, nutritional assessment/therapy) with Basic care kits plus at least two other services in the domains of HBC, psychosocial, spiritual, PwP and preventive services to all PLWHA enrolled into care. Lab services will include CD4, hematology, blood chemistry, LFT, OI and pregnancy testing if indicated. CD4 count follow-up will be provided at least every 6 months to monitor for change in status. Access to appropriate TB diagnostics and linkages with DOTS programs described under TB/HIV are also provided. Screening for hepatitis B, malaria and urinalysis are supported for all HIV+ persons if indicated. The nutritional status of PLWHA will be assessed at the initial clinical contact and at follow-up visits. If diagnosed with malnutrition, food by prescription consisting of a ready to mix soya based supplement fortified with multivitamins will be provided and referrals/linkages to wraparound services providing other nutritional therapy will be given. All PLWHA will be provided with a Basic Care Kit including ITN, water guard, water vessel, soap, ORS sachets, latex gloves, condoms and IEC materials on self care and prevention of common OIs. Prevention with positive services provided to PLWHA include condoms and information on use, counseling on reduction of high risk behaviors, abstinence messages, discordant couple counseling and syndromic management of STIs. A standard formulary is provided to sites to treat common opportunistic infections and malaria.

Community HBC will be provided in each of the 32 network catchments areas ACTION supports. This is overseen by a team comprising of community HBC nurse, health extension workers and volunteers. This activity will be linked to primary prevention and HCT programs emphasizing the home based approach to these other programs and ensuring family engagement in HBC. In addition to HBC for those requiring classic “palliative care” interventions, Community HBC providers support ART adherence in the home setting through education and addressing adherence barriers. Peers, buddies and pill boxes as reminders for effective drug adherence. Community support system of PLWHAs is also used to ensure adherence and tracking defaulters will be sustained. HBC providers focus on linkage to services, ensuring that clients in need of hospital care gain access to care and linking family members to OVC, PMTCT, community immunization, family planning, and TB DOTS services. These activities will be linked to the patient’s medical care source as the supervising community home based care nurse/PHC extension worker will work under the medical direction of the site physician.

PLWHA and PABAs will be afforded linkages to psychosocial support through participation in PLWHA support groups and individual counseling operational at all points of service. Emphasis on support group activities that encourage participation for pre-ART clients will be supported. The function of PLWHA support groups is strengthened by an ACTION program officer with a counseling background who works with the support groups to improve their programs and to ensure linkages between points of service and communities. Services to be provided to PABAs at the clinic and community levels include: promotion of HCT; HIV prevention education including balanced ABC services as appropriate; psychosocial support through on-site counselors; and participation in support groups designed for family members focusing on prevention of transmission, stigma/discrimination reduction, support for infected family members by serving as a treatment partner to enhance adherence. It is anticipated that many PABAs will be reached in the communities rather than clinic settings through the community HBC program which will provide HCT access, linkages to HIV care and other services, peer support and facilitation of home care to PLWHA by PABAs.

ACTION care and treatment services are in line with current GON guidelines. ACTION supported the update of the national care and treatment guidelines and will continue to participate actively in National Care and Treatment Guideline Committees. All sites are supported to employ treatment support specialists – PLWHA who participate in patient education, client advocacy, and home visits to track defaulters. A new SOP to enhance adherence services has been developed and piloted in a number of sites in COP08. This SOP creates a mandatory patient education/preparation before commencement of therapy and ongoing adherence within the health facility and a back up follow up using Treatment Partners and community
**Activity Narrative:**

AIDS and emergency prophylaxis starter kits for post-exposure prophylaxis to address occupational HIV exposure of health care workers.

ACTION uses ART expertise to ensure high quality care using a two-pronged didactic and experiential training approach. Using expert staff from established POS as resource persons, site staff will participate in central or regional trainings on ARV care, adherence counseling, and/or pharmacy SOPs. All training will include approaches for prevention for positives integrated into the clinic and community setting. Adapted IMAI manuals will be used to step down trainings for secondary, PHC and DOTS sites. The training plan for COP09 to support this scale up using the National training curriculum includes the training of 30 Master Trainers from established ARV sites who will work with ACTION. Additional training plans include a HIVQUAL training (see below) for the QA/QI Committee Chair at each of 32 hub sites and an Adherence Refresher site based training for 10 staff each of 32 hub sites. Thus the training target focused on ART care is 30 Master Trainers, 200 site staff, 32 QA/QI and 320 adherence counselors for a total of 582. ACTION will support HBC refresher trainings at 32 sites (or networks) to strengthen existing and new networks with community & primary care facilities for a total of 32 trainings for 10 providers each (subtotal 320). Standard training curricula for healthcare and community workers, developed by ACTION, to include specific modules on pediatric home based care will be utilized. To enhance sustainability, ACTION will support retraining for existing COP08 site nurses using nurse Master Trainers from the Health System Strengthening program area. ACTION will support step down trainings at each ART point of service in order to encourage ongoing in-house HIV continuing education program (220 nurses will participate in refresher training). Thus the total training target focused on Care and Support is 540. These training will facilitate task shifting and ACTION will support the GON in developing policies related to this.

Bedside teaching is also a component of ongoing education. IHV/UMD adult and pediatric HIV care specialists are posted in Nigeria as preceptors. ACTION has developed 3 regional training centers which are equipped with training venues adjacent to large clinical care facilities where best practices are modeled. A clinical training center in Abuja provides a model clinic that integrates physician, nurse, treatment support, pharmacy and community outreach teams to provide experiential training in a holistic model clinical setting in order to demonstrate feasible and functional strategies to strengthen care. ACTION supports 4 regional training labs that will train lab scientists working at GON and GF-supported sites in ARV lab monitoring including good lab practices, HIV rapid testing, automated CD4, hemogram and chemistries. This will serve to increase the quality and sustainability of ARV services outside of PEPFAR-supported sites.

ACTION in COP08 participated in the National HIVQUAL pilot and then expanded upon these clinical QA/QI indicators to conduct quarterly comprehensive QA/QI assessments jointly with all sites providing ART services. Deficiencies identified are discussed with the site QA/QI committee and ACTION staff and an improvement plan implemented. Training needs identified are addressed by the IHVN Training Dept. In COP09, ACTION will continue this process collaboratively with the sites, USG and GON. Based on gaps in knowledge identified the Training Department refines/updates training materials for new and on-going training activities. ACTION will also facilitate and actively support onsite standardized HIMS using GON forms and National electronic platforms and will provide onsite assistance with data management and M&E to guide quality improvement measures. ACTION will also participate in the yearly care and treatment evaluation jointly conducted by GON/USG.

Sites are supported to carry out renovations to ensure clinic facilities are adequate and particularly that pharmacy store and dispensing areas are able to store ARVs and other HIV care drugs and commodities consistent with manufacturer guidelines. Care and treatment drugs and commodities are procured through SCMS, and other local mechanisms.

**CONTRIBUTIONS TO OVERALL PROGRAM AREA:**

At the end of COP09 ACTION will be providing ART services to 70,953 people, contributing to GON/PEPFAR targets for Nigeria. This activity provides services which are a high priority for the 2-7-10 Emergency Plan strategy by providing a basic package of care services to all HIV+ adults and PABAs. The services are consistent with the current Guidelines for Palliative Care in Nigeria and the USG Palliative Care Policy as well as the Nigerian Guidelines for Antiretroviral Therapy. ACTION will build the skills of over 1000 care providers thus contributing to national sustainability plans.

**LINKS TO OTHER ACTIVITIES:**

Using the Hub-and-Spoke model in site selection leverages resources and improves referrals between tertiary, secondary and primary health care facilities. This activity is linked to drugs, HCT, HVOP, OVC, TB/HIV, PMTCT, Lab, and SI. Services are co-located with TB DOTS centers and TB/HIV linkages will be strengthened; all HIV infected patients will be screened for TB using the National algorithm. ACTION will also provide onsite assistance with data management and M&E to guide quality improvement. HCT targeting MARPs is established proximate to ARV POS. Using a network model, linkage to ART services for HIV+ women identified through PMTCT and HIV-infected infants are in place. Quality lab services supported by an ACTION-facilitated lab QA program are available at comprehensive sites while manual lab methods or specimen transport systems will be established for primary health center satellites. Sites have been chosen to maximize linkages with national TB DOTS sites and to provide services for HIV+ pregnant women identified through PMTCT.

**POPULATIONS BEING TARGETED:**

Populations targeted are adults living with HIV/AIDS and PABAs, TB patients, OVC, persons in prostitution, and pregnant women. Doctors, nurses, other health workers (public sector) as well as people living with HIV/AIDS and caregivers of PLWHA are targeted for training.

**EMPHASIS AREAS:**

Emphasis areas include human capacity building as capacity development for sustainability is a key focus. Local organization capacity building and TB-related wraparound programs are another focus.

  **Planned Funds:** $4,521,262
Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY DESCRIPTION:
The SCMS objective is to support PEPFAR programs in Nigeria by providing increased access to quality HIV/AIDS related commodities. SCMS activity under this program area covers the procurement but also the shipment, distribution and delivery of medical supplies and equipments used in ARV services including consumables and non medical supplies needed to run ARV services, as well as basic health care and support related commodities for adults including other supply chain management related activities. It also covers technical assistance (TA) and system strengthening (SS) activities provided to PEPFAR Implementing Partners (IPs) and to the Department of Defense (DoD) to strengthen or build their supply chain management capacity within their respective programs.

In COP09, SCMS will procure medical supplies and equipments used in ARV services and other commodities used to extend and optimize the quality of life of HIV infected adults and their families for three IPs and DoD. This also encompasses commodities for the prevention, management and clinical monitoring of opportunistic infections (OI), except tuberculosis (TB), other HIV/AIDS related complications, including malaria, and for the management of sexually transmitted infections (STIs). Example of such commodities are pharmaceuticals (OI drugs, pain killers, opioids), insecticide treated nets, home based care kits, water guard, gloves and therapeutic food. SCMS will also procure other medical and non medical supplies used in treatment and basic health care and support services, including home-based care.

Through its continuous support to and strengthening of commodity security in PEPFAR care programs, SCMS works towards ensuring uninterrupted availability of needed commodities to the target populations of people living with HIV/AIDS and the general population through their families. This will be achieved by assisting the IPs and DoD in quantification, forecasting of requirements and support for the development of long term supply plans (considering in country stocks and anticipated consumption rates) for stock management and delivery planning.

In COP09, SCMS will procure medical supplies and equipments used in ARV services, palliative drugs, care and support commodities and provide requested technical assistance for three IPs and DoD, each of which has allocated specific funds to SCMS for these services: DOD, $300,000 for Adult Care and Support and $1,750,000 for Adult Treatment; Columbia University/ICAP, $150,000 for Adult Care and Support and $675,000 for Adult Treatment; University of Maryland, $287,960 for Adult Care and Support; and URC, $4,500 for Adult Care and Support and $45,000 for Adult Treatment. The budgets will cover the cost of commodities as well as well as logistical and administrative services from the field office for the coordination and management of the procurements undertaken by SCMS. The budget also supports the cost of TA and SS.

SCMS will support the IPs and DoD in the following areas of the supply chain cycle: product selection in accordance with the Federal Government of Nigeria’s (FGoN) national treatment guidelines, marketing authorization status (NAFDAC registration) and FGON importation regulation. SCMS will also be responsible for ensuring that commodities procured meet eligibility criteria under the USG acquisition rules and regulations including source and origin waivers and approvals by the US Food and Drug Administration or other relevant stringent drug regulatory authorities.

SCMS will assist in quantification and forecasting of requirements and will support the development of long term supply plans for stock management and delivery planning. SCMS will identify suitable sources of supply both internationally and nationally. SCMS will work with IPs in Nigeria to locally procure products that are either banned for importation or for which local procurement represents a key advantage in terms of cost, delivery and associated services (i.e. maintenance service). SCMS will coordinate with the USG team to ensure selected products are appropriately registered in Nigeria. For products not yet registered by NAFDAC, SCMS will make suitable recommendations including waiver applications where appropriate. SCMS will take the lead to communicate with manufacturers on registration gaps in Nigeria.

Currently, there are several challenges associated with the procurement of Opportunistic Infections (OI) drugs. A number of key OI medicines are banned from importation into Nigeria and hence by default, need to be procured from local manufacturers. However, the fact that none of locally manufactured products has US FDA or similar stringent drug regulatory authority approval places the PEPFAR IPs in an untenable situation. In COP 09, SCMS will work with the IPs and GoN to identify key OI drugs that are needed and initiate the process of pre-qualification towards identifying local sources. SCMS will also work with GoN towards defining the modalities for use of opioids for pain management by HIV/AIDS programs. SCMS intervention in this area will ensure that required materials for palliative care are available for use of the programs, thus improving the quality of life of PLWHA.

SCMS procurement leverages global spend to provide best value and offers clients certainty of competitive prices and international quality standards. SCMS procurement strategy is articulated around buying generics whenever possible, pooling procurement for HIV/AIDS care, prevention and treatment programs across PEPFAR focus countries and negotiating long term contracts with suppliers. IPs and DoD’s requests for basic health care and support related commodities will be addressed to and coordinated with SCMS field office directly.

SCMS will be responsible for the shipment of procured commodities into Nigeria through Abuja or other points of entry as required. SCMS will take the lead and further streamline the customs clearance process as appropriate including management of the CC1, CC2 or CC3 duty exemption forms. SCMS will coordinate with the USG team to fulfill importation requirements and provide needed documentation to allow customs clearance in an efficient and timely manner.

Where appropriate, commodities procured and imported by SCMS will be supplied through the SCMS Regional Distribution Center (RDC) in Ghana. The warehousing of commodities in the RDC is a critical component of the SCMS technical solution. The use of the RDC will significantly reduce lead times and
**Activity Narrative:** provide an important buffer between the supply from manufacturers and demands from the PEPFAR programs in Nigeria. The RDC also ensure that shipment quantities do not overwhelm their recipients in country, an increasing challenge in the context of program scale up. The RDC concept also brings an increased flexibility in stock management thus reducing risk of stock obsolescence or need for emergency replenishments, resulting in important savings. Finally, the RDC approach serves regional and national sustainability, as the RDC is designed to be a commercially viable entity, available to other health (and non-health) programs, whose benefit will last beyond SCMS. Where possible and appropriate, SCMS will road freight from the RDC Ghana to Abuja; a mode of delivery that will provide significant savings over airfreight.

Delivery arrangements will be negotiated with URC, ICAP, UMD and DOD; SCMS will either deliver to a central location or to point of services as needed. When local warehousing is needed SCMS will continue to explore viable options make use of its recently acquired cross-docking facility and the long term warehouse facility (which will be acquired in COP 09). For in country distribution where necessary, SCMS will also deliver to the point of services.

SCMS provides TA and SS services in all areas of the supply chain including product selection, quantification & forecasting, supply planning, procurement, warehousing, customs clearance and delivery. In COP09, SCMS will provide TA and SS services to IPs including the training of individuals in the use of the ProQ or Quantimed forecasting and Pipeline supply planning tools. SCMS will continue to provide TA and SS services to DoD based on the recommendations that came out of a supply chain system’s assessment carried out in COP07. By providing training and supporting capacity building of local organization, SCMS addresses the emphasis area of human capacity development.

SCMS will provide the USG team with regular reports on supplies and equipments as well as monthly financial reports. In COP 09, Supply Chain Support Teams (to be made up of technical SCMS staff and GoN or IP staff as appropriate) will be constituted by SCMS to work with the IPs in providing their trained logisticians with the capacity to monitor and support the performance of the supply chains at various levels. Using standardized indicators of logistics performance, the SCSTs will track performance of the supply chains and together, act as an early warning system to identify impending or imminent supply chain breakdowns and act to forestall these. By developing methodologies and tools for conducting these activities, SCMS will work with GoN and IPs to establish and institutionalize this activity thereby building the capacity to identify these problems and resolve them before service delivery is compromised. In addition, an automated web based procurement tracking database will ensure that the USG team and IPs have adequate visibility on SCMS procurement status by providing an easy access to accurate and up to date information on procurement. Further procurement automation and harmonization will also be facilitated through linkages with the LHPMIP system of SCMS.

In COP07, SCMS undertook, under DoD’s request, a feasibility study for a Government Owned Contractor operated (GOCO) warehousing facility to be used by HIV/AIDS Nigerian military and DoD programs. In COP08, SCMS helped define detailed implementation workplan and responsibility for construction of the warehouse, SCMS will provide technical oversight for the construction and managing the equipment of the facility, while the NMoD will finance the construction of the facility, DoD will finance the equipment of the warehouse through COP allocations to SCMS in the range of $750,000. The establishment of a GOCO, as part of SCMS system strengthening to the host government’s supply chain system, will bring a long term solution contributing to the sustainability of the military HIV/AIDS programs in Nigeria. By providing training and supporting capacity building of local organization, SCMS addresses the emphasis area of human capacity development.

Under this program area, SCMS does not have targets of its own but supports PEPFAR IPs and DoD reaching their care planned targets.

**EMPHASIS AREA**

Human capacity development.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 554.09
Prime Partner: US Department of Defense
Funding Source: GHCS (State)
Budget Code: HBHC
Activity ID: 16942.25207.09

Mechanism: DoD Track 2.0 DoD Agency
USG Agency: Department of Defense
Program Area: Care: Adult Care and Support
Program Budget Code: 08
Planned Funds: $107,910
**Activity System ID:** 25207

**Activity Narrative:** ACTIVITY DESCRIPTION: This activity represents funding for one contracted Nigerian health care provider for activities in Basic Care and Support. A new emphasis by DOD in COP08 and continued emphasis in COP09 is to provide additional attention to psychosocial, spiritual, and other non-clinical support and aspects of care. Funding will also support external technical support of BCS. The budget includes funding for one FSN direct hire, overhead charges, funding required for domestic travel, training funds and allocated minor support costs. This funding also includes support for a USMHRP HQ Technical Assistance visit for two weeks of in-country support to provide TA on basic care and support, continuing medical education and mentorship. TA assistance may also be provided by the USMHRP’s site staff in Kenya, Uganda and/or Tanzania.

A unique aspect of the NMOD-DOD Program is the implementation of the program by non-PEPFAR remunerated staff. Support to and development of local support groups and encouragement of military members, staff and family members to participate in community efforts to care for HIV+ patients will enable increased programming.

The Care and Support Officer will work as members of the USG Care and Treatment Technical Working Group, as well as serve on the U.S. Department of Defense – Nigerian Ministry of Defense (NMOD) Clinical Working Group. The program officer’s responsibilities also include: 1) representing the DOD-NMOD in technical discussions with the GON and 2) overseeing relevant technical aspects of the program, including program management and oversight of the 20 DOD-NMOD PEPFAR site Care and Treatment Programs. The program officer will work with other Implementing Partners and the USG team to ensure a harmonized approach that is consistent among partners and with the GON national guidelines.

Activity Narrative: ACTIVITY UNCHANGED FROM FY2008
- Narrative combined; Targets updated

ACTIVITY DESCRIPTION:
This activity relates to activities in HCT, PMTCT, Basic Care and Support, and TB/HIV activities.

The Nigerian Military provides prevention, care and treatment to its service members and the surrounding civilian community (constituting approximately 75% of the Military’s patient load). During COP09, the U.S. Department of Defense (DOD) – Nigerian Ministry of Defence (NMOD) HIV Program will continue to provide free care and treatment services in 20 military hospitals.

In COP09, DOD – NMOD will provide comprehensive ART services to 9,806 adult patients. A total of 1,046 new patients will be added during the reporting period. Clinicians across the 20 sites will be assisted to promptly initiate support for ART eligible patients, with emphasis on supporting the 6 newer primary sites. Each site is an integrated hospital supporting HCT, laboratory, TB and other services. Linkages with both NMOD and other partner facilities will support referral of complicated or stable patients to ease overcrowding and maximize facility abilities. Care and support services will be provided to 18,600 HIV+ adults and will reach an additional 37,200 persons affected by AIDS (PABAs), including family members and children.

A major component of this activity is human capacity development - both in increasing numbers of providers and the training provided to them. The NMOD has committed to increasing and developing a sustainable treatment program by hiring 100 new health care professionals dedicated directly for PEPFAR goals (30 each physicians and nurses; 20 each laboratory technicians and pharmacists). In COP09, the DOD will support the training of an additional 100 health care workers, including doctors, pharmacists, nurses, laboratory technicians, site administrators, commanders, and team leaders in the areas of ART services and 100 in care and support. Additional temporary staff through the National Youth Service Corps (NYSC) will be utilized. In COP06, NYSC physicians were jointly funded by the DOD and NMOD programs; in COP07-COP08, the NMOD assumed total coverage of these salaries. Funding may be provided to expand this program in COP09.

Use of the NYSC (usually three to four per site) provides training positions in Nigeria in ARV services and HIV/AIDS care and support, and exposes them to the military system for possible accession to the uniformed services or as NMOD civilian providers. Advocacy for task shifting will be undertaken with NMOD leadership under policy activities.

Training is the second component of capacity development. The base of training has included the four week ART training at the Infectious Disease Institute in Uganda and will continue to serve as a training component for COP09. This will complement local training utilizing the DOD training manual/curriculum. A dedicated Infectious Disease physician will provide mentoring and continuing medical education courses through centralized in-country and on-site trainings on HIV/AIDS care and support, treatment, adherence and laboratory monitoring. Adherence counseling for ARVs and instruction in side effects and contra-indications is part of the NMOD internal ART course and each pharmacist is provided with initial and refresher training through this course.

The third tenet of capacity development is physical capacity. This will be increased through refurbishments at each site as required by each site to improve patient flow and throughput. This will be accomplished through bilateral planning of both the NMOD and DOD funding. US DOD funding has provided refurbishments at seven sites and the NMOD has funded refurbishments at seven sites. One site was jointly refurbished (44 NARHK) due to its size and dual use as a NMOD treatment site and as a referral center for all of Kaduna State.

To enhance quality of care, the DOD will conduct on-site clinical mentoring via centrally located staff and DOD HQ Technical Assistance rotations. The DOD-NMOD Technical Working Group will integrate with USG and MOH advisors to ensure that all activities and support are in compliance with National policies, curricula and guidelines. In additional, the DOD will ensure that routine meetings with all hospital staff involved in HIV/AIDS patient care are occurring monthly (or more frequently, as needed). This will support monitoring and evaluation of clinical outcomes and allow for dissemination of information and lessons learned to improve care, and will help to support participation in ongoing efforts such as HIVQUAL and NMOD/DOD’s electronic patient registry.

The DOD will support the provision of comprehensive clinical care, including OI syndromic treatment and management of STIs (e.g., ceftriaxone, azithromycin, acyclovir, penicillin G) and malaria (e.g., ceftriaxone, azithromycin, acyclovir, penicillin G), diagnosis and treatment as well as pain and symptom management, through the full course of infection at all 20 hospitals. This will be accomplished by:
- strengthening institutional and health worker capacity with ongoing, in-service training, providing initial training 100 health care workers in palliative care skills as part of and in addition to ART education; increasing the capacity of clinicians to diagnose and manage common OIs: provide psychosocial counseling; and strengthening laboratory diagnostic facilities and pharmacy capacity through refurbishments, equipment, training and QA/QC programming. Nutritional assessments (weight, height, BMI) will be conducted and vitamin supplementation will be provided as appropriate. Facility based care will be complemented using a network model through trained volunteers, nurses, health workers, PLWHAs and family members working together in the facilities as well as following up patients at home. Basic care kits, including an insect treated net, water guard, water vessel, latex gloves, ORS, soap, IEC materials, and condoms will be provided, as well as cotrimoxazole for patients as clinically appropriate according to national guidelines.

Laboratory services provided will include CD4 ascertainment and follow up, liver function tests, hepatitis screening and management of abnormalities (e.g., elevated liver function, decreased hemoglobin/hematocrit), as appropriate. All patients will be screened for TB and malaria; prophylaxis, treatment, and linkages to wraparound or other program areas will be provided as appropriate.
Activity Narrative:
A component of this activity will be supporting and maintaining links with active community-based organizations, home-based care providers (HBCs) and faith-based organizations (FBOs) that will provide at home follow up of patients attending ART clinics. While efforts will be strengthened to provide services to individuals in the community who cannot access ART services, a strong component of these efforts will be linking with local CBOs and FBOs since HBCs are limited in number at sites. Volunteers will be recruited and trained from existing PLWHA support groups. DOD will also work with, and support, the NMOD and its partners in further developing internal guidelines, protocols and standard operating procedures (SOPs), using evidence-based interventions, particularly in the area of pediatric care and implementation of a preventive-care-package.

In COP07-08, 44 Nigerian Army Reference Hospital Kaduna was provided with funding to refurbish a hall for a vocational and economic empowerment center. Support was also provided for the training of PLWHA on soap making, knitting and tailoring to provide the foundation for sustainable income generation activities. This activity focuses its efforts on young, HIV+ women. In COP09, this training activity will be expanded to additional sites that have space to accommodate a vocational center. PLWHA who were trained at 44 will serve as trainers for other sites. Support will also be provided to purchase a stock of necessary materials (e.g., soap making materials, weaving materials/equipment).

Another component of this activity is to strengthen spiritual and social services provided to those living with HIV/AIDS in the military barracks. In COP09, DOD will continue to provide support for Imams and Priests to provide spiritual support and/or counseling for PLWHA and people affected by HIV/AIDS (PABAs). This includes counseling related to a patient’s fears, life views, crises, adherence and bereavement. Health care providers will provide linkages and information to reach military Imams and Priests, as well as collaborating PLWHA support groups, during clinical care sessions. Imams and Priests will assist in increasing men’s involvement in care and encourage clients, in particular males, to participate in support groups.

In COP09, the DOD’s “prevention for positives” program will be continued at all 20 military sites. Providers at each site will provide adherence counseling, syndromic management of STIs in line with National STI control policy and guidelines; risk assessment and risk reduction; and prevention messaging to include partner reduction and/or mutual fidelity, correct and consistent condom use for PLWHA, disclosure and partner testing. Condoms will be provided free of charge. Providers will counsel clients on their disclosure of HIV status and partner/family notification with an emphasis on client safety. Person referrals for CT (individual and/or couple) will be provided. Also, referrals to community-based and barracks-based support groups will be provided to HIV+ clients. Linkages to support groups and services will also be enhanced by counselors who are members of PLWHA support groups. Referrals to family planning services will be provided as appropriate, as well as access to pregnancy testing when needed. Care kits for PLWHA will include preventative items, such as: an ITN, waterguard, water vessels, soap, ORS, and condoms. These interventions will be implemented using the recently adapted HIV Prevention in Care and Treatment Settings Prevention Package, which includes several training packages and job aids.
