Budget Code: HBHC

Activity ID: 8257.22729.09

Activity System ID: 22729

Mechanism: N/A

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$970,905

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Summary: Re-Action! Consulting (RAC) will continue to facilitate a co-investment partnership with Xstrata and other private companies to provide support for strengthening targeted government clinic sites, continuing to improve access to basic preventive, clinical care and psychosocial support services. The program will continue build on a public-private mix model for strengthening HIV and TB service.

Background:

Xstrata and RAC will work through established partnerships with local government, the Mpumalanga provincial Department of Health (MPDOH), community groups and private providers. Project deliverables have been defined in response to specific requests for assistance from the MPDOH. Major emphasis will be given to development of health workforce capacity, and community mobilization/participation, building linkages with other sectors, local organization capacity development and strategic information.

Activities: RAC will work in partnership with the District Management Teams (DMTs) in the provinces of Mpumalanga, Limpopo, North West and Northern Cape to develop and establish a task mix for Adult Care and Support service delivery.

In partnership with the DMTs, RAC will support the DOH with the sourcing, recruitment, training and supervision of critical health care professionals to deliver sustainable care and support programs.

RAC will establish community partnerships with the aim of strengthening existing HIV care and support programs in these communities, training of and providing supportive supervision to health care professionals and facilitating behavior change interventions focused on individual households in the community.

RAC will facilitate the building or renovation of three wellness clinics in the Nkangala District. This will be financed by Xstrata Coal South Africa as part of their contribution of the co-investment partnership model.

The Outreach Workers (OWs) program will be expanded to allow for intensified provision of care and support services through the early identification of and referral to HIV related care, support and treatment services. RAC will scale up care and support activities by recruiting and training 40 OWs and 20 traditional Healers focused on providing palliative care and quality of care and support services

SUMMARY:

Xstrata received funding in FY 2007 for a public-private partnership with the Mpumalanga Department of Health (MPDOH). The implementing partner for this is Re-Action! Consulting (RAC). RAC will facilitate a co-investment partnership with Xstrata to provide support for strengthening targeted government clinic sites, continuing to improve access to basic preventive, clinical care and psychosocial support services in one district of Mpumalanga, extending into a second district during FY 2008. The project will build on a public-private mix (PPM) model for strengthening HIV and TB service delivery that Xstrata and RAC has already begun to implement in the province with funding from Xstrata (dollar for dollar match with PEPFAR).

Xstrata and RAC will work through established partnerships with local government, MPDOH, community groups and private providers. Project deliverables have been defined in response to specific requests for assistance from the MPDOH. Major emphasis will be given to development of health workforce capacity, with minor focus on community mobilization/participation, building linkages with other sectors, local organization capacity development and strategic information. The target populations are underserved communities of men, women and children, and people living with HIV and AIDS in Nkangala District, extending to a second district during FY 2008, where Xstrata Alloys has its operations.

BACKGROUND:

Xstrata Coal employs 4,000 people at 11 mines (collieries) located within the socio-economically deprived Coal Powerbelt region of Mpumalanga, and has more than 10,000 employees with operations in three provinces of South Africa (Mpumalanga, Limpopo, and North West) and Swaziland. This funding partnership enables scaling up the community extension component of Xstrata's comprehensive workplace HIV and AIDS program that is managed by RAC. The project is based on implementing a PPM service-strengthening model of capacitating government providers within primary care clinic sites to deliver HIV-related preventive, clinical and psychosocial care services. FY 2008 funding will allow continued support to sites established in FY 2007 and to expand the number of sites within two target districts. The scope of assistance is defined within a MOU between Xstrata and the MPDOH, and responds to specific requests for support by the provincial department's HIV and AIDS Unit, as well as the district management teams. This fits within a broader range of interlinked corporate social investments being made by Xstrata to support sustainable local development in these communities.

The project will provide technical assistance, health workforce capacity development, clinic infrastructure improvements, strengthening of pharmaceutical supply management systems and service monitoring for public sector primary care clinics to deliver quality HIV-related preventive and clinical care services. This will contribute to strengthening district-level primary health care service networks and district service management, with a strong focus on improving human resource capacity, including through training and deploying community outreach workers to deliver household-level services. The project works in partnership with other PEPFAR partners in the province to achieve synergies and avoid duplicating activities.

ACTIVITIES AND EXPECTED RESULTS:

Activity Narrative: Three activity areas will be implemented to strengthen delivery of palliative and psychosocial care, HIV prevention, and TB services at government primary health care sites within two districts of Mpumalanga and to create strong linkages with community outreach services and home-based care. Service improvement plans will be implemented at each site based on specific service strengthening needs that are identified and agreed with District Management Teams and facility managers. This will result in more effective delivery of the essential package of HIV-related primary care interventions (including cotrimoxazole provision and integrated preventions services, including prevention with positives) integrated with Sexual and Reproductive Health services (including STI care, family planning, maternal health); Maternal, neonatal and child health services; and TB services to implement TB-HIV collaborative activities. Re-Action will also collaborate with the Foundation for Professional Development (FPD) in implementing services at Witbank Hospital.

ACTIVITY 1: Strengthening primary health care and district hospital delivery of HIV-related palliative and other clinical care services

A multi-skilled RAC Service Strengthening Team will undertake a detailed situation analyses (together with the district management team) within each target sub-district to identify specific service strengthening needs and prioritize sites for accreditation/down-referral. Service improvement plans will be developed to systematically address these needs. All available service providers at this level will be identified and supported to participate in delivering service tasks aligned with the national programs and coordinated through a 'public-private mix' delivery approach.

Services will be improved overall to both ensure that HIV-infected adults and children attending these sites have access to the essential package of HIV-related care and support interventions (including cotrimoxazole provision and integrated preventions services, including prevention with positives) integrated with Sexual and Reproductive Health services (including STI care, family planning, maternal health); Maternal, neonatal, child health services, and basic hygiene and sanitation. Prevention with positives and treatment services will be appropriately integrated into routine primary care services, so that service capacity is strengthened overall. Access to TB diagnosis and treatment will be improved at supported sites by implementing TB/HIV collaborative activities. Health worker training will be addressed through in-service training delivered in collaboration with other PEPFAR partners, based on National Program standards and integrated management approaches.

Technical assistance will be provided to improve public sector human resource management capacity so that health workers can be more effectively recruited to fill vacant positions at these sites. Where necessary, critical staff positions will be filled on a temporary basis (on agreement that these posts will be filled as soon as possible by permanent public sector employees). Site management capacity will be strengthened, including through leadership development activities. Strong linkages will be created between these first-level sites and second-level facilities for appropriate referral of patients and 'down-referral' of treatment, where necessary. Appropriate 'task-shifting' will be encouraged. Physical upgrades to clinic infrastructure will be undertaken through Xstrata co-investment and essential equipment will be procured. Health information management systems and patient monitoring systems will be strengthened through in-service training, technical assistance and procurement of equipment where necessary.

ACTIVITY 2: Community mapping, mobilization, health promotion, treatment preparedness and support, referral to appropriate health and social services

Community outreach workers will be trained to provide basic household health risk assessments and health promotion under supportive supervision. A full time project coordinator will be dedicated to coordinating community initiatives. They will mobilize the community to access care services, including HIV testing and counseling (through the 'I know!' campaign developed by RAC) and will direct community nurses to deliver provider-initiated HIV testing and counseling within households. Individuals with social and health risks will be referred for appropriate services and follow-up will be arranged. This will result in risk mapping of all households within targeted communities and systematic follow-up, linking patients to facility-based HIV and related palliative services.

ACTIVITY 3: Community Support and Psychosocial Care

Linkages with community-based service organizations (including faith-based organizations and non-governmental organizations) will be strengthened and all providers will be encouraged to participate in delivering their service tasks in more coordinated ways through the 'public-private mix' approach (which RAC will support district management teams to oversee). Peer support groups for HIV-infected and affected individual and family members will be established at all sites and linkages to the community will be strengthened through Community Outreach Services to provide social and psychological support. Traditional healers will be engaged and trained in partnership with the MPDOH and supported to provide appropriate referrals to the clinic sites, to provide chronic care support and health promotion. Attention will be given to gender equity, increasing male involvement in the program, addressing stigma and discrimination.

PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

With FY 2008 reprogramming funds, the community care program will be strengthened; PPM models initiated in 3 more provinces (Limpopo, North West and Northern Cape); and the up and down-referral of patients supported through technical assistance in a third district in Mpumalanga (Gert Sibanda).

Sustainability of this program is assured through the public-private partnership between Xstrata and the MPDOH. By providing support for palliative care in underserved communities, Xstrata is contributing to the 2-7-10 PEPFAR goals of providing care to 10 million people infected and affected by HIV.

Mechanism ID: 4760.09

Mechanism: N/A

Prime Partner: St. Mary's Hospital

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Care: Adult Care and Support

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 8262.22799.09

Planned Funds: \$291,271

Activity System ID: 22799

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activity 1:

St. Mary's will take a more focused approach to the training of therapeutic counselors (TCs) to assist in the community with clinical staging of patients requiring care, support and possible treatment. Training will also be provided to non-government organizations (NGOs) and community-based organizations (CBOs) to provide ongoing support in the home and referral to the hospital if and when required.

A family-centered approach will allow for early identification of infected and affected adults and children in need of care and support. Retention of patients in care and support services is essential and TCs, counselors and community healthcare workers will be made aware of their role and responsibility to continuously support and if required refer patients to clinics or St. Mary's Hospital.

TCs will be trained in basic palliative care and TB screening, which will also allow for a more efficient up and down referral system between the hospital and the community clinics, as well as enhance the support service offered to the patient in the community. There will be a need to integrate services with other service providers that have been identified and trained to offer other services that the TCs may not be able to continue with. The need to establish support groups at community clinics churches or with NGOs and CBOs will be important as the basic care package has to be provided in order to retain the patient for antiretroviral (ARV) treatment in the future. Preventative interventions such as testing of sex partners and the children of those HIV patients in care, disclosure of HIV status to sex partners, adherence interventions will be emphasized when patients are visited in the home.

Activity 2:

There will be no emphasis on the caesarian birth budget in this programmatic area, but this will be addressed in a limited way in the Prevention of Mother-to-Child Transmission (PMTCT) programmatic area.

There will be an aggressive focus on the use of cotrimoxazole for all HIV-infected patients. There is currently a national shortage of cotrimoxazole but children, HIV patients with a CD4 count under 100 and HIV-infected patients that are co-infected with TB will receive preferential treatment. The patients would continue with this treatment until the patient has reached two consecutive CD4 results above 200. Should this national shortage persist, this strategy will also apply in FY 2009. Nutritional support will be provided to those in-patients requiring this support.

Special attention will be given to the integration of pain assessment and management within care and support to all patients receiving palliative care.

SUMMARY:

St. Mary's Hospital in Durban, KwaZulu-Natal will implement palliative care activities that encompass human resources, training and consumables. A dedicated palliative care team will identify and provide clinical, spiritual, psychosocial, social and preventive support to the HIV-infected client and family. A hospital-wide education program will be initiated to enhance knowledge of palliative care practice. In addition a number of consumable items will be purchased to assist in managing pain and symptoms related to HIV and AIDS and ensuring comfort of people living with HIV (PLHIV). The emphasis areas of the project are related in particular to human resource support for the palliative care team, training, commodity procurement and the development of networks/linkages/referral systems. The primary target population is pregnant mothers, children, adults infected with HIV and AIDS; family members affected by HIV and AIDS and healthcare workers.

BACKGROUND:

This is a new program funded since FY 2007, although St. Mary's has received previous PEPFAR funding as a sub-partner to another PEPFAR partner, Catholic Relief Services. The project is an expansion of the current palliative care program that functions at St. Mary's Hospital. The hospital, established in 1927, serves a peri-urban/rural community of 750,000 people, a third of which are HIV-infected. The community has a high unemployment rate of around 60% and an estimated 25,000 people in the community require ART. On an annual basis approximately 3,000 of St. Mary's inpatients require palliative care support, 35,000 require palliative care, and over 2,500 patients are currently in HIV care at the hospital, who by definition fall into the category of people requiring palliative care including ART adherence support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Dedicated Palliative Care Team and Trained personnel to Ensure Delivery of Quality Services

The overall objective of this activity is to ensure that patients who require palliative care and their affected families are adequately supported in the hospital and in their surrounding communities; including clinical, spiritual, psychological, social, and prevention support. Patients and families requiring palliative care will be identified in the inpatient, maternity section, outpatient and ART clinic and hospice care settings. The need to expand to the wards dedicated to pregnant mothers is due to a high maternal death rate as a result of HIV and AIDS. The Hospital's caesarian rate is increasing due to HIV and averages around 29%. It is estimated that around 68% of the births at St. Mary's Hospital are from HIV-infected mothers. Activities to address this are described elsewhere in the COP. The HIV-related services offered by the hospital and its hospice service is based on the belief that the palliative care activity is central and automatically provides a network of services, from counseling and testing, stigma reduction, integrated preventions services, including prevention with positives, ART and adherence, counseling and support to the individual and

Activity Narrative: family, end of life care, referral to other organizations and continuous education and support thereafter to all concerned. The palliative care team will work with other facility-based health providers to ensure that HIV-infected adults and children in all facility settings are either provided or referred (with follow-up) for evidence-based preventive care interventions which include the following: OI screening and prophylaxis (including cotrimoxazole, TB screening/management), counseling and testing for clients and family members, safe water and personal hygiene strategies to reduce diarrheal disease, HIV prevention counseling, including prevention with positives, provision of condoms, referral for family planning services for HIV-infected women, appropriate child survival interventions for HIV-infected children and nutrition counseling, clinical measurement, nutrition monitoring and targeted support based on WHO criteria for severely malnourished PLHIV. The package of services also includes basic pain and symptom management and facility-based support for adherence to OI medications (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART). Community and home-based psychological support, stigma reduction strategies and adherence support for OI medications and ART will be provided by therapeutic counselors who are trained PLHIV, employed by the hospital that visit the patients and their families in the community. Attention will be given to increasing the gender equity in the HIV and AIDS programs, increasing male involvement in the program, addressing stigma and discrimination, and partnerships with local NGOs, FBOs and CBOs. In addition to care for PLHIV, therapeutic counselors and hospital staff will also expand their provision of psychological, spiritual and social support of affected family members. A complex referral network to a number of organizations, inter alia the KwaZulu-Natal Department of Health, the Ethekwini Metropolitan (Durban), other NGOs, the Highway Hospice, and the Dream Centre exists and is used on a proactive basis. A dedicated palliative care professional nurse and pastoral care worker will manage this activity, with additional involvement of other members of the palliative care multi-disciplinary team including hospital doctors and nurses, a social worker and the community outreach coordinator. The palliative care program is managed and administered via the organizational arrangements pertaining to the hospital itself and relies on a multi-disciplinary team approach for service delivery.

Training & Volunteer Engagement: The program relies on both volunteer and fulltime qualified and registered healthcare professionals who require technical support and training. St. Mary's hospice care program is a member of the PEPFAR-funded Hospice Palliative Care Association (HPCA) who is supporting St. Mary's with critical areas including staff training and clinical protocols so St. Mary's may meet the HPCA accreditation requirements essential to providing holistic quality health care to patients. In FY 2007, St. Mary's will scale up its palliative care training for all health professionals, volunteers and PLHIV therapeutic counselors involved in palliative care service delivery with training materials from HPCA and from the World Health Organization's (WHO) Integrated Management of Adolescent Illnesses (IMAI) program. All modules of IMAI will be utilized, however, the IMAI module on palliative care which will be made available to all the nursing students and staff at St. Mary's who will be directly involved in palliative care. Clinical protocols designed and approved by the HPCA are used for support and clinical services for opportunistic infections and pain assessment and management. St. Mary's has a number of partnerships with US universities and interest and support from US-based volunteers. On average, four to six U.S. volunteers will be accommodated by St. Mary's on a monthly basis (supported with non-PEPFAR funds). A relationship is currently being explored to link in with an active OVC program in the area that cares for children at drop-in centers in and around the community. St. Mary's will offer testing; counseling and treatment services; and the OVC program will provide the ongoing adherence support for the children. All palliative care support services will be offered by St. Mary's Hospital to children in care at the relevant drop-in centers

ACTIVITY 2: Commodity Procurement

Provision has been made for palliative care medications and commodities which directly improve the comfort of PLHIV, including medications for appropriate pain and symptom control (additional morphine for pain control, syringe drivers, anti-nausea medications, cotrimoxazole and other drugs for symptom control). Provision for such palliative medications and supplies are included in this activity and are vital to the overall success of the program. In addition there is a need to address some of the theatre requirements and consumables associated with caesarian section births at the Hospital. Almost 30% of all the births (150 births per month) in hospital are non elective caesarian sectional births. The primary reason for this high rate is due to the impact of HIV and AIDS in pregnant mothers. There is a steady increase in the number of maternal deaths due to HIV and very sick mothers are too weak to deliver naturally. The affect of this is the long stay of many mothers and their premature babies in the high care nurseries and palliative care medical wards, post delivery.

These activities contribute directly to the overall PEPFAR objectives of 2-7-10 as HIV-infected people will be identified, appropriately treated, cared for and supported. Family members affected will benefit directly from counseling and support within the hospital environment as well as within the community setting during home visits.

Activity ID: 22491.22874.09	Planned Funds: \$194,181
Activity System ID: 22874	

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

This activity is a component of a comprehensive prevention education, care and treatment program for small to medium enterprises (SMEs) with 20-200 employees and other workplaces in South Africa.

BACKGROUND:

SABCOHA program PEPFAR funds will be used to identify HIV-infected individuals as noted in the Vendor Chain and BizAIDS programs below. The major area of emphasis is Workplace Programs. Minor areas of emphasis include Community Mobilization/Participation, and Information, Education and communication. Specific target populations include Male and Female adults, Truckers, and the Business Community. The care component of this SABCOHA initiative will initially be implemented in at least three provinces namely: Gauteng, Mpumalanga and KwaZulu Natal. The SABCOHA Vendor Chain and BizAIDS counseling and testing (CT) programs will identify HIV-infected individuals will be referred into pre- ARV treatment (ART) services.

The Vendor Chain and BizAIDS components of the existing SABCOHA program will begin a CT and CARE component that will identify HIV-positive individuals and ensure that they are enrolled in care services until eligible for treatment. Through its program, SABCOHA will work with the existing infrastructure, and ensure that newly identified HIV-positive individuals will take advantage of the holistic education, testing, and treatment program for the employed sector.

Once an HIV-infected individual has been identified, it is the aim of the Vendor chain program to ensure adequate transition to care. Most of the HIV-positive individuals will be referred to one of the 440 established South African Department of Health (DOH) comprehensive care management and treatment sites as well as any other sites identified throughout the country. It is critical however that adequate referral is undertaken. To enable the referral, a specific referral path to a treatment site, adequate and close to the testing site is identified before testing. Patients tested HIV-positive are referred with the DoH or any other identified site's accepted referral information. In addition the CD4 count performed at the time of testing is referred to the treatment site. By referring most patients to government sites this program will leverage the available funding, infrastructure, personnel, ART and laboratory testing from Government. SABCOHA estimates that it will provide Pre-HAART services to approximately 2,100 people in the first year.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Identification of HIV-infected individuals who are not treatment eligible and ensuring that they receive the appropriate care

After undergoing VCT, The Vender Chain and Biz AIDS components of the existing SABCOHA program will refer HIV positive individuals to general practitioners within the established GP Network. The general practitioners will provide treatment for opportunistic infections, a minimum of 3 visits during the course of the year to monitor disease progression, laboratory services; prophylaxis or treatment for TB and Health Risk Management services to each patient. Health care providers will provide patients with pamphlets on signs and symptoms of disease progression. This will ensure patient awareness of disease progression.

SABCOHA's care activities will contribute to the PEPFAR 2-7-10 goals by identifying HIV-infected individuals for care, and ensuring they get the appropriate care until they are treatment eligible. This will contribute to the PEPFAR vision outlined in the Five-Year Strategy for South Africa by expanding access to, and availability and quality of care services.

Mechanism: N/A

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$1,213,631

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The focus of the second year of the Medical Research Council (MRC) project will be upon providing follow-up mentorship and technical support to the senior managers who have gone through the capacity building process in the first phase. Support activities will include joint reviews of plans and programs, designing of monitoring and evaluation systems and update of the nutrient values of the nutritional supplements and foods to be used in programs. MRC will expand the training program to include district and non-governmental organization managers as well.

SUMMARY:

The Medical Research Council (MRC) in partnership with University of the Western Cape (UWC) will strengthen basic care and support to people living with HIV (PLHIV) by developing training modules, and by improving monitoring and evaluation of the impact of nutritional support provided to PLHIV. The proposed project aims to train and build capacity throughout South Africa. This project will implement a mixture of short and distance learning courses, and related mentoring activities. The overall aim of this activity is to (a) strengthen nutrition programs in relation to HIV and AIDS and TB; (b) facilitate future development of community-based programs; and (c) enable evaluation of the effects of nutrition interventions through other programs. The target population includes national, provincial, district, sub-district, and facility level nutrition, maternal and child health, TB and HIV managers, and non-governmental organization's (NGO) managers who are involved in the management of TB and HIV programs at either the facility or community level.

BACKGROUND:

Significant resources are invested in providing nutrition supplements to many patients on antiretroviral treatment (ART). Hundreds of nutrition advisors and dietitians have been employed to provide nutrition counseling, and the Department of Social Development is implementing a large HIV and AIDS livelihoods program aimed at improving access to nutrition.

There has not been a formal evaluation of nutrition programs. However, reports from provincial government and other food and nutrition programs in the country strongly point to the lack of human resource capacity to implement, monitor, and evaluate these interventions optimally. This project aims to strengthen the capacity of provincial, district and sub-district nutrition and HIV managers to design, monitor, and evaluate facility and community-based food and nutrition interventions targeting people infected with HIV and TB.

ACTIVITIES AND EXPECTED RESULTS:

Building such capacity is particularly challenging since a large number of people need to be reached but as these people (managers) are in positions of responsibility they cannot be removed from their posts for significant periods. The School of Public Health at the University of the Western Cape has conducted short courses on nutrition policies and programming, nutrition information management and nutrition science for more than 10 years, recently in collaboration with Tulane University's School of Public Health and Tropical Medicine. However, the impact of such short courses is limited by the lack of follow up to consolidate and implement such learning. Experience suggests that the combination of intensive face-to-face sessions along with distance learning materials that encourage the implementation of knowledge learned, followed by feedback and further learning can be an effective strategy. This project therefore aims to create learning modules including a mix of face-to-face and distance learning formats. These modules are described in detail below.

ACTIVITY 1: Nutritional Aspects of the Management of HIV and TB

This module will summarize the latest scientific evidence on the relationship between nutrition and TB/HIV; provide updates on latest nutritional guidelines for HIV; include challenges of implementing clinical guidelines; and provide information on aspects to consider when implementing nutrition interventions in primary healthcare settings.

ACTIVITY 2: Nutrition Programming and Planning

This will build upon a module created by the University of the Western Cape with input from Tulane University. The focus of this module is on community-based HIV and nutrition programs. This module will emphasize the design, development, and implementation of community-based health and nutrition programs, and their adaptation and application to addressing the HIV epidemic.

ACTIVITY 3: Nutrition Information Systems, Including Program Monitoring and Evaluation

This course will be based on existing modules used at Tulane University and University of the Western Cape; a recent short course on this topic, run by UWC and Tulane with UNICEF support, provides a basis for a distance module. Each of these modules will consist of five days of face-to-face teaching along with readings and exercises that focus on the implementation of what has been learned. Participants may take related distance learning courses that will count towards a masters degree in public nutrition, to be developed under this program.

ACTIVITY 4: Mentoring and Trouble-shooting

The capacity to follow up with people trained through this process, and others working in national and local offices, will be developed. Mentoring is already part of the UWC teaching procedures, with participants conferring with faculty during the period of their learning (mostly in a distance format). These efforts will be expanded to supporting nutritional interventions, which will require some strengthening of UWC/Tulane capacities themselves. Trouble-shooting problems, as they arise, may form an integral part of this process. The people who can provide this mentoring may be from UWC/Tulane, from other institutions (e.g. faculty of other universities who participated in the UWC/Tulane training - and who may be providing similar training themselves). Some resources will be needed for the mentors' time and travel expenses even though some

Activity Narrative: mentoring can be done at a distance by email for example.

Through the strengthening of and integration of nutrition into basic HIV and AIDS and TB services, the MRC and its partners will help PEPFAR achieve its 2-7-10 goals.

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 2975.22937.09

Planned Funds: \$3,725,358

Activity System ID: 22937

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

Following the National Strategic Plan (NSP), Right to Care (RTC) will use FY 2009 funds to accelerate the scale up of family-centered approaches to adult and pediatric treatment, care and support. The specific aim is to increase the access to care support to 80% of individuals infected with HIV, in accordance with the NSP and the technical considerations for the FY 2009 COP. Focus for the adult care and support program will be to scale up TB and antiretroviral (ARV) activity at all Department of Health, Comprehensive HIV and AIDS Care, Management and Treatment (CCMT) sites, supported by RTC. At the request of the provincial DOH and implemented according to the memorandums of understanding (MOUs) with each province, RTC will continue to support the activity and budget for family centered treatment, care and support.

BACKGROUND:

RTC provides mentorship and technical assistance to over 18 sub-recipients. These are ongoing programs expanded with NDOH coordination and private sector support. By providing training and support to these sites, RTC leverages NDOH resources to reach an increasing number of patients. RTC supports these sites with infrastructure, staff, training, equipment and data management. In addition, the NDOH has recognized the successes of RTC supported NGO/FBO sites and has been accrediting these sites and taking over the provision of ARV drugs, laboratory monitoring and some staff salaries, thus enabling RTC to shift funds to other sites in need of support.

ACTIVITIES AND EXPECTED RESULTS

FY 2009 funds will be used for human capacity development and salaries at all care and support (C&S) providers; (1) non-governmental (NGO) and faith-based (FBO) clinics/organizations receive sub-awards earmarked for doctors, nurses, counselors and other healthcare workers; (2) RTC will provide support to South African Government (SAG) staff through the salaries of health care providers seconded to DOH facilities; and (3) a capitation fee-for-service arrangement exists with a network of private sector service providers for the Thusong program with wellness support to indigent HIV-infected individuals.

ONGOING ACTIVITIES

PEPFAR funds will also be used to maintain RTC's mobile clinics. NGO and FBO clinics also use PEPFAR funds for laboratory monitoring of HIV patients and for the procurement of health commodities such as medical equipment, ARVs, drugs for opportunistic infections, counseling and testing kits, and home-based care kits. RTC supports all the C&S providers by disseminating policies and guidelines and providing quality assurance through sharing best practices. With FY 2009 funding RTC will provide ongoing training and continued medical education to assure that staff is aware of the latest treatment norms.

Public-private partnerships (PPPs) have also been formed. These include those with the provincial DOH, where value is seen by the government in accrediting specific NGO clinics in order to provide ARVs and pathology monitoring thereby reducing the overall cost on one donor. RTC will continue to work hand in hand with the SAG to ensure sustainability of the service delivery through a human resource development plan where value has also been seen when the government takes over certain positions initially paid for by PEPFAR.

Down referral of stable patients from hospitals to community health centers and local clinics will be strengthened further with FY 2009 funding, which will ensure that people receive comprehensive care closer to their homes and thus improve patient retention. The major areas of focus for the down referral process are human resources, training, infrastructure, data management and support with drug distribution even though the drugs are not funded by PEPFAR. Up-referral mechanisms linking primary sites to tertiary sites for complicated patients have been integrated into the RTC network of sites.

HIV-infected women, with or without antiretroviral therapy, are at high risk for the development of cervical cancer. Cervical cancer screening in HIV-infected individuals has been initiated as an integrated wellness service for all women attending the Helen Joseph Hospital, Themba Lethu Clinic. Results of the initial period under review demonstrate that approx. 55% of HIV-infected individuals have abnormal pap smears with over 30% of those demonstrating high grade pre-cancerous lesions (Ref: Firnhaber et al submitted July 2008). HPV testing conducted in a sub-set of these patients (funding source NIH CFAR) demonstrate that all samples with abnormality have multiple oncogenic HPV types. Campaigns to increase the uptake of cervical screening at all treatment and wellness sites supported by RTC will be undertaken.

RTC will continue strengthen links between counseling and testing and care within and between facilities. For those testing positive a tracer system will reduce loss to treatment initiation. Those who test positive will be tracked so that they benefit from wellness services and are tested every six months for their CD4 counts to ensure that they commence ART as soon as they become eligible.

AREAS OF EMPHASIS

RTC will emphasize an increase in activities to meet the objectives of the technical considerations in the following areas:

- a. Cotrimoxazole prophylaxis - RTC sites report a high utilization of cotrimoxazole for patients with a CD4 <200. An increase in training and implementation is required for the discontinuation of cotrimoxazole in patients with a CD4 count greater than 200 at two sequential time points. This is in line with the comprehensive care guidelines for South Africa.
- b. Palliative care - RTC will continue to emphasize the training for palliative care, with training courses provided to all counselors, nurses and doctors. Home-based care will continue in remote districts. Palliative education and training will be undertaken for family members.

- Activity Narrative:**
- c. Transition to care and retention in care will be emphasized using call center support for all patients undergoing HIV testing, inclusion of CD4 testing for staging for all who are tested HIV-positive, site specified referral to care at the time of CT, and follow-up of patients who do not reach the referral point. RTC uses the TherapyEdge-VCT module which enables tracking of all these processes.
 - d. Enhancement of the basic care package for all wellness, pre-HAART patients will include access to Isoniazid Prevention Treatment (IPT);
 - e. Positive prevention will continue to be emphasized including provider initiated counseling and testing for family and household members; engagement of disclosure of HIV status for sexual partners; condom distribution; assessment and diagnosis of both symptomatic and asymptomatic sexually transmitted infections.
 - f. All women will be provided with access to cervical dysplasia screening. Treatment will follow the South African guidelines for cervical cancer screening.

SUMMARY:

Right to Care's PEPFAR program was recompleted through an Annual Program Statement (APS) in 2007 and was a successful applicant. RTC will continue to use PEPFAR funds to strengthen the capacity of healthcare providers to deliver Care and Support (C&S) services to HIV-infected individuals, and to improve the overall quality of clinical and community-based health care services in five provinces.

BACKGROUND:

RTC's C&S services will expand from the current levels achieved using PEPFAR funds. The integrated program of education, counseling and testing, care and ARV treatment has been implemented in five focus areas: (1) The employed sector, where RTC is currently providing HIV services to >130,000 employees in >32 companies; (2) FBO/NGO clinics which target underserved populations in rural areas, industrial areas, and informal housing sectors as well as targeted gender-specific support groups and family-centered approaches; (3) Thusong, a private practitioner program for indigent patients; (4) Small, Medium, and Micro-Enterprise, including farm employees, with mobile treatment units; and (5) In partnership with the National Department of Health (NDOH), capacity support for national comprehensive HIV and AIDS care, management and treatment sites. RTC provides mentorship and technical assistance to over 15 sub-recipients and manages their sub-agreements. These are ongoing programs expanded with NDOH coordination and private sector support. By providing training and support to these sites RTC leverages NDOH resources to reach an increasing number of patients. RTC has supported these sites with infrastructure, staff, training, equipment and data management. In addition, the NDOH has recognized the successes of RTC NGO/FBO sites and has been accrediting these sites to enable the provision of ARV drugs and laboratory monitoring.

ACTIVITIES AND EXPECTED RESULTS:

RTC will build on past successes by consolidating and expanding its support for government sites, NGO and FBO clinics/organizations and private sector programs. FY 2008 PEPFAR funds will be used for human capacity development and salaries at all C&S providers; (1) NGO and FBO clinics/organizations receive sub-awards earmarked for doctors, nurses, counselors and other healthcare workers; (2) RTC will not provide salary support to SAG staff, but rather the salaries of health care providers seconded to DOH facilities including support for doctors, nurses, data managers, and counselors; and (3) a capitation fee-for-service arrangement exists with a network of private sector service providers for the Thusong and Direct AIDS Intervention (DAI) programs.

PEPFAR funds will also be used to maintain RTC's mobile clinics. NGO and FBO clinics also use PEPFAR funds for laboratory monitoring of HIV patients and for the procurement of health commodities such as medical equipment, ARVs, drugs for opportunistic infections including cotrimoxazole, counseling and testing kits, and home-based care kits.

RTC supports all the C&S providers by disseminating policies and guidelines and providing quality assurance through sharing best practices. With FY 2008 funding RTC will provide ongoing training and continued medical education to assure that staff is aware of the latest treatment norms.

RTC will ensure that each HIV patient at RTC-supported facilities receives a comprehensive minimum package of C&S services and preventive care, including clinic, community and home-based services. This minimum package includes clinical and pathology monitoring, management and treatment of opportunistic infections, psychosocial counseling, healthy living education, prevention with positives services, nutritional counseling, assessment, monitoring and referral, home-based care, advice and assistance on welfare issues and applications for welfare grants, and hospice and end-of-life care for terminally-ill patients.

Emphasis will be placed on increasing the number of HIV-infected children and pregnant women in care. A number of NGO sites are doing nutritional counseling at community level and refer for nutritional assessment and monitoring. Examples of non USG-funded community activities include food gardens and income generating programs in order to support patients that are on ART. In addition, sites supported by the NDOH have dieticians for ARV-treated patients.

PEPFAR funds facilitate partner linkages and a referral system between treatment sites-based care, and other non-medical C&S services. At each site RTC will identify a community-based care organization to add to the counseling capacity of the site. Peer counselors complement the NDOH appointed clinic staff. The Thusong program is linked with a national network of care organizations. The expansion of the strategic mix of clinic, home and community-based C&S will bring more C&S services to the doorstep of impoverished populations such as farm workers, rural communities and residents of informal settlements.

Activity Narrative: Public-private partnerships (PPPs) have also been formed to ensure longer term sustainability. These include, for example, those with the provincial DOH, where value is seen by the government in accrediting specific clinics in order to provide ARVs and pathology monitoring thereby reducing the overall cost on one donor. In addition PPPs are being explored with a number of organizations to provide holistic and comprehensive care and treatment services to HIV-infected patients.

NGO clinics also receive cooperative funding from donors and patient fees. Knowledge sharing between treatment sites and networks is being facilitated by Value-based. Referral mechanisms linking primary sites to tertiary sites for complicated patients have been integrated into the RTC network of sites.

A number of NGO clinics also have gender-specific C&S programs. For example, the ACTS (AIDS Care Training and Support) clinic has a series of comprehensive monthly support groups aimed at young men or young women who are HIV-infected. Support group members meet to discuss challenges and problems and provide each other with support and guidance. These programs include family-centered approaches. Expansion of gender-specific activities with FY 2008 PEPFAR funding is planned.

Right to Care will continue to use PEPFAR funds to strengthen capacity of healthcare providers to deliver C&S services to HIV-infected individuals and to improve quality of clinical and community-based health care services in five provinces. RTC will strengthen links between counseling and testing and care. For those testing positive a tracer system will reduce loss to treatment registration. Those who test positive will be tracked so that they benefit from wellness services and are tested every six months for their CD4 counts to ensure that they commence ART as soon as they become eligible.

By reaching patients with care and support services at various outlets, RTC will contribute to the PEPFAR goal of providing services to 10 million HIV-infected and affected individuals. In addition, RTC activities will support the USG Five-Year Strategy for South Africa by training health care workers in care and support services, significantly expanding access to and quality of palliative care services.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP for Salvation Army (SA). No FY 2009 COP funding is requested. Salvation Army (SA) withdrew from continuing activities of its FY 2008 COP for FY 2009 therefore no FY 2009 funding is needed for SA. The home-based health care activity was approved in SA's FY 2008 COP and funded with FY 2008 PEPFAR funds. For FY 2008 funds were allocated to train volunteers to provide home-based palliative care to people living with HIV and AIDS. Salvation Army will continue support for home-based care activities using their own funds. For FY 2008 SA will implement and complete the activities according to the schedule outlined in the FY 2008 COP.

Activity ID: 15940.22893.09	Planned Funds: \$242,726
Activity System ID: 22893	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

1. After discussions with CDC South Africa and the National Department of Health, Pathfinder International decided that the project be piloted in the Northern Cape first. Therefore the project will be implemented in four clinics in the Northern Cape. The clinics will be selected by the provincial Department of Health (DOH).
2. The project sites should be part of the South African DOH antiretroviral (ARV) sites and not the Planned Parenthood Association of South Africa (PPASA) clinics. The sites will function as satellite ARV clinics for young people. This approach will mean that Pathfinder does not have to undergo the lengthy ARV accreditation process for new clinics and also will assist in getting the provincial DOH to be partners in the project. With this approach, getting the services up and running will also be faster.
3. In Pathfinder's initial project design under this program area, one of the functions of the peer educators would have been to provide ongoing home-based care to HIV-infected young people that needed it. However, evidence from the region has shown that home-based care is too intense for young peer educators to cope with, as they themselves might be infected. This has led to high burn out rates and high attrition of peer educators. Instead, what Pathfinder is proposing is that the peer educators conduct home-based visits to provide ongoing support for young people on treatment and also through these home-based visits follow up with young people that are defaulting on treatment. For those young people that need home-based care, appropriate referrals will be made to other home-based care givers and other community resources providing such care.

SUMMARY:

Pathfinder will conduct a situational analysis and select communities for implementation of community and home-based care (CHBC) services according to availability of referral sites, such as hospitals and other facilities offering treatment of opportunistic infections (OIs) and ART. Peer educators will also be trained and peer supervisors in CHBC and establish linkages with programs providing nutritional support to people living with HIV (PLHIV) and OVC. The objective under this program area is to improve the quality of life for young PLHIV and their families through expanded access and improved quality of CHBC services. All activities will be implemented by Planned Parenthood of South Africa (PPASA) and services will be made available in PPASA youth clinics in KwaZulu-Natal, Gauteng, North West, and the Eastern Cape. The emphasis areas for these activities are human capacity development and local organizational capacity development. Specific target populations include young people between the ages of 15-24 years and their families around the clinic catchment areas.

BACKGROUND:

As the number PLHIV increases in South Africa, the gap continues to widen between the supply and demand for health care services. Relying on the strengths of community networks, community home-based care has emerged as an effective method of providing compassionate care to those infected and affected by HIV and AIDS. Since the 1980s, Pathfinder has been a leader in managing successful CHBC programs in a number of countries, including Uganda, Kenya, Tanzania, and Ethiopia, as well as a new youth CHBC program in Mozambique. Pathfinder will transfer this experience to better meet the needs of PLHIV -- particularly youth infected or affected by HIV and AIDS in South Africa. This is a new partner for FY 2008. CHBC will be implemented by NGOs, Community-Based Organizations (CBOs), volunteers, and youth organizations with technical oversight provided by Pathfinder/PPASA. Youth CHBC volunteers will provide an important link between PLHIV, community services and the youth-friendly clinics providing HIV and AIDS care and support services. They will identify potential barriers to ART adherence and ensuring treatment compliance for PLHIV on ART.

ACTIVITY 1: CHBC Networks

CHBC programs provide clients and family members with practical nursing skills such as how to treat bed sores, pain and symptom management, how to treat opportunistic infections etc., psychosocial support and linkages to other community services, such as income generation, food, and orphan support. CHBC relies on networks of community health workers who are attached to local CBOs; they regularly visit homes of those who are affected and teach caretakers how to provide emotional support and physical care to household members living with HIV and AIDS. In addition, community health workers play a major role in prevention, stigma reduction and social mobilization within their communities. CHBC programs strengthen linkages with nearby health facilities, such as hospitals and PMTCT sites, establishing two-way referral systems between these facilities and community health workers. CHBC is a critical element in the continuum of HIV and AIDS prevention, care and support. CHBC programs will expand their focus on palliative care to include adherence support, community engagement, prevention with positives, and nutritional support. Through this project, Pathfinder will facilitate CHBC services in selected communities around the four youth-friendly clinics upgraded to provide HIV and AIDS care and support services under this project. The project will build upon existing relationships with the Provincial Departments of Health, (PDOH) as well as with youth NGOs and youth associations currently providing community outreach services. CHBC will be implemented by NGOs, CBOs, and youth organizations, with technical oversight provided by Pathfinder/PPASA. Under the coordination of PDOH, Pathfinder/PPASA and project stakeholders will select communities for CHBC during project start-up. Criteria for selection will include proximity to a youth-friendly clinic, referral facilities, and existence of appropriate youth NGOs, CBOs or associations that have the capacity to carry out such activities. Pathfinder will conduct situational analysis and select communities for CHBC services based on the above criteria. Peer Educator Supervisors will be selected in each of the communities, where peer educators will receive training in CHBC and subsequently become Youth CHBC Activists. The Youth CHBC Activists will be trained to provide palliative care and training for primary caregivers and especially to youth affected by HIV/AIDS in their communities. From its long history of implementing CHBC programs and working with youth, Pathfinder recognizes the need for

Activity Narrative: effective and frequent supervision and mentoring of Youth CHBC Activists. These Activists will be given the emotional support they need to do their jobs, which are often demanding and difficult. Supervisors will conduct monthly meetings with them to track progress and provide updates, as well as provide a forum for the health workers to support one another and discuss difficulties and solutions as a group.

ACTIVITY 2: Community Support and Mobilization

Community support and mobilization are key to CHBC. Peer Educator Supervisors and Youth CHBC Activists will be trained on social mobilization as a part of basic CHBC training. Peer educators will be trained as Youth CHBC Activists to provide palliative care and training for primary caregivers and especially to youth affected by HIV and AIDS in their communities. The Youth CHBC Activists will identify and follow up with young pregnant women for PMTCT services and promote VCT among community members (especially youth). They will facilitate anti-AIDS clubs and support groups for youth infected or affected by HIV and AIDS, and identify and link orphans and vulnerable children (OVC) to available services, such as nutritional support and support for payment of school fees. In those families with a PLHIV receiving ART, Youth CHBC Activists will provide adherence support, follow-up, and linkages to referral centers. Youth CHBC Activists will be trained on the referral systems, and will refer clients appropriately. Activists will play a key role in community sensitization and stigma reduction around HIV and AIDS, working to introduce CHBC services in their communities and garner the support of local leaders, faith-based groups, and other youth organizations. Pathfinder together with PPASA will conduct community sensitization meetings to introduce CHBC services and garner support for program and youth community health workers. Health workers will be supplied with basic home-based care kits, containing gloves, swabs, disinfectant, and basic medicines such as paracetamol and hydrocortisone cream to assist in their work. A communication strategy will be designed to help Youth CHBC Activists to facilitate dialogue and collective action in their communities.

ACTIVITY 3: Gender Issues

Gender and sexuality are significant factors in the sexual transmission of HIV and they influence access to treatment, care, and support. Pathfinder will facilitate adaptation of the DOH HBC curriculum to be more gender sensitive and responsive, especially in regard to gender roles and norms among young people to improve gender-sensitive training for Youth CHBC Activists and Supervisors. Pathfinder will also add youth, gender, human rights and social mobilization components to national HBC training curriculum. Pathfinder will ensure appropriate representation of male and female Youth CHBC Activists and ensure that the number of families and young people reached with CHBC is proportionate with the number of young males and females in need in each community. Special attention will be given to young women infected or affected by HIV/AIDS to ensure that care and support services are available and that schooling continues whenever possible.

ACTIVITY 4: BCC and social mobilization: Participation of young people and community members in social mobilization processes will be valued as a goal. To start this process, community members need clear values in relation to young people, especially those living with HIV and AIDS. They must believe that living conditions of these young people ought to change. Through dialogue and establishment of prevention clubs, community members will collectively evaluate the social consequences of those living conditions and elaborate a different future, free of stigma and discrimination. Materials explaining the purpose of CHBC and helping PLHIV to "live positively," as well as those that build treatment literacy will be sourced and disseminated by the Youth CHBC Activists. Addressing prevention with HIV-infected individuals is an important part of this comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission.

These results contribute to the PEPFAR 2-7-10 goals by improving the quality of life for young PLHIV and their families through expanded access and improved quality of CHBC services.

Mechanism: World Vision

USG Agency: U.S. Agency for International Development

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$141,267

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Data quality management is a key requirement in the roll out of the PEPFAR-funded World Vision programs in all the Area Development Programs (ADPs). FY 2009 priority actions will involve the improvement of service quality. World Vision will ensure that strengthened and adequate supportive supervision of caregivers/volunteers is continuously provided with at least one visit every quarter for direct assessments, training and enhancement of service delivery.

Human Capacity Development (HCD)

World Vision will endeavour to strengthen the capacities and abilities of families, community members, non-governmental, community and faith-based organizations at ADP level in the six communities in which the Networks of Hope (NoH) project operates.

World Vision, in collaboration with local health allied bodies and relevant stakeholders, will carry out extensive training for home visitors, home-based carers, peer counselors and others to enhance their ability to carry out nutritional assessments and counseling.

World Vision will conduct Palliative Care Training for ADPs using South African Government (SAG) - accredited service providers. This will be based on the national minimum standards for training on Palliative Care for Community Caregivers and Resilience in Children and Caregivers. Some of the core models include basic hygiene, psychosocial support and community care. The training activities will take place routinely during the Community Care Coalitions (CCC) monthly meetings and periodically on arrangements over a period of time.

Capacitating the community members and locally-based stakeholders in this way will ensure sustainability of the deliverables of this program as the skills transferred will remain with the individuals and institutions based in the community ensuring continuity and future task shifting to the community members.

Alignment with the National Strategic Plan or other SAG policies or plans

The Government of South Africa (GSA)'s HIV & AIDS and STI National Strategic Plan for South Africa 2007 -2011(NSP) calls for: 1) reduction of HIV incidence by 50%; and 2) expanding access to appropriate treatment, care and support to 80% of all HIV-infected people and their families by 2011. In order to achieve these targets communities and the health system must be engaged to expand and improve the continuum of prevention, care and treatment services provided to people living with HIV (PLHIV) and orphans and vulnerable children. Through its NoH project, World Vision fully endorses and is aligned to these NSP objectives in collaboration with the SAG at various district levels is essential for an active, effective and sustainable response.

GENDER

In the spirit of collectivism and collaboration, the NoH would continue to work with local communities to facilitate access to essential services, integration at local level, and build local capacity building programs. In sustaining and system strengthening at local and provincial levels, World Vision strives to achieve on the goal of GSA in providing a better life for its entire people.

World Vision Channels of Hope (CoH) team will conduct Community conversations in the communities/ (CCC) to address the following topics gender based violence, gender inequalities, help and support for female child-headed households, the right of women and girls to say no to unwanted sex and gender norms that deny women inheritance rights. World Vision will ensure that women and men will have equitable access to care and support and other services, under the adult care and support program

SUMMARY:

World Vision (WV) is expanding OVC care activities by increasing the coverage, scope, and quality of services to family members of HIV-infected individuals and older OVC. Emphasis areas are community mobilization, training, and development of linkages and referral systems. The target populations are people living with HIV and AIDS.

BACKGROUND:

World Vision is a non-profit organization established in 1967 working in 14 Area Development Programs (ADPs) in six provinces of the country, reaching over 42,000 children with holistic development support. World Vision has already identified and is providing community-led support to 4,439 OVC in these ADPs. With PEPFAR funding this number will be increased to 17,500 children through the OVC project. For this project, the target will be to address the needs of primary caregivers of OVC and older OVC which are not covered by OVC funding. By working with community partnerships through their Community Care Coalitions (CCC) model, World Vision enhances their ability to prevent, mitigate and alleviate the impact of HIV and AIDS. Care at the home and community level is a strategy within the South African Government National Strategic Plan.

World Vision will continue to strengthen access to integrated services as a part of a comprehensive care package for PLHIV and their families in Free State, Limpopo and Eastern Cape provinces, with expansion to at least 2 ADPs in Kwazulu-Natal province. The activities reinforce and expand services provided by Community-based Organizations (CBOs) and government care programs, such as basic hygiene, wound care, screening for pain and symptoms, nutrition assessment and support, spiritual care and support, psychological care and promotion of the HIV preventive care package. With FY 2008 funding, World Vision

Activity Narrative: will further institutionalize the program within government and CBOs, while also expanding its reach. World Vision will emphasize capacity building and local skills transfer, and assist HBC programs to develop strategies to alleviate the care burden on girls. These strategies will specifically address gender sensitive counseling, community outreach and couple counseling furthermore World Vision will ensure quality of community-based services, and identify/apply lessons learned.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Home-based care program

The majority (over 70%) of care workers (home visitors - HVs) in OVC programs are women (while two thirds of the adult beneficiaries of the current home care programs are also women. In many cases, care workers may also be recognized as traditional healers. World Vision will work to increase the involvement of men in care giving. As part of psychosocial support trainings, care workers will engage men by focusing on such topics as family violence, anger management, fathering and parenting skills. A stipend provided to care workers and volunteers through the HBC program is an important source of household income. Regular financial training seeks to improve the capacity and economic advancement of care workers in the program. In addition to the psychosocial support training HVs will be trained on Palliative Community Caregiving by Hospice.

Trained HVs provide a minimum standard of care focusing on physical, psychological, spiritual and social interventions. In addition to sharing integrated HIV-related palliative care messages with HIV-infected individuals and their families, care workers will use a family-centered approach to client assessment. Based on the need, clients will be referred to partner clinics and hospitals for pain management, treatment of OIs including cotrimoxazole prophylaxis, family planning or other issues as observed. Home visitors will monitor referrals to ensure appropriate follow-up and ongoing care and support. All clients will be counseled on prevention with positives and family members will be referred for counseling and testing. Outreach to the community and referrals are part of the HBC activities. An additional key activity of care workers is monitoring of adherence to TB and HIV treatment. Elements of the preventive care package for adults and children are also included during interaction between the care worker and the client. Special emphasis during training will ensure HVs have a comprehensive understanding of referrals and linkages with other services, including linkages with health and social welfare sectors for grants, legal aid, micro-finance, spiritual support, CT, ARVs, and FP. With FY 2008 funding, World Vision will also seek to include bicycle transport options for care workers to further improve coverage and support.

ACTIVITY 2: Psychosocial support training

In addition to home visitors, World Vision will also continue to identify and train supervisors and group leaders to provide psychosocial support services. In districts where psychosocial support will be established, community group leaders will be trained to reach family members of PLHIV and OVC, adults, and their households through group counseling. At each site, qualified and trustworthy community members to guide support group activities will be identified. These community-based group leaders will lead weekly support sessions for the group members and conduct home visits to families of OVC. WV's Regional Psychosocial Advisor will train supervisors as well as selected World Vision staff on a training curriculum based on successful modules designed to address the particular needs of children and of adults. The training will equip supervisors to assist and support others in care of the carer. At all levels, care of the carer and care support training will focus on psychosocial interventions, including assessment, basic counseling, group facilitation, and advocacy. Complementing health and nutrition lessons, training will ensure that all trainees are able to recognize general physical as well as psychosocial health problems associated with HIV and AIDS in children, and to make appropriate referrals to Child and Family Wellness clinics, Health Centers and PHC Centers as needed.

Support group meetings led by trained group leaders using interactive and participatory techniques will be held regularly with HVs. Working with churches/FBOs, and CBOs, World Vision will invite community members to form psychosocial support groups. Group members will also be identified through assessment interviews and information provided by relevant community members. During these support group sessions, HVs and volunteers will learn to enhance coping skills to accomplish activities of daily living. Members will carry out tasks designed to enhance relationships and build self-esteem. Positive living is reinforced as group members develop emotional resilience. At the end of the project's first year, groups will be encouraged to continue meeting, with ongoing guidance from World Vision's staff. The positive impacts of psychosocial support will extend to group members' households, and family members will benefit indirectly from the support group's second year of activities.

In all of the above activities, OVC will be counted only in the OVC program area. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services. PLHIV will receive at least one clinical and one other category of palliative care service.

These activities will contribute to the PEPFAR goal of reaching 10 million HIV-infected and affected individuals with care.

New/Continuing Activity: Continuing Activity

Prime Partner: Walter Sisulu University	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 7961.22715.09	Planned Funds: \$388,362
Activity System ID: 22715	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Eastern Cape Regional Training Center (RTC) will be scaling down direct patient care in future to concentrate on training. As advised by the province, RTC will be setting up Centers of Excellence. RTC will work closely with the HIV Directorate and other relevant departments in the Department of Health (DOH) to increase the current RTC onsite mentoring approach to cover more sites for longer periods and other aspects of care, including TB infection control, and integrated management of childhood illness (IMCI). RTC will establish district-based Performance Improvement projects and Specialist Clinics with a wellness program as Centers of Excellence where clinicians can rotate for specified periods to acquire skills.

RTC will offer training on care and support on subjects including: Basic HIV/ AIDS, Palliative Care and Acute Care and Prophylaxis.

RTC will work on development and accreditation of the Basic Care Package training program for people living with HIV (PLHIV), including their training in the 27 RTC-mentored sites.

RTC will introduce a family-centered approach to care and support at community and household level to reduce stigma and discrimination and provide a supportive environment for the PLHIV.

SUMMARY:

The Eastern Cape Regional Training Center (RTC) will use FY 2008 funds in the Eastern Cape for sustainable human capacity development for all health workers through provision of support and training for improvement of health systems of HIV and AIDS care in the Eastern Cape. RTC staff will also continue to improve their knowledge and skills by having weekly academic clinical discussions, internal workshops, and ongoing mentoring and Performance improvement meetings with staff of partner facilities and their feeder clinics and in so doing, creating a "learning" network across all the LSAs of operation. This will facilitate health workers to deliver quality HIV and AIDS palliative care and enhance their capacity to participate effectively in all levels of HIV and AIDS care. Three teams from RTC will each support a facility and its feeder clinics for a period of four months to initially evaluate the HIV and AIDS palliative care training needs and provide targeted didactic training, ongoing mentoring and coaching using standardized procedures manuals and tools that are in line with the national guidelines. A performance Improvement officer will continuously mentor and improve performance of the trained personnel while the teams move on to cover other clinics. Community support groups will be supported and trained in delivering the basic Care package to PLHIV and their families in their respective communities. The primary emphasis will be given to core activity of training, with minor emphasis to quality assurance and supportive supervision for health systems improvement in HIV and AIDS care, information, education and communication (IEC). The primary target groups are public and private health care workers. FY 2008 activities will be expanded to include continuous performance improvement of facilities and feeder clinics. There will also be a central information officer supporting the three teams, information systems strengthening at facility and feeder clinic levels, thus building information management and reporting capacity of these clinics. Teams will ensure all team data collection is captured into the main RTC M&E systems.

RTC will also train local PLHIV groups on the Basic Care Package and mentor these in the areas of support to implement the Basic Care Package. RTC will be responsible for the accreditation and production of the training material for this purpose. The Basic Care Package will include: Acceptance of status, disclosure, prevention with positives, nutrition assessment and counseling, What is HIV, progression of illness, treatment literacy and adherence counseling.

BACKGROUND:

Since 2004 RTC has developed two care support centers in two hospitals and nine clinics and generated a model and protocols which will be introduced at new sites in FY 2007. A system of improvement cycles have been introduced in one sub-district.

RTC has been working with ECDOH managers in developing and disseminating care protocols and will be providing support and working closely with the district and facility managers to increase skills capacity to improve the quality of HIV treatment and support services at facilities and community level.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008 RTC activities will continue to address activities related to training; local organization capacity development; quality assurance; and supportive supervision. Funding will be used to train and mentor health care providers on HIV and AIDS related palliative care and support programs. This will include the preventive package of care including prevention with positives, screening for opportunistic infections according to national guideline for management of HIV; WHO clinical staging and provision of cotrimoxazole prophylaxis, screening for and treating TB in PLHIV and provision of INH prophylaxis. RTC will also seed accreditation of training curriculum for the Basic Care Package for PLHIV in conjunction with NASTAD and train PLHIV in implementing the basic care package. Target personnel will include physicians, nurses and nurse practitioners and other hospital and clinic staff.

ACTIVITY 1:

RTC will through the 4 clinical teams assess the palliative care training needs of health care providers at selected hospital and feeder clinics sites in the Eastern Cape province. Palliative care training will be designed according to the needs of the care providers. The areas to be covered are: basic prevention including prevention with positives, clinical screening and monitoring of the PLHIV, treatment of opportunistic infections, cotrimoxazole and INH prophylaxis and pain and symptom management. These

Activity Narrative: training will be in the form of case discussions, ward rounds, targeted didactic training, mentoring and coaching. This will be followed up with quality assurance interventions by the QA team to ensure transfer of skills into practice.

ACTIVITY 2:

RTC will in conjunction with NASTAD's sub-partners (JRI and SA Partners) seek accreditation for the training curricula for the Basic Care Package for PLHIV. RTC will also produce the training material for this training and train PLHIV to form and facilitate support groups to deliver the Basic Care Package. This package will cover the following: acceptance of HIV status, disclosure, prevention with positives, and treatment of opportunistic infections (with a special focus on TB/HIV co infection and the provision of cotrimoxazole), ARV and adherence and nutrition assessment and counseling. RTC will form support groups for PLHIV and their families in each of the sites they support to deliver the basic care package.

These activities will contribute to the PEPFAR goal of reaching 10 million HIV-infected and affected individuals with care.

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$194,181

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Home-based Care (HBC) integration in orphans and vulnerable children (OVC) and AB Prevention programs:

TIPHC's HBC Care Givers will be trained in the identification, registration, need assessment and referral of OVC, including basic HIV and AIDS counseling and testing, linkage to antiretroviral (ARV) treatment and age specific prevention.

The three programs are linked, as the majority of HBC clients have OVC in their households, and often either both parents are terminally ill or one parent has died while the other remaining parent is terminally ill. The situations like this result in children fending for themselves and also looking after their sick parent while attending school. AB facilitators will also be responsible in the identification of HBC clients through AB Prevention and OVC integration programs by following up on the identified OVC in schools where they have programs running and referring them to HBC program for follow-ups. AB Prevention facilitators will also be part of the training team for both HBC and OVC care givers to help children, families and caregivers cope with everyday challenges.

The involvement of AB facilitators and OVC care givers in the HBC program will help to increase the number of clients that will be receiving PEPFAR supplementary direct services. It is anticipated that the integrated approach will increase the HBC target by 20% coverage and improve service quality.

Human Capacity Development:

TIPHC intends to consolidate the quality of its services by ensuring that the knowledge and skills of care givers are standardized to ensure quality improvement. Sustainability will be achieved through imparting the knowledge and skills in care giving to family and community members.

Induction and Orientation: All fifty Care Givers will undergo three days induction and orientation training at the beginning of the program. All care givers would have had attended the 59days comprehensive training course on home-based care facilitated by accredited service providers in the FY 2008. In service training on monitoring and evaluation (M&E) tools will be conducted on regular basis for quality data collection.

The Care Givers will also be empowered by attending training on couples counseling and testing so that they can be enabled to assist the households they visit and refer to relevant health facilities.

Management and leadership development: HBC Project staff will be capacitated on project management and supervision which will include data collection system for tracking care givers training, managing care givers deployment, performance and attrition information for planning and modeling long-term care givers needs.

Retention strategies for Care Givers: Care Givers will be retained through incentives, training, respite care and psychosocial support such as counseling and bereavement care for caregivers as well as adequate supervision by professional nurses.

Ten Care Givers with suitable qualifications will be identified and selected to attend a twelve-month training as Auxiliary Nurses. This will be an incentive for furthering the career path. The cost of the training will cover the tuition fee, books, uniform and per diem.

Economic strengthening

TIPHC will initiate income generating projects among the existing support groups. The projects include bead work, gardening, candle-making and sewing. Within the support groups a microcredit savings and lending scheme will be established. Members will lend each other small loans based on agreed lending terms.

Alignment with NSP, SAG policies and plans.

The TIPHC program contributes to the National Department of Health HIV & AIDS and STI National Strategic Plan (NSP) for South Africa 2008 – 2011 by recruiting and training new community care givers and by developing standards and career pathways as mid-level workers according to National Qualifications Framework. TIPHC has also strengthened support, mentoring and supervision of its care givers and are also receiving nationally determined stipends.

The Local Economic Development (LED) Plan for Nkangala District Municipality of December 2004 highlights Human Resources and Community Development as one of its seven pillars for LED with HIV and AIDS care taker training as one of its priority activities. The plan is to construct a facility for training "personnel providing care for HIV and AIDS sufferers". TIPHC care giver training is aligned with the LED Plan in that its goal is to enhance the skills and expertise of care givers in an effort to improve the quality of service delivery.

Gender

Gender is a critical issue in the HBC program with the implications for the quality and effectiveness of care provided and major burden on women and girls to provide. Gender norms and roles do affect women and men's ability to benefit fully from all aspects of care and support. Further, women's restricted inheritance and legal rights, along with their limited access to credit and reproductive resources in our societies, affect the ability of achieving the objective of social care. All the above will be referred to different service providers like Lawyers for Human Rights, Financial Institutions and Government Sponsored Organization like Umsobomvu Youth and Women Fund.

Activity Narrative: Implementation of programs that target men and boys encouraging their participation and responsibility in care giving and household functions, their support for female caregivers and their recognition of the burden of care will also be a priority.

Follow-up to HBC, especially referrals to other service providers, will be a mandatory. A checklist system will be put in place which will enable a follow-up to ensure provision of referral services to HBC. This is critical especially for HBC reporting cases of sexual abuse and domestic violence which require decisive intervention by the South African Police Services (SAPS). Reports from current HBC program indicates increasing numbers of women being abused in the homes due to the fact that male partners blame them for infecting them.

SUMMARY:

The TIPHC embarked on the initiative of providing care and support services to HIV and AIDS infected and affected persons in response to the need to complement the South African Government (SAG) provision of basic health care services to the underserved communities and vulnerable groups. The emphasis area is human capacity development. This is complemented by information, education and communication, linkages and referrals, training and food/nutrition support through private sector partnership of food parcel deliveries. The specific target populations include HIV-infected individuals and their families in underserved communities.

BACKGROUND:

TIPHC is a South African registered non-profit organization which has been operational since April 1994. It has a long history of implementing HIV and AIDS information, education, home-based care and support programs in Emalahleni Municipality, a local authority of Mpumalanga province. TIPHC is a key partner to the South Africa National and Provincial Government HIV and AIDS Prevention and Control Program. Its home-based care program is aligned to SAG's policy guidelines for providing a continuum of support services for HIV and AIDS infected individuals and their affected family members from the time the individual gets infected with HIV through sickness and terminal stages of AIDS through the time of family bereavement when the individual dies. To date, it has cared for and supported hundreds of HIV and AIDS infected and affected persons including OVC. It has since grown and gained the confidence of both the provincial and National Department of Health (NDOH) which have funded the bulk of its prevention and care activities. With PEPFAR funding, TIPHC's home-based care and support program will consolidate the integration of the three pillars of service provision as outlined in the Department of Health Home-based Care and Community-based Care Guidelines. This is a holistic approach that addresses the health, psychosocial and economic needs of the target group whereby PLHIV will be assisted to engage in PEPFAR supported income generating projects. The sustainability of the program is hinged on its integrated strategies for service provision. Every activity is implemented in collaboration with SAG and local municipalities. In addition, training and capacity building of caregivers, client families and communities will ensure that the communities will gain the necessary skills to be able to continue with future initiatives for program implementation.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Palliative Care

The basic service provided under this initiative will include elements of the preventive care package, OI prophylaxis, pain and symptom management and referral within clinical and home-based settings. A team of trained and dedicated home caregivers and supervisors conduct scheduled and emergency home visits to check on patients, arrange for patients visits to the clinic, organize collection of medication where necessary, ensure that patients take prescribed medication and offer physical assistance with cleaning and feeding of those without helpers. Given the high frequency of TB in patients with advanced HIV, there will be an emphasis on TB screening. Effort will be made to ensure equitable access to care services for both males and females.

ACTIVITY 2: Training and support for caregivers

Training of caregivers will increase the level of competence and effectiveness in providing care services. Caregivers will need to be multi-skilled in assessing patient condition, pain and symptom management and referral within clinical and home-based settings. TIPHC will coordinate the training of home-based carers. Caregivers will attend a ten-week training course that is facilitated by the Department of Health. This is a comprehensive course which provides caregivers with the knowledge and essential skills for patient care, illness management, assessment of patient's condition and environment, making referrals to the clinic, providing psychosocial support and counseling and guidance with good nutrition and family economic empowerment. In addition to training, caregivers will be supported through the decentralized district health system (local clinics and hospitals) with referrals, home care supplies and regular psychological debriefing which form the fundamental strategies of the care program.

ACTIVITY 3: Patient and family support

Provision of information to and counseling of the infected and affected persons is a requisite service. It enables the caregiver to establish a rapport with the client for dealing with more sensitive issues like advice and referral for counseling and testing. Other support services that are offered in conjunction with palliative care include the training and education of family members to care for patients as well as other family members in need of help, making arrangements for family psychological and spiritual counseling and support from the religious fraternity. Nutritional assessment and monitoring and provision of non-USG funded food parcels are a vital component of client support. Particular attention will be given to vulnerable

Activity Narrative: groups such as female, granny and child-headed households where gender-equity issues become highlighted due to high potential of gender-based violence, abuse, stigmatization and discrimination towards the disadvantaged groups like the sick, the old and frail, women and children. The importance of nutrition will be highly emphasized especially for the sick, the old and vulnerable children.

ACTIVITY 4: Capacity building for family and community members

Information and education about home-based care and mobilization for community member participation in the program will be intensified through house campaigns with the aim of reducing fear, misconceptions and stigma associated with patients suffering from AIDS related illnesses. During campaigns, families will get counseling and information materials. Family members will be guided on how to manage family resources and initiate income generating projects (IGPs). To facilitate income generating activities, PLHIV will be encouraged to form support groups in each community and the groups will be assisted with inputs for implementing IGPs. The projects will be linked to enterprise development agencies and TIPHC will monitor progress and report on outcomes.

ACTIVITY 5: Referral

Referral and support services are key components of palliative care. It entails working in close cooperation with the provincial and National Departments of Health, local clinics and hospitals other Government Departments like Education, Social Development, Home Affairs and Local Municipalities. Clients are assisted with hospitalization for clinical care. Support is also provided to enable clients to access subsidies for children's education, social grants, water and electricity and acquisition of personal documentation like birth certificates and identity documents. TIPHC caregivers and program staff will play a critical role of making the referral and following through to ensure that the client receives the entitled service. Clients will be monitored very strictly and their case files documented comprehensively.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

This activity will contribute to the PEPFAR objective of providing care to 10 million people infected and affected by HIV and AIDS, including orphans and vulnerable children.

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 14071.22848.09

Planned Funds: \$762,160

Activity System ID: 22848

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The project will increase access to care and support services by implementing a community wellness program through support groups. This program will aim at empowering people living with HIV (PLHIV) to be more involved in managing their illness. The projects will also seek to strengthen home-based care programs by providing funding to community-based organizations, building their capacity through training of carers on care and support programs and a family-centered approach to care and support activities.

Activity 1: Establishing wellness programs in support groups

The projects will recruit PLHIV from counseling and testing sites to join support groups where they will receive information, counseling, coaching and support and HIV and AIDS related issues. PLHIV will be assisted in the following: (acceptance of status, disclosure, prevention with positives, HIV and AIDS and TB/HIV, alcohol and substance abuse and HIV and AIDS, treatment literacy, nutrition assessment and counseling and treatment adherence. PLHIV will be encouraged to bring their family members and other members of the community for care and support services related to HIV and AIDS.

Activity 2: Family centered Approach to Care and Support services

The projects will strengthen home-based care services and train carers on family counseling and testing, prevention messages for the family, prevention with positives, water and sanitation within the home environment, and infant follow-up including growth monitoring. CBOs will be contracted to provide home-based care services to PLHIV and their families.

SUMMARY:

The aim of this project is to provide technical assistance to the National Department of Health (NDOH) and provincial health departments to ensure expansion and integration of palliative care services within all palliative care programs, including PEPFAR, in all provinces. Target populations for these activities include host country government, healthcare workers and community healthcare workers. PEPFAR funds will be used to employ one full time palliative care technical advisors to be placed at CDC and one full time palliative care technical advisor in each of the nine provinces to assist with the coordination of palliative care activities at provincial and district level, enhance capacity of provincial and district staff by providing support and technical assistance for the implementation of the Basic Care Package at district level in all nine provinces. The funds will also be used as part of a joint (inter-agency) APS to attract new partners to implement the Basic Care Package for PLHIV who do not qualify for ARV treatment.

BACKGROUND:

The goal of the National palliative care program is to ensure the universal access to palliative to all PLHIV and family members especially those who do not qualify for ARV therapy thus establishing a continuum of care from testing HIV positive to end of life care.

ACTIVITY 1:

The technical advisors at provincial level will be responsible for coordinating the implementation of the Basic Care Package and the integration of pain assessment and management into HIV care services at district level. This will ensure consistency and quality across all palliative care services and will build capacity within the provincial DOH to monitor and support palliative care services. It is expected that these advisors will be able to support and advocate for supportive palliative care policies at the national level and within the provinces respectively and ensure that these policies are in line with the South Africa National Strategic Plan for HIV and AIDS. These coordinators will liaise with provinces and work across all PEPFAR partners within the provinces to ensure quality palliative care services are rendered according to national and PEPFAR guidelines. They will also provide technical assistance at provincial level in monitoring and evaluation of Care programs at district level.

ACTIVITY 2:

Funds will be utilized in the joint agency APS to attract new partners to implement the Basic Care Package in all nine provinces. USG is seeking partners to implement services in: acceptance of status, disclosure, screening and treatment of opportunistic infection (cotrimoxazole and INH prophylaxis), nutrition assessment and counseling, pain and symptom screening and management, knowledge of HIV infection and disease progression, ART and treatment adherence, TB treatment and adherence and basic hygiene and safe water. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals. The rapid scale-up of HIV care and treatment has created an opportunity to reach many HIV-infected individuals with prevention with positives interventions on a regular basis. Emphasis will also be placed on accessing gender equity in care programs. USG is seeking partners to implement these services in hard to reach rural areas.

The main beneficiaries for this program will be PLHIV who will be encouraged to compete. This program will contribute to 2-7-10 goals by ensuring the implementation of quality palliative care and increasing access to palliative care services.

Prime Partner: South African Catholic Bishops Conference AIDS Office

Funding Source: GHCS (State)

Budget Code: HBHC

Activity ID: 13817.22867.09

Activity System ID: 22867

Mechanism: SACBC

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$2,385,249

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

With FY 2009 funding, the Southern African Catholic Bishops Conference (SACBC) will expand current home-based care for orphans and vulnerable children (OVC) and their family members to include the important components of community integrated management of childhood illnesses (IMCI); cotrimoxazole prophylaxis; active screening for health care needs of OVC in schools; and addressing the issue of alcohol abuse amongst family members.

The SACBC will continue with the activities of FY 2008 but intensify the following:

ACTIVITY 1: Support to parents (primary caregivers)

The SACBC will conduct workshops to family members taking care of OVC as a means to provide good parenting and to understand problems pertaining to such children at site level. This will require the community mobilization to offer support to families and children. Advocacy on counseling and testing will increase the number of persons on antiretroviral therapy (ART). Treatment literacy will be intensified to promote adherence to treatment.

ACTIVITY 2: Building Networks through Linkages and Integration

As a means of strengthening the existing structures, the SACBC will ensure that all treatment sites are child-friendly to accommodate children who are on treatment. The SACBC AIDS Office will also look into current structures to improve the information and communication flow. This aspect will aid speedy referrals and enable community members to know where they can access relevant assistance.

ACTIVITY 3: Mainstreaming Gender

The SACBC has found that mobilizing men as caregivers and members of the support group is a key way to increase awareness of HIV prevention, women's and girls' rights, and to engage men in HIV and AIDS and OVC activities. This will include working with various groups of men within dioceses to challenge some of the cultural taboos which may give rise to the stereotypical attitude that views women as insignificant members of the society. The SACBC's gender mainstreaming is centered on complementarity of species rather than stressing the difference between men and women.

ACTIVITY 4: Capacity Building

Training at the implementing sites will target lay and health workers to reinforce the existing human resources. The SACBC will collaborate with training service providers to conduct refresher courses and training for the continuing caregivers and the new ones. This will ensure sustainability and task shifting to the community at large. Emphasis will be on treatment literacy, opportunistic infections, linking of nutrition and treatment, and adherence to treatment.

The SACBC, through an identified service provider, will equip the site communities with a variety of income-generating activities, such as microfinance, and vendor models. Along those activities, the SACBC will ensure that skills development is carried out within the most disadvantaged communities. The SACBC will roll out training on self management to ensure proper use of social grants and to promote saving among the recipients of these monetary grants.

SUMMARY:

The Southern African Catholic Bishops Conference (SACBC) AIDS Office has adopted a family-centered developmental approach and a child-focused intervention for its OVC program. For the 2008 fiscal year the SACBC AIDS Office will extend its program and services to the surviving parents, guardians and the foster parents of HIV-infected individuals and orphans and other vulnerable children supported through this program. The SACBC AIDS Office will support its sub-recipients in palliative care program design, implementation and direct services for the surviving parents, guardians and foster parents living with HIV and AIDS. The SACBC AIDS Office will guide its sub-recipients to implement a comprehensive, holistic and interdisciplinary approach to HIV care. This program will strive to achieve optimal quality of life for people living with HIV (PLHIV) and their families and minimize suffering through clinical, psychological, spiritual, social and preventive care support. Through this program PLHIV will be referred to existing ART sites. Some of the sub-recipient sites receive funding through a Track 1 partner, Catholic Relief Services, for HIV care and treatment, and this co-location allows for ease of referrals.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support to parents (primary caregivers)

The SACBC AIDS Office will strengthen the capacity of families to protect and care for OVC by prolonging the lives of the primary caregivers through clinical care which include HIV counseling and testing, routine follow-up to determine the optimal time to initiate ART if HIV-infected; prevention and treatment of opportunistic infections including cotrimoxazole prophylaxis such as tuberculosis (TB); HIV prevention and behavior change counseling including prevention with positives. Sub-recipients will be encouraged to run counseling and testing (CT) campaigns. Through these campaigns primary caregivers will be encouraged to know their status. In addition the SACBC AIDS Office will support its sub-recipients to provide clinical, psychological, spiritual, social care and integrated prevention services. The SACBC AIDS Office will support its sub-recipients to establish community-based support groups and appropriate training will be provided. Advocacy initiatives will also be conducted at the congregational level to ensure that the local priests are supportive and promotes spiritual care through retreats. In addition the SACBC AIDS Office will support its

Activity Narrative: sub-recipients to develop programs geared towards stigma reduction. Sub-recipients will be supported to run awareness and acceptance HIV campaigns within their respective communities.

ACTIVITY 2: Building Networks through Linkages and Integration

The SACBC AIDS Office will provide technical support to its sub-recipients to strengthen and integrate home-based care, community-based care and facility-based care for family members of HIV-infected into the OVC programmatic interventions. The SACBC AIDS Office will ensure that its sub-recipients build and sustain comprehensive HIV and AIDS care systems. The SACBC AIDS Office will ensure that strong referral systems are in place at local level for the provision of prevention, treatment and care across facilities, clinics, communities and homes. The SACBC AIDS Office has eight sites that already provide on-site health care, and this ensures that access to health care for HIV-infected and OVC is improved.

ACTIVITY 3: Mainstreaming Gender

Gender equity will form an integral part of the SACBC AIDS Office program's activities. The SACBC AIDS Office will ensure that women and men are receiving equitable support and access to essential palliative care services, especially treatment. Sub-recipients will be encouraged to work with male groups in their dioceses to mobilize the involvement of men as caregivers and members of various support groups. Communities will be mobilized to enforce female protection from exploitation and abuse and to mitigate against gender-based violence. The SACBC AIDS Office will support its sub-recipients to work with the existing gender-based violence programs within the Department of Social Development at district level. . The SACBC AIDS Office promotes the teaching of the Catholic Church concerning abstinence and fidelity, as well as the appropriate use of condoms for discordant couples.

ACTIVITY 4: Capacity Building

The SACBC AIDS Office will provide technical support to strengthen the capacity of its sub-recipients by providing training on various aspects of palliative care. In addition the sub-recipients will be provided with ongoing supervision and mentoring. The SACBC AIDS Office will develop wraparounds with other partners (such as the Department of Social Development) for food supplements and nutrition assistance to ensure effective implementation of palliative care.

a) Training for secondary caregivers: In FY 2008, training of secondary caregivers will focus on treatment literacy, psychosocial support and caring for PLHIV. The SACBC AIDS Office will identify a credible service provider to provide the treatment literacy training. The course is conducted over five days. The Regional Psychosocial Support Initiative (REPSSI) will provide the psychosocial support (PSS) course for caregivers who are new to the program and are not well-versed in PSS. The psychosocial support course included themes such as a sense of self-worth, of value, self-esteem, bereavement care, building resilience, listening and talking to distressed children, child development; hero books and the holistic needs of human beings.

b) Training of primary caregivers: Families of HIV-infected individuals and OVC will be trained by secondary caregivers in identifying and establishing viable income-generating activities for economic strengthening of households. Primary caregivers will also be trained in basic nutrition, HIV and AIDS awareness and prevention including prevention with positives, basic hygiene and treatment literacy particularly for families of people living with HIV.

c) Training of trainers: In FY 2008, this program will target a few secondary caregivers from each sub-recipient to be trained as trainers in treatment literacy, psychosocial support and home-based care. These caregivers would then be responsible for training other caregivers using the same curriculum and materials to maximize the impact of training and to improve chances that information gained from the various training sessions is implemented at site level.

In all of the above activities, OVC will be counted only in the OVC program area. PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services

These activities will contribute to the PEPFAR goal of reaching 10 million HIV-infected and affected individuals with care.

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$330,000

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Community Grants will continue to support South Africa's most promising small community and faith-based organizations making significant contributions to the fight against HIV and AIDS. Major emphasis areas for this activity are training, procurement of basic equipment, and local organization capacity development.

The strategic direction of Community Grants is evolving with an increasing focus on economic strengthening. Community Grant Coordinators will help facilitate economic strengthening by continuing to link community and faith-based organizations funded through Community Grants with larger PEPFAR partners and South African Government departments to build capacity and ensure project sustainability.

As the strategy evolves, a significant emphasis will also be placed on income generation activities, such as supporting their IG initiatives and training Grantees on grant writing and fund raising, thus enabling our programs to benefit from multiple sponsors. Another focus area for funding will be program-sponsored, self-sustainable income generation businesses, such as bakeries, sewing projects, and bead making. This advancement will allow Coordinators to remain responsive in the ever-changing nature of the HIV and AIDS pandemic.

SUMMARY:

The Ambassador's HIV and AIDS Small Grants Program in South Africa will use PEPFAR funds to continue to support South Africa's most promising small community and faith-based organizations making significant contributions to the fight against HIV and AIDS. Major emphasis areas are commodity procurement and human resources. The activities target PLHIV and their families and caregivers, community volunteers, CBOs and FBOs.

BACKGROUND:

The Ambassador's HIV and AIDS Small Grants Program in South Africa (Small Grants) has had three tremendously successful years. Out of over 1,000 applications, the South Africa Mission has entered into agreement with 237 small community-based organizations (FY 2005, FY 2006, and FY 2007) in the areas of prevention, hospice care, home-based care, treatment support, and care for orphans and vulnerable children. Funded projects are located in nine provinces, primarily in disadvantaged rural areas. The average funding amount is approximately \$10,000. Programs supported with Small Grants funds provide service delivery that directly impacts communities and people affected by HIV and AIDS. The USG PEPFAR Task Force is increasingly linking community and faith-based organizations funded through Small Grants with larger PEPFAR partners and South African Government departments to build capacity and ensure project sustainability. Small grants projects generate positive publicity for PEPFAR and goodwill in communities. The Mission has established guidelines and review procedures to ensure that strong applications are considered for funding through a fair, transparent process. Criteria for selection include: improvement of basic conditions at the community level; benefit a substantial number of people in the community; be within the means of the local community to operate and maintain; and quick implementation of grant within one-year agreement period. Grants must conform to the PEPFAR Small Grants Guidelines. Projects are reviewed by a technical Mission Health Committee and supervised through the Embassy and each Consulate General by State Department Small Grants Coordinators. Based on experience in FY 2005, FY 2006 and FY 2007, the USG PEPFAR Task Force anticipates the strongest applications for FY 2008 will be in the areas of (1) care, particularly hospice and community-based care, and (2) orphans and vulnerable children.

ACTIVITIES AND EXPECTED RESULTS:

The next round of applications and approvals for Small Grants has begun (with anticipated FY 2008 funding). Given three successful years of the program, the USG PEPFAR Task Force expects to fund approximately 30 community and faith-based organizations that will assist HIV-infected individuals and their families with clinical and physical care, psychological care, spiritual care and social care, as well as elements of the preventive care package for adults and children. Anticipated activities include the provision or referral for psychosocial support and household support including assistance with house cleaning, cooking, feeding and changing of linens. Some Small Grants grantees will be involved in pain and symptom recognition and referrals to health care facilities as necessary. Referral for counseling and testing, treatment and ARV services will also be part of the care package. For organizations working in home-based care, the use of preventive measures such as the use of gloves, will also be emphasized. Grantees will message and mobilize for cotrimoxazole prophylaxis, screening for TB, and referral for appropriate opportunistic infection management. Grantees will make an effort to ensure equitable access to care services for both males and females and advocate for increased participation by men in service delivery.

ACTIVITY 2: Monitoring of Small Grants

The Small Grants Program monitors grantees on a regular basis to ensure financial and technical compliance as well as to review organizational capacity to adequately implement the program.

These activities support the South Africa Mission's Five-Year Strategy by providing support to and building capacity in small local organizations working at the community level. These activities also contribute to the PEPFAR goals of providing care and support to 10 million HIV-affected individuals.

New/Continuing Activity: Continuing Activity

Continuing Activity: 13921

Continued Associated Activity Information

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 1071.09	Mechanism: N/A
Prime Partner: US Peace Corps	USG Agency: Peace Corps
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 3106.22661.09	Planned Funds: \$93,000
Activity System ID: 22661	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009, Peace Corps will contract with individuals and organizations with specialization in delivering training and conducting outreach in activities with people living with HIV (PLHIV). Priority will be given to contracting with those individuals and organizations that have already received PEPFAR-capacity development support. This will (a) strengthened and build upon previous PEPFAR investment and (b) provide training and outreach in the communities where Peace Corps Volunteers (PCVs) live and work, allowing the PCVs to provide follow-up and document results.

ACTIVITIES AND EXPECTED RESULTS: In FY 2009 20 Community HIV/AIDS Outreach Project (CHOP) PCVs and their counterparts will devote 50% of their time to training PLHIV caregivers, CSO employees, and home-based care (HBC) volunteer workers in ways of addressing the needs of PLHIV and addressing stigma, discrimination and gender-based violence (key legislative issue). While these PCVs and their counterparts will still be engaged in organizational capacity building assistance, they will be encouraged to become more actively involved in the above issues. In FY 2008 the program did not place PEPFAR-funded PCVs, but instead will rely on the use of PEPFAR-funded staff to train and engage all CHOP PCVs in palliative care and stigma, discrimination and gender-based violence reduction.

ACTIVITY 1: In FY 2009, approximately 30 PCVs and 30 counterparts will receive training in meeting the physical and psychosocial needs of those living with HIV and AIDS, using internationally and locally produced materials. The training will provide skills and knowledge in counseling (e.g. dealing with self-stigma on the part of PLHIV and the negative attitudes of others), physical care (e.g., helping PLHIV in bathing, eating, dressing, using the toilet), household assistance (e.g. cleaning, cooking, shopping, running errands, gardening) and legal and financial assistance (e.g. government health grants).

ACTIVITY 2: Approximately 30 PCVs and 30 counterparts will receive training in addressing stigma, discrimination and some aspects of gender-based violence, using internationally and locally produced materials. The training will focus on combating social and self-discrimination, and physical violence directed against PLHIV, particularly HIV-infected women, psychological intimidation (e.g. threats to harm a woman's children, destruction of favorite clothes or photographs, repeated insults meant to demean and erode self-esteem, forced isolation from friends and relatives, etc).

ACTIVITY 3: Approximately 30 PCVs and 30 counterparts will train 100 CSO employees, HBC volunteer workers and PLHIV caregivers in topics addressed in Activity 1 and Activity 2. This will result in improved palliative care provided to 500 individuals and in the strengthening of 12 HBHC and HBC service outlets.

The CHOP PCVs will primarily contribute to this program area by uniquely providing American citizen assistance in rural communities. Their activities are also closely aligned to the South African government strategies in each of the provinces in which PCVs work.

NOTE: PCVs involved in this program area are part of the population of PCVs who are required to participate in Activities 2 and 4 described under the prevention program area. CHOP PCVs in this program area are part of the population of PCVs who may participate in Activity 3 described under the prevention program area.

SUMMARY:

Peace Corps Volunteers (PCVs), who work in civil society organizations (CSOs) that focus on home-based care and that address stigma and discrimination against those with HIV and AIDS, are assigned to the Community HIV/AIDS Outreach Project (CHOP). PEPFAR funds will be used to train these CHOP PCVs and their counterparts in (a) organizational capacity building-that is the strengthening of organizational and human capacity (b) PLHIV caregiver support-that is enabling them to meet the physical and psychosocial needs of those living with HIV and AIDS and (c) empowering CSO employees and HBC volunteer workers to address stigma, discrimination, and gender-based violence. CSO employees and HBC volunteer workers, who work with PLHIV caregivers, are the primary target populations for the PCVs and their counterparts. PCVs and their counterparts may also provide direct outreach to caregivers of PLHIV. PCVs will be primarily placed in the rural areas of North West, Limpopo, Mpumalanga and KwaZulu-Natal provinces. Funds requested in FY 2008 will cover the costs of training of PCVs and their counterparts and, through the VAST mechanism, the training of CSO employees, HBC volunteer workers and PLHIV caregivers.

BACKGROUND:

To date, the program in South Africa has relied primarily on PEPFAR-funded PCVs assigned to the (previous) NGO Capacity Building Project. Although the FY 2007 program still utilizes PEPFAR-funded PCVs, beginning in FY 2008 there will be no PEPFAR-funded PCVs and instead PCVs and their counterparts assigned to the (now) Community HIV/AIDS Outreach Project (CHOP) will be encouraged to be involved in training and outreach activities that will enable PLHIV caregivers, HBC volunteers and CSO employees to meet the needs of PLHIV and to address HIV and AIDS stigma, discrimination and gender-based violence.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008 40 CHOP PCVs and their counterparts will devote more than 50% of their time to training PLHIV caregivers, CSO employees, and HBC volunteer workers in ways of addressing the needs of PLHIV and addressing stigma, discrimination and gender-based violence. While these PCVs and their counterparts will still be engaged in organizational capacity building assistance, they will be encouraged to become more actively involved in the above issues. In FY 2008 the program will not place PEPFAR-funded PCVs and

Activity Narrative: instead will rely on the use of PEPFAR-funded staff to train and engage all CHOP PCVs in palliative care and stigma, discrimination and gender-based violence reduction.

ACTIVITY 1:

In FY 2008, approximately 40 PCVs and 40 counterparts will receive training in meeting the physical and psychosocial needs of those living with HIV and AIDS, using internationally and locally produced materials. The training will provide skills and knowledge in counseling (e.g. dealing with self-stigma on the part of PLHIV and the negative attitudes of others), physical care (e.g., helping PLHIV in bathing, eating, dressing, using the toilet), household assistance (e.g. cleaning, cooking, shopping, running errands, gardening) and legal and financial assistance (e.g. government health grants).

ACTIVITY 2:

Approximately 40 PCVs and 40 counterparts will receive training in addressing stigma, discrimination and gender-based violence, using internationally and locally produced materials. The training will focus on combating physical violence directed against PLHIV, particularly HIV-infected women, (e.g. punching, kicking), psychological intimidation (e.g. threats to harm a woman's children, destruction of favorite clothes or photographs, repeated insults meant to demean and erode self-esteem, forced isolation from friends and relatives, threats of physical abuse), and financial punishment (relatives taking away property after the death of a husband, a husband limiting or forbidding access to his income).

ACTIVITY 3:

Approximately 40 PCVs and 40 counterparts will train 100 CSO employees, HBC volunteer workers and PLHIV caregivers in topics addressed in Activity 1 and Activity 2 above, using the PEPFAR VAST mechanism to fund the training. Their activities are also closely aligned to the South African government strategies in each of the provinces in which PCVs work. NOTE: PCVs involved in this program area are part of the population of PCVs who are required to participate in Activities 2 and 4 described under the prevention program area. CHOP PCVs in this program area are part of the population of PCVs who may participate in Activity 3 described under the prevention program area.

These activities will contribute to the PEPFAR goal for reaching 10 million HIV-infected and affected individuals with care through the provision of training and capacity building.

Activity ID: 22624.09	Planned Funds: \$0
Activity System ID: 22624	
Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:	

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. This program area was discontinued in FY 2009 as the costs for this activity were transferred to another donor who was keen to assist with Care services. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 4616.09	Mechanism: N/A
Prime Partner: CARE International	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 7873.22635.09	Planned Funds: \$2,456,389
Activity System ID: 22635	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009 CARE will implement a family-centered approach to care and support services thus strengthening support for people living with HIV (PLHIV) at the household and community level. Another innovation will be the introduction of prevention with positive people with a focus on supporting male uptake of health services, family counseling and referral for testing and TB/HIV infection control at household and community level. CARE will also reach ensure the upward referral of 10% of PLHIV to access cotrimoxazole prophylactic treatment.

The number of implementing partners will be retained at 25. Past experience suggests that it is better to retain professionals in the more technically skilled partners to support and work with civil society organizations (CSOs) with whom they have an established relationship with. This will be continued with at least three implementing partners, notably CHOICE Health Care Trust, Dithlabeng Development Initiative and the Center for Positive Care.

With the expansion to Mpumalanga, the roll out for implementation of the Basic Care Package will be fast tracked as Mpumalanga Department of Health (DOH) is the furthest in piloting this curriculum.

CARE has also recruited its full staff complement (with the exception of new posts for implementation Year IV) and strengthened its clinical staff complement. Given this increased and strengthened capacity of the CARE staff, the completion of selecting and orientating new partners to PEPFAR, the technical and institutional training and mentoring of implementing CSOs will be fast tracked.

SUMMARY:

CARE will continue its work in building HIV and AIDS competence of civil society organizations (CSOs) who deliver HIV-related care services in South Africa. CARE aims to scale up palliative care by administering and managing 26 small grants and targeted technical assistance to identified grantees to scale up HIV-related palliative care services in organizations that are unable to receive direct funding due to limited capacity. Minor emphasis activities include community mobilization, training and development of networks.

BACKGROUND:

The CARE Letsema project is part of a five-year project, which started in October 2005. CARE in FY 2008 will geographically expand implementation further into the Free State (along Lesotho border) and Limpopo border along the Great Limpopo Transfrontier Park. In FY 2008 other changes will occur, namely, expansion into Mpumalanga, and southerly along the Great Limpopo Transfrontier Park along the borders shared with Mozambique and Swaziland. Technical program areas are supported by small grants and technical assistance for that program area, directly through CARE, as well as through identified Sectoral Education and Training Authority (SETA) accredited partners with specialized expertise in HIV-related palliative care and support. Since FY 2006, Letsema has been working primarily in the eastern Free State near the Lesotho border and will continue to work in this area.

ACTIVITY 1: Strengthen Delivery of Quality HIV-Related Palliative Care Services

Targeted training and mentoring support will be provided to selected organizations to address the clinical, physical and psychological care of HIV-infected individuals, and the psychological, spiritual and social care of affected family members. Technical emphasis will be supporting CSOs to appropriately message, provide and/or refer for elements of the basic preventive care package including prevention with positives. The aim of this activity is to build a more integrated HIV response that responds to the family as a whole and promotes increased coordination of services within the community, facilitating greater uptake and utilization of health and social government services such as HIV counseling and testing, treatment and social assistance. CARE aims to strengthen the referral network within each of the organizations it supports. This is an integrated response that promotes community mobilization, awareness and implementation of HIV prevention, care and treatment support activities as a continuum. Service delivery will be strengthened, and quality and success rates in accessing government services will be improved by:

- (1) placing salaried professional staff (nursing supervisors and social workers) together with sub-partners and contracted specialists to train and mentor staff and volunteers to improve the clinical component of home-based care within the government's specified guidelines and curriculum;
- (2) technical support to CSOs emphasizing the messaging, delivery and/or referral for evidence-based preventive care interventions which include the following: OI screening and prophylaxis (including cotrimoxazole, TB screening), counseling and testing for clients and family members, malaria prevention with ITNs (where appropriate), safe water and personal hygiene strategies to reduce diarrheal disease, nutrition counseling and supplementary feeding (where clinically indicated) or referral for nutritional and food support, HIV prevention counseling, provision of condoms, referral for family planning services for HIV-infected women, and appropriate child survival interventions for HIV-infected children. The package of services also includes basic pain and symptom management, psychosocial support, treatment support for OIs (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART) and psychological, spiritual and social support of affected family members; and,
- (3) strengthening collaboration among government departments at district and provincial levels to ensure access to basic healthcare, ART, legal documentation, state income grants, support for staying in school, and volunteer stipends and improved service coordination; and develop workplace support and supervision for volunteers.

CARE as part of the social service category will expand its savings and lending model, as well as income generation training to households of HIV-infected people to generate an income to deal with the shocks and stressors of HIV and AIDS, consumption and asset building (which includes productive income). Both

Activity Narrative: economic products serve social support functions to deal with issues like that of stigma, discrimination, child rearing, death and hardship that HIV-infected people and their families encounter. A gender analysis of the savings and lending groups through Local Links has revealed that 98% of the beneficiaries are women. Once these women have met their families' basic needs for food, school fees, transport to clinic and medication etc. the savings and the interest earned is put to productive use through income generation activities. This activity addresses gender issues through ensuring equitable access to HIV-related care services for both men and women and encouraging male involvement and mobilization of community leaders throughout the program.

ACTIVITY 2: Capacity Building

The activity combines organizational development training and mentoring to enhance institutional strengthening identified of CSOs to improve organizational functioning and service quality. The program will achieve this through an innovative combination of capacity building approaches including training workshops, mentoring, cross-visits, and organizational technical assistance. The proposed intervention will minimize one-time training and workshops and will develop longer term activities to strengthen CSOs and networks, ensuring sustained capacity building and joint learning. Organizational capacity will be strengthened to improve institutional functioning by (1) undertaking organizational assessments (human resources, policy development, project management, finance and governance) of each of the participating CSOs; (2) developing clear organizational/human development training and mentoring plans to address gaps emerging from the assessment; and (3) providing training in project management, basic book-keeping, narrative and financial reporting, monitoring and evaluation. These activities are key to increase sustainability by building local organization capacity.

ACTIVITY 3: Management of Sub-Grants

The activity provides and manages sub-grants to 26 CSOs, to sustain operations through improved fundraising and coordination. The activity aims to increase access to resources for small CSOs that do not meet the criteria of government and/or international donors, but that provide valuable care and support services at the community level in a culturally appropriate manner.

ACTIVITY 4: Improved Networking and Coordination Among CSOs and Related Stakeholders

The activity supports sharing, cross learning and co-ordination of services among partners and related stakeholders at district level. CARE and partners will continue to interact with government departments and structures for improved access to services for HIV-infected people, their families as well access to resources for CSOs.

ACTIVITY 5: Implement Basic Package of Care

CARE will support the implementation of the Basic Package of Care for individuals infected with HIV but not yet eligible for ARV treatment, as well as individuals who are ready and eligible for ARV treatment but for whom there is no immediate access to services. Services includes spiritual, social, psychological, clinical and prevention for HIV-infected persons and their families. CARE will do this by providing small grants to CSO to form support groups for PLHIV where they will receive a structured program of HIV-related palliative care as approved by PEPFAR and the National Department of Health South Africa. This structured program comprises the Basic Package of Care. CARE will work closely with the Department of Health in Mpumalanga to identify these CSO for funding.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

This activity will increase civil society organizational capacity to deliver quality basic healthcare and to expand access to quality palliative care services, thereby addressing the priorities set forth in the USG Five-Year Strategy for South Africa. In addition, the people receiving care and support will contribute to the care portion of the 2-7-10 goals.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 2790.09	Mechanism: N/A
Prime Partner: Catholic Relief Services	USG Agency: HHS/Health Resources Services Administration
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 3832.22646.09	Planned Funds: \$1,100,466
Activity System ID: 22646	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Provision of cotrimoxazole prophylaxis has been implemented at a large majority of the AIDSRelief (the Consortium led by Catholic Relief Services (CRS)) treatment sites; however, difficulties are being faced with the reporting aspect. The AIDSRelief monitoring and evaluation (M&E) team is providing assistance to the sites to improve reporting on this particular aspect of the program. During FY 2008, two AIDSRelief sites have handed over their patients to the South African Government (SAG) due to strong presence of SAG-sponsored treatment programs - at Sinosizo (Durban suburb) in KwaZulu-Natal province, as well as in Bethal in Mpumalanga province. Access has greatly improved from the SAG sites and the sites were able to transfer patients out in order to avoid duplication of services. At the same time, new sites have been opened in Kokstad (KwaZulu-Natal province) and Parys in Free State, leaving the total number of treatment sites unchanged.

In FY 2009, there will be renewed emphasis on patients in the wellness phase (patients in care who do not qualify for antiretroviral therapy (ART) yet), tracking patients in care, using community health care workers to identify household dependants, renewed emphasis on family-centered care and involvement of men, and increased screening conducted in community by home-based carers entering homes.

Proposed human capacity development activities include ongoing training: to equip staff to support the patient from the time of HIV diagnosis, throughout the continuum of HIV infection with renewed emphasis of follow-up of the wellness phase, and providing HIV related care (such as TB, prophylaxis, nutritional support etc.). Training of data capturers, nurses and managers on M&E indicators and electronic database is planned to assist with M&E activities with the view of increasing effective care and retention.

All adults in care and support (regardless of whether on ART) with BMI below 18.5 qualify for food support according to USG guidelines. As such, activities will include identifying the needy patients and provision of nutritional supplements to qualifying patients according to USG guidelines. Food support may be provided in either the facility or community-based settings for nutritional rehabilitation of severely and moderately malnourished PLHIV.

The National Strategic Plan (NSP) target is to provide an appropriate package of treatment, care and support services to 80% of people living with HIV and their families by 2011 in order to reduce morbidity and mortality as well as other impacts of HIV and AIDS. In order to meet this target, the AIDSRelief sites will pay attention to the following key issues: focusing on specific issues and groups: the prevention of mother-to-child transmission, the care of children and HIV-infected pregnant women, and wellness management of people before they become eligible for ART.

Activities and approaches to address gender issues will include involvement of men in the program as decision-makers, family-centered care, couple counseling and testing link with OVC programs - Identifying female/child headed households in need of care and support. The program will involve partners (through increased partner testing, male support, prevention and interventions in regards to gender-based violence), including support groups for HIV-infected patients. Other activities, where applicable, will include programs targeting partners of pregnant women and providing information to men on prevention of mother-to-child transmission (PMTCT), counseling and testing (CT), prevention and other health issues and encouraging couples counseling and testing in an attempt to increase men's involvement in HIV and AIDS treatment and care programs and to reduce stigma and violence against women. The approaches will include couple counseling and testing at CT and PMTCT sites with the view of promoting testing of men as well as building their support for their female partners, where possible. Efforts will be made to include health worker trainings to recognize signs of gender-based violence, to provide appropriate counseling and referral services to social, legal, and community-based support groups, as well as training and employment of women as health care providers to increase the confidentiality and comfort of women and girls seeking treatment for HIV.

SUMMARY:

Activities support the provision of palliative care under the comprehensive antiretroviral treatment (ART) program carried out by Catholic Relief Services (CRS) in 25 field sites in 8 provinces in South Africa. The area of emphasis is the improvement of quality of life to people living with AIDS who are not yet on antiretroviral treatment (ART), ensuring their wellness to delay the necessity of commencing the ART for as long as possible, ensuring optimal health for persons on ART, and ameliorating pain and discomfort for those in the terminal stages of the disease. The field sites target those in need of these services, who live in the catchment area of the site, and who lack the financial means to access services elsewhere. The major emphasis area is linkages with other sectors and initiatives. Minor emphasis areas are community mobilization/participation, development of referral systems, and human resources. The main target populations are HIV-infected individuals and their families as well as caregivers.

BACKGROUND:

AIDSRelief (the Consortium led by CRS) received Track 1 funding in FY 2004 to rapidly scale up ART in nine countries, including South Africa. In FY 2005, FY 2006 and FY 2007, South Africa COP funding was received to supplement central funding, with continued funding applied for under COP 2008. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and the Institute for Youth Development South Africa (IYD-SA).

All sites operate under the terms of a Memorandum of Understanding (MOU) with the provincial Department of Health (DOH) in which they operate, observing the national and provincial treatment protocols. There is a concerted effort at each site to ensure coordination with the South African Government (SAG) and sustainability by either having the SAG provide antiretroviral drugs, or by referring stable patients in to the SAG treatment plan. Progress made in this regard is discussed below under activities and expected results.

Activity Narrative: Contrary to initial expectations, the most difficult issue has been ensuring that men access HIV care and treatment services. Currently, only a third of patients on ART in the program are men. Many of the challenges faced in the implementation are rooted in social and cultural backgrounds of the South African male population, which AIDSRelief is trying to address by involving men while doing home-based care, as well as putting increased focus on family-centered CT. In addition, AIDSRelief will involve dieticians at selected sites to identify nutritional deficiencies and problems with patients, in order to assist with referral and proper food supplementation where needed.

ACTIVITIES AND EXPECTED RESULTS:

With funding provided in FY 2008, AIDSRelief will continue implementing activities in support of the South African national ARV rollout. Of the 25 existing field sites activated in March 2004, two have transferred all their ART patients into SAG sites, and have ceased providing treatment. Two new field sites have been activated in FY 2007 to enroll additional ART patients in support of the SAG rollout plan.

Utilizing technical assistance from AIDSRelief staff members and South African experts, ongoing support and guidance will be provided to sites in the form of appropriate refresher medical training courses, patient tracking and reporting, monitoring and evaluation mechanisms and other necessary support.

Basic palliative care services including elements of the preventive care package will be provided by the 25 field sites to patients through clinic-based and home-/community-based activities aimed at optimizing quality of life for HIV-infected clients and their families throughout the continuum of illness, by means of pain and symptom diagnosis and relief; psychological and spiritual support; clinical monitoring, related laboratory services, management of opportunistic infections and other HIV and AIDS-related complications (including pharmaceuticals); integrated prevention services including prevention with positives; and culturally-suitable and religiously-appropriate end-of-life care. Patients within the CRS home-based care network will be given cotrimoxazole prophylaxis where necessary. Effort will be made to ensure equitable access to care services for both males and females.

The home-based carers are recruited through parish networks, and are deployed in the areas they live in, with the intention that they should serve patients who live within the walking distance of their homes. All provincial DOHs pay stipends to their caregivers. Home-based carers within the CRS network tend to pay their caregivers the same stipend that the DOH pays theirs, as the training that they undergo is the same, as is the workload. Stipends paid to caregivers vary from one site to another according to the differences in stipends paid by different provinces. Caregivers are also reimbursed for transport expenses.

AIDS is stigmatized in many South African communities because of the association with death. This is because of the belief that AIDS inevitably leads to death. As the number of patients on treatment grows, and as communities see that those on treatment are living normal, healthy lives, stigma is decreasing visibly and more and more patients are presenting themselves to be tested, either in CT, or if they know that they are positive, to have their CD4 counts tested and see whether they qualify for treatment. This process has been accelerated by the way in which patients on treatment at each site are used as community peer educators and counselors.

All activities will continue to be implemented in close collaboration with the SAG HIV and AIDS directorate and the respective provincial authorities to ensure coordination and information sharing, thus directly contributing to the success of the SAG's own rollout and the goals of PEPFAR. These activities are also aimed at successful integration of AIDSRelief activities into those implemented by the SAG, thus ensuring long-term sustainability.

Holistic palliative care services are provided to all people who come to the field sites irrespective of their age, gender, nationality, religious or political beliefs. Historically, adults with HIV of both genders (children to a lesser extent) have been admitted for palliative care services in partner field sites providing such services. Palliative care services are provided by SACBC and IYD-SA at their respective sites, through the provision of services aimed at optimizing quality of life for HIV-infected patients and their family members, psychological support, management of opportunistic infections (where necessary), other HIV and AIDS related illnesses, and end-of-life care provided either at the clinic level (where available) or through home-based care mechanism. Field sites managed by SACBC provide a vast range of services, ranging from basic (home-based care) palliative support, to in-house, facility-based beds and full palliative care services, depending on the specifics of each site. IYD-SA also provide a different range of palliative care services, ranging from referral to other SAG clinics in the area, to home-based carers who provide compassionate and valuable services to palliative care patients. Even though prevention is not a specific program activity of the overall program, it is promoted through provision of information to patients regarding HIV and prevention of spreading the virus (prevention with positives). Secondly, skills training is provided to vulnerable populations, empowering them to make safer choices about their lives. Additionally, AB messages are shared with the target population, as well as accurate information regarding condoms is provided.

Some of the AIDSRelief sites also receive PEPFAR and other funding through different sources for the provision of OVC care. The overlapping of these services provides OVC with access to both care and treatment services provided under the program.

On the staffing front, AIDSRelief is making a conscious effort towards staff retention, through skills development and strengthening, retreats and debriefing sessions for the staff at the site level where burnout and compassion fatigue support groups are facilitated. In addition, staff remuneration is monitored and, to the extent possible within the faith-based environment, reasonable packages are offered. The task shifting strategy involves shifting certain tasks that medical nurses can do (such as screening the initial patients, follow-up and monitor stable patients) from medical doctors so that the overall workload is more manageable. Treatment counselors and community care workers are encouraged to provide pre- and post-test counseling, adherence training and support and help with basic administrative follow-on work. Other activities include considerations of community care workers conducting the oral rapid HIV tests, and nurses

Activity Narrative: only doing the confirmation tests if necessary.

FY 2008 COP activities will be expanded to include nutritional supplementation for patients receiving care or treatment under the program, primarily to support the effective use of antiretroviral drugs for the patients already on ART, or to assist patients awaiting to be placed on ART by providing them with necessary nutritional supplements, and increasing their chances of accepting ARV drugs once placed on ART. This support will be in line with OGAC guidance on therapeutic feeding. In addition, cotrimoxazole prophylaxis will be given to qualifying HIV-infected persons receiving palliative care within the operational guidelines of the host country and the donor, with special attention given to exposed or infected children.

This activity will directly contribute towards the 10 million people in care component of the 2-7-10 PEPFAR goals by increasing the quality and access to care.

Activity System ID: 22583

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

AgriAIDS will work in FY 2008 to raise awareness of HIV and AIDS and implement strategies to combat the disease among the following target groups: 1) farm workers; 2) farm owners; and 3) commercial agriculture businesses. Working with other non-governmental organizations (NGOs), as well as the Department of Health and Agriculture, AgriAIDS will work to prevent new infections among farm workers. This project will work to ensure that farm workers and, to the extent feasible, their families access counseling, testing, care, treatment, and prevention messages and services.

BACKGROUND:

AgriAIDS was established to address the devastation of the impact of HIV/AIDS on farms and therefore reduce the direct effects of HIV and AIDS on farm workers. This requires intervention on two levels:
-Direct: facilitating rapid access to information, voluntary counseling and testing (VCT), medical care, and antiretroviral therapy (ART) for farm workers; and
-Indirect: lobbying the commercial agricultural sector to start viewing HIV and AIDS as an occupational health threat and to encourage spending on care and treatment programs at the farm level.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

In FY 2009, AgriAIDS will identify farms in specific areas with limited or no HIV and AIDS care and treatment services. Additionally, AgriAIDS will identify regional/district-based medical service providers and link them to farming communities. This will be achieved, in part, through the development of mobile care and treatment interventions (where applicable).

ACTIVITY 2:

In FY 2009, AgriAIDS will develop memorandums of understanding (MOUs) with farms and service providers in order to create formalized relationships in order to ensure the consistent provision of care and treatment services in farming communities. Results will include an increase in the number of project partners (farms and service providers) with MOUs in place with AgriAIDS.

ACTIVITY 3:

AgriAIDS will finalize a draft strategy on the basis of recommendations received from workshop participants and through working groups. Dissemination of the strategy will be achieved through public relations activities (agricultural journals; presentations etc.), with a specific focus on reporting and dissemination to government entities. Results will include the following: 1) an increase in unified responses to HIV in the agriculture setting; 2) translation of strategies into practical interventions at the farm level; and 3) the approval/endorsement of strategies by the Department of Agriculture and/or Health at the provincial level.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Africa Centre (AC) will expand home-based care (HBC) activities with the appointment of a social worker for assisting in social (access to social security services for women and children as indicated in the South African Government's National Strategic Plan) and legal protection of patients.

The AC Support Group Coordinator will work with support groups to strengthen income generating project activities, linkages with other programs and sector. Support will also be given to male involvement in HIV prevention, care and treatment and to reduce stigma and violence against women.

The dietician will train HBC workers and support groups on nutrition care and support. A referral system between the community and the clinic and food security projects will be implemented. This will be used to refer children and adults with poor nutritional status to and from the clinic and community, and will strengthen efforts to manage malnutrition in the community.

Tracking of children and adults will now be expanded to the whole sub-district.

Africa Centre will develop food and nutrition policies and guidelines which are adapted to the local, rural community.

The dietician in the program will train nurses, counselors and home-based caregivers in nutritional assessment and counseling.

Anthropometric tools required to conduct effective nutritional assessment will be procured with PEPFAR funding.

For long-term food security, support groups will be getting guidance how to establish community gardens.

SUMMARY:

The Hlabisa ART program aims to deliver safe, comprehensive, effective, efficient, equitable and sustainable ART to all who need it in Hlabisa District, in rural KwaZulu-Natal province. Hlabisa District is characterized by a high HIV prevalence (about 22%), high HIV incidence, unemployment and poverty. Basic care and support services are part of the overarching HIV Care and Treatment program that is jointly run by the Africa Centre for Health and Population Studies, University of KwaZulu-Natal, and the Hlabisa District Department of Health (DOH). In FY 2008, the program will for the first time provide mobile palliative care teams that bring HIV care to people's homes and support the families of HIV-infected people. Major emphasis is on development of linkages and referral systems. This will be done through support to the SAG, clinical and physical care, home-based care and human capacity development.

BACKGROUND:

The Africa Centre is a department within the University of KwaZulu-Natal, fully funded by grants from mostly overseas institutions. The Program is based in Hlabisa sub-District, a rural health district in northern KwaZulu-Natal which provides healthcare to 220,000 people at one district hospital and 14 peripheral clinics. In September 2004 the program started delivery of ART in Hlabisa and has since expanded ART services to 14 clinics in the sub-district. The Africa Centre and KwaZulu-Natal DOH work to complement each other's abilities and resources in providing care and treatment. The Africa Centre has expertise in infectious diseases and management that are not available at the district DOH. The district DOH has clinical staff and infrastructure on which to build a care and treatment program. The Africa Centre contributes nurses, treatment counselors and physicians to the DOH staff, organizes trainings, supports the management of the supply chain and conducts monitoring and evaluation in cooperation with the DOH. The Africa Centre's basic care interventions are largely focused on care support, the period from when a patient tests positive until such time as s/he requires ART. The basic preventive care package is part of the program, as is symptom and pain management.

With FY 2008 funds the Africa Centre will continue to support the functions mentioned above and expand its support for the DOH. Specifically, Africa Centre involvement will strengthen the palliative care, TB/HIV Program, PMTCT, provision of ART and counseling and testing. Increased attention will be given to address gender issues and to promote the care and treatment services among men and children.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support to SAG in Hlabisa District through home-based care

FY 2008 funding will be used to provide support to five existing home-based care organizations which are located in the least served areas within the sub-district. These HBC organizations are operating on an ad-hoc basis. They are made up of committed caregivers who are passionate about serving their community, but do not have access to resources or training opportunities. Africa Centre will ensure that the HBC organizations will not only take care of the patients, but assess the situations in the households and take care of other family members if necessary. The identified HBC organizations will also be located near DOH clinics where ART initiations are taking place in order that Africa Centre staff at the clinic can serve as a point of contact. The Africa Centre will facilitate the distribution of HBC kits and food parcels, supplied by DOH to the home-based care organizations.

Capacity building will play a major role in the support of the HBC organizations. Africa Centre will ensure ongoing supportive supervision and mentoring. Training will include DOH-approved HBC, ART literacy, social grants (process for referral of HIV patients who qualify for disability grants) and HIV Counseling,

Activity Narrative: Funding will help to support volunteer stipends and equipment (for example computers and bicycles) to further enable these organizations to better manage and support their volunteers.

The funding will also go towards financing additional professional staff, including nurses and social workers who will constitute the core of a mobile team to provide home-based palliative care. In addition, funds will be used to finance a car, pharmaceuticals and other necessary supplies. The nurses in the mobile team will provide basic HIV-related care including prevention messages and symptom and pain screening and management, and the social worker will refer families for psychosocial services provided by the government (government food aid, government grants and the services of social workers). A partially financed physician will visit patients who need more specialized care. The target population for home-based care via the mobile team is non-ambulatory patients who cannot access treatment in clinics and ambulatory patients who request a home visit.

Africa Centre's involvement in the existing HBC structure within the sub-district will facilitate a more cohesive referral system between the DOH, AC and HBC organizations. It will also ensure that more home-based caregivers are provided with essential training and resources to better serve the needs of PLHIV in their communities.

ACTIVITY 2: Clinical and physical care

HIV-infected people who are not yet eligible for ART will receive palliative care consisting of screening and treatment of TB, screening for pain and symptoms and elements of the preventive care package such as prophylactic treatment with cotrimoxazole, INH and fluconazole. Africa Centre supported HBC organizations will provide ongoing care and monitoring support, including counseling. Patients will be advised to return to the clinic every six months for a CD4 test and clinical assessment. DOH funds are used for laboratory services (CD4 counts, viral loads, and routine and routine blood and urine tests) and drugs (ARV medication, drugs to treat and prevent opportunistic infections (OIs), and drugs to treat non-HIV-related diseases in HIV-infected patients). Patients on ART and those who are monitored for ART eligibility will be referred to a physician for further care if required. A pharmacy assistant will be trained to assist the DOH pharmacist to facilitate faster treatment of OIs and pain.

ACTIVITY 3: Nutrition

All participants will be referred for nutritional assessment and monitoring for food aid (Philani porridge, sugar beans) from the DOH. In order to ensure nutrition and food security, PEPFAR funding will be used to employ a dietician to teach families the basics of good nutrition. Volunteers will be recruited to train the community in nutrition and food preparation. Africa Centre will seek to establish public-private partnerships (PPPs) with other organizations (e.g. Kellogg Foundation, Garden Africa, Seeds for Africa) for sustainability of these activities.

ACTIVITY 4: Income generating programs for PLHIV

Poverty, unemployment and unpleasant socioeconomic status are prevalent to PLHIV in the area. Some are receiving disability grant which is still limited to meet their daily basic needs. In order to uplift their economic status and their nutrition there is a need for those able to be engaged in poverty relief projects/ income generating projects such as beadwork, woodwork, sewing, food gardens, poultry farming and sleep mats. Africa Centre has a Community Development Department, which has, over the past several years, successfully developed income generating programs in the rural area of Hlabisa Sub-district. PEPFAR funding will be used to strengthen the department through additional staff. These staff members will then develop business plans for the PLHIV groups and supervise their activities.

ACTIVITY 5: Referrals and linkages

In order to ensure delivery of holistic palliative care, counselors will be trained on available government support structures to link PLHIV and their families to other government programs, like screening for TB/HIV, PMTCT clinics, food aid, legal assistance and social workers, who can assist the families with applying for government grants.

ACTIVITY 6: Caring for Carers

ART Lay Counselors and Nurses are tasked with counseling and caring for patients affected and infected by HIV and AIDS. On a daily basis, during counseling sessions where they must disclose the patient's HIV status, they must deal with the trauma of the varied reactions of patients who are hearing for the first time that they are HIV-infected. To keep staff dedicated and motivated towards achieving their daily demands there is a need to minimize burnout and work-related stress. The Caring for Carers program aims to protect, support and care for employees tasked with caring responsibilities. The program started in FY 2007 and will have a focus on the new staff joining Africa Centre in FY 2008. The program will develop appropriate team building activities and staff retention strategies.

ACTIVITY 7: Human Capacity Development

The South African DOH and Africa Centre counselors and nurses in the hospital and clinics will be trained in all aspects of care according to government guidelines and standards. Refresher and on-the-job training will be provided as needed, keeping healthcare providers up to date in the delivery of care.

Due to the shortage of staff in the clinics and due to the increasing number of patients and increasing workload, additional staffing in clinics and the hospital will be provided.

ACTIVITY 8: Care Support Program

Activity Narrative: Services for the persons who have newly tested positive for HIV but are not yet eligible for treatment must be improved. A care support program will be established including: screening for TB, screening for STIs, PAP smears, treatment and prophylaxis of opportunistic infections, immunizations, nutritional information, counseling on family planning and help with grant applications.

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 12360.22573.09

Planned Funds: \$169,520

Activity System ID: 22573

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Economic Development

AMREF's women's association project will be piloted as a strategy of alleviating the plight of rural women. Under this initiative, women from the communities where the project is operating will be encouraged to group themselves and will be advanced a small loan from PEPFAR funding that will belong to the group. The model being followed here is the Care Voluntary Savings and Loan project currently being implemented with PEPFAR. Each group then develops a code of conduct on how the group will function, including the interest that will be charged on borrowed funds and defaulters. Individual members from the group will then borrow from the group at a nominal interest. At the end of the year, the profits will then be shared amongst the group members with the initial seed money being returned to the pot for use again the following year. It is envisaged that these associations will present opportunities for income generation for community health workers and children from disadvantaged families to participate. These income generating activities will be developed following locally focused operational research on niches in the local market conditions that could be exploited. Also leveraged will be the experience generated by other PEPFAR partners. The main outcome of this activity is that women's access to income and productive resources will be increased.

Human Capacity Development

For human capacity development, the focus will be on partner training and incentives for care workers. Partners will be trained on activities that enhance service delivery such as home-based care (HBC), first aid, counseling, monitoring and evaluation. Other areas that will be supported include management and leadership development for staff to reduce staff turnover. Support for staff salaries will be a key priority area as currently there is a high volunteer turnover due to unfavorable work conditions and low morale. Some of the strategies that will be introduced include experience related remuneration systems, incentives for staff, team building exercises as well as procurement of materials and equipment to enhance how work is done.

The trainings will focus on HBC-specific training support certified by the South African Government (SAG). Additional training for HBC care workers is to be leveraged through creating synergies with the OVC aspect of this project. For example, joint trainings can be conducted in basic first aid and counseling where children will be the primary beneficiaries, with HBC clients also benefiting from the skills. Meanwhile, incentives, such as stipends for 200 care workers, will be subsumed under partners contractual costs

Gender

AMREF will seek to address the gender imbalances that currently exist within the community. This will be done through promoting the participation of men in the provision of care at the community level. It is projected that the inclusion of men in the provision of care will challenge the gender stereotypes that currently exist. Males will be trained on identifying cultural practices that promote inequality and then identifying cultural practices to replace the harmful ones that currently exist.

Particular emphasis will be placed on the involvement of male volunteers in care provision as the presence and participation of men compliments unity in the real family setting. Secondly, male volunteer presence will be a clear message that men also care about the impact of disease and death on the family and community. This will also challenge the notion that salaried jobs are for men whilst the lesser paying and often voluntary jobs are for women since men will now also be working as volunteers. Both of these interventions will address male norms and behaviors, related to the PEPFAR emphasis areas.

Alignment with the National Strategic Plan (NSP) or other SAG policies or plans

At the organizational level, the project develops the capacity of community-based organizations to strengthen financial, project management and governance systems. This is done through the development of systems that are then used within these organizations to ensure effective and efficient implementation of activities that are in line with the NSP's objective of increasing the number of organizations accessing organizational and program support.

The program's reliance on community home-based care workers also ensures that capacity at the local level is developed and community care workers develop career paths that they are comfortable with. In addition the project also provides training to community health workers to ensure that their capacity is developed. Currently, AMREF's training unit is working with the health and welfare services sectoral training authority (HWSETA) on the accreditation of the training that AMREF is providing to CHWs. This program approach is aligned to the NSP's goal of expanding community home-based care as part of the expanded public works program.

SUMMARY:

The African Medical and Research Foundation (AMREF) will strengthen the capacity of South African district government departments, Child Care Forums (CCFs), NGOs and CBOs, and service providers to provide quality and accessible care and support for family members and caregivers through training, mentoring, awareness raising and advocacy. Emphasis areas for this program are local organization training and capacity building. Target groups for the program include family members and children older than 18 years, caregivers of OVC, community and public sector health and social service workers.

BACKGROUND:

AMREF is an international health and development NGO working in East and Southern Africa. In South Africa, AMREF previously worked in Mpumalanga from 2001 to 2004. This work focused on strengthening

Activity Narrative: community caregiving infrastructures for OVC, including the improvement of capacity and integration of service providers and government departments. Building on the OVC initiative in Kwazulu-Natal and Limpopo province, AMREF has formed partnerships with key government and civil society stakeholders in both Limpopo (Sekhukhune district) and KwaZulu-Natal (Umkhanyakude district). In these two particular districts, in which 55% and 57% respectively of the population are under the age of 18. According to the 2006 antenatal survey, KZN has the highest HIV prevalence rate in the country at 20.6% whilst Limpopo has a prevalence rate of 11.7%. AMREF has identified the need to develop a comprehensive program to address the needs of other family members of HIV-infected individuals and OVC who are in need of palliative care services. The project will be implemented in Kwazulu-Natal where the OVC project is being implemented. AMREF's work is closely aligned to the aims of the Department of Social Development's National Action Plan for OVC and the HIV and AIDS and STI National strategic plan 2007-2011.

ACTIVITY 1: Comprehensive Care for Family Members

The project will seek to facilitate access to health services to address needs of children and adults over 18 who are no longer classified as OVC under the South African constitution as well as PEPFAR guidelines. The palliative care project recognizes that, while formal health services may provide episodic advice and medical and material supplies, only community supporters/carers provide continuous patient care. Currently, partners that AMREF is working with already have volunteers who are already offering home-based care services, these volunteers will be trained to assess family members in need of palliative care services since there are already dealing with and have experience in the provision of palliative care. These services include assistance on how to manage common conditions associated with HIV and AIDS opportunistic infections e.g. dealing with pressure sores, wound dressing etc. In addition, assistance will be provided on how to deal with stigma and emotional trauma, grief management, assisting family members to prepare for death psychologically, spiritually and physically. In addition, any households with family members in need of palliative care that will have been identified by the OVC supporters will be given to the home-based care volunteers for them to be entered into the palliative care program. The same will apply to any OVC who will have been identified by home-based care supporters. Particular attention will be given to child headed households and elderly headed households that may have a limited capacity to respond to the needs of the sick family member. OVC will be counted in the OVC program area and eligible family members will receive at least two categories of service from clinical/physical, psychological, spiritual, social and preventive care.

1.1 Recruitment and Training of Volunteers

The project will not recruit new volunteers to implement the palliative care intervention but will utilize the already existing volunteers who are already working on the home-based care intervention. Volunteers will be encouraged to work within the neighborhoods where they reside in order for them to cover the area adequately as well as minimize traveling time and concentrate on service provision. Training of volunteers will be aimed at strengthening the services that they are already delivering under the department of health's community home-based care program. This training will cover areas such as general health, common diseases, health and hygiene as well as nutrition and wellness. In addition, AMREF will use its home-based care manual to train volunteers in the delivery of home-based care services. Furthermore, volunteers will be trained in the delivery of non-clinical services such as psychosocial support, health education as well as basic HIV and AIDS prevention education for the family members. Care workers and providers will be trained to conduct basic health care needs assessments, provide first aid and refer for clinical services that include screening for pain and symptoms, diagnosis, doctor consultations and treatment. Carers will link with local clinics and hospitals to ensure the provision of quality follow-up support for sick family members. AMREF will link with established service providers in the area to provide clinical care for patients and family members in need. One provider that AMREF intend collaborate with is Mpilonhle which is based in Mtubatuba and operate a mobile medical unit and thus are best placed to conduct clinical assessments of patients identified by AMREF's trained care supporters. The Africa Center will also be a potential AMREF partner on the palliative care project.

1.2 Non Clinical Services Provided

Some of the services that AMREF's partner will provide include psychosocial support and counseling services to clients identified within the home. Family members will also be taught on how to deliver home-based care services to build their capacity to give palliative care to family members in the absence of the community care supporters. Some of the services that they will be trained to deliver include medicine administration, providing social and psychological support as well as how to deal with common conditions such as skin conditions, bed sores, diarrhea, nausea and mouth infections as well as pain management. Family members will also be provided with HIV prevention education to reduce the likelihood of infection during the process of giving care to the sick family member. Other services that will also be provided include home cleaning and washing services and food preparation. AMREF's role on the program will be to provide technical assistance to partners in the implementation of the program. Technical support will be focused on training of the partners' volunteers in the delivery of palliative care services. The training will focus on monitoring and evaluation of their activities concerning the services that clients receive including training in supervisory techniques aimed at ensuring that volunteers work and deliver the appropriate services to clients as well as ensuring that services are of an exceptionally high standard.

ACTIVITY 2: Wellness Programs for Caregivers

The wellness model that AMREF will implement for caregivers will empower caregivers and help them develop healthier lifestyles and enhance wellness in both the individual caregivers as well as their families. AMREF will also use PEPFAR funding to conduct wellness programs, in collaboration with sub-partners, for volunteer caregivers through facilitating linkage with the health care centers and Counseling and Testing centers (clinics/hospitals) to ensure that carers receive the non-clinical (psychosocial support, spiritual counseling, nutritional counseling) and clinical care (screening, diagnosis, doctor consultations, treatment, and follow-up care) required. Volunteers will seek to transfer the knowledge and the skills that they will have received from AMREF so that family members are able to provide care and support to family carers. AMREF will also work with the CBO partners and the health care centers to develop support groups to

Activity Narrative: share coping skills and provide a support system for caregivers. Community care supporters will be encouraged to form community carers forums aimed at building solidarity among care supporters, reduce burn out and improve service delivery to clients. The community care forums will also present opportunities for care supporters to socialize; provide each other with literacy training; health education; coping advice; counseling and social support.

ACTIVITY 3: Capacity Building for Community partners

AMREF will continue to develop the capacity of community-based organizations by strengthening training and systems development, support and follow-up for CBOs/NGOs engaged in palliative care and OVC service delivery, including financial management, program and management skills, leadership and governance and resource mobilization training. AMREF will train the selected partner organization selected NGO workers and community care workers in psychosocial support and counseling for family members of HIV-infected and OVC.

These activities will contribute to the PEPFAR goal by providing care to 10 million people who are HIV-infected and family members of HIV-infected and OVC.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Human Capacity Development (HCD) is one of the strategic objectives of the AED-UGM, and is designed to provide ongoing capacity building to support and enhance the scale-up of activities and the sustainability of activities and partners. AED-UGM will plan and implement HCD activities for sub-partners that aim to improve core skills and capacities, in order to build organizational effectiveness and sustainability. Activities will include: training, technical assistance and support; mentoring and twinning; information exchange; technology transfer; and resource provision. Twinning, as defined by the HIV and AIDS Twinning Center is "the partnering of two entities with shared characteristics to achieve a common goal."

HCD training will consist of comprehensive, specific instruction to mainly enhance organizational management/human resources, project planning/design, and technical capacity for improved service delivery. FY 2009 training will include core group (all sub-partners) training in five organizational domains: 1) Financial Planning & Management, 2) Grants Management, 3) Monitoring & Evaluation, 4) Organizational Management & Human Resources, and 5) Project Planning & Design. Core trainings will be tailor-made to address the current organizational development challenges faced by sub-partners, as identified in yearly capacity building plans. Cluster/Cohort training (for select groups of sub-partners and/or staffing cohorts) will cover various topics in such domains as Governance & Strategic Planning, Technical Capacity, Mentoring & Coaching, and Networking & Advocacy. These trainings will be customized, in order to improve sub-partners' institutional and organizational systems. Technical capacity strengthening will focus on improving service delivery in the program areas where AED sub-partners are active and will be based on results from CB needs assessments and plans. Customized training for sub-partners will span all AED-UGM organizational domains.

Technical assistance will mainly occur after HCD training events and involve on-site technical support, focusing on: institutional strengthening of policies, systems and structures, in order to improve the quality of services; and adherence to statutory requirements, protocols and best practices. Leadership Seminars will be convened and cover such topics as Community Mobilization and HIV and AIDS Operational Research. Mentoring and twinning will consist of peer-to-peer capacity building to promote networking and collaboration between sub-partners and/or individuals which builds expertise and knowledge.

The AED-UGM has established an Educational Training Fund (ETF) to support the HCD needs of sub-partners through the provision of resources that include: funding for the development of job aides, handbooks and educational materials; and sponsorship for attending courses, technical meetings, etc. The ETF is a mechanism whereby staff and volunteers working for sub-partners can apply for, and receive, funding to improve skills and enhance service delivery. AED-UGM will assist sub-partners to identify courses and obtain sponsorships, to defray costs associated with participation, and encourage sub-partners to build professional development costs into their project budgets, to sustain this activity, over the long-term. Another sustainability approach is to link sub-partners to the Health and Welfare Sector Education and Training Authority (SETA), whereby sub-partners can tap into the government's National Skills Fund for learnership opportunities. Sub-partners engaged in Adult Care and Support will tap the ETF for sponsorship to attend short courses and technical meetings in such areas as: prevention, counseling, psychosocial support, spiritual support, paralegal training, etc. Additionally, the AED-UGM will adapt/develop and disseminate standard tools, protocols and manuals for use by sub-partners to improve operational systems and expand service delivery. Based on year one capacity building plans, the following are examples of technical capacity building activities of the three sub-partners working in Adult Care and Support: 1) exchange visits to forge twinning relationship between GRIP and Population Council on Rape Crisis Interventions; 2) GRIP Study Tour to other organization's sites to observe best practices on Rape Crisis Interventions; 3) training and TA for Hospice Palliative Care Association (HPCA) on TB/HIV integrated service delivery; 4) sponsorship of Ingwavuma Orphan Care (IOC) staff in local language Counseling course; 5) sponsorship of IOC staff in Memory Box course; and 6) sponsorship of IOC staff in paralegal training course. AED-UGM has been able to obtain non-PEPFAR USAID funding to fund a TB program involving two sub-partners, namely IOC and HPCA. Some of this funding will be used to hire a TB/HIV/AIDS Technical Advisor to provide technical leadership to this program.

AED-UGM is a capacity building program which ensures that sub-partner organizations collaborate and coordinate with the South African Government (SAG). AED-UGM seeks to ensure that all sub-partner service delivery strategies are aligned with the four priority areas in the National Strategic Plan (NSP), namely: (i) Prevention; (ii) Treatment, Care and Support; (iii) Research, Monitoring and Surveillance; and (iv) Human Rights and Access to Justice. As such, capacity building activities will focus on improving compliance of sub-partners with SAG policies, regulations and protocols. Where appropriate, AED-UGM will provide support to sub-partners in obtaining certifications and accreditations from various governmental and other institutional bodies pertaining to HIV and AIDS related service delivery. Capacity building activities will also promote effective partnerships between sub-partners and relevant government departments, the private sector and other civil society organizations, through strengthening of community-based service delivery networks and referral systems.

AED-UGM is committed to gender equality and has established systems, procedures and monitoring and evaluation instruments to ensure sub-partners are sensitive to this issue. Since gender equality and gender equity are concerned with ensuring that the needs of women, men, girls and boys are addressed in all phases of program planning, AED-UGM monitors the integration of gender concerns in situation analyses, the formulation of objectives, program activities and Monitoring, Evaluation, and Reporting (MER) plans. Thus, AED-UGM goes beyond the mere counting of the number of females and males attending training courses by actively promoting gender equality and gender equity, and providing support to sub-partners to enable them to address this issue effectively. As part of this process, sub-partners are required to report on gender-related activities in their quarterly monitoring reports. Gender equality consultants will also be engaged to strengthen the expertise of AED-UGM in this area.

Sub-partner organizations sign memorandums of understanding (MOUs) with provincial and district departments. Details concerning the status of MOUs in different provinces will be provided in sub-partner

Activity Narrative: COPs. AED-UGM ensures that sub-partners report progress on SAG collaboration efforts and MOU status on a quarterly basis.

SUMMARY:

As an Umbrella Grants Management (UGM) partner, Academy for Education Development (AED) supports institutional capacity building, technical assistance and grants administration for indigenous organizations that implement PEPFAR programs. These partners and sub-partners consist of indigenous NGOs, FBOs, and CBOs that were selected through the Inter-Agency PEPFAR Annual Program Statement (APS) and have met the criteria for full and open competition. The main functions of the UGM program are: (1) to facilitate further scale-up of HIV and AIDS care services and (2) to develop indigenous capability, thus creating a more sustainable program. The emphasis area is local organization capacity development and the primary target population is indigenous organizations.

BACKGROUND:

AED has extensive experience managing grants programs on behalf of USAID with PEPFAR funds. Prior to award of the UGM under the South Africa APS, AED was already managing grant programs funded with PEPFAR dollars in Ghana and Honduras, and providing TA and capacity building to PEPFAR partners on palliative care and OVC work in Mozambique and Kenya. In addition, AED has been sourced as USAID's exclusive partner for capacity building to the 23 NGOs funded under the PEPFAR Round One New Partners Initiative. As such, AED is well experienced in providing TA and capacity building on the broad array of technical areas related to PEPFAR programs, monitoring and evaluation, organizational development and finance management. In addition, AED has also been a key PEPFAR implementing partner in South Africa and is thoroughly familiar with working on HIV and AIDS program within that context. As a UGM partner, AED will not directly implement program activities, but rather act as a grants administrator, technical assistance provider, and mentor for sub-recipients, chosen by USAID, who in turn carry out the assistance programs. USAID closely collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grant mechanism. Although some of the partners work closely with various SAG Departments, AED's primary interface with the SAG is through the Senior Management Team (SMT), which includes key staff from USAID, National Departments of Health and Social Development, and representatives from the provincial departments. Under AED, between 6 and 11 indigenous partners will be supported via sup-grants and technical assistance. Priority will be given to harmonize approaches and policies of these indigenous partners and preclude overlap of services. Grants to palliative care partners support government clinics and hospitals with human resources including doctors, nurses, pharmacists, and counselors. These partners also work closely with new and established hospices to ensure hospice accreditation in accordance with national and global standards of palliative care. Palliative care services supported by partners include holistic; family-centered; clinical, psychological, spiritual and social care services for PLHIV and their families, supported by multidisciplinary teams at facility and community levels. During their partnership with PEPFAR, these providers will increase their reach while also building sustainability of their own programs and organizations. This scale-up and support for sustainability requires strong financial, monitoring and evaluation, and management systems to accommodate growth in reach and maximize sustainability.

ACTIVITIES AND EXPECTED RESULTS:

Funds budgeted under this narrative will support costs for administering, managing and facilitating technical support for the palliative care partners. Separate COP entries describe the palliative activities implemented by each partner. Institutional capacity building of indigenous organizations is a key feature of the umbrella grant mechanism and is designed to promote the sustainability of care programs and organizations.

ACTIVITY 1: Grant Management

AED will award and administer care grants to partners selected through a USAID/PEPFAR APS competitive process to implement HIV and AIDS activities. This involves an array of related activities including award and administration of grants, monitoring of grant progress, meeting reporting requirements, financial oversight, ensuring compliance with USG regulations, and grant closeout. AED will develop and monitor palliative care program implementation and adherence to financial regulations. This involves provision of extensive technical assistance to partners on palliative care project development and implementation, financial management, monitoring and evaluation, and reporting. A key result includes the development and monitoring of palliative care implementation plans which track critical program achievements in palliative care related areas such as service delivery, training, policy development, technical assistance, planning and evaluation.

ACTIVITY 2: Capacity Building

The umbrella mechanisms will support institutional and technical capacity building of indigenous organizations. (Capacity building activities are defined as activities that strengthen the skills of indigenous organizations to implement HIV and AIDS programs efficiently, with diminishing reliance on external technical assistance and support and increased potential for sustainability.) AED will support activities to improve the financial management, program management, quality assurance, strategic information (M&E) and reporting, and leadership and coordination of partner organizations implementing palliative care activities. AED will also assess and facilitate critical palliative care technical support for partners such as technical trainings, program reviews, technical planning and sharing of lessons learned. Emphasis will be placed on partner implementation of evidence-based preventive care interventions which include OI screening and prophylaxis (including cotrimoxazole, TB screening/management), counseling and testing for clients and family members, safe water and personal hygiene strategies to reduce diarrheal disease, HIV prevention counseling, provision of condoms, referral for family planning services for HIV-infected women,

Activity Narrative: appropriate child survival interventions for HIV-infected children and nutrition counseling as well as pain and symptom management and support for adherence to OI medications and antiretroviral therapy (ART).

ACTIVITY 3: Monitoring and Evaluation and Reporting

AED will provide support to palliative care partners in monitoring and evaluation, in order to strengthen measurement of the implementation and impact of palliative care program activities, an eventual achievement of PEPFAR goals. M&E support of palliative care partners includes: measurement of program progress; provision of feedback for accountability and quality; surveillance; and implementation of information management systems. In addition, AED will provide supportive supervision to provide guidance, monitoring, mentoring and oversight through site visits, technical assistance, and performance evaluation.

The management of service delivery programs under this project will contribute to the PEPFAR goals to provide treatment to 2 million HIV-infected people; prevent 7 million HIV infections; and provide care to 10 million people infected by HIV and AIDS, including orphans and vulnerable children.

Activity System ID: 23050

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY: USAID, through Research Triangle Institute (RTI), will provide support to strengthen the HIV-related clinical, psychological and social care services for the Thuthuzela Care Centers (TCCs) for rape victims in all provinces.

ACTIVITIES AND EXPECTED RESULTS: RTI will help the Sexual Offenses and Community Affairs Unit of the National Prosecuting Authority (NPA/SOCA) to establish eight new TCCs in FY 2009, eight in FY 2010 and seven more in FY 2011, for a total of 23 TCCs, and fund three core staff in each TCC. The program focuses on refurbishment of TCCs in order to meet health and TCC blueprint standards. RTI will orient and train TCC staff, doctors and forensic nurses; provide both core multi-disciplinary training and on-site training; and support all TCC staff by conducting training focusing on: delivery of post-exposure prophylaxis (PEP), HIV counseling and testing (CT), protocols for care and treatment of victims and follow-on psychosocial counseling for TB, PEP, antiretroviral (ARV) and secondary prevention adherence. Through the grants component, RTI will support referral systems for treatment and care and follow-on psychosocial counseling for children who tested positive by providing assistance to non-governmental organizations (NGOs) and working closely with them. With additional funding from the PEPFAR Special Initiative on Sexual Gender Based violence, RTI will pilot improved models of care at selected TCCs to inform SOCA's national "blueprint" for TCC care services and future Women's Justice and Empowerment Initiative (WJEI) program implementation. RTI will also develop pilot models based on existing best practices in rape care currently offered through the South African Government's Department of Health and non-governmental organization-supported services. RTI will strengthen health care services at TCCs, with special attention to improving PEP adherence and health care follow-up and referrals and explore strategies for explicitly raising community awareness of TCC services and for strengthening TCC linkages with community networks to help facilitate victims' access to services.

Activity narrative components in the FY 2008 COP related to the Department of Provincial and Local Government (DPLG) HIV and AIDS in the Municipal Workplace activity will no longer be part of this FY 2009 Plan.

SUMMARY:The first RTI component includes support to strengthen the HIV-related clinical, psychological and social care services for the Thuthuzela Care Centers (TCCs) for rape victims in all provinces with the exception of Limpopo, Free State and Mpumalanga. The second component encompasses strengthening the Department of provincial and Local Government (DPLG) HIV and AIDS care program in workplace programs in 4 districts and 15 local municipalities located in Gauteng, Mpumalanga, Western Cape, and Limpopo provinces. The third component includes training of community health care workers in the same municipality catchment areas on quality HIV palliative care. Populations served are adults and children, PLHIV, health care workers and caregivers. The major emphasis area is training with minor emphasis areas in IEC, commodity procurement, network/linkages/referral; linkages with other sectors and initiatives and local organization capacity development.

BACKGROUND:This is the third year of support to the TCCs and DPLG. The community care component is a new activity in FY 2007. Thuthuzela means "to comfort" in isiXhosa; TCCs are multi-disciplinary centers that provide comprehensive care for rape survivors with an emphasis on women and children. Funding to the DPLG in FY 2007 provides for the ongoing implementation of HIV and AIDS workplace activities initiated in FY 2006 with an emphasis on integrating elements of the preventive care package, psychosocial support and stigma reduction strategies for PLHIV. Caregiver training in DPLG catchment areas varies; as a result quality of care for PLHIV suffers. Select municipalities and districts will partner with the provincial Departments of Health and Social Development for standardized national HBC training.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthening HIV care in the TCCs PEPFAR funding will enable the TCCs to improve the quality of basic HIV-related clinical, psychological and social care services offered by the TCCs for rape victims with an emphasis on women and children rape victims (key legislative area). The TCCs offer a place of refuge and comfort for raped women and children, with an aim to reduce secondary victimization suffered by rape victims by ensuring that the reporting process, medical examination, initial counseling, quality of HIV-related care services are all done in one place on a 24-hour basis. Care services that will be provided include counseling and testing, disclosure support, PEP, gender-based violence screening, quality and supportive medical examination, psychological care and counseling by trained providers, personal hygiene, screening for pain and symptoms and HIV-related conditions such as opportunistic infections and provision of shelter and comfort measures. Qualified health care workers will also provide messaging on HIV prevention and counsel and refer for the provision of CD4 testing, ART, OI prevention and treatment (including cotrimoxazole prophylaxis, TB care), nutritional care and appropriate child survival and child care interventions (growth monitoring, child-specific nutritional care, immunizations). The program will provide legal counseling, program linkages for the legal protection of women and children and follow-up legal advice. A particular program emphasis is ensuring that women's legal rights and child protection is promoted and protected.

ACTIVITY 2: Strengthening HIV Care in Municipality Workplace Settings This component assists 4 districts and 15 local municipalities located in Gauteng, Mpumalanga, Western Cape, and Limpopo provinces to initiate and/or strengthen care delivery via HIV and AIDS workplace programs. Activities will be developed and strengthened that encourage employees to obtain access to HIV prevention and care services including emphasis on integrating elements of the preventive care package, psychosocial support and stigma reduction strategies for PLHIV. This includes counseling and referring for HIV testing services, disclosure support, basic screening for pain and symptoms and HIV-related conditions such as opportunistic infections, HIV prevention messaging and access to condoms, referrals for the clinical monitoring and care that includes ART, OI prevention and treatment (including cotrimoxazole prophylaxis, TB care), nutritional care

Activity Narrative: and appropriate child survival and child care interventions. On-site psychosocial care will be provided. Mandatory employee participation in HIV and AIDS education programs is a key element of the program. Strategies to reduce stigma directed towards PLHIV will be integrated in partnership with municipality leaders and participation with labor unions is included. Outcomes include improved access to HIV and AIDS care, stigma reduction and strategies to prevent the further spread of the disease

ACTIVITY 3: Expanding the Community Response to HIV and AIDS in Municipality Catchment AreasAll the targeted 4 districts and 15 local municipalities (mentioned in Activity 2) have CBOs who carry out HIV-related community and home-based care activities for PLHIV and OVC in their vicinity. It has been noted that community providers who receive the 59-day South African Government accredited home-based care training from the NDOH provide exemplary services. However, many CBOs do not have access to the standardized training program. This activity will expand NDOH standardized training in the targeted municipalities depending on the unique needs and ongoing training programs supported by the provincial Departments of Health and Social Development. The training will include but not be limited to the following topics: elements of the preventive care package for adults and children; basic HIV terminology and facts; psychosocial aspects of HIV and AIDS; basic pain and symptom management; bereavement care and communication skills; legal issues; care considerations for OVC; infection control; health education; culturally appropriate care; end of life care; ART adherence; how to provide referrals; supportive supervision; program design; and project management. Community caregivers working in drop-in centers (catering to orphans and vulnerable children) will be trained in ways to mitigate the burden of women and girls in their care of family members who are ill and of young children who have lost their parents to HIV and AIDS. Sites will be selected in partnership with municipalities and the provincial Departments of Health and Social Development. Follow up from the training and technical support will be provided to the community organizations by the designated training support team. Training provided through this activity serves to build and sustain linkages between the district municipalities, the provincial Departments of Health and Social Development, and community-based organizations (CBOs) and non-governmental organizations (NGOs) thereby reinforcing the coordination role of the DPLG. These activities will contribute to PEPFAR goals of providing palliative care to 10 million HIV-infected individuals and their families, including OVC.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY

Absolute Return for Kids (ARK) will be using PEPFAR FY 2009 funds to co-fund its Community Access and Adherence (CAA) activities in the Eastern Cape (EC). ARK has been requested by the EC HIV and AIDS, STI and TB (HAST) directorate and the Nelson Mandela Metro to further scale up support in this province. ARK has been supporting the province since 2006 and is currently working in 11 sites, delivering care and treatment in 10 sites and prevention of mother-to-child (PMTCT) services in one site. The scale up in these sites will ensure that individuals in needy areas of the EC have adequate access to care and treatment.

ACTIVITY 1: Support to KwaZulu-Natal (KZN) Department of Health (DOH) and EC Department of Health:

All diagnosed HIV-infected patients and family members will receive TB screening, prophylaxis and treatment if appropriate

Referral systems will be strengthened to ensure the easy, quick referral of patients between antiretroviral (ARV), TB, PMTCT and pediatric ARV services. Tracing of lab results for early and ongoing diagnosis will be conducted proactively to ensure that bottlenecks in the system are addressed with DOH and the National Health Laboratory Services (NHLS).

TB infection control practices are standard at ARK-supported sites and include well-ventilated waiting areas and consulting rooms, safe sputum collection, and patient and staff education on safe cough etiquette and hygiene.

ACTIVITY 5: Reporting and Quality Assurance/Improvement

Scale-up of clinical services includes increasing capacity for data management and reporting. All sites will have additional data capturing support, and additional monitoring and evaluation management support at the provincial office. All sites will have internet connectivity to facilitate information management activities.

SUMMARY:

Absolute Return for Kids' (ARK) focus is to provide a comprehensive palliative care package for services to HIV-infected mothers and their children through partnerships with local government health facilities. ARK's primary emphasis areas are human capacity development, local organization capacity development, and construction/renovation. The target population is people living with HIV and AIDS.

BACKGROUND:

ARK is a charity organization whose mission is to facilitate and support delivery of accessible and sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and poverty.

ARK's mission is to facilitate and support delivery of accessible and sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and AIDS. In partnership with the KwaZulu-Natal Department of Health (KZNDOH), ARK, as the implementing partner, has established an antiretroviral treatment program in government primary health facilities and hospitals. Specifically, ARK works with the KZNDOH to identify sites and areas for capacity building, including human resources, modest infrastructure support, and organizational capacity development. PEPFAR funding has enabled ARK to successfully enroll over 15,000 patients in ART in KZN with about 12000 remaining in care at ARK supported sites.

FY 2008 funding will enable ARK to expand its established ARV treatment program to include a comprehensive range of palliative care services. These services will be supported by improvements in the infrastructure of targeted sites, and the provision and training of human resources in partner health facilities to further strengthen their capacity to deliver quality care and support for HIV-infected mothers and their children. ARK provides palliative care services in accordance with South African national treatment guidelines.

ACTIVITIES AND EXPECTED RESULTS:

ARK's primary objective is to keep mothers alive to continue caring for their children. The primary caregiver's continued survival and potential ability to earn a living while receiving ARV treatment will have a substantial impact on the extended family.

ACTIVITY 1: Support to KZNDOH

ARK works with the KZNDOH to develop the necessary processes and systems to manage the palliative care program, to ensure that the model created is scaleable, sustainable and replicable elsewhere. Capacity-building is site specific. Upon identification of a site, an analysis of the needs of each site will be done with respect to staffing (doctors, nurses, pharmacists and pharmacy assistants), clinical equipment, management systems, patient advocacy and temporary structures. The most pressing requirements are met in order to speed up the ability for patients to receive treatment. Where necessary ARK provides support in the ARV site and pharmacy accreditation process.

ACTIVITY 2: Human Capacity Development

Activity Narrative: ARK will conduct a thorough needs analysis of human resource capacity prior to initiating support to the palliative care program at each site and recruits all the necessary medical and support staff required for the successful rollout of services. The staff recruited varies from site to site but include doctors, nurses, pharmacists, pharmacy assistants, medical technologists, facility-based counselors, and patient advocates. For all key staff, ARK will provide training and follow-up refresher courses cover all aspects of ARK's palliative program including employee and volunteer policies and procedures, onsite mentorship from experienced ARK staff, and an introduction to key performance areas. The specific topics covered include: counseling and testing, screening for pain and symptoms, screening for OIs including the provision of cotrimoxazole prophylaxis, symptom control and management of opportunistic and sexually transmitted infections, nutritional assessment and counseling, adherence support, as well as the value of community access, prevention with positives, referral and patient advocacy. Staff are invited and encouraged to attend formal training offered by external providers including other PEPFAR partners such as the Hospice Palliative Care Association (HPCA) and Foundation for Professional Development (FPD).

ACTIVITY 3: Clinical Care

ARK's palliative care program focuses on a network of clinics operating within a district, in order to create a sustainable and efficient system that supports the continuum of care and up and down referral. ARK-employed doctors and nurses provide comprehensive treatment management including patient uptake, doctor consultations, counseling and testing, TB screening and management, pain management and symptom control, treatment of opportunistic and sexually transmitted infections including the provision of cotrimoxazole, lab testing and patient education. Pharmacists are responsible for the dispensing of medication.

As part of the palliative care package for HIV-infected individual, individuals accessing ARK's services will be staged and entered into ARK's ARV treatment program. All patients with a CD4 count of <200 will be referred to ARK's ART program to confirm their eligibility for treatment. The program's medical and psychosocial criteria are designed to ensure that the patient is prepared and ready to adhere to ART. All patients being assessed undergo a treatment literacy program and are educated about positive living. Patients are encouraged to motivate their partners/spouses to get tested and, if necessary, enter the treatment program. HIV-infected patients, not in-need of ARV treatment and not with active TB, will be offered isoniazid prophylaxis, monitoring, and ongoing counseling support for 6 months. At the end of the 6 months, these patients will be reassessed for further treatment. Although ARK's treatment target population is predominantly mothers and children, increased attention is being given to encourage and increase male partner (and men in general) participation.

ACTIVITY 4: Family-Centered Care and Support Services.

In an effort to encourage adherence among mothers and ongoing care for their infants, ARK's program takes an integrated, family-centered approach to care and extends support (including treatment literacy and prevention education) to all members of a patient's household. Together, trained facility-based counselors, patient advocates and community health workers (CHWs) counsel patients and their partners on treatment literacy, positive living, nutrition, safe infant feeding practices, and safe sex. CHWs conduct pre-treatment home visits and provide ongoing psychosocial support to patients and their families. They also promote and support disclosure to partners and family, partner testing and facilitate treatment access. CHWs are required to facilitate support groups for their clients and ensure that all patients and their families have access to spiritual care, psychosocial support, prevention messaging including prevention with positives, nutritional counseling, economic assistance (government grants), and protection services, when required.

ACTIVITY 5: Reporting and Quality Assurance/Improvement

ARK provides computers and employs data capturers at all sites. Data is captured from patient folders and transferred to ARK's data center, allowing for ongoing evaluation and outcome analysis. Adherence rates, death rates and loss to follow-up are closely monitored. Quarterly updates are provided to the KZNDOH and information is used within the clinics to strengthen service delivery. To ensure high standards and quality of care in line with the national guidelines, all ARK staff are provided onsite, on-the-job training. This is followed up with regular onsite mentorship and site evaluation by ARK's national executive and provincial management teams. Informal training sessions are conducted quarterly by national staff. Staff are also encouraged to attend formal external training courses offered by FPD.

These activities contribute to PEPFAR's 2-7-10 goals by increasing the number of South Africans receiving palliative care.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 4757.09	Mechanism: N/A
Prime Partner: Project Support Association of Southern Africa	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 8250.23041.09	Planned Funds: \$242,726
Activity System ID: 23041	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Project Support Association of Southern Africa (PSASA) professional nurses will again receive follow up refresher training from master trainers according to the palliative care guidelines as received from FHI. The nurses will in turn be responsible for the training of the community care workers who will then train family members and then train caregivers in the homes of clients. Also PSASA administrative and finance support staff will attend training of PEPFAR guidelines on finance when available.

Training to community care workers will continue. Care workers do seek full time employment and are also mobile (moving around). Training of caregivers and family members will therefore be a continued activity as there will always be new care supporters and clients.

PSASA will strengthen communication and referral skills of home-based care volunteers (fourteen project sites) regarding the integration of family planning, HIV services and TB screening and referrals. PSASA will also provide basic information about TB, counseling and testing (CT), antiretroviral treatment, prevention of mother-to-child transmission (PMTCT) and assist home-based care clients to adhere to the treatment regimen. (FHI/PSASA Manual will be used) and refer to local health facilities.

Nurses working in this program will also be trained by the PSASA Master trainers on the referral mechanisms between PSASA's home-based care program and family planning, CT, PMTCT and ARV services. These 14 palliative care projects only involved training on palliative care previously.

SUMMARY:

Project Support Association of Southern Africa (PSASA), a community-based HIV and AIDS prevention and care organization, is expanding its home-based care (HBC) activities by increasing the number of services, increasing the scope of services (integrating OVC care and adult palliative care, provision of community-based HIV counseling and testing) and improving the quality of these programs through training. Emphasis areas are community mobilization/participation, training, information, education and communication, and development of linkages and referral systems. Target groups are people living with HIV and AIDS (PLHIV) and their families as well as healthcare workers. With FY 2007 PEPFAR funding, the number of HBC programs was expanded providing integrated palliative care, OVC care and HIV testing. The new projects targeted poorer rural communities of Mpumalanga province where health services are limited or non-existent. Through FY 2008 PEPFAR funding, the HIV and AIDS care programs will be expanded to provide prevention with positives elements among those who are HIV-infected. These interventions will target poorer rural communities of Mpumalanga where health services are limited or non-existent and focus mainly on PLHIV and support groups.

BACKGROUND:

PSASA is a non-profit organization, which was established in 1998 in HIV care and support, prevention and mitigation. Its mission is to create community partnerships that enhance their ability to prevent, mitigate and alleviate the impact of HIV and AIDS. Home-based care programs are an integral component of the PSASA mission and are a strategy within the South African Government Strategic Plan. PSASA has established and continues to support over 60 home care programs. Many of these were established in partnership with the Mpumalanga Department of Health. Since 2004, 127,614 clients received direct support from a PSASA project and over 32,000 household members received training from community caregivers. These activities will be expanded under PEPFAR as part of PSASA's ongoing core program. PSASA has worked closely with government structures, especially Departments of Health, Welfare Social services and Population Development. In recent years closer relationships have been formed with the provincial Department of Home Affairs, Agriculture Development, Premiers Office (Gender), Department of Education and Department of Labor (income generation activities). From 2004-2007, the Mpumalanga provincial Department of Health & Social Services (DOH&SS) has financed PSASA for over \$100,000 to conduct life skills training in HIV and AIDS. The DOH&SS also provides PSASA with HIV test kits and home-based care kits as well as assistance with establishing referral networks for family planning, antiretroviral (ARV) and tuberculosis (TB) programs. Social grants, food packages, child assessments and drop in centers are undertaken closely with Department of Social Development (DOSD) with funding from Dutch donors. Each of the projects are encouraged to work closely with and to participate in local AIDS Councils, churches, government departments and municipalities, schools with many businesses providing "in kind" support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

The aim of training is to build capacity at the community level for the provision of quality and holistic care. The majority of people living with AIDS in the care programs are women. PSASA will strive to increase with the number of males within the care program. In many cases, the care workers may also be recognized as traditional healers. PSASA will also work to increase the involvement of men in caregiving. As part of the HBC trainings, care workers will engage men by focusing on such topics as family violence, anger management, fathering and parenting skills being emphasized. To support this human capacity development of care workers and volunteers, a stipend provided through the HBC program is an important source of household income. Regular financial training seeks to improve the capacity and economic advancement of care workers in the program. From other donor funding, short-term loans or small grants are also provided to supplement this meager stipend. In addition to a 5-day annual training, one-day trainings are held weekly covering topics of sex and sexuality relationships negotiating safer sex abstinence and truthfulness and other key topics include: evidence-based preventive care interventions focusing on people living with AIDS, TB screening/management), counseling and testing for clients and family members, safe water and personal hygiene strategies to reduce diarrheal disease, HIV prevention counseling,

Activity Narrative: provision of condoms, referral for family planning services for HIV-infected women, appropriate child survival interventions for HIV-infected children and nutrition counseling, clinical measurement, nutrition monitoring and targeted support based on WHO criteria for severely malnourished PLHIV.

ACTIVITY 2: Home-Based Care

Trained care workers provide a minimum standard of care focusing on clinical/physical, psychological, spiritual, social and prevention interventions. In addition to sharing integrated HIV-related palliative care messages with HIV-infected individuals and their families, the care workers use a family-centered approach to client assessments. The package of services includes basic pain and symptom management, support for adherence to OI medications (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART), and referral for family planning. Community and home-based psychological support, stigma reduction strategies and adherence support for OI medications and ART will be provided. Attention will be given to increasing the gender equity in the HIV and AIDS programs, increasing male involvement in the program, addressing stigma and discrimination, and partnerships with local NGOs, FBOs and CBOs. Clients are also counseled on prevention with positives and family member are referred for counseling and testing (CT). Outreach to the community and referral to the FHI-sponsored Mobile Support Units for CT Family Planning referrals is part of the HBC activity. An additional key activity of care workers is monitoring of adherence to TB and HIV treatment. Elements of the preventive care package for adults and children are also included during interaction between the care worker and the client. The HBC project link closely with community and church groups who regularly supply "in kind" support (approximately 10% of project budget). Certain components of the home care program have become fully sustainable. For example, income generation activities for care workers such as food gardens have become sustainable with care workers receiving approximately \$150 per annum through the sale of vegetables and fruit.

By providing basic care and support to HIV-affected individuals and their families, these activities contribute substantially to the PEPFAR goal of providing care services to 10 million. The activities also support the USG Five-Year Strategy for South Africa by collaborating closely with SAG to improve access to and quality of basic care and support.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 5191.09	Mechanism: N/A
Prime Partner: Reproductive Health Research Unit, South Africa	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 9448.23045.09	Planned Funds: \$453,898
Activity System ID: 23045	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Reproductive Health and HIV Research Unit's (RHRU) will continue to provide the comprehensive package of care described above at all the sites it supports, including new initiation sites and their networks. This includes cotrimoxazole prophylaxis and standard nutritional assessments as part of ongoing care. In this program year, RHRU will focus activities on pre-antiretroviral therapy (ART) retention in care as a key driver of improving transition into treatment programs when patients become eligible. This will include exploring different wellness packages (using the Basic Care Package as a foundation) aimed at retaining patients in care and addressing their needs holistically. This may also include developing broader wellness packages tailored to the needs of different groups (families, men, and youth). These packages will also link into local community-based organizations in order to offer a wider range of services including psychosocial support, social care and opportunities to participate in income generating activities. RHRU will explore opportunities to provide care and support to recent victims of xenophobic violence, if such a need is identified and such opportunities exist.

In addition to this, RHRU will pilot a follow-up system using cellphone SMSes to increase pre-ART retention in care across selected sites in KwaZulu-Natal, Gauteng and the North West province. Patients will receive programmed reminders by SMS of key information, including date of last CD4 measurement, date of next follow-up visit and location of facility where CD4 measurement can be done. Patients lost-to-initiation will be tracked by dedicated tracers and followed-up by patient follow-up workers and home-based caregivers.

RHRU, at the request of the provincial Departments of Health (DOH), provides, and will continue to provide, training for health care providers in line with the WHO Integrated Management of Adult Illnesses program.

RHRU will continue to provide public sector staff with training on all aspects of HIV Care and Support. In addition, RHRU will work with the National DOH to disseminate the RHRU-developed HIV Standards, a self-assessment tool designed to improve and integrate HIV services at Primary Health Care facilities, and to prepare primary health sites for accreditation.

SUMMARY:

The Reproductive Health and HIV Research Unit's (RHRU) Basic Care and Support activities for FY 2008 will be part of an integrated program and will specifically include: (1) palliative care arising from clinical (both ARV and non-ARV) services rendered by RHRU staff through the activities described under the ARV Services program area; (2) the provision of psychosocial support to commercial sex workers, (3) the provision of support, home-based care and referral; and (4) the implementation of health provider training in all aspects of palliative care. The major emphasis area for these activities is quality assurance and supportive supervision, with additional focus on human resources, development of referral systems, and training. Populations targeted for these interventions include PLHIV (children, youth and adults), HIV-affected families, commercial sex workers, refugees, and public sector doctors, nurses, pharmacists, traditional healers and other health care workers

BACKGROUND:

RHRU, a unit of the University of the Witwatersrand in Johannesburg, currently provides technical support to the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa, which includes the national ARV rollout. Under PEPFAR funding since FY 2004, RHRU has provided regular on-site support, direct treatment, training and quality improvement to DOH sites in 3 provinces. The RHRU will continue these activities, which include inner city, district wide and rural programs focusing on providing support to complete up and down treatment referral networks. In addition, RHRU will continue the provision of counseling and testing (CT), palliative care, and prevention services. RHRU continues to develop models of service delivery that can be replicated and expanded, and produces findings from lessons learned and targeted evaluations to disseminate and share with others. It should be noted that the success of ARV treatment scale-up depends on the comprehensive approach detailed in other program areas. In particular, the strengthening of referral from other primary healthcare programs such as TB, family planning, antenatal/postnatal and STI treatment is critical. Basic Health Care and Support is an integral part of this system, and the RHRU will focus this part of its program on PLHIV, in impoverished areas such as the Hillbrow neighborhood in Johannesburg, and at PHC clinics in Durban, and rural areas of the North West province by delivering high quality palliative care, psychosocial support, and intensive training of doctors, nurses, and other health care professionals. Furthermore, RHRU will continue to develop strategies to address underserved communities affected by HIV, such as couples, high risk groups such as adolescents, and gender-based interventions with women at risk, including pregnant women, commercial sex workers, and men.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Provision of Palliative Care

Through comprehensive support and quality improvement programs to the Johannesburg inner city, eThekweni District in Durban, and through Mobile Clinical Support Teams operating in North West, KwaZulu-Natal (KZN) and Gauteng provinces, RHRU will continue to provide the preventive care package and opportunistic infection prevention and treatment, identification and treatment of syndromic STIs, provision of regular CD4 counts, and pain and symptom management in conjunction with ARV treatment to adults and children in partnership with the DOH. In addition, STI treatment will be provided to HIV-infected patients at a network of local health authority sites in the inner city of Johannesburg. This includes the Women At Risk Project that reaches commercial sex workers through a clinical and support outreach service that moves between the inner city brothels, and a special service run from the clinic every weekday morning (see the Other Prevention section for more details). Integrated reproductive health/HIV services will be provided to

Activity Narrative: HIV-infected clients at a large family planning clinic in the Durban CBD and via the gender-related projects described in the Other Prevention program area. Furthermore, health care and support will be provided to in-patients at an HIV step-down and palliative care facility in KwaZulu-Natal. Lastly, as described in the Other Prevention section, RHRU will provide home-based care in the deprived inner city suburb of Hillbrow through its new program of community outreach.

ACTIVITY 2: Psychosocial Support

RHRU or its sub-partners will provide psychosocial support through counseling, wellness programs and befriending. RHRU will assist with income generation, material support programs, and support group facilitation. RHRU will be key in the strengthening of adherence initiatives through their work in HIV treatment sites and within the community. RHRU will also assist the DOH in providing technical resources, continuity and support to the up and down referral processes that must take place to enable ARV program scale-up. Currently men are under-represented in seeking ARV treatment, and a family-based approach to care ensures all family members are provided with treatment and prevention initiatives where appropriate. Therefore, RHRU will also address gender issues by developing and providing specialized services such as family clinic days 3 days per week, male clinic 5 days per week for CT and ART, and male only support groups for families and men in order to improve access for these two key groups. In addition working with antenatal and postnatal clinics, RHRU will provide psychosocial support and specialized adherence counseling for HIV-infected pregnant women and new mothers, and will work with pediatric treatment sites to provide specialized adolescent counseling and psychosocial support. Through the Women At Risk project, commercial sex workers are provided with support and information on appropriate topics at outreach sites by community health workers, and referred into other psychosocial services as required, including support groups, workshops on CSW-relevant issues (such as gender violence and gender norms and behaviors), prevention with positives interventions, and income generation projects to provide peer support and encourage the exiting of sex work. Refugee populations, often a neglected, overlooked group, will also be targeted with services provided by RHRU. A special program for the care of refugees will be expanded to include more systematic identification of refugees seeking assistance through public facilities. These individuals will be counseled and provided full referral and follow up services to the NGO and private sectors to receive care, treatment and support if they are ineligible to receive services through the public sector programs.

ACTIVITY 3: Human Capacity Development

The objective of the training is to increase skills in the delivery of quality palliative care services including elements of the preventive care package. RHRU will provide on-site and didactic training to DOH and NGO doctors, nurses and counselors, and will specifically target ARV and non-ARV sites that need to be able to care for, manage and appropriately refer HIV-infected clients. RHRU will also provide mentoring to DOH staff via bedside teaching, case reviews, the sharing of quality improvement approaches, and support during consultations. RHRU's Primary Health Care Project will provide tools, training and on-site guidance to DOH staff in primary healthcare sites relating to quality improvement of primary healthcare services, including palliative care. This project will also provide support to ARV treatment and is described in the ARV Services section. In FY 2007-2008, RHRU will continue to undertake M&E activities to inform and develop quality HIV care. RHRU will be in a position to conduct Public Health Evaluations (PHE) of some of its palliative care related projects in FY 2008-2009. For each PHE, a detailed proposal will be developed and submitted to PEPFAR for review and funding approval.

These activities contribute significantly to both the vision outlined in the USG Five-Year Strategy for South Africa and to the 2-7-10 objectives by ensuring that HIV-infected individuals and their families are able to access comprehensive care, and by expanding access to these services in both the public and private sector.

Control & Prevention

Funding Source: GHCS (State)

Program Area: Care: Adult Care and Support

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 3069.22736.09

Planned Funds: \$218,454

Activity System ID: 22736

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The University of KwaZulu-Natal (UKZN) Nelson Mandela School of Medicine (NMSM) has further refined the definition of palliative care. The number of patients reported as receiving palliative care refers only to those patients who visited the Traditional Health Practitioners (THPs), were suspected of being HIV-infected, and received palliative care services. These services include: clinical/medical and/or traditional medicines; pre-pre test counseling and/or spiritual advice; and/or referral to grant office or social worker.

THPs often provide palliative care services which sometimes cannot be accessed from public health care centers. At the beginning of the project, home-based care kits provided by the project were to have been replenished by the eThekweni District Health Department. However, for reasons beyond the control of this project, this has not materialized. It is incumbent on the project to continue this necessary aspect of care for the very needy patients. NMSM will replenish the kits using its existing mechanism of visiting THPs.

SUMMARY:

The University of KwaZulu-Natal (UKZN) Nelson Mandela School of Medicine (NMSM) is using PEPFAR funds to support the implementation and refinement of common clinical guidelines for HIV and AIDS management by traditional healers, including: the standardization of HIV clinical staging for traditional healers; collaborative introduction of Patient Record Keeping, Monthly Data Sheets, and Data Transfer to the Medical School; and provision of basic medical supplies to trained healers. The main emphasis area is training, with minor emphasis placed on human resources, logistics, policy and guidelines, quality assurance and supportive supervision, and strategic information. The target population includes Traditional Health Practitioners (THPs) in the private and public sector who are members of the KwaZulu-Natal (KZN) and Ethekeeni Traditional Health Practitioner Councils.

BACKGROUND:

UKZN has an ongoing collaboration with associations of traditional healers in rural areas of Ethekeeni District. Traditional healers are extremely influential and are a largely untapped resource in HIV and AIDS prevention and mitigation on the community level. These activities began in August 2005 with the arrival of FY 2005 PEPFAR funding. NMSM is implementing the project in collaboration with the KZN and Ethekeeni Traditional Healer Councils, with the eThekeeni Health Unit, and the eThekeeni District Health Office of the KZN Department of Health.

ACTIVITIES AND EXPECTED RESULTS:

The principal focus of this project will be training and equipping traditional healers to better deal with the HIV epidemic in KZN.

ACTIVITY 1: Training

Training will be provided through workshops run by the project training team (including senior traditional healers). Trained THPs will be provided with a customized version of the home-based care medical kit currently used by the KZN Department of Health (DOH), modified to include the elements of the Adult Preventive Care Package including, nutritional referral, personal care, counseling, screening for pain and symptoms, recognition of signs and symptoms of opportunistic infections, worsening condition such as increased pain or wasting, and knowledge of when to refer to clinical providers. Treatment adherence, prevention (including prevention with positives) and other holistic care activities as allowed (bathing, wound care) will also be covered. Training includes the refinement and implementation of common clinical guidelines for HIV and AIDS patient management by traditional healers, including the standardization of HIV clinical staging, the introduction of patient record keeping, monthly data sheets, and transfer of these data to the Medical School.

ACTIVITY 2: Referrals:

NMSM is working closely with South African Government colleagues to establish viable bi-directional referral pathways (including referral forms); formalizing and enhancing what is currently happening. This process has involved consultation with municipal and district health authorities on the following:

- 1) the clinics that are near to the THPs and to which the THPs can send referrals;
- 2) the sharing with the government of the database of THPs registered with the project; this database provides (in addition to other information) details on the location of each THP practice site, their contact details, and the clinics to which these THPs are currently referring patients (informally);
- 3) a commitment by the government to include notification of referrals received by THPs in their Health Information System; and
- 4) formalization of a referral form, already reviewed and approved by municipal and district Health, for THPs to use in sending patients to clinics. Since current legislation does not permit public health officials to refer patients to THPs formally, the referral form has a simple tear off sheet to give to the patients to take back to THPs, simply acknowledging whether the patient was attended to at the health facility, and by whom.

ACTIVITY 3: Monitoring and Evaluation-patient record system

NMSM will also ensure that traditional healers have adequate stocks of appropriate medical supplies, through collaboration with the provincial Department of Health. Regular site visits will be conducted to monitor the implementation of these guidelines and data management protocols. THPs are visited regularly by a team of 12 project data monitors to collect anonymous copies of patient record data for entry into the project database. NMSM has determined that the optimum method is to use carbonized patient record forms, patient follow up forms (both in book form) and referral forms (in tear-off pads) and provide patient

Activity Narrative: cards to the THPs. Each patient card is linked to a unique patient record identifier number, pre-printed on the first-visit patient record forms. THPs must enter the patient record number on the patient follow-up forms and patient card. The patient takes the card with them and brings it back to facilitate the THP's use of the patient record system. The referral forms include a tear off sheet for use by the clinic, that the patient is expected to bring back to the THP.

ACTIVITY 4: Medical Kit Supply

Initial medical kits are supplied to the THPs registered with the project using project funds and logistics. These kits are a modification of the type of home-based care kits used by the Municipality and Province, and contain additional items specific to the THP needs. The re-supply in eThekweni District is being provided the District Health approved National Integrated Program (NIP) sites, and other NGO sites approved by District Health. These sites are normally used by DOH to re-supply the DOH Home-based Care (HBC) workers, and therefore are equipped with stock control staff and keep a registry of HBC workers using the material. DOH has agreed to add the THPs on the project to this system, and is exploring with the project the variable amounts of re-supply needed by different THPs (some are much busier than others), and the specific needs of THPs that may vary from those of HBC workers.

ACTIVITY 5. Clinical Management Follow-Up

In the refresher training sessions and workshops with THPs already on the project, NMSM concentrates on ensuring that fundamental facts about HIV, patient management, and referral criteria are clearly understood. Discussions between traditional health and biomedical practitioners in these sessions focus on optimizing patient management.

Expected Results:

1. Refine and implement Standardized Clinical Guidelines for HIV and AIDS management for traditional healers.
2. Develop Standardized Therapeutic Protocol for HIV and AIDS patient management by traditional healers.
3. Improve collaboration and referral between biomedical and traditional healers.
4. Improve record keeping by traditional healers and availability of the anonymous data to public health authorities.
5. Provide adequate basic care package to trained traditional healers.
6. Assess the usefulness of working with traditional healers to enhance their capacity to provide palliative care to HIV-infected patients.
7. Human resources: Through this activity, traditional healers will be trained, equipped, with basic medical supplies and enhanced clinical care knowledge. A small number of medical school staff, traditional healer representatives, and support staff receive salaries from the project for administration, training, THP support and monitoring and evaluation.

Logistics: Includes managing the medical kit supply and re-supply, with the trained traditional healers and government colleagues. This overlaps with commodity procurement since NRMSM funds will purchase the initial medical kits. Through regular site visits quality assurance and supportive supervision will be conducted on the use of adapted clinical guidelines and HIV staging, medical kits and record keeping systems.

Through training, monitoring and evaluation, medical supply and referral system implementation in partnership with local government, policy and guidelines for working with traditional healers will be developed.

By providing new tools and materials to traditional healers working with HIV and AIDS patients, this project will expand basic care and support services in KZN, contributing to the PEPFAR goal of providing care and services to ten million HIV-affected individuals. These activities will also support efforts to meet the care and treatment objectives outlined in the USG Five-Year Strategy for South Africa.

Budget Code: HBHC	Program Budget Code: 08
Activity ID: 3030.22997.09	Planned Funds: \$0
Activity System ID: 22997	

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. The National Department of Correctional Services is in its fourth year of funding with a very high carryover amount. All the proposed FY 2009 activities will be supported using carryover funds. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY

The National Department of Correctional Services (DCS) has decided to enhance its activities under Care Services by conducting training of offenders in Correctional Center-Based Care (CCBC). Training of Professionals in CCBC will include: training of personnel as support group facilitators (including the workplace program) to assist in the establishment and maintenance of support groups for offenders who are either infected or affected by HIV and AIDS in Correctional Centres; training of healthcare personnel in the Comprehensive Management of HIV and AIDS including other related diseases (opportunistic infections); training of professionals in spiritual counseling; and training of healthcare professionals as Antiretroviral (ARV) Project Managers. This training will increase access to care and support services for offenders and personnel living with HIV and AIDS and also reduce morbidity and mortality as well as other impacts of HIV and AIDS. Training of offenders and personnel will be conducted continuously, due to the high turnover of nurses and movement of inmates. This applies for all trainings.

Training of offenders / personnel in support groups never occurred due to lengthy tender processes in order to procure training services. However, a need does exist as personnel were never trained in this regard and DCS will aim to address this with FY 2009 funding.

CCBC: 150 nursing personnel were trained and due to the fact that this was the first training, a need still exists. Policy and policy procedures are in place outlining the procedure on how to utilize offenders in rendering correctional center-based care. Following training, the Regional HIV and AIDS Coordinator will be responsible for the actual implementation, monitoring and evaluation of CCBC.

Comprehensive HIV and AIDS Care, Management and Treatment (CCMT): CCMT was not part of core curriculum for nurses and since DCS is using the Primary Health Care approach where a nurse deals with the inmates holistically. Subsequent to training, a portfolio of evidence must be completed and assessed by external service provider. Implementation at correctional center-level and implementation forms part on the day-to-day functions of the nurse depending on the patient's diagnosis

Religious Care Workers: 20 religious care workers will be trained in spiritual counseling. They will play an important part in the post test - and terminal phase counseling.

SUMMARY:

PEPFAR funds will be used by the National Department of Correctional Services (DCS) to provide basic HIV and AIDS care and support to offenders and staff in DCS Correctional Centers in all nine provinces. The major emphasis area for this program will be the training of personnel as facilitators on the establishment and maintenance of support groups for infected and affected HIV and AIDS offenders in Correctional Centers. Special emphasis will be placed on integrated prevention services, including prevention with positives and behavior change as well as the management of psychosocial challenges. Minor emphasis will be given to community mobilization and participation; development of network/linkage/referral systems; information, education and communication; linkages with other sectors and initiatives; and local organization capacity development. The target population will include men and women offenders, people living with HIV (PLHIV), their caregivers and several most at-risk populations (e.g., men who have sex with men, injection drug users and tattooing with contaminated instruments).

BACKGROUND:

The training will be provided by an identified service provider registered and accredited according to the South African laws and contracted through the DCS procurement process. However, the actual services will be carried out by both offenders and DCS members who have been trained. This activity is also one of the National Department of Health's strategies aimed at promoting positive living among people who have tested HIV-infected and integrate prevention services with those who seek to support one another and to cope with their status. The activity will contribute to the core objective of the Department of Correctional Services which is rehabilitation by enhancing a rational thinking among offenders and allowing them to take charge of their own behavior and future.

Although the DCS is encouraging the establishment of care support groups in Correctional Centers, no formal training was conducted to ensure that facilitators (personnel) are equipped with the necessary skills and knowledge to establish and maintain these care support groups. Challenges have been previously experienced whereby the support groups were without a skilled coordinator, and the concept of support groups lost its meaning in terms of its objectives and core business. The establishment of support groups for infected and / or affected members will also contribute positively towards creating an enabling and conducive environment and will promote the Department's intentions to care and support members who have to deal with the psychosocial impact of this epidemic. DCS will also encourage family members, where possible, to be part of the support activities for PLHIV.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

Activity Narrative: FY 2008 funds will continue to support personnel that are aimed at strengthening the HIV and AIDS Workplace Program. It is envisaged to train 180 members (at least 5 from each Centre of Excellence).

The activity will ensure gender balance by training both males and females as HIV and AIDS Support Group Facilitators to establish and maintain support groups. Coverage will include the 36 Correctional Centers identified as Centers of Excellence by the DCS in all six of its Regions which correspond with the nine provinces of South Africa. The support group facilitators will consist of custodial officials, administrative staff, professionals, etc to become comfortable with basic facts of HIV and AIDS and the support and care of infected and / or affected members.

ACTIVITY 2: Provision of Care

The training of offenders in basic palliative care and support will continue. Trained offenders will provide basic palliative care and support to other HIV-infected offenders. The basic palliative care activities will stem from those provided by the DOH as adapted for prison use. Nutritional referral, personal care, counseling (both pastoral and basic support), recognition of worsening condition such as increased pain or wasting, knowledge of when to refer to clinical providers in the prison, treatment adherence, prevention (including prevention with positives) and other holistic care activities as allowed (bathing, wound care). Screening for TB, STI, and OIs with appropriate referral and follow-up will be emphasized. This will be done in collaboration with the nurses at the prison since treatment for pain can only be done with a physician's orders and under strict supervision. A two-day workshop will be conducted with care specialist to look at the basic care package for offenders.

ACTIVITY 3: Care for Family Members

DCS will introduce a care and support package of family members of PLHIV to assist the individuals who are about to be released. This will assist in the transition from incarceration to civil society while continuing to be supportive of positive living behaviors. The training will include, promotion of family member CT, coping mechanisms, referral and follow up to public sector facilities for the continuation of palliative care services.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

The Department of Correctional Services activities contribute to the PEPFAR objective of 2-7-10 by increasing the number of people in care as well as preventing new infections.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 274.09

Prime Partner: South African Military Health Service

Funding Source: GHCS (State)

Budget Code: HBHC

Activity ID: 2979.22785.09

Activity System ID: 22785

Mechanism: Masibambisane 1

USG Agency: Department of Defense

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$97,090

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The South African National Defence Force (SANDF) is planning a pilot community outreach program for this FY 2009 in two or three provinces. The aim is to recruit, train, mentor and monitor community-based workers to do outreach programs in military and the surrounding communities. Members within the military as well as dependants will be identified to provide care and support to members especially those who are on extended sick leave and those on treatment.

The expansion of palliative care services and facilities will be undertaken to improve the quality of life of Department of Defense members. This will largely be comprised of training for both health care workers as well as dependants/families in palliative care and home-based care.

To improve and better manage adherence, a program on distributing pill boxes and other adherence tools will be established.

SUMMARY:

The palliative care program focuses on training of clinic, hospital, and hospice health workers for SANDF, and HIV-infected and affected individuals and their families. Program activities include training of health care workers to effectively manage HIV-infected individuals, expanding terminal care facilities, establishing a home-based care database, and distributing home-based care kits. OI prophylaxis, TB screening, and identification of individuals who qualify for ART as services are available, will be addressed, following National guidelines. The care and support is multi-professional and includes psychosocial, nutritional, spiritual and people living with HIV and AIDS (PLHIV) support. In addition, the program will address the issue of stigma in the workplace through a targeted program evaluation and contribute to effective and innovative palliative care programs through attendance of PEPFAR palliative care partner meetings and conferences. Overall, the program supports the development and implementation of a comprehensive palliative care plan as part of the South Africa Department of Defense (SA DOD) Plan for the Comprehensive Care, Management and Treatment of HIV and AIDS.

BACKGROUND:

The SA DOD provides care to the military and their families. Training of health care professionals in the provision of holistic palliative care has been performed since the inception of PEPFAR, but the development of a strategy for terminal care to HIV-infected members is fairly new and was established through PEPFAR funding in FY 2005 following a needs assessment. Some of the main components of the terminal care strategy are the development of infrastructure, including the upgrading of hospices, of which one was included in the FY 2005 budget. Further hospices were planned for upgrade in FY 2007 and it is anticipated that unit-based facilities for the care and support of terminal HIV-infected members will be established during FY 2008.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

The primary aim of this training is to equip health care workers with the knowledge, skills and attitudes required to conduct HIV pre and post-test counseling interviews. Training of health care professionals will be conducted through the Health Care Workers Course developed by the SA DOD. This is a four-day course, of which two days are dedicated to developing interviewing skills and practicing pre and post test counseling scenarios. Some time will be spent on issues of sexuality, policy and legislation, and occupational exposure. This will enhance the ability of health care professionals to manage HIV-infected individuals. Target health care workers will include physicians, nurses, social workers, and psychologists.

ACTIVITY 2: Provision of care

Expansion of terminal care facilities through the establishment of regional step down care facilities within military communities is planned in FY 2008. This may include upgrading or sourcing of hospice services according to need towards management of individuals with terminal HIV disease. The package of services also includes basic pain and symptom management and facility-based support for adherence to opportunistic infections medications (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART).

Support to individuals providing home-based care through training aimed at optimizing quality of life and effective management of terminal family and community members living with HIV, sourcing of home-based care packages (inclusive of items like gloves) and IEC material to ensure appropriate care to terminal HIV-infected individuals and to prevent transmission of HIV to caregivers. The establishment of a home-based care provider data base will help to ensure quality support to HIV-infected members and their dependants when home-based care is required.

Patients will be identified for ART and referred, as additional ART services are expanded. Referral to PLHIV support networks and workshops will help to address stigmatization and discrimination and will be a useful strategy to ensure healthy living.

ACTIVITY 3: Addressing stigma

As a result of findings of KAP survey (SA DOD, 2006), which suggest continuing stigmatizing attitudes of individuals surveyed, the SA DOD requested a program evaluation, using qualitative methodology, to address stigma within the SA DOD associated with HIV-testing and HIV-infected in an effort to modify

Activity Narrative: existing prevention of stigma in the workplace programs and the Health Care Workers Course. The Director of Nursing will work with the Military Psychological Institute (MPI) in the development of the methodology for this evaluation.

ACTIVITY 4: Dissemination of innovation

The SA DOD will disseminate innovation through attendance of PEPFAR palliative care partner meetings, publications in military and peer reviewed magazines and journals and oral and poster presentations on effective and innovative programs at conferences and seminars.

Program implementation will be supported by supervision and quality assurance through staff visits to the regions and monitoring and evaluation through the HIV M&E programs to track performance. Technical assistance will be provided to the SA DOD by the U.S. DOD.

The activities will contribute to the PEPFAR 2-7-10 goals by increasing the number of individuals receiving palliative care and support.

Program Budget Code: 08

Activity ID: 12371.22770.09

Planned Funds: \$0

Activity System ID: 22770

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. During the PEPFAR South Africa Interagency Partner Evaluation, the review committee determined that the strength of EngenderHealth's program no longer lies in this program area. In FY 2009 EngenderHealth will focus more attention on sexual prevention, counseling and testing, and male circumcision. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 193.09	Mechanism: N/A
Prime Partner: Elizabeth Glaser Pediatric AIDS Foundation	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 3805.22764.09	Planned Funds: \$1,066,053
Activity System ID: 22764	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

With FY 2009 funding, the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will continue to improve the quality of the adult care and support services, and activities started in FY 2008 will continue. With the expansion of the HIV treatment program, EGPAF assists the Department of Health (DOH) in preparing primary health care (PHC) facilities to become down referral sites as well as assists selected facilities to prepare for DOH accreditation. EGPAF will continue to work closely with community-based organizations (CBOs) and faith-based organizations (FBOs) in the various EGPAF-supported communities to improve wellness defaulter tracing, early identification of HIV patients, as well as community HIV care and support awareness. Where applicable, community health care workers (CHCW) will be trained on various aspects of the care and support approaches. EGPAF will work closely with DOH in building human capacity within various DOH-funded community-based NGOs. Other activities planned for FY 2009 will include training in infection control within communities and in the TB/HIV context. Prevention with positives, which includes effective referrals to family planning, couple counseling for discordant couples and encouragement of disclosure, will be of priority.

The adult care and support program is well established at EGPAF-supported sites. EGPAF provides additional staff where required. Health care workers are trained on comprehensive care and support including clinical staging, management of opportunistic infections and sexually transmitted infections (STIs), TB/HIV and infection control. Onsite mentoring and coaching is provided to ensure the quality of care and compliance with national protocols and guidelines. At service delivery level, EGPAF employs dieticians and nutrition advisors to provide comprehensive nutritional support based on needs identified. Community linkages with community-based care and support services and organizations will be strengthened by providing training and technical assistance where required.

Gender is a critical issue in care and support, with implications for the quality and effectiveness of the care provided and, the disproportionate burden on women and girls to provide care. EGPAF will work with the DOH to ensure equitable access for both women and men to medicines and other care and support services and resources. Linkages with reproductive health programs for female-headed households and caregivers will be strengthened. Programs for older women caregivers that provided support networks and access to productive resources will be targeted. Programs that target men and boys and encourage their participation and responsibility in care-giving and household functions, their support for female caregivers and their recognition of the burden of care as well as programs that reduce gender-based violence and promote human rights will be implemented. Specific needs of women will be addressed.

EGPAF overall adult care and support is provided in line with the National DOH policies and guidelines and National Strategic Plan (NSP) 2007-2011 Priority Area 2, i.e. Treatment, Care and Support, goals 5, 6, 7, and 8 and their objectives are taken into account. All EGPAF support is aimed at assisting the DOH to scale up coverage of the comprehensive care and treatment package, increase retention of patients in care, and decrease HIV and AIDS related morbidity and mortality.

SUMMARY: Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will use FY 2008 PEPFAR funds to continue palliative care support for its existing partners in KwaZulu-Natal. The Foundation is also expanding its program activities to the Free State, North West, and Gauteng provinces. EGPAF aims to improve the quality of life for people living with HIV (PLHIV) by strengthening care and support services at facility as well as community level. The primary emphasis areas are human capacity development and expansion of services through training and task shifting, quality improvement, development of networks, linkages, referral systems and strengthening local organization, development of infrastructure, development of policies and guidelines, and health information systems strengthening. Primary populations to be targeted include PLHIV, pregnant women, OVC, and family members. BACKGROUND: The long-term goal of EGPAF care and support program in South Africa is to achieve optimal quality of life for PLHIV. Ongoing care and support of HIV infected individuals and their families are pivotal to their long-term wellbeing. Sites supported by EGPAF will expand their activities and partnerships with community-based leaders and organizations providing care and support to communities thus ensuring sustainable community-based care and support of HIV infected and their families. Strategies to identify family members who may or may not be infected and are in need of care and support will be explored. Project Help Expand Antiretroviral Treatment (HEART) care and support services will expand with increased geographic coverage during FY 2008. The program will focus on routine screening and treatment of opportunistic infections (OIs) such as tuberculosis (TB), ongoing adherence counseling and support, general HIV prevention, prevention with positives, nutrition and infant feeding options support, psychosocial support, as well as strengthen linkages with home-based care, orphans and vulnerable children (OVC), legal, and social welfare support systems or organizations. In their regular reporting, sites will be required to demonstrate functional networks/ linkages with existing governmental and non-governmental support services, especially (OVC), home-based care services. EGPAF utilizes Project HEART resources to complement those of the Department of Health (DOH) and private partners, such as faith-based organizations (FBOs) and other non-governmental organizations (NGOs) providing health care services. EGPAF will expand/strengthen care and support service delivery through training and task-shifting. A syndromic approach to the most common adult illnesses including sexually transmitted infections (STIs) and most opportunistic infections will be emphasized in training. EGPAF will also provide additional health care providers e.g. nurses, counselors, based on staffing needs. The provision of additional staff ensures that ongoing clinical monitoring and assessments viz. laboratory tests, nutritional assessment, screening for TB and, other OIs, cotrimoxazole prophylaxis, are conducted at all times. PLHIV as well as family members will also be utilized in treatment support to achieve optimal compliance and adherence to ART The existing sites are: 1. McCord Hospital, Durban 2. Aids Healthcare Foundation (AHF), Umlazi, Durban 3. KwaZulu-Natal Department of Health (KZNDOH), Umgungundlovu District (Edendale and Northdale Hospitals and their feeder clinics), 4. KZNDOH, Zululand District, Vryheid, Benedictine Hospital and their feeder clinics, as well as eDumbe Community Health Centre (CHC) and its feeder clinics New HEART partners include the remaining St Francis, Nkonjani, Ceza, Itshelejuba, and

Activity Narrative: Thulasizwe TB Hospitals and their feeder PHC clinics, in the Zululand District in KZN; all five districts in the Free State Province; two sub-districts in North West Province, as well as Eastern Ekurhuleni sub-district in Ekurhuleni District and Lesedi sub-district in the Sedibeng District in Gauteng Province. **ACTIVITIES AND EXPECTED RESULTS:** Project HEART aims to improve the quality, availability, and accessibility of care and support services. Activities undertaken in order to achieve the program objectives include: 1. Conducting site assessments to identify gaps or needs to be addressed to increase the number of patients on palliative care. This could include minor renovations to address space constraints. 2. Improving the quality of counseling and testing by providing ongoing support to lay counselors and health care professionals. 3. Assessing quality of the program and supportive supervision to staff. 4. Providing technical assistance to enhance family-centered approach to clinical screening and opportunistic infection prophylaxis in community settings. 5. Human capacity development through training and task-shifting to improve the quality of palliative care services. This includes a syndromic approach to the most common adult illnesses including sexually transmitted infections (STIs) and most opportunistic infections will be emphasized in training. Clear instructions will be provided according to the DOH guidelines so that health worker knows which patients can be managed at the first-level facility and which require referral to the district hospital or further assessment by a more senior clinician. Preparing health workers to treat the common, less severe opportunistic infections will allow them to stabilize many clinical stage 3 and 4 patients prior to ARV therapy without referral to hospital. All patients are asked/observed for cough (to improve TB case detection) and asked about genital ulcers or sore or (in men) a urethral discharge. These trainings enable HCW to offer appropriate prophylaxis and treatment of opportunistic infections for adults and children. They will also cover Integrated Management of Childhood Illness (IMCI). Trainings will also cover appropriate referral to and linkages with provision of antiretroviral therapy for eligible patients, including both adults and children. 6. Providing M&E support with a focus on strengthening data management systems to enhance routine program monitoring, improve data quality and facilitate data use. 7. Developing/ strengthening linkages and referral systems with community-based government and non-government support services namely, home-based care, OVC, social welfare and support groups, or other primary health care services like PMTCT and TB care. 8. Screening and treatment of opportunistic infections e.g. TB screening, INH and cotrimoxazole prophylaxis. 9. Nutritional support including infant feeding options support. In FY 2008, the HEART program will increase the percentage of HIV-infected patients with palliative care by 30%. EGPAF plans to embark on a growth strategy - building on the experience and success achieved in FY 2007. This growth in patient numbers will be achieved through a combination of expanding the efforts of existing HEART programs, forming alliances with new sub-partners, and supporting the efforts of South African Government Departments of Health at provincial and district level.

With FY08 reprogramming finds, EGPAF will scale up, raise awareness and champion the need for early initiation of HAART, especially for those babies that are coming out of the PMTCT program, 50% of whom should be on HAART by the first birthday; support the implementation of community IMCI; strengthen adult care at the community level; and create pediatric-friendly family clinics and adolescent services.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Consolidation of Columbia activities in the Northern Cape (NC) and Free State (FS) will necessitate strengthening elements of programmatic care with establishment of comprehensive care at the sites. The International Centre for AIDS Care and Treatment Programs (ICAP) plans to support the following aspects of the adult care package, with an emphasis on ensuring quality, integration and comprehensive care:

Cotrimoxazole - This will be routinely given as a part of adult care for all patients with WHO stage 2-4, and/or for those with CD4 count below 200.

Palliative care - ICAP will expand its field caregiver (FCG) program to all the sites in the Eastern Cape (EC), to enhance home-based care (HBC) and support systems. All FCG will be trained in home-based care (HBC) methods and provided with standard HBC kits. Through regional referrals directory projects, collaborations will be sought with community-based organizations (CBOs) and institutions to provide palliative care, including pain management.

Early referral and retention in care and support - ICAP will initiate and emphasize: treatment buddy selection and involvement; sexual partner tracing; engaging families in care; coordinated visits and assessment of family members; couple counseling. ICAP will expand FCG to all supported primary health clinic (PHC) and community health centre (CHC) sites. Support groups that have been formed at all the facilities, will be strengthened to gain greater independence, sustainability and empowerment leading to a greater network of support for patients, including those ineligible for antiretroviral therapy (ART). ICAP has begun an initiative, aimed at group application for non-profit organization (NPO) status thus opening up more funding opportunities, income generation activities, and participatory community development tools.

Psychosocial support - Psychosocial support for people living with HIV (PLHIV) are in place at all facilities supported and will continue to be enhanced through additional Peer Educators (PE) and FCG, greater collaboration with the Department of Health (DOH) lay counselors and outreach workers, and monthly refresher trainings. Treatment literacy and adherence counseling will be enhanced through established patient competencies and adaptation of supportive tools. For better outreach and tracing of defaulters, a project will be carried out in Nelson Mandela Metro (NMM) to improve retention and tracing mechanisms which includes computerized text messages to clients for reminders and notices of missed appointments (with consent). Food and nutritional support will be addressed through continued multivitamin and other supplementation, provided by DOH through wellness program collaboration with dieticians.

Mental health services - Counseling provided by PE, FCG and DOH lay counselors will be supported and strengthened through newly hired regional psychologists, who will provide mentorship among sites on a rotational basis, especially for referred difficult cases, and referrals for any special treatment needed.

Prevention of cervical cancer - The above initiative will be evaluated, strengthened and rolled out to additional sites in 2009. Cervical cancer screening began in Greenville primary health care clinics: ICAP activities will include:

- a) In-service sensitization of nurses on the need for cervical cancer screening among HIV-infected women
- b) Building collaboration with DOH/stakeholders for routine single visit approach
- c) Writing protocols for routine programming
- d) Training of providers/in-service -start-up of service delivery
- e) Developing M and E systems with specific attention to feasibility questions to be answered
- f) Community mobilization and education
- g) Purchase of supplies and equipment

Prevention with positives - All elements of prevention with positives are in place at facilities supported, primarily through PE and FCG. Tools will be developed in order to standardize approaches used, focusing on: routine counseling and testing of sexual partners, children; couples counseling for discordant couples; condom promotion and distribution; assistance with disclosure; provider-initiated behavioral risk reduction interventions; assessment, diagnosis and management of sexually transmitted infections (STIs); adherence to prophylaxis and treatment; referrals to family planning; alcohol assessment; counseling and referrals for needed professional services.

TB/HIV services - The NMM outreach project will incorporate TB screening of HIV clients and family members in the home, with referrals for testing when needed. PE will continue to give counseling as a part of routine counseling and testing in supported TB hospitals, and home-based follow up will be enhanced for those with HIV who are discharged, to ensure access of ART programs at local clinics. In addition, a TB infection control project at all the sites will focus on preventing transmission among patients and staff in clinical facilities and in the home.

Quality of care and support services - ICAP will implement standards of care (SOC) and associated tools for measuring quality of care, in the clinic and in the home. These SOC cover activities within all major categories of adult and pediatric care and support, psychosocial and adherence support, and prevention.

Monitoring and reporting - PEPFAR and DOH indicators related to care will be collected, reported, shared and utilized for continuous quality improvements by ICAP as well as site staff. Monitoring of indicators related to psychosocial support will be strengthened, with development of standardized tools, procedures documentation and reporting forms.

Human capacity development and continuous provider training - FCG in each region will be trained in HBC and receive standard kits. More DOH lay counselors and community health workers in each region will be trained in ART and adherence. The care givers program will be expanded through interventions by the program psychologists, group debriefing and individual counseling for lay staff and DOH professional staff.

Activity Narrative: The use of local CBOs to mentor care givers in HBC will be initiated with the NMM outreach services integration project.

SUMMARY:

Columbia University carries out activities to support implementation and expansion of comprehensive HIV treatment and care. The major emphasis area for this program will be human resources, with minor emphasis on infrastructure development, technical assistance and training, community mobilization, quality assurance and supportive supervision and strategic information. The target population will include infants, children and youth (non-OVC), men and women (including pregnant women and family planning clients), people living with HIV (PLHIV) and healthcare workers in the public and private sectors.

BACKGROUND:

Columbia, with PEPFAR funds, began supporting comprehensive HIV care and treatment activities in South Africa, in 2004. HIV palliative care has included training of healthcare workers in providing standard care for opportunistic infections (OI) management, use of cotrimoxazole prophylaxis for common OIs, and the provision of information on when and where to refer for end-of-life care. In FY 2006, in response to provincial HIV care and treatment priorities, Columbia began strengthening the down-referral of services from hospitals to primary health clinics. This resulted in a total of 42 health facilities receiving technical and financial support from Columbia, including public hospitals, community health centers, primary health care (PHC) and an NGO-run care support center. In FY 2007 additional health facilities in KwaZulu-Natal (East Griqualand and Usher Memorial Hospital and the Kokstad Community Clinic) received technical and financial assistance for HIV care and treatment services.

In FY 2008 Columbia will expand its reach by providing basic care and support to PLHIV in Free State. The health facilities to be supported will be determined after negotiations with the Free State DOH.

ACTIVITIES AND EXPECTED RESULTS:

All activities are in line with South African Government (SAG) policies, and activities will be undertaken to create sustainable comprehensive HIV care and treatment programs and primarily include four activities:

ACTIVITY 1: Training and Onsite Clinical Mentoring

Currently healthcare providers rendering services at ART sites participate in ongoing didactic training events and are continuously supported with regular clinical and supportive supervision. In FY 2007 Columbia initiated a Nurse clinical training with emphasis on the development of a comprehensive HIV nurse preceptor (NP) training and support program. The outcome of this training was to have NPs; situated at the Columbia-supported ART sites, focusing on building the capacity and skills of facility-based nurses to deliver high quality HIV patient care and treatment including elements of the preventive care package for adults and children including OI screening and prophylaxis (including cotrimoxazole, TB screening/management), counseling and testing for clients and family members, safe water and personal hygiene strategies to reduce diarrheal disease. Initially, trained NPs would be responsible for providing daily clinical guidance and constructive feedback, using custom designed assessment and training tools, to facility-based site nurses providing basic HIV patient care and treatment. In keeping with the Department of Health HIV and AIDS and STI strategic Plan 2007-2011 (NSP) objective of increasing the level of nurse participation in management of HIV individuals including those on ART - with nurses initiating ART in 20% and 50% of eligible HIV-infected adults in 2008 and 2009, respectively. The NP program has included: (1) one-week didactic training that includes clinical material currently in development by the WHO as part of their second-level, competency-based 'Integrated Management of Adolescent and Adult Illness' (IMAI) training program; (2) onsite mentoring of patient triaging, provision of complex care and treatment, modeling on how to conduct basic and complex patient case conferences, evaluation of nurses' basic HIV care and treatment skills and developing instructional plans to address the performance gaps and assisting NPs in practicing teaching; and (3) a series of at four continuing education sessions lasting two to three days.

By FY 2008 the first nurse mentorship initiative training would have been completed and Columbia will review the recommendations of this initiative to make a determination as to whether similar training activities need to be rolled out in the Eastern Cape, KwaZulu-Natal and/or in Free State.

ACTIVITY 2: Community-based Support

Columbia is involved in the implementation of Peer Educator (PE) programs to enhance retention into care and to maximize adherence to treatment. More than 30 Columbia-supported PEs are currently working at St. Patrick's, Holy Cross, Frere and Cecilia Makiwane, Dora Nginza and Livingstone Hospitals. PEs work under supervision of the ART site coordinator or his/her designee to provide: elements of the preventive care package, education on HIV and AIDS care, living positively; psychosocial counseling and emotional support; adherence to care and treatment support; promoting referral linkages to clinic/hospital and other networks; where possible conduct home visits; and attend PE-specific and general PLHIV support groups. Approaches to PLHIV support were initially centralized with the development of care support centers; the current implementation strategy through FY 2007 will be supporting the decentralization of PLHIV services.

In Free State, Columbia proposes to implement Peer educator programs, provide HIV clinical training and mentorship for health professional staff, support the design and implementation of HIV information system and support the integration of PMTCT and TB programs into HIV chronic care

ACTIVITY 3: Strengthening Program Integration Activities

District hospitals and public healthcare facilities have co-located TB, PMTCT and STI services, and integration activities to strengthen these services with holistic palliative care will be carried out in

Activity Narrative: collaboration with the following programs at district and provincial levels:

a. PMTCT: Support early infant diagnosis through the use of dry blood spots (DBS) for PCR testing. This activity will include training PMTCT nurses in specimen collection, information gathering to assess the uptake of DBS and referral linkages of HIV-infected children to chronic care, ensure that HIV-exposed children receive cotrimoxazole. DBS training activities will be carried out in collaboration with the Local Service Area authority and the National Health and Laboratory Services (NHLS).

b. TB: Support active TB case finding and referral for TB treatment for the TB/HIV co-infected. Columbia will support the implementation of TB screening and diagnosis algorithm for HIV-infected patients to include the adaptation of a simple questionnaire for use as a screening tool for active TB at the designated HIV clinics and incorporating the questionnaire into routine clinical care.

ACTIVITY 4: HIV Care and Treatment Information System

Columbia will continue to support the implementation of a provincial information system that captures information on HIV palliative care and ART. Activities in FY 2008 will include:

a. Implementation of facility paper-based non-ART registers that captures non-ART indicators. These facility registers will be introduced mainly at the primary and community health clinics that are designated by the provinces as down-referral sites for HIV care and ART services.

b. In collaboration with the Department of Health and other partners in the Eastern Cape, support the development and implementation of standardized individualized patient records for use at health facilities.

c. Strengthen the paper-based data collection systems at HIV care and treatment sites in the Eastern Cape in preparation for computerization of a minimum set of key data elements.

d. Work with ART managers and facility site staff to support the utilization of information to improve service delivery and patient care.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

With FY 2008 reprogramming funds, Columbia will facilitate greater adherence and reduce loss to follow-up through starting a pilot to using text messaging with cell phones.

Planned Funds: \$873,814

Activity System ID: 22615

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009, BroadReach Health Care (BRHC) will expand on and strengthen existing capacity building activities all conducted at the request of and in partnership with the South African Government (SAG). The FY 2008 narrative primarily describes activities under BRHC's general practitioner (GP) program with private providers which offers services to HIV-infected persons through three different treatment models. This program was designed to ease the burden on the public sector to provide treatment services by strategically leveraging capacity in the private sector in underserved areas. The GP program will be maintained in FY 2009, but the majority of funding requested under this program area will be for the intensification of BRHC's program to build capacity in public sector (SAG) health facilities. All proposed activities will be aligned with the National Strategic Plan (NSP), national antiretroviral (ARV) guidelines and other national guidelines governing care and treatment of HIV-infected and affected people. BRHC's overall goal under this program area is to promote creative, sustainable and comprehensive treatment programs that improve the quality of life of people living with HIV (PLHIV) and increase resilience in the public health care system.

In late 2006, BRHC began capacity building work with SAG sites and was initially assigned to four hospital systems in KwaZulu-Natal (KZN). As of June 2008, BRHC was reporting data from a total of 110 sites in five provinces. Almost 20,000 patients are receiving treatment, care and support services at BRHC-supported sites as of 30 June 2008 which exceeds the September 2008 target by nearly 250%. At the request of the district DOH, BRHC has committed to continued expansion and plans to be supporting 19 complete hospital systems by September 2009. With FY 2009 funds, BRHC expects to be active at 250 palliative care sites, including 25 SAG hospital systems.

Activity 1: Clinical Services and Operations

BRHC will place particular emphasis this year on expanding wellness programs for HIV-infected people not yet eligible for ART, and their family members. The goal will be to ensure early referral and enrollment into comprehensive care programs to maintain CD4 >200, and to reduce loss to initiation. Wellness programs will provide a basic care package, consisting at a minimum of: repeat CD4 testing per national guidelines, cotrim prophylaxis, screening and treatment for opportunistic infections (OIs), ongoing counseling and psychosocial support, nutritional assessment and supplementation, pain assessment, and prevention messages as part of routine care. Wellness programs will also provide necessary referrals to other health services such as reproductive health, family planning, immunization, and routine-offer HIV testing. BRHC support to facilities will focus heavily on integration of TB and HIV services.

Activity 2: Human Capacity Development

BRHC provides a combination of in-house and outsourced training courses aimed at ensuring quality delivery of treatment services. Alignment with SAG training plans and service providers ensures training is provided with the appropriate intensity to all cadres of staff. All BRHC-implemented or sponsored training courses use DOH-approved curricula. Training will emphasize provision of cotrim prophylaxis, pain assessment/mgmt and nutritional assessment and counseling. BRHC will engage additional qualified clinical mentors and preceptors to ensure supportive supervision within the work setting. BRHC will continue to provide salary support to SAG for clinical and lay staff on a temporary basis to fill critical vacancies.

Activity 3: Referrals and Linkages across the Health System and Community

BRHC assists each site it supports to strengthen or develop active defaulter tracing programs for HIV-infected patients by providing technical assistance, personnel and transportation solutions as required. Defaulter tracing models are built on best practices and adapted to the individual needs of a particular health system. In most areas where BRHC works, BRHC's site includes an entire health system, which allows for the creation and testing of scaleable approaches to patient tracing across large, rural geographical areas.

BRHC takes a family-centered approach to providing comprehensive care and treatment services and will intensify efforts in this area to build HIV and AIDS-competent communities. In FY 2009, BRHC will expand partnerships with non-governmental organizations (NGOs) and community-based organizations (CBOs) to ensure uninterrupted service delivery and community-level support for PLHIV and their families. Training, institutional strengthening, monitoring and evaluation (M&E) and other technical assistance and HR support will be provided to NGOs/CBOs to enable them to meet the demand for community-based services for care and support, especially those organizations specializing in HBC. Community-based services will extend and complement facility-based services by: addressing issues of water, sanitation and hygiene; providing linkages to wrap around programs (particularly food and nutrition programs), provide consistent prevention messages; spiritual support; and assistance in accessing social grants. BRHC will play a critical role in providing coordination between SAG facilities and communities, creating sustainable coordination mechanisms and mutually beneficial partnerships. The goal is to furthermore ensure coordination and referral mechanisms are in place such that patients are able to navigate the health and social welfare systems successfully, and that facilities are able to track and locate patients at any time throughout this process. Linkages with family planning, maternal and child health, gender-based violence, Directly Observed Treatment, Short-course (DOTS) and nutrition programs will be strengthened.

SUMMARY:

BroadReach Health Care (BRHC) activities include doctor consultations, lab testing, adherence support, patient counseling, remote decision support, quality assurance monitoring, training for both patients and health professionals, support groups and data management. Basic Care and Support activities are in support of individuals participating in an antiretroviral therapy (ART) program, largely representing the population of those HIV-infected, but not yet eligible for ART. The major emphasis is on human resources with minor emphasis on quality assurance and training. These emphasis areas are realized through clinical and non-clinical services, human capacity development, quality assurance, referrals and linkages and South

Activity Narrative: African Government (SAG) support including meeting equipment, infrastructure and human resource needs. Primary target populations include people living with HIV and AIDS (PLHIV) and their families/households, program managers, public and private doctors, nurses, laboratory workers, pharmacists, other health care workers, the business community/private sector, CBOs, FBOs, and NGOs.

BACKGROUND:

PEPFAR funds support BRHC initiatives which provide HIV and AIDS clinical management, care and support services to HIV-infected, uninsured individuals in public sector government facilities and areas where the SAG ART roll-out has not yet reached or where there is high demand. The BRHC PEPFAR program began in May 2005 and now operates in 15 communities across five provinces. Today, BRHC is supporting approximately 3,500 individuals directly with care and treatment and 15,000 indirectly. The BRHC mission is to tap into private sector health professionals to provide comprehensive care and treatment, fostering capacity building initiatives and service delivery within the public health system, and partnering with and supporting community-based programs with sustainable impact on long-term patient care. BRHC leverages the community-based PLHIV support programs to identify and assist with treatment literacy, adherence support and ongoing community mobilization, prevention education activities, and positive living initiatives. In addition, BRHC works to build capacity in public health facilities, focusing on human capacity development including clinical training, clinical mentorships, patient training and operational assistance training. BRHC is expanding its provision of additional staff and infrastructure support to SAG facilities. Finally, BRHC is expanding its involvement in the design of scaleable down referral models in partnership with FBOs, CBOs, and as a partner in innovative public-private partnerships (PPPs).

ACTIVITIES AND EXPECTED RESULTS:

The primary goal of this program area is to ensure that new patients are started on ART when clinically qualified and enrolled patients continue to receive outstanding care and support.

ACTIVITY 1: Clinical Services

BRHC patients will be treated in accordance with SAG ARV National Guidelines and provided regular doctor visits, laboratory tests, HIV and AIDS education, counseling, TB screening, and cotrimoxazole prophylaxis. Using a family-centered approach, BRHC will recruit eligible family members of HIV-infected patients - including greater numbers of men and children - in order to improve the health of families/households and facilitate family doctor visits and drug pick ups. Care includes the preventive package, symptom and pain management, a care support program (during the time from when a patient finds out his or her HIV-infected status until eligible for ART), care during and after the initiation and possibly failure of ART. Patient nutrition and wellness needs will be met by the provision of multivitamin supplements, and doctor, patient and facilitator training in nutrition.

ACTIVITY 2: Human Capacity Development

1) BRHC will continue to provide training to its network of providers including doctors, nurses, pharmacists and other healthcare professionals through a variety of initiatives including remote decision support, telemedicine, web-based training, didactic training, and clinical mentoring from experienced HIV and AIDS clinicians. Comprehensive HIV and AIDS training for health professionals includes ART Management, TB, adherence support, management of complications and side-effects, prevention and pediatric HIV management.

2) BRHC will continue to focus on community training on topics including HIV and AIDS, ART, adherence support, living positively and prevention with positives, universal precautions and accessing psychosocial support in communities. BRHC will continue to train support group facilitators on topics including HIV and AIDS, ART, adherence, disclosure, and linking patients with psychosocial services in the community.

ACTIVITY 3: Support to SAG

BRHC will support capacity development for care and support services at partner SAG facilities. According to SAG articulated needs, these services will include commodity procurement, healthcare financing, human resource recruitment and salary support (for doctors, nurses, pharmacy staff etc.), BRHC doctors providing temporary services at SAG facilities, training of SAG staff in HIV care and treatment and/or ART program management, and physical infrastructure building/refurbishment and equipment procurement. BRHC will work with SAG staff to improve operational efficiency in SAG facilities through needs assessments including identification of key bottlenecks and then generate and implement solutions. Additionally, BRHC will support SAG National Department of Health (NDOH) efforts, by assisting with development of down referral models. Finally, BRHC will build on its existing public-private (PPP) model (SAG - BRHC - Daimler Chrysler) in East London and develop new PPPs to further involve small to medium enterprises in supporting employees and dependents in the communities where they operate, alleviating some of the burden on government services.

ACTIVITY 4: Referrals and Linkages

Development of linkages and referral systems will be provided through strengthened referral networks between the public and private sectors (including referring stable patients back to the SAG ARV program), assistance to local clinics to facilitate SAG down referral process. Finally, BRHC will continue to expand its community-based linkages with CBOs in order to refer patients in need of non-USG funded food parcels and other wraparound services intended to support patients.

ACTIVITY 5: Quality Assurance/Quality Improvement (QA/QI):

Recognizing the critical role of monitoring and evaluation in ensuring a successful program, BRHC QA/QI activities include regular internal data and systems audits, collection of patient level surveillance data,

Activity Narrative: exception reports, doctor-specific feedback report, and doctor decision-making support. The BRHC adherence program monitors and evaluates patient adherence through monitoring of drug pick up information, clinical reports, self-reported adherence, and pill counts.

All BRHC activities articulated in the FY 2007 COP will be scaled up significantly in FY 2008 through its partnerships with 15 SAG hospital systems (which include hospitals and affiliated CHCs and PHCs).

With FY 2008 funding, BRHC's palliative care activities will be expanded and enhanced as follows:

- BRHC will continue to support QA/QI at each of its public sector partner hospitals through QA assessments, systems re-engineering, and the development of reporting systems that provide program management feedback that is used to improve program performance and more closely monitor patient care.

- Strengthen down referral activities between public sector hospital partners and their affiliated clinics (PHCs) by re-engineering referral processes, improved data management and patient tracking, and training.

- Training for health professionals at all public sector sites (hospitals and PHCs)

- HIV and AIDS Literacy training for patients as part of community mobilization

- Expanded care and treatment activities through the BRHC PPP to additional Daimler Chrysler supply chain companies/employees and their families and communities.

- Staff augmentation: BRHC will provide additional salary support to fill key positions within SAG partner hospital sites. BRHC will also work with the site to motivate for the creation of permanent posts where needed and ensure that BRHC/PEPFAR supported staff are incorporated into subsequent site budgets to ensure a sustainable staffing solution

BRHC Basic Healthcare and Support activities directly contribute to the 2-7-10 objectives of supporting 10 million people with basic healthcare and support by expanding these services in South Africa.

Prime Partner: Aurum Health Research

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Care: Adult Care and Support

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 3323.22606.09

Planned Funds: \$1,019,450

Activity System ID: 22606

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Aurum's program will mainstream gender in FY 2009 and focus on a family-centered approach. Aurum will strengthen links to communities in four provinces (Gauteng, North West, Eastern Cape and Limpopo) through devolution of care to lower level facilities. The care program will be closely linked to TB-HIV initiatives and many of the activities in that area will be integrated here.

There is a need to continue with the appointed trained human resources and to appoint additional staff to meet the demands of the growing program. The staff will cover the program comprehensively and be multi-skilled to provide for continuum of care and the family approach. The staff will receive ongoing training as part of their development and Aurum will also appoint new staff to be trained.

The Department of Health and Correctional Services staff will also be trained in the entire program to ensure the sustainability of program when the current PEPFAR-funded staff is no longer available.

The program will continue to have mentorship from both the PEPFAR-appointed staff and the South African Government (SAG) staff.

The lay counselors will also be offered continuous training and update on new developments. Their stipend will also be augmented to provide for motivation and continued volunteering. They will be trained in all the counseling programs including the adherence training in both HIV and TB.

Mentoring and training of health care staff on prevention with positives, treatment literacy approaches and engagement of couples and partners will be undertaken.

Under the small and medium enterprises (SME) project, training is provided to lay counselors, peer educators, managers and representatives of taxi drivers and traders to develop and implement a workplace HIV policy. Technical assistance on SME management and leadership development will continue to be provided to targeted companies to decrease stigma and discrimination of HIV-infected employees in the workplace. In addition training and capacity building of the City of Johannesburg staff, the Metropolitan Trading Company, and small traders within taxi ranks is undertaken.

SUMMARY:

Aurum's palliative care program provides care to patients infected with HIV following HIV counseling and testing, and screening for treatment eligibility in accordance with South African Government (SAG) guidelines. The facilities where palliative care is provided include general practitioners' clinics, non-governmental clinics and public sector sites. These sites are located mainly in the Gauteng, North West Mpumalanga and KwaZulu-Natal. Patients are also assessed for opportunistic infections and eligibility for ART and provided with preventive therapy i.e. INH and cotrimoxazole. Emphasis areas include human resources, commodity procurement, logistics, quality assurance and training. The primary target populations are people living with HIV (PLHIV), HIV-infected children, prisoners, homeless people and street youth.

BACKGROUND:

This is an ongoing program funded by PEPFAR since October 2004. The PEPFAR-funded project aims to rapidly expand access to HIV care and treatment to South Africans living with HIV, and especially in areas (such as mining areas) where Aurum is familiar and other partners are less likely to work. Aurum has established a number of general practitioner (GP) clinics which are capable of providing care to large numbers of HIV-infected individuals and achieving high quality results. In order to ensure sustainability of this model, Aurum has partnered with Faranani Solutions, a network of general practitioners from a previously disadvantaged population. Advantages of this model, now termed the Auranani model, are that Aurum has been able to secure lower consultation rates for GPs and GPs are encouraged to provide assistance at their local hospital clinics. The presence of trained individuals in these public health facilities will enable the transfer of knowledge to nurses and doctors in the public sector. It is hoped that this model can be used to rapidly scale up delivery of HIV services in South Africa, in partnership with government efforts. Sites are located throughout the country, but are concentrated in Gauteng, North West province and KwaZulu-Natal. There is only one site each in the Northern Cape and the Western Cape. A further extension of Aurum's program is to include care and treatment services in HIV prevention trial sites of the Aurum Institute in the North West and KwaZulu-Natal. Thus patients are being diagnosed in early stages of their disease and are being counseled and prepared for antiretroviral therapy (ART) and palliative care. In both these provinces there is a close collaboration with SAG, and patients are referred to public sector facilities for ART initiation. These clinics are will be used in the future as down referral facilities In FY 2006 Aurum fostered new relationships with non-governmental organizations (NGOs) and public sector sites. A number of primary healthcare clinics attached to NGO and faith-based organizations (FBOs) have been established. Metro Evangelical Services, a sub-partner, is a FBO providing training, housing and health services for the homeless and street youth of Hillbrow, Johannesburg. An HIV center has been established to provide CT and HIV services to this population. In Gauteng, a contract has been concluded with Chris Hani-Baragwanath hospital for support and a contract for extension of these services to other parts of Gauteng is being negotiated with the provincial health departments. In the North West, Aurum supports the provision of HIV Care at Tshepong Hospital through the provision of medical and nursing staff. In addition, through the establishment of a walk-in clinic at Jade Square in Klerksdorp Aurum provides care for HIV patients that are not able to currently access care through the public hospital. Aurum has met with the KwaZulu-Natal Department of Health about sites attached to the Medical Research Council. Furthermore, in Mpumalanga, one of Aurum's sub-partners, Reaction Consulting, has worked with the provincial health department to strengthen support for Ermelo Hospital, and in the Northern Cape, Aurum's public-private partnership with De Beers Consolidated Mines in the Danielskuil area has been discussed. In the Limpopo area, discussions are underway with Anglo Platinum and the Limpopo Department of Health to provide support to a down-referral clinic based in the Capricorn district close to one of the Anglo Platinum mines. Aurum intends to continue to support the Department of Correctional Services in Johannesburg but also to expand activities to other Gauteng-based correctional facilities, namely Pretoria. A number of Aurum's sites, Caritas Care, MES and Duff Scott collaborate with the local health departments that provide funding for

Activity Narrative: inpatient care to palliative care patients. In FY 2008, the SME project will commence the provision of care and support services to HIV positive SME employees including market traders and taxi drivers and their partners and dependents in targeted sites in Gauteng, Mpumalanga and Limpopo provinces.

ACTIVITIES AND EXPECTED RESULTS:

PEPFAR funding will be used to fund all central staff responsible for monitoring and evaluation of the program. FY 2008 funds will also be used to provide training and human resources at the sites. Focus areas of training include how to run support groups, disclosure and stigma, special counseling situations such as couples and children, and the prevention of mother-to-child transmission. Care will be provided through occupational health care clinics, the mobile vehicles, the GP network and at the fixed service points such as Bree Street site.

ACTIVITY 1: Monitoring for Opportunistic Infections

At each of the patient visits, a full physical examination including pain and symptom management of the patient is conducted to exclude the existence of opportunistic infections (OI). If a client presents with an OI, further investigations and management of the infection including the provision of cotrimoxazole may occur at the site, or the patient may be referred to another healthcare service. Adherence to OI medications (including cotrimoxazole prophylaxis and TB treatment) is also part of the package of services. Effort will be made to ensure equitable access to care services for both males and females.

ACTIVITY 2: Provision of Prophylactic Medication

Patients with CD4 below 200 will receive elements of the preventive care package including cotrimoxazole preventative therapy. It is expected that 30% of all patients receiving palliative care will be receiving cotrimoxazole preventative therapy.

ACTIVITY 3: Psychosocial and Spiritual Support As part of a holistic approach to palliative care, patients receive counseling by trained staff member at each clinic visit. A psychologist, a dietician and a social worker based within the central office is responsible for education, training and support of site staff. Some of the sites have established psychological and spiritual support groups. The Basic Package of Care including acceptance of status, disclosure, prevention with positives, opportunistic infections, adherence counseling, treatment literacy and nutrition counseling will be included at all Aurum funded sites (private sector).

ACTIVITY 4: Work with prisons

Aurum provides technical assistance to the Department of Corrections in Gauteng province in three areas: 1) assist in the development of the ART and care delivery system, 2) training health care workers on ART and holistic palliative care, and; 3) development of a data management system to track prisoners who are receiving ART and care support. Patients will be encouraged to bring family members in the facilities. Training on couple counseling and counseling for children is given to the health providers. Family members will be encouraged to test for HIV and will be provided education and counseling on HIV and TB. Those family members that test HIV positive will be enrolled into Aurum's care program and will be provided with all the services as already described above. In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services. Aurum's palliative care services contribute to the PEPFAR goals of 10 million people in care by increasing the quality of care.

ACTIVITY 5: Work with SME Employees

Aurum has established a project that strengthens the provision of services to SME employees, their partners and dependents initially within the Johannesburg CBD. The project will be expanded to an additional site in Gauteng as well as to Witbank and Polokwane. Aurum has developed partnerships with the Johannesburg City Council and with individual companies that have existing occupational health care clinics. Utilizing these partnerships and the mobile vehicles and GP network, HIV positive clients will be screened for the presence of opportunistic infections, provided prophylactic therapy and provided education on nutrition.

Program Budget Code: 08

Planned Funds: \$0

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Based on consultation and recommendations of the South Africa PEPFAR In-Country Team, Genesis Trust has modified its adult care and support program. The in-patient palliative care program will continue essentially unchanged from FY 2008. There will, however, be significant changes to the home-based care (HBC) program being implemented by Project Positive Ray (PPR). PPR will employ 13 additional HBC workers, bringing the total number to 26 in the eight communities served. This was done to add capacity and improve quality of the program in the current areas of operation. All of these HBC workers will undergo the standard 59-day training course during the course of the year (currently they have received the 10-day training only). Additionally PPR has employed two professional nurses, who will oversee the HBC program and add a professional level of services not previously available in the program. They will accomplish pain and nutritional assessments on patients, provide referrals to local clinics and hospitals and liaise with the local clinics and hospitals facilitating the integration of care. Prevention with Positives programs and formation of support groups will be initiated. Treatment compliance and adherence to prevent relapses and drug resistance. TB screening of clients with HIV and encourage HIV testing to TB infected clients. This will greatly assist in the provision of a basic package of Palliative Care to all HBC patients. Families of people living with HIV will be encouraged to know their status and the encouraged to disclose to prevent discrimination.

SUMMARY:

Genesis Trust (GT) is a new South Africa PEPFAR partner under the New Partners Initiative. Palliative care is a major aspect of the GT program incorporating home-based care in 9 communities, in a 40-bed, 24-hour inpatient unit and HIV counseling and testing services. The project will emphasize increasing gender equity in the programs. This will be done through couple counseling and testing; adopting a family-centered approach to care and treatment services; health worker training to recognize signs of gender-based violence and providing appropriate counseling and referral services to the prevention program to address societal and community norms to reduce stigma. Another area of emphasis is human capacity development, which will be done through in-service training and a retention strategy. The primary target populations are individuals who are referred to the inpatient unit by local government hospitals (patients with HIV and AIDS and/or TB), their families, and community members in need of home-based care and /or counseling and testing.

BACKGROUND:

The Ugu AIDS Alliance (UAA) project's palliative care program consists of two components, an inpatient hospice/step-down care unit and a home-based care component. Palliative care services are offered to patients and family members in a holistic and family-centered approach. It optimizes the quality of life of adults living with HIV through the active anticipation, prevention, and treatment of pain, symptoms and suffering from the onset of HIV diagnosis through death. GT palliative care involves offering patients clinical/ physical, psychological, spiritual, social support care and integrated prevention services.

GT has had an agreement with KwaZulu-Natal Department of Health (DOH) and is paid by the DOH on a per patient-bed-day status (the fee covers a portion of the cost of care). Patients are admitted to Genesis Trust Care Centre GTCC only on referral from one of the local hospitals (Port Shepstone and Murchison Hospitals). Both hospitals strongly support and depend on the services of GTCC, which help to decongest their overcrowded wards. In-patients with HIV who require ongoing step-down or palliative care can be transferred to GTCC, opening hospital beds for patients with more acute conditions.

ACTIVITIES AND EXPECTED RESULTS:

Clinical care services offered include: screening and management of pain and symptoms, prevention and treatment of TB/HIV, and prevention and treatment of other opportunistic infections (OIs) including the provision of cotrimoxazole and nutritional assessment and counseling. Nutritional rehabilitation for malnourished PLHIV may be provided if patients fall within the parameters of OGAC guidance and the South African Government recommended interventions.

GT psychological care services include: interventions that address the non-physical suffering of individuals and family members, identification and treatment of HIV-related psychiatric illnesses such as depression and related anxieties, and bereavement services.

The spiritual care services include: offering culturally sensitive interventions that support individuals and families through life review, counseling on hopes, fear, meaning of life, guilt, forgiveness, life completion tasks and life planning for those who feel renewed life following improved quality of life after starting ART.

While in the Genesis Trust Care Centre patients and their families receive intensive counseling about HIV as well as their treatment. The families are encouraged and enabled to provide supportive care of the patients. Family members are also educated on the importance of HIV testing and referred to government testing sites. Appropriate patients are counseled on CD4 testing and ARV treatment. CD4 counts that are drawn at the GTCC are sent to the hospitals for testing. Patients are then counseled on their results and referred for follow up monitoring or initiation of ARV treatment.

Supportive care services offered include: assisting individuals and family members in linking to care services such as adherence to treatment, accessing government grants, linking to income generating programs.

Prevention with positives interventions for HIV-infected individuals are an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives

Activity Narrative: interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals.

The home-based palliative care component is done through locally-based community members who are trained as volunteers. These volunteers are recruited and employed by Positive Ray (PPR). The volunteers are trained to provide a professional, but compassionate service to those who are sick with AIDS with the goal of restoring dignity and providing a caring service. Training topics covered include capacity building on the services outlined above and specifically cover: palliative care overview; fire prevention; basic health & safety; oral hygiene; HIV infection; pain management; dying patient care and bereavement; basic nursing skills; administrative skills; computer skills; HIV medication; diet/nutrition; conflict management; self-development skills; and, physiotherapy workshops for professionally accredited physiotherapists. The duration of the training will vary according to training needs and will be offered throughout the course of the year as and when required. Several of the courses are accredited by the South African Government but some of them are offered by local doctors and other medical personnel from the government hospitals. Training quality assurance is done through questionnaires and quality of output of trained staff.

All HIV-infected individuals will receive palliative care with at least one clinical intervention and at least one non-clinical intervention. Family members of HIV-infected individuals will receive palliative care services two of the five categories of palliative care.

These activities contribute to the PEPFAR care goal for reaching 10 million people affected by HIV.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 10472.09

Mechanism: NPI

Prime Partner: Woord en Daad

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Care: Adult Care and Support

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 25069.09

Planned Funds: \$0

Activity System ID: 25069

Activity Narrative: SUMMARY:

Woord en Daad, a Dutch faith-based organization, will work through its long-standing South African partner organization, Mfesane, in collaboration with the Western Cape Department of Health, to assist and provide physical, psychological, integrated prevention services, social care and spiritual care to people living with HIV (PLHIV). The combination of services will not only address the care needs of PLHIV and their families but will also build protective measures to address vulnerability and empower family members to potentially protect themselves against HIV infection.

BACKGROUND:

Woord en Daad will work with Mfesane to provide quality prevention, counseling and testing, and care services to members of communities in two distinct municipalities: Saldanha Bay in the Western Cape, and Nelson Mandela Bay in the Eastern Cape. Mfesane will target informal settlements and other communities where people are at high risk of infection, socially dislocated and underserved by government services. The two programs will stand alone, but learn from each other, building upon Mfesane's engagement with communities and government, local structures including churches and schools and experience in responding to HIV and AIDS.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Recruitment of home-based care (HBC) workers

In total 45 HBC workers are active at the start of this project. Most of the HBC workers are females, but Mfesane will work to engage males. 45 carers will be recruited to provide home-based care services.

ACTIVITY 2: Human Capacity Development

Ongoing training will be needed due to staff turnover. St. Johns College provides accredited training and also conducts follow-up in the following three years.

Care for Carers: Mfesane will have a debriefing every two months under the guidance of a professional psychologist. Twice a year there will be team building sessions to encourage group cohesion.

ACTIVITY 3: Materials for Palliative Care

The HBC workers will receive Basic Care kits enable them to do their HBC work. The kit contains basic medical materials such as bandages, ointments etc. The government clinics sometimes do have materials to supplement the kits.

ACTIVITY 4: Implementation of Palliative Care Programs

The services are provided to any PLHIV and any bedridden person. Mfesane keeps a patient filing system, to prevent double counting over the course of the project. Mfesane does not take on anyone except when referred by a clinic.

Physical care includes wound care, bathing.

Psychosocial care includes adherence to antiretrovirals (ARVs) and other chronic diseases medicines.

Social care includes access to social and disability grants.

Spiritual Care includes counseling and if people desire so, prayer

Other prevention to the patients and to other members of the households. The family needs to take over responsibility. This is a process in which first visits are longer than later visits. Families are trained by the HBC to take over care. Mfesane does not want to create dependency, but there will be continuous support to ensure, for example, adherence of ARVs. The HBC workers do provide preventive TB care and although they do not provide TB medication, they will assist in the DOTS implementation.

ACTIVITY 5: Monitoring Adherence and Compliance to Antiretroviral Therapy (ART)

Counselors, nurses and health care workers monitor signs of drug failure during home visits, signs of drug failure such as weight loss and yeast infections can be detected quickly and the side-effects of drugs needs to be reported to the respective clinics.

ACTIVITY 6: Food gardens and soup kitchens

Mfesane will have food gardens to teach PLHIV to start a food garden in their own house, and to give them food from there.

ACTIVITY 7: Support Groups

Mfesane stimulates forming support groups, which meet once a month in different areas. Currently there are four. Information sessions on gender violence, drug abuse, alcohol abuse, and women rights will be presented during the support group meetings. This aims to reduce stigma and loneliness and to empower them to advocate and lobby for their own rights.

Referrals, networking and linkages: Local Clinics: the areas where we work in are allocated by the local government and we work closely with any clinic that is near to the working area. In that way the clinic can

Activity Narrative: refer to us, and vice versa.

Local Health department: Mfesane is part of the network that meets monthly under the supervision of the Local Health Department. This is to prevent duplication of services and to assist other parties. Also in that way organizations involved in the same work can learn from each other.

Planned Funds: \$97,090

Activity Narrative: SUMMARY:

Right to Care (RTC)'s Umbrella Grants Management (UGM) project will support several sub-partner organizations through financial oversight, project management, human capacity development, training, mentorship programs, program development, treatment expertise, and strategic planning in providing Adult HIV Care and Support (ACS) services. With the variety of program activities that RTC currently implements or oversees, they have developed a wide base of skills and capacity to manage a range of organization activities, including organizations that provide prevention, training, HIV treatment care and support, pediatric care and treatment, cervical cancer screening, care for orphans and vulnerable children (OVC), home-based care and TB care and treatment.

BACKGROUND:

The following proposed activities are designed to support sub-partner initiatives to implement the goals of PEPFAR and the South African Government (SAG)'s Comprehensive Plan. Over the last two years, RTC has developed a UGM capacity while developing specific skill sets, competencies and capacity to support many sub-grantee organizations. RTC has developed in-house capacity in financial management, pre-award assessments, training functions in financial management and USAID regulatory compliance. In addition, the technical expertise in medical aspects will be supported by internal RTC capacity and through the Clinical HIV Research Unit, an extension of the ongoing activities of the current RTC grant.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: UGM Technical Assistance and Quality Assurance

Needs assessment and program planning will be done on a regular basis with sub-partners. Site visits will be conducted alongside sub-partner staff to systematically evaluate needs of capacity, human resources, facility planning, approaches to programmatic areas such as treatment and care, in order to effectively reach determined targets and quality of care. The needs assessments will use the experience of RTC clinicians and program staff to develop proper planning and forecasting to facilitate patient growth. Programmatic technical assistance will be provided on an ongoing basis, with clinical mentors responding to requests and providing treatment updates, ongoing training, updated guidelines, and case-specific support.

ACTIVITY 2: UGM Financial Management

The finance department at RTC has developed systems to support sub-partners that enable compliance and capacity to manage PEPFAR funds effectively. Support includes a complete range of necessary financial management. RTC will meet with sub-partners annually to align financial and programmatic planning.

Regular oversight and support will be given with monthly financial reports required for all sub-partners. Periodic internal audits will also be conducted at the sites of all sub-partners to establish the quality of financial management and human resources (HR) management, review of asset control and alignment with USAID financial management policies.

The finance department at RTC has developed a state-of-the-art financial software tool, which uses Business Intelligent Tools, to monitor and track all sub-partner transactions against budget projections for modeling and cash flow. This integrated program will allow proper management of budget at all sites. Combined with the monthly financial reports, RTC will be able to use this system to produce up-to-date fund accountability statements and fund balances for its sub-partners.

ACTIVITY 3: UGM Monitoring and Evaluation

RTC's monitoring, evaluation and reporting (MER) system (standards, systems, procedures and tools) is established, documented and continuously improved, based on best practices and quality criteria, in the programmatic areas of Adult Treatment, Adult Care and Support, Pediatric Treatment, Pediatric Care and Support, TB/HIV, voluntary counseling and testing (VCT), Outreach and Training.

All implementation sub-grantees/programs will be provided with support, training and technical assistance to necessary for sub-partners to effectively meet USAID reporting requirements. In addition, RTC programmatic experts will monitor the reports for quality assurance.

ACTIVITY 4: UGM NGO Management and Sustainability

RTC supports NGOs with established policy guidance and procedures that meet the requirements of both the South African labor law as well as the USAID regulations. All sub-partners will have access to the RTC human resources capacity.

Support of infrastructure will be given through expertise within RTC for advice and consultation. Through various infrastructure projects, RTC has developed expertise in proper clinic flow, effective interior space design in both CCMT sites as well as TB clinics. Other sub-partners facing infrastructure challenges will be able to make best use of limited resources which are necessary in increasing clinic capacity.

Sustainability of sub-grantees will be supported through RTC's continued relationship with the Department of Health to ensure that continued HIV and AIDS response is in line with the strategic plan for South Africa, ensuring that once the PEPFAR program is complete, that the activities of the NGO can be taken over by the South African Government.

Where systems are identified to be inadequate, RTC aims to capacitate NGO organizations to manage their programs independent of RTC. Within the implementation plan and budget, RTC has planned to provide financial reporting systems, management SOPs, human resources policies and procedures, clinical guidelines, and monitoring evaluation systems that will ensure sustainability beyond RTC support.

ACTIVITY 5: Technical Assistance (TA) for Adult Care and Support (ACS)

RTC will support its UGM sub-partners by disseminating policies and guidelines and providing quality assurance through sharing best practices and monitoring. With FY 2009 funding, RTC will provide ongoing

Activity Narrative: training, staff counseling and supervision of counselors, and continued medical education to assure that staff is aware of the latest guidelines. Non-governmental organization (NGO) clinicians will also be able to participate in the mentorship program with doctor training and regular rounds at identified sub-partner sites (according to province).

RTC will give TA to sub-partners to ensure that each HIV patient at RTC-supported facilities receives a comprehensive basic package of ACS services and preventive care, including clinic, community and home-based services. This minimum package includes clinical and pathology monitoring, management, prevention and treatment of opportunistic infections, psychosocial counseling, healthy living education, prevention with positives services, nutritional counseling, assessment, monitoring and referral, home-based care, advice and assistance on welfare issues and applications for welfare grants, end-of-life care for terminally-ill patients, and bereavement support for the family.

Emphasis will be placed on increasing the number of HIV-infected children and pregnant women in care. Home-based care programs will be oriented around a family-approach, identifying family members who have not yet tested for HIV or TB or who are positive but have not yet enrolled in HIV care; expanding services to these other family members. Sub-partners will be encouraged to do nutritional counseling at community level and refer for nutritional assessment and monitoring. Examples of non USG-funded community activities include food gardens and income generating programs in order to support patients that are on ART.

Activity ID: 12354.23077.09

Planned Funds: \$799,055

Activity System ID: 23077

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Focus Area: The programmatic guidance issued by PEPFAR has included pre-treatment training, positive living, prevention with positives and adherence under Palliative Care, which was previously reported under treatment literacy. All partners in this programmatic area will now expand their programs to refer patients to clinical and physical care; psychological care, spiritual and social and prevention with positives and positive living.

Service delivery: Turntable Trust (TTT), based in KwaZulu-Natal, uses trained peer educators and community caregivers to establish support groups, conduct community events and door-to-door visits to provide support to people living with HIV. TTT uses the materials developed by Community Health Media Trust (CHMT) to train caregivers to provide a range of palliative care and treatment literacy education.

Mass Media: Johns Hopkins University (JHU)'s new drama series, "Circles," will be in its second season. JHU will integrate messages on living with HIV and opportunistic infections for the within its mass media outputs. "Circles," will target men and the Scrutinize Campaign that targets young people aged 18 - 32 on issues relating to HIV.

SUMMARY:

The Johns Hopkins University/Center for Communication Programs (JHU/CCP), coordinates the work of 20 South African partners, provides technical assistance and capacity building to prevent HIV and AIDS through a comprehensive HIV prevention program that addresses risky behaviors and the key drivers of the epidemic in the general population through mass media and social mobilization. Three partners working across South Africa will support efforts around palliative care. The target populations are: youth, adults, people living with HIV (PLHIV), religious leaders, teachers, public health workers, and community, faith-based and non-governmental organizations.

BACKGROUND:

This is the second year that JHU/CCP will undertake strategies using community-based mobilization in support of palliative care. Their approach recognizes the need to mobilize communities to provide care and support for people living with HIV and their families throughout the continuum of illness. To achieve this, medical practitioners and community-based organizations need to be capacitated so that they can respond appropriately to the needs of patients.

ACTIVITY 1: Community Mobilization and Support for Palliative Care

Community Health Media Trust (CHMT), with PEPFAR funding, has developed a series of video and print materials for people affected by and living with HIV, their caregivers and communities. PEPFAR funding assists CHMT in the updating and community rollout of the series on palliative care including opportunistic infections that will be used in group sessions and workshops. CHMT has 92 Treatment Literacy and Prevention Practitioners (TLPPs), (72 funded by PEPFAR and 20 by the National Department of Health (NDOH)), that train and mentor community-based organizations to use their treatment literacy materials and provide training and counseling to organizations of PLHIV on palliative care. This intervention has received National Department of Health (NDOH) accreditation. TLPPs also work with PLHIV within health care sites to provide advice and guidance on palliative care that will be broadcast through Mindset's patient channel at 400 health facilities.

The Mindset Health Channel (MHC) provides direct information to health clinics, targeting patients in waiting rooms with general information, and healthcare providers with technical and training information. To broadcast current and accurate information on palliative care, JHU/CCP continues its collaboration with MHC which, at the beginning of FY 2008, will be in more than 400 health facilities. Existing material will be revised and updated, including treatment videos, web content and print materials in up to five languages for healthcare workers at these sites. Materials developed through previous PEPFAR funding will be updated as national guidelines and protocols change. CHMT TLPPs spend half their time with patients in ARV rollout sites and downstream referral sites that have the MHC. Both Mindset and CHMT material have been developed through public-private partnerships including business (MTN, Liberty Foundation and Sunday Times) as well as assistance from government and parastatals (e.g. NDOH, SABC).

DramAidE utilizes Health Promoters In 23 Tertiary institutions in South Africa to provide information on palliative care and support, including the treatment of opportunistic infections for tertiary students living with HIV through the HIV support groups that they manage on tertiary campuses using the treatment literacy series developed by CHMT.

The Valley Trust, working in KwaZulu-Natal, promotes and provides palliative care including clinical, social, psychological care and prevention services to persons in need in the rural areas of KwaZulu-Natal through its 15 mobile clinic sites and one fixed site. They train clinical personnel and peer educators in palliative care using the treatment literacy series developed by CHMT that addresses the continuum of care and support, including treatment for opportunistic infections as well as cotrimoxazole prophylaxis that will support vulnerable women and mine workers.

Lesedi Lechabile and Mothusimpilo have 11 and 20 mobile clinics respectively, working in the mining areas of the Free State and the North West provinces that provide palliative care to persons living with HIV through their mobile clinic sites. They train their clinical personnel and peer educators in palliative care using the treatment literacy series developed by CHMT that addresses the continuum of care and support including treatment for opportunistic infections that will support vulnerable women and mine workers.

Activity Narrative: Lighthouse Foundation trains its Peer Educators and Community Facilitators to work in the 13 informal settlements in the Madibeng District of the North West province to incorporate palliative care including the treatment of opportunistic infections into their community outreach, comprising door to door campaigns and their HIV support group based on the treatment literacy series developed by CHMT.

Mechanism: N/A

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$457,704

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The activity has been modified in three key focus areas:

A. The Qualitative Aspects of Palliative Care

- 1) Retention in care: The dedicated antiretroviral therapy (ART) clinics have, until recently, focused their attention upon the treatment of those already in need of ART. Counseling and testing and the staging of patients have been a minor activity provided to the relatively few walk-in patients. The vast majority of patients are already tested and staged, having been referred by the government clinics in the area. A pre-ART register has been instituted and these patients are being followed up at the required intervals.
- 2) Increase the promotion of adherence again: Despite effective compliance strategies, there is invariably more that can be done to promote adherence. Many of the patients will at this stage of the program have been on treatment for a number of years and it will be important to introduce adherence aids such as pillboxes and calendars to sustain the effort. Support group meetings will be continued and linkages with home-based care organizations will be maintained.
- 3) Pain management and the prompt availability of doctors for the treatment of opportunistic infections have had a decided positive effect on patient adherence to treatment. This eases the patient's experience of the condition and promotes quality of life.
- 4) Increase the linkages and communication with referring government clinics, which has been problematic on both sides due to the high workload. The emphasis on compliance is strengthened by strong referral systems with other facilities such as local hospitals and TB treatment sites. Local hospital linkages have proven to be invaluable with regard to prevention of mother-to-child transmission cases and the subsequent follow-up of mother and baby.
- 5) Ameliorate TB education, screening and follow up.
- 6) Increase prevention with positives: Government-supplied condoms are inserted in every medicine package. Referrals to family planning clinics are practiced to avoid unwanted pregnancies and provide sexually transmitted infection (STI) management.
- 7) Cotrimoxazole is widely available and yet the measurement of this indicator has been sub-par. This will be addressed and rectified. Currently cotrimoxazole is available to 100% of patients although the period on the medication differs from patient to patient.

B. The Quantitative Aspects of Care

- 1) The program currently supports ART at 15 primary health clinics, a youth clinic, and two dedicated ART clinics.
- 2) The clinic sites provide palliative care to all patients and all uncomplicated opportunistic infections are treated as part of the comprehensive ART care package offered. This includes the treatment of STIs.
- 3) Bringing the whole family into care: A family-centered approach is followed with patients encouraged to bring their partners and children in to be tested.

C. Service Provider Quality Improvements

- 1) On the side of the service providers, access has been arranged to counseling services and an employee assistance program has been developed for staff within the HIV division. This assistance extends to counseling, psychologists and spiritual matters.
- 2) A number of external clinical audits on service provision will be conducted during the period to build upon existing benchmark data. This is designed to address qualitative aspects of care and to inform future service provision.

SUMMARY:

HIVCare will use FY 2008 funds to work with the Free State Department of Health (FSDOH) to provide antiretroviral treatment and care in private health facilities to patients who do not have medical insurance, either through referrals from the public sector, or self-referrals. The Free State has mainly a rural population, with only two major metropolitan areas (Bloemfontein and Welkom). In addition, the government rollout of HIV care and treatment has been geographically limited, with only one treatment initiating site in each of the five districts. The major emphasis area for this program will be the development of networks, linkages and referral systems, with minor emphasis given to quality assurance & supportive supervision, food and nutrition support as well as commodity procurement. The target population includes men and women; families (including infants and children) of those infected and affected factory workers and other employed persons, and government employees - specifically teachers, nurses and other health workers (without medical insurance). The most significant target group is those persons in the economically active age group of the population that cannot access services in the public health system due to the high demand for services. Additional attention is to be given to the screening and treatment of TB among the patients attending the program. The linkage with the youth centre will ensure that the program will have a larger proportion of younger persons being attended to specifically adolescents aged 10-14 and 15-24. This focus on the youth should further encourage some involvement with the street youth and it is anticipated that the program will be marketed among those NGOs working with the street youth as a testing & treatment site.

Activity Narrative: BACKGROUND:

Since 2005, the main thrust of the activity was to match the FSDOH with partners from the private sector (in this case Netcare, the largest private sector health provider in South Africa, through their primary health centers) in order to build private sector capacity and absorb some of the burden from state facilities. Many FSDOH centers have waiting lists of people waiting to go on ARV treatment. Patients from these waiting lists who meet the eligibility criteria for this program are referred from those public sector clinics to one of the primary health centers throughout the Free State Province for treatment. The FSDOH is a collaborating partner in this public-private partnership.

The Medicross Medical Centre in Bloemfontein, a well-equipped private primary health center, provides the main resource base and in conjunction with three other sites in Bloemfontein and another two in Welkom, will provide an effective means of distributing antiretroviral treatment (ART) to patients who are either referred from state facilities or who access the sites by word of mouth. In addition patients will be able to access a private doctor from the Netcare network in a number of rural towns across the Free State Province. These network doctors that will be enrolling patients onto the program are based in the following communities: Botshabelo; Kroonstad; Harrismith; Phuthithaba; Frankfurt; Winberg; Warden and Viljoenskroon.

ACTIVITIES AND EXPECTED RESULTS:

The HIVCare treatment sites will provide comprehensive palliative care to those patients mostly referred by state clinics in immediate need of ART. The program is able to focus its attention on actual ART patients as a result of its linkages with the Department of Health facilities in the area.

ACTIVITY 1: Clinical Care

The clinic staff comprises a full-time HIV trained doctor, nurses (with training in HIV, TB and pain management) and counselors. Clinical activities include the usual onsite activities of any HIV clinic: ART education and readiness assessment, drugs and pathology testing as required for proper follow-up, adherence education and follow-up, prophylaxis of opportunistic infections, treatment of minor out-of-hospital opportunistic infections, management of disease and or drug-related associated symptoms such as pain and diagnosis and treatment of TB through DOT. Nutritional supplementation is provided until nutritional status has recovered to within normal range (BMI >16). The same activities, including family planning, are to be provided at the Youth Clinic. Prevention with positives interventions will be emphasized.

ACTIVITY 2: Psychosocial Support

Psychosocial support is provided for those patients who are in need of it through a support group which meets weekly. Where the clinic is far from the patient's home, the patient will be referred to a support group with a more accessible venue. For patients who are bedridden, HIVCare has strong links with the local Red Cross home-based care organization. Patients in this instance are visited in the home with deliveries of medication and supplements as required. Counselors regularly contact patients in need of psychosocial support where referred by the doctor or nurses and in addition provide an important support service to the families of patients. Consultations with a trained psychologist are also available where appropriate to patient wellbeing. Spiritual care is not directly provided at the clinic. Those patients requiring spiritual services are usually referred to a religious support group near their home. A priest frequently attends the support group sessions and HIVCare has further links with both the Protestant Church and the Catholic Relief Services (a PEPFAR partner).

ACTIVITY 3: Social Care

HIVCare clinics place emphasis on social care in the context of the family. The testing of partners is actively promoted as is disclosure to a spouse/partner. Child testing days over weekends are regularly organized for the children of patients. Patients are educated on their rights and on the access to social grants. A social worker is available on call.

Patients attend the clinic monthly to collect their medication. Those that do not attend on schedule are phoned by counselors or visited at home by a Red Cross home-based carer.

ACTIVITY 4: Integrated Prevention Services

Apart from the family members of patients, the adult clinic does not promote extensive CT sessions. This role is fulfilled through the Youth Centre, which serves to screen and provide HIV education for children/adolescents. The Youth Clinic is situated in close proximity to provide clinical support and treatment. This public-private partnership has been ongoing for a number of years and includes the greater Netcare Group in the Free State.

By providing HIV care services to a significant population of people without private insurance and school age children, HIVCare is contributing to the PEPFAR goals of providing care for 10 million others who are infected with HIV. These activities also support care and treatment objectives outlined in the USG Five-Year Strategy for South Africa by expanding public-private partnerships and expanding care to an underserved population.

Activity ID: 3015.23064.09	Planned Funds: \$0
Activity System ID: 23064	
Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:	

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. PEPFAR home-based care funds were allocated to Health Policy Initiative (HPI) to develop capacity of PLHIV organizations in South Africa to equip them with skills to mobilize and advocate for essential care and treatment support services, knowledge and awareness of essential prevention and basic preventative care interventions and the importance of mobilizing and referring for essential HIV and AIDS PMTCT, ART, OI management (including TB), family planning and CT services for its members and their families. The HBHC activities of HPI will be completed according to schedule in 2008 but will not be funded in COP 2009. It is felt that HPI has built enough capacity in this area and the National Department of Health now has to take this forward. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Activity Narrative: SUMMARY:

Hands at Work in Africa (HAW) will use FY 2009 PEPFAR funds to provide a holistic care and support package to people living with HIV (PLHIV) through community-based programs in four provinces.

BACKGROUND:

Established in 2002, HAW is a South African non-governmental organization (NGO) that provides comprehensive care and support services to PLHIV through a network of associated community-based organizations (CBOs). The Hands at Work model, and in particular, the Masoyi project, (described by various independent organizations as a best practice model) lends itself towards mobilizing new community initiatives in resource-poor settings. This model builds on the foundation of home-based care and local community ownership by mobilizing the local church to accept the biblical mandate to look after the sick and the dying in their communities and to care for the orphans. Hands at Work helps to establish, encourage and build capacity in CBOs that are formed out of local churches that agree to implement the Masoyi Community Intervention Model. With PEPFAR funding, Hands at Work reaches patients and care givers with an integrated service package that includes psychosocial and nutrition assistance. With FY 2009 funding, Hands at Work will continue to increase the program's reach and extend additional support to established care centers. In addition, Hands at Work will continue to implement income-generating initiatives, home-based care and resilience-building programs to further support improved security and livelihoods for PLHIV.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Local Organization Capacity Development

Hands At Work will partner with 17 local CBOs in Mpumalanga. Local organization capacity will be developed through a CBO training and mentoring program. Partner CBOs will be trained and mentored for an 18-month period in palliative care and support, and the provision of direct services to palliative care which will develop and improve organizational capacity. As the number of CBOs capacitated increase nationally, more sick adults can be reached in a cost-effective way, and brought into a safety net of care in a way that ensures sustainable service delivery. Organizations will be taught how to access and implement services within the frameworks provided by the departments of Health and Social Development. Part of the outcome of the Local Organizational Capacity Development program is to make sure that the CBOs get funding from other sources to be able to stand on their own after PEPFAR has stopped. For example, they will be taught how to secure funding from other sources to be able to give better care to adults in their various communities. Also, Hands at Work staff will be going for more training to capacitate themselves more on recent trend in the industry and through that competent and capacitated CBOs will attract government funding, thereby assisting government to reach their objectives.

As part of the Training and Mentoring program, CBOs will be trained in organizational matters such as bookkeeping, proposal and report writing, conflict mediation, forming linkages and partnerships and establishing relationships with local government departments and local service providers (HIV and AIDS treatment sites etc.)

Hands at Work will strengthen referral networks and working relationships through the CBOs to other services in the same locations. Strong and functional referral networks are essential to ensure that they receive comprehensive care.

Additionally, care givers will receive basic counseling skills and HIV education training. All CBO and faith-based organizations (FBOs) will receive monthly ongoing training and supervisory site visits.

Hands at Work makes use of combination of materials developed by Tearfund, DIFD-sponsored Barnabas Trust Toolbox and Hands at Work which are structured accordingly to the national guidelines for home-based care. CBOs will be trained to develop and/or strengthen referral networks and working relationships to other services in the same locations. Strong and functional referral networks are essential for palliative care to ensure that all clients receive comprehensive care.

Hands at Work will work with the Department of Health and will encourage caregivers from the 17 CBOs to attend the 59-day home-based care training provided by the Department of Health. This will help ensure that some of the care givers receive a government stipend. Hands at Work will also forge relationships with the Department of Health and will negotiate with the department so that the care givers can get HBC kits directly from government.

ACTIVITY 2: Palliative Care

Due to this being a new PEPFAR budget area with limited funds, Hands at Work will be supporting its anchor partner, Masoyi Home-based Care (Masoyi), with the majority of funds to support them as the model and then some limited funding will go towards the other 17 CBOs organizations to assist them with a small budget for their HBC activities which is similar to the services that are being rendered by Masoyi. Hands at Work will extend the support of palliative care with the 17 CBOs organizations as the budget from PEPFAR grows. And mainly they will be supported with budget in taking care some of their palliative care needs.

Through the bi-monthly workshop in the different CBOs. lessons will be given to the care givers to provide a minimum standard of care focusing on clinical/physical, psychological, spiritual, social and prevention interventions. In addition to sharing integrated HIV-related palliative care messages with HIV-infected individuals and their families, the care workers will use a family-centered approach to client assessments. The package of services includes basic pain and symptom management, support for adherence to opportunistic infection (OI) medications (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART), and referral for family planning. Community and home-based psychological

Activity Narrative: support, stigma reduction strategies and adherence support for OI medications and ART will be provided. Clients are also counseled on prevention with positives and family member are referred for counseling and testing (CT). Outreach to the community and referral to health facilities for CT, Family Planning referrals will be part of the palliative care activity. An additional key activity of care givers is monitoring of adherence to TB and HIV treatment. Elements of the preventive care package for adults and children are also included during interaction between the care worker and the client.

ACTIVITY 3: Masoyi HBC Support

Every aspect of the palliative care of Masoyi will be supported. Masoyi provides backup for people who need extended care (not necessarily hospital care) or patients that are discharged early from hospital. Services target terminally ill patients and people living with HIV. Masoyi has a strong referral support structure with local clinics and ACTS clinic in Masoyi, which is then followed up by the designated care giver for each patient referred.

The following areas will be supported:

--Cotrimoxazole Prophylaxis - support for transport for non-mobile patients and initial visits at ACTS clinic and facilitating the handover to government clinics for continued support.

--Palliative Care – a support budget will be given to each of our CBOs for HBC kits (including napkins, diapers, gloves and wound dressings), transport for the nursing staff, soya life porridge, individual garden support, individual care plans to assist family members, adherence counseling refresher courses, care for the care givers (minimal focus on incentives but rather on income generating activities).

--Early referral and retention in care and support - retraining of care givers in various aspects, including a focus on reducing stigma, training of local churches to create a channel of early referral and addressing stigma issues, transport support for patients.

--Basic Care Package - retraining of care givers, home visits, vitamins, counseling and nutrition training

--TB/HIV Services - monitoring through direct observing programs

--Quality of Care and Support Services - monthly workshops with nurses or a HBC specialist from each CBO, bi-monthly workshops with care givers and continued training on reporting

Hands at Work and the CBOs plan to strengthen existing referral networks, working relationships with other organizations, and development of other networking and referral partnerships within the same geographic areas. This will aid in the provision of holistic service. CBO/FBOs will be trained on and encouraged to refer clients for sexually transmitted infection screening and management, family planning, counseling and testing substance/alcohol abuse and care for orphans and vulnerable children.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

This new partner was awarded under the FY 2008 funding competition. The overall objective of the International Organization for Migration (IOM) Ripfumelo project is to reduce HIV vulnerability of farm workers in various districts of South Africa by implementing a coordinated, evidenced-based and focused HIV and AIDS prevention and care program. Building on experiences and lessons learned from the International Organization for Migration (IOM) pilot projects in southern Africa, the Ripfumelo project aims to provide sustainable prevention and care services to farm workers by building the technical capacity of local implementing partners (IPs); strengthening partnerships among and with local, provincial, and national governmental agencies; promoting public/private partnerships; and developing a network of stakeholders working specifically on HIV-related issues within the commercial agriculture sector.

BACKGROUND:

The overall anticipated results of the project are a reduction in the HIV incidence in the targeted areas, and a mitigation of the impact of AIDS on farm workers and their families and communities. The project will build particularly on experiences and lessons learned from the ongoing IOM prevention and care project which has been implemented in Hoedspruit, Mopani District, Limpopo province since 2005. The Ripfumelo project will strengthen the existing intervention in Hoedspruit and target additional seasonal, temporary, and permanent farm workers, whether South African or foreign, documented or undocumented, in the commercial agricultural areas of Hectorspruit/Malelane (Lowveld, Mpumalanga), Makhado/Musina (Vhembe, Limpopo), and Tzaneen (Mopani, Limpopo). The project will initially target approximately 20,000 farm workers on about 120 commercial farms and will run for three years, from September 2008 until August 2011. Once this initial expansion phase has been consolidated in these geographical areas, it is proposed that opportunities be reviewed in other provinces with large commercial farming sectors, such as KwaZulu-Natal, Free State, Western Cape and Eastern Cape.

The International Organization for Migration (IOM) will execute the Ripfumelo project and assume overall responsibility for the coordination and management of all project activities. Ripfumelo will fall under IOM's regional Partnership on HIV and Mobility in Southern Africa (PHAMSA) program, which targets economic sectors characterized by high levels of labor mobility, and which aims to reduce the HIV incidence and mitigate the impact of AIDS among migrant and mobile workers and their families.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Care and Support

A minimum of 300 farm workers will be trained as home-based caregivers. As caregivers, the farm workers will be able to provide palliative home-based care and support to colleagues with health conditions like TB, HIV, malaria, hypertension and diabetes. The target gender balance will be 60:40 (women to men).

ACTIVITY 2: Promotion and Access to HIV Treatment and Related Services

Depending on the local services available, links will be made to promote easier access to HIV treatment and services. Efforts will focus on building the capacity of local government clinics to deliver services, building awareness about the rights of foreign farm workers to health services, and working with partners to promote the provision of antiretrovirals (ARVs) at the district and local level.

ACTIVITY 3: Nutritional Support

A minimum of nine communal gardens will be established to provide nutritional support to people with chronic health conditions including HIV and TB.

ACTIVITY 4: Support Groups/Healthy Living Action Teams

A minimum of eight HIV and/or TB support groups and 20 Healthy Living Action Teams (HLATs) will be established in and around the targeted farms to provide peer support, capacity building, treatment, financial literacy, etc. HLATs bring together all change agents (i.e. peer educators, gender advocates, carers, sports captains) on a farm to develop coordinated action plans and activities.

SUMMARY:

The overall objective of the Ripfumelo project is to reduce HIV vulnerability of farm workers in various districts of South Africa by implementing a coordinated, evidenced-based and focused HIV and AIDS prevention and care program. Building on experiences and lessons learnt from IOM pilot projects in the southern Africa, the Ripfumelo project aims to provide sustainable prevention and care services to farm workers by building the technical capacity of local implementing partners (IPs); strengthening partnerships among and with local, provincial, and national governmental agencies; promoting public/private partnerships; and developing a network of stakeholders working specifically on HIV-related issues within the commercial agriculture sector.

The overall anticipated results of the project are a reduction in the HIV incidence in the targeted areas, and a mitigation of the impact of AIDS on farm workers and their families and communities. The project will build particularly on experiences and lessons learned from the ongoing IOM prevention and care project which has been implemented in Hoedspruit, Mopani District, Limpopo Province since 2005. The Ripfumelo project will strengthen the existing intervention in Hoedspruit and target additional seasonal, temporary, and permanent farm workers, whether South African or foreign, documented or undocumented, in the commercial agricultural areas of Hectorspruit/Malelane (Lowveld, Mpumalanga), Makhado/Musina (Vhembe, Limpopo), and Tzaneen (Mopani, Limpopo). The project will initially target approximately 20,000

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 242.09

Prime Partner: JHPIEGO

Funding Source: GHCS (State)

Budget Code: HBHC

Activity ID: 7887.23178.09

Activity System ID: 23178

Mechanism: ACCESS

USG Agency: U.S. Agency for International Development

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$679,633

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In line with the Basic Care Package, JHPIEGO is currently assisting in the development of a step-down care/sub-acute care guideline, which would assist in the discussions around loss of patients on antiretroviral therapy (ART) in follow-up of pre-ART and ART clients. If such guidelines are adopted by FY 2009, JHPIEGO would see itself playing a role in training health care workers in these guidelines.

SUMMARY:

Since 2004, JHPIEGO has been working in HIV and AIDS service delivery areas, supporting human capacity development strategies which include health care worker training and quality assurance that improve provider performance. In FY 2008, JHPIEGO will support the expansion of palliative care services through the provision of clinical and social care services for people living with HIV and AIDS (PLHIV) with an emphasis on opportunistic infections and cancers in service delivery settings and social and legal care at the NDOH. JHPIEGO will provide technical support to the NDOH by placing a HIV and AIDS Care Technical Advisor and training within the NDOH HIV and AIDS Care and Support Unit. The major emphasis areas of these activities are: 1) training, 2) networks/linkages/referral systems, and 3) human resources. Specific target groups are HIV-infected individuals and their families, women of reproductive age, family planning clients, pregnant women, and health care workers.

BACKGROUND:

The JHPIEGO palliative care program is continuing from FY2006 to provide technical support to the NDOH and to train health workers in state of the art HIV-related care issues. Despite social and legal program successes in South Africa, technical support is required in the NDOH to address national-level social and legal inequities and program gaps for PLHIV. In FY 2008 JHPIEGO will continue to also focus its support on training and health worker skill for screening for opportunistic infections and AIDS-associated malignancies, particularly cervical cancer. Protocols and materials for prophylaxis and treatment of OIs are widely available throughout clinics in South Africa; however, training support is needed at primary health care levels throughout the country. Given the high burden of HIV in South Africa, prevalence of AIDS-related malignancies and the corresponding high incidence of cervical dysplasia among HIV-infected women a gap exists in screening and treatment for AIDS-related cancers, especially cervical cancer. Recently published studies (Moody et al. 2006) document an increased risk for squamous intraepithelial lesions (SIL), the precursor to invasive cervical cancer, among HIV-infected women in Western Cape, confirming data from other international studies. Cancer of the cervix continues to be the second commonest cancer among South African women and is included as one of the defining conditions of the AIDS in South Africa. Studies and clinic experience in South Africa continue to underscore the importance of developing locally relevant cervical screening and management guidelines for HIV-infected women in South Africa. In collaboration with the North West province provincial Department of Health, JHPIEGO will provide training and technical support for OI prophylaxis and care for PLHIV and screening for cervical cancers in HIV-infected women (key legislative area) at primary health care centers.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support for National Department of Health JHPIEGO will continue to provide technical support to the NDOH by placing a HIV and AIDS Care Technical Advisor within the NDOH HIV and AIDS Care and Support Unit to support and expand the government's programs for care of PLHIV. At the request of the NDOH, emphasis is needed to support and expand legal and social support activities for PLHIV. Activities in FY 2008 include activities to mitigate HIV and AIDS stigma in partnership with PLHIV, and training paralegals on human rights for PLHIV. The advisor will have the full access to technical experts at JHPIEGO and the experts based at Johns Hopkins University. This technical advisor will work closely with a JHPIEGO sponsored advisor focusing on accreditation of primary health care facilities.

ACTIVITY 2: Training and technical support for OI prophylaxis and care for PLWHIV and screening for cervical cancers in HIV-infected women at primary health care centers In FY 2008, JHPIEGO will expand care program in the North West province and work collaboratively with Columbia University in Eastern Cape and KwaZulu-Natal. JHPIEGO will train facility-based health care workers on OI prophylaxis and care (emphasis on cotrimoxazole prophylaxis, TB screening and OI treatment) and will include all elements of the evidence-based adult and pediatric preventive care package, ART adherence and basic pain and symptom management within the training program. Facility-based care also creates an entry point for screening and treatment of human papilloma virus (HPV, the cause of 95% of cases of cervical dysplasia), other sexually transmitted infections, cervical cancer itself and other AIDS-associated cancers which are often overlooked in clinic settings. JHPIEGO will train and support district and primary health care level health professionals working with PLHIV to appropriately screen, diagnose, treat and educate PLHIV and their partners about HPV, other STIs, cervical dysplasia and other AIDS-associated malignancies as a component of comprehensive care services for PLHIV. Protocol and material development, training, supportive supervision and follow-up technical support will be provided. The program will be developed and implemented in partnership with the North West province provincial Department of Health and is intended to improve the capacity of the South African health system to provide holistic care of PLHIV, especially women infected or at risk for both HIV and cervical cancer. This activity addresses gender issues by promoting equal access to OI, STI and cancer care for both males and females and equipping health care workers with skills to address HPV and cervical dysplasia in women, an important element of HIV and AIDS care for HIV-infected women that is largely overlooked. Screening, messaging and referral on gender-based violence will also be integrated into the program.

ACTIVITY 3: Development of linkages between facilities and services To improve overall program effectiveness and integrate elements of social care to the clinical care program (activity #2 above), JHPIEGO will support and work with one district DOH in North West province to formalize referral systems and develop linkages between health facilities, and within health facilities (service-to-service) as well referral

Activity Narrative: and counter-referral between the health system and social services as it relates to HIV-related palliative care services. These results contribute to the PEPFAR 2-7-10 goals by improving access to and quality of palliative care services that were not previously provided.

Activity System ID: 22986	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Mpilonhle's school-based health screening now offers CD4 count results to all people living with HIV (PLHIV). It continues providing referral services for all PLHIV to community-based health facilities for further management, and to community-based support groups. It does this by drawing blood from all learners who we identify as being HIV-infected and agree to and desire a CD4 count, by taking the blood specimen to the local KwaZulu-Natal (KZN) Department of Health (DOH) clinic, by following up to ensure that the blood specimen reaches the District Hospital where the CD4 counts are done, by then obtaining the result from the laboratory or the clinic, and by then meeting with the learner to provide the result to them (and if they wish their family).

Community members that are identified as HIV-infected are referred to the local KZN-DOH clinic that serves their area. With the plan for the mobile units to return to the same location monthly, Mpilonhle may arrange to provide CD4 counts to community-program users along the lines described above for learners.

Mpilonhle shall improve its referral systems for linking up participants in its programs with community-based health facilities, support services, and support groups, particularly to access reproductive health services, and services for substance abuse issues. Mpilonhle shall also strengthen its relationships with other community-based organizations and faith-based organizations (FBOs) in the community involved in Care activities for PLHIV and orphans and vulnerable children..

SUMMARY:

This is a follow on PEPFAR-funded activity to be implemented through Mpilonhle. Mpilonhle is working with the support from district and provincial South African Government (SAG) leadership. It will begin operating in late 2007 with a single mobile unit funded with support from Oprah's Angel Network, and expand with two further mobile units funded by PEPFAR funds. It is currently building up its staff, which is expected to be 40, and is based in the Mpilonhle office in Mtubatuba, Kwazulu-Natal (KZN).

Mpilonhle will provide elements of HIV-related clinical care and social care through two main activities: 1) provision of HIV-related screening, care and prevention, and 2) school and community-based HIV and AIDS education. These activities will be delivered through mobile clinics deployed to secondary schools and community (non-school) sites in rural KwaZulu-Natal. Emphasis areas are gender and human capacity development. Target populations are adolescents aged 10-24, adults, and PLHIV.

BACKGROUND:

Mpilonhle is a new South African community-based organization registered in 2007 with the South African Directorate of NGOs. It is dedicated to improving the health and well-being of adolescents in high schools in Umkhanyakude District Municipality, KwaZulu-Natal through its "Mpilonhle Mobile Health and Education Project" whose key activities are described below. The care activities will be implemented in Umkhanyakude District Municipality, the poorest and most rural district in KwaZulu-Natal, and one that has extremely high HIV prevalence rates, at 39.1%.

Implementation will take place in representative rural secondary schools and non-school sites that suffer from physical remoteness, poor health conditions, and inadequate resources. Partners consist of the Department of Education, PLHIV, the South African Democratic Teachers' Union, District Health Services, and District Municipality and Municipal leadership, including that of Traditional Authorities. School principals, local Department of Education officials, district and municipal mayors and focus groups of teachers and students have expressed the community acceptability of school-based CT.

ACTIVITIES AND EXPECTED RESULTS:

These activities will be provided through mobile clinics that visit schools to address the needs of PLHIV in the secondary school population and that visit non-school sites to address the needs of adult PLHIV in the general population. These activities will satisfy minimum requirements for Palliative Care by providing PLHIV with clinical services, integrated prevention, psychological support, and support with social services. Each mobile clinic is staffed by one primary care nurse, four health counselors, and one health educator. Each mobile clinic will visit a participating secondary school one week per month for eight months per year.

ACTIVITY 1: Screening and provision of basic HIV-related clinical and social care and HIV prevention messaging at schools and in communities

The first care component is the clinical aspect which includes HIV and AIDS counselors offering one-on-one health screening, messaging and referrals for preventive care services at secondary schools via a mobile clinic. This will include screening and treating for symptoms indicative of Opportunistic Infections (OI) and other HIV-related illnesses (including TB); individualized counseling on HIV prevention and behavioral change; provision of counseling and testing (CT); provision of counseling in nutrition and personal hygiene; psychosocial support for students (including support for disclosure of status); and referral to essential HIV and AIDS services such as PMTCT, ART, symptoms and pain (including screening and referral to TB services). A mechanism will be established to provide parental consent and referrals for family members of HIV-infected students. The partners and focus groups of teachers and students have expressed the community acceptability of schools-based CT and HIV prevention and care services. Effort will be made to ensure equitable access to care services for both males and females. The second care component is the social aspect which includes screening of HIV-related social problems and referrals to a staff social worker for assistance with accessing government grants and legal services for; PLHIV and their families.

ACTIVITY 2: Group HIV and AIDS education sessions

Activity Narrative: An HIV and AIDS educator will conduct group education sessions at secondary schools and in surrounding communities that will discuss the basic facts about HIV prevention and care targeted. Topics include the importance of HIV prevention (AB for adolescents and ABC for adults); CT; prevention and care of opportunistic infections including TB, ART adherence; accessing PMTCT services; nutrition counseling; and the importance of personal hygiene and utilizing safe water to reduce diarrheal disease. Information, Education and Communication (IEC) materials will also be provided. Mpilonhle will work with community leaders and PLHIV to reduce stigma and discrimination against PLHIV and raise community awareness to mobilize for essential HIV prevention, care and treatment services. Efforts will be made to engage male community members and promote respect between men and women in communities. Support will be provided for disclosure of HIV status and strategies to reduce disclosure-related gender-based violence will be encouraged. An age-appropriate curriculum will be developed by the Educational Development Center (EDC) and the South African Democratic Teacher's Union (SADTU), drawing on material developed by the EDC in collaboration with SADTU, and the World Health Organization. This curriculum emphasizes the traditional three-part public health theory of improving Knowledge, Attitudes, and Practice, skill-building methods in topics such as risk reduction, being faithful, decision making, and social responsibility, as a way of preventing HIV infection, providing care to those infected and affected by HIV, respect for women, fighting stigma and discrimination, and dealing effectively with the challenges of everyday life. Group health education provides supportive social care in the form of efforts to reduce stigma and efforts to increase community awareness of care, prevention, and treatment. Providing care to those infected and affected by HIV, respect for women, fighting stigma and discrimination, and dealing effectively with the challenges of everyday life.

Building human capacity in remote rural areas is a critical issue. Mpilonhle responds to this challenge by maximizing the capacities and skills of relatively abundant lay health workers through rigorous training and regular refresher courses to enable them to perform critical yet currently scarce services such as the promotion of elements of the preventive care package, provision of screening for Opportunistic Infections, basic pain and symptoms management, and health education thus shifting the burden of these activities away from relatively scarce professional health workers. Gender issues will be addressed in the provision of basic HIV screening and care and prevention messaging to large numbers of male and female adolescent and adult PLHIV support for disclosure of HIV status and reduction of gender-based violence), involvement of male adolescents and adults in the program mobilization of community leaders for promoting community efforts against stigma and discrimination, and for raising awareness regarding HIV prevention, care and treatment.

Sustainability of activities is facilitated by political commitment from District and Municipal governments, and the local Department of Education to scaling-up and to fund-raising in support of such scaling-up; the relatively low-tech and easily replicable nature of many core program features; minimal dependence on scarce health professional such as doctors and nurses; the ability of rugged mobile facilities to reduce the need for additional investments in fixed physical infrastructure; declining prices over time for the program's information technology requirements; the possibility of adapting the service delivery model to workplaces as well as schools; the multi-dimensionality of program activities, which includes HIV and AIDS, general health, and education related activities, and which broadens the scope of donors interested in funding continuation and scale-up of activities.

These activities will contribute to PEPFAR goals of providing palliative care to 10 million HIV-infected individuals and their families.

Mechanism: N/A

Prime Partner: McCord Hospital

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Care: Adult Care and Support

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 7912.23185.09

Planned Funds: \$734,975

Activity System ID: 23185

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

1. PAIN MANAGEMENT: Zoe-Life (ZL) will advocate for policy changes to enable PHCs to access drugs currently only available at Hospital Level, such as amitriptyline for neuropathic pain. This will strengthen integration of pain management.
2. CLINICAL SERVICES: ZL will strengthen follow-up of HIV-infected clients to include regular PAP smears, TB screening and nutritional assessments.
3. COMMUNITY-BASED PSYCHOSOCIAL SUPPORT: ZL will create linkages with existing community-based psychosocial support services such as support groups (SG), and provide technical support to enhance the impact of SGs. This includes assisting SG facilitators to screen for TB, nutrition, mental health (using validated community tools), alcohol, and appropriately refer. ZL promotes outcomes based SGs with clearly identified care related goals.
4. MONITORING AND EVALUATION (M&E): Activities will focus on a paper based patient-linked system for palliative care to maintain/assess quality of services, guide health care workers (HCWs) to provide a basic package of care, and to track patients, improving patient retention. This health management information system (HMIS) would ideally move from a paper-based system to an electronic system. Paper systems are a good starting point, and should be piloted in at least one small clinic. As a scalable patient record system it may not be appropriate for large patient numbers accessing palliative care services (and a patient folder). Large numbers of paper folders are an implementation barrier for eThekweni municipality (eTM) and the Department of Health (DOH). eTM does not hold patient records. Patient folders for only HIV-infected clients may not be the best use of resources. ZL will explore collaborations with partners with experience in electronic hand held devices to pilot new ways to manage patients, or to scale up piloted technologies. A hand-held device used by any HCW could provide an easier way to integrate services/ track patients (if linked to GPS/SMS reminder systems).
5. REFUGEES: ZL will seek to understand the barriers to accessing care at public health services and address these where possible. One intervention will be to provide a safe and culturally appropriate place to receive care/support. The other will facilitate integration within public health facilities through provision of educational materials in foreign languages, training of foreign HCWs to provide accurate information, translation, patient advocacy and services at public facilities where refugees should ideally access services, and facilitation of relationships with South African HCWs. ZL will partner with local organizations with influence in this field.
6. SUSTAINABILITY: The current relationship and Service Level Agreement (SLA) between eTM and the provincial Department of Health (PDOH) does not allow municipal sites to become accredited antiretroviral (ARV) sites. This influences budget allocation from the provincial DOH to eTM, and implies that the provincial DOH will not increase human resources, drug supply or other budget (M&E, patient records) to sustain new HIV services at eTM clinics. This challenges sustainability. ZL will focus on strengthening the relationship between eTM, the provincial DOH and the district DOH to address sustainability. This will not only benefit PEPFAR supported sites, but will have a broader impact at all eTM sites.

NEW ACTIVITIES:

1. MENTAL HEALTH: ZL will train HCWs to conduct simple screening for mental health (depression, anxiety, suicide risk, psychosis, dementia) and substance misuse (including alcohol). This will increase the awareness of the impact of mental health/ substance misuse on adherence to care and treatment, as well as on morbidity. ZL will develop a tool which will include referral/ management recommendations.
2. PSYCHOSOCIAL MENTORSHIP AND REFERRAL: ZL will explore development of linkages with local tertiary institutions that train social workers/ psychologists. Students may be available to provide short-term interventions as part of their practical training for clients with non-complicated mental health problems/ addictions including alcohol. This would be a sustainable way to address staff shortages and contribute to human capacity development. ZL will develop linkages with the KwaZulu-Natal Community Psychiatric services that have historically not been integrated into the HIV public health arena. This will strengthen the support base for referrals.
3. HUMAN RESOURCES:
 - A. Workforce planning- ZL will monitor HCW human resource (HR) needs at PHCs providing a comprehensive range of HIV services to analyze workforce needs to assist eTM management to forecast HR and budget requirements as part of the SLA with the KwaZulu-Natal provincial DOH.
 - B. HR Management systems- ZL will develop a supportive supervision/ mentorship model for psychosocial support services.
 - C. Quality- ZL will participate with other partners to develop standard operating procedures/ service standards for palliative care. ZL will focus on psychosocial support and screening services, and include these in accredited training curricula.
4. NUTRITION:
 - A. ZL will develop/implement a nutrition screening tool for use in SGs to ensure anthropometric assessment and appropriate intervention.
 - B. ZL will provide technical support to access micronutrient supplementation for nutritionally compromised clients enrolled in care.
 - C. ZL will develop guidelines for primary level and community-based HCWs as well as training and resources for HCWs to provide integrated nutritional assessments and counseling for adults in care.

SUMMARY:

The McCord Hospital/ Zoë-Life (MZL) activities in this area will build capacity in four municipal clinics, three NGOs, and businesses in Durban, KwaZulu-Natal, to provide a comprehensive range of care and support services for HIV-infected clients and their families. These services will be available to adults and children

Activity Narrative: from the time of CT, and will support sustained care services for clients not on ART as well as those receiving treatment. Services will extend to end-of-life care with referral linkages to community-based care services where available.

McCord Hospital receives funding for PMTCT and ARV treatment through the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF). This program focuses on strengthening the capacity of public sector facilities, and is distinct from EGPAF's hospital-based program.

BACKGROUND:

This project seeks to address health seeking behavior by helping communities access comprehensive HIV care proactively in a primary health setting, encouraging HIV-infected individuals and their family members to access care as early as possible, and in so doing emphasize sustained wellness, quality of life and productivity for as long as possible. Palliative care services offered by a multidisciplinary team will play an integral part in this health behavior change model of care and improve palliative care services within the context of both an HIV care program and ARV services. Clinical services will be nurse-led, with only complex clinical issues referred to a clinician or secondary level facility. The emphasis on care services will promote screening for pain and symptoms, prophylaxis and prompt treatment of opportunistic infections (OIs), integration prevention services including prevention with positives, with well established systems for tuberculosis (TB) screening and treatment. Psychosocial services are essential to promote early engagement with health services, family-centered care, and the chronic health model. Increasing access to care and treatment for men is a critical gender issue for the success of this program. This will be addressed through access to couple counseling, family-centered services and mobile services offered in the workplace to employed men (and women). This project is supported by both municipal and provincial government. All protocols followed will be in line with the provincial treatment guidelines, and outcomes of the program will be reported monthly and quarterly to the eThekweni municipality (Durban) as well as to the KwaZulu-Natal Department of Health (KZNDOH).

ACTIVITIES AND EXPECTED RESULTS:

The areas of legislative interest addressed in this program area are increasing gender equity as described in the summary above, and increasing women's access to income and productive resources through linkages with the three NGO income-generating programs.

ACTIVITY 1: Human Capacity Development

This activity will focus on training multidisciplinary teams in each site to provide comprehensive palliative care services. Clinical staff will be trained to provide prophylaxis, screening and treatment for opportunistic infections; training of counselors, community workers and spiritual supporters to provide augmented counseling and support services to adults and children.

Clinical and psychosocial staff will support and mentor staff to develop skills and confidence to provide the following services: couple counseling, psychosocial support for children, family-centered counseling, wellness literacy for adults, children and caregivers, clinical care (including screening and prophylaxis of OIs) and treatment of primary health level OIs.

ACTIVITY 2: Psychosocial services

MZL will establish community linkages to strengthen community referrals and to utilize existing community-based psychosocial services (such as home-based care, church-based counseling and support groups).

MZL will develop and implement sustainable psychosocial support services, including a support group for children at two clinics and one NGO site.

ACTIVITY 3: Monitoring and Evaluation

MZL will develop a monitoring and evaluation (M&E) system for palliative care services for use in quality improvement and capacity building at local and provincial level.

ACTIVITY 4: Care services for refugee and asylum seekers

MZL will provide appropriate palliative care services for refugees and asylum seekers in the Durban central area in collaboration with the United Nations High Commission for Refugees (UNHCR) and KHWEZI AIDS Project. These services will be provided in French and Swahili. Palliative Care services for HIV-infected clients and their families, adults and children from the time of testing, and will support sustained care for clients not on ART as well as those receiving treatment, and includes: psychosocial support services (patient HIV literacy, psychosocial assessments, augmented counseling, interventions and appropriate referral); initial care screening: WHO staging, CD4 screening, TB screening, pregnancy tests; basic primary health care: screening for pain and symptoms, prophylaxis and prompt treatment of opportunistic infections (OIs), treatment with clinic level drugs from a limited formulary and referral for more complex medical problems; care support: CD4 counts at regular, designated, appropriate intervals, support groups, spiritual support, health education updates.

Services will extend to end-of-life care with referral linkages to community-based care services where available.

ACTIVITY 5: Mobile services

A range of onsite palliative services will be provided for employees in industry who do not have access to medical aid. PEPFAR will fund staff to provide mobile onsite services such as counseling, wellness literacy, CD4 count monitoring, screening, prophylaxis and treatment for OIs where possible and integrated prevention services including prevention with positives. Drugs and laboratory tests will be supplied by the KZNDOH.

Sustainability at the municipal clinic sites will be addressed by assisting sites to become accredited with the KZNDOH, and thus making all direct costs of maintaining a quality palliative care service the responsibility of the KZNDOH. This project will build capacity in these sites to effectively manage the program without

Activity Narrative: ongoing technical assistance. The NGO sites will be assisted to build infrastructure and referral networks to ensure sustainability of services. The long-term plan for the NGO sites is to build strong relationships with nearby clinics with the intent of building clinical capacity to take over the clinical aspects of palliative care services. This project will later build capacity with these institutions to become accredited sites. Staff will assist the NGOs to source alternative funding. The services for workers in an industrial setting will be co-funded by industry.

NEW ACTIVITIES for FY 2008:

1. Staff at the clinics and NGOs as well as community-based organizations will be trained to provide nutritional assessments and counseling, and to link eligible clients with nutritional support. This entails accessing nutritional supplementation available from the KZNDOH, as well as infant feeding supplementation included in the PMTCT program.

2. Additional training will be provided at community level to assist with TB and other OI screening and referral.

3. Linkages with social services, home-based care and community-based services will be strengthened to ensure sustainable food security and follow up

PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

With FY2008 reprogramming funds, MZL will undertake a basic program evaluation focused on expanded HIV testing and linkage to care. While McCord has focused on retention in care of HIV-infected patients who have already initiated ART, data suggests that substantial numbers of HIV-infected persons never reach care following the HIV diagnosis. The currently proposed program evaluation will focus on determining the success of linkage to care of patients along the pathway from being offered an HIV test to beginning and maintaining care at McCord and St. Mary's Hospital (a collaborating partner). The evaluation will identify socio-demographic and clinical factors that correlate with patients who are most likely not to be in care 12 months after a new HIV diagnosis. In addition, the two sites will also develop, pilot, and evaluate a multifaceted, supportive intervention to improve linkage to HIV care for HIV-infected individuals at McCord and St. Mary's. The pilot intervention will provide insight into the feasibility, efficacy, and cost of preventing pre-treatment loss to care in these settings. Insights from this evaluation will enhance both the McCord Hospital-based HIV testing program as well as strengthen linkage to HIV care at its primary clinic sites.

Activity ID: 3019.23155.09

Planned Funds: \$7,155,567

Activity System ID: 23155

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: PROVISION OF PALLIATIVE CARE:

Areas identified for the modification and enhancement of the provision of Palliative Care are: nutritional support; strategic alliances; and the implementation of a Hospice Data Management System.

Nutritional Support: Many patients cared for by Hospice Palliative Care Association (HPCA) are hungry, an urgent need which often overshadows other serious holistic needs. There are numerous reports from caregivers who go to homes where there is nothing to eat, causing distress not only to the patients and families, but to the caregivers themselves. The provision of palliative care would be strengthened by a co-ordinated, comprehensive approach to nutritional support.

Strategic Alliances: Given the wide range of clinical and social services required by HIV and AIDS patients and their families, coupled with the need for a comprehensive and coordinated approach towards Palliative Care, it is imperative that HPCA and its member hospices establish strategic alliances with a wide range of partner organizations. One of the outputs of these alliances will be a Palliative Care strategic plan for every province, health district and health sub-district to be implemented jointly by these partner organizations.

Hospice Data Management System (HDMS): During FY 2009 HPCA will be implementing a comprehensive HDMS in all member hospices.

ACTIVITY 2: DEVELOPMENT OF NEW DEVELOPMENT SITES:

The focus of this activity is to expand the reach of palliative care. The major modification and enhancement of this activity will be the adoption of a country-wide strategic approach to the identification and development of new palliative care service sites. HPCA's Vision is 'Quality Palliative Care for All'. Currently HPCA's existing 141 palliative care service sites extend to all nine provinces reaching 87% (46 of 53) of the health districts in South Africa. Since many of the health districts cover a large geographic area with a high HIV and AIDS prevalence, HPCA intends to expand palliative care services to every health sub-district in South Africa. The strategy for doing so will be based on a correlation between HIV and AIDS prevalence and existing palliative care service sites in every health sub-district. Sub-districts with a poor correlation between HIV and AIDS prevalence and existing palliative care services will be targeted as palliative care development zones prioritised for the development of new palliative care service sites. It is recognised that HPCA and its member hospices will never have, nor desire to have, the capacity to provide care for all persons in need of palliative care. Consequently, HPCA will forge strong collaborative partnerships with a wide range of partners including government clinics, non-governmental organizations; existing home-based care organizations and faith-based organizations. HPCA's main role will be to build the capacity of these partners to provide quality palliative care for all within their health sub-district. Within this strategic framework the notion of what constitutes a palliative care development site may broaden to include a wider range of partner organizations.

Reflecting on the success of a recent HPCA pilot project in the Eastern Cape, one of the approaches used to expand the reach of Palliative Care will be for member hospices to support community-based home care organizations within their health sub-district to include Palliative Care within their range of services. This implies that organizations that have a variety of services (e.g. support groups, peer education, OVC etc) will incorporate a palliative care 'stream' focusing on the specific needs of people needing pain and symptom management and families who need to be trained to care for such patients. Currently at least ten hospices are keen to implement this model.

ACTIVITY 3: ACCREDITATION AND QUALITY IMPROVEMENT:

The modifications and enhancements of the HPCA accreditation and quality improvement system will be to explore the development of a more flexible and differentiated quality monitoring and improvement system which can be applied to a wide range of partner organizations. During FY 2007 HPCA staff participated in an extensive review of the existing Standards for Palliative Care developed in collaboration with the Council for Health Service Accreditation of South Africa (COHASA). While these Standards are appropriate to member hospices that will become exemplar sites for quality Palliative Care they may not, in their entirety or current form, be appropriate to the large number and wide range of partner organizations that HPCA is capacitating to provide quality palliative care. Consequently the need to explore a more flexible and differentiated accreditation and quality improvement system has become apparent.

ACTIVITY 4: HUMAN CAPACITY DEVELOPMENT:

HPCA provides support to local organizations to integrate palliative care into their services while building capacity for good governance and management of these organizations. Long-term sustainability is a key objective of HPCA Human Capacity Development.

The modifications and enhancement envisaged for this activity is a rapid expansion of the provision of palliative care training tailored to the expressed needs of hospices and partner (including PEPFAR Partners) organizations within each province, health district, and sub-district. The increased demand for palliative care training from the public health sector, member hospices, and partner organizations will necessitate a more comprehensive, strategic and focussed approach towards human capacity development for palliative care.

One of the bottlenecks to the comprehensive roll-out of palliative care training has been the absence of an overarching implementation plan tailored to expressed needs of partner organizations.

Activity Narrative: SUMMARY:

The Hospice and Palliative Care Association of South Africa (HPCA) currently has 75 member hospices and 73 development sites throughout South Africa (SA), each an independent legal entity. The Mission of HPCA is to provide and enhance the provision of sustainable, accessible, quality palliative care. PEPFAR funds will strengthen the capacity of member hospices and other governmental and non-governmental organizations to provide quality services to HIV-infected persons.

BACKGROUND:

HPCA strengthens existing services and develops new services through direct funding to member hospices to promote accessibility and availability of palliative care in SA, including work with religious leaders and member hospices that are faith-based organizations. HPCA personnel at national, provincial and district levels continue to provide the infrastructure and coordination to develop and strengthen palliative care programs within member hospices, the formal health care sector and NGOs. Improved collaboration between HPCA and the National Department of Health (NDOH) is a key objective, aimed at optimum utilization of scarce palliative care resources. FY 2006 funding has allowed the training of 7,108 trainees from October 2006 to July 2007. The major focus of FY 2008 funding will be to provide direct palliative care to patients and their families, to assess quality of palliative care, assist in the development of new services, provide support to the care providers and provide training in palliative care. An HPCA member hospice will also focus on increasing male patients' participation in the fight against HIV and AIDS. The Bana Pele Project, in partnership with St Nicholas Hospice, will be using PEPFAR funding in FY 2008 to focus on the expansion of palliative care in their area. HPCA will provide capacity building support to St Nicholas, who will be administering the Bana Pele Project. Additional funding has been granted for Soweto Hospice in Gauteng for FY 2008 which was managed by Hope Worldwide previously. HPCA intends to liaise with Prison Services and the SA Defense Force (military populations) to share palliative care expertise and support to these organizations.

ACTIVITIES AND EXPECTED RESULTS:**ACTIVITY 1: Provision of palliative care**

HPCA is funding member hospices to provide care to patients with HIV and their families. Sites providing palliative care include home-based care (HBC), day care centers, and in-patient units. Services include elements of the preventive care package, management of opportunistic infections including provision of cotrimoxazole, pain and symptom management, clinical prophylaxis, prevention with positives, treatment for TB, psychosocial and spiritual care, and bereavement support for families and friends. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals. Family care includes training in all aspects of patient care, infection control, prevention, nutrition, individual and family counseling and reduction of stigma. Increased participation by male patients will be encouraged by an after-hours clinic at a member hospice. Bereavement care is integral to the provision of palliative care and will be offered throughout the course of the illness as well as after the death of the patient. A key aspect of both individual counseling and hospice support group services is reduction of stigma and discrimination and reconciliation within families. Nutritional support will also be arranged (with non-PEPFAR funding). ART referrals, as additional access sites are made available, will be a component, including pediatric cases of advanced HIV. If the need for OVC services is identified but not provided by the hospice, an established referral system is used to refer the patient to an outside service provider.

ACTIVITY 2: Development of new palliative care sites

This activity entails enhancing existing and establishing new palliative care services. HPCA Provincial Palliative Care Development Coordinators (PPCDCs) lead development teams (PPCDT) in the regions, comprising technical expertise from local hospices. The PPCDT assists in identifying new development sites and providing financial and non-financial resources and mentorship to help build capacity in these sites. The main criteria for development are community need and available resources. In addition to development the PPCDCs also develop public-private partnerships between HPCA and government departments to support these development sites. PEPFAR-funded Regional Centers of Palliative Learning (CPLs) in 10 regions and mentor hospices will continue to develop new service delivery sites. The CPLs are attended by health professionals in the public and private sectors including doctors, nurses, pharmacists, and home-based care (HBC) workers. A mentor hospice is a fully accredited hospice, and receives funding to provide technical expertise and meet mentorship needs in its region. Through these development activities, the total number of HPCA palliative care sites will be expanded and palliative care will be more accessible to currently under-resourced and under-served areas, increasing the availability of quality palliative care to many more HIV and AIDS patients and families. Sustainability of existing and new sites is addressed through ongoing fundraising workshops, through increased quality of services, through increased human resources capacity building and through increased collaboration with the formal health care sector. The integration of palliative care into existing non-hospice health services e.g. district hospitals, home-based care organizations and clinics, has become an important aspect of the expansion of palliative care.

ACTIVITY 3: Accreditation and Quality Improvement

PEPFAR funding has facilitated the development of comprehensive HPCA and Cohsasa (Council for Health Services Accreditation of SA) Standards of Palliative Care, which include standards of management and governance, and clinical, psychosocial, spiritual care and quality improvement to ensure quality palliative care in service delivery. A mentorship and accreditation program is based on these standards. FY 2008 funding will continue to support the accreditation and quality improvement of existing member hospices based on compliance with these standards. Trained mentors and surveyors visit the hospices and an audit

Activity Narrative: of the hospice standards is carried out. To date, eleven hospices have received full accreditation, and many are in preparation. The hospices that receive full accreditation are used as mentor hospices in Activity 2 above and to assist new member hospices to comply with the standards. The accreditation process is aimed at raising the standard of palliative care services throughout the country.

ACTIVITY 4: Human Capacity Development

The objective of this training is to increase skills in delivery of quality palliative care services including elements of the preventive care package. A CPL is an established hospice which has either achieved, or is close to achieving, full accreditation and which has been selected because it has the best resources and expertise to provide training and promote awareness of palliative care. A multi-disciplinary approach is used in ongoing training programs to ensure human capacity development. In partnership with higher education institutions, professional associations and the National and provincial Departments of Health, Social Development and Education, a wide range of accredited palliative care training programs are offered for volunteers, community health workers, nurses and doctors. HPCA strives to have all training curricula accredited.

PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

HPCA supports the USG South Africa Five-Year Strategy to expand access to quality palliative care services and improve quality of palliative care and HBC services, and thereby contributes to the 2-7-10 goal of providing care to 10 million people affected by HIV.

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 7885.23166.09

Planned Funds: \$329,622

Activity System ID: 23166

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1 Home-based care:

During FY 2007 Humana People to People (Humana) has managed to start its own home-based care program in three local municipalities: Bushbuckridge in Mpumalanga and Greater Tzaneen and Greater Letaba in Limpopo province. By FY 2009 the clients will no longer be identified by the Total Control of the Epidemic (TCE) Field Officers as TCE will no longer be operating in these areas. Instead, the clients will be identified by HOPE Activists, counselors working in the clinics, HOPE Counselors and by the Caregivers themselves.

Humana will include and further develop the training of HOPE Caregivers in support of holistic palliative care that includes services falling under emotional/psychological, social, clinical and physical (including pain and symptom management) and spiritual needs, as well as integrated prevention services. The training will also focus on issues around prevention with positives and will include services such as adherence and disclosure support, family centered care, counseling and testing (CT), sexually transmitted infections (STIs), alcohol assessment and counseling, bereavement support and wrap-around family planning programs. The training program will include care and support for caregivers and referral networks. The caregivers are trained in accordance with the Department of Health's 69-day training for Community Care Workers. In addition to this, the caregivers also receive continuous training through Humana's internal trainings and bi-monthly meetings where courses are held by the leadership of HOPE as well as guest speakers from the Department of Health and other service providers.

ACTIVITY 2 Support for people on ARV treatment (TRIO):

This is a correction to the FY 2008 COP narrative regarding the description of the TRIO. A TRIO consists of three people: someone who is HIV-infected and two TRIO Passionates (usually family members or close friends). In the areas where TCE has finished its three-year program, the responsibility for supporting the TRIOs will start to fall under the HOPE projects. Finally, a TRIO can be formed before the client starts taking antiretrovirals (ARVs). When a TRIO is formed at this stage, it means that the client will be well prepared for taking the treatment when the time comes.

Humana will include and further develop the training of Field Officers in HIV/family planning integration (for prevention with positives). There will be a focus on developing skills and knowledge to support holistic palliative care that includes services falling under Emotional, Social, Physical and Spiritual needs.

ACTIVITY 3 Linkages with sectors and initiatives:

As well as continuing to strengthen the links that have already been established, Humana People to People will create linkages with more governmental and non-governmental organizations and departments as the TCE program expands into new areas with new stakeholders. Humana will work to develop and strengthen referral networks and working relationships with other organizations working within the same geographic areas to aid in the provision of holistic service. This will be done by formalizing the referral systems, e.g. entering signed agreements with networking partners. This will also include referrals of clients for STI screening and management, family planning, and substance/alcohol abuse.

SUMMARY:

Humana implements a comprehensive HIV and AIDS prevention and care program called Total Control of the Epidemic. This program trains community members as Field Officers (FOs) to utilize a person-to-person campaign methodology to reach every single household within the project target area with HIV-related care services where necessary. The major emphasis area is community mobilization/participation, while minor emphasis areas are development of referral systems and training. Key target populations are PLHIV, pregnant HIV-infected women, families affected by HIV and AIDS, and caregivers.

BACKGROUND:

Since 2000, TCE has been implemented in eight countries in Southern Africa reaching a population of 5 million people. This program trains community volunteers to reach every single household within the project target area with a comprehensive program that includes care, prevention and CT. Effort will be made to ensure equitable access to care services for both males and females. In 2007 Humana has 5 PEPFAR funded TCE areas in the Mpumalanga province and one area in the Limpopo province. With FY 2007 funding, Humana added elements of palliative care to its program. Humana has previously implemented home-based care (HBC) programs and activities are implemented according to the experiences gained from those programs and work across the region. Furthermore, Humana is implementing the TRIO program, which provides support for people on ARV treatment in Limpopo and Gauteng in a public-private partnership with Johnson & Johnson who have provided \$750,000 for similar activities in different geographic areas. Humana works in partnership with the South African Government (SAG) and the Ehlanzeni and Mopani District Municipalities, which are major partners for the program and contribute with a significant counterpart support. The program has received a number of awards, including the 2003 Stars of Africa Award (in partnership with Johnson and Johnson) for best Corporate Social Investment Program within Health/HIV and AIDS in South Africa.

ACTIVITIES AND EXPECTED RESULTS:

Humana has identified a need for palliative care services in the existing TCE areas. In the areas where Humana operates, few HBC organizations exist or they lack the capacity to effectively deliver services. TCE will implement palliative care activities with an emphasis on elements of the preventive care package with home-based care and treatment adherence programs.

ACTIVITY 1: Home-based care

Activity Narrative: TCE will follow two strategies: 1) TCE strengthens existing HBC initiatives carried out by local CBOs through training, monitoring and support of the caregivers and by employing a nurse who offers clinical services to such programs, where it is appropriate, or 2) TCE starts its own HBC program and employs and trains Passionates (community volunteers) as caregivers, and monitors and supports them in their work. The caregivers will form groups of 10-20 and a nurse will be employed to carry out training and supervision and offer clinical services to patients. The HBC program is implemented by Hope, a sub-program under TCE with its own Project Leader and staff. The patients are identified through TCE's door-to-door campaign. TCE makes use of SAG standards for HBC training and ensures that all caregivers are accredited by the SAG. The HBC program provides and mobilizes for the elements of the preventive care package and screening for pain and symptoms in addition to other clinical, psychological, social support and prevention services to patients in need. The objective of the program is to bring relief and add quality to the lives of the patients and their families. The home-based caregivers offer psychological and spiritual support to the patients and their families, and clinical services, such as cleaning of wounds, analysis of symptoms, monitoring of patients are offered by trained nurses. The program works in close conjunction with public or other private services and refers patients to services; including where needed accompanying patients, and conducting follow up visits. In order to be able to meet the challenges of their work, the home-based caregivers will meet at least twice a week to receive continued training and support.

ACTIVITY 2: Support for people on ARV treatment (TRIO)

TCE has developed a unique system to offer support to people on ARV treatment. It is called the TRIO, as it involves the patient, a family member or a friend, and a Field Officer. This system has been successfully tested in Botswana, where TCE has reached a population of 900,000 people. TRIO will seek to provide and mobilize for the elements of the preventive care package and ensuring that each patient adheres to the ARV treatment through a Directly Observed Therapy strategy (DOT). Patients in the Humana TRIO program will receive a package of care services tailored to their individual needs: education about ART and adherence; screening for OIs, pain, symptoms; nutritional counseling and support, e.g. by facilitating the patient receiving food parcels from the Department of Social Services or by vegetable gardens; and referring patients to positive living clubs or support groups, either run by TCE or other organizations. Volunteers will undergo training as trainers (TRIO supporters) in the above issues and carry out trainings of family members and Passionates. In cases where needed, family members will also receive support from the FOs, e.g. by being referred to CT, PMTCT and other services in the area. A nurse will be attached to the program to offer clinical services to clients and to provide monitoring and supervision of services.

ACTIVITY 3: Linkages with sectors and initiatives

The activities within palliative care are a strongly integrated part of the TCE program. The Field Officers in the basic prevention activities of TCE are well placed to identify community members in need of services. Through this prevention strategy, all households receive messages on the benefits of care services and the TRIO program, and are informed how to receive support from these programs. The care activities will be integrated closely to Humana's CT activities, where people who have tested positive and who need care can be referred to these programs to receive immediate support. Proposed collaboration includes: Linkages with SAG clinics and hospitals providing treatment to facilitate access to ARVs and related services such as support groups. A strong partnership with the TB sub-directorate in the Bohlabela district. FOs are trained to raise awareness about TB, make referrals to clinics and collect sputum. Working with public clinics to ensure that pregnant women have access to antenatal services and PMTCT. Working with the Department of Education to ensure children and youth access education and receive HIV and AIDS information and education.

These activities will contribute to the PEPFAR goal of reaching 10 million with care by offering care and support to people living with HIV and AIDS through the already existing TCE program.

Activity System ID: 23169

Mechanism: N/A

USG Agency: U.S. Agency for International Development

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$240,105

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1- Ingwavuma Orphan Care (IOC)'s linkages with OVC will be strengthened to allow earlier referrals of children identified by the palliative care staff. At admission to the program, the caregivers compile a genogram of the family. They therefore identify children in the household who might be made vulnerable by the sickness and death of the patient. These children are referred to the OVC staff, who can then assist with accessing documents, psychological support and planning who will care for the children in future.

Prevention of HIV will be improved through counseling and testing sexual partners and children of HIV clients, counseling discordant couples, diagnosis and management of sexually transmitted infections (STIs), condom distribution, and encouraging adherence to antiretroviral therapy (ART).

Caregivers are supported by regular supervision sessions, monthly in-service training, access to a trained counselor and end of year social functions. Caregivers are also provided with an occupational health service which includes counseling and testing (CT) and izoniazid prophylaxis, where needed. This is run by the doctor and professional nurses.

The doctor has a dispensing license and is responsible for the dispensary. Nurses are allowed to prescribe up to Schedule 4 drugs. Senior caregivers will be trained and supplied with Schedule 0 medications which are available to the general public without prescription. This is in line with task shifting.

ACTIVITY 2-Caregivers are trained in DOTS and TB and will provide support to patients on TB treatment. There will be regular screening of HIV patients for TB and TB patients for HIV. IOC is receiving USAID funding for TB work and so there are additional activities around TB, such as formation of TB support groups, holding community awareness campaigns and workshops for TB patients.

ACTIVITY 3- Funding will be used to complete a 28-bed in-patient unit to provide care for patients who do not have adequate support at home. The unit is being built with great attention paid to infection control as it is anticipated that it will be used by terminally ill patients with multi-drug resistant (MDR) and extremely drug resistant (XDR) TB.

ACTIVITY 4- Clients in support groups will be assisted with economic strengthening through income generating projects. The comprehensive care and treatment package is implemented through the support groups which IOC runs. Adherence support is achieved through support groups and also through home visits by caregivers to clients who are taking ART. The caregivers provide ongoing counseling, education and encouragement to clients taking ART and report any problems which occur to the nursing staff. Clients who are taking TB treatment are offered home testing for HIV by the nursing staff. Clients who are HIV-infected will be screened regularly for signs of TB by their caregivers. Caregivers will check that CD4 counts are being checked six-monthly for all HIV-infected patients. Those who are unable to access testing at government clinics due to illness, social or geographical reasons will be offered CD4 counts by IOC using their own testing facility. All nurses and caregivers have been trained in palliative care provision. In addition to the palliative care provided at home, IOC will open an in-patient unit for adults and children who cannot be adequately cared for at home due to social, medical or other reasons.

SUMMARY:

Ingwavuma Orphan Care (IOC) activities are carried out to expand the current home-based care project through recruiting and training of lay caregivers and to provide medical support in the way of hiring and training nurses and provision of medical supplies.

BACKGROUND:

This project started in 2002 and was expanded in 2003 to include additional patients and caregivers. IOC is a member of the Hospice and Palliative Care Association (HPCA) and has benefited indirectly from PEPFAR through mentoring and support of the HPCA medical director and professional nurse. IOC became a PEPFAR partner in FY 2007. The project works closely with Mosvold Hospital and its clinics in KwaZulu-Natal, with referrals in both directions. The hospital supplies the project with drugs, food and nursing supplies. The project is also partially funded by the provincial Department of Health/European Union Partnership. Most of the caregivers are women and the project provides them with education and a regular income. Male caregivers provide good role models to show that men can also be caring and look after the sick.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Improving/Expanding Health Services

IOC will use PEPFAR funding to continue to improve and expand its health services. IOC employs three nurses, a chaplain to offer spiritual support and 25 paid caregivers. All staff are paid adequately and care is taken to provide good working conditions in order to retain staff in this remote rural area. This project offers pre-employment and in service training and employment for volunteers, all of whom are affected by HIV, as home-based caregivers. The home-based caregivers live in their own communities spread across 2,100 square kilometers of the health district. They work in teams of 1-4 caregivers plus several local untrained volunteers. They visit people who are ill, providing basic nursing care and ensuring delivery of the elements of the preventive care package that includes: psychological, social and spiritual care. Family members are taught basic nursing techniques and about hygiene and nutrition. The caregivers distribute items such as gloves to promote infection control. If they suspect that a patient is HIV-infected, they will counsel them about the need for testing and encourage disclosure and testing of the whole family. Clients who test

Activity Narrative: positive are then referred to the nearby local Department of Health (DOH) clinics and hospital for administration of ARVs. Caregivers follow up on referrals to ensure that patients have received the necessary care and understand medication instructions. Effort will be made to ensure equitable access to care services for both men and women. The teams of caregivers are visited by the nurses and chaplain 1-4 times a month ensuring the delivery of elements of the basic care package. The nurses and chaplain, together with the caregivers, then visit the clients needing specialized care. The nurse carries a basic supply of drugs, including cotrimoxazole, pain medication and treatment for opportunistic infections. Nurses collect sputum samples if TB is suspected and deliver the samples to the nearest clinic for analysis. If the results are positive, the clients are referred to the DOH clinic for DOTS. The chaplain visits clients who request spiritual support. The project also advocates to government sources for HIV-affected families who do not have enough food. The open and caring attitude of the caregivers helps to reduce discrimination and stigma against those who are HIV-infected. The caregivers counsel relatives and neighbors who exhibit discriminatory behavior against the clients. Vulnerable children in the families are identified and referred to the OVC branch of the project. Bereavement support is provided, if necessary. PEPFAR funding will allow the project to employ nearly twice as many trained home-based caregivers, which will result in nearly twice as many patients receiving care. It will also contribute to the support of the clients through medical personnel and medical supplies. This funding enhances the support already given to the project through the DOH, which contributes to some of the existing caregivers' salaries and project running costs. The project will aim to recruit volunteer nurses from the United States to assist with ongoing supervision and in-service training of the lay caregivers. FY 2008 activities will be expanded to ensure that the entire catchment area of Mosvold Hospital is provided with palliative care. Quality of care will be further improved to provide the basic care package to encompass clients who are HIV-infected but asymptomatic.

ACTIVITY 2: Caregiver Training

The main objective of the training is to increase skills in delivery of quality palliative care services including elements of the preventive care package. Lay caregivers are trained by a former home-based caregiver, who is assisted by the nursing staff, paralegals, a social worker, and other staff. Subjects covered in the training include HIV counseling, basic nursing, TB and ARV support, screening for pain and symptoms and methods of encouraging clients to start and continue taking ARVs or TB medication properly. Volunteer caregivers will be trained at IOC's training center, doing their practical training at Mosvold Hospital. This 56-day training is in line with the South African DOH guidelines for home-based caregivers. At the end of the training these caregivers could be employed by the project to further extend the reach of home-based care support, funds permitting. FY 2008 activities will be expanded to include training of all staff in the basic care package. New caregivers will be recruited and trained to provide services in areas which are currently uncovered. PLHIV will be trained to implement the basic care package.

ACTIVITY 3: Renovation of training center and expanded office facility

The purpose of this activity is to renovate buildings at a new office complex which will allow the integration of all the activities of Ingwavuma Orphan Care at the geographical center of the area in which it works. A run down building requires extensive renovation to convert it into some offices and storage area for PEPFAR-funded staff. Current offices were built to accommodate 7 staff while by 2008 there will be around 30. The current offices will be converted to a full time training center, providing much needed infrastructure and services in the area. The training center will be used by the organization to train staff, volunteers and community members for many of the PEPFAR-related activities. Changes to the building will include landscaping the grounds and purchasing appropriate furniture. Funding for renovation is expected to cost no more than 10% of funding for this program area.

ACTIVITY 4: Support Groups

Support groups will be formed to better provide the basic care package. Support groups will be strengthened throughout the health district. Support groups are aimed at mixed groups of men and women who are HIV-infected. There are separate groups which target children and their caregivers. Groups meet once a month. Groups are led by caregivers, especially those who are HIV-infected themselves, but members of the groups are encouraged to take the lead over time. This will be a place where the basic care package is implemented as well as integrated prevention strategies. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals.

In the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

These results contribute to the overall PEPFAR objectives of 2-7-10 by increasing the number of people trained as home-based caregivers, increasing the number of people receiving palliative care, and increasing the quality of palliative care services.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 224.09	Mechanism: CTR
Prime Partner: Family Health International	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 2925.22950.09	Planned Funds: \$1,262,176
Activity System ID: 22950	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

With FY 2009 funding, Family Health International South Africa (FHI) will strengthen existing quality assessment systems, including the use of standard program monitoring indicators, on-site supervision for care givers and supervision training for supervisors of care givers, monitoring and evaluation tools and the application of standards in home-based care kits. Activities will also include wrap around activities such as health sector linkages like family planning, safe motherhood, TB, etc. as part of their comprehensive, family centered holistic care and support program.

Activity 1: Strengthening community-based organizations

At the request of the provincial Department of Health in the Eastern Cape and the local Chieftaincy of the Abathembu people at Mvezo, FHI worked with the local communities in Mvezo, which has a 33% HIV prevalence rate, to support comprehensive palliative care (PC) projects. In FY 2009, FHI will scale up this intervention and work with the provincial government and the people of Mvezo through outreach to: 1) Provide technical assistance (TA) to volunteers to identify PC, counseling and testing (CT), antiretroviral therapy (ART) and family planning (FP) needs in the household and to refer to the Mobile Services Unit (MSU) and other appropriate services; 2) Leverage government and partner resources by building/strengthening formal referrals between home-based care (HBC) projects and CT sites, nearby ART providers, and FP clinics; 3) Train HBC volunteers to assist clients with adherence to ART and care interventions; e.g. referral for cotrimoxazole prophylaxis; 4) Strengthen TB management and nutritional assessment, monitoring and supplements, including and referrals to government/non-governmental organization (NGO) services for food parcels; 5) Support select HBC programs through financial assistance, supportive supervision TA, and reporting and; 6) Provide PC training for health providers and HBC programs using the nationally accredited curriculum. The intervention above is grounded in a family centered approach to PC and a major emphasis will be placed on early referral to care and retention in care and support services of HIV-infected individuals and their families.

Activity 2: Strengthening government programs

At the request of the National Department of Health (NDOH) and the provincial departments of health of Limpopo and Northern Cape provinces, FHI will continue to provide support and technical assistance to both community- and facility-based palliative care services at primary care and hospital level, while strengthening the linkages/referral between PC, CT, ART and FP for comprehensive care and support. In FY 2009, however, FHI will take the model further and scale up the intervention from the original four sites to an additional two sites per province. As part of the FHI comprehensive family-centered PC program which provides care in all the five care service categories, this program will work with multi-disciplinary teams each project site to ensure that all the different care needs of clients are addresses. FHI will also strengthen the integration of services within different facilities that may be provided by different providers as well as strengthening linkages between programs, facilities, families and community programs and services. Interactive sessions with HIV-infected persons and their families will also be conducted covering issues of prevention among positives, disclosure, family planning, and disclosure.

FHI is currently assisting the NDOH with developing guidelines for Step Down Care facilities in addition to assisting them with the guidelines for palliative care. In FY 2009, at the request of the Northern Cape and Limpopo provincial departments of health and supported by the NDOH, FHI will assist the provincial Departments of Health with setting up of at least one Step Down Care facility for each of these provinces. The costs for infrastructure and the building will be provided by government, whilst FHI will provide technical assistance to ensure the facilities are set up according to local and internationally recognized clinical guidelines, and provide overall programmatic support.

Activity 3: Technical Assistance to Johannesburg Hospital Palliative Care Team (JHPCT)

FHI will continue to provide support and technical assistance to JHPCT. With FY 2009 funding, however, FHI will link up with the newly formed Johannesburg Center of Excellence for Palliative care as was requested by the NDOH. Stronger linkages will also be forged with the community-based PC services in Johannesburg as part of the Integrated Community Palliative Care project.

Activity 4: Support to the NDOH

In FY 2009, FHI will support and strengthen the government's approach of including FP/HIV integration activities in their yearly operational plans. This will include creating a fixed position in the NDOH of an HIV and FP Integration Officer; there is a need for a dedicated person for these activities in order to make a significant difference in prevention with positives programs. As requested by NDOH, FHI will provide training, mentoring and coaching to HIV and FP providers to equip them to appropriately refer and link HIV and FP services as part of the comprehensive palliative care package. This will take place in the Free State, North West and Eastern Cape provinces.

FHI will continue to strengthen supportive supervision and revise daily routine monitoring forms to include FP referral information. New data elements will be included to address FP/HIV integration in the monthly data summary sheet of the facilities. To strengthen integration of FP and HIV services as part of the wrap around activities at a facility level the National and provincial Quality Assurance Unit will be involved to enhance quality improvement in the implementation and assessment of integration.

FHI will lead a collaborative initiative of developing an FP/HIV integration brochure that focuses on male involvement. The brochure will be introduced and championed in the communities by community leaders

SUMMARY:

Activity Narrative: Family Health International (FHI) will continue to improve access to holistic services for people living with HIV and AIDS (PLHIV) and their families by enhancing palliative care (PC) programs and strengthening links to ARV, counseling and testing (CT), family planning (FP), and other essential services. Emphasis areas are pre-service and in-service training, local organization capacity development and wraparound programs in family planning. Target populations are people living with HIV and AIDS and men and women of reproductive age.

BACKGROUND:

The FHI-supported Integrated Community Palliative Care (ICPC) model is the first public sector palliative care model at the district level funded by the South African Government with technical assistance from FHI. As requested by the Departments of Health (DOH) and Social Development, FHI provides support to both community- and facility-based PC services at the primary care and hospital level, while strengthening the linkages between PC, CT, ARV and family planning (FP) for comprehensive care and support. FHI's interventions strengthen the physical, spiritual, social, psychological and preventive aspects of PC, and leverage government resources through service networks to meet multiple care needs. Tighter links between PC, CT, ARV and FP services, in particular, afford men and women the opportunity to improve their overall quality of life through integrated services. Since FY 2005, FHI and partners trained 828 community volunteers and provided services to over 12,000 home-based care (HBC) clients in Mpumalanga and KwaZulu-Natal; trained 50 government HBC volunteers in Limpopo and Northern Cape using the Health/Welfare Sector Education and Training Authority curriculum; trained 484 health care professionals in PC; and provided support to the Johannesburg Hospital Palliative Care Team (HPCT), reaching out to more than 4,000 clients. In the communities where they are working, FHI is expanding pediatric PC services to ensure HIV-infected children are receiving appropriate care, and setting up a mobile clinic to improve access to integrated services in remote HBC programs. FHI carries out PC activities with government and community-based organizations (CBOs), including Project Support Association-South Africa (PSASA), the South African Council of Churches, South Africa Red Cross, Nightingale Hospice and Evelyn Lekganyane HBC.

ACTIVITIES AND EXPECTED RESULTS:

FHI will continue to strengthen access to integrated services as a part of a comprehensive palliative care package for PLHIV and their families in Mpumalanga, KwaZulu-Natal, Limpopo, Northern Cape and Gauteng provinces. This includes the ICPC model in 2 provinces. Effort will be made to ensure equitable access to care services for both males and females and increased participation by men will be encouraged in service delivery. The activities expand existing services that CBOs and government care programs currently provide with an emphasis on promotion of the HIV preventive care package. With FY 2008 funding, FHI will further institutionalize the program within government and CBOs, while also expanding its reach. FHI will emphasize capacity building and local skills transfer, and will also stress gender sensitivity in counseling and community outreach, promote couples counseling, and assist HBC programs to develop strategies to alleviate the care burden on girls.

ACTIVITY 1: Strengthening community-based organizations

Benefiting HBC clients, family members and caregivers in Mpumalanga, KwaZulu-Natal, Limpopo, and Northern Cape provinces, FHI will continue to work with community groups through outreach to :1) Provide technical assistance (TA) to HBC volunteers to identify PC, CT, ARV and FP needs in the household and to refer to appropriate services; 2) Leverage government and partner resources by building/strengthening formal referrals between HBC projects and CT sites, nearby ARV providers, and FP clinics; 3) Train HBC volunteers to assist clients with adherence to ARV therapy and care interventions; e.g. referral for cotrimoxazole prophylaxis and caring for caregivers; 4) Strengthen TB management and nutritional assessment, monitoring and supplements, including and referrals to government/NGO services for food parcels; 5) Support select HBC programs through financial assistance, supportive supervision TA, and reporting; 6) Provide PC training for health providers and HBC programs using the nationally accredited curriculum, and expand services to include pediatric PC as appropriate, and; 7) Conduct trainings for ARV providers on prevention with positives including FP referral for HIV-infected couples, including those on ARVs. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals.

ACTIVITY 2: Strengthening government programs

FHI will provide TA, training and financial support to four districts of Limpopo and Northern Cape. Specifically, FHI will continue to work with government to: 1) Train district-level PC health providers in pain and symptom assessment and management, TB and other opportunistic infection screening, pediatric PC, psychosocial and spiritual needs of PLHIV and affected families, PMTCT and FP counseling; 2) Implement mechanisms for quality assurance and supervision, as per standard operating procedures; 3) Conduct district-level workshops for family members, traditional healers, and local AIDS councils to promote care, support and treatment services; reduce discrimination and stigma; increase awareness of HIV-infected individuals needs; and support pediatric PC, and; 4) Strengthen referral networks between primary health care and CBO services, including linkages with health and social welfare sectors for grants, legal aid, micro-finance, spiritual support, CT, ARVs, and FP.

ACTIVITY 3: Technical assistance to Johannesburg

HPCT FHI will continue to support the Johannesburg HPCT and other government-accredited ART sites by increasing access to pediatric PC and reinforcing the integration of HIV and FP services. Through TA to

Activity Narrative: nurse managers, nurses, midwives, medical officers, coordinators and other providers in ART sites, FHI will continue to improve the capacity of Johannesburg HPCT, including strengthening linkages with community-based organizations to enhance client follow-up and contribute to identification of new clients. In addition, FHI will provide TA to strengthen prevention with positives, including increasing providers' knowledge and skills to address the FP needs of their ART clients.

ACTIVITY 4: Support to the NDOH

To guide the HIV/FP integration efforts described above, and in response to specific requests from the DOH, FHI will support National DOH (NDOH) and provincial staff in Mpumalanga, KwaZulu-Natal, Northern Cape, Limpopo and Gauteng provinces to strengthen integration of family planning and HIV services. With separate funding, FHI will help the NDOH to revise the current sexual and reproductive health curriculum to include guidelines for HIV-infected couples, including those on ARVs. In FY 2008, FHI will provide TA to the NDOH on implementing the new curriculum and integrating HIV and FP services, particularly in PC service sites. In FY 2008, FHI will continue to support NDOH and provincial staff to build on government operational plans and address gaps, including: 1) Providing mentoring and on the job training to enhance prevention with positives through integration of HIV and FP services; 2) Enhancing functional referrals between HIV and FP services; 3) Providing technical assistance to the NDOH to continue to roll out the revised sexual reproductive health (SRH) curriculum and ensure that more providers are equipped with skills to address the SRH needs of HIV-infected women and men; 4) Collaborating closely with district DOH management to strengthen supportive supervision for integrated HIV/FP services, including use of provider tools that reinforce new FP counseling skills and revision of routine monitoring forms to include FP information and indicators.

These activities contribute to the PEPFAR goal of providing care services to 10 million. The activities also support the USG strategy for South Africa by collaborating closely with the DOH to improve access to and quality of basic care and support.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

New Areas:

Family Health International (FHI)'s Umbrella Grants Management (UGM) program will work with sub-partners to develop and strengthen referral networks to ensure that comprehensive care is provided. FHI will also ensure that emphasis is placed on supporting HIV-infected people to reduce the risk of HIV transmission and re-infection.

FHI will work with sub-partners to ensure that all caregivers/volunteers are trained on the national training program (59-day training) for home-based caregivers and community health workers.

FHI will work with those sub-partners providing training as a service, to get their training accredited. FHI will also work with partners to ensure that there is provision of care and support for caregivers.

FHI will review project descriptions to ensure that OVC care is integrated into home-based care and palliative care and will monitor this activity.

SUMMARY:

Currently, USAID/South Africa (SA) supports institutional capacity building of indigenous organizations that implement PEPFAR programs, including basic health care and support (BHCS) programs, through three competitively-selected Umbrella Grants Management partners: Pact, the Academy for Educational Development (AED) and Family Health International (FHI). The main purposes of these UGM projects are to: (1) facilitate further scale-up of HIV and AIDS care services and (2) develop indigenous capability, thus creating a more sustainable program. The emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs) and community-based organizations (CBOs). The current UGM with FHI will support five sub-partners who have transitioned over from Pact and five new sub-partners. This activity refers only to the USAID/SA UGM project managed by FHI.

BACKGROUND:

USAID/SA's Health and HIV and AIDS strategy responds to the overwhelming challenges posed by the HIV and AIDS epidemic on individuals, families, communities and society in South Africa. Through this UGM, FHI is responsible for managing sub-grants to ten USAID partners (all of whom submit their COPs directly to USAID). As USAID's prime partner and the managing umbrella organization, FHI will not directly implement program activities, but rather act as a grants management partner to manage and mentor its ten sub-recipients who, in turn, will carry out the assistance programs. Thus, FHI functions primarily as a sub-grant making entity, and a relatively small percentage of overall funds are used for administrative purposes. Given that recipients require significant technical assistance and management support to grant recipients, FHI will devote a reasonable percentage of overall funding to providing this support. USAID closely collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grant mechanism. Although some of the partners work closely with various SAG Departments, at national, and/or local (i.e., provincial and district) levels, the umbrella grant's primary interface with the SAG is through the Senior Management Team (SMT), which includes key staff from USAID, National Departments of Health and Social Development (NDOH, DOSD), and representatives from the provincial departments. Under this UGM with FHI, USAID is supporting four indigenous and international FBO and NGO partners who provide basic health care and support services such as palliative and home-based care (HBC) to communities in the provinces. These are: Humana People to People; LifeLine; MCDI; and PSA-SA. Grants to palliative care partners support government clinics and hospitals with human resources including doctors, nurses, pharmacists, and counselors. These partners also work closely with new and established hospices to ensure hospice accreditation in accordance with national and global standards of palliative care. Palliative care services supported by partners include holistic; family-centered; clinical, psychological, spiritual, social care and integrated prevention services for PLHIV and their families, supported by multidisciplinary teams at facility and community levels. An emphasis will be placed on TB screening, national guidelines for OI prophylaxis, identification of pediatric cases, and ART referral, as services become available. Through their partnership with PEPFAR, these providers will increase their reach two to three-fold. This scale-up requires strong financial, monitoring and evaluation, and management systems to accommodate growth in reach and maximize sustainability.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008, USAID/SA will continue to support existing palliative care partners through this UGM with FHI. Funds budgeted under this narrative will support costs for administering, managing and facilitating technical support for FHI's palliative care sub-partners. Separate COP entries describe the palliative activities implemented by each sub-partner under FHI. Institutional capacity building of indigenous organizations is a key feature of the umbrella grant mechanism and an important strategy for achieving prevention, care, and treatment goals of PEPFAR to ensure long-term sustainability of programs and organizations.

ACTIVITY 1: Grant Management

Through this UGM, FHI will award and administer care grants to partners selected through a USAID/PEPFAR APS competitive process to implement HIV and AIDS activities. This involves an array of related activities including award and administration of grants, monitoring of grant progress, meeting reporting requirements, and grant closeout. FHI will continue to monitor palliative care program implementation and adherence to financial regulations both within FHI and in its sub-partners (USAID's partners). This involves provision of extensive technical assistance to partners on palliative care project

Activity Narrative: development and implementation, financial management, monitoring and evaluation, and reporting. All these functions provide key support to organizations so they can better implement care activities.

ACTIVITY 2: Capacity Building

This new umbrella mechanism will support institutional and technical capacity building of indigenous organizations, defined as activities that strengthen the skills of indigenous organizations to implement HIV and AIDS programs efficiently, with diminishing reliance on external technical assistance and support. FHI will support activities to improve the financial management, program management, quality assurance, strategic information (M&E) and reporting, and leadership and coordination of sub-partner organizations implementing preventive activities. FHI will also provide technical assistance to the USAID partners, as needed, to improve the technical approaches used for AB prevention activities and to enable quality assurance/quality improvement (QA/QI) of activities falling within this technical area. All these functions provide key support to organizations so they better implement care activities.

ACTIVITY 3: Monitoring and Evaluation (M&E) and Reporting

The umbrella grants mechanism will ensure support to USAID's care partners in M&E, in order to strengthen measurement of the implementation and impact of palliative care program activities, an eventual achievement of PEPFAR goals. M&E support of palliative care partners include: measurement of program progress; provision of feedback for accountability and quality; surveillance; and implementation of information management systems. In addition, the umbrella mechanism will provide supportive supervision to provide guidance, monitoring, mentoring and oversight through site visits, technical assistance, and performance evaluation. The management of service delivery programs under the umbrella grant mechanisms will contribute to the PEPFAR goals to provide treatment to 2 million HIV-infected people; prevent 7 million HIV infections; and provide care to 10 million people infected by HIV and AIDS, including orphans and vulnerable children.

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 7904.22917.09

Planned Funds: \$217,483

Activity System ID: 22917

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Revision to Activity 1: At the beginning of 2008, the iLembe District Department of Health endorsed Medical Care Development South Africa (MCDI-SA) as the primary referral organization to provide technical and other organizational support to the community-based organizations (CBOs) funded by the department to give stipends to and supervise home-based carers (HBCs) to promote the delivery of quality, holistic, family-centered care, including clinical/physical care, psychological care, spiritual care, social care, integrated prevention services and referrals including family-planning counseling and referral, according to South African Government (SAG) guidelines on home-based care (HBC). MCDI-SA now works directly with these organizations and their carers to train, mentor and otherwise support their ongoing work. MCDI-SA has taken as its mandate the support of the current SAG-provided stipend system for home-based carers to ensure its success and sustainability in iLembe District by providing technical support and guidance. MCDI-SA holds monthly meetings with CBO leadership to discuss training needs, share technical information, field questions on quality care, and assist with data collection and reporting to the Department of Health. In addition, MCDI-SA has set a series of technical training workshops for CBOs and their carers, focusing on provision of palliative care to clients and family members, with particular emphasis on the Basic Care Package; TB-HIV integration (cross-testing, co-treatment protocols); TB signs and symptoms; TB and ART treatment adherence and directly observed treatment (DOT) support; prevention of mother-to-child transmission and the new dual therapy; HIV and AIDS counseling; healthy lifestyles; positive prevention for TB and HIV-infected people, and more.

Additional activity: MCDI-SA will supplement HBC kit supplies as the Department of Health has had budget cuts and is unable to provide adequate supplies of kit items.

Additional activity: Due to rising food and fuel costs, many households in the project area have become food insecure, which is exacerbated when HIV-infected household members become ill and are unable to work or a caregiver must stay home to look after a sick child. MCDI-SA will pilot a community garden project, managed by a local resident, to grow, maintain and distribute parcels of fresh vegetables to HIV- and AIDS-affected households serviced by HBCs.

Additional activity: MCDI-SA is undertaking a community mapping exercise, beginning in Maphumulo sub-district, to identify and map using GIS technology all community-based resources available to people living with HIV in those communities, from health care facilities to food schemes to support groups. This activity is in support of the Local AIDS Councils and will produce a map of resources to be posted at health facilities, traditional courts, and at other high-visibility public locations throughout the area.

SUMMARY:

Medical Care Development South Africa (MCDI-SA) will carry out activities to support expansion of holistic, comprehensive community HIV and AIDS and TB care and support from Ndwedwe sub-district to the other sub-districts of iLembe District in KwaZulu-Natal province. FY 2007 and FY 2008 PEPFAR funding will be used to expand the primary activities of training, support and supervision of home-based care volunteers (HBCVs) and Directly Observed Treatment, Short-course (DOTS) providers, as well as the introduction of software to monitor home-based patient care. This will help to improve quality of care and treatment adherence for those on TB medication and/or ART; facilitate linkages between HIV and AIDS and TB-related community-based projects with the local health facilities; and build capacity among relevant community-based organizations (CBOs).

The emphasis areas include human capacity development (Pre- and In-service training, Retention strategy), local organization capacity building, and are extended through Child Survival and Safe Motherhood Wraparound Programs. The target populations are children, adolescents and adults, discordant couples, pregnant women, people living with HIV and AIDS, and orphans and vulnerable children.

BACKGROUND:

MCDI-SA is a US-based private voluntary organization (PVO) that is registered as a Section 21 company (NGO) in South Africa. MCDI-SA has been successfully implementing community public health and social support projects in KwaZulu-Natal, South Africa, since 1995. Prior to PEPFAR funding, projects have incorporated activities focusing on traditional Child Survival (CS) interventions, reducing HIV and AIDS through prevention among youth and adolescents, assisting with CT/PMTCT site establishment, strengthening the government healthcare system's provision of services to and creating support groups for HIV-infected and TB-affected individuals, and supporting other health-supportive community-based initiatives.

The activities proposed are expansions of those previously implemented by MCDI-SA in Ndwedwe sub-district and are in line with the PEPFAR and SAG objective of providing quality palliative care for HIV-infected and -affected individuals. The key program partner is the South African National Department of Health (NDOH), whose current policies on HIV and TB care and gender equity inform all project objectives, and whose representatives are actively engaged in the design and implementation of activities to promote consistency and long-term sustainability. The NDOH has agreed to provide staff and financial support for project activities, as needed. Other project partners include The Valley Trust, the National Association of People With AIDS (NAPWA), and Strengthening Pharmaceutical Systems (SPS).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training, Support and Supervision of HBCVs

Due to the large distances between households and health facilities throughout the iLembe District, HBCVs

Activity Narrative: are a crucial part of a comprehensive system of care for people living with HIV and AIDS (PLHIV) and people living with TB (PLWTB) and play a significant role in their day-to-day treatment. As part of its ongoing USAID-funded Child Survival Project and the ongoing Ndwedwe Integrated HIV/AIDS Tuberculosis Project, MCDI-SA will broaden its existing integrated home-based care (HBC) program in Ndwedwe sub-district to the three other sub-districts of the Ilembe District: Maphumulo, Mandeni and KwaDukuza. PEPFAR funds will be used to train new HBCVs in comprehensive home-based care skills during a three-week course on providing quality care for community members, including elements of the preventive care package, pain and symptom management and other palliative care services for PLHIV and PLWTB. Trainers from The Valley Trust will assist with this activity. Supervisory training and checklists will be provided, also in collaboration with The Valley Trust. Ilembe District community health facilitators (CHFs), who are responsible for overseeing HBCV activities in the District, and previously trained HBCV will be provided with refresher training in comprehensive home-based care skills for patients and their families. Distinctions between the needs of adults and children will be emphasized, as well as gender-specific issues such as integrating males into household care practices; increasing male knowledge of effective HIV prevention measures; increasing women's and girls' use of healthcare services; and recognizing and addressing domestic abuse against women and girls. Monthly meetings will be held between HBCVs and facility staff members to promote consistent quality care. Trained HBCVs will also become eligible for registration with the NDOH and to receive a government stipend for their work. Community-based organizations (CBOs) will be identified and supported to serve as supervisors of HBCVs. CBOs will also distribute HBCV supply kits, provide care for caregivers, assist with training, and arrange for HBCVs to receive recognition for their work at community gatherings. MCDI-SA will provide participating HBCVs with regular incentives, such as cell phone airtime, so that they will have the means to remain in contact with the supervising CBOs, clients and health facilities. Supervised by MCDI-SA, the CBOs will work in collaboration with CHFs to monitor and maintain the quality of services provided.

ACTIVITY 2: Introduction of Software to Monitor HBC Visits

Once HBCVs are trained, supported and supervised, and strong linkages are established with facility staff, it will be important to monitor HBCVs activities. Consequently, the introduction of software to monitor HBC visits is proposed. The Outreach Home-Based Care Database Software Program will be installed on DOH computers to track HBC monthly visit rates, activities during visits, client conditions, and the number of OVC in target communities. The system includes paper forms that are filled out by HBCV and their CBO supervisors, and the data is then captured and analyzed at the District level. As part of its collaboration with MCDI-SA, the RPM Plus project has agreed to collaborate with MCDI-SA to help institute this system as a pilot test of the concept. MCDI-SA will collect and analyze the data initially and will train Ilembe District health information officers to continue using the system to monitor the performance of its ongoing HBC program with potential scale-up to the KwaZulu-Natal provincial level. This system will strengthen the capacity of the District Health Office in monitoring health events at the community level and provide data to show the breakdown by gender of those receiving care services. The data also will be used to monitor the project's HBCV activities and inform project management decisions. The ultimate focus of this tool is to provide feedback to service providers with a focus on quality improvement.

These results contribute to the PEPFAR 2-7-10 goals by improving access to and quality of care and support for PLHIV and their families.

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 6424.22856.09

Planned Funds: \$0

Activity System ID: 22856

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is being funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. This will no longer be funded in FY 2009 due to the existing National Institute for Communicable Diseases (NICD) Cooperative Agreement ending. A new Cooperative Agreement is now in place with the National Health Laboratory Service (NHLS), the parent organization for the NICD, and a smaller Funding Opportunity Announcement is being developed with the Sexually Transmitted Infections Reference Center (STIRC), an STD division within the NICD. The TB/HIV funds earmarked for FY 2009 have been moved into LAB for FY 2009, so that there are only 2 program areas for NHLS in FY 2009, LAB and SI. All existing program activities in these areas will be supported under the new NHLS Cooperative Agreement in the FY 2009 COP. Care, treatment, and a smaller SI budget will continue to be supported, but through a new TBD COP entry for a NICD continuation (STIRC) in FY 2009. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Budget Code: HBHC	Program Budget Code: 08
Activity ID: 13821.22862.09	Planned Funds: \$388,362
Activity System ID: 22862	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In order to provide comprehensive and quality services to the Southern African Clothing and Textile Workers Union (SACTWU) members and their families suffering from HIV/TB, SACTWU has recently negotiated and signed a memorandum of understanding (MOU) to build capacity and support at St Luke's Hospice in the Western Cape. SACTWU is currently in negotiation with a similar facility in KwaZulu-Natal. With SACTWU's support, St Luke's has been able to reopen a ten-bed ward that has been closed due to a lack of funding. Although SACTWU members will be provided with preferential access to these services, the use hereof will be extended to any HIV/TB-infected individual requiring care.

In order to provide a quality home-based care program, unemployed former SACTWU members will be trained on the national accredited home-based care program. This will consist of a full-time six-week home-based care and mentorship course which will then be complimented with DOTS training. Ex SACTWU members are trained on the national training program. It is a 59-day course inclusive of practical and theory. Theory work covers: home-based care (HBC) ethics; physical, social, psychological & spiritual needs of the client; creating a caring, safe environment; communication; sexually transmitted infections, HIV/AIDS/TB infections and control; nutrition; basic anatomy and physiology and common disease management. 180 hours is spent in the classroom on practical work, such as hygiene promotion, pressure care, basic observations, catheter care, nutritional care after which the carers are placed at care centres and receive four weeks on site practical experience. With FY 2009 funding, it is planned that these services will expand to all areas in the geographic scope of the project.

A home visit will be made and a psychosocial assessment will be conducted for all clients being initiated onto ART. A report is provided at the multidisciplinary team meeting on this assessment. Integrated Management of Childhood Illnesses (IMCI) components will be added to the current home assessment forms as well as to the home-based care visitation forms.

As the bargaining council clinics offer services to SACTWU members and their dependants, a family centered approach will be adopted at all sites and an early referral and retention in care service will be promoted. Wellness programs have been initiated at all sites for individuals that are HIV but not eligible for antiretroviral therapy (ART). Services include the support and encouragement of status acceptance and disclosure; psychosocial support; partner counseling and testing; prevention for positives; treatment literacy and adherence counseling and family support groups and counseling. A six-month cohort and defaulter system has been introduced to enable prompt follow up and tracing of individuals that do not return to the service outlet.

All care givers will be provided with ongoing psychosocial support in the way of group debriefing sessions provided by an external provider.

Skills development workshops will be implemented in all five provinces in which SACTWU services are provided. SACTWU has an existing care component for the program in KwaZulu-Natal which includes building capacity for HIV-infected workers and their families. The following skills development workshops are conducted which are geared as income generating activities for participants. These workshops currently include but are limited to the following: beadwork; food gardens; quilting; and floral arranging. It is planned to roll out the skills development workshops to all five provinces in which SACTWU operates. SACTWU plans to hold workshops once per month in all five provinces, with each session lasting up to three hours.

SUMMARY:

The Southern African Clothing and Textile Workers Union (SACTWU) project has received PEPFAR funding in previous years through a sub-agreement with the Solidarity Center, but in FY 2007, SACTWU received direct PEPFAR funding. SACTWU has a well-structured training program, initiated in 1999, that has evolved within the dynamics of the industry and includes basic facts on HIV, AIDS, abstinence, being faithful and condom use. The major emphasis area of the activity is training. Target populations include factory workers and people affected by HIV, HIV-infected women and business/ community/ private sector.

BACKGROUND:

The Southern African Clothing and Textile Workers Union is South Africa's largest trade union organizing textile and clothing workers. It also organizes footwear, leather and retail workers. Hence, SACTWU members form part of the economically active population that has been identified as being the hardest hit by the HIV and AIDS epidemic. Further, around 66% of SACTWU's membership is female. The prevention program is a three-level training program that starts with a foundation phase on the basic facts of HIV and AIDS, abstinence, being faithful and consistent and correct condom use (ABC). The FY 2008 the training will focus specifically on the issues of multiple concurrent partnerships, and intergenerational sex. These facts are reinforced and strengthened with the intermediate and advanced modules of training. The intermediate module deals with legal aspects and workplace policy development. In the advanced module, delegates are trained to become trainers, lay counselors and home-based carers. SACTWU also has an HIV and AIDS awareness workplace program where trainers take the training to floor level in 30-minute sessions in the factories.

SACTWU has a membership of approximately 110,000 members nationally. The SACTWU AIDS Project is a national program that provides prevention and care services in five provinces: KwaZulu-Natal, Western Cape, Gauteng, Eastern Cape and Free State. The SACTWU AIDS Project was initiated in 1998 and developed a national comprehensive program, with an initial focus on prevention. It has matured over the years to the point where it now has a well-structured comprehensive training program, provides "in house" testing and counseling (CT) services, access to a social worker in KwaZulu-Natal, runs income generating workshops, provides a primary package of care through the CT service, and provides home-based care

Activity Narrative: through its regional nurses and a home-based care network in KwaZulu-Natal. The nurses provide some level of support in the home through home visits, but this activity is mainly implemented by the home-based care network of 19 home-based carers who provide ongoing home-level support.

ACTIVITIES AND EXPECTED RESULTS:

SACTWU has not received PEPFAR funding for palliative care before. However, though the activities are new, they support the current prevention, counseling and testing (CT) and ARV services components.

SACTWU has an existing care component for the program in KwaZulu-Natal. These include counseling and therapeutic services on social problems to workers and their dependants within the industry to enhance their social functioning; to provide psychosocial support to HIV-infected workers and their families, including support groups; building capacity by running skills development workshops (e.g., food gardens, beadwork skills, cooking, cushion-making skills, and candle making skills). These activities are geared as income generating activities for participants.

In addition the FY 2008 funding provides for the palliative care of the ARV services program, including: screening for pain and symptoms; screening for TB, STI and OI including the management of opportunistic infections; cotrimoxazole prophylaxis; support groups for people on antiretroviral treatment, support groups for those who are HIV-infected but not yet on treatment, integrated preventions services, including prevention with positives and nutrition assessment, counseling and support.

The training programs involve skills transfer for income generation to the targeted participants. These participants include HIV-infected members of SACTWU and their families. The training frequency is expected to be once per month, lasting between 2 and 3 hours for each session.

For health workers, SACTWU has an in-house home-based care training program. There are 3 levels of training: Phase 1 - 2 day theory, 2 day Practical; Phase 2 - Mentorship Program; and Phase 3 - Field Assessment. The mentorship program is conducted at a step-down facility. The field assessments are conducted by the regional nurse who assesses the home-based carers on their skills at the home of a client. Once the assessments are complete the home-based carers are required to conduct 3 home visits on their own. Once the home-based carers have successfully completed the 3 home visits they are given a certificate of competency and are then deployed to provide service

With FY 2008 funding, these services will expand to the Western Cape, and possibly to other areas in the geographic scope of the project.

The SACTWU activities support the PEPFAR 2-7-10 goals of reaching 10 million people with care.

USG Agency: U.S. Agency for International Development

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$182,530

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Human Capacity Development (HCD)

Pact's primary focus in implementing the Umbrella Grant Management Program (UGM) is the development of human capacity in South African NGOs and CBOs to promote the establishment and strengthening of viable and sustainable civil society organizations. However, the COP guidance is very specific in terms of what can be included in Human Capacity Development (HCD) and for this reason Pact will only address the Leadership and Management development aspects of the UGM HCD activities.

Prior to the signing of grant agreements, Pact provides extensive assistance to partner organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact emphasizes to management staff during this process the importance of ensuring that program and finance units work as a team rather than in isolation. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of management to diversify their funding base and ensure sustainability.

Pact conducts organizational capacity assessments in collaboration with each partner. The core methodologies used in all of Pact's capacity building activities are as follows: assessment of sub-recipient organizational and technical capacity, development of institutional strengthening plans, delivering capacity building services, reassessment and refinement of institutional strengthening plans (ISP). Several individuals from partner organizations participate in the assessments in order to ensure that feedback is obtained from staff at all levels. This process develops the skills of senior management to objectively assess organizational strengths and weaknesses and utilize the results to develop a realistic strategy that will ensure that organizational objectives are achieved (including retention strategies for staff) and identified gaps are addressed. The strategy also details what interventions and support will be provided, by whom, when and how organizational change will be measured.

Pact also conducts workshops that primarily target senior management and board members. A resource mobilization course is offered annually to provide information to partner organizations on sources and strategies for diversifying their funding base. One day of the three-day workshop is devoted to developing the skills of participants in writing proposals. Board training is also offered annually to address issues related to fiduciary, legal and ethical roles and responsibilities of board members. Although Pact's Monitoring and Evaluation (M&E) course targets M&E and Program staff, senior management members of partners organizations are encouraged to attend in order to ensure that they understand how to utilize data to make organizational decisions.

Pact, in working with partner organizations over the course of the past four years, has recognized that management skills among the leadership of many of the civil society organizations need to be further developed. For this reason, utilizing FY 2008 and 2009 funding, Pact will identify short-term management courses in South Africa that will enhance leadership and management skills. Attendance to leadership courses will be made available to all partner organizations and their sub recipients but will primarily target the partners that have experienced great difficulty in transitioning to the increased funding levels or have new management staff and structures.

Alignment with National Strategic Plan (NSP) or other South African Government (SAG) policies or plans

In developing program descriptions with partners, Pact ensures that activities are aligned with district and provincial business plans, the NSP and/or other SAG policies or plans.

Gender

Pact ensures that gender related activities are clearly articulated in partner's program descriptions and implementation plans. Programmatic and technical assistance provided to partners addresses gender issues as part of the assessments and recommendations for strengthening technical and organizational capacity.

SUMMARY:

Pact's Rapid Response for HIV and AIDS in South Africa is an umbrella grant mechanism for USAID PEPFAR grants identified through a USG interagency competitive (APS) process. Pact's primary goal is to build sustainable institutional capacity and increase the effectiveness of local partners to achieve expanded and quality services in the spectrum of palliative care. Primary targets include non-governmental organizations (NGOs), private voluntary organizations (PVOs), and faith-based organizations (FBOs). Pact's major emphasis is the enhancement of local sub-partner capacity through the development and implementation of documented organizational systems and procedures and human capacity development at management and operational levels.

BACKGROUND:

Since 2004, Pact has facilitated the efficient flow of grant funds during the rapid scale-up of the PEPFAR South Africa program. Pact provides PEPFAR funding and assistance to over 30 total PEPFAR partners and sub-partners in South Africa playing valuable roles in the fight against HIV and AIDS.

Pact has contributed to the 2-7-10 PEPFAR goals through support to 8 partners providing palliative care to over 80,000 individuals infected and affected by HIV and AIDS. These partners equip government clinics and hospitals with the human resources including doctors, nurses, pharmacists and counselors. They offer

Activity Narrative: specialized training and infrastructure renovation required to more effectively serve their communities. In addition, these partners work closely with new and established hospices to develop, improve, and evaluate current services to ensure hospice accreditation in accordance with national and global standards of palliative care.

Palliative care services extend beyond patient facilities and include the support of grassroots initiatives for home-based care, prevention, and positive living activities. Partners engage private doctors, traditional healers, church groups, and people living With HIV (PLHIV) support groups to extend and enhance the networks for entry point and follow-up care. During their partnership with PEPFAR, these providers will increase their reach two to three-fold. This scale-up will require strong financial, monitoring & evaluation, and management systems to both accommodate the growth in reach and maximize sustainability. In FY 2008, Pact will continue to provide capacity building support through training and mentoring necessary to further develop and strengthen partner organizations. Pact will also facilitate the sharing of these systems between emerging and well-established partners and reinforce the use of data and reporting for strategic decision making.

ACTIVITY 1 - Grant Management

Pact conducts a participatory assessment of each partner organization and collaboratively develops an organizational capacity building strategy that details planned interventions. These assessment results also inform Pact of what type of assistance must be provided urgently in order to ensure that the organizations comply with USAID rules and regulations.

Prior to the signing of grant agreements, Pact provides extensive assistance to organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact assists partners in developing realistic cost share levels and emphasizes the sustainability aspect of this requirement. After the signing of the agreement, Pact works with each partner in developing a very detailed annual work plan that includes specific activities to be implemented, timelines, budgeted amounts, target beneficiaries and projected reach. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of partner organizations to diversify their funding base and ensure sustainability. Consistency with National Guidelines is emphasized.

ACTIVITY 2 - Human Capacity and NGO Development

Pact has developed a customized training series to orient new partners and their sub-partners. The training series includes basic and advanced grants and sub-grant management which addresses USAID rules and regulations, good governance and minimum financial management standards. Monitoring and evaluation courses cover basic principles of monitoring and evaluation and PEPFAR data requirements as well as internal data quality assurance. Refresher courses are also offered throughout program implementation. Pact also ensures that ongoing, intensive on-site training and mentoring is provided to partners and sub-partners. On a quarterly basis, Pact assesses the level and type of assistance required by each organization and develops a site visit plan that ensures that the necessary support is delivered to each partner and sub-partner. Pact organizes and supports technical consultation meetings for the sharing of best practices and lessons learned among PEPFAR and non-PEPFAR partners. As required, technical assistance from select regional and international providers is sourced to assist partners in improving their technical capacity.

ACTIVITY 3 - Monitoring and Evaluation (M&E)

Pact assists each grantee in developing a results framework that tracks success against both PEPFAR program and organizational indicators. Pact further assists partners and sub-partners in the development of monitoring, evaluation and reporting (MER) plans and systems. Participation in a five day M&E training is mandatory for all partners prior to full implementation. Pact provides additional M&E assistance to all partners in the following areas: review and development of effective data collection, analysis and reporting tools; setting realistic and achievable targets; establishing and strengthening data quality management systems, conducting internal data quality audits and verifying and validating partner and sub-partner data submissions

ACTIVITY 4 - Program and Financial Monitoring

Pact recognizes the importance of monitoring partner and sub-partner program progress and early identification and resolution of implementation issues. Pact has frequent and regular contact with partners and if technical/programmatic gaps or problems are identified, ensures that issues are promptly addressed and resolved.

In addition to monitoring program progress, Pact closely monitors partner financial management and ensures that grants funds are utilized only for activities approved by USAID under PEPFAR funding. All partners submit monthly financial reports that detail and document expenditures. Once Pact has ascertained that the partner has implemented and/or strengthened financial management systems which fully comply with USAID regulations, the documentation requirement is removed and only the monthly reporting requirement remains in effect. Pact finance staff visit partners every quarter to audit program expenses and accompanying documentation, compliance with USAID rules (including branding requirements) and cost share.

ACTIVITY 5 - Technical Assistance

Pact will provide and manage direct technical assistance in prevention, care and support strategies for all sub-grantees. Pact technical staff will conduct assessments and provide consultation and training on the

Activity Narrative: development and implementation of programs and services (in line with best practice models, donor and SAG recommended methodologies and standards). In addition, sub-grantees will be supported with guidance and ongoing assistance on the design and delivery of partner HIV and AIDS curricula, training modules and publications. Pact will also work closely with partners to ensure the effective incorporation and strengthening of nutrition and food security, protection services, gender mainstreaming, and human capacity development in existing programs.

Activity ID: 16273.22968.09

Planned Funds: \$291,271

Activity System ID: 22968

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 5: Pre-Court Training:

Greater Mpumalanga Rape Intervention Program (GRIP) will continue to utilize the training program of the Child Witness Program - complete with the toolkit as purchased. GRIP is able to provide an intense 4 day training program to all children and adults who need empowerment in order to become confident witnesses. GRIP also holds a graduation party for all rape survivors who the Pre-Court trainers (Friends of the Court) feel is competent to go to Court. These trainings are done on a continuous basis and there are always new children in the court systems that need help and support. The Pre-Court training is done on Saturdays when there are no court cases and when the children are not attending school. As a result of negotiations with the Department of Justice, GRIP is allowed to use the courts on Saturdays in order to train the survivors within the Court Setup and to sensitize survivors, especially children, within the court building and court chambers. During one day of the training, a prosecutor from the Department also takes part in the Pre-Court Training and shows the survivors, through role play, how to act when testifying in court. The survivor will also receive ongoing support and the help of a witness assistant when she/he enters and proceeds through the court system, and her/his rights and dignity will be protected by the GRIP Friend of the Court who is working from within the court itself on a daily basis. Separate Victim-Friendly Waiting rooms and Child Intermediate rooms are also operated and maintained by GRIP within the court.

GRIP activities include both Adult and Child Care and Support services and includes physical, psychological, social and integrated care. The approach is to provide integrated care and counseling services within our program to the survivors of rape, sexual assault and domestic violence. Since GRIP only receives funding in Adult Care, it has included all survivors with whom GRIP works who report their cases within the Criminal Justice System, regardless of age, gender or race.

ENHANCEMENTS:

These activities bring together, in a holistic, coordinated fashion, a myriad of essential social support services for people who have been sexually assaulted, many of whom become infected with HIV as a result. The GRIP program provides a vehicle for the seamless integration of comprehensive services that provide care and support for groups that are at high risk of HIV infection.

Thirty community members who are working as Volunteer Counselors will be receiving ongoing training, monitoring, supervision and support in order to develop human capacity regarding job performance, reaching of objectives, personal empowerment, and to ensure professional and effective service delivery.

The Administration Officer will receive ongoing training, capacity building, monitoring, supervision and support in order to ensure sufficient and effective management, financial control, and structure within the organization. The Area Managers and the Monitoring and Evaluation Officer will receive human capacity development in order to ensure the ongoing and effective monitoring of all indicators, targets, inputs, outputs, outcomes and objectives to be reached. The Area Managers will also ensure the effective operations of six Care Room facilities that are situated within police stations and hospitals and therefore the Human Capacity Development of these governmental facilities will also improve. The Monitoring and Evaluation officer will also be able to monitor and assist the two Friends of the Court, who are rendering their Witness Assistance and Pre-Court Training activities from the two court facilities, also improving the human capacity development for the Department of Justice. Human Capacity Development will aim at ensuring that Volunteer Counselors and GRIP staff are adequately trained and capable of empowering survivors of rape, domestic violence and sexual assault. In addition, GRIP provides extra and ongoing human capacity support to the Criminal Justice system, which is often understaffed and not well-trained in the fields of their service delivery.

Within this priority area GRIP is working with victims of sexual assault, rape, domestic violence and those infected or affected by HIV as a result of sexual assault. GRIP is helping the government to make sure that everyone in South Africa can get all the necessary services from government, from non-governmental organizations (NGOs) and from private practitioners. GRIP ensures that people know about all medicines used in the management of HIV and AIDS- including ARVs, and know how to take care of them. GRIP supports survivors in taking these medications. GRIP ensures that clinics provide support to people living with AIDS and help with community outreach so that people living with HIV and AIDS and their families are getting the support and treatment that they need. GRIP ensures care, love and non-discrimination for our survivors and those who are HIV-infected. GRIP assist the Government in making sure that the health care system is strong enough to support people who are living with HIV or are affected by sexual assault.

GRIP increases the amount of people working within the Criminal Justice System.

By ensuring that the rights of people who are exposed to sexual assault and living with HIV are legally protected and that these people are treated with dignity and respect falls in line with the South African Government's National Strategic Plan priority area 4: Human Rights and Access to Justice.

GRIP is ensuring that people who are sexually or physically assaulted get justice, counseling and treatment and understands why people may have problems getting services.

GRIP also ensures that the rights of women and girls are understood and respected so that secondary trauma can be reduced when they need to enter the Criminal Justice System.

GRIP lobbies that all existing laws to ensure the safety of women and children are carried out and focus on the needs of people in abusive relationships, and making sure they get the help they need.

Activity Narrative: SUMMARY:

Greater Mpumalanga Rape Intervention Program (GRIP) provides basic health and care services to sexually assaulted/domestic violence survivors and people living with HIV (PLHIV). GRIP is involved in palliative care by supporting care rooms in hospitals, courts, police stations, and providing community-based support. The emphasis areas are gender and human capacity development. Primary target populations are survivors of sexual assault including children and adults, and PLHIV and their families.

BACKGROUND:

GRIP was established in 2000 in response to the high levels of sexual assault and domestic violence and the concordant high levels HIV and AIDS infection transferred to survivors. GRIP was initiated by volunteers and seeks to empower women, men, and children by providing comprehensive basic health care services. GRIP's approach to providing care services was established in consultation with volunteers, survivors, PLHIV, and community, to offer the services that best meet the needs of the community.

ACTIVITIES AND EXPECTED RESULTS:**ACTIVITY 1: Hospital Care Rooms**

GRIP will support care rooms in hospitals to provide clinical and psychosocial support to survivors of sexual assault including children and adults. The medical care rooms are maintained by GRIP and open twenty-four (24) hours, 7 days a week. With support from the Department of Health, care rooms have a full time forensic professional nurse during the day alternating with the doctor on-call in the evening. Survivors undergo examination, are screened for STIs and OIs, receive treatment and cotrimoxazole as appropriate, and receive post-exposure prophylaxis and other necessary medication. In addition, survivors receive psychosocial support, counseling and testing, and are also referred to support groups to assist with recovery.

ACTIVITY 2: Police Care Rooms

GRIP will open care rooms in police stations where victims can report their cases and receive comprehensive care services including protection. GRIP has existing Victim-Friendly Facilities in some police stations which also operate 24 hours, 7 days a week. At these facilities, J88 Forms (police dockets) are completed to open cases against the perpetrator, and psychosocial support and practical assistance is offered. Each care room has an Area Manager who oversees the daily operations to ensure that necessary procedures are followed and services are offered to the survivor once the case is reported. These care rooms are an initial entry point for psychological support and survivors are referred to hospital care rooms in Activity 1.

ACTIVITY 3: Community-based Support for Survivors

The community-based support for survivors is integrated with the Care Rooms operations. Survivors are allocated counselors who offer them service in the care room and conduct follow-up thereafter. These same counselors will remain the support counselors to the survivor throughout the program. These counselors will then visit survivors at home for the provision of psychological and social support. A holistic approach is employed, an integrated approach to holistic social welfare intervention, where survivors of sexual assault and domestic violence needs are addressed in collaboration with other stakeholders, for example the Department of Education, Health and Social Services, Justice, Safety and Security, and Home Affairs. GRIP acts as the eyes and ears of each community. By conducting these home visits, GRIP accesses each family's and individual's unique care needs, and can refer and act upon accordingly. Confidentiality and privacy is respected.

ACTIVITY 4: HIV and AIDS Support Groups for Survivors

The goal of the HIV and AIDS support group is to establish, build and facilitate area-specific sites for an ongoing support system, catering to HIV-infected persons, which offers a forum for continuous information and sharing of life experiences, for mutual benefit to those needing or requesting it. These groups are facilitated by trained counselors and have more or less 15 persons to meet on a twice a month basis for a 6 month period. The venue for the meetings will be sourced through collaboration with traditional leaders or community halls. These meetings will enhance the psychological, spiritual, and social aspects of palliative care.

Through the support groups, a major component will include the following activities: acceptance, disclosure, prevention with positives, opportunistic infections, adherence counseling, treatment literacy, nutrition, and counseling.

Through the provision of clinical, psychological, social, spiritual, prevention and victim empowerment interventions, these activities contribute to the PEPFAR goal of reaching 10 million with care.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 226.09	Mechanism: N/A
Prime Partner: Foundation for Professional Development	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 13753.22957.09	Planned Funds: \$847,600
Activity System ID: 22957	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2009 funding for the Foundation for Professional Development (FPD) will be used to support the expansion of adult HIV care and support services and to strengthen adult human capacity development (HCD) within all the provinces where FPD works. Activities in support of adult HIV care and support focus on: strengthening and integrating public and civil society service delivery models for people living with HIV (PLHIV); collaborating with the South African Government (SAG) to build sustainable human and institutional capacity to support integrated adult HIV care and support services; promoting family-centered services through the integration of pediatric and adult HIV care programs; promoting the basic care package aimed at promoting early referral and retention in care; supporting surveillance activities monitoring continuity of care and integration with counseling and testing (CT), TB and HIV care and support programs; and expanding FPD's adult specialist mentoring and referral support to strengthen doctor and nurse capacity to provide quality adult HIV care and support; expanding integrated preventive service, psychological care, spiritual care and social care in all HIV care and support sites; implementing routine TB screening and active TB case finding in all HIV care and support settings; improving the linkages with and providing support to hospices whereby FPD-employed clinical staff does ward rounds in order to ensure a continuum of care between treatment sites and hospices for all adult HIV patients.

The adult HIV care and support program will continue to expand a multi-sectoral model of care provision that leverages diverse resources from within a geographical area; this model has proven to be extremely cost-effective as it leverages substantial philanthropic and volunteer resources. FPD will work closely with faith-based organization (FBO) and non-governmental organization (NGO) partners to expand access to clinical care for populations whereby the public sector facilities are not able to provide such care. FBOs and NGOs that enroll patients in care and support programs will be supported with access to CD4 counts and cotrimoxazole prophylaxis.

All FPD-supported sites will ensure that patients have access to PLHIV-led patient support groups to maximize patient retention. The work of these support groups will be directed to focus on: status acceptance and disclosure; stigma and discrimination; violence and coercion; male norms and behaviors; gender equity; partner counseling and testing; treatment literacy and adherence; prevention of positives; nutrition; alcohol; and safe sex and family planning. Support groups will also serve to link the health facility with the community to promote a continuum of care, as well as actively trace support group members.

New activities will target the promotion of family-centered HIV care services. Activities will include: piloting booking systems that allow families to gain access to services on the same day as a unit; and supporting promotional and awareness campaigns encouraging disclosure and CT services for all family members.

The antiretroviral therapy (ART) clinical quality assurance system that has been developed through collaboration between FPD and JHPIEGO will be expanded to all facilities offering adult HIV care and support. This system uses a standards based measurement and rating (SBMR) approach with an aim to identify and respond to challenges to improve quality of adult HIV care. SBMR activities will be implemented by facility staff on a routine basis and by external auditors periodically.

FPD will also start a course on pain assessment and management to be rolled out to health care professionals country-wide. All FPD supported care sites staff will also receive such training to ensure that pain is assessed appropriately and that there is no delay in referring patients in pain to medical services where necessary.

The electronic medical record (EMR) that is utilized by FPD-partnered ART clinics will be expanded to encompass general HIV care and wellness activities and be available at all ART sites and be piloted at five adult HIV-palliative care sites which provide the basic package of care components (e.g. psychological care, spiritual care and social care). The EMR was developed at the direct request of the Tshwane District of Health in order to strengthen and harmonize facility-based monitoring systems while ensuring that data quality and data use are integral components of the process. Key activities for the EMR include strengthening the integration of various HIV service points (CT, TB, HIV-palliative care, ART) and optimizing inter-connectivity with existing SA DOH systems (District Health Information Systems; National Health Laboratory Systems). In support of these activities, FPD will place a strong emphasis on didactic training and ongoing on-site mentorship to build sustainable, local monitoring and evaluation and HMIS systems.

The electronic medical record (EMR) is supported on an integrated virtual private network which allows for the electronic transfer and/or access of data between different HIV service points. This inter-connectivity holds great potential in terms of monitoring service integration and continuity of care within a district. In the EMR, the electronic HIV and AIDS data will be held in a physically and technically secure environment with minimum data repositories and limited individual access. Data access will be determined by designated user roles and rights. The existing defaulter tracer module will support active tracing of missed appointments, mitigate loss to HIV care and work in support of appropriate and early ART initiation for PLHIV.

SUMMARY:

The Foundation for Professional Development (FPD) supports the expansion of access to comprehensive HIV and AIDS palliative care by focusing on human capacity development with a view to increasing the detection and treatment of patients with TB and HIV co-infection. The emphasis areas for these activities are local organization capacity building and HCD. Target populations for these activities include people living with HIV and AIDS (PLHIV) and most at risk populations.

BACKGROUND:

Activity Narrative: FPD is a South African Private Institution of Higher Education working exclusively in the health sector in Southern Africa. With PEPFAR funding, FPD supports the public sector expansion of access to comprehensive HIV and AIDS care by focusing on provision of antiretroviral therapy (ART) and increasingly basic health care (wellness programs) for people living with HIV (PLHIV) who do not yet require ART. Due to the acknowledged drop-off of patients who test positive for HIV between testing and actually entering ART the basic care program attempts to provide a continuum of basic care at places of testing to ensure retention of patients.

This approach allows patients to be enrolled in a care support program that allows regular contact with health care providers, monitoring of CD4 counts and early referral of patients into ART programs. Activities include supporting the establishment of such programs in public sector, NGO and FBO CT sites, through the provision of staff, training, equipment purchase, technical assistance, mentoring, and refurbishment of facilities. Care programs offer psychosocial support through support groups and individual counseling and treatment of opportunistic infections. The program also includes dedicated staff (tracers) who follow-up on any patients who drop out of the program to determine the reason and where possible attempt to convince such patients to return to the program. The emphasis areas for this activity are human capacity development, gender, local organization capacity development and construction and renovation. Coordination with provincial Departments of Health (DOH) takes place through Memorandums of Understanding (MOUs). FPD provides substantial assistance initially to public sector facilities and works towards a diminished role over time, working towards sustainability at the sites. Sub-agreements are used to partner with NGOs and FBOs to provide care support services where public sector facilities are either overcrowded or not accessible. Gender issues are embedded in all aspects of the project and include collecting gender-specific data in treatment programs, linkages with NGOs working in the gender field, CT services that specifically focus on couple counseling, domestic violence and abuse detection. Other issues addressed by this project are: 1) Male norms and behaviors that are addressed in the counseling provided at basic care sites. All staff actively work towards reducing violence and coercion by identifying victims of violence.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support to Government ART, CT and PHC clinics

PEPFAR funds are used to respond to requests from provincial DOH to support South African Government (SAG) ART, CT and Primary Health Care Clinics (PHC) through temporarily seconding clinical and administrative staff, providing equipment, refurbishment and technical assistance. The FPD-supported staff will play a critical role in introducing the provision of basic care programs at these sites as they will supplement to government staff. Patients enrolled in such programs will be linked into the electronic patient record system currently supporting patients on ARVs to allow patient tracking, mentoring by FPD specialists and early referral to treatment facilities.

ACTIVITY 2: Support to NGOs and FBOs

Numerous NGOs and FBOs in the areas where FPD supports ART services are involved with CT activities but seldom provide basic care, FPD will partner with these organizations to expand their services to include a basic care component, including regular monitoring of CD4 counts at six month intervals, diagnosis and treatment of opportunistic infections and psychosocial support. Patients enrolled in such programs will be linked into the electronic patient record system currently supporting patients on ARVs to allow patient tracking, mentoring by FPD specialists and early referral to government treatment facilities. It is anticipated that this activity will also leverage existing resources in these organizations in support of basic care programs and to expand the services provided to patients enrolled in the basic care program especially for psychosocial support and income generation. FPD will also provide additional support through its Compass Project, an organizational development project funded by the Dutch Government. This project provides technical assistance to help develop and strengthen these local organizations in the areas of governance, management, and M&E.

ACTIVITY 3: Referral and linkages

FPD will continue to strengthen and expand the referral networks and linkages of its partner NGOs and CBOs with care and treatment services for clients identified to be HIV-infected. Linkages with community mobilization and outreach activities will be initiated to promote the uptake of both HIV CT and basic care services, including the regular monitoring of CD4 counts, treatment of opportunistic infections including the provision of cotrimoxazole, and psychosocial support.

FY 2008 COP Activities: Although FPD has not in past years been funded for basic care activities such activities were conducted at the ART sites that FPD supports. New activities will include expanding care support activities to where CT takes place in both public and civil society facilities. This will help to ensure that those who are HIV-infected but not yet eligible for treatment are enrolled in a care program. Where feasible such programs will also be introduced at Primary Care facilities. A critical component will be integrating patient data from basic care programs into the electronic record system that currently supports patients on ART; this will allow better patient tracking and referral and allow the FPD clinical mentoring team to also support patients on basic care.

FPD will contribute to the PEPFAR goals of 2-7-10 by developing the capacity of organizations to expand access to ART services for adults and children, building capacity for monitoring ART service delivery and reaching thousands of individuals with care and ART.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 2312.09	Mechanism: N/A
Prime Partner: National Association of Childcare Workers	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 12366.22992.09	Planned Funds: \$194,181
Activity System ID: 22992	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

There is a need to formally evaluate the 'Caring for Carers' program. In addition, the new design of the bereavement counseling/grief work for young people heading households, grannies heading households and Isibindi child and youth care workers cannot be initiated in FY 2008 due to funding limitations. In view of the importance for the expansion of the Caring for Carers program, as well as the importance of developing more effective models for advanced grief work, the NACCW will consider making efforts to raise cost share funding for these programs in both FY 2008 and FY 2009.

SUMMARY:

The National Association of Childcare Workers (NACCW) provides accredited child and youth care training to community members in order to provide holistic services to family members of OVC. Funding will be used in the emphasis areas of training and community mobilization, developing referrals and linkages, and conducting needs assessments. Primary target populations are HIV-infected families and their caregivers, and community organizations.

BACKGROUND:

NACCW is the only South African NGO focusing on provision of specialized, professional training in child and youth care. NACCW has developed a unique community-based child and youth care response to the HIV and AIDS crisis called the Isibindi Model. This program trains unemployed community members in an accredited child and youth care course and provides an integrated child and youth care service to child headed households and vulnerable families through partnerships between NACCW and community-based organizations. This project is part of a larger initiative of the NACCW to replicate the Isibindi Model nationally in partnership with the Department of Social Development (DOSD). Since 2004, PEPFAR has supported 24 of NACCW's 40 Isibindi projects, providing direct services to 10 891 OVC and training for 430 child and youth care workers in 7 provinces in South Africa. The NACCW also offers this accredited training to other PEPFAR funded projects. From FY 2007 PEPFAR funding has supported palliative care activities. To promote the sustainability of the NACCW Isibindi childcare model, public-private partnerships will support the program in selected provinces. Partners include De Beers Fund, Anglo America Chairman's Fund, AngloGold, Royal Netherlands Embassy, UNICEF, ABSA Bank and the Impumelelo Innovations Award Trust.

ACTIVITY 1: Clinical Services for Family Members of HIV-infected and OVC

Child and Youth Care Workers (CYCW) will provide information on clinical services and refer OVC and their families for screening of pain and symptoms, diagnosis, treatment services such as TB or ARVs. CYCW will regularly follow up to ensure that services are accessed and to provide adherence support for adults and children on treatment. CYCW will be capacitated to identify children requiring clinical services or hospitalization and to provide referrals to children and family members. NACCW will ensure each Isibindi site is linked to a network of clinical care services and providers. The NACCW has a non-PEPFAR program called Masihlangane: Make a Difference which focuses on securing funding for food parcels for the Isibindi projects. Essential nutritional requirements through the food parcels will be provided to children and families who are on antiretroviral treatment. This will complement the treatment process.

ACTIVITY 2: Psychological/Social Services for OVC and their Families

CYCW will assist family members of HIV-infected and OVC with a range of social and psychological services. This will include providing information on and assisting caregivers to access disability grants and other forms of economic support. CYCW will also provide family counseling and assist with succession planning. This will include ensuring caregivers have wills, making arrangements for the care of children, ensuring children have birth certificates and identity documents and providing support for disclosure. CYCW will provide bereavement support and counseling and refer family members to social workers and other support services. CYCW also ensure that families live in hygienic and safe home environments and assist family members to maintain their households.

ACTIVITY 3: Training of CYCW

CYCW in Isibindi project sites will be trained by Bigshoes on a 5-day program focusing on providing palliative care services to OVC and their families or caregivers with the aim of delaying orphanhood. This will include providing referrals to clinical services, follow ups and providing social and psychological services designed to support family caregivers and sick OVC. Monthly Regular mentorship will ensure that CYCW are able to implement the services and provide quality care and support to family members of HIV-infected individuals and OVC.

ACTIVITY 4: Care for Caregivers

NACCW will contract the services of registered therapists to provide support to CYCW in all Isibindi sites, thereby facilitating deeper and more sustainable relationships with their clients. The less they are burdened by their personal feelings and stories, the more emotionally available they will be for their clients. They should also begin to develop a healthy discrimination for appropriate levels of involvement with their clients. The support will include debriefing sessions, workshops and individual counseling in a structured six-month program. It is anticipated that this intervention will reduce burn out, psychosomatic symptoms among CYCW, increase the quality of services provided and improve the long-term sustainability of the program.

In all of the above activities, OVC will be counted only in the OVC program area. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

Activity Narrative: PLHIV will receive at least one clinical and one other category of palliative care service.

These activities will contribute to meeting PEPFAR's goals of providing 10 million people with care and support, including family members of PLHIV and OVC.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 2803.09	Mechanism: N/A
Prime Partner: Olive Leaf Foundation	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 3303.23152.09	Planned Funds: \$572,130
Activity System ID: 23152	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1 (Support Group Mechanism):

A) Hope worldwide South Africa's (HwwSA) 10 week 'Living with Hope' education series has been revised based on input received from people living with HIV (PLHIV) support group members and support group coordinators. Prevention with Positives, Parenting skills, and Therapeutic Measures for Self Care topics will be added to the series.

The HwwSA-adapted Nutritional Guideline will be implemented during FY 2009. Topics on Nutritional Education which will also be included in the series in line with the guidelines. Topics that will be included are: energy requirement of PLHIV and pregnant woman infected with HIV; food and safety recommendations; recommendations for treatment; and management of opportunistic infections and ART side effects.

The education program has now been extended to 15 weeks. PLHIV will meet once a week with HwwSA support-group coordinators. Coordinators will continue to facilitate the sessions in an interactive manner, covering a range of topics relevant to HIV and AIDS. A pre- and post-questionnaire will be used to evaluate the effectiveness of the series and its impact on participants.

B) HwwSA will pro-actively facilitate income generating partnerships between the private sector and the support group members who have already graduated from the 'Living with Hope' education series and formed their own support groups ('open' support groups). Support from the private sector will contribute to sustaining income generating activities established within the 'open' support groups.

C) Gender-related activities: Care and Support and Abalingani program collaboration
Program activities will include: facilitating workshops and training to support group members on gender-related issues, providing mentoring after workshops, establishing male support groups that focus on particular issues of masculine health and referring PLHIV and their family members to service providers as appropriate.

The expected outcome of the collaboration is to reduce gender-based violence, to increase male involvement in care and support of the sick, and to improve communication within families and awareness of sexual rights amongst PLHIV.

D) Several trainings will be outsourced and will mostly target PLHIV support group members in order to empower PLHIV with the ability to partake in economic strengthening activities. These include Gardening, Nutrition, Entrepreneurial Skills, and Catering.

ACTIVITY 2 (Home-based Care):

A) A proactive approach to identify clients infected by TB will be encouraged. During routine home visits, clients that present with symptoms of TB (based on the Centre for Disease Control's symptom based questionnaire) will be referred to the closest clinical support structure (CSS) and follow up will be done regarding test results and treatment adherence.

Clients infected with TB will be visited regularly to ensure treatment adherence. Vitamin B6, ready to use therapeutic food and a basic food parcel will be provided to TB infected clients based on the outcome of nutritional assessments. Weak clients will be accompanied by fieldworkers to the closest CSS for further care and support.

B) PLHIV will receive a broader spectrum of services during routine home-based care visits. Such services will include education on issues related to chronic disease and treatment, support through nutrition and therapeutic measures and education on the use of therapeutic measures for self care. The overall outcome of the above mentioned strategies will ensure a more holistic care package for PLHIV.

C) The HwwSA-adapted Nutritional Guideline will be implemented in FY 2009. Activities will include a baseline nutrition and dietary assessment when a client is first met; ongoing nutritional information education and counseling; follow up assessments based on initial findings and guidelines; food distribution to clients meeting the criteria stated in the guideline; food preparation education; supplementation and micronutrient provision (according to the guideline); referral to clinical (e.g. South African Government Clinics) or non-clinical (e.g. Department of Social Development) support structure.)

D) Training specifically focused on improving care and support activities will be provided to HwwSA staff, stakeholders and PLHIV, by HwwSA.

The full 69 day 'Home-based care training' will not be provided in FY 2009 as a result of budget constraints. Rather, four adapted five-day trainings will be provided. The modules included in the trainings will be adapted from the 69 day 'Home-based care' training. The trainings will include: Basic ART Information and Adherence Counseling; Gender-based Issues, Nutrition, and a Home-based Care refresher course provided only to people previously completing the 59- or 69 day Home-based Care course.

Secondary Cross-Cutting Budget Attributions Description:

Food and Nutrition: Policy Tools and Service Delivery

HwwSA will adapt national and international nutritional guidelines for PLHIV to better address issues that have been identified as challenges in FY 2007. The resulting internal guidelines will inform changes that will be made to the training curriculum and implementation plans for FY 2009 that will ultimately improve the quality of services delivered at community and household levels. The nutritional enhancement activities will be incorporated within the program's home-based care, training, and support group activities.

Food and Nutrition: Commodities

Activity Narrative: In accordance with the PEPFAR HIV and Food Security Conceptual Framework, HwwSA will provide therapeutic measures and treatment addressing dietary complications caused by HIV infection and ART. The following will be provided by the HwwSA care and support program:

- i) Ready-to-use therapeutic foods will be procured and provided to clients suffering from mild to moderate malnourishment, oral and oesophageal ulcerations and candidiasis. Vitamin B6 (micronutrient supplementation) for the treatment of peripheral neuropathy will be administered intramuscularly by the HwwSA professional nurses during home-based care visits.
- ii) Multi-vitamin supplementation and food parcels will be provided to the following beneficiaries: Pregnant woman infected by HIV and challenged by the affects of ART and/or those infected by TB (pre- and post-natal)
- iii) Food parcels will be delivered to clients meeting the food parcel eligibility criteria.
- iv) Referring severely malnourished clients to Clinical Support Structures (CSS) and accompanying the weak. HwwSA has developed well established referral networks with CSS throughout the South African sites.

SUMMARY:

Hope worldwide South Africa (HWSA) will continue activities to provide and strengthen comprehensive care and support of people living with HIV (PLHIV) and their families through community-based support groups and home-based care (HBC) programs. Activities will use a family-centered approach and HWSA will receive support from HPCA to strengthen clinical care services provided to its clients. The target populations are PLHIV and their families and the emphasis area is increasing women's access to income and productive resources, and human capacity development through in-service training.

BACKGROUND:

The activities described below are part of an ongoing Basic Care and Support program of HWSA, funded by PEPFAR since FY 2004. HWSA and their community partners will implement all activities. The HWSA project is managed through an umbrella agreement with PACT, Inc.

ACTIVITIES AND EXPECTED RESULTS:

HWSA collaborates with over 52 local government clinics to provide care and support services. HWSA has established 52 support groups for PLHIV, most of which are integrated into the existing health care system. In FY 2006, HWSA provided 5520 clients and 734 family members with palliative care services. Through a sub-grant to the Soweto Hospice, HWSA has provided 609 home-based care (HBC) clients palliative care services through HBC visits. HWSA has three separate activities in this program area. A family-centered approach will be implemented to ensure that both clinical and supportive needs of HIV-infected adults, children and family members, including OVC, are addressed. Care and support field staff will work in tandem with OVC staff and volunteers. Both care and support and OVC activities at site level will be centralized and managed by the site coordinator.

ACTIVITY 1: Support Groups

The first activity is to provide and strengthen comprehensive care and support of PLHIV through community support groups. HWSA has reached over 6000 PLHIV through its 52 support groups to date. HWSA will continue to facilitate 52 support groups in disadvantaged communities covering 5 national sites located in the Gauteng province, Mthatha and Port Elizabeth in the Eastern Cape province, in Durban in KwaZulu-Natal and in Cape Town in the Western Cape.

PLHIV support groups operate primarily out of local health facilities. The integration into DOH facilities will help ensure government collaboration and facilitate access to appropriate clinical services for clients, including ARV services. At clinics that do not provide ARVs the clients will be referred to appropriate SAG hospitals or clinics. Facility staff will be trained to provide basic clinical services including screening for symptoms and pain management. In addition, HWSA will work closely with provincial government to collaborate and report on progress. New PLHIV referred to support groups will attend HWSA's basic HIV and AIDS education course 'Living with Hope' in which clients meet with facilitators weekly over a period of 10-weeks. The course will be revised and updated to strengthen topics such as prevention with positives, ARVs and adherence, and nutrition. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The course will be disseminated as a training resource to key stakeholders, allowing for the scale-up of community support groups. Selected PLHIV graduates of the course will be invited to assist with facilitation of support groups as well as the course.

ACTIVITY 2: Home-based care services

The second activity is providing HBC for PLHIV. HWSA at all its sites will provide a range of HBC services to clients, including psychosocial support, nutritional support, spiritual support, referrals, clinical support and integrated prevention services. Levels of clinical support include screening for pain and symptoms, screening for STIs and OIs with appropriate referral including referral for cotrimoxazole. HWSA will work closely with government HBC efforts for necessary referrals and follow up.

Ongoing psychosocial and spiritual support will be offered to all clients and their family members with a special focus on elderly female caregivers. Through wraparound programming, non-USG funded food parcels sourced from partners such as Tiger Brands and supermarket outlets will be provided to needy clients identified by staff and volunteers.

Activity Narrative: Income generation activities, supported by organizations such as Golden Cloud/Tiger brands, will support livelihood strengthening and job creation. These activities will principally target HIV-infected and affected women. Human capacity development at community level will be strengthened through training PLHIV in facilitation of support groups, peer education, ART, facilitation skills and counseling. As a result, trained PLHIV will facilitate support groups and other services to members. This will promote GIPA (Greater Involvement of People Living with HIV and AIDS).

Home-based care sites will be strengthened with Nursing staff in all the sites. Nurses will then train staff, volunteers and caregivers on pain, screening and basic symptoms management. HWSA will also collaborate with hospices that are not PEPFAR funded to ensure greater reach, especially with clinical services

Home-based carers will be trained by SAG-approved service providers in the government HBC training program. The HBC program will continue to collaborate with a host of community partnerships in Hospices and other HBC and community support organizations.

Ongoing training of staff on nutrition will be conducted by partners such as AED and Nestle. AED will also train HWSA staff to conduct nutritional assessments of their clients and educate caregivers and their clients on good nutrition and hygiene practices.

All HIV-infected individuals will receive at least one clinical service and one other category of palliative care services. All family members of HIV-infected individuals and OVC will receive palliative care from at least two of the five categories of service.

ACTIVITY 3: Providing care for caregivers

HWSA will train and educate caregivers on new developments in relation to HIV and AIDS. HWSA will facilitate workshops, in partnership with HWSA's prevention program. HWSA will also strengthen referrals to organizations providing debriefing sessions of caregivers. This activity will be facilitated through camps and /or one-on-one counseling. Using non-PEPFAR funding, HWSA will also help to set up and strengthen Income Generating Activities such as food gardening and sewing.

Through these activities, HWSA contributes to the PEPFAR goal of providing care to 10 million HIV-infected and affected individuals. These activities also support the PEPFAR vision in South Africa as outlined in the Five-Year Strategy by expanding local communities' capacity to deliver quality care for PLHIV in their communities. In addition, HWSA will increase PLHIV access to government support systems and strengthen linkages and referral systems with other social services such as Health and Social Development.

Budget Code: HBHC	Program Budget Code: 08
Activity ID: 23690.09	Planned Funds: [REDACTED]
Activity System ID: 23690	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activity 1: This activity was only partially initiated in 2008, due to lack of funding during the Prime Partner (NICD) Continuation application approval process. A new partner to be determined (TBD) (STIRC Follow on) has been identified to allow activities to begin. A close partnership with the Mothusimpilo non-governmental organization (NGO) in Carletonville has been maintained. A protocol is under development in collaboration with technical STI partners in Atlanta (CDC/DSTDP), and will be cleared through local and CDC Ethical Review Boards. Additionally, because of the delays, new approvals are being obtained from the Gauteng and North West Departments of Health and the West Rand Health Dept. Project staff announcements have been developed to allow quick hire of project staff when needed approvals are completed. The initial activities will be completed as described in earlier COP submissions. Additionally, because of new data on better means of promoting contact tracing and HIV uptake in partners, more activities are anticipated in this regard -- especially promoting HIV testing in male partners.

Activity 2: This activity will use two nurses rather than one, due to significant operational difficulties experienced when staff left for other positions and in order to ensure cover for sickness, other leave and training. The use of two nurses will ensure that projected targets will be met, through an increased workforce. During 2008 it became clear that a major challenge that needs to be addressed is the poor attendance of sexual partners to the project site. Some data were collected in this area that will allow development of additional partner notification interventions that will be tried out in 2009.

SUMMARY:

ACTIVITY 1: Cervical screening, HPV testing and STI screening in women at high risk of STIs and HIV (includes sex workers, women with multiple partners, and women whose sex partners have multiple partners).

This project aims to screen 600 women at high risk for STIs/HIV for STIs, cervical dysplasia/cancer and HPV infection. The project will be undertaken in collaboration with a local non-governmental organization (NGO) as well as technical sexually transmitted infection (STI) partners in Atlanta (CDC/DSTDP). The project will provide capacity to local clinical, counseling and peer educator staff in these areas. This baseline information will provide the key data on the prevalence of STIs and cervical pathology among a high risk cohort of women with STIs/HIV, most of whom have never had access to cervical screening before due to economic issues and living in rural areas. The results of this program project will serve as a model for other rural areas to conduct STI and cervical dysplasia/cancer screening in high risk women. The activity is anticipated to contribute directly to PEPFAR 2-7-10 goals in Care by increasing care outlets, training of staff on palliative care including STI management, and detection and treatment of sexually transmitted infections and other opportunistic infections including cervical dysplasia/cancer screening.

ACTIVITY 2: STI screening among asymptomatic HIV-infected persons in an HIV clinical care setting.

This project aims to screen 1,200 asymptomatic HIV-infected patients for a number of key STIs which have been linked to further HIV transmission to HIV-negative partners. Data obtained in 2007, when this project was initiated highlighted the high burden of asymptomatic STIs in this patient population. All STIs diagnosed were treated etiologically, and contact tracing initiated. Sex partners are encouraged to return to the project site, or else to local health care facilities, for appropriate STI treatment, prevention activities (including training on use of male and female condoms and provision of condoms), and routine offer of HIV testing and counseling. The activity is anticipated to contribute directly to PEPFAR 2-7-10 goals in Care by increasing care outlets, training of staff on palliative care including STI management, and detection and treatment of sexually transmitted infections and other opportunistic infections.

Activity Narrative: SUMMARY:	

The NGO will provide support to people living with HIV (PLHIV) in the Eastern Cape, Free State, and Northern Cape provinces to implement a package of care and support services for PLHIV, their family and community members. These services will include the following:

- Acceptance of status
- Disclosure
- HIV and AIDS and TB/HIV
- Nutrition assessment and counseling
- Alcohol and substance abuse and HIV and AIDS
- Mental Health and HIV and AIDS
- Treatment Literacy
- Prevention with positives.
- Gender roles and norms and HIV transmission

The NGO will utilize a family centered approach to implement these activities and to ensure sustainability of programs. (This is a TBD section and the NGO will describe their activities once the award has been made).

Program Budget Code: 08

Planned Funds: \$61,167

Activity Narrative: SUMMARY:

The Tshepang Trust (Tshepang), a non-profit organization, recognizes the need for a holistic approach to HIV management and the need to work in collaboration with other partners to ensure the delivery of a comprehensive health care package to HIV-infected individuals. To this effect Tshepang has had a long-standing relationship with the Treatment Action Campaign (TAC) utilizing its counselors at the grassroots level to bring the required psychosocial care and adherence support in some areas of operation within the program. It has been Tshepang's experience that some patients might not want to be assigned counselors due to fear of stigma; however, these services will continue to be made available to them as well as the telephone line counseling offered by Tshepang Patient Managers on a monthly basis. Tshepang acknowledges that the program has been, until now, more treatment-focused but it is progressing to be more comprehensive. A major modification under this program area is to set targets for enrolled individuals in the FY 2009 COP and to offer a more comprehensive HIV care package for patients enrolled for HIV management who do not need antiretroviral therapy (ART) yet.

BACKGROUND

Tshepang is the South African Medical Association (SAMA)'s HIV and AIDS program. Its mission is to utilize private general practitioners (GPs) to increase HIV testing and treatment access to individuals dependent on the public health care system in a public private partnership model with the South African Government (SAG). It focuses on providing doctor human resource by mobilizing HIV clinical management trained GPs using two models of care, a sessional model where GPs are placed on a sessional basis in public ART clinics and a private GP model where (ideally) the same GPs are utilized to test and treat patients in their rooms in order to alleviate the burden of care and treatment associated with shortage of infra structure e.g. consulting rooms, long cues and stigma currently experienced in public healthcare facilities.

The GP model was formulated out of a need by individuals to access treatment services in areas of close proximity to their places of abode for several important reasons:

Patients can access their treatment and medical care outside of working hours without having to miss work because they have had to stand in queues for long periods of time in a crowded healthcare setting. Patients do not have to worry about stigma, e.g. being seen by people they know queueing at an HIV clinic.

The GP model is simply a means to complement government services because it addresses two fundamental challenges that currently face the department of health: infrastructure and medical human resources, which are currently lacking in public health facilities. Both the sessional and GP models are an effective short and immediate way for South Africa to reach its National Strategic Plan (NSP) targets. This is because 70% of the medical resources, including HIV Clinical Management skills, are in the private sector in the form of GPs versus 80% of South Africa's population that is dependent on the poorly-resourced public health care system.

Long-term sustainability depends on all HIV and AIDS patients being cared for by the government, and when the public health care system is stronger and stable enough with systems in place to take on the challenges of care and treatment, Tshepang will work with the government to find ways of returning the patients currently seen at GP's rooms back to government facilities. Looking at the already-mentioned challenges, this can realistically take place in another three to four years. To take patients back to government facilities now would create more of a burden for the public health system rather than assist in ensuring that the country reaches its National Strategic Plan treatment goals of ensuring that 80% of all individuals needing ART receive it by 2011.

All Tshepang-contracted GPs are skilled professionals who have been trained in HIV clinical management that acknowledges SAG standards and procedures for HIV care and management. Furthermore, Tshepang protocols on HIV disease management are based on the SAG national guidelines and the Tshepang model ideally (although not always possible) has been to utilize GPs who would also assist at local public sites in order to ensure that they understand clinic procedures and work according to national guidelines.

Tshepang started off as a sub-grantee of American Center for International Labor Solidarity (Solidarity Center) commissioned as a treatment partner in the Prevention Care and Treatment Access to South African Teachers (PCTA) program. The partners within the PCTA consisted of four South African teacher unions, the U.S. Academy for Educational Development (AED), the American Federation of Teachers (AFT) and the Solidarity Center being the prime recipient of funding from PEPFAR for all these partners. Within this partnership teacher unions would refer their colleagues for HIV and AIDS treatment to Tshepang and later as the program evolved also referred them for testing.

In the meantime, a request for proposals was issued by PEPFAR via the CDC for a five-year cooperative agreement for a workplace intervention program (WIP) to run from FY 2007 until FY 2012 and Tshepang applied. The organization was awarded the grant and now receives direct funding from PEPFAR through CDC to provide counseling, care and ART to individuals in the workplace in order to continue with the treatment of teachers from the PCTA program but also extend the program to include healthcare workers and workers from the Small Medium Micro Enterprises (SMMEs), their spouses and immediate family dependents. WIP is based on the GP model. The funding cycle for WIP started in October 2007 but because Tshepang had been given a no cost extension as mentioned earlier, the organization only started using its grant funds with effect from January 2008.

In the past when Tshepang was still a sub-grantee of the Solidarity Center, although HIV care enrollment for HIV-infected individuals was recorded, there were no specific targets for it. Care or wellness management went as far as monitoring individuals who were pre-ART for repeat GP consultations. At these consultations, clinical assessments and CD4 counts blood tests would be taken within three months or six months intervals depending on the baseline CD4 counts and clinical condition of the patients. Cotrimoxazole was only offered to individuals eligible for ART as part of treatment readiness and those that presented with minor opportunistic infections (OIs) even though ART was not yet warranted.

Activity Narrative: However, past experience has demonstrated that most pre-ART patients have a tendency to disappear from the program in cases where follow-up is not regular and linked to service delivery. Thus, starting in FY FY 2008, the major focus will be to retain individuals enrolled for care who are at a pre-ART stage at the time of enrollment. Retention strategies will include status support through counseling, promotion of limited disclosure to spouses or partners and trusted family members or friends, couple counseling (especially because in Tshepang's experience most of the patients seen come without their spouses or partners) for testing and treatment services.

In FY 2009, Tshepang will be offering a basic care package that includes cotrimoxazole prophylaxis for all patients at stages 2, 3 and 4 of the disease enrolled in the program. Numbers of individuals under care will be a target indicator and care will include cotrimoxazole prophylaxis, TB screening, cervical cancer screening, pathology and clinical assessments e.g. repeat CD4 counts and physical examinations for all pre ART individuals, status acceptance counseling, couples counseling and testing, encouraging disclosure on a limited basis, continued counseling on treatment literacy and adherence. This will be facilitated by Tshepang Patient Managers who are professional nurses trained and experienced in HIV Clinical Management in collaboration with the GPs seeing the patients on the ground. During the PCTA program, Tshepang had trained nurses as well to be counselors working with GPs to follow up on patient adherence. These will be further utilized to facilitate support groups for patients enrolled under WIP.

ACTIVITIES AND EXPECTED RESULTS:

New Activities:

From October 1, 2008, all HIV-infected patients enrolled for HIV palliative care but not eligible for ART will be seen by GPs more regularly. This will involve patient monthly visits to restore and maintain the individuals' immune system by offering cotrimoxazole prophylaxis as mentioned above and delaying the need for ART, TB screening and TB prophylaxis, monitored referrals to local TB clinics for TB active persons, cervical cancer screening and general patient clinical assessment.

Tshepang anticipates enrolling an additional 1,000 individuals for HIV care, taking the anticipated number of people enrolled to 2,600. All the 1000 newly enrolled individuals will be screened for TB and when negative receive TB prophylaxis in the form of Isoniazid, all HIV-infected individuals not TB active but in stages 2, 3 and 4 will receive cotrimoxazole prophylaxis to prevent opportunistic infections. Women will also be screened for cervical cancer through pap smears.

Modified Activities:

Tshepang's approach has also evolved to include prevention and in-depth adherence counseling for patients on treatment. Currently, Tshepang is doing voluntary counseling and testing (VCT) for early detection and positive prevention, encouraging routine family counseling including couples and children.

In the repeat consultations, patients will be counseled on accepting their status, maintaining a lifestyle of positive prevention, where the principles of ABC will be emphasized, couples and other immediate family members, counseling and testing will be encouraged as well as disclosure to spouses and trusted individuals for better adherence.

All these planned activities will ensure that patients on pre-ART are regularly seen by their GPs (at least once a month), making follow-up monitoring of the enrolled individuals easier so that the program does not end up with lost to follow up cases but rather maintains a high retention rate of individuals under care.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 1201.09	Mechanism: HCI
Prime Partner: University Research Corporation, LLC	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 3109.23889.09	Planned Funds: \$699,051
Activity System ID: 23889	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

While Health Care Improvement (HCI), the follow-on to the URC/Quality Assurance Project (QAP), will continue to focus on the five key activities described above, the emphasis during FY 2009 will be on expanding these activities and other activities, in the following ways:

ACTIVITY 1: Establish Quality Improvement Teams at the Facility Level

By improving and institutionalizing the formation of quality improvement teams at a facility and district level, HCI staff is involved in providing the knowledge and skills required for leadership and sustainability for the program. This is an ongoing initiative, which is specific to each area / district/ province, due to the variable nature of the different stakeholders involved and geographic location of HCI-supported sites and districts.

ACTIVITY 2: Human Capacity Development

As HCI is already in the process of recruiting and placing medical staff in health facilities, these medical staff will be tasked with provision of clinical services to HIV-infected clients on a day-to-day basis and provision of training and mentoring for health facility staff regarding HIV and AIDS care, with specific reference to antiretroviral therapy (ART) and care services on a weekly and monthly basis. As part of HCI's sustainability initiatives, HCI staff seek to build capacity and develop local skills, by providing training and support to DOH clinic staff (doctors, nurses, counselors, pharmacists, etc.) to ensure that providers have appropriate knowledge and skills to deliver quality ART services to all ART clients enrolled on the program / eligible for ART treatment and care. HCI staff and department of health (DOH) staff meet regularly to ensure that any additional knowledge regarding newer ART medication / treatment options and research findings are readily shared.

ACTIVITY 3: Strengthening Supervision Systems

HCI has been extensively involved in revision of the Clinic Supervision Manual for health care facilities, and will continue to lead the implementation and monitoring of supervision systems within the country, by training district and facility-level supervisors in quality assurance methods and facilitative supervision techniques for improving the quality of ART and follow-up services.

ACTIVITY 4: Care Support Groups

HCI has been involved in providing assistance to implement, run and facilitate community and facility-based care support groups at all HCI-supported health care sites in the five provinces. In FY 2009, it is envisioned that this support will be expanded to include counseling on remaining HIV negative, Prevention with Positives (PwP), HIV wellness programs, care for the caregivers' activities and community outreach programs.

ACTIVITY 5: Training

In FY 2009, HCI staff will work to develop accredited HIV and AIDS and home-based care training materials, including a comprehensive package of manuals, posters, flip charts and job aids. The development of these materials will include modules on basic HIV, staging of HIV disease, care of HIV-infected individuals, eligibility for ART, initiation of ART in both adult and pediatric patients, disclosure, adherence issues, poly-pharmacy (addressing concomitant administration of medication), living positively with HIV and TB/HIV co-infection.

In addition, HCI will revise existing QA training materials and expand on proposed training initiatives to include QA/QI methodology for all cadres of health care staff, including informal staff such as community workers, lay counselors and home-based carers. This is particularly important at primary health care facilities where HIV-infected clients interact with a wide range of formal and informal health staff.

ACTIVITY 6: Referrals and Linkages

Building on lessons from previous experiences, HCI is able to facilitate linkages between different stakeholders within the health system, by coordinating and providing leadership.

To improve existing referral networks, HCI staff members will identify and strengthen linkages between prevention of mother-to-child transmission, counseling and testing, family planning, sexually transmitted infections, TB and ART treatment sites, by working with health facility staff at different levels of care and advocating for the development of integrated referral and follow-up networks. All staff at these sites will be responsible for referring HIV-infected clients for onward care, treatment and support, while staff at ART sites is responsible for care, treatment, support and follow-up of these patients. It is essential to ensure that all patients receive optimal care and remain within the health care system, ensuring compliance / adherence with treatment and an improved quality of life.

ACTIVITY 7: Policy

HCI will actively participate in the development, revision and implementation of the National HIV and AIDS guidelines, Continuum of Care for HIV-infected people and HIV and AIDS monitoring and evaluation framework policy in collaboration with the national and provincial DOH staff, to ensure accountability and long-term sustainability of this program.

SUMMARY:

Activity Narrative: University Research Co. LLC/Quality Assurance Project (URC/QAP) will support Department of Health (DOH) facilities in 5 provinces to improve the quality of basic health care for people living with HIV (PLHIV) by improving compliance of healthcare workers with treatment guidelines through capacity building and strengthening of monitoring and supervision. The essential elements of QAP support include streamlining of process of care for PLHIV as well as helping improve technical compliance with evidence-based norms and standards, interpersonal communication and counseling and increasing organizational efficiency. The major emphasis area for this activity is quality assurance and supportive supervision, with minor emphasis on development of referral systems, training and policy/guidelines. The activity targets public health workers, program managers, volunteers and PLHIV. These activities will result in improving the continuum of care for adults and children living with HIV and their families as they pass through different stages of the disease or through different levels of healthcare system ensuring that they receive high quality services.

BACKGROUND:

URC/QAP currently works with 70 DOH facilities in five provinces improving the quality of basic healthcare and support services for PLHIV. In FY 2008 the number of DOH facilities that URC/QAP mentors will be expanded. In FY 2008, URC/QAP will work with the South Africa (SA) DOH and Department of Social Development, community-based organizations/home-based organizations (CBOs/HBOs) and other PEPFAR partners to ensure the delivery of comprehensive family-centered services for PLHIV. Using Quality Assurance (QA) tools and approaches, URC/QAP will help facilities provide an essential package of activities following national guidelines and standards, to ensure that PLHIV receive high quality basic healthcare and support services. Temporary medical staff will be made available to healthcare facilities to initiate and strengthen provision of basic health services for PLHIV. URC/QAP will also work with HBOs/CBOs to improve home-based care services by linking home-based caregivers to facilities providing care and support. It is envisioned that URC/QAP activities will support integrated programming in a network of services for all HIV-infected clients and their families by integrating preventive messages and condoms into HIV and AIDS care activities, screening and referral for PLHIV to other service delivery areas, stigma reduction activities and involvement of community/home-based caregivers to promote adherence to ART and anti-tuberculosis (TB) regimens.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Establish Facility-level Quality Improvement Teams

URC/QAP will work with each facility to identify core teams representing various clinical services involved in care and support for PLHIV. These teams, with support from URC/QAP and district staff, will be responsible for implementing plans for improving access to quality basic primary healthcare and support services for PLHIV, particularly issues pertaining to equitable access for women and girls/related gender considerations. Each team will conduct baseline assessments to identify and address quality gaps in clinical services. These assessments will be used by the facility teams to develop and implement a quality improvement plan. URC/QAP will assist facility teams in developing and implementing strategic plans for improving access to quality healthcare services. URC/QAP activities will focus on improving preventive care services for PLHIV and their families, including access to HIV counseling and testing services, TB/OI screening and provision of cotrimoxazole prophylaxis. Addressing prevention with HIV-infected individuals is an important part of a comprehensive care strategy. Through healthy living and reduction of risk behaviors, these prevention with positives interventions can substantially improve quality of life and reduce rates of HIV transmission. The goal of these interventions is to prevent the spread of HIV to sex partners and infants born to HIV-infected mothers and protect the health of infected individuals. URC/QAP will monitor staff interventions to provide high quality services in nutrition counseling, diarrhea management, screening for pain and symptoms, treatment for OIs and ARV services, home-based support, social service linkages and community-based ART follow-up and adherence support, in accordance with the national guidelines. URC/QAP will facilitate linkages to treatment and care for eligible clients by training facility staff on the need for treatment referrals. Effort will be made to ensure equitable access to care services for both males and females. URC/QAP will work with facility staff to design and implement referral plans and strengthen the development of networks with CBOs/HBOs to improve referral patterns.

URC/QAP activities at facility level will include an integration of key HIV and AIDS prevention messages and provision, including prevention with positives, and referral for condoms into all care activities. At national and provincial levels, URC/QAP will continue to collaborate with the NDOH on the development of infection control guidelines, emphasizing measures such as good hygiene practices and use of safe water for PLHIV. At a community level, CBOs/HBOs linked to DOH facilities will be assisted to provide home-based care services to PLHIV and expand outreach services to the community. URC/QAP will also train facility and CBO/HBO staff in pain and symptom management for all PLHIV, including basic assessment and management of common pain and symptoms related to HIV disease and appropriate use of the WHO analgesic ladder and referral when necessary.

ACTIVITY 2: Human capacity development

URC/QAP will train facility staff in QA strategies, specific to basic health care. In addition, job-aids and wall charts will be provided to improve compliance with clinical and counseling guidelines. All training will be in accordance with the SA National DOH training guidelines for community and home-based care, HIV and AIDS Care and Treatment Guidelines and PMTCT guidelines for pediatric care. At the community level, URC/QAP will fund and capacitate CBOs/HBOs to better utilize community health workers and strengthen the capacity of families and community members to meet the needs of PLHIV.

ACTIVITY 3: Strengthening supervision

URC/QAP will visit each facility/CBO at least twice a month to provide onsite mentoring to healthcare workers. This will focus on improving clinical skills of staff as well as ensuring that improvement plans are being implemented correctly. During these visits URC/QAP will also review program performance data to

Activity Narrative: ensure expected results are being achieved. URC/QAP will conduct quarterly assessments in each facility/CBO/FBO to assess whether staff is compliant with national guidelines. To ensure staff is being supported on an ongoing basis and promote sustainability, URC/QAP will train district, facility-level, and CBO supervisors in QA and facilitative supervision techniques.

ACTIVITY 4: Care support groups

URC/QAP will provide assistance with set up, running and facilitation of community and facility-based care support groups at all QAP-supported health care sites in the five provinces. The focus will include Prevention with Positives (PwP), wellness programs and care for the caregivers activities.

ACTIVITY 5: Support for families of PLHIV

URC/QAP will provide support to improve support and care services provided to families of PLHIV by facility - and community-based healthcare workers. To this end, staff at URC/QAP-supported facilities and home-based care organizations will be encouraged and mentored on the importance of provision of clinical/physical, psychological, spiritual, social and preventive services to families of PLHIV. URC/QAP staff will focus on identification of clinical/social needs within these families and the development of appropriate referral linkages and networks.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

This activity contributes to the PEPFAR target of 10 million people in care. URC/QAP will assist PEPFAR in reaching the vision outlined in the USG/South Africa Five-Year Strategy by improving the continuum of care for PLHIV.

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 23698.09

Planned Funds: [REDACTED]

Activity System ID: 23698

Activity Narrative: SUMMARY:

Activities will focus on a family-centered approach to care and support. This will include enhancing facility-based management of palliative care (including pain and symptom management and cotimoxazole prophylaxis). Strengthening pre-antiretroviral therapy (ART) and ART support care based in the clinics and at community level will help to support down referral from hospitals and health centers. This will include particular emphasis on implementation of the Basic Care Package.

ACTIVITY 1: Family-centered approach to care and support

The awardee will strengthen existing support groups and form new support groups that is linked to a health clinic in the community(each clinic should have at least 1 support group. Expert patients (PLHIV) and other support group facilitators will be trained on implementing a basic package of care and support services that will include (acceptance of status;Disclosure; HIV and AIDS and TB/HIV; Alcohol and Substance abuse and HIV and AIDS; Prevention with Positives; Treatment Literacy; Nutrition assessment and counseling and Treatment adherence and support). PLHIV will be encouraged to join the support groups from the time they are tested HIV-positive where they will receive information on HIV and AIDS, ongoing counseling and support, referral for additional care when needed, thus forming a link for continuity of care to community level. PLHIV will be encouraged to bring along family members and other community members so they can receive information and support. Family counseling sessions will be conducted where counseling and testing for other family members will be encouraged and other prevention messages (e.g. prevention with positives) will be disseminated. Children within families will be referred to the health facility for HIV testing and support.

ACTIVITY 2: Nutritional support through gardens

To promote quality, economical nutrition, the team will work with the Department of Health (DOH) to develop a local low-literacy cookbook (in Xhosa) and home economics guide. Clinic nurses will be trained on the use of the guide. Community health workers and support group leaders will be trained on the national curriculum for HIV and AIDS and nutrition using the national training manual and reference guide. Cooking demonstrations will be established at clinics and selected churches on using nutritious foods, especially the foods and herbs from the permaculture gardens. Funding will support referral for nutritional support and monitoring as well as training clinic teams and as budget allows, outfitting modest kitchens, such as adding a table, stove or sink to existing clinic kitchens.

ACTIVITY 3: Gender-related activities

The awardee will integrate gender norms, roles and behaviors into the support group activities. Activities will focus on exploring behaviors that may lead to gender violence, exploitation and abuse and together find ways and alternatives to deal with/avoid such behaviors. Negotiation skills will be developed through role plays and discussion around gender issues.

Medicine, Comprehensive
International Program for
Research on AIDS

Funding Source: GHCS (State)

Budget Code: HBHC

Activity ID: 3814.23657.09

Activity System ID: 23657

Mechanism: CAPRISA Follow On

USG Agency: HHS/Centers for Disease
Control & Prevention

Program Area: Care: Adult Care and Support

Program Budget Code: 08

Planned Funds: \$135,441

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

1. Training of the CAPRISA site team in pediatric HIV care: the site personnel had no previous experience, and therefore needed to be trained on the complexities of pediatric care. This was achieved by the development and implementation of a program of training on the principles of chronic care management and treatment of children with HIV and AIDS. Training activities included formal didactic training, workshop and specific training program attendance, a program of twinning of our staff with staff experienced in pediatric care at McCord Hospital and Escourt, Grey's and Northdale provincial Hospitals, and adaptation and implementation of best practice of service delivery in pediatric care provision and support. Further specific training on adherence support counseling, phlebotomy in children, immunization and management of common childhood infections were also conducted.

2. Development of referral pathways for patients into and out of the facility. Dr Neil McKerrow, a pediatrician with many years experience in the management of pediatric HIV, has been engaged to play a supportive role in providing technical expertise and clinical management oversight in patients that may require specialist level clinical intervention, and up-referral. CAPRISA has also established linkages with the Umgungundlovu District Social welfare department, to fast track single care grants for children enrolled into the program.

The adjacent Mafakhatini Clinic adds to CAPRISA'S services by providing a one-stop service for the children, by scheduling appointments for immunization and nutrition support and TB screening, on the same day as their HIV care appointments are scheduled. Community leaders and surrounding clinics have been informed about the roll-out of pediatric care and have been encouraged to refer suitable patients in. Clinics providing antenatal care and prevention of mother-to-child transmission (PMTCT) services in the district have also been informed about the rollout of pediatric care and have also been encouraged to refer suitable patients in.

3. Development of site tools: These tools have been developed and implemented for monitoring of clinical care, response to antiretrovirals, and the collection of program indicators for reporting to PEPFAR

4. Procurement of supplies: Pediatric antiretroviral therapy (ART) formulations, and drugs used for common ailments have been procured. Specialized equipment such as pediatric scales, medicine dispensers etc have been purchased.

Strengthening systems for decanting stable patients into DOH supported sites:

While down referral remains a challenge, it is not insurmountable as CAPRISA continues to work with the clinics and hospitals which are part of the district and provincial Department of Health as well as other PEPFAR partners in our efforts to down refer stable patients. In an attempt to strengthen the down referral process from CAPRISA sites to Department of Health antiretroviral (ART) roll-out sites, we have established relationships with key role players (such as the Medical Superintendent or Hospital Manager) at each of the down referral facilities and are negotiating procedures and logistics that will ensure the smooth flow of patients, with uninterrupted access to drugs and services. We have assisted the Umgungundlovu District Health Office in their efforts to expand HIV services by conducting training for key staff and strengthening processes and systems in individual referral facilities to enable them to accept down referrals from the CAT program. This has been a slow process of building rapport, strengthening logistics, undertaking supportive ongoing training, and maintaining strong lines of communication for referral back to CAPRISA, if this is needed.

CAPRISA has ongoing communication with the facilities we decant to, regarding the number of CAPRISA patients that can be accommodated in their ART programs per week, the individual accompanying documentation needs to facilitate continued treatment and care of the patient, setting up of clinic appointments for patients to secure a place in the ART programs and referring patients that are appropriate to the government facilities' designated drainage area.

By decanting small numbers at a time and maintaining regular communication with facilities and Department of Health Liaison officials, the process has been slow and deliberate but has not compromised any patients' care.

Positive Prevention for Patients in Care

Prevention among Positives: All patients are offered condoms, and messages on HIV transmission prevention, as they queue for HIV related services in the HIV clinic. In addition patients are educated on the need to disclose to partners, availability of on-site testing for partners, and the need to treat STI's timeously. During post test counseling with patients that test negative, counselors would address the following issues:

(a) Returning for testing in three months, due to possible testing in the window period when HIV antibodies are undetectable;

(b) Dispel any beliefs that the individual is invulnerable to HIV;

(c) Promote condom use to remain HIV negative;

(d) Discuss possible risky sexual behavior that the individual maybe engaging in and safer lifestyle practices.

SUMMARY:

Activities are carried out to provide clinical, spiritual and psychosocial support to the HIV-infected patients and family members affected by the disease at two established treatment sites in KwaZulu-Natal. With FY 2008 funding the CAPRISA AIDS Treatment (CAT) Program will be continued and expanded at these two

Activity Narrative: sites. Pediatric services will be introduced at the Vulindlela site.
BACKGROUND:

CAPRISA was established in 2002 as a not for profit AIDS research organization by five major partner institutions: University of KwaZulu-Natal, University of Cape Town, University of Western Cape, National Institute for Communicable Diseases, and Columbia University. The headquarters of CAPRISA are located in the Doris Duke Medical Research Institute at the Nelson R Mandela School of Medicine, University of KwaZulu-Natal. The PEPFAR-funded CAPRISA AIDS Treatment (CAT) Program was initially started as a supplemental effort to deal with the large volume of HIV-infected clients that were screened out of CAPRISA's other research studies. It has since evolved into one of the pillars of CAPRISA and is evidence of the ongoing commitment to provide comprehensive services to communities. The CAT Program was initiated in June 2004 and currently provides an integrated package of prevention and treatment services. The program provides an innovative method of providing ART by integrating the tuberculosis (TB) and HIV care as well as counseling and testing, family planning, sexually transmitted infections (STI) treatment, prophylaxis and treatment for opportunistic infections (OIs), and other HIV associated conditions at both a rural and urban site. The CAPRISA eThekweni Clinical Research Site is an urban facility attached to the Prince Cyril Zulu Communicable Disease Clinic (CDC) which is a large local government clinic for the diagnosis and treatment of STIs and TB, for which it provides free treatment. The HAART provision at this clinic integrates TB and HIV care into the existing TB control program. Patients are either self referred, or enter the HIV care continuum via the adjoining TB or STI services. The CAPRISA Vulindlela Clinical Research Site is a rural facility located about 150 km west of Durban in KwaZulu-Natal. The Vulindlela district is home to about 500,000 residents whose main access to health care is at seven primary health care (PHC) clinics that provide comprehensive services. The CAT Program at Vulindlela is an entirely rural nurse-driven service with doctors available for the initial eligibility assessment and for advice and referral. At the Vulindlela Site, by the end of June 2007, 2654 people have been enrolled into HIV care and 1002 people had been initiated on ART, with 857 currently actively accessing ART services. At the eThekweni Site, which was initiated in September 2004, 818 people had been ever initiated on ART, with 696 currently actively accessing ART and 2803 people accessing palliative care by the end of June 2007

ACTIVITIES AND EXPECTED RESULTS:

The CAT Program offers a range of free services including treatment services as well as extensive counseling and education around HIV, care and support, disclosure, and HIV treatment adherence. Patients are also encouraged to bring partners in for testing. For women of child-bearing age, program synergy is facilitated at both sites by provision of onsite injectable and barrier methods of contraception, pap smears and pregnancy testing. Both the eThekweni and Vulindlela sites operate with a multi-skilled team of people. Each site has an administrative division, a team of doctors, pharmacists, nurses and counselors. Field workers and peer educators complement the clinic teams as they interact with the community through providing information and education on HIV as well as assisting with patient retention at the clinic.

At the eThekweni site, currently all injectable contraceptives and pap smear analyses are provided free of charge from the eThekweni Municipality. Patients are referred from TB and STI clinics or other CAPRISA research studies. Patients from throughout the greater Durban area who may have TB are routinely evaluated at the communicable disease clinic and are routinely offered counseling and HIV testing. HIV-negative patients are invited to participate in ongoing prevention activities at both facilities.

At the Vulindlela site, all injectable contraceptives and pap smear analyses, TB sputum analysis and basic OI medication is provided free of charge from the Mafakhatini Clinic. Patients who test positive for HIV are offered HIV specific care through the CAT Program. Concurrent TB diagnostic care and treatment services are accessed via the CAT program from the adjacent TB services. The CAT Program offers extensive counseling and education around HIV, wellness maintenance, disclosure, and HIV treatment adherence. Patients are encouraged to bring partners in for testing. In addition counselors liaise with social welfare departments and other community-based organizations (CBOs) to assist in enhancing social support for patients. HIV clinical care services that are offered include Bactrim prophylaxis, routine screening for OIs, via clinical examination, and blood, urine or sputum testing where required. The CAT project has the capacity to treat commonly occurring OIs at site level and these include pulmonary and extrapulmonary TB, candidiasis, pneumonia, gastro-enteritis, and other respiratory infections. The CAT project also accesses and supplies drugs such as diflucan from DoH PMSC. Patients are referred to tertiary level facilities if they require investigation and inpatient management out of the scope of the clinic management. Referral networks exist for the triaging of sick patients into district and tertiary facilities at both treatment sites. All patients that test HIV positive through the counseling and testing service are offered a routine CD4 count test, which may be repeated at 3, 6 or 9 monthly intervals depending on the level at screening. All patients in the CAT Program with CD4 counts < 200 cells/mm³ see a clinician monthly for clinical and laboratory follow-up and if they are willing to participate in the program, they will also get offered a viral load test. Ongoing adherence support is provided by trained community educators, as well as counselors.

For patients who are TB/HIV co-infected, the TB management is undertaken routinely at the CDC and in accordance with the South African National TB control program. Patients at Vulindlela are referred from the Mafakhatini PHC clinic, research (e.g., non-PEPFAR funded microbicide trial, adolescent cohort, community-based CT Project, community referrals) from community health workers, community advocates and 30 youth peer-educators. The CAT program in Vulindlela aims to address issues of stigma and discrimination and is linked to an Oxfam-funded project which addresses Stigma and Discrimination in the community. The CAT program provides support for disclosing to family members and assists patients in obtaining disability grants. CAPRISA has an extensive community program which supports and facilitates community involvement and informed participation for all CAPRISA projects This includes pre and post-test counseling for HIV infection, treatment and adherence education and support, implementation of ARV treatment, prophylaxis for OIs, management of OIs, adverse events and severe adverse events. These are done at the clinic and through appropriate referral channels when needed. Women account for approximately 70% of participants at both Vulindlela and the eThekweni clinic. Additionally, the majority of staff employed by the CAT project are women. Additionally, a "one stop shop" is available to female participants in that patients

Activity Narrative: access family planning services, STI services, and ART services within the CAT program at both sites. Additionally, Vulindlela patients are also able to access PMTCT services from the adjacent Mafakathini clinic. Male peer educators are employed in order to encourage men's participation in health care, and their uptake of counseling and testing for HIV. This is in keeping with CAPRISA's policy to increase gender equity in their programs. Professional nurses employed are trained and developed to take over routine care activities that are traditionally performed by doctors. This includes ART eligibility assessment, treatment of minor opportunistic infections, and the prescribing of prophylactic agents like contraceptives, cotrimoxazole to program participants. In addition, nurses have been trained to perform a nutritional assessment and identify those participants that may benefit from the nutrition program. Peer educators have been trained to perform a range of activities that have traditionally been performed by nurses, and this includes the provision of health education to participants and provision of support to patients and their caregivers. As part of CAPRISA's retention strategy the CAT program offers services, including ART to all staff employed by the CAT program. This is done in a manner that preserves the privacy and confidentiality of the staff member accessing care. Further, staff training is supported by assistance with fee remuneration, and time to attend training activities.

These results contribute to the PEPFAR 2-7-10 goals by providing facility-based HIV-related palliative care to HIV-infected individuals by providing clinical prophylaxis and treatment for TB/HIV co-infected patients prior to initiation of ARVs.

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 4753.09	Mechanism: N/A
Prime Partner: LifeLine North West - Rustenburg Centre	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 23731.09	Planned Funds: \$194,181
Activity System ID: 23731	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Three community-based organizations (CBOs) or faith-based organizations (FBOs) will be identified to join the LifeLine project as sub-grantees. Management in the organizations will be encouraged and supported to improve the quality of service delivery with an increase in beneficiaries.

Existing monitoring and evaluation activities will be augmented with a state-of-the-art data management and reporting system to enhance monitoring and evaluating activities to ensure accurate and reliable data compilation to guide and improve programs.

LifeLine will facilitate active involvement and participation of men in care and support activities, both managerial and at home-based care level within the community. LifeLine will access training programs by other organizations to improve skills within the organizations. CBO/FBOs will be trained to improve current screening to include pain management and identification of symptoms. In the North West province, CBOs, FBOs, and non-governmental organizations (NGOs) may not prescribe medication unless a medical doctor is on staff. In homes where adult care and support takes place, children from these homes are referred to Orphan and Vulnerable Children (OVC) centers, local health facility and social services. CBO/FBOs will also be trained on HIV/family planning integration (for prevention with positives) and other prevention techniques (consistent condom use, reduction of multiple and concurrent partnerships etc), adherence and disclosure support, family centered care, OVC support and pediatric palliative care services. There will be a focus on developing skills and knowledge to support holistic palliative care that includes services falling under Emotional, Social, Physical and Spiritual needs.

LifeLine and the sub grantees plan to strengthen existing referral networks, working relationships with other organizations, and development other networking and referral partnerships within the same geographic areas. This will aid in the provision of holistic service. CBO/FBOs will be trained on and encouraged to refer clients for sexually transmitted infection screening and management, family planning, counseling and testing and substance/alcohol abuse.

SUMMARY:

LifeLine's activities in Palliative Care/Basic Health Care & Support involve sub-grantees who have prior home-based care services and protocol training in line with SAG policies and guidelines. Activities include the following three components: 1) referral of HIV-infected individuals from the Counseling and Testing unit to local faith-based and community-based organizations (FBOs/CBOs) for follow-up; 2) Supervision of the delivery of palliative care services by LifeLine's second-tier sub-grantees (FBOs/CBOs); and 3. Capacity building in the form of training to support LifeLine's sub-partner FBOs/CBOs. The Bojanala District Department of Health in North West province assists LifeLine with capacity building and supervision of the FBOs/CBOs. The program increases access to services for PLHIV, especially women and their families, who are disproportionately HIV-infected in South Africa. Emphasis areas for this PEPFAR supported program are human capacity development and local organizational capacity development. The target populations adolescents aged 15 -24 and adults and also include most at risk populations namely, mobile population, non injecting drug users, persons who engage in transactional sex, but who do not identify as persons in sex work, people living with HIV and AIDS (PLHIV), and HIV and AIDS affected families.

BACKGROUND: LifeLine Rustenburg is a non-governmental, non-profit, community-based organization, affiliated to LifeLine Southern Africa which in turn is affiliated to LifeLine International. Affiliation is awarded annually based on maintenance of standards, adherence to policy and procedures and acceptable performance in areas of service. LifeLine Rustenburg has been operational since 1991, and serves an area of approximately 200 kilometers radius. A close working relationship exists with the National Office -which is informed about projects and services run by LifeLine Rustenburg. Bi-annual consultative meetings are held and quarterly reports are submitted to the main office by LifeLine Rustenburg. LifeLine focuses on counseling and crisis intervention services; provision of life skills and personal development training; capacity building for less established CBOs; CT (counseling and testing) and prevention activities with regards to HIV and AIDS. To date, LifeLine has implemented a CCP (community counselor project) which provides counselors to 150 health facilities in Bojanala (in partnership with provincial Department of Health), established a non medical CT site, provide 24 hour counseling service via a national counseling line, and have provided training to numerous other organizations. Future plans for the project is to place counselors at all health facilities; supply mobile (outreach) CT; support and care to HIV-infected individuals and other affected persons; and, HIV and AIDS prevention services to rural and other underserved communities throughout the Bojanala District of the North West province. Care and support activities will be provided through ongoing partnerships with other CBOs/FBOs with expertise in these areas. FY 2007 funds were provided to LifeLine to work in 8 such hot spots. FY 2008 PEPFAR funding will be used to expand the number of hotspots to increase care coverage. The target groups for the Care activities messages are PLHIV located in the identified hot spots within North West province. A hot spot is defined as an area that has a high rate of traffic of vulnerable persons; for example, taxi ranks and the mining hostels. The LifeLine hot spots are currently located in the Bojanala region, with 2 hot spots identified in each sub-district.

ACTIVITIES AND EXPECTED RESULTS: After initial CT services are provided, clients and/or their family members will be referred to LifeLine's sub-grantee FBOs/CBOs for ongoing care and support. Counseling and testing is the entry point to care and support. The care component will be linked to CT services. After initial testing, clients and/or their family members are referred to the nearest sub-grantee FBO/CBO for ongoing care and support.

ACTIVITY 1: Palliative Care and Support Services The sub-partner, i.e. the FBOs/ CBOs, carry out the palliative care services. Each sub-partner provides service delivery in at least two of the five required categories i.e. clinical, psychological, spiritual care, social care and prevention services. This minimum package includes screening and referral for opportunistic infections including the provision of cotrimoxazole, screening and referral for TB, psychosocial counseling, wellness/healthy living education, monitoring and

Activity Narrative: referral, home-based care, advice and assistance on welfare issues and applications for welfare grants, and hospice and end-of-life care for terminally-ill patients. Through the public health system, the North West Department of Health will provide rudimentary clinical services to PLHIV that are receiving palliative care services from the sub-grantee FBOs/CBOs. LifeLine monitors that activities are carried out as per sub-partner agreements.

ACTIVITY 2: Local Organization Capacity Building LifeLine provides capacity building to sub-partners and strengthens the referral system. The palliative care program is set-up to foster sustainability to enable the sub-partner FBOs/CBOs to receive organizational capacity building from LifeLine. PEPFAR funding will support in-service training activities conducted by four LifeLine trainers targeting members of the sub-partner FBOs/CBOs. Training consists of workshops of five days covering topics relevant to administrative and financial systems. By the end of the project, these FBOs/CBOs will have the skills and expertise necessary to do fundraising for their own sustainability and to provide proficient services without the technical support of LifeLine. Peace Corps volunteers help with development, training, assessment and monitoring of the project activities. In the above activities, to be counted as having received palliative care service, all HIV-infected clients will receive at least one clinical service and one non-clinical service and family members will receive service in at least two categories of palliative care. These activities will contribute to 2-7-10 PEPFAR goal by ensuring PLHIV receive adequate care and support. Its efforts to strengthen referral networks also ensure PLHIV have greater access to treatment.

Budget Code: HBHC	Program Budget Code: 08
Activity ID: 23743.09	Planned Funds: ██████████
Activity System ID: 23743	

Activity Narrative: SUMMARY:

This activity is a component of a comprehensive prevention education, care and treatment program for small to medium enterprises (SMEs) with 20-200 employees and other workplaces in South Africa. PEPFAR funds will be used to support implementation of a palliative care program for South African workers and managers in SMEs. The partner to implement these activities is to be determined. The major emphasis for this program will be the development of a workplace program, with minor emphasis given to community mobilization and participation; information, education and communication and linkages with other sectors and initiatives. The target population will include adults (men and women of reproductive age), factory workers, host country government workers and workers in both the public and private sector.

While a growing number of large companies in South Africa are now providing HIV and AIDS related services to their employees, very few small (20-50 employees) or medium (50-200) sized enterprises have made progress towards developing comprehensive strategies to combat the epidemic. SMEs face significant obstacles in providing HIV and AIDS services to employees. In a random sample of SMEs in Gauteng and KwaZulu-Natal conducted by the Center for International Health and Development (Connelly and Rosen 2005), six major barriers to action on the part of SMEs were identified: 1) lack of information about HIV and AIDS services; 2) lack of access to these services; 3) little perception of costs or damages being imposed by AIDS, leading to low willingness-to-pay for services; 4) stigma among employees, who were not requesting HIV-related programs or benefits; 5) lack of external pressure from labor unions, shareholders, or advocacy groups; and 6) the relative weight of other problems facing the companies, making HIV and AIDS a low business priority. The study also reported that the vast majority of AIDS-related attrition occurs among easily replaceable, non-critical, and/or unskilled employees. Because SMEs offer fewer benefits, have higher employee turnover, and employ fewer skilled workers than do larger companies, they are less likely to capture the uncertain benefits of investments in HIV and AIDS programs than are large companies. Given the complexity of the disease and the widespread impact that HIV and AIDS have on companies, communities and local economies, diverse resources and skills are needed. This often requires a multifaceted approach ranging from awareness and prevention to care and treatment to public advocacy. Through public-private partnerships, businesses can deal more effectively and efficiently with the challenges that HIV and AIDS present. Businesses possess expertise and skills that, if applied to the HIV and AIDS pandemic could assist in developing innovative approaches and deploying resources in ways that could greatly assist the fight against HIV and AIDS. Businesses also have experience in product launches, supply chain management and manufacturing. They also have the ability to access and understand important subsets of the population, their employees, major business partners, and customers. Non-governmental organizations (NGOs), on the other hand, often have resources that are key in the response to HIV and AIDS. They have complementary networks, and are trusted by individuals and communities in ways that businesses are not. They have a tradition within the community of aggressively dealing with crisis and they frequently have the leadership in place that can marshal the necessary resources. Government brings crucial resources in the form of infrastructure, policy, regulations, human capacity and the political will to act. Public-private partnerships provide an opportunity for businesses to leverage the diverse resources of another organization and generate value above and beyond what the individual organization could generate on their own.

Continuing Activity:

Table 3.3.08: Activities by Funding Mechanism

Mechanism ID: 1066.09	Mechanism: PHRU
Prime Partner: Wits Health Consortium, Perinatal HIV Research Unit	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Adult Care and Support
Budget Code: HBHC	Program Budget Code: 08
Activity ID: 3102.23640.09	Planned Funds: \$873,814
Activity System ID: 23640	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The activities involving children will now be described under Pediatric Care and Support.

The Perinatal HIV Research Unit (PHRU) will continue improving on the care and support package described in the above activities. There is considerable drop-out from HIV-care programs and PHRU will explore innovative ways to improve retention. The greater numbers attending care programs and the relatively longer time between appointments makes this task more difficult. People are extremely mobile and tend to move around seeking opportunities for employment. PHRU will attempt to increase retention rates in care through outreach, counseling and health promotion programs.

PHRU has started investigating HIV-related mental health issues and how to include mental health screening and appropriate referral into the HIV-care and treatment services. Working with psychiatrists and psychologists we are developing a screening tool, assessments and referral to appropriate services. PHRU will strengthen mental health screening and referral to mental health services as issues such as depression and stress are impacting on adherence and quality of life. In addition, we will increase our efforts on pain and symptom screening and provide relief where necessary.

Women are still the main group of people accessing HIV-care and treatment services. Trying to address this imbalance in innovative ways to make the services more attractive to men remains a challenge, and will be addressed in all PHRU's activities. PHRU has specific activities targeting men and expect that overtime more men will access the HIV-care and treatment services.

Prevention for HIV-infected people is an important component of PHRU's work and will be strengthened to ensure that the risk of transmission is reduced. Clients will be encouraged to bring partners and family members to the service for counseling and HIV-testing. Risk reduction counseling will be provided to help the client understand the risks of transmission, condoms will be promoted and distributed, and disclosure encouraged.

Alcohol and drug abuse remains prevalent in many communities that the PHRU works in. Domestic and gender violence, unemployment and other social issues increase risk of HIV transmission. PHRU will explore innovative ways to work with people, especially men, to explore these risk factors and to reduce alcohol consumption. Both community and individual approaches will be explored.

Renovation and refurbishing will be needed at some of the sites we support to increase the capacity and efficiency of the site to provide HIV-care and treatment services.

PHRU has run three very successful Priorities in AIDS Care and Treatment (PACT) conferences which are targeted to public sector health care workers (doctors, nurses and pharmacists) and program and facility managers. These conferences have different themes and are very practical in nature. They have been well received by participants who find that they are able to take away useful information and knowledge to improve the quality of care and treatment access at their facilities. Through these conferences PHRU been able to disseminate it's research findings and HIV-prevention, care and treatment experiences and has invited other PEPFAR partners to share their experiences, knowledge and best practices. Over 800 people have attended these conferences.

SUMMARY:

The Perinatal HIV Research Unit (PHRU) will use PEPFAR funds to continue to provide quality holistic care for PLHIV comprising of elements in the preventive care package, medical care and psychosocial support categories in Gauteng, rural Limpopo, Mpumalanga and Western Cape provinces. Clients are monitored, prepared and referred for antiretroviral treatment (ART). Linkages to counseling and testing (CT), the prevention of mother-to-child transmission (PMTCT) and referral to ARV services will be strengthened. The major emphasis area is human resources, minor emphasis areas are development of networks, local organization capacity development and training. A family-centered approach targets HIV-infected adults, children and infants.

BACKGROUND:

Since 2002, PHRU has established palliative care programs in Gauteng, rural Limpopo and Mpumalanga provinces for people identified as HIV-infected through PMTCT and CT (also funded by PEPFAR). Primary health care nurses are the main providers of care under physician supervision. The Department of Health (NDOH) guidelines for HIV care and laboratory testing are used to ensure compatibility with South African Government (SAG) treatment sites. In South Africa, a care program covers the period from testing positive through end of life care. A holistic approach is taken comprising elements of the preventive care package for adults and children, clinical services, psychosocial support, healthy lifestyle promotion and preparation and transition of clients onto ART when required. These programs are predominately accessed by women; however PHRU is attempting to redress this imbalance. Men are encouraged to participate through CT programs which specifically target men. Clients are encouraged to bring partners, children and other family members. A focus of the program is to identify HIV-infected infants and children and to provide family-centered care and support. Quality assurance, client retention, monitoring and evaluation are integral parts of the program. The aim of the programs is to delay progression of HIV to AIDS by providing palliative care and support to HIV-infected clients who do not yet qualify for ART. Care includes: screening for active TB, preventative treatment for latent TB infection, cotrimoxazole prophylaxis for OIs, syphilis screening, symptomatic screening for syndromic STIs, screening for cervical cancer, provision of family planning and regular CD4 counts. Opportunistic illnesses are treated using a formulary based on the South African Essential Drug List. Support for clients, their families and community members is provided through support groups and education sessions at all sites covering issues such as basic HIV and AIDS information, HIV

Activity Narrative: services, PMTCT, ART, opportunistic infections, TB, prevention, disclosure, prevention, nutrition, stigma, positive living and adherence.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Soweto, Gauteng

The Soweto care program was initiated in 2002 serving over 4,500 adults with around 700 people being transferred onto ART and others who have been referred to SAG rollout sites. Support groups and education sessions are run by an NGO partner, HIVSA. Since 2004, a focus has been to identify children requiring care, ART and psychosocial support through linkages to PMTCT and infant testing. Over 630 children are currently receiving care and referred for growth monitoring and routine immunizations. Support programs are in development to assist caregivers and children, in particular around issues of bereavement, disclosure, dealing with stigma and discrimination, positive living and life skills.

ACTIVITY 2: Bushbuckridge, Rural Mpumalanga/Limpopo

The Bushbuckridge District in Limpopo/Mpumalanga province is one of the poorest in South Africa. Access to information and HIV healthcare and support is a basic need. The PHRU in partnership with Rural AIDS Development Action Research Program (RADAR) and HIVSA established a wellness clinic at Tintswalo hospital and a district wide support network for people living with HIV and AIDS. Since 2003, over 2,000 people have accessed the wellness clinic and 2,500 have accessed support groups running in the district clinics. A training program has been implemented to train nurses, lay facilitators, counselors and local NGOs to provide effective support to people living with HIV and AIDS and the preventive care package, pain and symptom management, basic education on HIV, CT, HIV treatment services and related issues to the broader community. Disclosure is encouraged to reduce stigma, discrimination, improve male norms and attitudes and reduce violence. US-based volunteers have worked in these programs. Expansion of medical care to the district primary health care clinics and to prepare for down referral from tertiary facilities is planned.

ACTIVITY 3: Tzaneen, Rural Limpopo

Since 2003, the University of Limpopo (UL) has been supporting the DOH to develop a district-wide wellness program based in the primary health care clinics in the Letaba sub-district of the Mopani District in Limpopo province. PHRU partnered with UL to formalize and expand the program. With PEPFAR funding health workers have been trained in HIV care of adults and children and infrastructural support provided. HIVSA has provided training to support group members to enable them to run more effective support groups and provide better information to people in the district. The Mopani District (population 1 million) is extremely poor. The program operates in the primary care clinics with support by a medical doctor and aims expand to the whole district. Over 600 people have enrolled and more than 100 are now on treatment and supported at the clinics. On going in-service training and mentoring occurs at the clinics. US-based volunteers support the program. These activities will be continued and expanded to additional groups with FY 2008 funding.

ACTIVITY 4: Western Cape

In 2006, PHRU partnered with a number of organizations in the Western Cape including the University of Stellenbosch, Red Cross Hospital and the Desmond Tutu HIV/AIDS Foundation that support a number of DOH ART sites. PEPFAR funds support these programs to improve linkages to primary care clinics for down referral, and to provide holistic care and support to people on ART and their families. Training staff to assist with scale-up and sustainability are focus areas. These activities will be continued and strengthened and will reach additional people with FY 2007 funds. With FY 2008 funds PHRU will continue to support one of its sub-partners, HIVSA, to expand palliative care services in rural areas in Mpumalanga, Western Cape, and Limpopo and in urban areas in Gauteng province. HIVSA utilizes male involvement, door to door, home-based care, and youth friendly models. HIVSA will implement systems to ensure that all PHRU assisted ART sites will reduce loss to ART initiation from the time tested positive until eligible for ART and will improve uptake of ART as soon as a patient is eligible. Support group models will also be expanded. HIVSA will also assist PHRU treatment programs to better monitor care provided to family members. Retention in care after HIV diagnosis will be a focus for FY 2008.

In all of the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two of the five categories of palliative care services.

These activities directly contribute to the PEPFAR 2-7-10 goals by improving access to and quality of palliative care for HIV-infected individuals and their families.

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 3025.23097.09

Planned Funds: \$330,748

Activity System ID: 23097

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Living Hope (LH) is due to receive its Council for Health Service Accreditation of Southern Africa (COHSASA) accreditation in October 2009. This will give credibility to the service offered by LH and provides an industry standard to work toward and maintain.

Living Hope will provide a family-centered holistic approach to people living with HIV and AIDS (PLHIV). This will include symptomatic pain relief, medication optimisation and family respite relief. It also includes counseling and education of family members of the patient with respect to HIV and/or TB medication adherence.

LH's social worker, in addition to patient counseling for emotional needs, also provides practical assistance in obtain disability grants, identity documents and where necessary, accommodation and placement in long-term facilities. She will also refer to LH's sister organization, Living Grace, when faced with substance abuse problems. Where applicable, bereavement counseling is provided. LH's in-house chaplains will provide spiritual care and/or liaison with the individual patient's own spiritual counselor where required.

LH's in-patient unit provides linkages and referrals to its community-based staff, where patients are residents within the geographical areas in which LH operates. LH staff will follow up and provide home-based care, medication adherence advice, and general patient monitoring. When a patient is discharged and resides outside of our area of operation, a referral is given to the provincial Department of Health for them to ensure that adequate follow-up by other organizations is maintained.

Multi-drug Resistant (MDR) TB and Extremely Drug Resistant (XDR) TB are areas of concern. LH has established protocols that require TB patients that are admitted to its in-patient unit to be on treatment for 14 days prior to admission; otherwise, they will be isolated until their medication is proving to be effective. Living Hope plans to enhance its isolation facilities in the in-patient unit facility as soon as funding allows. Currently LH staff are under going training for TB DOTS and LH will therefore be able to provide TB medication adherence and monitoring in the home context within the period of this operational plan. Isoniazid preventive therapy, contact screening, active case finding and sensitivity testing is provided by the local provincial government clinic or hospital. LH will coordinate its care program, which is HIV and AIDS-focused, to that of a TB program to enhance the level of service to patients who are co-infected with HIV and TB.

Both in-patient and community-based patients are referred to our Support Group Facilitators and are visited by these people in either the hospice or the home. The patient therefore has a support system established from the earliest opportunity where they can associate with people in similar circumstances and receive ongoing advice, prevention counseling, general counseling and spiritual counseling.

Referrals to other services such as occupational therapy, physiotherapy, speech therapy and nutritional services are also provided.

Living Hope seeks to increase the professionalism of all its care workers and provides specialized palliative care training, IMCI (integrated management of childhood illnesses), Advanced Home-based Care and Patient Advocacy training for LH's Community-based and facility-based care givers.

LH's community and facility-based care providers are given pre-service basic palliative care training. This is an HPCA-accredited 59-day palliative care training. It enables LH carers to provide the basic elements of palliative care service according to South African Government (SAG) standards and to provide a higher standard of Community-based Care (CBC), including IMCI.

LH also encourages experienced CBC givers to participate in advanced home base care courses administered by "Peninsula Training & Assessments". This training includes advanced issues such as better management, patient environment awareness, infection control, patients with special needs, etc. This training equips CBC's to provide comprehensive care to families of HIV-infected individuals, including children. This will result in improved health status of for all family members.

Additional training includes advocacy training that encourages community members to consider HIV testing and initiating ART and helps to reduce stigma in the community. Advocacy training includes education relating to ARV medication and its side effects, monitoring of patient adherence to the taking of their medication, the statistical reporting on patient condition and compliance, and the referral process.

All home-based and in-patient unit care givers are provided with regular in-service or refresher training on the required medical services. This training is provided by peer HBC staff or Living Hope nurses.

Living Hope desegregates adult care data collected by gender to make informed decisions for planning, identifying gaps in gender care to help LH develop a more family-centered approach to care and treatment services.

In an effort to prioritize reaching more women in LH's adult care program, the majority of LH's palliative care staff are women. This improves the confidentiality and comfort of women seeking HIV specific treatment or care. LH also provides training for the women in its adult care program to recognize signs of gender-based violence and provide appropriate counseling and HIV referral services to the community.

SUMMARY:

Living Hope (LH) will provide in-patient hospice care and home-based care (HBC) for HIV-infected individuals in the Western Cape peninsula. The program will also provide elements of the preventive care

Activity Narrative: package, post-test counseling and support groups for PLHIV. The emphasis areas include human resources, training and the development of referral systems. The main target population is people living with HIV.

BACKGROUND:

Living Hope Community Center is an indigenous South African FBO formed in 1999 in direct response to the HIV and AIDS epidemic. The activities below are ongoing; PEPFAR funding for this activity began in 2005, helping to expand LH's reach into high risk communities with HBC, caring for caregivers and providing hospice-based services and referrals.

LH is working in partnership with the False Bay Hospital by providing a lay counselor for PMTCT counseling and support and with a local government clinic in Masiphumelele, Fish Hoek, Muizenberg, Ocean View, Simon's Town, Red Hill and Seawinds Clinic where lay counselors assist in offering pre and post-test counseling.

LH coordinates with the DOH to ensure that their care activities complement the HIV and AIDS strategy of local government facilities and strengthening their prevention and care policies. With non-PEPFAR funds, LH has also constructed a 22 bed hospice to care for HIV-infected patients referred by local hospitals and HBC givers in the surrounding communities to offer culturally appropriate end-of-life care, symptom and pain management, and referral for ART.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

All members of LH's HBC and hospice staff receive specialized training in palliative care including the basic preventive care package. LH is working in partnership with the Palliative Association of South Africa to develop a carefully managed, outcomes-based, training curriculum for their home-based caregivers. The training modules and time frames are still under development but will be have the accreditation of the Hospice Palliative Care Association (HPCA) and will be tailored for the needs of the caregivers. LH has had negative experience with some of the other outsourced training programs so this provided the motivation to tailor-make a training program.

LH will provide comprehensive HBC to people in four Western Cape communities - Masiphumelele, Ocean View, Red Hill, and Muizenberg. This specifically includes people living with HIV (PLHIV) and their family members. HBC caregiver visits incorporate nursing care, personal hygiene, HIV and AIDS education to infected individuals and family members, screening for symptoms and pain and referral when treatment it is unavailable through routine nursing care. All patients are assessed, referred for ART, TB, STI, OIs and are provided with follow-up and ongoing care and support including the provision of DOTS and cotrimoxazole when appropriate.

LH utilizes a family-centered approach to the provision of care. HBC caregivers spend time in the homes of those who are ill and get to know the client's family, presenting an opportunity to provide training and support to the family caregivers. This includes discussions on knowing one's HIV status and PMTCT for pregnant women that will include safe infant feeding practices and family planning. This training and support for the caregivers of PLWA and their families will include a comprehensive package of basic information about caring for their family member, pain and symptom management and relief in the administration of care. Preventive measures in home-based care are also covered. The hospice also provides ARV treatment and clinical care for those eligible (treatment is procured and funded by the Western Cape DOH).

The HBC program will include services also provided by the Wound Dressing Clinics in Masiphumelele, Muizenberg, and soon to be Ocean View Communities. The wound dressing clinics provide basic clinical services one would find in drop-in clinics including dressing of wounds, treatment for basic injuries and referrals to social or hospital services. These locations and services provide an effective means to establish relationship with those individuals who are HIV-infected and need HBC or other services. It is also an opportunity to encourage all individuals to get tested.

As part of the HBC activity a system will be established for the referral of HIV-infected individuals needing holistic inpatient and/or hospice services (including those experiencing acute HIV-related illnesses, including TB and other opportunistic infections) to LH's hospice or other appropriate healthcare institutions for preventive care and symptom and pain management. A system will also be established for the referral and follow up of ARV treatment-eligible patients to the nearest public health treatment site.

ACTIVITY 2: In-patient Hospice Care

LH will provide holistic in-patient care at their 22-bed hospice facility (20 of those beds are funded by PEPFAR and are shorter term). The hospice is designed to provide palliative in-patient care to adults and children over 12 with pain and symptom management such as those who are experiencing acute HIV-related illnesses including TB, other opportunistic infections, and any other HIV and AIDS complication requiring inpatient care. In addition to short-term hospice care, LH and its staff provide a place to die in peace and dignity with psychosocial and culturally appropriate bereavement and spiritual support to the patient as well as their family members.

The hospice is part of a network of care and support offered by LH that works in collaboration with government and other NGO HIV and AIDS services in the area such as ART, counseling and testing and clinical support including the basic package of care. LH also provides transportation for clients to access any of the medical or care services required in the area from hospital care, clinical results or collecting the ARVs for patients at the LH hospice.

Activity Narrative: ACTIVITY 3: Non-clinical Care and Support

As part of providing comprehensive palliative care, LH places an emphasis on meeting emotional and spiritual needs. There are weekly support groups and one-on-one counseling available for HIV-infected community members where they find acceptance, hope, encouragement and support needed to live a productive and satisfying life. Those who attend are also coached in how to plan for their family members who may be affected by an HIV-infected member of the household. LH's social workers link the OVC and other vulnerable family members to social services, government grants where applicable, non-USG nutritional support through temporary food parcel delivery, skills training, as well as ongoing emotional and spiritual support.

ACTIVITY 4: Referrals & Linkages

The referrals system links HIV-infected people from initial pre and post-test counseling with LH lay counselors to appropriate next level of service such as psychosocial support, home-based care, government clinic or hospital services, PMTCT support or hospice care.

The LH Hospice receives and sends out referrals via partnerships with local area government hospitals and clinics. Local hospitals refer clients to the hospice or home-based care program if the patient requires this level of care. LH's social worker and chaplain are also called upon in many cases to visit or work with clients from the government hospitals and clinics.

Home-based caregivers also refer and receive clients from local area hospitals or community members that are aware of LH's service. Many times, clients looking for home-based care inquire about these services at local hospitals and then the client is referred to Living Hope. Home-based carers are also being utilized in area clinics to assist in wound care. They are learning as well as providing additional medical support in these clinics. From this, better cooperation and referral linkages are made.

LH is in the process of developing a planned approach to South African Business inviting partnerships with those businesses looking to fulfilling their social responsibility to reduce HIV infections in the workforce.

FY 2008 activities will be expanded to include an additional full day professional care staff to help provide a broader level of clinical and medical services to clients in LH's home-based care programs. This service will contribute to the holistic care and improve the basket of services to care clients. The geographic reach and number of sites will remain the same although targets will increase due to improved 'family member' indicator tracking and counting and more integration between the prevention program linking clients who require the service to care providers.

In the above activities, PLHIV will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or OVC will be provided in at least two or the five categories of palliative care services.

This activity specifically contributes to the overall PEPFAR objectives of 2-7-10 by providing direct health care, emotional and spiritual support or those who are HIV-infected and their families.

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. The funding mechanism from field support to a local agreement for JHPIEGO anticipated will not be taking place and the funding mechanism will continue to be through field support. Therefore a COP entry is being made to reflect this change in mechanism and activity number only. JHPIEGO activities under this program area are expected to continue under the FY 2009 COP and funds are being requested in the new COP entry. Therefore there is no need to continue funding this activity with FY 2009 COP funds in this COP entry.

New/Continuing Activity: New Activity**Continuing Activity:****Table 3.3.08: Activities by Funding Mechansim****Mechanism ID:** 255.09**Mechanism:** TASC2: Intergrated Primary Health Care Project**Prime Partner:** Management Sciences for Health**USG Agency:** U.S. Agency for International Development**Funding Source:** GHCS (State)**Program Area:** Care: Adult Care and Support**Budget Code:** HBHC**Program Budget Code:** 08**Activity ID:** 2949.23100.09**Planned Funds:** \$0**Activity System ID:** 23100

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. PEPFAR funds were allocated to HCBC through the Integrated Primary Health Care Project (IPHC), a collaborative project between the National Department of Health, the provincial Departments of Health in the Eastern Cape, KwaZulu-Natal, Limpopo, Mpumalanga and North West provinces and the United States Agency for International Development (USAID) awarded in 2004 and extended until December 2010 to Management Sciences for Health (MSH). Since this project has a ceiling which cannot be exceeded, no further funding can be added since the contract has reached its ceiling. MSH will work with the DOH to ensure that activities are sustainable to the maximum extent possible. The HCBC activities of MSH will be completed according to schedule in 2010. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Prime Partner: Sophumelela

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Care: Adult Care and Support

Budget Code: HBHC

Program Budget Code: 08

Activity ID: 24734.09

Planned Funds: \$0

Activity System ID: 24734

Activity Narrative: SUMMARY:

The Sophumelela Clinic Incorporated (SCI) has just received funds under the New Partnership Initiative. Funds were received and activities only commenced in September 2008. SCI has been a sub-partner under the Catholic Relief Services (CRS) Track 1 award for the past four years. Additional funds are being used to support HIV care and support activities not covered under the current award with CRS. Through this program SCI will increase the quality of life for the terminal patients and their families and as SCI assists with the care for the dying and helping families through the bereavement process.

BACKGROUND:

SCI is a non-profit faith-based organization that was formed by the First City Baptist Church, Buffalo City, Eastern Cape, South Africa in 2005. SCI exists to provide comprehensive clinical, social and spiritual care to HIV-affected people and their families in a faith environment within the greater Buffalo City Metropolis. SCI began as, and is currently, an antiretroviral (ARV) roll-out sub-contractor under the AIDS Relief PEPFAR Track 1 Treatment and Care grant to Catholic Relief Services. Soon after opening the ARV clinic, the decision was made to form a non-governmental organization. This was done because of the recognition that the simple provision of ARVs to patients attending our existing clinic did not address their many individual needs and social problems. From its inception the vision of SCI was to provide comprehensive and holistic care services to people infected and affected by HIV and AIDS.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Hospice Care

With FY 2008 funds, a hospice care facility will be developed with the aim that patients will die with dignity rather than the unfathomable situations they are finding themselves in at present, as is so often the case, in a cold shack with no ablution facilities or personal care. This facility would create beds for public hospital patients to die with dignity as terminal patients are discharged from hospital as only emergencies are admitted currently because of the medical overload caused by the HIV pandemic. This facility will be available for both adults and children.

ACTIVITY 2: Home-based Care

SCI will continue to use the same models that have been successful in its current ARV program. Home-based care workers have approximately 30 patients and their families to visit each month. Their main objective is to monitor adherence and provide social and spiritual support. Patients include those enrolled in SCI's ARV clinic, partner NGOs and public health facilities. These patients include both adults and children. In addition, family members will be targeted for HIV-related care and will be referred for other services offered by SCI (e.g., the orphans and vulnerable children program) and referred for services not offered by SCI with local service providers.

Mechanism: Nurse Initiated ART

USG Agency: U.S. Agency for International
Development

Program Area: Treatment: Adult Treatment

Program Budget Code: 09

Planned Funds: \$3,973,913

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

JHPIEGO's ART2Scale project activities in the FY 2009 COP will separate HIV and AIDS treatment work from systems strengthening. The policy and systems strengthening work on building consensus, and stakeholder buy-in for both accreditation and Nurse-Initiated and Managed (NIM) antiretroviral therapy (ART) policy development, which were dealt with under the treatment section in the FY 2007 and 2008 COPs, will move to systems strengthening. FY 2009 COP activities will be modified as follows:

ACTIVITY 1: Performance Standards

JHPIEGO proposes a model that will link accreditation to standards-based management and recognition (SBM-R), whereby facilities are accredited in order to ensure high quality ART service provision, and the SBM-R approach is used to sustain quality post accreditation. To strengthen TB/HIV integration, JHPIEGO will work with the National Department of Health (NDOH) to develop a specific SBM-R standard focused on improving TB case finding, TB preventive therapy and TB management in accordance with the national TB infection control guidelines. Also, with the NDOH, JHPIEGO will also explore the development of SBM-R for TB service delivery, which would include HIV testing of TB patients.

The SBM-R model will be introduced to five primary health care (PHC) facilities that were assisted by JHPIEGO to get accredited in FY 2007. Building on the FY 2008 COP, during which JHPIEGO would have initiated ART SBM-R in five sites within a district in Limpopo province; JHPIEGO proposes to expand to four facilities with FY 2009 funding, and to strengthen the capacity of district and facility teams to implement the program. This will be achieved through training, on-site technical support, involving different stakeholders and sharing SBM-R results widely with provincial, district and facility staff. Together with the provincial Quality Assurance and HIV and AIDS managers, JHPIEGO plans to establish provincial, district and facility teams in order to institutionalize SBM-R. The SBM-R teams and staff at implementing sites will be trained on the SBM-R approach and tools. The following activities will be undertaken to strengthen SBM-R: conducting baseline assessments of actual performance at targeted sites, conducting root cause analysis and design of interventions, implementing interventions to improve quality of services, supporting continuous measurement of actual performance, and working with the provincial and district management to establish criteria for recognition and rewarding best performing sites. As a result of these interventions, sites are anticipated to achieve a minimum score of 85% on the ART SBM-R standards.

ACTIVITY 2: Strengthening Nurse-Managed Antiretroviral Therapy and Comprehensive HIV and AIDS Services

With FY 2007 funding, JHPIEGO provided technical support to the development of the national NIM ART framework, and conducted a situational analysis to assess capabilities and readiness of NIM ART within comprehensive HIV and AIDS services. It is expected that the focus in the implementation of the FY 2008 COP will be the dissemination of NIM ART results, and further collaboration with DOH in the development and finalization of NIM ART policy. JHPIEGO will further collaborate with nursing institutions and associations on the development of training curricula and strategies for pre-service and in-service nurses. In the FY 2009 COP period, JHPIEGO proposes pre-service and in-service workforce development for nurses in line with the NIM ART framework, which will address the role of nurses and task-shifting in clinical management of ART. JHPIEGO will work with nurse-training institutions to strengthen and align training curricula to NIM ART, and strengthen linkages between the training institutions and provincial departments of health. To improve nursing skills on TB/HIV integration, JHPIEGO will ensure that all aspects of TB/HIV management will be included in the curriculum (e.g. systematically offering counseling and testing to all TB patients and providing insulin potentiation therapy (IPT) to eligible people living with HIV (PLHIV)).

Task shifting will broaden the range of health workers to manage ART services and increase access overall. JHPIEGO proposes a competency-based in-service training for nurses on ART and comprehensive HIV and AIDS management, advanced ART course for ART specialization, development of nursing job aides for ART services, as well as on-site support and supervision to trained providers in selected sites in order to strengthen the management of ART clients by nurses including TB/HIV integration. Competency-based training is a methodology that relies on the learner demonstrating the ability to put the lessons into practice before moving on with other areas of learning. As a result of this intervention, it is expected that 460 nurses will be trained on NIM ART nationally.

ACTIVITY 3: Expand Capacity for Accreditation, Site-Readiness and TB/HIV integration

In the FY 2007 COP period JHPIEGO began conducting national accreditation capacity building workshops for provincial teams. JHPIEGO will focus on district and facility-based trainings in supported provinces and upon provincial request in the FY 2008 COP period. With FY 2009 funding, the accreditation technical support will be expanded from two provinces to four provinces: Limpopo, Northern Cape, Eastern Cape and North West. JHPIEGO will continue to strengthen and expand accreditation through capacity building for the provincial, district and facility accreditation teams. JHPIEGO will conduct district-based accreditation workshops to capacitate the accreditation teams and service providers on site readiness, the accreditation tool and the process, conducting self-appraisal and development of action plans to fill performance gaps. JHPIEGO will assist the department of health prepare twenty-four sites to get accredited. The national accreditation tool will be used as framework to prepare facilities for accreditation, identify gaps and develop action plan, and provide technical support until facility is accredited. The accreditation of primary health care (PHC) sites will strengthen down referral by ensuring that there is capacity at PHC for hospitals to refer ART patients close to where they live. During accreditation on-site support JHPIEGO will assist facilities to strengthen referral systems with other facilities within a service point; and assist them identify and strengthen links with community-based support organization that provide counseling, home-based and other relevant services within the catchment population.

JHPIEGO will ensure the training of staff on infection prevention and control. In collaboration with the Foundation for Professional Development (FPD) and other PEPFAR partners, JHPIEGO will provide

Activity Narrative: continuing education on TB/HIV strengthening using FPD's standardized, certified modules. JHPIEGO will create or strengthen TB/HIV integration models. Patient education will be enhanced through the distribution of TB information, education, and communication (IEC) materials to enable PLWHA to recognize TB symptoms, to protect themselves and others from exposure to TB. JHPIEGO will provide technical assistance on proper ventilation in accordance with the national TB infection and control guidelines. If and when a need arises, JHPIEGO will assist with the procurement of ultraviolet germicide radiation lights in ten of the primary health care clinics or community health care clinics in four provinces (Limpopo, Northern Cape, Eastern Cape and North West provinces).

SUMMARY:

JHPIEGO's activities support efforts by the National Department of Health (NDOH) and public sector antiretroviral therapy (ART) sites in Gauteng to ensure access to and quality of ART services. The emphasis areas include human capacity and development (including task shifting for nurse managed ART services), and local organization capacity building. Specific target groups include people living with HIV (PLHIV).

BACKGROUND:

JHPIEGO has been working with the NDOH since FY 2004 to improve institutional capacity through training and dissemination of national HIV and ART guidelines and through support of a treatment technical advisor to the NDOH. In FY 06 and FY07, JHPIEGO partnered with the Foundation for Professional Development (FPD) (a PEPFAR-funded partner) to initiate a standards-based management and recognition approach for improving ART services. In FY 2008, JHPIEGO will continue to implement these interventions, aimed at improving access to and quality of HIV and AIDS service delivery. In FY 2007 JHPIEGO supported implementation of the NDOH's model for nurse-initiated and managed ART through an approach that will encourage a healthcare culture supportive of nurse-initiated and managed ART; a policy environment that will ensure that these frontline nurses have the training, funding, and ongoing support they require; and ensure that South African training institutions are strong partners in the efforts to achieve the ambitious targets set in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 for increasing the proportion of adults and children started on ART by nurses. These activities will continue in FY 2008.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Performance Standards

Standards-based Management and Recognition (SBM-R) is a practical management approach for improving the performance, efficiency and quality of health services. It consists of the systematic utilization of performance standards as the basis for the implementing organization and related service delivery. Compliance with standards is recognized through formal mechanisms and is in line with NDOH standards and guidelines. In FY 2005 and FY 2006, JHPIEGO developed detailed performance standards for ART and introduced this process at four FPD-supported ART sites. Performance standards focused on twelve different areas of ART service delivery including pre-treatment, treatment commencement, and management of complications for both children and adults; pharmacy services; laboratory services; information, education and communication; health information systems; infrastructure; and human resources.

Based on the initial work by the South African Government in FY 2007, JHPIEGO will support scale-up of this process to other NDOH sites in the Northern Cape, especially those where ART will be integrated into primary healthcare services. JHPIEGO will coordinate with other PEPFAR treatment partners in the accreditation process. JHPIEGO will support scale-up of SBM-R for ART in the Gauteng province, or other provinces as requested by the NDOH. As a result of these interventions, access to and quality of ART services will improve for both children and adults.

ACTIVITY 2: Strengthening Nurse-Managed Antiretroviral Therapy and Comprehensive HIV and AIDS Services

In FY 2008, JHPIEGO will continue to support implementation of the NDOH's model for nurse-initiated and managed ART through an approach that will encourage a healthcare culture supportive of nurse-initiated and managed ART; a policy environment that will ensure that these frontline nurses have the training, funding, and ongoing support they require; and ensure that South African training institutions are strong partners in the efforts to achieve the ambitious targets set in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 for increasing the proportion of adults and children started on ART by nurses.

JHPIEGO proposes strengthening both in-service and pre-service education with a focus on training nurses and providing on-going support to ensure their competency in day-to-day management of patients on ART and identification and referral of treatment complications from the health center to district hospital level. This will relieve the heavy client burden on tertiary ART institutions resulting in improved access for current clients and more clients getting on ART.

ACTIVITY 3: Expand Provincial and District Capacity of Accreditation and Site Readiness

In FY 2008, JHPIEGO will continue to work with the National Department of Health to build the capacity of the national, provincial and district teams to accredit sites. Activities will include adaptation of the accreditation tools for primary health care level, training and onsite mentoring of teams. JHPIEGO will also work with the sub-district level teams by providing support for implementation of site readiness plans and work with other USAID treatment partners to assist them in receiving ART accreditation for their sites.

These activities will indirectly contribute to the overall PEPFAR objectives by ensuring sustainability and

Activity Narrative: quality of ART services. Technical experts working with NDOH will indirectly contribute to increased access to treatment services through site accreditation, and standards-based management of services will indirectly increase access due to improved quality of service. These activities contribute the PEPFAR goal of putting two million people on treatment, and support the USG/SA Five-Year Strategy by building capacity for ART service delivery.

Planned Funds: \$1,615,449

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The signing of memorandums of understanding (MOUs) between Management Sciences for Health's (MSH) Strengthening Pharmaceutical Services (SPS) with the provinces will enhance accountability by both sides (SPS and counterparts) as the MOUs will list the obligations by both parties as well as the activities to be undertaken.

SPS will keep providing support to this critical component of the National Strategic Plan (NSP), including the strengthening/management of down referral systems.

SUMMARY: Management Sciences for Health's (MSH) Strengthening Pharmaceutical Services (SPS) project will support the South African Government's (SAG) Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment (CCMT). SPS improves the reliable provision of ARV services and other related services; support monitors progress towards compliance with pharmaceutical legislation and ARV accreditation requirements for provincial health facilities; trains pharmacists and pharmacist assistants in basic principles of HIV and AIDS management; trains health personnel in conducting medicine use evaluations, using adherence to antiretroviral treatment (ART) measurement tools; supports the review of national standard treatment guidelines (STGs) for HIV and AIDS, TB, STI and other diseases; strengthens the provincial implementation of pharmaceutical therapeutic committees and medicine information centers; and strengthens pharmacovigilance reporting. The emphasis areas are human capacity development and wraparound programs. Target populations include National AIDS Control Program staff, policy makers, public and private health care workers (especially pharmacists), people living with HIV (PLHIV) and their families, OVC and the general population of children, youth and adults. SPS will work in all nine provinces to support national, provincial and local government pharmaceutical services as well as the Department of Correctional Services. Opportunities for collaboration with the Supply Chain Management System (SCMS) Project will be explored. BACKGROUND: Since FY 2004, RPM Plus has been working in close collaboration with the National Department of Health Pharmaceutical Policy and Planning (NDOH-PPP) Unit, and provincial and local government pharmaceutical services to support the delivery of pharmaceutical services at all levels. The following activities are a continuation of the activities initiated since FY 2004. Systems and models have been developed and tested. In FY 2008, SPS will continue the implementation of these on a larger scale and monitor the impact on the delivery of ART at accredited sites. These activities have received the full support of the NDOH-PPP unit and the provincial pharmaceutical services. ACTIVITIES AND EXPECTED RESULTS: ACTIVITY 1: Pharmaceutical Services Delivery Since 2004 RPM Plus has provided assistance to all provinces in monitoring progress towards compliance with the SAG legislative requirements that relate to the delivery of pharmaceutical services as well as the applicable standards for the accreditation of health institutions (hospitals, community health centers) to provide ART. This activity addresses issues related to infrastructure, human resources, equipment and systems. Thus far activities have included the development of a monitoring tool and the conducting of reviews in the provinces and Metros. A national workshop was held in 2007 which was attended by representatives of all provinces, the national office, local governments and correctional services. In FY 2008 the work will continue with the focus being on strengthening pharmaceutical services within the legislative framework. Activities will include assistance with the development of policies and procedures at all levels, development and implementation of models of service delivery to support the provision of quality service to patients with HIV and AIDS, TB and other diseases, capacity building in the areas of governance, pharmaceutical care and monitoring and evaluation of pharmaceutical service delivery. ACTIVITY 2: Pharmacovigilance The CCMT recognizes the importance of strengthening pharmacovigilance measures to ensure the safe and effective use of ARVs and other medicines used in HIV and AIDS patients. The identification, diagnosis, management and reporting of HIV medication-related adverse effects are critical. RPM Plus has worked with the national and provincial health departments and other key stakeholders to develop training materials to meet this need. SPS will conduct training programs to build capacity by providing skills and knowledge to HIV and AIDS program managers and the Medicine Regulatory Authority (MRA) on the principles of public health pharmacovigilance and the safety of antiretroviral agents. In addition, SPS will assist and advise facility-based HIV and AIDS programs on the planning and implementation of pharmacovigilance surveillance activities, with subsequent follow-up at the provincial and national levels; support scientific research relating to key drug safety issues identified in the region; assist in the communication of information obtained from pharmacovigilance systems and research managed by the national and local HIV and AIDS programs; and establish networks linking pharmacovigilance programs in the region with each other in order to encourage information exchange and skills transfer. ACTIVITY 3: ART Adherence Since August 2005, RPM Plus has been working in collaboration with the national and Eastern Cape HIV and AIDS units and other key stakeholders to improve treatment outcomes and prevent resistance to ARVs through the development of ART adherence measurement tools and determining best practices. Following the successful development and piloting of an adherence assessment tool the National Department of Health requested RPM to roll out the tool in May 2007. Clinical staff (doctors, nurses and pharmacists) will be trained by SPS in providing: patient education on HIV, AIDS and ART; provider education on HIV, AIDS and ART; psychological and social screening of patients to assess readiness for treatment; and support services to facilitate resolution of barriers to adherence. These efforts will also contribute to the overall strengthening of the health system as medication adherence monitoring and support measures are generic tools that may be applied to settings providing treatment for other chronic diseases. In the long-term the goal is to develop a network of expertise and facilities, and establish South Africa as a Regional Pharmaceutical Technical Collaboration Centre (RPTCC) for ARV adherence-related matters. ACTIVITY 4: STGs and Rational Drug Use The revised edition of the South Africa adult and pediatric STGs for the hospital level has just been published. These STGs include new chapters on HIV and AIDS care and treatment. SPS will assist the NDOH in reviewing these STGs and the primary health care EDL on an ongoing basis, and the provinces in promoting these new STGs. SPS will also conduct provincial workshops on rational drug use; strengthen provincial, district and institutional pharmaceutical and therapeutic committees (PTCs); assist with the development of provincial formularies; train staff in basic principles of pharmacy economics and the use of evidence-based principles for drug selection; and implement provincial medicines information centers. Through these activities SPS will also assist the NDOH in reviewing their infection control policies and guidelines. ACTIVITY 5: Down Referral and Integration of Services There is a need to scale-up access to ART. One strategy of the NDOH

Activity Narrative: is to down refer stabilized patients on ART to their nearest primary health care (PHC) facility. The other long-term approach is to initiate the treatment at PHC level. SPS will support these two critical initiatives by assisting in the development, implementation and strengthening of down referral systems as well as the integration of the provision of ART with the supply of medicine for other conditions treated at PHC level. RPM Plus has included a down referral module in their integrated drug supply management system (RxSolution).
ACTIVITY 6: Training of Pharmacy Personnel from ART sites (and others) There is an urgent need to build capacity among pharmacy personnel to manage patients on ARVs. The anticipated deployment of the National AIDS treatment program at PHC level, make this activity a priority. RPM Plus has developed a 5-day HIV and AIDS training program specifically for Pharmacists and Pharmacist's Assistants. This training program is being accredited by the South African Pharmacy Council. In FY 2006 over 1200 health personnel have been trained. SPS will expand this program to PHC Level Pharmacy personnel and to other counterparts such as Correctional Services.
ACTIVITY 7: Technical Assistance to Local Counterparts Since its inception in 2003, RPM Plus has been requested on a regular basis by government (e.g. Medicines Control Council) and non-government organizations (e.g. the South African Pharmacy Council, the South African Qualifications Authority) to provide ad hoc technical assistance for a wide range of services such as the development of staffing norms for pharmaceutical services, accreditation of facilities, development of standards of pharmacy practice, the review/revision of the scope of practice and competency standards for persons involved in the provision of pharmaceutical services, implementation of legislation to reduce the price of medicine and improve medicine availability to communities, (including ARVs and medicine used in the treatment of co-morbidities) and the development and implementation of public-private partnership service level agreements. In FY 2008 SPS will continue to provide technical assistance in these areas as well as other emerging issues such as pharmacy care and monitoring and evaluation. All these activities will build South African capacity and support the improvement of health services. This will contribute to the achievement the overall PEPFAR goals of reaching 10 million people with care and 2 million with treatment.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. PEPFAR funds were allocated to ARV treatment through the Integrated Primary Health Care Project (IPHC), a collaborative project between the National Department of Health, the provincial Departments of Health in the Eastern Cape, KwaZulu-Natal, Limpopo, Mpumalanga and North West provinces and the United States Agency for International Development (USAID) awarded in 2004 and extended until December 2010 to Management Sciences for Health (MSH). Since this project has a ceiling which cannot be exceeded, no further funding can be added since the contract has reached its ceiling. MSH will work with the DOH to ensure that activities are sustainable to the maximum extent possible. The ARV treatment technical assistance activities of MSH will be completed according to schedule in 2010. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Activity ID: 3299.23073.09	Planned Funds: \$1,678,247
Activity System ID: 23073	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

It is largely anticipated that the funding requirements in this budget period will be reduced as accreditation processes are completed and clinics are able to draw stock from government supplies.

The antiretroviral treatment (ART) clinics have been dedicated to providing ART to eligible patients. It does not operate as a primary health clinic although the clinic does provide care and treatment for opportunistic infections. It has existing systems for radiology, pathology and referral and is operating effectively. Sufficient community-based organizations have been providing home-based care (HBC), tracing and similar services.

The activity has been modified in the following key focus areas.

A. An emphasis on qualitative aspects of patient care, including:

1) Retention in care at the dedicated ART clinics have until recently focused their attention upon the treatment of those already in need of ART. Counseling and testing and the staging of patients have been a minor activity provided to the relatively few walk-in patients. The vast majority of patients are already tested and staged, having been referred by the State clinics in the area. A pre-ART register has been instituted and these patients are being followed up at the required intervals. In addition to the clinics activities a separate call center communicates with each patient in terms of a preset protocol with the objective of informing, educating and promoting the patients personal interest in his/her condition.

2) Support group meetings will be continued and linkages with HBC organizations will be maintained.

3) Increase the linkages and communication with referring State clinics which has been problematic on both sides due to the high workload. The emphasis on compliance is strengthened by strong referral systems with other facilities such as local hospitals and TB treatment sites. Local hospital linkages have proven to be invaluable with regard to PMTCT cases and the subsequent follow up of mother and baby.

4) Ameliorate TB education, screening and follow-up.

5) Increase prevention with positives: State-supplied condoms are inserted in every medicine package and referrals to family planning clinics manage unwanted pregnancies and sexually transmitted infections (STIs).

6) All patients accessing the ART centers have access to trained professional and lay counselors as well as to psychologists should this be required. This assists in the treatment process by providing coping mechanisms for the patient.

7) All ARV medication is issued on a doctor's script and an individual treatment plan is maintained for each patient. This is overseen by an external clinical advisor who is both a highly experienced and qualified HIV clinician. In a similar fashion all switching and treatment changes take place following discussion between the treating doctor and the medical advisor. This ensures quality of care as well as continuity of referrals where this is required.

8) All treatment protocols utilized are those of the National Department of Health in order to facilitate the return of the patients to State care upon the cessation of funding.

B. An emphasis on quantitative aspects of patient care, including:

1) The Youth Clinic offers an outreach service to local church groups, orphanages and nursery schools in order to promote the early identification of HIV-infected persons.

2) The program currently supports ART at 15 primary health clinics, a Youth clinic as well as two dedicated ART clinics.

3) The clinic sites provide palliative care to all patients and all uncomplicated opportunistic infections are treated as part of the comprehensive ART care package offered. This includes the treatment of sexually transmitted diseases.

4) The doctor practices that are supported are able to offer routine HIV counseling and testing and this will be provided. In addition this will be coordinated from the Head Office to ensure accost effective uptake.

5) Cotrimoxazole is widely available and yet the measurement of this indicator have been found wanting. This will be addressed and rectified. Currently cotrimoxazole is available to 100% of patients although the period on the medication differs from patient to patient.

6) Bringing the whole family into care: A family centered approach is followed with patients encouraged to bring their partners and children and to have them test.

SUMMARY:

HIVCare will use FY 2008 PEPFAR funds to work with the Free State Department of Health to provide antiretroviral treatment in a private health facility to patients who do not have medical insurance and who are referred from the public sector waiting lists for treatment. The Medicross Medical Centre, a well equipped private primary healthcare center, provides the main resource base and in conjunction with thirteen other sites, will provide an effective means of properly distributing ART to patients who are either referred from public sector facilities or who access the site by word of mouth. The emphasis areas for this program will be human capacity development and local organization capacity building. The target population includes men and women; families (including infants and children) of those infected and affected, factory workers and other employed persons, and government employees - specifically teachers, nurses and other health workers (who do not have medical insurance). A further specific population that will be targeted will be secondary school children. The most significant target group is those persons that cannot access services in the public health system.

All treatment administered is done in strict accordance with South African Government (SAG) guidelines

Activity Narrative: and with due regard to the need to transfer the patients back to SAG facilities when feasible. Additional attention is to be given to the screening and treatment of TB amongst the patients attending the program. The linkage with the youth centre will ensure that we have a larger proportion of younger persons being attended to, specifically adolescents aged 10-14 and 15-24. This focus on the youth should further encourage some involvement with the street youth and it is anticipated that the program will be marketed amongst those NGOs working with the street youth as a testing and treatment site.

BACKGROUND:

PEPFAR funding for the HIVCare project commenced in June 2005. The main thrust of the activity was to match the Free State Department of Health (FSDOH) with partners from the private sector (in this case Netcare, the largest private sector health provider in South Africa) in order to build private sector capacity and absorb some of the burden from public sector facilities. Many FSDOH centers have waiting lists of people for ARV treatment. Patients from these waiting lists who meet the eligibility criteria for this program are referred from those public sector clinics to one of the four primary health centers in Bloemfontein and one in Welkom for treatment. The FSDOH is a collaborating partner in this public-private partnership.

ACTIVITIES AND EXPECTED RESULTS:

The HIVCare treatment sites will provide all medical services related to the delivery of HIV care and treatment. Management and coordination activities will be provided by HIVCare. The majority of patients will be referred from public clinics in the FSDOH network to the thirteen HIVCare centers based on the following criteria: (1) Clinical criteria (CD4 <200 cells/mm³ or WHO stage III or IV); (2) Inability to pay (lack of private insurance or state coverage) and (3) Overcrowding at referring clinic.

Among the non-medical criteria for enrollment (based on the SAG's Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa and a request from the FSDOH), is that the patients have a stable point of contact to assure continued follow-up. HIVCare relies heavily on telephone access to ensure that patients keep scheduled physician visits, collect their medication, and respond to other questions.

Patients referred to the program receive PEPFAR-funded consultations and exams from HIVCare physicians, who will also order relevant tests and refer patients to expert specialists when necessary. The package of care also includes counseling and testing (for patients who do not know their status), adherence counseling, and access to therapeutic nutrition support as per the national guidelines and OGAC guidance. An initiative aimed at improving overall compliance and treatment efficacy is the distribution with the medication of a parcel of nutritional supplements. The supplements provide a single fortified meal per day for each of the indigent patients on ART and aids in the absorption of the medication. Patients are assessed based upon their BMI and general condition. Benchmark weight amongst patients starting ART at the center is just 55kg(-5.2). The patients that are on the waiting lists for ARV treatment at the public health facilities are offered the option of attending the HIVCare treatment sites. The patients that choose the HIVCare program present at the treatment center with a referral letter and other clinical notes (e.g. CD4 count) from the public health center. The patients meeting the clinical criteria are enrolled onto the program. Where patients present directly at the HIVCare treatment center and are found to be in need of TB treatment or treatment of an opportunistic infection requiring specialized treatment, hospitalization or investigative procedures, are referred to the local public facility for care. Similarly radiography and pathology for investigative procedures is provided by the public health facilities. This is based on the request from the FSDOH to provide only a limited range of services, and the HIVCare program is only meant to assist with the unmet demand at the public sector sites, rather than create a parallel health service delivery program. Due to this working relationship, referrals between the HIVCare sites and public sector sites are seamless. With regard to pregnant patients, they receive PMTCT drugs and information on its use prior to the birth event. Subsequent to this, the patient returns to the center to continue treatment and unless specifically rejected by the mother, infant formula is made available. Prophylaxis syrup is also made available to the infant until it is possible to perform the PCR test to determine the infant's status.

Data is shared with the DOH on two levels. Firstly data on all new patients enrolled onto ART is provided by the pharmacy to the provincial authorities. Secondly a return is submitted to the National Department of Health, with a copy to the provincial DOH, giving the data of all those on the program. In addition to this, a representative of HIVCare attends the monthly provincial task team meetings.

In addition, HIVCare will expand its existing project to target children as part of its continuum of care. This activity targets children between the ages of six and secondary school age through HIV awareness activities. Older children will be provided with access to HIV care and treatment, as well as psychosocial support services (in line with relevant South African laws and regulations pertaining to healthcare for minors). A teen center catering for the specific needs of this age group has been established and PEPFAR funding will be applied in continuing the treatment started in FY 2007. The funds will be specifically applied in providing ARV treatment to children and some prevention materials (including abstinence and being faithful) at a number of schools in order to expand awareness of HIV care and treatment services offered by the program. The teen center will provide a testing service to local orphanages with treatment where not otherwise provided through SAG resources. Other referrals will be made by the FSDOH clinics in the area and through HIVCare's collaboration with other organizations, including the Anglican Church and Red Cross Society.

A number of support groups have been established aimed at involving the partners of the mainly female patients in the treatment process. These groups meet weekly and the aim is to promote support for the patients among their family members and also to get their partners to test and where necessary to join the treatment sites group. The Welkom area will include two treatment sites which should encourage a greater proportion of male patients into the program as a result of the number of large mines in close proximity and their use of migrant, mainly male labor. Case managers employed by HIVCare provide psychosocial support, treatment management and compliance promotion. This individualized management approach will

Activity Narrative: also include telephone support for patients and their families, information about the condition and its symptoms, nutrition advice and healthy living. Case managers actively assist patients to identify and utilize the family and community structures that may exist as well as providing information on other available support . A defaulter program exists that utilizes local resources - Home-based Carers - to follow up on not compliant patients. The service is provided through the church and the Red Cross.

By providing comprehensive ARV services to patients and promoting ARV services for a large population of underserved people living with HIV, (and who do not have private insurance) and school age children, HIVCare is contributing to the PEPFAR goals of placing 2 million people on ARV treatment and providing care for 10 million others who are infected with HIV. These activities also support care and treatment objectives outlined in the USG Five-Year Strategy for South Africa by expanding public-private partnerships and expanding care to an underserved population.

Activity ID: 3274.23081.09

Planned Funds: \$776,724

Activity System ID: 23081

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Lesedi Lechabile (LL) has explored the possibility of including treatment literacy mobilization activities. As they are based within a wider primary health care setting, these services are already on offer from their clinic. Further, Community Health Media Trust (CHMT) has established a provincial office in the town of Welkom, where LL is based, and will provide treatment literacy to the communities served by LL. Turntable Trust (TTT) works in the rural areas of KwaZulu-Natal. TTT will use materials developed by CHMT to provide pre-treatment and adherence counseling training to peer health educators and to community care givers who in turn conduct community outreach events, door-to-door visits and support group meetings.

John Hopkins University (JHU) will work with its partner Health-E to promote informed media reporting around advancements in treatment.

JHU, together with its strategic partner the South African Broadcasting Corporation (SABC), will produce the second series of "Circles," a new drama targeted at the male market that explores the impact of HIV on men, their spheres of influence and their attitudes across different generations.

SUMMARY:

Johns Hopkins University Center for Communication Programs (JHU/CCP) coordinates the work of 20 South African partners and provides technical assistance and capacity building to mobilize and educate communities and clinicians about ARV treatment. The focus is on pre-treatment literacy, adherence, counseling, and training clinicians through distance learning. Target populations for this activity are adult men and women (including pregnant women) living with HIV (PLHIV), discordant couples, volunteers, public health workers, and community-based, faith-based and non-governmental organizations. The emphasis areas for this activity are human capacity development, local organization capacity building and gender. Findings from the National HIV and AIDS Communication Survey, carried out in early 2006, help focus on community perceptions of treatment-related messages, their perceived needs for treatment literacy and the amount of social capital invested in providing assistance in better understanding treatment and its uptake. The survey provided a valuable baseline to further develop present communication interventions on treatment.

BACKGROUND:

The JHU/CCP initiatives are in their third year, following successful programming and ongoing partnerships in providing pre-treatment training, adherence counseling and clinician training. Twelve of the 20 partners that JHU/CCP works with across South Africa are engaged in supporting work relating to pre-treatment training and adherence counseling for people living with HIV. This intervention mobilizes communities around treatment literacy and builds community preparedness by reaching several million people. Mindset uses its onsite access to clinicians to build their capacity to deliver ART services in line with national protocols. Treatment literacy includes pre-treatment training and adherence messages for persons on treatment, treatment support education for families and individuals supporting those on treatment, and ART preparedness education for communities and individuals who anticipate initiating treatment. Other issues covered include prevention with positives with emphasis on discordant couples.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Community Mobilization

Community mobilization activities are implemented by a variety of partners. Community Health Media Trust (CHMT), with PEPFAR funding, has developed a series of video and print materials for people affected by and living with HIV, their caregivers and communities. PEPFAR funding assists CHMT in the community rollout of these materials through group sessions and workshops. CHMT has 92 Treatment Literacy and Prevention Practitioners (TLPPs), (72 funded by PEPFAR and 20 by the National Department of Health (NDOH)), that train and mentor community-based organizations to use their treatment literacy materials to provide pre-treatment training and adherence counseling to PLHIV. This intervention has received NDOH accreditation. Treatment literacy practitioners also work with PLHIV on treatment literacy issues that are broadcast through Mindset's patient channel at 400 health facilities.

The seven hours of treatment literacy videos developed by CHMT and Mindset for the public channel are a major part of the support materials for the TLPPs (in addition to the materials developed previously by CHMT). The materials also cover prevention with positives, male norms and behavior, and stigma and discrimination.

The Valley Trust, as part of their rollout of antiretroviral treatment (ART), has a treatment literacy program supported by the CHMT developed materials and their TLPPs. The Valley Trust also incorporates treatment literacy into its workplace based program being undertaken in small and medium enterprises in several communities in KwaZulu-Natal.

LifeLine works with small business associations as well as farmers and farm workers' associations in areas surrounding one informal settlement in the Gauteng, Limpopo, Northern Cape, and Mpumalanga provinces, to develop workplace programs, including prevention for positives, pre-treatment training and adherence counseling. These programs focus on treatment preparedness and adherence for HIV-infected persons and their treatment supporters (treatment buddies).

The Mindset Health Channel (MHC) provides information directly into health facilities, targeting patients in waiting rooms with general information, and healthcare providers with technical and training information. To broadcast current and accurate information on ARV treatment, JHU/CCP continues its collaboration with MHC in more than 400 health facilities. Existing material will be revised and updated, including treatment videos, web content and print materials in up to five languages for healthcare workers at these sites.

Activity Narrative: Materials developed through previous PEPFAR funding are also updated as national guidelines and protocols change. CHMT treatment literacy practitioners spend half their time with patients in ARV rollout and downstream referral sites that have the MHC.

Both Mindset and CHMT material have been developed through public-private partnerships including business (MTN, Liberty Foundation and Sunday Times) as well as assistance from government and parastatals (e.g. NDOH, and the national broadcaster, South African Broadcasting Corporation (SABC)).

DramAidE utilizes HIV-infected Health Promoters in 23 tertiary institutions in South Africa to undertake treatment literacy, including pre-treatment training and adherence counseling for tertiary students living with HIV, using the treatment literacy series developed by CHMT. They work closely with government treatment sites to fast-track students to initiate treatment early on.

Lesedi Lechabile and Mothusimpilo train their peer educators in treatment literacy using the treatment literacy series developed by CHMT that addresses pre-treatment training and adherence counseling, targeting vulnerable women and mine workers in the mining districts of North West and the Free State provinces.

Lighthouse Foundation trains its peer educators and community facilitators to work in the 13 informal settlements in the Madibeng district of the North West province. Training incorporates treatment literacy, including pre-treatment training and adherence counseling, based on the treatment literacy series developed by CHMT. These topics are included in their community outreach activities, comprising door to door campaigns and HIV support groups.

Sonke Gender Justice undertakes treatment literacy, including pre-treatment training and adherence counseling with people living with HIV in the areas surrounding the men's clubs that are to be expanded in North West, Northern Cape and Limpopo provinces.

Matchboxology (MB), in partnership with the South African Professional Footballers Union and the Professional Soccer League (PSL), provides treatment literacy training to football players who are living with HIV including pre-treatment counseling and pre-adherence counseling. MB works closely with treatment centers so that they can fast-track players to initiate treatment early on. Footballers will be mobilized to promote treatment literacy in interaction with their supporters and as part of their social responsibility.

A partner, to be identified, will undertake treatment literacy, including prevention with positives, pre-treatment training and adherence counseling in the areas of northern KwaZulu-Natal using the materials developed by CHMT as part of their community outreach activities with people living with HIV.

ACTIVITY 2: Media Support for Community Mobilization

ABC Ulwazi produces a radio talk show series tailored to 60 community radio stations. Special emphasis is on pre-treatment training and adherence counseling. Each episode ends with a summary and clear messages on the topic discussed. Listeners' Associations formed by local citizens have facilitators' guides to carry out community outreach interventions related to the series themes.

SABC continues the theme of treatment through two programs: Trailblazers, a 13 episode TV series highlighting success stories including best practices in this area; and a second season of a 26 episode adult TV drama series. Both TV programs are accompanied by radio talk shows (on 9 local language stations) as well as web-based content. The storylines include a focus on treatment and prevention for positives.

JHU/CCP contributes towards meeting the vision outlined in the USG PEPFAR Task Force Five-Year Strategy for South Africa by providing quality treatment literacy education to health providers, their patients and communities. In addition JHU/CCP builds capacity of other organizations to utilize treatment literacy materials to support work with people living with HIV on positive prevention and treatment literacy. By training individuals to deliver quality ARV services and reaching South Africans with correct treatment literacy messages, this activity contributes to the PEPFAR goal of putting two million HIV-infected people on treatment. This activity also contributes towards achieving the National Strategic Plan of South Africa 2007 - 2011 target of ensuring that more than 80% of people living with HIV and their families are provided with an appropriate package of treatment, care and support.

Table 3.3.09: Activities by Funding Mechanism

Mechanism ID: 520.09	Mechanism: CAPRISA Follow On
Prime Partner: University of Kwazulu-Natal, Nelson Mandela School of Medicine, Comprehensive International Program for Research on AIDS	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Treatment: Adult Treatment
Budget Code: HTXS	Program Budget Code: 09
Activity ID: 3072.23660.09	Planned Funds: \$1,603,158

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In an effort to increase its ability to enroll new patients onto treatment without impacting on current capacity, CAPRISA has established referral networks with various Department of Health (DOH) antiretroviral (ARV) sites for decanting of stable, virologically suppressed treatment patients. The South African Government first line regimen is a twice-daily d4T, 3TC and EFV. Treatment patients who have exceeded 24 months in the CAPRISA treatment program and who are stable and virologically suppressed undergo a single drug switch from ddI to d4T. Clinicians, nurses and adherence counselors monitor and assist these patients over a one-month period ensuring treatment compliance and good immunological response. Patients are then transferred out to their nearest DOH ARV site and clinic staff liaise with DOH sites to set appointments for patients. Patients are given a one-month supply of drug by the CAPRISA pharmacy, and appointments to decanting sites are usually made within the first two weeks after the last CAPRISA appointment.

SUMMARY:

Activities are carried out with FY 2008 funding to continue the provision of HIV care and antiretroviral treatment (ART) services to patients already initiated on treatment and to expand access to treatment at two established treatment sites in KwaZulu-Natal. The major emphasis area is human capacity development and local organization capacity building. The target population is people living with HIV (PLHIV). Pediatric services will be introduced at our Vulindlela site to create a shift to a family centered approach to delivering HIV and AIDS care.

BACKGROUND:

CAPRISA was established in 2002 as a not-for-profit AIDS research organization by five major partner institutions; University of KwaZulu-Natal, University of Cape Town, University of Western Cape, National Institute for Communicable Diseases, and Columbia University. The headquarters of CAPRISA are at the University of KwaZulu-Natal. The PEPFAR-funded CAPRISA AIDS Treatment (CAT) Program was initially started as a supplemental effort to deal with the large volume of HIV-infected adult clients that were screened out of CAPRISA's other research studies. The current CAT Program provides an integrated package of prevention and treatment services and provides an innovative method of providing ART by integrating TB and HIV care. The CAT program operates from two facilities: CAPRISA eThekweni Clinical Research Site and Vulindlela clinical research site.

The CAPRISA eThekweni Clinical Research Site, is an urban facility attached to the Prince Cyril Zulu Communicable Disease Clinic (CDC) which is a large local government clinic providing free diagnosis and treatment of STIs and TB.. The ART provision at the CAPRISA eThekweni clinical research site integrates TB and HIV care into the existing TB directly observed therapy (DOT) programs. This allows for the opportunity to initiate HIV care and ART for patients identified as HIV-infected during TB treatment as well as to be able to continue such management for those who develop TB during HIV treatment.

The CAPRISA Vulindlela clinical research site is a rural facility located about 150 km west of Durban, KwaZulu-Natal. The Vulindlela district is home to about half a million residents whose main access to health care is at seven primary healthcare clinics that provide comprehensive services. The CAT Program at Vulindlela is an entirely rural nurse-driven service with doctors available for the initial eligibility assessment and for advice and referral.

Those with CD4 counts under 50 are identified and followed up with home visits by PEPFAR-supported nurse aides and community health workers. The clinic is open Monday to Friday and is operated by 2 full-time and one part-time doctor, 4 nurses, 3 counselors, a pharmacy assistant and a full-time pharmacist. Patients from throughout the greater Umgungundlovu district are referred to the Vulindlela CAT program for HIV treatment and care. Regular meetings (imbizos) between the Vulindlela treatment site personnel and leaders in the local community occur, which enhances community participation, acceptance and utilization of the HIV treatment service. CAPRISA has worked closely and has established strong links with TAI, a community-based organization that assists the Vulindlela CAT program with the provision of trained community educators who do peer education and adherence motivation among our patients, home visits, as the implementation of our nutrition program. TAI is also actively involved with care and support of the extended families, including orphans and vulnerable children, of the program clients.

ACTIVITIES AND EXPECTED RESULTS:

The eThekweni CAT Program has established strong referral networks with surrounding tertiary level DOH facilities for the management of sick and complicated patients requiring tertiary level admission and management. The CAT program provides the ongoing HIV care in partnership with these facilities while co-morbid conditions are being managed, until patients are stabilized and get discharged back to the facility.

CAT patients diagnosed with MDR/XDR TB are fast-tracked for admission to the local MDR hospital, the King George V Hospital. Patients admitted to this facility are visited, and have their ART medicines delivered, by a CAPRISA nurse. Once these patients are stabilized, and deemed non-infectious, they are transported to the CAPRISA facility for follow-up visits. CAT patients that are receiving standard TB therapy, are referred to one of the step-down TB hospitals in the community, and again are visited, and have their ART medicines delivered, by a CAPRISA nurse.

Discussions with the DOH ART Program Manager around the transitioning of eThekweni CAT patients have occurred, and processes are being developed together with the local district office to transition patients who have completed more than 24 months with the CAT program to DOH facilities.

Patients at Vulindlela are referred from the Mafakhatini primary healthcare clinic, research programs (including the non-PEPFAR funded microbicide trial, adolescent cohort, community-based VCT Project) and

Activity Narrative: community referrals (community health workers, community advocates and 30 youth peer-educators). The CAT program in Vulindlela will address issues of stigma and discrimination and is linked to an Oxfam-funded project which addresses stigma and discrimination in the community. The CAT program provides support for disclosing to family members and assists patients in obtaining disability grants. CAPRISA has an extensive community program which supports and facilitates community involvement and informed participation for all CAPRISA projects. Comprehensive services are provided to HIV-infected participants where appropriate. This includes pre- and post-test counseling for HIV infection, treatment and adherence education and support, implementation of ARV treatment, prophylaxis for opportunistic infections, and management of OIs, adverse and serious adverse events. These are done at the clinic and through appropriate referral channels when needed. Only adolescents 14 years or older are targeted. Currently no HIV-related services are offered by CAPRISA to a pediatric population.

Preparations for DOH accreditation visit are at an advanced stage, for the Vulindlela site being accredited as an ART Initiation site. The visit by DOH is expected to take place in August 2007. With the accreditation in place, surrounding public primary health care (PHC) clinics will be scaled up to offer chronic care to stable patients on ART. The Vulindlela CAT program will then commence transitioning stable patients to the PHC facilities. Discussions have been ongoing with the KwaZulu-Natal ARV manager and the DOH District Office to facilitate the smooth transition of patients. It is anticipated that five patients per week will be transitioned which will not overburden the receiving facilities, and the initial patients transitioned will be those from areas with an existing ART roll-out. Transitioned patients will be followed up 6-12 monthly, to ensure successful transitioning.

EXPECTED RESULTS:

ART will be expanded in FY 2008 at both the eThekweni and Vulindlela sites. CAPRISA does not anticipate having to expand the space or staff at these facilities to reach the FY 2008 targets. Laboratory services will continue to be performed at the CAPRISA Laboratory. It was anticipated that by October 2006, patients will start to be transitioned to the Department of Health at a rate of approximately 20 per month from each site and new patients will be enrolled to maintain a steady cohort, however this process has been delayed and these figures have yet to be finalized.

These results contribute to the PEPFAR 2-7-10 goals by increasing the number of newly initiated patients on antiretroviral therapy.

USG Agency: U.S. Agency for International
Development

Program Area: Treatment: Adult Treatment

Program Budget Code: 09

Planned Funds: \$8,349,780

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

All activities align with the South African Government's (SAG) policies and programs outlined in the National Strategic Plan (NSP). Pediatric ARV treatment is described separately. The current activities will continue, and emphasis will be placed on the following areas:

Family approach:

Since children are retained in the system better than adults, we will continue to encourage the whole family to be treated in the same facility. Mothers identified through prevention of mother-to-child transmission (PMTCT) as being infected with HIV are referred to antiretroviral (ARV) treatment and care programs and encouraged to bring their partners with for counseling and testing (CT), care and treatment providing a safe space for mothers. Family planning and ongoing counseling are important components to ARV treatment programs and are provided at these ARV sites. The promotion of strong family networks to and support of the family institution form part of the program. Including men in these programs encourages them to be more responsible in their sexual behavior and child-rearing and allows safer disclosure of status and ongoing counseling reduces violence towards women and constructive engagement in health care.

Gender equity:

Most ARV treatment sites have more women than men attending the clinics. The Perinatal HIV Research Unit (PHRU) has a number of programs targeting men that aim to increase the number of men knowing their HIV-status and attending care and treatment programs. PHRU supports adolescent-friendly services that are designed to attend to the special needs of girls and boys in a confidential and appropriate manner.

Workplace program:

The PHRU has over 500 staff and has an active HIV-workplace program. The program comprises HIV-prevention, care and treatment as well as general health care and family planning. Being an HIV research organization, many of the staff are HIV-infected. PHRU also encourages their sub-partners to develop workplace programs.

Lay staff:

Lay staff are the backbone of the ARV program in South Africa. PHRU will continue training and developing these staff to enable them to grow in their careers. In addition, these staff will be used to assist nurses in their duties to enable task shifting to take place.

Strengthen down referral systems:

PHRU has been instrumental in setting up down referral systems in Gauteng. PHRU will continue to disseminate this information through training and mentoring to support increase numbers of ART sites.

Number of sites:

Expanding access by increasing the number of sites that can initiate and maintain people on ARV treatment is important for equity in health care (an NSP goal). Many of these sites require refurbishing or renovation such that these clinics can be accredited and patient flow can be improved resulting in more people accessing ARV treatment. The focus of this expansion is in the rural and less resourced areas of the provinces in which we work.

At the same time, the PHRU will endeavor to pull out of sites that have the capacity of working on their own and only to provide technical support and assistance on an as needed basis.

Expand access to treatment for marginalized and most at-risk populations (MARPs)

A focus of PHRU's ARV treatment and care programs is to increase access to treatment for all people infected with HIV including marginalized and MARPs. PHRU will continue to work by mainstreaming this focus into public sector health facilities.

Training:

Training is becoming an increasingly important component in all our programs and PHRU will continue to expand this aspect. PHRU will continue running workshops, providing in-service training and mentoring, updating staff on latest developments and continue running the larger practically oriented AIDS priorities symposiums, conferences and workshops.

Rural Mpumalanga:

In rural Mpumalanga province, the focus will be on the ARV sites. There are many non-governmental organizations (NGO) now offering HIV-services in the district and rather than duplicating efforts the PHRU is focusing on supporting and increasing the number of ARV treatment sites in the district. PHRU liaises with the other NGOs that provide the support networks in the district.

Adolescents:

The activities have been described under Pediatric Treatment. Young women, in particular, are vulnerable to violence and coercion to engage in sexual activities. While the PHRU focuses on prevention of HIV-infection in adolescents it is recognized that some will require ARV treatment. The sites PHRU supports are trained to be able to provide services that take into account the special requirements of adolescents.

TB:

In South Africa, the TB program is generally run separately from the ARV treatment program. In all programs, TB prevention, screening, testing, referral and follow-up for TB treatment is encouraged.

SUMMARY:

The Perinatal HIV Research Unit (PHRU) provides comprehensive care and support for people living with HIV (PLHIV). PHRU will use PEPFAR funds to provide high quality, holistic ARV treatment and

Activity Narrative: psychosocial support in Soweto (Gauteng), rural Limpopo and Mpumalanga, and the Western Cape. PHRU will also use PEPFAR funds to provide personnel and ARV drugs for these services. Clients are provided with ART, pre-treatment literacy, adherence counseling and access to adherence support groups. Linkages from CT, PMTCT, and palliative care will be strengthened. The emphasis areas for ARV services are renovation, gender, human capacity development, local organization capacity building, and TB. A family-centered approach targets HIV-infected adults and children.

BACKGROUND:

Since 1998 PHRU has provided comprehensive treatment, care and support to PLHIV. Since 2004, PEPFAR funding has supported ARV treatment and South African Government (SAG) ART sites in Gauteng, rural Limpopo and Mpumalanga provinces, and the Western Cape. PHRU purchases ARVs and provides treatment for adults and children. PHRU's family-centered approach encourages clients to bring partners and other family members for testing and treatment. PHRU is expanding activities to scale up government ART sites and to investigate down referral systems. With FY 2008 funds, PHRU will work with provincial health departments to ensure safe transfer of participants to ongoing care within the SAG rollout program. PHRU will support, train and mentor healthcare workers involved in the management, care and treatment of HIV-infected individuals. All programs follow national guidelines for ART. PHRU provides regular training on ART issues such as adherence, medical treatment, and appropriate regimens. A NGO partner, HIVSA, provides all sites with psychosocial support programs providing community-based support, support groups and education. They cover issues such as basic HIV and AIDS information, HIV services and treatment, treatment literacy, adherence, TB, positive living, nutrition, prevention, opportunistic infections and TB. The comprehensive care approach leads to stigma reduction, increased disclosure, and improved adherence to ART. Throughout the comprehensive program, PHRU has established a continuous set of assessment functions to improve the quality of care at ART service sites.

ACTIVITIES AND EXPECTED RESULTS:

All of the activities described in this section will be continued and expanded with FY 2008 funds.

ACTIVITY 1: Adults, Soweto

Funding from PEPFAR supports women on treatment in the family-centered PMTCT program. The program is ongoing and provides treatment, monitoring and support for adults who meet SAG guidelines for treatment. HIVSA provides treatment literacy and adherence support.

ACTIVITY 2: Pregnant Women, Soweto

This program has been initiated in the maternity section at Bara in July 2005 by PHRU in partnership with the Department of Obstetrics and Gynecology. In Soweto 8,000 pregnant women are identified annually as HIV-infected, with around 1,600 needing treatment. Following SAG guidelines, pregnant women eligible for treatment are offered HAART. In order to fast-track women onto treatment, PHRU is training and mentoring doctors and nurses. The program is being expanded to other ART sites in the area through FY 2008 funds. HIVSA provides treatment literacy and adherence support.

ACTIVITY 3: Children, Soweto

The PHRU identifies HIV-infected children who need treatment through PMTCT and children of adults who are already on treatment. As part of a comprehensive family-centered approach, these children are put onto treatment following SAG treatment guidelines with ARVs purchased by PHRU according to USG and SAG guidelines. Staff is trained on an ongoing basis in pediatric ART.

ACTIVITY 4: Rural Mpumalanga and Limpopo

At Tintswalo Hospital, Limpopo, in partnership with Rural AIDS Development Action Research Program (RADAR), adults and children are identified as needing treatment in the palliative care and PMTCT programs. RADAR supports the ART site at this hospital, as well as Mapulaneng hospital, and is assisting other sites for ART accreditation. Human capacity building is fundamental to sustainability of the program and PHRU provides staff, training and mentoring existing treatment staff. HIVSA offers district-wide support in the primary care clinics that includes treatment literacy, adherence counseling and group support for these clients.

ACTIVITY 5: Tzaneen, Limpopo

PHRU in partnership with the University of Limpopo is supporting the Limpopo Department of Health wellness program operating in the district's primary healthcare clinics. Currently clients are referred to the ART sites including Letaba hospital and CN Phatudi hospital. Through Choice, a local NGO, clients are provided with a treatment readiness program, referred to rollout sites when they become eligible for treatment and given adherence support. Due to vast distances to the hospitals, clients on ART are supported in local primary care clinics.

ACTIVITY 6: Franchise, Gauteng

This program targets uninsured workers in densely populated areas in Johannesburg. ARVs are made available and affordable through a franchising scheme, and supplied free of charge or at significantly discounted rates to patients unable to purchase their own medication. ARV drugs are procured and supplied within the service by trained providers. This program provides a stand-alone ART full service clinic in Johannesburg and provides lessons learned about demand for ART outside the public sector, willingness and ability to pay for services, and the cost-effectiveness of this model of delivery.

ACTIVITY 7: Western Cape

Activity Narrative: A number of partners and SAG ART sites have been identified in the Western Cape that need support to scale up their activities. These include the Desmond Tutu HIV/AIDS Foundation, the University of Cape Town and Stellenbosch University. These partners are supporting SAG ART sites and provide training, mentoring and support. Many ART sites in tertiary hospitals are reaching capacity and the PHRU is establishing innovative down referral mechanisms.

In FY 2008, all activities will expand. Additional partners are likely to be identified in order to increase access to treatment. A specific emphasis will be placed on pediatric treatment. In addition, tracing and tracking programs will be implemented to ensure retention in care. Renovations will be made as necessary per facility. Training for all categories of health workers and task shifting strategies will be implemented in FY 2008. Task shifting focuses on the effective utilization of existing staffing skills.

These activities will contribute substantially to the PEPFAR 2-7-10 goal of providing ARV treatment to two million people by supporting SAG treatment sites.

Activity System ID: 23702

Activity Narrative: SUMMARY:

The project will provide support to antiretroviral (ARV) services in the district in which they will be operating. The aim of this program area is to extend access to antiretroviral therapy (ART) through increased uptake and the accreditation of more health care facilities within the district.

ACTIVITY 1: Increased access to ARV services

The project will work with district HIV and AIDS managers to identify health facilities for strengthening to provide ART services. The project will work with health care providers within these facilities to identify strategies that will increase access to ART. This would include introduction of treatment readiness programs from the time one is tested HIV-positive through the support groups, thus shortening the time to initiate ART. Also, the project will facilitate down referral of stable patients on ART to primary health care sites and recruit and train private general practitioners in the area to support primary health care clinics to provide ART services.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.09: Activities by Funding Mechanism

Mechanism ID: 1201.09	Mechanism: HCI
Prime Partner: University Research Corporation, LLC	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Treatment: Adult Treatment
Budget Code: HTXS	Program Budget Code: 09
Activity ID: 3108.23892.09	Planned Funds: \$873,814
Activity System ID: 23892	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

While Health Care Improvement (HCI), the follow-on to the URC/Quality Assurance Project (QAP), will continue to focus on the four key activities described above, the emphasis during FY 2009 will be on expanding these activities and other activities, in the following ways:

ACTIVITY 1: Establish Quality Improvement Teams at the Facility Level

By improving and institutionalizing the formation of quality improvement teams at a facility and district level, HCI staff is involved in providing the knowledge and skills required for leadership and sustainability for the program. This is an ongoing initiative, which is specific to each area / district/ province, due to the variable nature of the different stakeholders involved and geographic location of HCI-supported sites and districts.

ACTIVITY 2: Training

In FY 2009, HCI staff will work to develop Continuing Professional Development (CPD)-accredited antiretroviral therapy (ART) training materials, including a comprehensive package of manuals, posters, flip charts and job aids. The development of these materials will include modules on eligibility for ART, initiation of ART in both adult and pediatric patients, disclosure, ART adherence issues, poly-pharmacy (addressing concomitant administration of medication) and specific ART challenges.

In addition, HCI will revise existing quality assurance (QA) training materials and expand on proposed training initiatives to include QA/QI methodology for all cadres of health care staff, including informal staff such as community workers, lay counselors and home-based carers. This is particularly important at primary health care (PHC) facilities where HIV-infected clients interact with a wide range of formal and informal health staff.

ACTIVITY 3: Human Capacity Development

As HCI is already in the process of recruiting and placing medical staff in health facilities, these medical staff will be tasked with provision of clinical services to HIV-infected clients on a day-to-day basis and provision of training and mentoring for health facility staff regarding HIV and AIDS care, with specific reference to ART treatment and care services on a weekly and monthly basis. As part of HCI's sustainability initiatives, HCI staff seek to build capacity and develop local skills, by providing training and support to department of health (DOH) clinic staff (doctors, nurses, counselors, pharmacists, etc.) to ensure that providers have appropriate knowledge and skills to deliver quality ART services to all ART clients enrolled on the program / eligible for ART treatment and care. HCI staff and DOH staff meet regularly to ensure that any additional knowledge regarding newer ART medication / treatment options and research findings are readily shared.

ACTIVITY 4: Referrals and Linkages

Building on lessons from previous experiences, HCI is able to facilitate linkages between different stakeholders within the health system, by coordinating and providing leadership.

To improve existing referral networks, HCI staff members will identify and strengthen linkages between prevention of mother-to-child transmission (PMTCT), counseling and testing (CT) and ARV treatment sites, by working with health facility staff at different levels of care and advocating for the development of integrated referral and follow-up networks. All staff at PMTCT and CT sites will be responsible for referring HIV-infected mothers and their newborns for onward care, treatment and support, while staff at ARV sites is responsible for care, treatment, support and follow-up of these patients. It is essential to ensure that all patients receive optimal care and remain within the health care system, ensuring compliance / adherence with treatment and an improved quality of life.

HCI staff will also ensure that health care workers are capacitated to ensure appropriate infant care follow-up, opportunistic infection (OI) prophylaxis, and basic preventive care to HIV-exposed infants identified in the PMTCT programs, as well as capacitating community-based tracers to identify and follow-up PMTCT, TB or ART defaulters, including HIV-exposed babies who have been 'lost to follow-up'.

HCI plans to strengthen linkages between Orphans and Vulnerable Children (OVC) programs, routine maternal and child health services and ART services. It is envisaged that this will serve to identify and strengthen existing networks; highlight gaps in the quality of services provided; and provide information about the feasibility of incorporating relatively rapid QA approaches into ongoing OVC programs.

ACTIVITY 5: Strengthening supervision systems:

HCI has been extensively involved in revision of the Clinic Supervision Manual for health care facilities, and will continue to lead the implementation and monitoring of supervision systems within the country, by training district and facility-level supervisors in QA methods and facilitative supervision techniques for improving the quality of ART and follow-up services.

ACTIVITY 5: Policy:

HCI will actively participate in the development, revision and implementation of the National ART guidelines, ART monitoring and evaluation framework, ART adherence tool and ART-accreditation policy in collaboration with the national and provincial DOH staff, to ensure accountability and long-term sustainability of this program.

SUMMARY:

Through training, mentoring and the introduction of quality assurance (QA) tools and approaches, URC/QAP will work with 65 South African Department of Health (DOH) antiretroviral therapy (ART) sites in

Activity Narrative: 5 provinces (Eastern Cape, KwaZulu-Natal, Limpopo, Mpumalanga and North West) to improve provider and patient compliance with ART treatment guidelines and improve the delivery of quality ARV treatment services to HIV clients. The essential elements of QAP support include technical compliance with evidence-based norms and standards, interpersonal communication and counseling and increasing organizational efficiency. The emphasis area for this activity is human capacity development. The activity targets public and private health care workers, and people living with HIV (PLHIV).

BACKGROUND:

URC/QAP is currently training healthcare providers in 25 DOH ART service delivery sites in the use of QA tools and approaches for increasing compliance with ART guidelines. URC/QAP has developed a number of QA tools for healthcare facilities offering ART services. URC/QAP will increase the number of DOH ART-accredited facilities that it supports in the five provinces to improve the quality of care provided to all clients on ART. To strengthen HIV and AIDS services at facility level, URC/QAP plans to enhance community-based support for ART patients to ensure treatment adherence and active facility-based quality improvement using QA tools and approaches. In addition, URC/QAP will hire sessional medical staff in facilities in the 5 provinces to provide ART services. These providers will serve as mentors to DOH staff for six months to a year. This strategy will create local capacity to provide treatment services over time. URC/QAP will assist healthcare facilities to develop operational strategies to improve the care, treatment and follow-up of children and adolescents on ART. URC/QAP will also capacitate local community-based organizations (CBOs) and home-based care organizations (HBOs) to integrate QA tools and approaches for improved quality of their home-based case management and follow-up of ART patients.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Establish Facility-level Quality Improvement Teams

URC/QAP will work with provincial DOH facilities to identify a core team representing staff from ART and other service providers. Based on a review of better practices, the facility-based teams, with support from URC/QAP coordinators and other district staff, will be responsible for developing and implementing plans for improving the quality of ARV services as well as the continuum of care for patients on ART. Each facility team will be responsible for conducting periodic assessments to identify quality gaps in screening, treatment and follow-up of PLHIV on ARV treatment. These assessments will be used to design interventions for improving the quality of specific services. The assessments will use QAP-developed (based on the national guidelines) patient chart audits, patient-provider observations, interviews with providers, patients and care givers, among others.

URC/QAP will assist facility teams in developing and implementing strategic plans for expanding access to and improving the quality of ART services, in line with national guidelines. The key elements of the plan will include training, infection control and prevention, patient information, nutrition support and counseling, community involvement, follow-up system at treatment and other levels of care, use of data at facility level, and monitoring and evaluation of the program.

ACTIVITY 2: Training

Additional ART service providers and other staff will receive training in the provision of high quality ART services in FY 2008. URC/QAP will strengthen the supervision and support systems at community, facility, district and provincial levels. In addition, URC/QAP will provide job-aids/wall charts to improve compliance with clinical and counseling guidelines. URC/QAP will also work with facility staff, CBOs/HBOs and PLHIV associations to develop strategies for identification and referral of ARV defaulters as well as provision of treatment support to PLHIV on ART in their community, reducing loss of clients to follow-up. URC/QAP will visit each DOH facility/CBO/HBO at least twice a month to provide onsite mentoring and support to staff.

ACTIVITY 3: Human Capacity Development

URC/QAP will assist staff to provide family-centered and pediatric ART services. Within existing ART programs there is an identified need to strengthen pediatric ART care. In FY 2008, URC/QAP will expand these programs to ensure that ART accredited sites as well as sites providing follow-up care to pediatric and adult patients are capacitated to incorporate pediatric care and treatment into existing ART programs. Training will be provided to facility staff to ensure that ART programs are family-centered, enabling parents, children and other dependents to have access to HIV care and treatment services. In addition, emphasis will be placed on training facility staff to recognize the value of wellness programs for PLHIV, of which prevention with positives (PWP) is a key component. Wellness programs are essential to ensure that PLHIV not eligible or ready for ART are retained within the health system to enable regular follow-up and review of client ART eligibility. URC/QAP is developing linkages with these NDOH ART programs to target health facilities and HBO programs for adherence support. This process will continue in FY 2008, with expansion at QAP-supported facilities within all 5 priority provinces. Finally, URC/QAP will train facility and CBO/HBO staff in analyzing performance and quality indicators.

URC/QAP will recruit physicians and nurses to provide ART services at facilities in 5 provinces, this will increase the human capacity available at each facility and increase the number of HIV clients that are able to receive ART and other services. These providers will serve as mentors to local DOH clinical staff. This strategy will help in building capacity of local staff in providing ARV as well as high quality follow-up services.

URC/QAP will continue to train district and facility-level supervisors in QA methods and facilitative supervision techniques to improve the quality of ART services. URC/QAP has contributed to the development of the continuum of care for PLHIV policy document currently under development by the NDOH and will continue to support its development and implementation. URC/QAP will conduct quarterly assessments in each DOH facility, CBO, and HBO to assess compliance with national ART guidelines.

Activity Narrative: ACTIVITY 4: Referrals and Linkages

URC/QAP will facilitate linkages to treatment for eligible PLHIV. All facility staff will be trained in national guideline compliance, QA methods specific to ART programs, and developing and implementing quality-specific improvement plans. These improvement plans include process redesign, integration of services, and enhancement of network development to improve referral patterns. URC/QAP has prioritized plans to strengthen the approach and referral of HIV-infected pregnant women and their infants from PMTCT programs to ART programs, with a well-functioning down referral system, and will continue to promote and expand these linkages. In addition, URC/QAP plans to strengthen linkages from OVC programs to routine maternal and child health services and ART programs. URC/QAP will also assist the DOH to scale-up best practices for ART referrals.

URC/QAP work contributes to the PEPFAR 2-7-10 goals by improving access to and quality of ART services.

Activity ID: 17720.23919.09	Planned Funds: \$1,535,583

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY

This activity will continue antiretroviral therapy (ART) and HIV clinical management for approximately 1,500 South African National Defense Force (SANDF) personnel and family member dependents that were previously receiving ART via the Phidisa II clinical trial. The Phidisa II clinical trial, initiated in 2004, compared four combination ART arms and was terminated in December 2007. 1,400 patients have been transferred, beginning in April 2008, to an observational cohort study entitled Phidisa IA, with continued research collection. The Phidisa Project established the infrastructure, staffing, and procedures for ART and HIV clinical management capability at all three of the South African Military Health Service (SAMHS) hospitals, and in three rural sickbays. With the national roll-out, the strategy of the SAMHS Masibambisane Program has been to extend the geographical coverage of ART primarily to rural sites other than the Phidisa clinic and to have a well defined presence in the three SAMHS hospitals. In these hospitals, the Phidisa Project is managing the majority of HIV-infected SANDF personnel and dependent family members; however, a transition has begun to ultimately transfer routine HIV management and care of these patients to the SAMHS. This has been slowed primarily due to lack of uniformed human services to staff these clinics. The SAMHS has been challenged in filling these much needed posts for doctors, nurses, and pharmacists - despite active recruitment. The Charisma Phidisa staff continues to be one source of recruitment, although the numbers have been small. A more feasible strategy for sustainability will be the addition of SANDF resources to support the key Charisma personnel necessary. To this end, co-location and integration of the Phidisa clinic and the SAMHS ARV roll-out clinic is in process. In two of the three hospital sites, where the SAMHS roll-out is also available, patients newly initiated on ART are offered a choice of participating in the Phidisa observational cohort or being followed by the SAMHS roll-out. In those rural sick bays that are Phidisa Project only, patients who choose not to be enrolled in Phidisa 1a are managed by the Phidisa clinic staff, without research collection. HIV management will continue to be comprehensive, with opportunistic infection (OI) prophylaxis and treatment given according to the South African national guidelines. There will continue to be a translation and communication of the Project Phidisa research findings to the SAMHS and to the greater South African and PEPFAR professional community.

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Retention of clinical staff and capacity at the six ART sites

PEPFAR funds will continue to support a percentage of the costs (ranging from 10% to 50%) for positions comprised of physicians, pharmacists, nurses, and laboratory technicians as detailed in the FY 2008 COP. Modifications to this activity include the increasing SAMHS Masibambisane ARV roll-out capacity, which has begun at the three SAMHS hospital sites, as detailed above. All three hospitals will have co-located clinics with an ultimate goal of sufficient SAMHS human resource capability (uniformed and civilian) to adequately manage routine HIV ART care and management for active duty members and their families. Periodic training of staff in clinical management and quality assurance will continue without modification.

SUMMARY:

This activity will continue antiretroviral therapy (ART) for approximately 1200 South African National Defense Force (SANDF) personnel and family members that were previously receiving ART via a collaborative clinical trial with SANDF, HHS/NIH/NIAID, and US DoD. The Phidisa clinical trial with approximately 1325 participants on therapy was initiated in 2004 and will be terminated in early 2008. PEPFAR funding will ensure continued ARV therapy for these individuals as they are transitioned from the clinical trial to HIV treatment and care still provided through Phidisa clinics and service delivery professionals. There will also be continued accrual of patients on ART. These patients will be on ART regimens consistent with the national guidelines, with research collection. A priority for the South African Military Health Service (SAMHS) is maintaining the human capacity that has been developed, and the ARV services logistics established in the six clinical trial/patient management sites. The existing staff and mechanism for ARV services support that have been built into these 6 SAMHS clinical sites will be retained with anticipated accommodation into the SAMHS ART program as it gains capacity in two or three years. Therefore, the major emphasis of this activity is responding to SAMHS to support the recruitment, training and provision of human resources, including the physicians, nurses, and pharmacists. Minor areas are commodity procurement (ARVs) and quality assurance. The main targets for the ARV treatment intervention are SANDF personnel, their spouses and family members who are living with HIV.

BACKGROUND:

Project Phidisa initiated Protocol II, a randomized clinical trial, in January 2004 at the request of SANDF with the support of the US Ambassador to South Africa and the US DoD. In addition to answering scientific questions important to South Africa, including a comparison on efficacy and toxicity of South African Government ART regimens, this protocol also helped SAMHS provide access to ARVs for SANDF personnel and their family members. Through Phidisa and implementation of this protocol capacity to deliver ART has been developed in all three military hospitals and at three rural military sick bays. Approximately 1800 SANDF personnel and their family members have been randomized to one of four ART regimens over the past four years. Civilian South African health care personnel, including physicians, nurses, pharmacists, and clinical administrative support personnel have been recruited, trained, and retained to augment a core of SAMHS military health care personnel. The clinical trial sites and staff were the only ART capacity within the SAMHS through 2005 and were critical to SAMHS being able to expand ARV care with PEPFAR support over the last two years. Building on Phidisa's foundation, the SAMHS ARV roll-out has generated additional intrinsic capacity, which now includes different clinical sites. Due to unanticipated slower endpoint accrual, NIH/NIAID, SANDF, and US DoD came to an agreement to terminate the trial and to mine existing data for scientific results. A very high priority for SAMHS is to maintain HIV care and treatment for Phidisa-recruited participants, and to maintain the infrastructure and human resources that have been developed. Medical staff recruitment can be particularly challenging for

Activity Narrative: the SANDF, with additional screenings and delays due to military policies. These shortages have been overcome with employment by civilians through an indigenous NGO, Charisma, which has been able to comply with SANDF screenings and policies. ARV clinics have been successfully manned, with integration of the Charisma staff with the SAMHS clinical personnel. These six clinical sites will remain a training site for the SAMHS ARV-rollout clinical staff.

Additionally, since 2004, Lancet Laboratory has provided laboratory support and performed virological, immunological, serological, and safety laboratory tests and procedures under the certification by South African National Accreditation System (SANAS).

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Retention of clinical staff and capacity at the six ART sites

PEPFAR funds will support five physicians, 7 full time and 1 part-time pharmacists, nine nurses, and a part time laboratory technician. Recruitment of these clinical personnel has been done in close coordination with the SAMHS in order to appropriately hire staff in accordance with the South African military guidelines so that these individuals can be transitioned into SAMHS uniformed or SAMHS civilian personnel. This process, has complicated the hiring process for Charisma, and it is acknowledged that the transition to South African military support is lengthy (1 - 2 years), however directly addresses building indigenous SAMHS HIV treatment and care capacity. PEPFAR funds will support periodic training of staff in clinical management and quality assurance.

Activity 2: Patient Care

Patients will be prescribed drugs according to South African Government guidelines. Regular scheduled follow-up is crucial for patients receiving ART, in order to assess responses to treatment as well as to detect side effects. Procurement of laboratory support for ART management will be provided through Lancet, through Science Applications International Corporation (SAIC). Assessment of responses to ART will include measurement of immunologic status (CD4 count) and virologic response (viral load), every six months or with treatment failure. This information is critical to detect treatment success or failure. In the cases where patients' CD4 count has risen to > 200 cells/mm3 for more than three months, prophylaxis against Pneumocystis jirovecii pneumonia can be discontinued.

Lancet also performs courier services for all clinical samples from the six SAMHS sites, also has carried out all laboratory data reporting, arranged courier service for all clinical samples from all six sites, and maintained a sample, certified, repository, besides has historical database of all results.

These activities will contribute to the number of persons receiving treatment and care in the military, and support the PEPFAR 2-7-10 goals.

Activity ID: 21166.23739.09 **Planned Funds:** ██████████
Activity System ID: 23739

Activity Narrative: SUMMARY:

This activity is a component of a comprehensive prevention education, care and treatment program for small to medium enterprises (SMEs) with 20-200 employees and other workplaces in South Africa. PEPFAR funds will be used to support implementation of an HIV Treatment program for South African workers and managers in SMEs. The partner to implement these activities is to be determined. The major emphasis for this program will be the development of a workplace program, with minor emphasis given to community mobilization and participation; information, education and communication and linkages with other sectors and initiatives. The target population will include adults (men and women of reproductive age), factory workers, host country government workers and workers in both the public and private sector.

While a growing number of large companies in South Africa are now providing HIV and AIDS related services to their employees, very few small (20-50 employees) or medium (50-200) sized enterprises have made progress towards developing comprehensive strategies to combat the epidemic. SMEs face significant obstacles in providing HIV and AIDS services to employees. In a random sample of SMEs in Gauteng and KwaZulu-Natal conducted by the Center for International Health and Development (Connelly and Rosen 2005), six major barriers to action on the part of SMEs were identified: 1) lack of information about HIV and AIDS services; 2) lack of access to these services; 3) little perception of costs or damages being imposed by AIDS, leading to low willingness-to-pay for services; 4) stigma among employees, who were not requesting HIV-related programs or benefits; 5) lack of external pressure from labor unions, shareholders, or advocacy groups; and 6) the relative weight of other problems facing the companies, making HIV and AIDS a low business priority. The study also reported that the vast majority of AIDS-related attrition occurs among easily replaceable, non-critical, and/or unskilled employees. Because SMEs offer fewer benefits, have higher employee turnover, and employ fewer skilled workers than do larger companies, they are less likely to capture the uncertain benefits of investments in HIV and AIDS programs than are large companies. Given the complexity of the disease and the widespread impact that HIV and AIDS have on companies, communities and local economies, diverse resources and skills are needed. This often requires a multifaceted approach ranging from awareness and prevention to care and treatment to public advocacy. Through public-private partnerships, businesses can deal more effectively and efficiently with the challenges that HIV and AIDS present. Businesses possess expertise and skills that, if applied to the HIV and AIDS pandemic could assist in developing innovative approaches and deploying resources in ways that could greatly assist the fight against HIV and AIDS. Businesses also have experience in product launches, supply chain management and manufacturing. They also have the ability to access and understand important subsets of the population, their employees, major business partners, and customers. Non-governmental organizations (NGOs), on the other hand, often have resources that are key in the response to HIV and AIDS. They have complementary networks, and are trusted by individuals and communities in ways that businesses are not. They have a tradition within the community of aggressively dealing with crisis and they frequently have the leadership in place that can marshal the necessary resources. Government brings crucial resources in the form of infrastructure, policy, regulations, human capacity and the political will to act. Public-private partnerships provide an opportunity for businesses to leverage the diverse resources of another organization and generate value above and beyond what the individual organization could generate on their own.

Mechanism ID: 4625.09

Mechanism: N/A

Prime Partner: McCord Hospital

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Treatment: Adult Treatment

Budget Code: HTXS

Program Budget Code: 09

Activity ID: 23742.09

Planned Funds: \$246,610

Activity System ID: 23742

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

McCord Hospital/Zoe-Life (MH/ZL) plan to continue to strengthen all activities mentioned in the FY 2008 COP narrative. Slow progress in this program area related to a variety of procurement, budget, and pharmacy systems issues will continue to be addressed. Provision of antiretroviral therapy (ART) at primary health settings will remain a priority within the context of a functional comprehensive primary health care service.

NEW ACTIVITIES:

1. **NUTRITIONAL SUPPORT:** ZL will develop and implement a nutrition screening tool for clinical use within adult HIV care services, at patient literacy sessions and support groups to ensure anthropometric assessment and appropriate interventions. Also, ZL will provide technical support to access micronutrient supplementation for nutritionally compromised HIV-infected patients enrolled in the programs.

C.ZL will develop guidelines for primary level and community-based health-care workers (HCWs) as well as training courses and resources for HCWs to provide integrated nutritional assessments and counseling for adults on treatment, including guidelines for primary health nutrition management of patients with high BMI and side effects.

2. **GENDER:** Access of ART to men will be addressed by assisting non-governmental organization sites to offer ART services after work hours, as well as through provision of ART within the workplace program.

SUMMARY: The McCord Hospital/Zoe Life activities of this program area relate to strengthening capacity at four municipal clinics and three non-governmental organizations (NGOs) to provide comprehensive antiretroviral treatment (ART) services in a primary healthcare setting as part of a decentralization plan. A mobile service will provide ART to infected workers as part of a workplace program. Emphasis areas are development of referrals across vertical programs (CT, PMTCT, TB/HIV), community programs and to secondary and tertiary facilities; local organization capacity building (major emphasis); quality assurance, improvement and supportive supervision; strategic information; training; and workplace programs. The primary target populations are the general population, people affected by HIV and AIDS, refugees and the private sector (workers without health insurance). McCord Hospital receives funding for PMTCT and ARV treatment through the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF). This program described here focuses on strengthening the capacity of public sector facilities, and it is distinct from the hospital-based program funded by EGPAF.
BACKGROUND: There are a number of constraints to the rapid rollout of ART in the public sector. This is largely due to the lack of human and infrastructural resources, and that ART is generally offered at secondary or tertiary care level. McCord Hospital has over 2,000 patients on ART, and it is not sustainable to continue the follow-up of stable patients at this or any other hospital. This new activity will be implemented by the McCord/Zoe Life team in partnership with the eThekweni Municipality (Durban), three NGOs and participating corporate bodies. The project will build capacity at primary health care (PHC) level to continue follow-up of down referred stable patients on ART (initiated at hospital level) and to increase skill at PHC level to provide ART services (including initiation of ART in patients who are stable). This project is supported by metropolitan and provincial health departments. provincial ART guidelines are followed. Gender issues will be addressed through increasing access to ART in workers (assuming most are men) in a workplace program, and by ensuring that a family-centered treatment approach is offered to partners and family members via access to couple counseling, community-based referrals, provider-initiated palliative care for partners and active case management of families.
ACTIVITIES AND EXPECTED RESULTS:
ACTIVITY 1: Site accreditation This activity will support site accreditation at four metropolitan clinics through negotiation with metropolitan and provincial health departments to ensure sustainability and ongoing provision of staff and commodities for ART services.
ACTIVITY 2: Human capacity development Nurse-led multidisciplinary teams at each site will be trained to provide comprehensive ARV services at clinics. Training will include adult and pediatric clinical services, psychosocial support/adherence counseling, pharmacy management and monitoring and evaluation (M&E). Teams will initially be trained to follow up down referred patients on ART, and will later be supervised to initiate stable clients on ART. Counselors will be trained to provide routine focused HIV prevention counseling to clients on ART. This will also be included in routine treatment readiness training for patients. Staff will be trained to provide services with a French/Swahili interpreter to increase access to refugees/asylum seekers.
ACTIVITY 3: Pharmacy systems Pharmacy systems will be strengthened to support drug chain management. Commodity procurement will be largely the responsibility of the provincial government, and McCord Hospital has been accredited as a KwaZulu-Natal Department of Health (KZNDOH) site, with the result that decentralized ARV service sites will also fall under the KZNDOH. Provision of ARV drugs, test kits and labs will be supplied by the DOH as a cost-share. **ACTIVITY 4: Technical support** These activities will build capacity through technical support, mentorship and supervision to implement a comprehensive care and treatment program. This project will provide experienced staff to each site on a weekly basis to ensure that ARV services are seamlessly linked with wellness services, TB/HIV and PMTCT to strengthen continuity of care and patient retention. This will be supported by development of referral tools and regular M&E feedback with problem solving support.
ACTIVITY 5: Pediatric ART McCord/Zoe Life will provide technical support to increase provision of ART to children. Staff from the municipal and NGO sites will attend a preparatory workshop in which an approach to increasing pediatric services will be formulated. Technical support will be offered to integrate ARV services into current vertical services such as PMTCT, TB, children's clinic, immunization services and community-based psychosocial services. Staff will be encouraged to implement routine testing of children, and assistance will be given to develop effective systems which ensure referral of infected children to voluntary counseling and testing, HIV care, and other programs. **ACTIVITY 6: Referrals** McCord/Zoe Life will assist in strengthening referrals and linkages by establishing a system of up referral for specialized or hospital-based care, and down referral from any accredited ARV site to the municipal clinics and NGO sites for patients living in the area; and establish referrals for workers receiving ART (workplace program). **ACTIVITY 7: Adherence** A strong community-based family-centered adherence component with existing and new role-players for continuity of care between facility and community will be developed. Where possible, treatment readiness and adherence support programs will be decentralized

Activity Narrative: further into community facilities. ACTIVITY 8: M&E The project will develop and implement a model of M&E that can be integrated into, as well as strengthen the current data collection systems for partners across both community and vertical programs and up to the secondary and tertiary level. This will improve quality, ensure a multidisciplinary continuum of care and manage referral pathways. ACTIVITY 9: Staff programs Partnerships will be developed to provide ARV services to employees who do not have access to medical insurance. Sustainability at the municipal clinic sites is addressed by assisting sites to become accredited with the KZNDOH. This project will build human capacity to effectively manage the program without ongoing technical assistance. NGO sites will be assisted to build infrastructure and referral networks to ensure sustainability of services. The long-term plan for the NGO sites is to build strong relationships with nearby clinics where clinical capacity can be increased to take over clinical aspects of decentralized ART. These institutions will be included in FY 2008 funding to become accredited sites. NGOs will be assisted to source other funding. The workplace services will be co-funded by industry. Where possible, corporate occupational health clinics will be assisted to become accredited KZNDOH sites. New activities: 1. Linkages with educational facilities and facilities housing orphan's or vulnerable children will be established and counseling and testing services will be offered to these facilities in addition to linkages with care and treatment services. Children found to be HIV-infected at these sites will either be referred to nearby treatment centres (Either PEPFAR funded sites or referral sites, dependant on the severity of illness) 2. Staff at educational or facilities housing orphans or vulnerable children will be trained in basic ARV care principles so that they will eventually be able to provide ongoing adherence support and monitor side effects with appropriate referrals. 3. Staff at sites will be trained in family counseling techniques. This counseling approach encourages participation of all family members including men (partners and fathers) and will assist counselors to involve men in both decision making and caring processes. Where possible, counseling will be offered at times that are suitable for employed men 4. Patient retention will be strengthened through strong patient tracking systems, community-based adherence support, psychosocial support services which offer a comprehensive range of services, child friendly sites which encourage ongoing participation with the services, and linkages with community-based organizations which offer other services which may appeal to patients, such as art/drama, nutrition support, income generation. The McCord Hospital activities contribute to the 2-7-10 PEPFAR goals and the USG South Africa Five-Year Strategic Plan by strengthening the public sector and expanding access to care and treatment.

Activity System ID: 24473

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

TB Care Association (TBCA) activities noted in the FY 2008 COP will continue in FY 2009. Activities are planned and implemented in partnership with Department of Health coordinators for HIV/AIDS, STIs and TB (HAST) at all levels of government.

The following additional activities will be occurring in FY 2009:

ACTIVITY 4: Provision of accredited training by becoming an Health and Welfare Sector Education and Training Authority (HWSETA)-accredited provider

In FY 2007/08, TBCA began the process of seeking formal accreditation as a training provider with HWSETA. It is anticipated that in FY 2008/09, approval will be granted and provision of accredited trainings at National Qualifications Framework (NQF) levels 4 and 5 will be offered to community health workers, non-governmental organizations, and provincial governments as needs are identified. Focus of trainings offered will be on educating and working closely with the community with regard to sexually transmitted infections (STIs), including HIV; applying listening skills in the care and support environment; providing information about TB; developing and implementing a client antiretroviral (ARV) treatment plan; health promotion in the community; and provision of primary health care in the community.

ACTIVITY 5: Support to Brooklyn Chest Hospital for Management of multi-drug resistant (MDR) / extremely drug resistant (XDR) TB and HIV

Clinical and psychosocial support will be provided to Brooklyn Chest TB Hospital in the form of two social auxiliary workers who will counsel MDR/XDR-TB patients and run group sessions in the hospital wards. We will employ two lay counselors who will counsel MDR-TB patients attending the outpatient department. These staff will be report to hospital management and be fully integrated into a multidisciplinary team. Training and mentorship will be provided for clinicians to improve HIV care and treatment for co-infected hospitalized patients. Funds will be used to improve the physical environment of the hospital to be more pleasant for patients who are hospitalized for long periods of time. Referral systems will be put in place to ensure that discharged patients complete their treatment, attend follow up visits and receive community-based adherence support, for both TB and HIV.

This is a new activity in FY 2008.

SUMMARY:

TB Care Association (TBCA) will support care and treatment services at three hospital-based clinics and eight primary health clinics (PHC). Training and mentoring on topics to ensure provision of quality care will be provided: clinical care, social support, monitoring and evaluation, and health system support. Referral systems, including community adherence support and coordination of services between hospital and PHC, will be strengthened through human resource, capacity development and programmatic support. People infected and affected by HIV, including healthcare providers will be the beneficiaries of this PEPFAR-supported program.

BACKGROUND:

TBCA has been providing community-based counseling, emergency material relief, and support, and TB treatment support in the Western Cape since 1992. Support for HIV care and treatment services in the West Coast Winelands is a new initiative. Training and mentoring activities will be done in collaboration with the Department of Health (DOH). Support has been requested by the Western Cape province and all program activities will occur within public health facilities. Essential drugs and ARVs will be procured through DOH, and the National Health Laboratory Service (NHLS), through the DOH, will provide laboratory services. The Western Cape has identified the West Coast Winelands as a district that would benefit from technical assistance because the burden of TB with HIV co-infection is high. In Malmesbury, clinical support will be provided at Swartland Hospital (ART site) and Dorp and West Bank clinics. In Saldanha, clinical support will be provided in Dorp and Diaz Ville clinics. In Vredenburg, clinical support will be provided in Vredenburg Hospital (ART site) and Dorp and Hannah Coetzee clinics. In Atlantis, clinical support will be provided in Wesfleur Hospital (ART site) and Saxon Sea and Protea Park clinics. In summary, three hospitals and eight clinics will be supported in the Western Cape province. TBCA is exploring the possibility of expanding activities to the Northern Cape province.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: Integration of Services and Quality Assurance

The first activity is human capacity development, focusing on integration of the HIV program into primary healthcare services, including pediatrics. Under the guidance of the clinical coordinator, two TBCA-employed nurse mentors with extensive experience in HIV care and treatment will work closely with the DOH to identify training/mentoring needs. DOH clinicians will be trained through didactic and mentoring sessions, on topics including identification and counseling of victims of abuse, reducing stigma, clinical management of patients, integration of services, and clinical management of TB and HIV. HIV testing, care and treatment will be strengthened by ensuring all clinicians involved in patient care (doctors, nurses, pharmacists) in all areas of patient care services (outpatient services, pediatrics, TB, family planning, antenatal services) are clinically competent in managing HIV-infected clients. A quality assurance program will be implemented through support of the DOH multi-disciplinary team meetings, provision of clinical updates and in-service mentoring, and introduction of a formal routine chart review, in collaboration with clinic managers. National and provincial standards of care and guidelines will be followed. TBCA will work closely with DOH to facilitate coordination of services among the three hospitals and their affiliated clinics, anticipating provision of ART at clinic level by end of FY 2008. Systems support will be provided as needs

Activity Narrative: are identified (e.g., down referral of drugs, strengthening of patient referrals). Ten percent of the budget will be spent on promoting pediatric services.

ACTIVITY 2: Community Mobilization Related to Care and Treatment

The second activity is to strengthen community involvement in HIV care and treatment services through outreach services provided by community health workers (CHW). In consultation with the DOH, TBCA will employ one community team leader and ten CHWs for each clinical site supported. The Western Cape province has plans to expand CHW programs, therefore sustainability will be addressed. TBCA will train the CHWs on priority health issues so that they are multi-skilled to provide integrated community care. The role of the CHWs will be to promote information, education, communication (IEC) in the communities they serve. IEC activities aim to increase awareness of the availability of comprehensive HIV services; to promote HIV prevention, including prevention with positives; to ensure family-centered care through referrals of family members affected by HIV; and to ensure community-level follow-up of patients who have not returned for routine care (in collaboration with M&E). Existing community groups will be encouraged to participate, and through collaboration with existing home-based care programs, community-based wellness programs will encourage patients to seek routine care. Peer counseling and education provided by the CHWs will target male behaviors. The team leaders and TBCA-employed nurse mentors who supervise them will facilitate links with social development programs, nutritional support programs, and other governmental and non-governmental services.

ACTIVITY 3: Strengthening Clinical Services through Monitoring and Evaluation (M&E) Support

The final activity is to assist with monitoring and evaluation of the national comprehensive HIV care and treatment program at supported sites. TBCA will employ a data capturer at each site to assist with TB/HIV reporting. Coordination of M&E with clinical services will ensure prompt follow-up of patients enrolled in care who do not return to clinic. Data collection will be facilitated through provision of computers to each clinic. Training needs related to capturing quality data will be identified and addressed. Gender equity in the HIV program will be revealed through collection of data showing breakdown of women and men receiving prevention, care and treatment services. The data capturers will liaise with community team leaders to follow up patients referred from TBCA-supported voluntary counseling and testing sites that tested HIV-positive as well as those who have TB or STI symptoms.

These results contribute to the PEPFAR 2-7-10 goals by improving access to care and treatment services, thereby increasing the number of persons receiving ARV services.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for these activities. PEPFAR funds were allocated for Family Health International Umbrella Grants Manager (FHI UGM) to manage sub-partners working in this program area, but in FY 2009, there are no sub-partners receiving funding in this program area. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Activity System ID: 22961	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activity 1: Support to South African Government (SAG) antiretroviral (ART) clinics is expanding to the Eastern Cape (2008) and the Western Cape (2009) after conclusion of memorandums of understanding (MOUs) with these provinces.

At the request of SAG, the Foundation for Professional Development (FPD) will continue to actively assist the Department of Health (DOH) in the accreditation of Community Health Clinics (CHCs) and Primary Health Clinics (PHCs) and the expansion of down referral services. The primary goal of this COP is to build capacity at the CHC and PHC levels in order to support nurse-initiated and -driven antiretroviral therapy (ART). At primary- and community-level, FPD will collaborate with key stakeholders to strengthen scope of non-ART services and coordinate linkages and delivery between these services.

A key focus area is to strengthen family friendly services; these activities will include: to strengthening integration between HIV and AIDS services and Family Planning (FP) Reproductive Health (RH) clinics and Safe Motherhood programs in order to facilitate women's access to services, and partner and family member identification and testing to enroll more men and children.

FPD will work with facility Health Management Information Systems (HMIS) systems to track patient progress and outcomes, support data use and program improvement at site and ensure compliance with national HIV care and treatment patient monitoring systems. Activities in 2010 will focus on developing, strengthening and harmonizing facility- and community-based monitoring systems while ensuring that data quality and data use are integral components of the process. Key to HMIS will be integration and inter-communication with other DOH systems (e.g. National Health Laboratory Service (NHLS) and District Health Information System (DHIS)). In support of these activities, FPD will place a strong emphasis on didactic training and ongoing on-site mentoring to build sustainable, local monitoring and evaluation (M&E) and HMIS capacity.

Activity 2: Clinical training: FPD anticipates that the number of people trained will increase with around 1,000 additional people trained due to increasing need to train teachers on HIV-related issues in the context of the AIDS outreach activities that involve schools. The mix of course will also be adjusted to meet the current training needs of clients and could also include courses such as an advanced HIV course and a course that integrates the latest developments on HIV/TB and sexually transmitted infections (STIs) for health care professionals who have completed the existing AIDS training portfolio. Depending on demand, this activity could also be used to absorb training requests for TB training on extensively drug resistant (XDR) TB and multi-drug resistant (MDR) TB and counseling and testing (CT) if the dedicated funds in their respective COPs are exhausted and surplus funding is available in this COP. The FPD training model is based on a adult education model and does not extend to direct supportive supervision at the work site, the numbers of people trained would render such follow-up prohibitively expensive (i.e workplace supervisory visits for 7,000 students) The indirect support model will, however, be further strengthened. This includes access to an alumni program that provides monthly continuing education meetings in all provinces in the country, regular news letters, access to a free HIV clinical journal every quarter and access to two toll free support lines: the HIV Hotline that provides treatment advice and the HIV911 line that provides advice about accessing non-governmental organization (NGO) support services.

Activity 3: Management training: Due to the successes of the course and the increasing need from managers for a ladder of learning that allows them to increase their managerial skills as they move up in management seniority, an Advanced Health Care Management Course will be added for around 70 more senior AIDS managers who have completed the Certificate in Advanced Health Management. This qualification will be acquired through a work-based action research project. This cost for this activity will be absorbed by reducing the intake on the Certificate in Advanced Management Course with 50 students.

Activity 4: Internship program: After two years of experience with the program, it was decided to extend the placement period for some interns to 12 months rather than 6 months. This will allow FPD to recruit higher quality interns and also secure the cooperation of some of the hosts who have requested this extended period.

Activity 5: Placement Activity: Africa Health Placements addresses some of the priorities related to Health Systems Strengthening, including recruitment and placement of qualified foreign health care professionals in the public sector. This project currently is the only project of its kind in South Africa, and FPD is working to understand the dynamics behind health professional migration in South Africa, including migration between the public and private sector and also between South Africa and abroad.

Activity 6: Human Capacity Development/Call Center/Clinical mentoring support: This activity is slightly modified to include the use of international infectious diseases specialists who will come on a voluntary basis to provide clinical mentoring in rural parts of Limpopo. The call center activity was contracted to the National Medicines Information Centre at the University of Cape Town, which already had substantial resources in place for this activity with the requirement that they must expand their activities to all provinces.

SUMMARY:

The Foundation for Professional Development (FPD) program supports the public sector expansion of access to comprehensive HIV and AIDS care by focusing on provision of care, and through human capacity development (HCD). Activities supporting improved and expanded service delivery in public sector ART clinics include the provision of staff, clinical and management training, equipment, technical assistance, mentoring, and refurbishment of facilities. Additional HCD activities include an international volunteer and an intern program. The emphasis areas for these activities are Human Capacity Development, Local Organization Capacity Building and Workplace Programs. Target populations for the activities include people living with HIV (PLHIV) and the Business Community. The activities also target most at risk

Activity Narrative: populations.

BACKGROUND:

FPD is a South African private institution of higher education working exclusively in the health sector in Southern Africa. Since FY 2005, FPD has supported treatment for thousands of PLHIV and training for thousands of healthcare providers and managers delivering ART and related services. Coordination with provincial Departments of Health (DOH) takes place through Memorandums of Understanding (MOUs). FPD provides substantial assistance initially to public sector facilities and works towards a diminished role over time, working towards sustainability at the sites. Sub-agreements are used for supporting a national HIV consumer line (HIV 911). Gender issues are embedded in all aspects of the project and include collecting gender specific data in treatment programs, linkages with NGOs working in the gender field, counseling and testing (CT) services that specifically focus on couple counseling, domestic violence and abuse detection.

Other issues addressed by this project are: 1) Male norms and behaviors that are addressed in the counseling provided at ART sites. All staff actively work towards reducing violence and coercion by identifying victims of violence; 2) stigma and discrimination is addressed in counseling and training programs; and 3) volunteers, including Peace Corps volunteers, will be involved at treatment sites.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support to Government ARV Clinics

PEPFAR funds are used to respond to requests from provincial DOH to support South African Government (SAG) ART sites through temporarily seconding clinical and administrative staff, providing equipment, refurbishment and technical assistance. The FPD-supported staff play a critical role in service delivery and have been able to reduce waiting times to less than a week at most facilities. FPD works with each public sector site to determine the number of staff needed, and the timeframe for transferring them into SAG employment. Most sites provide an integrated system of treatment and prevention, including CT and wellness services. These services emphasize adherence and promote ART services among referral clinics (TB, STI & Family Planning). All sites are also linked to a system of dedicated tracers who follow-up on any patients who drop out of treatment to determine reasons and where possible try to encourage patients to return to treatment. All sites are pediatric treatment sites and a minimum target is set at 10% of patients. FPD's support to SAG ARV clinics will expand substantially to include increased numbers of patients.

ACTIVITY 2: Human Capacity Development (HCD)/Clinical Training

This activity ensures a cadre of skilled healthcare practitioners able to provide care to PLHIV. Healthcare workers will be trained in various courses (clinical management of AIDS and TB, CT, palliative care, adherence and workplace AIDS programs) using a proven short-course training methodology that provides training close to where participants work. PLHIV form part of the faculty to help with stigma reduction among participants and to articulate the needs of PLHIV. To update knowledge, an alumni program including regular continuing medical education (CME) opportunities, meetings, journals, newsletters and mentorship has been developed. This program provides alumni with membership in a relevant professional association, the Southern African HIV Clinicians Society. Eskom (large power and utility company) and Discovery Health (large health insurance company) are in a PPP with FPD to financially support this training.

Training takes place in all provinces for both public and civil society organizations. For public sector training such training is coordinated with relevant human resources departments.

ACTIVITY 3: HCD/Management Training

This activity addresses the severe shortage of skilled managers within the public, NGO and FBO sector to manage rapid scale-up of AIDS care through a one year management training program, offered in association with Yale University, designed to develop local organizational capacity. Students are recruited through a competitive scholarship program and graduates are enrolled with the SA Institute of Healthcare Managers to provide them access to alumni services. Quality assurance mechanisms for Activities 2 and 3 are those currently prescribed by the Council for Higher Education for SA Universities. Impact studies and participant surveys and external impact assessments are also conducted on a regular basis to assess relevance quality and impact. Results of these surveys are used to make revisions to the management training program. The management training program will be expanded in FY 2008 to introduce a lower level operational management course geared at clinic rather than program managers. A need for such training has been identified during the past two years of management training that has shown that the skills needed at the clinic manager level is much more operational rather than strategic, the current management training program does not meet the specific need of this more junior level managers.

ACTIVITY 4: HCD/Internship Program

There is a growing need for rapid expansion of the development of human capacity to support ARV treatment programs. Based on the success of the current internship program that improves the skills of graduate students by partnering them with implementing PEPFAR partners or public sector institutions, FPD will continue to support a formalized HCD Program. FPD is well placed for this activity as training and HCD activities are FPD's core business. The USG PEPFAR Task Force is developing a more robust HCD strategy, and this activity will contribute to that strategy. FPD will coordinate with universities and other institutions to recruit interns and will mentor both the intern and the recipient organization to ensure that interns are optimally utilized to promote treatment initiatives.

ACTIVITY 5: HCD/Placement Project

Activity Narrative: This activity further expands FPD's role in HCD in the public sector by providing a user-friendly recruitment mechanism that attempts to meet severe shortages of healthcare workers in the public sector by recruiting local and internationally qualified professionals against public sector funded vacancies, on both a remunerated and voluntary basis. Support provided includes matching applicants with vacancies, fast-tracking the registration of international participants and mentoring international recruits. Atlantic Philanthropies, a charitable organization, funded the startup of this activity in 2006 through a public-private partnership (PPP) with FPD.

ACTIVITY 6: HCD/Call Center/Clinical mentoring support

The call center will provide access for healthcare workers to infectious disease specialists, pediatricians and clinical pharmacologists through a toll-free line for queries related to treatment and post-exposure prophylaxis. This call centre closely cooperates with the HIV 911 Call Centre that handles consumer queries for referral to AIDS service organizations in both the public and the civil society sectors.

FPD will contribute to the PEPFAR 2-7-10 goals by expanding access to ART services for adults and children, building capacity for ART service delivery, and increasing the demand for and acceptance of ARV treatment.

Activity System ID: 22877	

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

The Vendor Chain and BizAIDS components of the existing SABCOHA program will begin a CT component that will identify HIV-infected individuals. Through its counseling and testing program, SABCOHA will work with the existing infrastructure, and ensure that newly identified HIV-infected individuals will take advantage of the holistic education, testing, and treatment program for the employed sector.

Once an HIV-infected individual has been identified, it is the aim of the Vendor chain program to ensure adequate transition to care. Most of the HIV-infected individuals will be referred to one of the 440 established South African Department of Health (DOH) comprehensive care management and treatment sites as well as any other sites identified throughout the country. It is critical however that adequate referral is undertaken. To enable the referral, a specific referral path to a treatment site, adequate and close to the testing site is identified before testing. Patients tested HIV-positive are referred with the DOH or any other identified site's accepted referral information. In addition the CD4 count performed at the time of testing is referred to the treatment site. By referring most patients to government sites this program will leverage the available funding, infrastructure, personnel, ART and laboratory testing from Government. SABCOHA estimates that it will provide Pre-HAART services to approximately 2,100 people in the first year.

For SABCOHA-identified HIV-infected individuals who do not live or work near one of the established DOH sites, SABCOHA will establish a network of private general practitioners who can provide treatment, care and support services to the employed population with no access to health care insurance. SABCOHA estimates that (in the first year) of this initiative approximately 190 patients will use the general practitioner network.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Expansion of treatment services

SABCOHA will use FY 2008 PEPFAR funds to accelerate the implementation of the national rollout plan at government sites in partnership with the National Department of Health (NDOH).

All of the HIV-infected patients will be maintained through a model that enables primary healthcare providers to communicate directly with HIV experts.

SABCOHA will ensure that each ART patient at a SABCOHA supported facilities receives a minimum package of ART services, including clinical and pathology monitoring, and adherence counseling. There will be follow-up of all defaulting patients. Adherence activities will include a focus on reducing stigma and encouraging disclosure in order to enhance drug compliance and to improve patient retention.

Providing comprehensive treatment services in a workplace setting will contribute to the PEPFAR 2-7-10 goals. These activities will also support the care and treatment objectives laid out in the USG Five-Year Plan for South Africa.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In March 2008, a mobile clinic was purchased by way of a sub-grant from The Solidarity Centre. Although this will initially be used as a mobile voluntary counseling and testing (VCT) clinic, servicing factories within the Amajuba and Uthikhela districts, it is anticipated that in FY 2009, workers that have been initiated on treatment at public sector clinics and are stable, will be "down referred" and managed by this clinic. This clinic is manned by a professional nurse, an enrolled nurse and a lay counselor/driver.

Similarly, HIV counseling and testing (CT) has been rolled out at seven bargaining council clinics in the Western Cape. Within the clinics, lay counselors offer counseling and education on prevention to clients in the waiting rooms.

Currently in the Western Cape, patients testing HIV-positive are being referred to public sector clinics. However, it is anticipated that a Wellness Program will be piloted at Salt River Clinic, one of the seven bargaining council clinics. CD4s, viral loads and other baseline tests will be conducted as will sexually transmitted infection (STI) and TB screening and testing. The Western Cape Department of Health (WCDOH) has committed to cover the costs of all lab tests up until the end of Quarter 1 FY 2008. It is currently being negotiated that this agreement be extended for a greater period of time. Negotiations are currently underway to utilize these clinics as "down referral" sites for all SACTWU members and their dependants that have been initiated onto treatment at Department of Health (DOH) facilities and considered to be clinically stable.

To ensure continuous improvement and quality of care, antiretroviral therapy (ART) clinical staff are provided with didactic training and onsite mentorship. The didactic training is provided by another PEPFAR partner, The Foundation for Professional Development and the medical faculty of the University of KwaZulu-Natal. All lay counselors are trained in defaulter tracing and treatment adherence and provide such interventions where necessary.

Micronutrient supplements are provided where indicated e.g. when clinical assessment indicates inadequate dietary intake to meet basic vitamin and mineral supplements. Food supplements are also provided to severely and moderately malnourished people living with HIV (PLHIV). At the skills development workshops, PLHIV are also taught skills to develop food gardens and provided with seeds.

The social worker makes a home visit prior to any HIV client being initiated onto antiretroviral treatment. A psychosocial assessment is completed and a report is presented at the pre-initiation multi-disciplinary team meeting. Included in this assessment is a report on the client's availability and access to clean water as well as their ability to store clean water within their homes. Lay counselors provide hygiene education and promote hand washing with soap when conducting educational talks in the bargaining clinic waiting rooms.

All HIV clients are initiated onto cotrimoxazole prophylaxis prior to being initiated onto anti retroviral therapy. Screening and treatment for the prevention of cervical cancer in HIV-infected women will be routinely conducted.

SUMMARY:

The Southern African Clothing and Textile Workers Union (SACTWU) has a comprehensive HIV program that has received PEPFAR funding in the past through a sub-agreement with the Solidarity Center. In FY 2007, SACTWU received direct PEPFAR funding for prevention, care and treatment activities, with the prevention and care program focused in five provinces: KwaZulu-Natal, Western Cape, Gauteng, Eastern Cape and Free State. The treatment program is currently limited to KwaZulu-Natal, but will add activities in Free State and Western Cape in FY 2008. The emphasis areas are gender, human capacity development, local organization capacity building, and workplace programs. The target population of the overall program is factory workers.

BACKGROUND:

The Southern African Clothing and Textile Workers Union is South Africa's largest trade union supporting textile and clothing workers. It also supports footwear, leather and retail workers. Hence, SACTWU members form part of the employed population. SACTWU has a membership of approximately 110,000 members nationally, of which 66 percent is female.

The SACTWU AIDS Project is a national program that provides services in five provinces. The SACTWU AIDS Project was initiated in 1998 and developed a national comprehensive program. It has matured over the years to the point where it now has a well-structured comprehensive training program, provides in-house voluntary and counseling services, provides access to a social worker in KwaZulu-Natal, runs income-generating workshops, provides a primary package of care through the voluntary and counseling testing service, and provides home-based care through its regional nurses and a home-based care network in KwaZulu-Natal.

SACTWU initiated a pilot antiretroviral therapy program in the KwaZulu-Natal province as a public-private partnership (PPP) with the Department of Health in FY 2007. SACTWU utilizes South African government protocols. SACTWU has designed confidentiality protocols as well as client care flowcharts, and is working closely with the King Edward VIII Hospital in Durban to ensure a formal confidential referral system via a public-private partnership.

ACTIVITIES AND EXPECTED RESULTS:

SACTWU will contract medical practitioners to provide treatment services as per the South African guidelines and eligibility criteria. Lay counselors or field workers will be employed (one per site) as well as

Activity Narrative: one contracted social worker per site to serve as part of the multidisciplinary team. The long-term goal will be to develop a partnership with the public sector to replicate the model developed with the King Edward Hospital where the clients are prepared for initiation of treatment (which includes laboratory tests, and adherence counseling sessions), then referred to King Edward VIII Hospital for the initiation of treatment, and then down referred back to SACTWU once stable. The South African government will provide the antiretroviral drugs for the program. Patients will be identified for the program through the counseling and testing program, in one established site and two new rural sites in KwaZulu-Natal. In addition, patients will be referred from the existing SACTWU home-based care program, factories and the Bargaining Council Clinic in KwaZulu-Natal. In partnership with the Dream Centre in Durban, patients will have access to step-down care.

The aim in FY 2008 is to train shop-stewards and volunteers as home-based carers. This training will be done in collaboration with a Belgian-based trade union (ABVV), which supports the clothing, textile and leather sectors in Belgium. This is a long-standing cooperation relationship.

In FY 2008 this pilot will be expanded to two additional sites in KwaZulu-Natal. In addition to the two new sites in KwaZulu-Natal, SACTWU will also add a site in the Free State (a mobile clinic), and one in the Western Cape.

The services provided, beyond the standard counseling and testing, palliative care, and ART (as piloted in KwaZulu-Natal), will be expanded to include a pediatric ART component. This will be done by strengthening the family-centered approach to ensure that workers in the factories have the opportunity to bring their children for HIV care and treatment. In addition the new site in Western Cape will focus specifically on ensuring HIV care and treatment for TB patients (due to the high prevalence of TB in that area).

The SACTWU activities support the PEPFAR 2-7-10 goals.

Activity System ID: 22951

Mechanism: CTR

USG Agency: U.S. Agency for International Development

Program Area: Treatment: Adult Treatment

Program Budget Code: 09

Planned Funds: \$894,689

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2010, the core deliverables for Family Health International's (FHI) Adult HIV and AIDS treatment section will be to provide outlets that will provide 1) assist in referrals to antiretroviral therapy (ART) services; 2) provide counseling and testing (CT); 3) tracking and tracing of CD4 counts; 4) assessment, diagnosis and management of sexually transmitted infections (STIs); 5) referral to family planning (FP) services; 6) referrals to home-based care (HBC)/ palliative care (PC) programs for care services as well as ART adherence counseling; 7) screening for tuberculosis (TB) in all clients and family members of suspected TB clients; 8) cervical cancer education as part of prevention among positives; and 9) referrals for clients' other needs, such as social and legal support. As part of the client tracking system and providing quality services, monitoring and evaluation systems will be put in place and monitoring activities will continue over the life of the project. Data from the mobile service unit (MSU) will also be reported to the local government clinics and district officers that provide the commodities for the MSU.

The above are in addition to the services described above (FY 2008 COP content) and are based on requests from the department of health (DOH). The additional services are also consistent with the changes already made in the MSUs that are currently functioning.

All staff for the MSUs will have been hired and trained using the DOH approved and certified curricula by the FY 2009 COP. FHI will coordinate with the DOH and other training groups to ensure that MSU staff attends refresher trainings on the services provided by the MSUs.

Starting in FY 2008 COP, FHI will manage all four of the MSUs directly and will continue to do so in the FY 2009 COP as per discussions to date with Project Support Association of Southern Africa (PSASA) and USAID. FHI-SA will continue to work with HBC volunteers in mobile clinic service sites to provide referrals for CT, TB, STI, FP and ART services and to conduct, and continue to conduct, outreach to HBC projects and communities through Information, Education, and Communication (IEC) materials and household visits. In FY 2009 COP, FHI will thus work directly with the communities and the provincial departments of health of Mpumalanga, KwaZulu-Natal, Limpopo and Eastern Cape provinces to scale up community outreach activities in support of the four MSUs through the provision of technical assistance (TA) including training to HBC volunteers to identify PC, CT, ARV, FP and other needs in the household and to refer appropriately.

With FY 2009 funding, FHI will further work with the provincial departments of health in assisting them with their strategies and plans for taking over the functioning of the MSUs as per the MOU agreements. The above will include MSU handover preparations. As part of the handover preparations, FHI will develop and review existing tools and algorithms for services to facilitate and ensure mobile services are in line with the DOH policies and guidelines.

To facilitate quality assurance and quality improvement, and as part of MSU performance assessments, FHI conducts quarterly MSU costs analysis, report analysis and feedback and random MSU visits on-site. FHI also worked with PSASA to develop management guidelines and service protocols for the MSUs, which follow both national and international standards.

This is a new activity in FY 2008.

SUMMARY:

Family Health International (FHI) will use FY 2008 funding to continue to expand access to integrated services for HIV-infected and affected individuals in home-based care (HBC) programs by strengthening the linkages between HBC and counseling and testing (CT) through establishing additional mobile clinics in underserved areas in Mpumalanga and KwaZulu-Natal provinces. FHI will work with the Departments of Health as well as PEPFAR partners, Project Support Association of Southern Africa (PSASA), Right to Care (RTC), and BroadReach, and will refer patients in need of antiretroviral treatment (ART) to government-accredited institutions for ART initiation. The emphasis areas for the following activities are in-service training, local organization capacity building, and health-related wraparound programs in family planning, safe motherhood, and tuberculosis. Target populations addressed are people living with HIV and AIDS and men and women of reproductive age.

BACKGROUND:

In response to requests from the national and provincial Departments of Health and Social Development, FHI has been strengthening the linkages between home-based care (HBC), counseling and testing (CT), TB, antiretroviral treatment (ART) and family planning (FP) services for comprehensive treatment, care and support. This project addresses the need to establish formal referral and follow-up mechanisms for CT and ART and other essential healthcare services, such as FP, in HBC programs where clients are often in need of ART. Experience suggests that improved access to ARV services in South Africa is improving the health status of many HIV-infected individuals, leading to a return of libido and sexual activity, and this also requires careful decisions about their sexual and reproductive health. Tighter links between palliative care (PC), TB, CT, ARV and FP services, in particular, afford men and women the opportunity to improve their overall quality of health through integrated services. FHI is creating and strengthening functional referral mechanisms between CT, HBC, ARV and FP service programs in Mpumalanga and KwaZulu-Natal in collaboration with PSASA and the South African Council of Churches (SACC) HBC programs. To date, over 500 new clients have initiated ARVs through the program referral network. Access to ART is still a major constraint in these rural programs. PSASA's and SACC's HBC programs typically reach out to low-resource, isolated communities where HIV service needs are high and transport to services is prohibitively expensive.

In FY 2006, FHI and its partners established a mobile clinic to provide better access to CT, diagnosis/treatment of sexually transmitted infections (STI), ARV services, and FP. These integrated mobile services target HBC caregivers, clients and their families, as well as the surrounding communities.

Activity Narrative: Additional units are being added in FY 2007 to reach those who reside in remote, underserved areas in Mpumalanga and KwaZulu-Natal. This will enable project partners to cover a larger geographical area and meet the needs of more HBC clients and family members.

ACTIVITIES AND EXPECTED RESULTS:

In close collaboration with the Mpumalanga and KwaZulu-Natal Departments of Health (DOH), PSASA, SACC, RTC and BroadReach, FHI will expand access to quality integrated services for infected and affected individuals in HBC programs through a continuation of the project and through continued support to four mobile service units to provide CT, ARV services, STI screening and FP services in rural, underserved areas. PSASA and SACC will provide basic care and support services and refer clients for services offered by the mobile clinics and provide follow-up and ART adherence at the HBC level. Nearby DOH facilities will process lab work for CD4 counts and place clients on ARVs according to clinical protocols. Specifically FHI will continue to (1) support the four mobile clinics that were established in FY 2006 and 2007, based in Mpumalanga and in KwaZulu-Natal; (2) serve remote HBC sites in Mpumalanga and KwaZulu-Natal of which the program participants and immediate community will have access to the mobile clinics; (3) hire and supervise local mobile clinic staff (professional nurse and one counselor in each mobile clinic) to provide CT, STI and FP services and ARV referrals as it is anticipated that patients' treatment by the mobile clinic staff will be transferred to public sector sites as soon as these sites have the necessary capacity; (4) train four professional nurses and four counselors to oversee the quality of CT, ARV screening, TB screening and treatment, STI testing and treatment, FP services and counseling; (5) train four professional nurses and four counselors on couple counseling and gender awareness, and ensure it is staffed by qualified health professionals; (6) work with HBC volunteers in mobile clinic service sites to provide referrals for CT, TB, STI, FP and ARV referrals services; (7) conduct outreach to HBC projects and communities through IEC materials and household visits; and (8) use the mobile clinics to transport clients to doctors or facilities for urgent care.

FHI will leverage resources from partners and the DOH for all commodities. FHI will support a Management Information System to collect service and referral data relating to all patients. A monitoring and evaluation specialist, who will be hired to spearhead this effort in FY 2007, will continue to be supported in FY 2008. Also, in FY 2008, COP activities will be expanded to train approximately 40 government officials (10 per mobile support unit) on maintenance and management. All activities will be implemented closely with local partners with an aim towards bolstering capacity to take ownership of the mobile clinics by September 2009. These activities will contribute to the PEPFAR 2-7-10 goals by increasing the number of people receiving ARV treatment.

Program Budget Code: 09

Activity ID: 22322.23172.09

Planned Funds: \$1,422,328

Activity System ID: 23172

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Institute for Youth Development in South Africa (IYDSA) competed in the South Africa local Annual Program Statement in 2008, and was approved for funding August 6, 2008. IYDSA as a prime partner is also currently a sub-partner under the Track 1 Catholic Relief Services (CRS) program. However, in FY 2009 the Track 1 CRS program will transition, and IYDSA will become one of three local implementing partners that will have CRS funds and responsibilities transferred to, and thus current funding levels will increase in FY 2009. These will be adjusted through reprogramming in FY 2009.

The IYDSA treatment program Zisa Uncedo is implemented in the Eastern Cape, where the majority of the population live in a rural setting. This is a resource and capacity poor province. The province requires a further 10,700 professional healthcare workers in order to implement a primary health care service. Buildings are old and space is limited. The disincentive for health workers is strong. The reason for starting the work in these areas is in order to improve the services lacking in the South African Government (SAG) sector, which is affected by the lack of qualified staff, high staff turnover, lack of public sector infrastructure and other challenges related to the historical reality, where former 'black' areas were marginalized from sufficient institutional and financial support by the previous regime.

IYDSA often works alongside and within existing government facilities, as well as supporting community programs implemented the local church structures in these rural areas. Using this strategy IYDSA fosters and gains active community participation. In doing so, the staffing and infrastructure challenges are overcome through task shifting by the training of community healthcare workers. The lack of infrastructure challenges are overcome by working through the existing local church structures and, in special circumstances, provision of limited additional work space through purchase of refurbished shipping containers. The hub and spoke model contributes to mitigating the existing space limitations by down referring patients to satellite clinics within their own communities.

In order to support the down referral of patients, IYDSA plans to transport patients from distant communities during their treatment preparation phase. Once on treatment they will be monitored at a satellite site within their community. This program will be initiated at Kwelera, a site earmarked for Government accreditation. Through this process a cohort of patients will be recruited and initiated in preparation for the implementation of an accredited treatment site.

The average rural person faces very real challenges if they are to maintain their treatment, this includes correct nutrition, stigma, and crucially transport. Often patients will travel extensive distances in order to access care. The Great Kei Treatment Center (an existing treatment facility) is required to be an up referral point for Kwelera, yet patients travel to East London as there are established transport routes. With the initiation of an IYDSA satellite, it is anticipated that over 70 patients will be referred to Kwelera from East London.

The necessity of this development is marked by the unacceptably high default and treatment failure rate in this area. There are no Adherence Monitors and patients have to find the finances on a monthly basis to travel to East London in order to maintain their treatment. This strategy will contribute greatly not only to adherence and consistent treatment, but also to the increase of male and pediatric patients.

Summary:

The Institute for Youth Development South Africa (IYDSA) is a new PEPFAR partner selected for funding in August 2008 (but not yet funded – the CDC is currently processing the paperwork to award a cooperative agreement). However, IYDSA is a current sub-partner under the Track 1 Catholic Relief Services (CRS) program. In FY 2009 the Track 1 CRS program will transition, and IYDSA will become one of three local implementing partners that will have CRS funds and responsibilities transferred to it.

Background:

IYDSA is an indigenous South African organization providing care, treatment and support to people living with HIV in the Eastern Cape Province (EC). Within IYDSA, the care and treatment program is called Zisa Uncedo, which means 'bring help'. Reducing HIV infection and AIDS morbidity and mortality is the purpose of this program.

The IYDSA hub-and-spoke model includes main ART sites, extensions and satellite sites to ensure equitable access for the poor with minimum cost to themselves. This is achieved through a strategy that mobilizes clinical staff from major treatment sites to remote sites through an extensive outreach program.

There are three main treatment sites where all HIV care and ART are provided with a full staff complement (Doctor, Social Worker, Nurses, Pharmacist, and Dietician). IYDSA has established three extensions that are linked to an ART site. Remote satellites are located where there is a large concentration of enrolled patients. Here VCT is provided, with referral back to treatment and extension sites for ART initiation. The remote satellites are key to enabling 'access for all'

Initiation and preparation for effective treatment is a crucial first step, the better the preparation, the better the outcome. IYDSA strives to ensure that the treatment centers where people are initiated on ARV treatment has all the necessary skills to ensure patients are properly prepared before being initiated on HAART.

Once the patient is consistently taking their treatment and they have been stabilized, the best long-term solution is for them to collect their treatment close to where they live, at the same time receiving localized monitoring and support. It is with this as a philosophy that IYDSA works towards creating 'access for all' in the Eastern Cape.

Activity Narrative: Activities:

1) Provide access for all: Through the use of a this model IYDSA seeks to provide services at as many sites as possible to ensure access to treatment with minimum cost. The maximized use of resources, spreading scarce skills through a mobile staff strategy is cost and time efficient, supplemented by a high level of training for the primary health care (PHC) staff, who remain in the community.

2) Provide comprehensive HIV medical care to 18,384 HIV positive adults and children, and initiate and maintain 6,128 people on antiretroviral treatment: Zisa Uncedo will build on current treatment activities of IYDSA in South Africa, using the extensive capacity and current network of sites to rapidly scale up treatment numbers. Zisa Uncedo will include assessing site needs and readiness, capacity building of medical professionals and developing continuum of care mechanisms. This will establish community-based linkages and systems to support the continuity of care from the health facilities to the households.

3) Build Local capacity, enhancing sustainability: The resultant training of professionals located in rural areas increases the professional skills within these areas which may be accessed by people from these communities.

4) Enable people living with HIV and AIDS to lead healthy and productive lives: Ultimately care without an enabling environment increases dependence. Healthy productive lives are the result of empowering the individual. This is practiced throughout the program.

There are a number of organizations that IYDSA partners with, these include Government departments at various levels, local NGOs and faith-based organizations, as well as contracted service providers. The primary partners are 'The Pill Box', providing a complete Pharmaceutical Solution, and 'PEZ' who is responsible for all administration, development and maintenance of the Adherence Monitors component of the program.

Planned Funds: \$970,905

Activity System ID: 23067

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In addition to the current courses offered, Health Science Academy (HSA) will introduce two new courses in 2009. FY 2009 funds will also enable Health Science Academy to increase PEPFAR capacity by employing a training coordinator for the two new courses. The new courses address the current needs of the National Department of Health (NDOH). The NDOH is currently unable to roll out a full-scale program and regards capacitating itself in order to do so as a priority. The two new courses are:

1) Pharmacovigilance Course

Target group: Public sector pharmacists in South Africa

Program design: The course will be presented as a self-learning package of a manual and CD, supported by two contact sessions. Focused learning activities and tasks will be included in the learning material.

Assessment methodology: Candidates will compile a portfolio during the course and complete a written assessment on completion.

Duration: The course will take six months to complete and will be spread over two years. In the first year FY 2010 Health Science Academy will train 375 learners and another 375 will be trained in FY 2011.

Content: Learning material will include the following topics:

- The role of pharmacovigilance in patient safety
- Concepts and principles of pharmacovigilance
- Adverse drug reactions (ADRs): efficacy and risk in treatment
- Identifying and managing adverse drug reactions
- HIV medication-related ADRs
- Pharmacovigilance for pediatric patients
- Pharmacovigilance of complementary, alternative and traditional medicines
- Communication in pharmacovigilance
- Bringing it all together: Pharmacovigilance in the health care facility

2) HIV and Aids Comprehensive Care Management and Treatment course:

Health Science Academy will address the HIV and AIDS Adherence and Counseling modules of the course. This is a new request from NDOH for Health Science Academy. The course is structured as follows:

Target group: Pharmacist, Nurses and Medical Doctors

Program Design: The course is presented as an interactive workshop based on lectures and participatory learning methods suitable for adult learners. As well as self-study component. The registration period is 6 months.

Assessment Methodology: Learner assessment will be both formative and summative. 20% will be assigned during the workshop for group assignments. 80% will be allocated to the submission of an assignment after completing the self-study component of the course.

Duration: Six days spread over six months

Content: Learning material will include the following topics:

- Epidemiology and prevention
- Pathogenesis
- Diagnosis
- Monitoring HIV and AIDS
- Clinical features
- Opportunistic infections
- Neurological complications
- Neoplasms
- ARV management
- Nutrition
- HIV and infant feeding
- PEP
- Sexually Transmitted Infections
- Vaccines
- HIV and AIDS in the workplace
- Palliative care

Health Science Academy is also committed to supporting the Gauteng province to train more dispensing practitioners than in other provinces. HSA aims to train:

- 600 Community-based Care Givers
- 75 Adherence Counseling
- 1,000 Dispensing Course
- 108 Pharmacists' Assistant

Health Science Academy will place more emphasis on the Pharmacists' Assistant course. Courses for which the uptake is slow will be phased out. These courses include Adherence Counseling and Drug Supply Chain Management. This will allow Health Science Academy to decrease the targets in the above areas and add more to the Dispensing and Pharmacists' Assistant courses.

Activity Narrative: Repackaging of the slow courses

As stated above, the Adherence Course is seen as only a part of the comprehensive HIV and AIDS Management course. The uptake has been very slow for this course. The organization will train 75 healthcare professionals from the KwaZulu-Natal Department of Health. The course is designed for healthcare professionals who hold bachelors degrees and higher. Health Science Academy will repackage the course in order to accommodate other healthcare professionals with lower qualifications but who are engaged in HIV and AIDS work.

Health Science Academy is amongst few partners accredited by the South African Pharmacy Council to provide Pharmacists' Assistant training. This provides an opportunity to train other PEPFAR partners, such as Foundation for Professional Development, CAPRISA, Absolute Return for Kids (ARK) and Right to Care.

Training in the Private Sector

The program stated that pharmacists in the private sector will be targeted as an extension of the HIV and AIDS management in communities by virtue of their expertise in the field. Health Science Academy would intensify advocacy of the program to the private sector in general and the private pharmacists in particular.

Partnerships

Health Science Academy will continue forming partnerships with PEPFAR partners first and other training providers in general. It is through such partnerships that Health Science Academy will train community care givers in Limpopo, Eastern Cape, North West and Mpumalanga.

A relationship with RPM Plus in the implementation of the Supply Chain Management will be sought.

SUMMARY:

Health Science Academy (HSA) is a new FY 2007 PEPFAR partner. HSA will increase access and the availability of safe and effective drug treatment through human resource development, with a specific emphasis of pharmacists and pharmacist assistants. HSA aims to substantially increase the number of South African healthcare workers with the appropriate knowledge, skills and attitudes to support substantial rollout of antiretroviral treatment (ART). The major emphasis areas are human capacity development and local organization capacity building. The primary target population for this project is healthcare professionals, such as doctors, nurses, pharmacists and pharmacist assistants, as well as community-based healthcare workers and caregivers.

BACKGROUND:

HSA is a South African training institution, accredited with the South African Pharmacy Council, providing training in the pharmaceutical sector. HSA is a training provider to the National Department of Health (NDOH), provincial Departments of Health and the pharmacy profession in the private sector. PEPFAR funding will be utilized to scale up the existing HSA training activities. The project will be implemented on a national and provincial level, and will expand on the already existing relationship between HSA and the National Department of Health and respective provincial human resource departments. The proposed training programs have already been developed and this, in conjunction with the existing NDOH contracts, will allow the proposed training to be fast-tracked. In line with HSA's past practice, learners will be recruited with an emphasis on gender and racial representation and will give preference to women wanting to register for the national qualification, providing increased access to income for this group.

ACTIVITIES AND EXPECTED RESULTS:

The project will deal predominantly with the training of healthcare professionals in the public sector in order to increase capacity, enhance the skills of existing staff and increase the number of skilled staff available. In addition the project will also attempt to leverage existing private sector pharmacists in the provision of adherence counseling for patients on ART and expand the role of community workers. The overall goals of these training activities are: 1) increased ability in the public sector to dispense antiretroviral drugs (ARV); 2) increased access to HIV care and treatment; 3) increased capacity in the public sector to adequately manage the supply chain; and 4) improved adherence support in the provision of adherence counseling, monitoring and evaluation. HSA will introduce two new courses from client request: Comprehensive HIV and AIDS Care, Management and Treatment (CCMT) and Pharmacovigilance. In addition, further trainings will be given in supply chain management. These courses will have to be revised to meet the criteria of the Council for Higher Education. The following training courses will be offered:

ACTIVITY 1: Adherence Counseling

This activity will increase the role of the pharmacist and pharmacist assistant in both the public and private sector with respect to counseling and monitoring of adherence to treatment regimens. The training is offered as a competency-based training course facilitated by a two day workshop. Workshops will be offered in each province and will be available to both the public and private sector (e.g. NGOs, FBOs, private clinics, etc.) providing HIV care and treatment services.

ACTIVITY 2: Supply Chain Management

This activity deals specifically with drug supply management and will improve the capacity of the public sector in providing access to safe and effective drug treatment through good distribution practices. The program will enhance the skill of existing staff in the public sector, such as nurses, pharmacists and other personnel involved in the procurement and supply of medicines. The course is offered as a competency-

Activity Narrative: based training course facilitated by a two day workshop. Workshops will be offered in each province along with the option to do cascade training at a provincial level.

ACTIVITY 3: Dispensing

This activity deals with the provision of dispensing training for all authorized prescribes in the public sector as specified by the Medicines and Related Substances Control Act 101 of 1965. This is a distance learning program that will provide healthcare providers in under-serviced areas access to the training, specifically clinic nurses who require a dispensing license in order to dispense in ARV clinics. A half day orientation workshop is offered to nurses and doctors in the public sector who are registered in this course.

ACTIVITY 4: Pharmacist Assistants

This activity will train pharmacist assistants on a national qualification accredited by the South African Pharmacy Council, based on unit standards in line with the regulated scope of practice of a pharmacist's assistant. This activity will increase the pool of pharmacist assistants available to the public sector ART programs by training people living with HIV and other school leavers as pharmacist assistants. This activity requires that learners be employed in a pharmacy for on-the-job skills training and includes modular assessment of the learner. Workshops will be made available for groups requiring additional training or tutoring.

ACTIVITY 5: Community-Based Care for People Living with HIV

This activity will train a core group of community health workers as ancillary health workers offering community-based care for people living with HIV. Particular emphasis will be placed on extending the role of the community-based health worker with regard to pharmacological aspects of ART such as monitoring adverse effects and compliance. The training program provides a national certificate and comprises practical onsite skills training facilitated by workshops.

Study material for all the activities has been developed by leading experts in relevant specialties and the course content is continually updated and refined to meet the needs of the individuals being trained.

The above activities address the 2-7-10 PEPFAR goals by developing capacity with regard to supply chain logistics and pharmaceutical management to improve the quality of ART services.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ART treatment sites receive the following package of support from Right to Care (RTC):

- RTC conducts an initial needs assessment at all treatment sites, including the epidemiology of HIV and AIDS in the target population served by the treatment site. During this period, RTC also establishes the priorities of the district and provincial department of health (DOH) for the health care facility.
- Technical assistance is provided to establish the policies and procedures at the site. This includes supporting the health care facility to ensure the most efficient workflow processes, task shifting, interaction with local non-governmental organizations (NGOs), pharmacy supply chain management for facilities, data system strengthening and quality assurance assessments.
- Training is provided to all health care workers. This provides both on-site mentorship programs, as well as didactic training courses. Retention of staff and career development are emphasized.
- RTC is focused on the recruitment and retention of staff for treatment sites, particularly in rural and under-served or hard-to-reach populations. Where possible RTC will fill existing DOH positions, or alternatively if a position needs to be supported until the DOH can establish new positions, RTC will employ and second staff to sites. RTC has supported down referral from the overloaded and successful Comprehensive Care Management and Treatment (CCMT) sites of patients stable on ART. Such down referral is conducted with an emphasis on transfer not only of the patient, but also the data record. In addition to internal HAART treatment reviews, quality assurance activities will include the following: (1) review of all counselors at site to ensure consistent treatment adherence education and counseling (2) review of the use of treatment protocols at site including pharmacy and laboratory resource utilization (3) review of management of toxicity e.g. Nevirapine dose escalation and rash or hepatotoxicity, (4) individual clinician level performance review to ensure management is according to training, policies and guidelines, (5) monitoring the quality of care provided by down referral sites and maintenance of down referral guidelines, (6) monitoring prescription, dispensing and supply management of pharmaceutical supplies, (7) provision of cotromoxazole and isoniazid prophylaxis, (8) management of opportunistic infections.

ACTIVITIES AND EXPECTED RESULTS:

RTC will use PEPFAR funds to accelerate the implementation of the National Strategic Plan (NSP) CCMT program at DOH sites. Through memorandums of understanding (MOUs) in the five provinces, RTC plans to enhance the ART services by developing network coverage of the CCMT and primary health care facilities in each district. This may include additional CCMT treatment sites as requested by the DOH. More emphasis is however placed on the improved efficiency of each of the sites, and the integration of CCMT sites into the primary health care facilities through down referral. FY 2009 funds will be used to expand access to treatment with a special focus on the following target areas:

- Improved management of patients according to the treatment guidelines focused on safe, effective ART treatment to reduce HIV and AIDS associated morbidity and mortality.
- Integration of ART with prevention of mother-to-child (PMTCT) activities with Highly Active ART (HAART) provided to all eligible pregnant women.
- Improved follow-up of patients in pre-HAART wellness clinics through the provision of care and support activities at these clinics, strengthening the scope of non-ART services including but not limited to, HIV counseling and testing (CT), HIV primary care, opportunistic infection management, family planning, nutritional counseling, linkages to in-patient care, home-based care, and secondary prevention, and OVC and social services.
- Increased CT for ART access, and transition to care by linking CT activities to referral treatment sites. CT is provided to couples, to reach the partners and family members of individuals already in care.
- Focused activities to the current gender imbalance focused on reaching more men (approx. 65% of ART patients are women).
- Inclusion of pediatric patients in family-focused clinics
- Expansion of the successful down referral model to 18 sites in four provinces Mpumalanga, Free State, Gauteng and Northern Cape as requested by those provincial DOH. By the end of FY 2009 RTC will have over 20,000 patients will be treated at down referral sites.
- RTC will support the early diagnosis of TB, improved TB treatment, access to TB culture and polymerase chain reaction (PCR) testing for drug resistance, HIV testing in TB, and provision of ART to TB patients. Linkage between ART treatment sites and TB hospitals will facilitate care for patients diagnosed with multi/extensively drug resistant TB. Isoniazid prophylaxis will be introduced and expanded in all RTC-supported CCMT sites, in accordance with the national and provincial treatment guidelines.
- RTC will continue to support capacity development for pharmacy services, in particular the training of pharmacy assistants, integration of pharmacy supply chain IT systems chosen in each province with HIV data systems, and overall reporting of outcomes according to SAG and PEPFAR requirements.
- RTC will increase the access to data management systems enabling clinics to monitor quality assurance including CD4 percentage increases, viral load, disease stage, side-effects, adverse events and outcomes at annual intervals.

In order to complement clinic-based ARV services, support is provided to at least one community-based care organization to partner with each treatment site. This team is tasked with monitoring patients' adherence, providing support such as nutrition, wellness and welfare services, encouraging patients to remain on treatment, tracking patients that are lost to follow up and providing home-based care services for those that are terminally ill. The Clinical Mentorship Program will continue to enhance the provision of HIV care by transferring skills, using local and international clinical mentors. Implemented in rural sites and hard to reach populations, with human capacity development and skills transfer, increased numbers of people in hard to reach populations will receive quality care and treatment services. To address gender imbalances, RTC anticipates opening a male-only clinic in partnership with the Clinical HIV Research Unit (CHRU) at Wits University. This clinic will focus on recruiting adult males from local industries dominated by males in the private sector as well as males from indigent populations.

SUMMARY:

Right to Care (RTC) will use FY 2008 PEPFAR funds to strengthen the capacity of healthcare providers to deliver ARV treatment (ART) services to eligible HIV-infected individuals in five provinces. Emphasis will be placed on increasing the number of HIV-infected children and pregnant women on ART. The emphasis areas are renovation, gender, human capacity development, and local organization capacity building. The

Activity Narrative: primary target populations are people living with HIV (PLHIV), public and private healthcare providers.

BACKGROUND:

RTC's ARV Treatment (ART) services are a continuation of activities, which have been USG-funded since 2002. Originally initiated as a holistic education, testing, care and treatment program for the employed sector (called the Direct AIDS Intervention (DAI) program), RTC's ART activities have expanded their reach through a range of partnerships with government sites, private sector providers and NGO and FBO clinics and organizations. RTC is now reaching substantial numbers of people from predominantly vulnerable populations in five provinces. RTC's ART activities consists largely of support for the ART services of all of RTC's treatment partners, including its Thusong network of private practitioners, many government sites and NGO and FBO clinics and organizations. In addition, RTC itself implements the ART components of the DAI and other partnership workplace programs. ART training is conducted by RTC's Training Unit as well as by several sub-partners. With FY 2008 funding, RTC will expand its pediatric treatment, expand into a male-only clinic and increase its focus on reducing stigma and encouraging disclosure. RTC will consolidate and expand its support for government sites, NGO and FBO clinics and organizations and private sector programs, and build on past successes (over 22,500 people reached with ART by the third quarter of FY 2007).

ACTIVITIES AND EXPECTED RESULTS:

RTC will use PEPFAR funds to accelerate the implementation of the national rollout plan at government sites in partnership with the National Department of Health (NDOH). As the procurement of ARV drugs and lab services is undertaken by government in these sites, PEPFAR funds will be used to expand access to treatment. RTC has successfully negotiated for the NDOH to supply certain NGO and FBO sites with ARVs and laboratory services, freeing PEPFAR funds to support new treatment sites.

PEPFAR funds will be used for: (1) human capacity development and salaries (consultant and part-time healthcare workers) at all ART facilities: NGO and FBO clinics and organizations receive sub-awards for doctors, nurses, pharmacists and counselors, and a fee-for-service arrangement exists with the network of private sector service providers for the Thusong and private programs; (2) developing a training program for pharmacy assistants as human capacity development for the distribution of ARVs and HIV services; (3) addressing minor infrastructure needs where necessary at NGO, FBO and government sites, and to maintain RTC's mobile clinics; (4) NGO and FBO clinics use PEPFAR funds for the laboratory monitoring of HIV patients, as well as for the procurement of health commodities; and (5) covering the costs of labs for the new mobile clinic treatment program servicing remote communities in Mpumalanga, in collaboration with another PEPFAR-funded partner, FHI.

Down referral sites will be established with the Department of Health in Gauteng and Mpumalanga in FY 2007 for stable patients. Human capacity, minor infrastructure and training will be provided to these sites. A 'smart card' system is being developed with Therapy Edge and Supply Chain Management Service to track transfer of patient data.

RTC supports its ART providers by disseminating policies and guidelines and sharing best practices. Ongoing quality assurance and supportive supervision is undertaken by centralized treatment experts. RTC and several of its sub-partners will also provide training in ART services for health workers. In the delivery of medical ART services, doctors are given ongoing support in clinical decision-making, prescribing and case management by RTC's team of medical HIV experts, through RTC's Expert Treatment Program (ETP). The ETP management model enables primary healthcare providers to communicate directly with HIV experts. ETP uses a sophisticated web-based IT tool in the form of TherapyEdge, licensed to RTC, which enables the effective management of patients and includes a secure patient database. The Clinical Mentorship and Preceptorship Program (CMPP) will continue to enhance the provision of HIV care and clinical expertise across the intermediate levels of health care within the overburdened public healthcare system. Through human capacity development, increased numbers of people will receive care, support and treatment. The anticipated benefit of the mentorship program is the dissemination of training and knowledge gained by healthcare personnel in the urban academic site to rural and smaller sites around the country.

A new PPP, the AIDS Treatment Institute (ATI), is proposed with Vodacom and the DOH. Vodacom will provide all infrastructure requirements for a HIV care and treatment centre for indigent patients, with the DOH supplying all ARV and covering lab costs. PEPFAR funds will be used for training, human capacity development of necessary health care workers, and ongoing technical assistance. This clinic is targeted to provide treatment for 10,000 patients, care and support to 15,000 patients, CT to 40,000 individuals and prevention education to 100,000 in FY 2008. Vodacom, other private sector organizations and DOH will provide over 90% of support for this program, and PEPFAR funds will provide less than 10% of the PPP budget.

RTC will ensure that each ART patient at RTC-supported facilities receives a minimum package of ART services, including clinical and pathology monitoring, adherence counseling and support, and follow-up of defaulting ART patients. Adherence activities will include a focus on reducing stigma and encouraging disclosure in order to enhance drug compliance and to improve patient retention. Emphasis will be placed on increasing the number of HIV-infected children and pregnant women on ARVs according to the national treatment guidelines. Mobile clinics are used to bring ART services to farm workers and other vulnerable populations in rural areas of the Northern Cape and Mpumalanga.

To support the implementation of ART, adherence counseling and support is implemented through individual counseling, support groups and direct observed therapy, either clinic-based or community-based. In order to complement clinic staff, support is provided to at least one community-based care organization to partner with each treatment site. This team is tasked with monitoring patients' adherence, providing support such as nutrition, wellness and welfare services, and providing home-based care services for those that are terminally ill. The team also provides referral services to clinics and in some cases, arranges transport or hospice services. RTC anticipates opening a male-only clinic in partnership with the Clinical HIV Research

Activity Narrative: Unit (CHRU) at Wits University. This clinic will focus on recruiting adult males from local industries dominated by males in the private sector as well as males from indigent populations. Patients in this clinic will receive ART services, clinical and pathology monitoring, with specific adherence and other support designed to meet the needs of men. Best practices on adherence and support as well as clinical care from this clinic will be shared with other RTC partners. In FY 2008, RTC will contribute to increased patients on ART at various sites towards the PEPFAR treatment target of 2 million patients, and will train healthcare workers in ART services. RTC will support the PEPFAR vision outlined in the Five-Year Strategy for South Africa by expanding access to ART services for adults and children, building capacity for ART service delivery, and increasing the demand for and acceptance of ARV treatment.

Budget Code: HTXS

Program Budget Code: 09

Activity ID: 2912.22611.09

Planned Funds: \$10,253,724

Activity System ID: 22611

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activities from FY 2008 will continue, and in addition, in FY 2009 Aurum intends to scale up prevention with positives, retention in treatment and a focus on public sector consolidation with down referral.

The prevention with positives approach will include risk stratification, risk reduction counseling, substance abuse screening and intervention, condom access (female and male), and couple counseling. Aurum will undertake the evaluation of the effect of these on the sexual behavior of populations at public sector sites.

With regards to down referral, Aurum will focus on the referral of stable patients from district level services to lower levels and develop networks of referral linked to the TB-HIV activities defined elsewhere in the COP.

Networks will be developed in Gauteng, Eastern Cape and Limpopo provinces. Support will include human resources, training and mentoring, pharmacy and data collection support, monitoring and evaluation.

In the general practitioner (GP) and non-governmental organization (NGO) program, Aurum will continue the process of devolvement of patients to alternative means of support primarily within the public system and enroll new patients only at public sector sites. The GP and NGO network will be incrementally downsized from Aurum support to this alternative and strategies as accreditation of NGO sites will be completed.

Retention will be addressed through the development of down referral to clinics closer to patient's homes and linkage to community support from the community health centers and primary health care clinics.

A further activity in the public sector will be surveillance of primary resistance at the Tembisa site to allow for rational drug use and choice. This will be done in cooperation with the Department of Health and local government.

SUMMARY:

This activity provides support services at public facilities providing antiretroviral therapy as part of the national ARV rollout and HIV care and treatment at primary health centers, clinical trial sites and general practitioner (GP) practices. ART is provided in accordance with the National Department of Health (NDOH) guidelines. The emphasis areas are renovation, human capacity development, and local organization capacity building. The primary target populations are people affected by HIV and AIDS, HIV-infected children, prisoners, homeless people and street youth. The SME Project will provide treatment to targeted SME employees, taxi drivers, market traders and their partners and dependents.

BACKGROUND:

This is an ongoing activity funded since FY 2004, providing access to HIV care and treatment in the public, private and NGO sector. This activity takes place in the following NDOH ARV sites: (1) Madwaleni Hospital, Eastern Cape; (2) Tshepong Hospital, North West; and (3) Chris Hani-Baragwanath Hospital, Gauteng. In addition Aurum intends to provide ARV services in FY 2008 to sites added in FY 2007: (4) Ermelo Hospital, Mpumalanga, and (5) Thembisa Hospital, Gauteng. In FY 2008, Aurum intends to provide support to a further two public sector hospitals. Aurum plans to provide support for down referral in the following areas: North West province (Kanana clinic), Limpopo province (Mathe-bathe clinic), Madwaleni-linked primary health centers, Gauteng down referral program and Northern Cape (Danielskuil clinic).

A number of sub-partners are involved in implementation of this activity:

1. Faranani Network is described in the Basic Health Care and Support activity and this network supports treatment of people without medical insurance in general practitioner (GP) sites.
2. Reaction Consulting is based in the Mpumalanga Area. This is a public-private partnership with X-Strata which provides the clinics. This organization received direct PEPFAR funding in FY 2007.
3. MES Impilo, a faith-based organization based in Hillbrow, Johannesburg, functions as a home-based care center for the homeless population of Hillbrow, including street youth.
4. Medical Research Council (MRC) site based in KwaZulu-Natal, provides HIV services to prevention trial participants (microbicides, diaphragms) who are found on screening to be HIV-infected.
5. De Beers Consolidated Diamond Mines has developed a public-private partnership in the town of Danielskuil, Northern Cape where contractors and partners of employees are treated for HIV.

In addition, new sub-partners are envisaged as follows:

8. Department of Correctional Services: Aurum will provide support for HIV services including HIV counseling, laboratory monitoring and preventive therapy in two correctional facilities - the Johannesburg Correctional Facility and one other facility. The drug and laboratory costs would be funded by the South Africa Government (SAG).

Additional sub-partners involved in the implementation of central activities include:

9. S Buys will be involved with procurement, dispensing and distribution of medications and will provide pharmacy support at the Chris Hani-Baragwanath Hospital.

Activity Narrative: 10. Toga Laboratories will assist with laboratory testing. Toga has negotiated with Bayer to secure reduced pricing for viral load testing for the Aurum program. Toga is piloting a new initiative to place point-of-care lactate tests at some of Aurum facilities to facilitate early recognition of ART adverse events.

11. Kimera Solutions will provide specialist HIV clinical support to doctors in the form of training and onsite mentoring with regular site visits.

ACTIVITIES AND EXPECTED RESULTS:

The program activities include:

ACTIVITY 1: Wellness of HIV-infected Individuals

Human resources, laboratory monitoring and counseling services for patients who are enrolled into HIV care are included (described in other sections of the COP). Aurum provides a continuum of care from provision of counseling, preventive therapy and preparation for ART. In some sites (MRC, Reaction) patients are referred to public health facilities for initiation of ART.

ACTIVITY 2: Provision of ARVs to Children

Provision of ARVs to children is a recent focus of the program. Aurum has partnered with Wits Pediatrics (sub-partner of Reproductive Health Research Unit) to provide training for two Aurum clinicians. These clinicians attend a pediatric clinic once a week to gain experience in pediatric care. This will help capacitate Aurum to provide ARV services at pediatric units. Aurum is actively encouraging partners to provide services to children and have provided for HIV PCR testing for children in this COP. One of the Aurum GPs is involved in routine treatment of orphans and vulnerable children and has enrolled onto the Aurum program as a provider. Also, Metro Evangelical Services and Caritas Care Centre have a few orphans enrolled onto their hospice. We will attempt to expand to other partners who provide care to orphans and vulnerable children.

ACTIVITY 3: M&E

M&E is a central component of the Aurum program. Every patient contact is recorded on a standardized form and a unique patient identifier is allocated by the central Aurum office. The information is then couriered or faxed to the central office where the data is captured in a database. Monitoring visits take place at the sites to ensure adherence to guidelines and completeness of data collection. Quarterly reports are produced for all stakeholders. Aurum also provides a data management system for the Adult ARV clinic at Chris Hani-Baragwanath and Tshepong hospital in North West program. This system will also be implemented at Thembisa hospital.

ACTIVITY 4: Provision of ARVS to SME employees

People identified as HIV-infected through Aurum activities within the workplace, mobile clinics or taxi ranks will be offered ARV treatment within the GP network if they do not have immediate alternate access to treatment

Provision of laboratory services is per a standardized schedule of follow-up in accordance with SAG guidelines.

The program started in March 2005 and has established 60 treatment sites where about 7000 patients are receiving ART and 80% achieve virological success at 6 months.

Aurum will contribute to the PEPFAR 2-7-10 goals by providing quality HIV care and treatment services in the public, private and NGO sector.

Planned Funds: \$339,817

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Please note that the activities and reference numbers have been changed. Activity 1 in FY 2008 COP is no longer included as a Basic Public Evaluation (BPE). Activity 2 in FY 2008 COP is now BPE 1 in FY 2009 COP. BPE 2 in FY 2009 COP was previously included under the Palliative Care section of FY 2008 COP.

BPE 1: Evaluation of patient-level non-clinical outcomes

This evaluation will not be modified in any major way from the FY 2008 COP. It is taking place at three PEPFAR-supported treatment facilities that are sub-partners of PEPFAR partner Right to Care and relies on data collected during routine clinic visits. Approximately 800 adult patients will continue to be assessed for non-clinical outcomes of treatment. In FY 2009, the patients being followed will have been on antiretroviral therapy (ART) for 3-5 years, allowing long-term impacts of treatment to be assessed. It is expected that at least three additional publications of international journal quality will be produced by the evaluation team by the end of FY 2009, as well as several site- and issue-specific reports that will assist in developing operational improvements to programs. This BPE serves as an evaluation system to track patient progress and outcomes in terms of non-clinical indicators such as quality of life and economic well-being. Understanding these impacts and improving the non-clinical outcomes of long-term patients is essential to the sustainability of treatment programs. This BPE is expected to continue to serve as a valuable tool for routine monitoring and evaluating of treatment service quality. It will continue to generate information to improve the treatment services being provided by Right to Care and to maximize the economic and other non-clinical benefits of treatment to adult patients and their households.

BPE 2: Improvements in linkages to care

In FY 2009, this evaluation will move from observational data collection to evaluation of programmatic improvements implemented by PEPFAR partners. As noted in the FY 2009 COP Technical Considerations, patients not yet ready for ART require a more active follow-up strategy than is currently in place at most facilities, to reduce loss to care and promote early presentation for treatment. Once the rates of and reasons for loss to care are identified through FY 2008 COP activities, potential improvements in procedures and services will be identified through discussion with the treatment sites and other stakeholders. With FY 2009 funding, two or more such improvements will be implemented and evaluated through this BPE. Depending on the results of these intervention-specific evaluations and availability of funding, ongoing evaluation responsibilities will then be transferred either to the implementers of the interventions (other PEPFAR implementation partners) or to the Health Economics Research Office of the Wits Health Consortium. This BPE is expected to produce at least two publications of international journal quality and to generate a set of recommendations to service providers for improving linkages to care.

SUMMARY: Boston University (BU) will use FY 2008 funds to 1) expand and extend an ongoing analysis of cost and cost-effectiveness of models of treatment delivery in South Africa; and 2) extend an ongoing analysis of the outcomes and sustainability of treatment for adult patients. Results will be used to inform future planning by the USG PEPFAR Task Force and South African Government and improve treatment delivery. All of the activities are public health evaluations, and the target populations for the activities are adults, people living with HIV, policy makers, program managers, clinicians (public and private), organizations (all types), and USG staff. BACKGROUND: ACTIVITY 1: BU was requested in FY 2005-2007 to examine cost and cost-effectiveness of alternative models of treatment delivery in use in South Africa. The original methodology considered only the first 12 months following treatment eligibility and included relatively small sample sizes. Initial results have raised new questions requiring larger samples and longer periods of follow-up. In FY 2007, BU amended the methodology to cover up to the first 24 months on treatment, expand the sample of patients from each site, and analyze new models of treatment delivery initiated after the original sites were selected. In FY 2008, the number of sites will be increased further and the methodology will be refined to generate more detailed information about the relationships between resource utilization (costs) and patient outcomes. In addition, the methodology will be adapted to analysis of pediatric treatment delivery models and an initial set of pediatric sites will be analyzed. ACTIVITY 2: With USG support, BU began an evaluation in 2005 of the impact of treatment on South African patients' social and economic welfare, including quality of life, labor productivity, family stability, and other outcomes. In FY 2008, this evaluation will be continued for a fourth year, allowing examination of longer term outcomes essential to treatment sustainability. Both activities address specific areas of interest of the South African Government and are being undertaken with the approval of relevant local and provincial authorities. Both activities will be conducted in partnership with the Health Economics Research Office (HERO) of the Wits Health Consortium. BU's findings from all phases of the targeted evaluations are being utilized by the USG PEPFAR Task Force and other PEPFAR partners to improve efficiencies within current treatment service delivery models. ACTIVITIES AND EXPECTED RESULTS: ACTIVITY 1: Analysis of treatment models and costs. The USG supports a wide range of treatment delivery models in South Africa, including public sector, private sector, and NGO-based programs. In FY 2005-2007, PEPFAR provided support to BU and HERO for a targeted evaluation of the cost-effectiveness of approximately 10 treatment sites representing various models of delivery, including urban and rural public hospitals, a rural NGO clinic and a rural faith-based clinic, and a private physician-based program. The models and sites have been chosen to represent the most promising or most common approaches to large-scale treatment delivery in urban and rural areas and in the public and private sectors. The analysis relies mainly on retrospective data routinely collected by treatment programs to generate information about which models of treatment delivery are successfully treating the largest number of patients at the lowest cost, which characteristics of delivery systems are most important, and whether patient medical outcomes are affected by the model and cost of treatment delivery. The specific measure of cost-effectiveness being used is cost to retain a patient in care and responding to therapy, with responding defined as an undetectable viral load, incremental increase in CD4 count, and/or absence of serious clinical conditions. Both costs and outcomes are estimated at the 12-month and 24-month points following medical eligibility for treatment under South African national guidelines. Initial results of the evaluation have raised a number of additional questions that can only be answered by expanding and extending the activity for a fourth year (FY 2008). These include the cost per successful outcome in years 3 and 4 following treatment eligibility; costs for subsets of patients, such as those who initiate treatment with very low CD4 counts or who switch to second-line regimens during the first year; and cost-effectiveness of

Activity Narrative: treatment delivery models launched after the original study sites were chosen. In FY 2008, BU will revise its methodology to estimate costs and effectiveness up to 48 months following eligibility, incorporate the larger sample sizes needed to examine subsets of patients, and add additional study sites to the evaluation. In addition, the methodology will be adapted to pediatric treatment, which will require different definitions of outcomes and different time frames for evaluation. The pediatric methodology will be applied to an initial set of treatment sites. The expected results of this activity are accurate and detailed estimates of the costs of delivering treatment and achieving successful outcomes across a wide range of settings and types of patients. This information will assist the South African Government, PEPFAR, and other funding agencies to estimate future resource needs, increase efficiency among existing providers, and target future investments toward the most cost-effective models of delivery. **ACTIVITY 2: Impact of treatment on patients' welfare.** While the medical effectiveness of antiretroviral therapy (ART) in suppressing viral replication and restoring immune function is well established, little is known about the impact of treatment of HIV and AIDS on the economic and social welfare of African patients. In particular, it is not known if treatment will offset the impact of untreated AIDS on labor productivity, family stability, quality of life, and other indicators of social and economic development and treatment sustainability. In FY 2005, BU and HERO launched an evaluation of the economic and social outcomes of treatment for adult South Africans receiving care from three PEPFAR-supported treatment sites. The sites include a large urban public hospital, an informal settlement non-governmental clinic, and a rural faith-based non-governmental clinic. At each site, a random sample of pre-ART patients and patients who had been on ART less than 6 months were enrolled in the study and completed a baseline questionnaire focusing on family stability, ability to work and/or perform other normal activities, quality of life, adherence, costs of obtaining treatment, and sources of income. Follow-up interviews are conducted during regularly scheduled clinic visits at intervals of 3-6 months, depending on the patient's status. Over the course of FY 2005 and FY 2006, 672 ART patients and 446 pre-ART patients were enrolled in the study and completed baseline and follow-up questionnaires. By the end of the FY 2007 funding period, all of these patients will have been followed for a minimum of 2 years, and some for more than 3 years. In FY 2008 no new patients will be added, but because the impact of treatment on patients' welfare will change over time, following the current patients for an additional year will generate valuable information about the sustainability of treatment beyond the initial two years. Almost all of the pre-ART patients will have initiated ART by FY 2008, allowing a pre- and post-treatment comparison for this group. The expected result of this activity is rigorous empirical information available about the non-clinical outcomes of treatment for South African patients treated through PEPFAR and South African Government treatment initiatives. If patients are shown to be able to resume their normal activities, find and retain jobs, maintain family stability, and improve quality of life, support for long-term provision of treatment and expansion of current programs will be strengthened. Analysis of the characteristics of patients for whom outcomes are less successful will also help improve treatment program design and patient support efforts. Information coming out of both of these targeted evaluations will be definitive in designing more efficient and effective programs, contributing to the US Mission's ability to reach its PEPFAR targets.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009, BroadReach Health Care (BRHC) will expand capacity building activities all conducted at the request of and in partnership with the South African Government (SAG). The FY 2008 narrative primarily describes activities under BRHC's general practitioner (GP) program with private providers which offers services to HIV-infected persons through three different treatment models. The GP program will be maintained, but the majority of funding for this program area will be for the intensification of BRHC's program to build capacity in SAG facilities. All proposed activities will be aligned with the National Strategic Plan (NSP), national ARV guidelines and other national guidelines governing the care and treatment of HIV-infected people.

Activity 1: Clinical Services

The majority of BRHC support for accreditation has been aimed at district and regional hospitals. In FY 2008 and increasingly in FY 2009, BRHC support for accreditation will shift from hospitals to community health centers (CHCs) and primary health clinics (PHCs) where in line with district/provincial priorities for ART roll-out. Other support for accreditation includes human resources, training, equipment, refurbishment or creation/expansion of space. BRHC will continue to prioritize down referral as a solution to bottlenecks and overcrowding at hospital initiating sites. BRHC takes a holistic approach to down referral, viewing an initiating site and all PHCs as part of one interdependent health system supported by a single information system.

BRHC will employ both facility and community-level approaches to improving the integration of services and referral systems within facilities. The goal is to ensure that at whatever point a patient accesses the health care system (outpatient departments, in patient wards, mobile counseling and testing (CT), antenatal care (ANC), TB clinic, community health workers, home-based care) that a comprehensive package of prevention, care and treatment services are made available to that patient and family and household members. These services will include cotrimoxazole prophylaxis, targeted prevention messages, nutritional counseling, micronutrient supplementation, and routine offer and provider initiated CT. Linkages with family planning, maternal and child health, gender-based violence, directly-observed treatment, short course (DOTS) and nutrition programs will be strengthened.

BRHC support to facilities will focus heavily on integration of TB and HIV services, where routine offer of CT of HIV patients for TB, and of TB patients for HIV is provided in accordance with national guidelines. Importance will be placed on infection control measures in health facilities and in the home and community. BRHC will build on existing DOTS infrastructure, programs and personnel to assist with smooth integration of TB and HIV services.

BRHC's program will include strategic support for strengthening of supply chain for lab and pharmacy as appropriate, and may involve partnership with other PEPFAR partners with this expertise. BRHC engages with the National Health Laboratory System (NHLS) at both facility and district levels to improve systems for collection and transportation of lab tests. Assistance to pharmacy is provided in the form of HR and streamlining of dispensing and drug delivery processes, particularly in down referral settings. All ARVs used at BRHC-supported SAG facilities are procured through SAG.

Activity 2: Human Capacity Development (HCD)

HCD activities will focus on creative problem solving to expand access to comprehensive and integrated treatment services at lower level facilities. Approaches will include training, operations and mentoring support to shift tasks such as treatment initiation and ARV prescription renewals from doctors to nurses. BRHC will review existing best practices before designing new approaches, and use monitoring and evaluation (M&E) of HCD interventions to inform strategies for scale-up.

BRHC provides a combination of in-house and outsourced training courses aimed at ensuring quality delivery of services in the SAG facilities it supports. Training workplans are designed in cooperation with district/provincial authorities and are harmonized to address gaps and increase training volume and coverage. All BRHC implemented/sponsored training courses use nationally certified or DOH-approved curricula. BRHC will engage additional qualified clinical mentors and preceptors to ensure supportive supervision within the work setting.

BRHC provides salary support to SAG staff on a temporary basis to fill critical vacancies. This support will be coupled with budgeting and planning technical assistance (TA) to assist SAG to take over full support of these staff in future budget cycles. BRHC will explore innovative strategies for ensuring retention of health workers, maintaining a healthy and productive workforce, and optimizing workstreams.

Activity 3: Referrals and Linkages

BRHC assists each site to strengthen or develop active defaulter tracing programs by providing TA, personnel and transportation solutions as required. Defaulter tracing models are built on best practices and adapted to the individual needs of a particular health system. In most areas where BRHC works, BRHC's site includes an entire health system, which allows for the creation and testing of scaleable approaches to patient tracing across large geographical areas. BRHC takes a family-centered approach to providing comprehensive care and treatment services and will intensify efforts in this area to build HIV and AIDS-competent communities. BRHC will expand partnerships with non-governmental organizations (NGOs) and community-based organizations in the catchment areas of BRHC sites to ensure uninterrupted service delivery and community-level support for people living with HIV (PLHIV) and their families. Training, institutional strengthening, M&E and other TA will be provided to NGOs/community-based organizations (CBOs) to enable them to meet the demand for community-based services. BRHC will help coordination between SAG facilities and communities.

Activity 4: Information systems/M&E/Quality Assurance & Quality Improvement (QA/QI)

In anticipation of SAG decisions-mandating software, BRHC aims to provide temporary solutions that improve the ability of sites to meet SAG reporting requirements. Information systems build on existing paper

Activity Narrative: -based and register systems, providing added value by improving data quality and information use. BRHC will expand systematic QA/QI approaches across all sites to promote consistent quality of care for all HIV-infected and affected people who seek services in the public sector, and to provide ongoing monitoring and support of training that has been provided. BRHC will focus on the use of patient treatment outcomes, especially viral load suppression, patient retention, and patient adherence, to monitor the progress and quality of programs.

SUMMARY:

BroadReach Healthcare's (BRHC) antiretroviral (ARV) services activities include training for health professionals, management support, laboratory support, quality assurance, and community outreach. BRHC's emphasis areas are human capacity development, local organization capacity building, and strategic information. Primary target populations include children, adolescents, adults, pregnant women, and people living with HIV (PLHIV).

BACKGROUND:

PEPFAR funds support BRHC initiatives that provide HIV and AIDS clinical management, care and support services to HIV-infected individuals in areas where the SAG rollout has not yet been implemented and assists ART rollout in the public sector. The BRHC PEPFAR program began in May 2005 and now operates across 5 provinces. Activities will expand to a sixth province in FY 2008. BRHC is supporting approximately 5000 individuals directly with care and treatment and 15,000 indirectly. BRHC taps private sector health professionals to provide comprehensive care and treatment, fostering capacity-building initiatives within the public health system, and supporting community-based programs. BRHC leverages PLHIV support programs to identify and assist with treatment literacy, adherence support and ongoing community mobilization, prevention education activities, and positive living initiatives. BRHC also works to build capacity in public health facilities, focusing efforts on human capacity development (HCD) activities, including clinical didactic training, clinical mentorships, patient training and operational assistance training. BRHC is expanding its provision of staff and infrastructure support to SAG facilities. Finally, BRHC is expanding its involvement in the design of scaleable down referral models in partnership with faith-based organizations (FBOs), community-based organizations (CBOs), and public-private partnerships (PPPs).

ACTIVITIES AND EXPECTED RESULTS:

To ensure that new patients are started on ART when clinically qualified and enrolled patients continue to receive quality care and support, BRHC will carry out the following activities:

ACTIVITY 1: Clinical Services

BRHC patients will be treated in accordance with national guidelines by ensuring that all elements for effective treatment are provided in a coordinated manner. This includes addressing issues of human resources, provision of technical expertise, training, information, education and communication (IEC), community mobilization, laboratory and testing, drug logistics, equipment and supplies, physical space, M&E, and other cross-cutting support functions such as budgeting, finance, policy, and planning support. Patients see doctors regularly, and will receive laboratory tests, HIV and AIDS education, adherence support, counseling, cotrimoxazole prophylaxis and linkage to other support and wellness (including prevention) services. Patient nutrition and wellness needs will be assisted by local FBOs and NGOs (e.g. food parcels). BRHC supports patients through the private sector until those patients can access treatment through public services. BRHC continues to expand its support to strengthening services in the public sector.

ACTIVITY 2: Human Capacity Development (HCD)

BRHC will provide comprehensive HIV and AIDS training to its network of providers including doctors, nurses, pharmacists and other healthcare professionals through a variety of initiatives including remote decision support, telemedicine, web-based training, didactic training, and clinical mentoring from experienced clinicians. Comprehensive HIV and AIDS training for health professionals include ART management, tuberculosis (TB), adherence, management of complications and side-effects, prevention, and pediatric HIV management. BRHC human capacity development activities, such as training and clinical mentoring, will also take place within SAG facilities. BRHC will continue to train patients and support group facilitators on topics including HIV and AIDS, ART, adherence, living positively, and accessing psychosocial support in communities. The BRHC adherence program supports patients by providing features such as treatment buddies, support groups, cell phone message reminders, a patient call center and adherence counseling.

ACTIVITY 3: Support to SAG

BRHC will conduct an initial needs assessment at each new SAG partner facility. The assessments will identify problems that impact overall capacity and efficiency. Solutions for each institution include recruitment and salary support for doctors, nurses, and pharmacy staff. BRHC will also work with the site to motivate for the creation of permanent posts where needed and ensure that BRHC/PEPFAR supported staff are incorporated into subsequent site budgets to ensure a sustainable staffing solution. BRHC general practitioners provide part-time services at SAG facilities, and train SAG staff in HIV care and treatment and related management. Other support may include infrastructure, such as refurbishment, equipment and supplies procurement. Finally, BRHC will build on its existing public-private partnership (PPP) model with SAG and Daimler Chrysler in East London and develop new PPPs to further involve private companies in supporting small business employees and dependents in communities where they operate.

ACTIVITY 4: Referrals and Linkages

Activity Narrative: Support systems for treatment will be provided by strengthening referral networks between the public and private sectors, including referring stable patients back to the SAG ARV program, and support to local clinics to facilitate SAG up and down referral. Finally, BRHC will continue to expand its linkages with CBOs in order to refer patients in need of food and other community services.

ACTIVITY 5: Quality Assurance/Quality Improvement (QA/QI)

Recognizing the critical role of M&E in a successful treatment program, BRHC QA/QI activities include regular internal data and systems audits, collection of patient-level surveillance data, exception reports, doctor-specific feedback report, and doctor decision-making support. The BRHC adherence program monitors patient adherence through monitoring of drug pick-up information, clinical reports, self-reported adherence, and pill counts. BRHC will also work with SAG facilities to improve data management and medical records systems.

ACTIVITY 6: Pediatric care and treatment

BRHC will expand pediatric enrollment using a family-centered approach. BRHC will encourage testing of families/households, using patients already enrolled in the BRHC program as the index case and point of entry into the household. By recruiting eligible family members, BRHC will enroll greater numbers, including children, into the program. Finally, the family-centered approach will allow BRHC to link an entire household to a single doctor in order to facilitate doctor visits and drug pick ups.

All BRHC activities articulated in the FY 2007 COP will be scaled up significantly in FY 2008 through its partnerships with 15 SAG hospital systems (which include hospitals and affiliated community health centers (CHC) and primary health care clinics (PHCs).

All of the above activities will serve to greatly enhance sites' ability to enroll significantly greater numbers of patients onto ARV treatment.

These activities directly contribute to the PEPFAR 2-7-10 goals by increasing the number of people receiving ARVs, improving access to HIV services, and increasing the capacity of local organizations.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. Because the South-to-South program of Columbia University focuses solely on improving care and treatment for children, the FY 2009 funding was moved from Treatment Services to the new categories of Pediatric Care and Pediatric Treatment. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

Columbia University implements a comprehensive HIV care and treatment program in South Africa that is funded with Track 1 central funding, as well as South Africa COP funding. The activities do not differ across the funding mechanisms, and this entry is thus a repeat of the South Africa COP entry. All targets are reflected in the South Africa COP entry.

SUMMARY:

Activities are carried out in FY 2008 to support implementation and expansion of comprehensive HIV treatment and care primarily through human resources and infrastructure development, technical assistance and training and community education and support, primarily in public sector facilities in the Eastern Cape, Free State (new geographic focus area) and KwaZulu-Natal. Columbia University will support these activities by using funds for human capacity development, local organization capacity building, and strategic information. The degree of activity effort will vary in each site, but all emphasis areas will be addressed in all sites. The target population will include infants, children and youth, men and women (including pregnant women) and people living with HIV (PLHIV). Columbia will continue to support the recruitment of doctors, nurses, pharmacists and pharmacist assistants.

BACKGROUND:

Columbia University (Columbia), with PEPFAR funds, began supporting comprehensive HIV care and treatment activities in FY 2004. Health facilities were initially identified in the Eastern Cape and in FY 2006, due to new boundary demarcations and additional PEPFAR funds, Columbia started providing similar assistance in KwaZulu-Natal. In FY 2006, in response to provincial HIV care and treatment priorities, Columbia began strengthening the down referral of services from hospitals to primary health clinics. This resulted in a total of 36 health facilities receiving technical and financial support from Columbia, including public hospitals, community health centers, primary health clinics and a non-governmental wellness center. In FY 2007 an additional two health facilities in KwaZulu-Natal (East Griqualand Usher Memorial Hospital and the Kokstad Community Clinic) received technical and financial assistance for HIV care and treatment services.

ACTIVITIES AND EXPECTED RESULTS:

All activities are in line with South African government (SAG) policies and protocols, and activities will be undertaken to create sustainable comprehensive HIV care and treatment programs, and primarily include four programmatic areas:

ACTIVITY 1: Support Recruitment and Placement of Health Staff

Since FY 2005 Columbia has been involved in the recruitment of staff to support the HIV comprehensive program at health facilities. High staff attrition rates of Department of Health (DOH) recruited personnel have been a challenge in guaranteeing a steady enrolment of eligible PLHIV into care and treatment. Columbia will continue to support the recruitment of doctors, nurses, pharmacists and pharmacist assistants through existing partnerships with University of Fort Hare, Nelson Mandela Bay Metropolitan Municipality, Ikhwezi Lokusa Wellness Center, University of KwaZulu-Natal Cato Manor, and the Foundation for Professional Development. Columbia supported the recruitment and placement of approximately 15 doctors, 30 nurses (registered and enrolled nurses), 4 pharmacists and 7 pharmacist assistants and 15 trainee pharmacist assistants. These health personnel provide direct patient care in the hospitals and clinics including: clinical assessment, screening for tuberculosis (TB) and antiretroviral treatment (ART) eligibility, opportunistic infections (OI) diagnosis and management, and offering OI prophylaxis and treatment, and ART. The health providers also develop patient treatment plans as part of the multidisciplinary team in the health facility; and assist patients to access relevant SAG social grants.

ACTIVITY 2: Training and Clinical Mentoring

Columbia has established a partnership with the Foundation for Professional Development to provide ARV didactic training in all supported health facilities. A second partnership with Stellenbosch University assists the rural health facility staff (St. Patrick's, Holy Cross and Rietvlei hospitals and their referral clinics), with the management of patients on ART by conducting case discussions on a monthly basis. Columbia has clinical advisors as part of its South African team consisting of nurse mentors, and medical officers who provide day-to-day clinical guidance on the management of patients on ART.

ACTIVITY 3: Strengthen ART Down and Up Referral Linkages Between Hospitals and Primary Healthcare Clinics

In the early phases of the ART program, all patients are evaluated and initiated on therapy at hospital level. Within three to six months of providing support to the hospital-based ART program, designated referral clinics are integrated into the services. In the rural health facilities, a small team of health providers, usually comprising of a medical officer, professional nurse and peer educator, travel to the primary healthcare clinics (PHC) to screen patients for OIs and to determine suitability for ART. This approach has enabled expansion of ART services at PHC level and has resulted in improving and increasing access to treatment. The team of health providers has also developed capacity of the onsite health providers and the goal is to have the onsite DOH health staff eventually provide the full package of HIV care and treatment services. In FY 2008, Columbia will continue to support linkages with the public clinics and the development of a more sustainable system of service provision.

ACTIVITY 4: HIV Care and Treatment Information System

Columbia will continue to support the implementation of a provincial information system that captures

Activity Narrative: information regarding HIV palliative care and ART. Activities in FY 2008 will include:

- a. Continued implementation of facility paper-based ART registers that capture both adult and pediatric ART indicators.
- b. In collaboration with the Eastern Cape Department of Health (ECDOH) and other partners in the Eastern Cape, support the development and implementation of standardized individualized patient records for use at health facilities that incorporates information on client ART use.
- c. Implement an ART software system. In FY 2007, Columbia in partnership with Africare (a PEPFAR partner) and Health Information System Program (HISP) customized and developed ART software that captures and collates HIV and AIDS program data. This ART database is being adapted for data entry, and installation is expected before end of FY 2007. The system is being piloted at three health facilities in East London: Frere, Cecilia Makiwane and Duncan Day Village hospitals. In FY 2008, after assessing results from the pilot sites, Columbia will engage the ECDOH in discussion on how the module could be added into the existing district Health Information System to efficiently generate reports on the HIV program, and thereafter implemented at more ART services outlets.

In addition, in 2007 Columbia began a new partnership with Disease Management System (DMS) - a patient-centered health management information system (HMIS) that operates at the patient level of care to assist health care professionals initially at 4 identified Columbia supported health facilities in Port Elizabeth (Livingstone, KwaZakhele Day Hospital, Motherwell clinic and Chatty clinic) to provide comprehensive care management of people living with HIV, as well as providing management information for relevant stakeholders. In FY 2008, with lessons learned from the implementation of this system, Columbia in partnership with ECDOH proposes to extend the use of this information system in all HIV and ART service delivery points, where feasible. In addition, by FY 2008, Columbia will support the implementation of similar program activities (as specified above) in newly identified health facilities in the Free State (to be determined).

By providing support for ARV services in the public sector and two NGO sites, Columbia's activities will contribute to the realization of the PEPFAR goal of providing care to 2 million people. These activities will also support efforts to meet HIV and AIDS care and support objectives outlined in the USG Five-Year Strategy for South Africa.

Activity System ID: 22753

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 4:

Disease Management System (DMS) Program will now only be supported at three Columbia sites, as one of the sites has been taken over by another partner.

Columbia will provide comprehensive services in:

Prevention - Columbia will address the uptake of prevention of mother-to-child transmission (PMTCT) programs, partner testing, prevention with positives (provider-initiated testing and counseling (PITC) couple counseling, condom promotion and distribution, encouragement of disclosure, behavioral risk reduction interventions, assessment, diagnosis and management of sexually transmitted infections (STIs), effective family planning referrals, and alcohol assessment and counseling. Columbia will also ensure that counseling and testing is offered routinely to clients seeking care in the antenatal clinic, family planning and STI clinics.

Pre-antiretroviral therapy (ART) care – Columbia will use pre-ART registers to keep clients in care, inform timely referral for ART and ensure that pre-ART service providers are sensitized to the eligibility criteria for ART initiation, capacitate feeder sites to manage pre-ART clients until they are eligible for ART, and increase the number of clients enrolled onto pre-ART care following a positive HIV test.

Early referral and retention in care and support - Columbia will initiate and emphasize treatment buddy selection and involvement; sexual partner tracing; engaging families in care; coordinated visits and assessment of family members; couple counseling; support groups; and cohesive care plan for family.

Treatment adherence – Columbia will provide pill boxes, adherence counseling, sensitization of pharmacy staff and community workers on conduct adherence counseling, pill counts at every visit, and educational materials.

Cotrimoxazole (CTX) prophylaxis – Columbia will educate staff on the indications for CTX, providing education materials, trainings, onsite mentoring, pharmacy support to ensure uninterrupted supply of CTX, and providing alternate prophylaxis if CTX is contraindicated.

Family-focused care – Columbia will enroll and assess family members of people living with HIV (PLHIV) as a priority of clinical support activities. The tools to assist this process include family counseling and checklists to ensure mentoring activities identify and address bottlenecks in the family-focused approach.

Pharmacy support - Columbia is currently involved in facilitating the two-year Pharmacy Assistant training program. This training is coupled with field work which assists with decongesting current treatment sites. The regional Columbia pharmacy advisors are supported by one central Pharmacy Advisor who provides onsite mentoring, support with ensuring functioning pharmacy systems are in place at all sites, and regularly communicating with district and provincial departments of health.

Infrastructure support - Columbia will support necessary renovations and site remodeling to ensure suitable space to provide all aspects of the comprehensive program is available. This includes minor structural renovations, alterations to patient flow patterns, and the provision of a project manager to provide expertise and advice.

Interventions for FY 2009 to address challenges around the quality of patient care will include:

- Continuing Medical Education to be incorporated with onsite mentoring on lab staging, and monitoring with particular emphasis on regular monitoring tests (CD4, VL)

- Capacitating clinical teams to identify treatment related complications such as adverse events, side-effects and the formulation of management plans

- Staging of disease is routine at every clinical visit by chart reviews, precepting, case-based learning, and utilizing IEC materials (posters, flip-charts)

- Increasing the number of clients with undetectable viral loads after 12 months of treatment by promoting adherence strategies, prompt follow-up of missed visits, regular lab and clinical staging, early identification and management of treatment related complications, and opportunistic infections.

- Down referrals of stable clients to feeder sites for continuation of ART as part of the chronic care model, with relevant up-referrals for management of complications

- Capacity development of feeder sites to manage ART clients, with the ultimate goal of achieving ART Accreditation

Staffing: to meet the demands of the growing site programs, and Columbia geographical expansion during the FY 2008, there is a need to increase both Columbia staff complement, and DOH staff supported by Columbia. Most supported sites are faced with human resource constraints, and Columbia intends assisting by the direct recruitment of staff, health systems strengthening to retain current staff, and promoting other programs to retain staff (team focused site support, recognition of staff achievements, debriefing sessions, attending to operational issues in a timely manner).

SUMMARY:

Activity Narrative: Activities are carried out in FY 2008 to support implementation and expansion of comprehensive HIV treatment and care primarily through human resources and infrastructure development, technical assistance and training and community education and support, primarily in public sector facilities in the Eastern Cape, Free State (new geographic focus area) and KwaZulu-Natal (KZN). Columbia University will support these activities by using funds for human capacity development, local organization capacity building, and strategic information. The degree of activity effort will vary in each site, but the emphasis areas will be addressed in all sites. The target population will include infants, children and youth, men and women (including pregnant women) and people living with HIV (PLHIV). Columbia will continue to support the recruitment of doctors, nurses, pharmacists and pharmacist assistants.

BACKGROUND:

Columbia University (Columbia), with PEPFAR funds, began supporting comprehensive HIV care and treatment activities in FY 2004. Health facilities were initially identified in the Eastern Cape and in FY 2006, due to new boundary demarcations and additional PEPFAR funds, Columbia started providing similar assistance in KZN. In FY 2006, in response to provincial HIV care and treatment priorities, Columbia began strengthening the down referral of services from hospitals to primary health clinics. This resulted in a total of 36 health facilities receiving technical and financial support from Columbia, including public hospitals, community health centers, primary health clinics and a non-governmental wellness center. In FY 2007 an additional two health facilities in KZN received technical and financial assistance for HIV care and treatment services.

ACTIVITIES AND EXPECTED RESULTS:

All activities are in line with South African government (SAG) policies and protocols, and activities will be undertaken to create sustainable comprehensive HIV care and treatment programs, and primarily include six programmatic areas:

ACTIVITY 1: Support Recruitment and Placement of Health Staff

Since FY 2005 Columbia has been involved in the recruitment of staff to support the HIV comprehensive program at health facilities. High staff attrition rates of Department of Health (DOH) recruited personnel have been a challenge in guaranteeing a steady enrolment of eligible PLHIV into care and treatment. Columbia will continue to support the recruitment of doctors, nurses, pharmacists and pharmacist assistants through existing partnerships with University of Fort Hare, Nelson Mandela Bay Metropolitan Municipality, Ikhwezi Lokusa Wellness Center, University of KwaZulu-Natal Cato Manor, and the Foundation for Professional Development (FPD). Columbia supported the recruitment and placement of approximately 15 doctors, 30 nurses (registered and enrolled nurses), 4 pharmacists, 7 pharmacist assistants and 15 trainee pharmacist assistants. These health personnel provide direct patient care in the hospitals and clinics including: clinical assessment, screening for tuberculosis (TB) and antiretroviral treatment (ART) eligibility, opportunistic infections (OI) diagnosis and management, offering OI prophylaxis and treatment, and ART. The health providers also develop patient treatment plans as part of the multidisciplinary team in the health facility; and assist patients to access relevant SAG social grants.

ACTIVITY 2: Training and Clinical Mentoring

Columbia has established a partnership with FPD to provide ARV didactic training in all supported health facilities. A second partnership with Stellenbosch University assists the rural health facility staff (St. Patrick's, Holy Cross and Rietvlei hospitals and their referral clinics), with the management of patients on ART by conducting case discussions on a monthly basis. Columbia has clinical advisors as part of its South African team consisting of nurse mentors, and medical officers who provide day-to-day clinical guidance on the management of patients on ART.

ACTIVITY 3: Strengthen ART Down and Up Referral Linkages Between Hospitals and Primary Healthcare Clinics

In the early phases of the ART program, all patients are evaluated and initiated on therapy at hospital level. Within three to six months of providing support to the hospital-based ART program, designated referral clinics are integrated into the services. In the rural health facilities, a small team of health providers, usually comprising of a medical officer, professional nurse and peer educator, travel to the primary healthcare clinics (PHC) to screen patients for OIs and to determine suitability for ART. This approach has enabled expansion of ART services at PHC level and has resulted in improving and increasing access to treatment. The team of health providers has also developed capacity of the onsite health providers and the goal is to have the onsite DOH health staff eventually provide the full package of HIV care and treatment services. In FY 2008, Columbia will continue to support linkages with the public clinics and the development of a more sustainable system of service provision.

ACTIVITY 4: HIV Care and Treatment Information System

Columbia will continue to support the implementation of a provincial information system that captures information regarding HIV palliative care and ART. Activities in FY 2008 will include:

- (a) Continued implementation of facility paper-based ART registers that capture both adult and pediatric ART indicators.
- (b) In collaboration with the Eastern Cape Department of Health (ECDOH) and other partners in the Eastern Cape, support the development and implementation of standardized individualized patient records for use at health facilities that incorporates information on client ART use.
- (c) Implement an ART software system. In FY 2007, Columbia in partnership with Africare (a PEPFAR

Activity Narrative: partner) and Health Information System Program (HISP) customized and developed ART software that captures and collates HIV and AIDS program data. This is being adapted for data entry, and installation is expected before the end of FY 2007. The system is being piloted at three health facilities in East London. In FY 2008, after assessing results from the pilot sites, Columbia will engage the ECDOH in discussion on how the module could be added into the existing District Health Information System to efficiently generate reports on the HIV program, and thereafter implemented at more ART services outlets.

In addition, in 2007 Columbia begun a new partnership with Disease Management system (DMS) - a patient-centered health management information system (HMIS) that operates at the patient level of care to assist health care professionals initially at 4 identified Columbia supported health facilities in Port Elizabeth to provide comprehensive care management of people living with HIV, as well as providing management information for relevant stakeholders. In FY 2008, with lessons learned from the implementation of this system, Columbia in partnership with ECDOH proposes to extend the use of this information system in all HIV and ART service delivery points, where feasible. In addition, by FY 2008, Columbia will support the implementation of similar program activities (as specified above) in newly identified health facilities in the Free State (to be determined).

d. In an effort to improve and monitor quality of activities being implemented, Columbia in FY 2007 developed a standard operating procedure (SOP) for data quality. Dissemination and use of this SOP is currently underway in all Columbia-supported facilities. In FY 2008, Columbia plans to recruit a quality assurance officer who will be responsible to monitor quality of implemented activities from both a data and program perspective.

ACTIVITY 5: Improve Retention into Care and Treatment and Reduce Loss-to-Follow-Up

In FY 2006/7 Columbia begun implementing strategies to establish and mitigate the losses to follow-up in the HIV program. In the supported sites in East London, dedicated staff were hired to assist tracing and re-introducing patients lost-to-follow-up. In partnership with the Buffalo City Municipality and the ECDOH, Columbia has created an external referrals director for HIV and AIDS services for the East London environs. With the lessons learned in this initial work of tracing patients in HIV care and treatment and the development of the referral directory, Columbia plans to initiate similar support across all supported facilities in FY 2008. In addition, Columbia is developing Adherence and Social Support Unit guidelines to standardize procedures used across supported health facilities. Dissemination of these guidelines will take place in early 2008.

ACTIVITY 6: Improve and Increase Enrollment of Infants and Children into HIV Chronic Care and Treatment

In the Eastern Cape, pediatric ART enrollment is centralized at the regional and tertiary facilities, where pediatricians are heavily involved in the care and treatment of children and infants and decentralization of pediatric ART services to PHCs that are providing ART for adults has been very slow. In FY 2007 services of pediatricians were retained to train and/or mentor health staff at the facilities to improve pediatric HIV care and treatment, and this will continue in FY 2008. In addition, Columbia will continue to take advantage of the established partnership with Stellenbosch-Tygerberg to train nurses and doctors in pediatric HIV care and treatment. Recruitment for a pediatrician to spearhead all pediatric HIV activities in the Eastern Cape, KZN and Free State is currently ongoing.

Program Area: Treatment: Adult Treatment

Budget Code: HTXS

Program Budget Code: 09

Activity ID: 3296.22762.09

Planned Funds: \$5,283,351

Activity System ID: 22762

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

Activities funded with Track 1 funding is integrated with the local funding and this comprehensive program (including progress and planned activities) are contained in the local funding COP entry.

Elizabeth Glaser Pediatric AIDS Foundation implements a comprehensive HIV care and treatment program in South Africa that is funded with Track 1 central funding, as well as South Africa COP funding. The activities do not differ across the funding mechanisms, and this entry is thus a repeat of the South Africa COP entry. All targets are reflected in the South Africa COP entry. BACKGROUND: The long-term goal of the EGPAF care and treatment program in South Africa is to increase life expectancy amongst HIV-infected persons by increasing access to care and treatment services and service utilization. Primary emphasis areas are human capacity development and expansion of services through training and task shifting, local organization capacity building, development of infrastructure, policy and guidelines, and strategic information. Primary populations to be targeted include infants, men and women, pregnant women, people living with HIV (PLHIV), and public and private healthcare providers. Project Help Expand ART (HEART) will expand geographic coverage of services in FY 2008. HEART/South Africa is part of a larger worldwide initiative by EGPAF to support care and treatment services, and receives both Track 1 and in-country PEPFAR funding. The program's focus is on integrating PMTCT services to provide a family-centered model of care that includes access to treatment for HIV-infected pregnant women, couple counseling, partner testing and screening for TB. EGPAF utilizes PEPFAR resources to complement those of the KwaZulu-Natal (KZN) Department of Health (DOH) and private partners, such as faith-based organizations (FBOs) and other non-governmental organizations (NGOs). These resources fund staff, infrastructure, drugs, laboratory testing and provide technical support. EGPAF will identify gaps in the program at the site level and implement activities to address the needs. The intent is to facilitate national and provincial plans and work with the government and partners to transition programs to South Africa government (SAG) support. EGPAF has a partnership with a private NGO, the AIDS Health Care Foundation (AHF); this is a cost-sharing relationship (drugs and staff) to support the AHF care and treatment program. McCord Hospital, a faith-based organization, is a sub-grantee of EGPAF. The EGPAF partnership with the DOH includes support for human capacity development, infrastructure rehabilitation and technical support for sites in KZN. The existing sites are: (1) McCord Hospital, Durban; (2) AHF (Ithembalabantu Clinic), Umlazi, Durban; (3) KZN DOH, Pietermaritzburg Up/Down-referral program (Edendale Hospital and four referral clinics, Northdale Hospital and five referral clinics); and (4) KZN DOH, Vryheid Hospital plus three referral clinics, Benedictine Hospital and three referral clinics, and Edumbe Community Health Centre (CHC) plus one referral clinic, in Zululand District. This partnership with the DOH will be expanded to the whole Free State province, to Ramotshere Moiloa (Zeerust) and Tswaing (Delareyville) sub-districts in the North West, to all of the Umgungundlovu and Zululand districts in KZN, and the Eastern Ekurhuleni and Lesedi sub-districts in Gauteng. ACTIVITIES AND EXPECTED RESULTS: ACTIVITY 1: Human Capacity Development EGPAF will support training of healthcare providers on the following: 1. Screening and treatment of TB/HIV and opportunistic infections, ART in pregnancy, and referral systems (between PMTCT and ART); 2. Supporting systems to improve access to care and treatment of children (including early infant diagnosis); 3. Capacity building at sites for implementation and management of the comprehensive care, management and treatment support program; 4. M&E; 5. Project management; and 6. Funding health workers to complete a HIV and AIDS Diploma at the University of KwaZulu-Natal. In addition EGPAF will provide technical assistance for the creation of outreach programs to build capacity at primary healthcare (PHC) clinics for downward and upward referral in order to maintain patients on ART, initiate new patients on therapy, and decongest treatment sites that have reached capacity. ACTIVITY 2: Down Referral Process The KwaZulu-Natal Health Department (KZNDOH) started providing comprehensive care and treatment services to HIV-infected patients in May 2004 at hospital level. PHC clinics will be capacitated so that they are able to manage stable patients on ART referred down from the hospitals or community health centers (CHCs), and also up refer those that are eligible for initiation of ART to hospital or CHCs that are ARV accredited sites. The KZNDOH aims to make ART accessible to all by expanding and strengthening existing HIV and AIDS care and treatment service delivery. A number of CHCs have been accredited by the national and provincial health departments and will initiate ART. The PHC clinics conduct rapid HIV testing, CD4 testing and provide the first, second and third adherence counseling sessions, which is also done at CHC and hospital level, and then refer patients to accredited CHCs or hospitals for initiation. The KZNDOH has identified the Pietermaritzburg and Zululand Districts as areas needing immediate support as they are poorly resourced with high HIV seroprevalence rates. The KZNDOH has requested that EGPAF support be extended to these districts. The districts have identified clinics where stable patients on treatment can be referred to continue ART management. ACTIVITY 3: Pediatric Care and Treatment EGPAF's goal is to ensure that 10 percent of all patients on treatment are children, which has not been achieved in the Zululand district. To strengthen pediatric HIV care and treatment, EGPAF will provide training on early infant diagnosis, pediatric HIV clinical staging and diagnosis and ART in children, in addition to provision of staff, strengthening the linkages between PMTCT and care and treatment. The Edendale and Northdale pediatric HIV clinic has the largest cohort of pediatrics in the province on ART. The hospital down refers stable patients to the care of the PHC clinics to free up space for new pediatric patients. EGPAF aims to: 1. Increase the rate of down referral of stable children on ART; 2. Increase the up referral of new eligible children for initiation of therapy; and 3. Improve linkages between PMTCT programs and care and treatment programs. EGPAF will provide financial and technical support to eight PHC clinics in the catchment area of the Edendale and Northdale hospital in Pietermaritzburg, thus capacitating them to: (1) receive and manage transferred stable pediatric patients on ART from the pediatric HIV clinic; and (2) provide screening and preparation of eligible HIV-infected patients at three PHC facilities for up referral and initiation of ART at Edendale Hospital Pediatric HIV clinic. The same approach will be applied as we expand to other provinces, namely Free State, North West and Gauteng Provinces. ACTIVITY 4: Counseling and Testing (CT) The focus will be strengthening comprehensive HIV and AIDS care and treatment services using a family-centered approach to increase access to CT, by fast-tracking TB, STI, and family planning patients to CT; to integrate PMTCT with HIV and AIDS care and treatment; to improve referral of eligible pregnant mothers, partners, family members, and HIV-infected infants and children to treatment sites; to screen for opportunistic infections. With this focus, EGPAF will increase pediatric care and treatment, couple counseling, partner testing, and testing for siblings. For patients who test HIV positive and are not yet eligible for ART, they will be retained through wellness clinics, support groups, patient tracking, etc. The overall goal is to expand coverage of HIV and AIDS care and treatment services to reach mothers, partners

Activity Narrative: and children who would not otherwise have access to these services. The increase in funding in FY 2008 will be used to expand EGPAF program activities viz. human capacity development, down-referral process, pediatric care and treatment as well as counseling and testing activities to the Free State, North West and Gauteng Province. In addition, EGPAF will strengthen M&E systems at all levels of service delivery. The activities contribute to the PEPFAR 2-7-10 goals.

With FY 2008 reprogramming funds, EGPAF will provide additional support to the Free State and North West Department of Health (Bojanala District) to provide integrated HIV, TB, PMTCT and HIV care and treatment services. This will include a focus on strengthening the down-referral program in both provinces.

Prime Partner: South African Military Health Service

USG Agency: Department of Defense

Funding Source: GHCS (State)

Program Area: Treatment: Adult Treatment

Budget Code: HTXS

Program Budget Code: 09

Activity ID: 3339.22788.09

Planned Funds: \$121,363

Activity System ID: 22788

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2009 funding will support the two-week antiretroviral (ARV) training and the four-day refresher training of Health Care Professionals in the South African Military Health Services (SAMHS). A simpler customized ARV training course for pharmacy assistance will also be funded. Health Care Professionals will also be trained on TB management, particularly management of multi-drug resistant (MDR) and extremely drug resistant (XDR) TB, the new TB guidelines and sexually transmitted infection (STI) syndromic management. There will also be a focus on cervical screening for HIV-infected women.

Adherence counseling facilities will be upgraded at some ARV sites. For improved adherence, members on treatment will be provided with pill boxes.

The project will also focus on site readiness to ensure accreditation of roll-out sites by the department of health (DOH).

Another focus area for successful implementation of health care service delivery will be to equip health centre managers with the necessary management skills. It is necessary that professional clinical training and guidance is provided to clinicians at sites and units throughout the country.

SUMMARY:

The South African Department of Defence (SADOD) has an existing HIV and AIDS program that includes antiretroviral treatment (ART) services. FY 2008 funds will be used to improve and expand ART and related services. The main emphasis area is human capacity development. The main target is people living with HIV (PLHIV) in the military and their families.

BACKGROUND:

This activity commenced in FY 2005 with PEPFAR funding and was mostly focused on the preparation of pharmacies at the first rollout sites for ART, supplementing SADOD funding for the phased rollout of ART in the military. Six ART sites have been accredited with the aid of PEPFAR funding, and further funding will be utilized towards addressing human resource deficiencies that delay implementation of ART at these sites. FY 2008 activities will focus on the acquisition of commodities in support of ART, laboratory costs associated with ART, continued human resource support and activities that encourage adherence. Limited uptake of current ART services may be addressed through a media campaign to educate members and dependants on ART. To date only two of the six accredited ART sites are operational due to staffing issues, and thus FY 2008 funding is focused on addressing the needs of the four sites that are accredited, but not operational.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Training of personnel to strengthen management systems, improve the quality of service through training of healthcare workers in ARV service provision.

ACTIVITY 2:

Continued development, modification, and printing of media, including posters and pamphlets, towards the provision of information and education on ART to members of the SADOD and their dependants.

ACTIVITY 3:

Interventions aimed at increasing treatment adherence by utilizing, and adapting, where necessary, available adherence tools.

ACTIVITY 4:

A needs assessment will be conducted at the four focus ART sites to determine gaps in staffing, and a plan to address these gaps will be developed and implemented by SADOD, with some support from PEPFAR funding.

ACTIVITY 5: To ensure quality monitoring and evaluation, the SADOD will implement the HIV and AIDS database developed in FY 2006 in order to capture all relevant patient data for tracking and reporting purposes at the four focus ART sites.

These activities will contribute to the number of persons receiving treatment and care in the military, and support the PEPFAR 2-7-10 goals.

Activity System ID: 22898

Mechanism: N/A

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Treatment: Adult Treatment

Program Budget Code: 09

Planned Funds: \$400,255

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 2: The materials were updated and translated into local languages with FY 2008 funding. In FY 2009, more than 200 new training sessions will be conducted with an average of 30 people per session. At least 425,000 copies of these materials will be distributed through Soul City's training partners and to facilities providing antiretroviral therapy (ART), including those of other PEPFAR partners. These materials are also distributed to health facilities, through a partnership with the Department of Health. All Soul City Materials are updated regularly (with each reprint) and checked by experts in the field for quality and accuracy. The training is focused around schools, but is largely with the adult community of the school: the school governing body, teachers and parents. In this way, many adults and children will be assisted to get into ART programs.

SUMMARY:

Soul City is implementing a media and community-driven program to strengthen prevention, and increase awareness of and demand for HIV care and treatment services, including treatment literacy. There are two activities which target adults and children through training and community mobilization nationally. The emphasis areas gender, education, human capacity development and local organization capacity building.

BACKGROUND:

Soul City has received PEPFAR funding since FY 2005 to implement a comprehensive HIV and AIDS program that includes improving access to treatment and adherence counseling. Soul City has a long history of partnership with the South African Government (SAG), collaborating with the National Departments of Health (NDOH), Education (DOE), Social Development (DOSD), Transport, and Public Service and Administration, which includes financial support from NDOH, and potentially DOSD in the future. All Soul City interventions pay particular attention to addressing gender issues particularly those that are associated with driving the epidemic. These include power relations and gender violence. Violence reduction will be a particular focus of Soul City over the next five years as will those issues that promote violence such as substance abuse. There are 18 partner NGOs which currently implement training and community mobilization activities across the country.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Soul Buddyz Club

Based on the Soul Buddyz media intervention (described under Prevention), Soul Buddyz Club is a community mobilization intervention aimed at children, based mainly at schools and facilitated voluntarily by teachers. Children in the clubs learn about life skills covered in the Soul Buddyz series and are encouraged to do outreach work in their schools, families and communities. The content focus of the clubs is mainly on prevention, but the Clubs offer a major opportunity to educate children on all aspects of antiretroviral treatment. These children then become peer educators as well as being able to support people in their communities on treatment. PEPFAR funding will be used to support approximately 80 percent of this activity, with other donors funding the remaining 80%. This activity will be implemented in partnership with the DOE at both a national and provincial level. This activity contributes towards PEPFAR objectives by promoting treatment literacy and treatment compliance.

ACTIVITY 2: Information, Education and Communication (IEC) materials

This activity relates to information and training materials for use in facilitated learning settings, as well as the general public. Soul City develops flexible training materials in five local languages. These deal with all aspects of the epidemic, in particular prevention stressing AB as well as antiretroviral treatment (ART) support and support for home-based care and orphans and vulnerable children. These materials are used by 18 sub-partner NGOs in a cascade training model. Through this training, trainees are given the support and skills with which to become mobilizers in their community. More than 200 training sessions will be conducted in FY 2008 with an average of 30 people per session. Soul City has produced the following treatment literacy materials: a booklet for people newly on ART; a booklet for healthcare workers providing ART; and a booklet for people who are caring for children on ART. In FY 2008 these materials will be updated and translated into other languages if necessary. At least 500,000 copies of these materials will be distributed through Soul City's training partners and to facilities providing ART, including PEPFAR partners. These materials are also distributed to health facilities, through a partnership with the Department of Health.

PEPFAR funding will be used to support approximately 70 percent of this activity, with other donors funding the remaining 30%. This activity addresses gender, stigma and discrimination and education with particular attention to building the organizational capacity and sustainability of the implementing NGO sub-partners in the form of organizational and human resource development assistance. This activity contributes towards PEPFAR goals by promoting treatment literacy and treatment compliance.

The long-term sustainability of Soul City is being addressed through diversifying its funding sources as well as through the establishment of a broad-based empowerment company which can take ownership of shares and whose dividends will accrue to Soul City.

By providing clear and relevant messages regarding ARV treatment and adherence, Soul City's activities will have a direct and measurable impact on demand for and effective use of ARV treatment in South Africa. These achievements will contribute to the realization of the Emergency Plan's goal of treating 2 million people, and support the treatment goals outlined in the USG Five-Year Strategy for South Africa.

Program Budget Code: 09

Activity ID: 8107.22887.09

Planned Funds: \$0

Activity System ID: 22887

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

John Snow, Inc.'s (JSI) Supply Chain Management System (SCMS) project does not plan on continuing with this activity, as it involves expertise with patient information systems development, which is not a core mandate of the SCMS project. However, while SCMS does not currently have the technical expertise or staff in country to lead and oversee this type of initiative, SCMS has stated that they could continue this activity if requested by the U.S. Government. Therefore no FY 2009 funding is requested.

SUMMARY:

John Snow, Inc. (JSI), through SCMS, is using PEPFAR funds to strengthen ARV patient information and reporting capabilities utilizing a system based on biometric fingerprinting to ensure data verification and smart cards as a mobile, patient-retained medical record. The prototype system that was successfully pilot tested as a proof of concept was named STAT (Secure Technology Advancing Treatment). SCMS is further developing the STAT system as a cost-effective system that is both scaleable and sustainable. The emphasis areas are human capacity development, local organizational capacity building and strategic information. The primary target populations are people living with HIV (PLHIV) and public and NGO healthcare providers.

BACKGROUND:

The lack of verified program reporting data/performance indicators and use of cumbersome and often incomplete paper-based patient medical records continue to present major challenges in scaling up antiretroviral treatment (ART) programs. Under the DELIVER project, JSI developed a public-private partnership with a local biometrics and smart card leader to design and field test a prototype patient information and reporting system, named STAT, based on combination biometrics and smart card technology. The system was successfully demonstrated in a static clinic environment and also in an offline, remote, rural setting for both ART and care and support services. In order to address emerging issues during the pilot phase around proprietary software, licensing fees, and data transmission costs, which made large-scale implementation impractical, SCMS developed new partnerships in FY 2006 to continue the development of the STAT system in an open source environment, eliminate licensing fees, and design a data transmission mechanism that was both scaleable and sustainable. Specifically, SCMS partnered with Right to Care (RTC), a leading PEPFAR-funded ART provider and their IT collaborator Therapy Edge, to develop a smart card component in the context of a much needed down referral system where patients can be down referred from specialist ART initiation sites to primary health care facilities. Of particular concern in expanding ART services is the reality that large accredited ART sites are becoming overburdened with patient follow-up and are struggling with the human capacity to add new patients. Under these circumstances, the development of effective down referral systems where patients can receive follow-up care and drug re-supply closer to their local communities is critical. The STAT system offers several crucial components to a successful down referral model: from a clinical and quality of care perspective it enables doctors who have stabilized ART patients to track patients over time, quickly assess them, and make clinical treatment adjustments when patients are referred back to the initiating ART treatment site in case of treatment failures; from a patient perspective it enables patients to easily access ARV services at multiple service delivery sites; and from a program performance perspective, it enables program managers and funding agencies to access verified (i.e. high quality) PEPFAR indicators at any time, providing virtually real time reporting and strategic information capabilities. Using FY 2007, SCMS focuses on implementing the solution at the RTC initiation site at Helen Joseph Hospital and several down referral sites that are currently being identified. It is anticipated that this activity will result in a model demonstration system in which SCMS will have developed an open source solution and a standard for smart card systems in health care. This effort is important as the National Department of Health (NDOH) has included biometrics and smart cards in its long-term strategic plan for developing an electronic patient medical record for South Africa. SCMS will continue to build on their collaborative relationships with the SAG, and will also explore potential deployment of the STAT system in private sector environments..

ACTIVITIES AND EXPECTED RESULTS FY 2008:

Specific activities will include STAT system training for ARV service providers, implementation and maintenance of the STAT system at sites, and the development of sustainable financial support mechanisms to ensure STAT remains after PEPFAR funding has been utilized to introduce the system and provide the initial implementation. The focus of activities will include technical assistance and human capacity development.

Activity 1: Technical Assistance

It is anticipated that once the demonstration system for down referral at RTC/Helen Joseph Hospital and its down referral sites is fully operational and documented in FY 2007, that the Gauteng DOH will support expansion of the down referral system across the province. This may involve the utilization of the Therapy Edge/Smart Card as is from the demonstration site, or it may involve a full scale tendering process. Either way SCMS will have made a significant contribution as even in the event of a tender, SCMS will be able to provide the smart card standards that are required for successful systems development and integration. In addition to Gauteng province, the Reproductive Health Research Unit (RHRU) and the Foundation for Professional Development (FPD) have both expressed interest in the smart card concept to assist in down referral systems development. SCMS will follow up on the feasibility of expanding the system to RHRU and/or FPD sites once these PEPFAR partners and others have experienced and evaluated the demonstration project

Activity 2: Human Capacity Development

Training on the patient information system for ARV service providers and data capturers will be conducted

Activity Narrative: for all those participating in the expansion program. Follow-up supervision and technical assistance will be provided and evaluated. It is expected that overall quality of care will be improved by the system's ability to track patient information including ARV initiation, drug regimen changes, and treatment outcomes. SCMS will contribute significantly towards meeting the vision of the NDOH in developing an electronic patient-retained record and will also contribute significantly towards meeting the vision of the USG PEPFAR Task Force Five-Year Strategy for South Africa by providing a state-of-the-art system to facilitate the virtual real time collection, analysis and reporting of the required PEPFAR M&E indicators for ART for thousands of patients.

Activity ID: 2917.22767.09

Planned Funds: \$1,913,973

Activity System ID: 22767

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009, EGPAF will continue to assist the Department of Health (DOH) with its down referral process and accreditation of more primary health care (PHC) facilities in an effort to ensure adequate and appropriate geographic and epidemiologic treatment coverage. EGPAF will train PHC-level staff on comprehensive HIV and AIDS prevention, care, management and treatment and, ensure that didactic training translates to good clinical practice. Facility-based quality improvement (QI) teams will be established and service gaps identified will be addressed to ensure quality service delivery. Testing and counseling will be offered at all possible entry points to ensure that HIV-infected people eligible for treatment are identified early. Patients not eligible for antiretroviral therapy will be enrolled into wellness programs. Coordinated linkages with other care and support services within facilities and in communities will be established or strengthened. Prevention interventions will be integrated in care and treatment settings. All HIV-infected patients will be screened for TB, and all TB patients will be offered HIV testing. Tracing or tracking of patients that do not return for results will be strengthened. Monitoring and evaluation systems to track patient progress and outcomes in the care and treatment setting will be put in place. The family-centered approach will be standard practice. After McCord was accredited as a DOH rollout site in 2006 and the DOH provided antiretroviral drugs (ARVs) and HIV-related lab tests it was decided that the funds be reprogrammed for the ARV drug and lab portion. This resulted in funding of McCord and six other sites.

In an effort to strengthen human capacity, task shifting will be explored where nurses will be supported to manage stable patients on treatment thus preparing them for adult treatment initiation in the future. EGPAF will provide support in the form of ongoing didactic training, onsite mentoring, preceptorship and supportive supervision. An integrated training approach will be implemented thus the trainings will cover the following areas, basic and advanced HIV and AIDS training, TB/HIV, sexually transmitted infection (STI) and opportunistic infection (OI) management, QI, monitoring and evaluation (M&E), and general infection control practices.

Gender is a critical issue in treatment, care and support, with implications for the quality and effectiveness of the care provided and, the disproportionate burden on women and girls to provide care. EGPAF will work with DOH to ensure equitable access for both women and men to medicines and other care and support services and resources. Linkages with reproductive health programs for female-headed households and caregivers will be strengthened. Programs for older women caregivers that provided support networks and access to productive resources will be targeted. Programs that target men/ boys and encourage their participation and responsibility in care-giving and household functions, their support for female caregivers and their recognition of the burden of care as well as programs that reduce gender-based violence and promote human rights will be implemented. Specific needs of women will be addressed. Generally, more females than males access treatment services and the ratio is 60:40.

EGPAF overall support is in line with National DOH adult treatment policies and guidelines. The National Strategic Plan (NSP) 2007-2011 Priority Area 2, Treatment, Care and Support, goals 6 and 7 are taken into consideration. All patients will be managed according to government guidelines and standards to ensure quality, including CD4 percentage increases, viral load, disease stage, side effects, adverse events and outcomes at 12 and 24 months.

BACKGROUND:

The long-term goal of the EGPAF care and treatment program in South Africa is to increase life expectancy amongst HIV-infected persons by increasing access to care and treatment services and service utilization. Primary emphasis areas are human capacity development and expansion of services through training and task shifting, local organization capacity building, development of infrastructure, policy and guidelines, and strategic information. Primary populations to be targeted include infants, men and women, pregnant women, people living with HIV (PLHIV), and public and private healthcare providers.

Project Help Expand ART (HEART) will expand geographic coverage of services in FY 2008. HEART/South Africa is part of a larger worldwide initiative by EGPAF to support care and treatment services, and receives both Track 1 and in-country PEPFAR funding. The program's focus is on integrating PMTCT services to provide a family-centered model of care that includes access to treatment for HIV-infected pregnant women, couple counseling, partner testing and screening for TB.

EGPAF utilizes PEPFAR resources to complement those of the KwaZulu-Natal (KZN) Department of Health (DOH) and private partners, such as faith-based organizations (FBOs) and other non-governmental organizations (NGOs). These resources fund staff, infrastructure, drugs, laboratory testing and provide technical support. EGPAF will identify gaps in the program at the site level and implement activities to address the needs. The intent is to facilitate national and provincial plans and work with the government and partners to transition programs to South Africa government (SAG) support.

EGPAF has a partnership with a private NGO, the AIDS Health Care Foundation (AHF); this is a cost-sharing relationship (drugs and staff) to support the AHF care and treatment program. McCord Hospital, a faith-based organization, is a sub-grantee of EGPAF. The EGPAF partnership with the DOH includes support for human capacity development, infrastructure rehabilitation and technical support for sites in KZN.

The existing sites are:

- (1) McCord Hospital, Durban
- (2) AHF (Ithembalabantu Clinic), Umlazi, Durban
- (3) KZNDOH, Pietermaritzburg Up/Down referral program (Edendale Hospital and four referral clinics, Northdale Hospital and five referral clinics),
- (4) KZNDOH, Vryheid Hospital plus three referral clinics, Benedictine Hospital and three referral clinics, and Edumbe Community Health Centre (CHC) plus one referral clinic, in Zululand district.

Activity Narrative: This partnership with the DOH will be expanded to the whole Free State province, to Ramotshere Moiloa (Zeerust) and Tswaing (Delareyville) sub-districts in the North West, to all of the Umgungundlovu and Zululand districts in KZN, and the Eastern Ekurhuleni and Lesedi sub-districts in Gauteng.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

EGPAF will support training of healthcare providers on the following:

1. Screening and treatment of TB/HIV and opportunistic infections, ART in pregnancy, and referral systems (between PMTCT and ART);
2. Supporting systems to improve access to care and treatment of children (including early infant diagnosis);
3. Capacity building at sites for implementation and management of the comprehensive care, management and treatment support program;
4. M&E;
5. Project management; and
6. Funding health workers to complete a HIV and AIDS Diploma at the University of KwaZulu-Natal.

In addition EGPAF will provide technical assistance for the creation of outreach programs to build capacity at primary healthcare (PHC) clinics for downward and upward referral in order to maintain patients on ART, initiate new patients on therapy, and decongest treatment sites that have reached capacity.

ACTIVITY 2: Down Referral Process

The KwaZulu-Natal Health Department (KZNDOH) started providing comprehensive care and treatment services to HIV-infected patients in May 2004 at hospital level. PHC clinics will be capacitated so that they are able to manage stable patients on ART referred down from the hospitals or community health centers (CHCs), and also up refer those that are eligible for initiation of ART to hospital or CHCs that are ARV accredited sites.

The KZNDOH aims to make ART accessible to all by expanding and strengthening existing HIV and AIDS care and treatment service delivery. A number of CHCs have been accredited by the national and provincial health departments and will initiate ART. The PHC clinics conduct rapid HIV testing, CD4 testing and provide the first, second and third adherence counseling sessions, which is also done at CHC and hospital level, and then refer patients to accredited CHCs or hospitals for initiation. The KZNDOH has identified the Pietermaritzburg and Zululand districts as areas needing immediate support as they are poorly resourced with high HIV seroprevalence rates. The KZNDOH has requested that EGPAF support be extended to these districts. The districts have identified clinics where stable patients on treatment can be referred to continue ART management.

ACTIVITY 3: Pediatric Care and Treatment

EGPAF's goal is to ensure that 10 percent of all patients on treatment are children, which has not been achieved in the Zululand district. To strengthen pediatric HIV care and treatment, EGPAF will provide training on early infant diagnosis, pediatric HIV clinical staging and diagnosis and ART in children, in addition to provision of staff, strengthening the linkages between PMTCT and care and treatment.

The Edendale and Northdale pediatric HIV clinic has the largest cohort of pediatrics in the province on ART. The hospital down refers stable patients to the care of the PHC clinics to free up space for new pediatric patients.

EGPAF aims to:

1. Increase the rate of down referral of stable children on ART;
2. Increase the up referral of new eligible children for initiation of therapy; and
3. Improve linkages between PMTCT programs and care and treatment programs.

EGPAF will provide financial and technical support to eight PHC clinics in the catchment area of the Edendale and Northdale hospital in Pietermaritzburg, thus capacitating them to: (1) receive and manage transferred stable pediatric patients on ART from the pediatric HIV clinic; and (2) provide screening and preparation of eligible HIV-infected patients at three PHC facilities for up referral and initiation of ART at Edendale Hospital Pediatric HIV clinic. The same approach will be applied as we expand to other provinces, namely Free State, North West and Gauteng provinces.

ACTIVITY 4: Counseling and Testing (CT)

The focus of this activity will be on strengthening comprehensive HIV and AIDS care and treatment services using a family-centered approach to increase access to CT, by fast-tracking TB, STI, and family planning patients to CT; to integrate PMTCT with HIV and AIDS care and treatment; to improve referral of eligible pregnant mothers, partners, family members, and HIV-infected infants and children to treatment sites; to screen for opportunistic infections. With this focus, EGPAF will increase pediatric care and treatment, couple counseling, partner testing, and testing for siblings. For patients who test HIV-positive and are not yet eligible for ART, they will be retained through wellness clinics, support groups, patient tracking, etc. The overall goal is to expand coverage of HIV and AIDS care and treatment services to reach mothers, partners and children who would not otherwise have access to these services.

The increase in funding in FY 2008 will be used to expand EGPAF program activities viz. human capacity development, down referral process, pediatric care and treatment as well as counseling and testing

Activity Narrative: activities to the Free State, North West and Gauteng province. In addition, EGPAF will strengthen M&E systems at all levels of service delivery.

The activities contribute to the PEPFAR 2-7-10 goals.

Mechanism: UGM

USG Agency: U.S. Agency for International Development

Program Area: Treatment: Adult Treatment

Program Budget Code: 09

Planned Funds: \$2,077,736

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Human Capacity Development

Pact's primary focus in implementing the Umbrella Grant Management (UGM) Program is the development of human capacity in South African non-governmental organizations (NGOs) and community-based organizations (CBOs) to promote the establishment and strengthening of viable and sustainable civil society organizations. However, the COP guidance is very specific in terms of what can be included in Human Capacity Development (HCD) and for this reason Pact will only address the Leadership and Management development aspects of the UGM HCD activities.

Prior to the signing of grant agreements, Pact provides extensive assistance to partner organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact emphasizes to management staff during this process the importance of ensuring that program and finance units work as a team rather than in isolation. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of management to diversify their funding base and ensure sustainability.

Pact conducts organizational capacity assessments in collaboration with each partner. The core methodologies used in all of Pact's capacity building activities are as follows: assessment of sub-recipient organizational and technical capacity, development of institutional strengthening plans, delivering capacity building services, reassessment and refinement of institutional strengthening plans (ISP). Several individuals from partner organizations participate in the assessments in order to ensure that feedback is obtained from staff at all levels. This process develops the skills of senior management to objectively assess organizational strengths and weaknesses and utilize the results to develop a realistic strategy that will ensure that organizational objectives are achieved (including retention strategies for staff) and identified gaps are addressed. The strategy also details what interventions and support will be provided, by whom, when and how organizational change will be measured.

Pact also conducts workshops that primarily target senior management and board members. A resource mobilization course is offered annually to provide information to partner organizations on sources and strategies for diversifying their funding base. One day of the three day workshop is devoted to developing the skills of participants in writing proposals. Board training is also offered annually to address issues related to fiduciary, legal and ethical roles and responsibilities of board members. Although Pact's Monitoring and Evaluation (M&E) course targets M&E and Program staff, senior management members of partners organizations are encouraged to attend in order to ensure that they understand how to utilize data to make organizational decisions.

Pact, in working with partner organizations over the course of the past four years has recognized that management skills among the leadership of many of the civil society organizations (CSOs) need to be further developed. For this reason, utilizing FY 2008 and 2009 funding, Pact will identify short-term management courses in South Africa that will enhance leadership and management skills. Attendance to leadership courses will be made available to all partner organizations and their sub recipients but will primarily target the partners that have experienced great difficulty in transitioning to the increased funding levels or have new management staff and structures.

Alignment with National Strategic Plan (NSP) or other South African Government (SAG) policies or plans

In developing program descriptions with partners, Pact ensures that activities are aligned with district and provincial business plans, the NSP and/or other SAG policies or plans.

Gender

Pact ensures that gender related activities are clearly articulated in partner's program descriptions and implementation plans. Programmatic and technical assistance provided to partners addresses gender issues as part of the assessments and recommendations for strengthening technical and organizational capacity.

SUMMARY:

Currently, the USG PEPFAR Task Force supports institutional capacity building of indigenous organizations that implement PEPFAR programs through four competitively selected Umbrella Grants Mechanisms: Pact, the Academy for Educational Development (AED), Family Health International (FHI) and Right to Care (RTC). The main purposes of these new umbrella organizations are to: (1) facilitate further scale-up of HIV treatment services; and (2) to develop indigenous capability, thus creating a more sustainable program. The major emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs), and community-based organizations (CBOs).

Pact's primary goal is to build sustainable institutional capacity and increase the effectiveness of local partners to achieve expanded and high quality services. Primary target include Non-Governmental Organizations (NGOs), Private Voluntary Organizations (PVOs), and Faith-Based Organizations (FBOs). Pact's major emphasis is the enhancement of local sub-partner capacity through the development and implementation of documented organizational systems and procedures and human capacity development at management and operational levels.

BACKGROUND:

Activity Narrative: Since 2004, Pact has facilitated the efficient flow of grant funds during the rapid scale-up of the PEPFAR South Africa program. Pact provides PEPFAR funding and assistance to over 30 PEPFAR sub-partners in South Africa playing valuable roles in the fight against HIV and AIDS.

The sub-partners procure USG and SAG approved ARVs through supply chain vendors and oversee their distribution to government treatment facilities and accredited private providers. Partners also work closely with providers to develop drug tracking and monitoring systems to facilitate correct and accurate patient uptake, treatment management, and referral. Additional services in support of ARV drug distribution include lab testing, adherence support, patient counseling, telemedicine and quality assurance monitoring. Partners also equip government clinics and hospitals with the human resources including doctors, nurses, pharmacists and counselors. In addition, these programs provide specialized training addressing appropriate delivery of ART services and the provision of holistic HIV care. Pact has contributed to the 2-7-10 PEPFAR goals through support to 2 partners providing ARV drugs to over 1,000 HIV-infected, uninsured individuals in treatment sites throughout South Africa.

Partners work closely with and in the SAG provincial, municipal and district facilities to facilitate the seamless transfer of patients in and out of public and private networks of care. As a result, their programs continue to grow tremendously in both reach and complexity. This scale-up will require strong financial, monitoring and evaluation, and management systems to accommodate the growth in reach and maximize sustainability. With FY 2008 funding, Pact will continue to provide capacity building support through training and mentoring necessary to further develop and strengthen partner organizations. Pact will also facilitate the sharing of these systems between emerging and well-established partners and reinforce the use of data and reporting for decision making.

ACTIVITY 1: Grant Management

Pact conducts a participatory assessment of each partner organization and collaboratively develops an organizational capacity building strategy that details planned interventions. These assessment results also inform Pact of what type of assistance must be provided urgently in order to ensure that the organizations comply with USAID rules and regulations (with emphasis on financial and procurement management).

Prior to the signing of grant agreements, Pact provides extensive assistance to organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact assists partners in developing realistic cost share levels and emphasizes the sustainability aspect of this requirement. After the signing of the agreement, Pact works with each partner in developing a very detailed annual work plan that includes specific activities to be implemented, timelines, budgeted amounts, target beneficiaries and projected reach. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of partner organizations to diversify their funding base and ensure sustainability.

ACTIVITY 2: Human Capacity and NGO Development

Pact has developed a customized training series to orient new partners and their sub-partners. The training series includes basic and advanced grants and sub-grant management which addresses USAID rules and regulations, good governance and minimum financial management standards. Monitoring and evaluation courses cover basic principles of monitoring and evaluation and PEPFAR data requirements as well as internal data quality assurance. Refresher courses are also offered throughout program implementation. Pact also ensures that ongoing, intensive onsite training and mentoring is provided to sub-partners. On a quarterly basis, Pact assesses the level and type of assistance required by each organization and develops a site visit plan that ensures that the necessary support is delivered to each sub-partner. Pact organizes and supports technical consultation meetings for the sharing of best practices and lessons learned among PEPFAR and non-PEPFAR partners. As required, technical assistance from select regional and international providers is sourced to assist partners in improving their technical capacity.

ACTIVITY 3: Monitoring and Evaluation

Pact SA assists each grantee in developing a results framework that tracks success against both PEPFAR program and organizational indicators. Pact further assists sub-partners in the development of monitoring, evaluation and reporting (MER) plans and systems. Participation in a five day M&E training is mandatory for all partners prior to full implementation. Pact provides additional M&E assistance to all partners in the following areas: review and development of effective data collection, analysis and reporting tools; setting realistic and achievable targets; establishing and strengthening data quality management systems, conducting internal data quality audits and verifying and validating sub-partner data submissions.

ACTIVITY 4: Program and Financial Monitoring

Pact recognizes the importance of monitoring sub-partner program progress and early identification and resolution of implementation issues. Pact has frequent and regular contact with sub-partners and if technical/programmatic gaps or problems are identified, ensures that issues are promptly addressed and resolved.

In addition to monitoring program progress, Pact closely monitors sub-partner financial management and ensures that grants funds are utilized only for activities approved under PEPFAR funding. All partners submit monthly financial reports that detail and document expenditures. Pact finance staff visit partners every quarter to audit program expenses and accompanying documentation, compliance with USAID rules (including branding requirements) and cost share.

ACTIVITY 5: Technical Assistance

Activity Narrative: Pact will provide and manage direct technical assistance in prevention, care and support strategies for all sub-grantees. Pact technical staff will conduct assessments and provide consultation and training on the development and implementation of programs and services. In addition, sub-grantees will be supported with guidance and ongoing assistance on the design and delivery of partner HIV and AIDS curricula, training modules and publications. Pact will also work closely with partners to ensure the effective incorporation and strengthening of nutrition and food security, protection services, gender mainstreaming, and human capacity development in existing programs.

Program Budget Code: 09

Activity ID: 9446.23048.09

Planned Funds: \$16,269,216

Activity System ID: 23048

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Reproductive Health and HIV Research Unit (RHRU) will continue with all the activities described above in the new program year. In addition, RHRU will strengthen its network and collaboration with public sector facilities in the Johannesburg inner city through the development of a hospital based care and treatment (C&T) and antiretroviral therapy (ART) initiation and referral model at Selby Hospital. This hospital receives large numbers of "stepped down" patients from large local hospitals, many of whom have undiagnosed or untreated HIV. RHRU will conduct in-hospital case finding through bedside voluntary counseling and testing (VCT). All patients and visiting family members tested will receive support and referral to other services, both clinical and non clinical as appropriate. Eligible patients will receive adherence counseling and fast-track entry to treatment either on-site or through rapid referral to an initiation site. Prior to discharge, patients will be referred to a named ART site with a map and a medical summary indicating the urgency of accessing ART. Patients who are lost-to-follow up will be traced using home-based organizations.

It should be noted that all RHRU assisted initiation sites now have designated down referral linkages which are also receiving support from the program. Nurse initiation of ART at a primary health care (PHC) level will be scaled up in appropriate PHCs, in line with findings from a pilot of this approach in partnership with the Department of Health in Ekurhuleni. RHRU will ensure integration of new approaches and task shifting responsibilities into trainings of health care providers and support staff.

RHRU has developed a set of HIV Standards to guide PHCs on the accreditation, provision and integration of HIV care into their facilities and is working with the National Department of Health to roll these out to all provinces over the next two years (see also Care and Support section). RHRU has been requested by the Department of Health in all three provinces to expand its support to new sites. In 2009-2010, RHRU will expand to a minimum of three new sites, along with their associated down referral networks in Gauteng, North West province and KwaZulu-Natal (KZN).

RHRU will continue to place emphasis on the development and implementation of appropriate systems to streamline and improve care and treatment in all sites it supports. This includes the continuing development and implementation of the Cell Life pharmacy system, patient follow-up systems, case finding methods and facility patient file audits.

Lastly, RHRU will work closely with general practitioner (GP) networks in eThekweni, KZN to ensure up referral of indigent patients to public sector ART sites. RHRU will provide training of GP's and the development and implementation of referral systems.

RHRU has made contact with local prisons, with the view of improving HIV conditions of care and referral networks in the future. In addition, prisoners attending local ART clinics are being counseled regarding safe sex practices; condom access in prisons has been assessed (and appear to be broadly available), while knowledge of HIV prevention appears to be good amongst prisoners.

SUMMARY:

The Reproductive Health and HIV Research Unit's (RHRU) will provide ARV rollout support services with Department of Health (DOH) partners in over 30 facilities in 4 provinces. The emphasis areas are renovation, human capacity development, and wrap-around programs. Services target people living with HIV (PLHIV) and their families, including children, pregnant women, caregivers, doctors, nurses, traditional healers, and other healthcare workers.

BACKGROUND:

RHRU currently provides technical support to the South African Government (SAG) that includes the national ARV rollout. With PEPFAR funding since FY 2004, RHRU has provided regular onsite support, direct treatment, training and quality improvement to provincial departments of health (DOH) sites in Gauteng, North West, Limpopo and KwaZulu-Natal (KZN). RHRU will continue these activities as well as an inner city program in Johannesburg. Up and down treatment referral systems are being improved in all provinces. In addition, RHRU will continue the provision of counseling and testing (CT), palliative care, and prevention services. RHRU will develop service delivery models that can be replicated and expanded, and produces lessons learned to share with others.

An effective, sustainable ARV treatment (ART) program is founded on strong partnerships with local public sector treatment sites. The needs of each facility vary, and successful incorporation of ARV services at facilities requires a thorough facility-based situational analyses. RHRU's aim is to deliver decentralized HIV care or up and down referral between hospitals and related primary care clinics. ARV clients will be identified, screened, prepared and initiated on ARV treatment with access to future care at up or down referral sites. This system reduces congestion at primary treatment sites and improves patient access to care.

As of June 2007 RHRU-assisted sites were treating over 28,000 people with ART, and over 2,000 health providers had been trained in ART. RHRU will continue assistance in existing sites and expand services to several new sites. Pediatric support as well as ART for pregnant women will be expanded. In addition, RHRU will continue an HIV Maternal Health Outreach Service, and provide planning, training and technical assistance (TA) to two primary healthcare clinic (PHC) networks in Gauteng and KZN. This will enable these clinics to receive down-referred patients, and initiate new patients in selected sites. Nurse-based services will be promoted whenever feasible.

ACTIVITIES AND EXPECTED RESULTS:

Activity Narrative: ACTIVITY 1: Treatment Support

Specialist HIV treatment teams will support urban and rural ARV sites for adults (including pregnant women) and pediatrics. They will provide TA to new sites, and will develop and facilitate referral networks. Teams include a doctor, nurse, management specialist and counselor and will rotate among a cluster of treatment facilities providing onsite training and management support. In most cases, these teams will be anchored at each site by a permanent quality improvement nurse and a patient tracker to reduce the number of patients lost-to-follow-up and lost to initiation. The continuum of care will be emphasized including: prevention, healthy lifestyle, responsible behavior, nutrition advice, opportunistic infection prevention/treatment, palliative care, and ART. Materials previously developed to educate healthcare workers and HIV clients about HIV care will be utilized. Outreach teams will provide ARV and referral clinics with TA on up and down referral models. The teams will assist local clinic staff to improve practice, integrate and expand services (including TB, see TB section), and maximize referral for CT, palliative care and ART. As part of this, clinic renovations and provision of park homes, to maximize quality service delivery, may be necessary in selected sites. RHRU will also explore the possibility of linking with the private health sector to access and refer indigent populations into public sector care through low salaried family members on basic medical aid plans. Furthermore, senior staff will provide TA to national and provincial government in the development of policies and guidelines. ARV treatment and HIV care for perinatal women will provide outreach in maternal services. Family-based and gender-specific services for underserved groups such as men and high-risk women will also continue to be expanded.

ACTIVITY 2: Human Capacity Development

Insufficient skills in HIV care and program management have been a barrier to scale-up of site support. RHRU will develop an internal site-based training program to enhance staff skills. RHRU also offers a structured program for young doctors interested in pursuing a career in HIV. All RHRU staff involved in the PEPFAR program will become skilled HIV clinicians and program implementers, benefiting the program in the short-term, and improving the South African skill base in public health in the longer term.

RHRU will provide DOH staff in ARV sites with expert capacity and TA to develop models of effective service delivery using existing infrastructure and resources. It will emphasize clinical training and promotion of quality improvement techniques that can be applied by the DOH staff to develop local solutions to local problems. The teams will provide onsite support to clinical management, referral, patient flow and data management.

Through the PHC and decentralized care projects, RHRU will assist PHC sites to integrate HIV care into routine service delivery and will support sites with ARV accreditation if appropriate. Nurses will lead these services, with doctor support when necessary (task shifting). RHRU will conduct formal training courses including foundation courses in adult and pediatric ART for healthcare providers and traditional healers, and HIV management for nurses and doctors.

ACTIVITY 3: Pediatrics

RHRU and its partners will expand pediatric and services for young people to additional provinces based on a review of needs and requests from provincial authorities. The pediatric clinical support teams will rotate through DOH sites, capacitating and strengthening clinical skills, and supporting the development of referral networks. They will aid collaborations between healthcare facilities and local FBOs, NGOs and CBOs to provide holistic care for children on ART. RHRU will play a pivotal role in initiating pediatric ARV services at facilities where no pediatric services exist. Innovative methods of improving pediatric and adolescent adherence to ART will be investigated.

The National Adolescent Friendly Clinic Initiative (NAFCI) supports the public sector to provide quality services geared to youth, and are developing a referral system for HIV-infected adolescents to receive ongoing care and provision of ART. RHRU will support services at NAFCI sites in proximity to HIV treatment facilities in Soweto.

ACTIVITY 4: Referral Networks

RHRU will provide training, mentoring, management support and consultants across 4 provinces, to assist DOH ART sites with referral processes. This includes increasing referral capacity at secondary sites to channel and monitor stable patients at peripheral sites closer to patient's homes. This mechanism will reduce congestion at primary sites, enable clinics to see more patients, reduce patient transportation costs and increase adherence. RHRU will aid capacity development and training of local organizations, as well as develop linkages, referral systems, human resources, information, education and communication (IEC), needs assessments, policy and guidelines and strategic information.

ACTIVITY 5: Nutrition

RHRU will support several ART sites including TB hospitals in Johannesburg and Durban by employing dieticians to provide TA, coordinate supplies of nutritional supplements from the district health office to facilities for pediatric and TB/HIV-infected clients, provide nutrition information and counseling support and develop IEC materials. RHRU will provide TA to national and provincial DOH about appropriate nutrition interventions at different stages of disease in people infected with HIV and TB.

ACTIVITY 6: Monitoring and Evaluation

In FY 2008, RHRU will continue to undertake M&E activities to inform and develop quality HIV care.

These activities directly contribute to PEPFAR's goal of 2 million people on treatment. RHRU will support the South Africa 5 year strategy by expanding access to HIV services, improving ARV service delivery, and

Activity Narrative: increasing the demand for and acceptance of ART.

Prime Partner: National Department of Correctional Services, South Africa

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Treatment: Adult Treatment

Budget Code: HTXS

Program Budget Code: 09

Activity ID: 4526.23000.09

Planned Funds: \$0

Activity System ID: 23000

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. The National Department of Correctional Services is in its fourth year of funding with a very high carryover amount. All the proposed FY 2009 activities will be supported using carryover funds. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The National Department of Correctional Services has decided to enhance its activities under Treatment Services by conducting training of offenders in Correctional Centre-Based Care. This will increase access to care, support and treatment services for offenders and personnel living with HIV and AIDS and also reduce morbidity and mortality as well as other impacts of HIV and AIDS.

Training includes:

-Training of personnel as support group facilitators (including workplace programs) to assist in the establishment and maintenance of support groups for offenders who are either infected or affected by HIV and AIDS in Correctional Centers;

-Training of healthcare personnel in the Comprehensive Management of HIV and AIDS, including other related diseases (opportunistic infections);

-Training of professionals in spiritual counseling;

- Training of healthcare professionals as ARV Project Managers.

Training of offenders and personnel will be conducted continuously, due to the high turnover of nurses and movement of inmates. This applies for all trainings.

Training of offenders and personnel in support groups never occurred due to lengthy tender processes in order to procure training services.

Correctional Centre Based Care (CCBC): Nursing personnel will be trained on how to utilize offenders in rendering correctional centre-based care. Following training, the Regional HIV and AIDS Coordinator is responsible for the actual implementation, monitoring and evaluation of CCBC.

Correctional Services is using the Primary Health Care approach, in which a nurse deals with the inmates holistically. Subsequent to training, a portfolio of evidence must be completed and assessed by an external service provider. Implementation at the correctional center-level forms part of the day-to-day functions of the nurse depending on the patient's diagnosis.

Correctional Services will train 120 healthcare professionals as ARV Project Managers. All managers will be trained to be equipped with relevant skills to manage ARV wellness clinics effectively. This is to ensure a holistic approach in the management of the inmate.

SUMMARY:

FY 2008 PEPFAR funds will be used by the Department of Correctional Services (DCS) to establish and accredit six more antiretroviral (ARV) treatment sites which will facilitate the comprehensive management of HIV and AIDS. These six new sites, in addition to the nine already accredited, will ensure that there is one accredited ARV treatment site per province. The major emphasis area for this program will be human capacity development. The target population will include men and women offenders, people living with HIV (PLHIV) and their caregivers, and several most at-risk populations (e.g., men who have sex with men, injection drug users and tattooing with contaminated instruments).

BACKGROUND:

DCS currently has nine correctional centers that have been accredited as antiretroviral treatment (ART) sites (Grootvlei Correctional Center in the Free State/Northern Cape Region, Pietermaritzburg Correctional Centre and Qalabusha Correctional Centre in KwaZulu-Natal Region, Kimberley, Groenpunt and Kroonstad Correctional Centres in Free State/Northern Cape Region, St. Albans Correctional Centre in Eastern Cape Region and Johannesburg Correctional Centre in Gauteng Region). Other than the nine accredited ART centers, the DCS refers offenders to Department of Health public health facilities to access ART. This program will encourage the establishment and accreditation to improve access for incarcerated populations.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training of Personnel as ARV Project Managers

FY 2008 PEPFAR funds will be utilized to train DCS personnel as ART project managers. Training will include management of ART services, plan development, budget planning, information and other management systems. The trained personnel will ensure adequate facility and resource management of ART service, in accordance with South African ART guidelines. At this point in time staff members are just being trained to provide services to offenders.

ACTIVITY 2: Procurement of Information, Education and Communication Material

Activity Narrative: DCS will procure ART educational material that will be utilized during treatment literacy campaigns. The educational material will be distributed to all correctional centers and the utilization thereof will be monitored and recorded by the management area and correctional center coordinators. In addition to the distribution of pamphlets, there will be treatment literacy education to enhance the understanding of adherence to the offenders.

This activity contributes to the PEPFAR objective 2-7-10 by providing information on treatment to offenders, and thereby increasing capacity to effectively provide HIV care and treatment services. These activities are not at the site level but are more system strengthening activities and constitute what is considered 'indirect' support within the Correctional Services facilities. Therefore there are no direct targets for numbers of people reached.

Table 3.3.09: Activities by Funding Mechanism

Mechanism ID: 2787.09	Mechanism: N/A
Prime Partner: Absolute Return for Kids	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Treatment: Adult Treatment
Budget Code: HTXS	Program Budget Code: 09
Activity ID: 3283.22558.09	Planned Funds: \$4,576,503
Activity System ID: 22558	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In addition to above work in KwaZulu-Natal (KZN) province, Absolute Return for Kids (ARK) will be using PEPFAR funds to co-fund its treatment activities in the Eastern Cape (EC). ARK has been requested by the Eastern Cape HIV and AIDS, STI and TB (HAST) unit and the Nelson Mandela Metro to further scale up support in this province. ARK has been supporting the Eastern Cape since 2006 and is currently working in eleven sites delivering care and treatment in ten sites and PMTCT services in one site - Uitenhage provincial hospital.

FY 2009 funds will be used to support the scale-up of integrated treatment services in the EC. The scale-up in these sites will ensure that communities in this resource constrained province are reached at the primary level of care. Nelson Mandela Metro has one of the largest treatment gaps in the province with a large peri-urban population, thus treatment will reach patients in these high burden areas.

Modifications to FY 2008 Activities are as follows:

ACTIVITY 1: Support to KwaZulu-Natal Department of Health and Eastern Cape Department of Health

Referral systems will be strengthened to provide effective referral of patients between ARV, TB, prevention of mother-to-child (PMTCT) and pediatric antiretroviral (ARV) services to ensure that mothers and infants testing positive will be referred for early care and treatment, and people co-infected with HIV and TB receive early diagnosis and appropriate care. Tracing of lab results for HIV-infected pregnant women and HIV-exposed infants for early infant diagnosis will be conducted proactively to ensure that bottlenecks in the system are addressed with DOH partners and the National Health Laboratory Services (NHLS). TB infection control practices are standard at ARK-supported sites and include well-ventilated waiting areas and consulting rooms, safe sputum collection, and patient and staff education on safe cough etiquette and hygiene.

ACTIVITY 3: Family-Centered Treatment Services

ARK supports a family-centered approach that integrates care for the whole family to ensure access to all appropriate services. ARK's PMTCT program will link into the adult ART and pediatric care component. HIV-infected pregnant women will receive comprehensive HIV care including TB and other opportunistic infection (OI) screening and treatment, cotrimoxazole prophylaxis and rapid enrollment for those eligible for ART. All HIV-infected pregnant women and HIV-exposed infants who have a TB contact will receive TB screening, prophylaxis and treatment if appropriate. HIV-exposed infants will be monitored closely in the postnatal period by community-based patient advocates who will ensure referral at any signs of deterioration prior to immunization, and encourage and support testing at six weeks, and entry into care and treatment services for HIV-infected infants. ARK patient advocates encourage male partners, other family members, and exposed children to test and enter care services if needed. Patient advocates provide TB prevention education and engage family members in assisting with treatment adherence measures as part of creating a supportive environment that encourages full disclosure and minimizes stigma within the family.

ACTIVITY 4: Pediatrics

Pediatric ART services will focus on improved child survival activities with specific reference to improved diagnosis and treatment of TB, recommended Vitamin A supplementation, routine immunization and the integrated management of childhood diseases. All HIV-exposed infants will receive the basic preventative care package including infant feeding and nutrition, cotrimoxazole prophylaxis, early testing, and TB screening, prophylaxis and treatment.

ACTIVITY 5: Human Capacity Development

ARK provides training and mentoring of ARK and department of health (DOH) clinical staff (doctors, nurses, pharmacists and pharmacy assistants) in KwaZulu-Natal and the Eastern Cape. All clinical staff receive pre- or in-service three-day training in Adult HIV Management, which is accredited by the Health Professions Council of South Africa for the provision of continuous professional development. The course focuses on HIV infection and disease progression, staging, opportunistic infections including TB/HIV co-infection focusing on TB screening, diagnosis and treatment, antiretroviral therapy, managing side effects, adverse events, clinical monitoring, and adherence support.

In-service training is also provided on pediatric care and treatment and PMTCT for three days, covering early diagnosis and treatment, TB prevention, screening and treatment, infant feeding and nutrition, immunization, cotrimoxazole prophylaxis, adverse events, dosing and adherence. Training is provided both pre- and in-service as well as through on-site mentoring.

ACTIVITY 6: Reporting and Quality Assurance/Improvement

Scale-up of clinical services includes increasing capacity for data management and reporting. All sites will have additional data capturing support, and additional monitoring and evaluation management support at the provincial office. All sites will have internet connectivity to facilitate information management activities.

New activity for FY 2009:

ACTIVITY 7: Construction and Renovation

In those clinics where space is a bottleneck to service delivery, ARK will assist the facility with the provision of space in the form of temporary infrastructure, or renovating existing rooms to ensure more efficient patient flow.

Activity Narrative: SUMMARY:

ARK's focus is to provide ART and accompanying support to HIV-infected caregivers of children, their spouses, and children. Primary emphasis areas are renovation, human capacity development, and local organization capacity building. Target populations include OVC, people living with HIV (PLHIV), HIV-infected pregnant women, HIV-affected families, and caregivers.

BACKGROUND:

ARK is a charity organization whose mission is to facilitate and support delivery of accessible and sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and AIDS. In partnership with the KwaZulu-Natal Department of Health (KZNDH), ARK, as the implementing partner, has established an antiretroviral treatment program in government primary health facilities and hospitals. Specifically, ARK works with the KZNDH to identify sites and areas for capacity building, including human resources, modest infrastructure support, and organizational capacity development. PEPFAR funding has enabled ARK to successfully enroll over 15,000 patients in ART in KZN. FY 2008 funding will enable ARK to provide ARV treatment to existing and new patients, strengthen the infrastructure of the ARV delivery system in targeted sites, provide human resources, and build local institutional capacity to deliver ARV services. ARK provides treatment in accordance with national treatment guidelines.

ACTIVITIES & EXPECTED RESULTS:

ARK's primary objective is to keep mothers alive to continue caring for their children. The primary caregiver's continued survival and potential ability to earn a living while receiving ARV treatment will have a substantial impact on the extended family.

ACTIVITY 1: Support to KwaZulu-Natal Department of Health

ARK works with the KZNDH to develop the necessary processes and systems to manage the ARV program, to ensure that the model created is scaleable, sustainable and replicable elsewhere. Capacity-building is site specific. Upon identification of a site, an analysis of the needs of each site will be done with respect to staffing (doctors, nurses, pharmacists and pharmacy assistants), clinical equipment, management systems, patient advocacy and temporary structures. The most pressing requirements are met in order to speed up the ability of patients to receive treatment. Where necessary ARK provides support in the ARV site and pharmacy accreditation process.

ARK's ARV program focuses on a network of clinics operating within a district, in order to create a sustainable and efficient system that supports the continuum of care and up and down referral. While patients are being assessed for treatment, a community health worker (CHW) from ARK's palliative care program is allocated to the patient. This CHW will conduct a pre-treatment home visit and will provide ongoing support to the patient and his/her family. Should a patient be non-adherent or lost-to-follow-up, the CHW will investigate the reasons for this, acting as the link between the patient and the clinic. ARK facilitates the integration process for ART, TB, other palliative care, and maternal HIV services.

ACTIVITY 2: Human Resources

ARK conducts a thorough needs analysis of human resource capacity prior to initiating support to the treatment program at each site. Once it has been determined that KZNDH has budgeted for the identified posts needed within a period of three years, ARK recruits all the necessary medical staff required for the successful rollout of ART. The staff recruited vary from site to site but include doctors, nurses, pharmacists and pharmacy assistants. In addition ARK employs data captureurs for monitoring and evaluation of the program.

ACTIVITY 3: Family-Centered Treatment Services

Although ARK's primary goal is to provide ARV service support to primary caregivers with children, ARK assists in the treatment of all HIV-infected adults and children requiring ART at ARK sites in KZN. All patients considered for ART need to meet both medical and psychosocial criteria before starting therapy. The psychosocial criteria are designed to ensure that the patient is prepared and ready to adhere to ART. All patients being assessed undergo a treatment literacy program and are educated about positive living. Patients are encouraged to motivate their partners/spouses to get tested and, if necessary, enter the treatment program. Although ARK's treatment target population is predominantly mothers and children, increased attention is being given to encourage and increase male partner (and men in general) participation. ARK-employed doctors and nurses are responsible for treatment management, patient consultations and the treatment of opportunistic and sexually transmitted infections. Pharmacists are responsible for the dispensing of medication.

ACTIVITY 4: Pediatrics

HIV-infected parents and caregivers will be encouraged and educated by the medical staff to get their children tested and to enter the treatment program where indicated. Staff in the local midwifery and obstetric units will be trained to refer HIV-infected mothers and their babies to the ARK ART program, ensuring access to full ART services when indicated. All at-risk infected infants with HIV diagnosis confirmed by PCR will be monitored, and have immediate access to ARVs and related services including the preventive package of care. Children identified through ARK's OVC program (also PEPFAR-funded) will be referred to the clinic by community care workers and social workers.

ACTIVITY 5: Human Capacity Development

Activity Narrative: Key staff are provided with a two week orientation training which covers all aspects of ARK's ARV program areas including employee policies and procedures, onsite mentorship from experienced ARK staff, and an introduction to key performance areas. The areas covered in training include: ARV treatment guidelines for adults and children, adherence, opportunistic and sexually transmitted infections as well as the value of community access, adherence and refresher on prevention, including prevention for HIV-infected people. Staff are invited and encouraged to attend formal training offered by external providers including other PEPFAR partners such as the Foundation for Professional Development (FPD).

ACTIVITY 6: Reporting and Quality Assurance/Improvement

ARK provides computers and employs data capturers at all sites. Data is captured from patient folders and transferred to ARK's data center, allowing for ongoing evaluation and outcome analysis. Adherence rates, death rates and loss-to-follow-up are closely monitored. Quarterly updates are provided to the KZNDOH and information is used within the clinics to strengthen service delivery. To ensure high standards and quality of care in line with the national guidelines, all ARK staff are provided onsite, on-the-job training. This is followed up with regular onsite mentorship and site evaluation by ARK's national executive and provincial management teams. Informal training sessions are conducted quarterly by national staff. Staff are also encouraged to attend formal external training courses offered by FPD.

These activities contribute to PEPFAR's 2-7-10 goals by increasing the number of South Africans on treatment.

Development

Program Area: Treatment: Adult Treatment

Program Budget Code: 09

Planned Funds: \$1,165,086

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The most important task for FY 2009 is to develop systems of task shifting. If the Department of Health (DOH) allows the Africa Centre (AC) to start nurse lead antiretroviral therapy (ART) initiations, this will be started with FY 2009 funding. In addition, further task shifting from nurses to lay counselors will be a priority.

A family approach will be established to make sure that families will be appropriately counseled, tested and treated. In FY 2007, AC started family clinics in the two biggest sites and this year will try to make this approach available to other clinics. The wellness clinic will increase cervical screening and will make family planning services more accessible. Provision of psychosocial support where within the clinics and support groups will be available.

The incorporation of provider-initiated testing and counseling (PITC) for all patients attending clinics will improve the numbers of people knowing their status and for those accessing ART, if eligible. A wellness program will be available for patients not yet eligible for treatment. Pre-ART registers have been developed in FY 2007 COP and the wellness clinic will help to identify changes in clinical staging.

Africa Centre will develop food and nutrition policies and guidelines which are adapted to the local, rural community. The dietician in the program will train nurses, counselors and Home-based Caregivers in nutritional assessment and counseling. Anthropometric tools will be bought with PEPFAR funding. For long-term food security support groups will be getting guidance how to establish community gardens. Micronutrient supplementation will be made available following DOH and WHO guidance. Women are encouraged to exclusively breastfeed. However, if the mother chooses replacement feeding, formula will be made available according to the AFASS criteria. Food parcels and porridge will be made available for severely malnourished patients.

Counselors and nurses who work in the ART program receive in-service training in ART care based on DOH curriculum and comprised of four sessions of three hours each, covering ART eligibility, ART, side effects, Pregnancy HIV and ART, TB HIV and ART, adherence follow up of patients, changing regimens and practical sessions like taking routine monitoring bloods. Training primarily takes place on sites at the district clinics by Africa Centre training officers in collaboration with DOH trainers. In addition, individual mentoring of nurses is also done.

All newly-employed healthcare workers in the ART program will receive pre-employment training in all aspects of the full ART, PMTCT and TB package according to government guidelines and standards. This training lasts for two weeks and covers HIV and AIDS, TB, palliative care, drug toxicities, pediatric HIV, pregnancy HIV, adherence, HIV pathophysiology, HIV resistance, and Post-Exposure Prophylaxis (PEP).

Nurses and counselors will also attend educational workshops, as part of long-term training, conducted every month with the aim of improving the quality of care offered to the HIV-infected clients. The scope comprised of the induction training above and other training topics such as syndromic management of STIs, PAP smears and pain management. The training will also be supported with a training-of-trainers approach, will enhance the sustenance of training activities.

AC also offers certificate courses such as supervision, assertiveness, diversity management, facilitation, problem solving and decision making skills, of which all ART staff will be given an opportunity to attend. Some of the staff members are doing post-graduate courses and other courses related to the program where a portion of their tuition is contributed by the employer.

Human resource information systems in the form of HIV and AIDS mini-libraries will be maintained within the clinics to provide information and education to healthcare staff and patients in the clinics. In addition, the training will also be supported with training-of-trainers approach. This approach will enhance the sustenance of training activities.

Poverty, unemployment and unpleasant socioeconomic status are prevalent to people living with HIV (PLHIV) in the area. AC has a Community Development Department, which has, over the past several years, successfully developed income generating programs, such as beadwork, woodwork, sewing, food gardens, poultry farming and sleep mats, in the rural area of Hlabisa Sub-district,

Income generating activities have been started in FY 2008 and will continue in FY 2009. PEPFAR funding will be used to strengthen the community development department through additional staff. These staff members will then develop business plans for the PLHIV groups and supervise their activities.

SUMMARY:

The Africa Centre Hlabisa antiretroviral treatment (ACHART) program aims to deliver safe, efficient, equitable and sustainable ART to all who need it in the Hlabisa district through the district health department, rural KwaZulu-Natal. The target population for the treatment program is people living with HIV (PLHIV), HIV-infected pregnant women and HIV-infected infants and children. The emphasis area of this program is human capacity development, renovation, and local organization capacity building.

BACKGROUND:

The ACHART Program is a partnership between the KwaZulu-Natal (KZN) Department of Health (DOH) and the Africa Centre, a population research department of the University of KwaZulu-Natal. The DOH program is based in Hlabisa sub-district, and provides health care to 220,000 people at a government hospital and 14 fixed peripheral clinics. The ACHART Program is embedded in the DOH antiretroviral therapy rollout where the Africa Centre and KZNDH work to complement each other's abilities and resources in providing ART. The Africa Centre has expertise in infectious diseases and management that are not available at the

Activity Narrative: district DOH. In addition to clinical staff and infrastructure, the district DOH provides the necessary drugs and laboratory testing for effective rollout.

With FY 2008 funds the Africa Centre will continue to support the provision of ART and expand its support for the KZNDOH. Increased attention will be given to address gender issues (especially reaching men) and to promote the ART services among men and children.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support to South African Government (SAG)

The ART program is jointly run by the KZNDOH and Africa Centre. The Africa Centre contributes human resources and co-finances facility needs and supplies. The Africa Centre supports the KZNDOH with strategic planning and the implementation of the SAG National Strategic Plan 2007-2011 for HIV & AIDS and STI. This includes the establishment of an up and down referral system that ensures that HIV-infected people are treated at the optimal level of care at each stage of the disease. The Africa Centre support further extends to operating the supply chain of drugs from the central pharmacy to the peripheral clinics and the transport of blood samples from the peripheral clinics to the central laboratories. In addition to this, Africa Centre also supports the monitoring and evaluation of the ART program and the development of management and treatment algorithms.

With FY 2008 funding, additional support will include park-homes (inexpensive portable prefab long-lasting structures) which will be set up in peripheral clinics where patient load exceeds facility capacity. Operational assistance will be in the form of funding to support training of staff, transport, logistics, IT support and administrative assistance to smaller peripheral clinics.

ACTIVITY 2: ARV Treatment

The Africa Centre will continue to support the expansion of the ART program at Hlabisa hospital and the 14 KZNDOH clinics. ARV treatment is following the DOH guidelines. Patients with stage IV disease or CD4 count <200 are eligible for treatment. After the necessary baseline investigations (blood tests, screening for TB) have been performed, the patients are initiated for treatment in 14 government clinics and the hospital.

Through CT, TB and the mobile ART and palliative care programs, the Africa Centre will work to increase uptake of ART among targeted communities. Africa Centre's goal is to test babies at 6 weeks after delivery and get them on treatment if required. Mobile teams of nurses and counselors will provide ART in the clinics, and community mobilization activities will be used to enhance community awareness and uptake of services. The Africa Centre will investigate the best possible way to roll out ART in the mobile clinics, which are serving the population. The mobile team will twin with the DOH mobile clinic team, and visit the service points together.

In FY 2008, additional mobile teams will visit clinics bi-weekly to provide onsite training, assess complicated patients, and do quality assurance checks. This process will institute a continuous process of quality improvement. Data capturers, supervised by the M&E officer, will move with these teams to capture data from the clinics. A doctor will join the mobile team to initiate patients on ART at smaller clinics and assist with treatment of side-effects and adverse events. All patients will be trained in prevention of HIV transmission and the importance of treatment adherence. Prophylaxis against common opportunistic infections includes cotrimoxazole prophylaxis in all patients with CD4 count under 200. Data from these activities will be monitored to ensure that clients receive comprehensive services and that all eligible individuals are put on prophylaxis at the earliest opportunity.

Two mobile teams of the DOH are tracking TB patients who don't pick up their treatment. Africa Centre will integrate the tracking of TB patients by forming two more teams. With that support all four teams are then able to track TB and HIV patients, thus preventing duplication of tracking and expanding the coverage of both groups of patients.

ACTIVITY 3: Human Capacity Development

KZNDOH and Africa Centre counselors and nurses who work on the program will receive training on HIV and ART. The baseline course is based on the KZNDOH curriculum and comprises four sessions of three hours each, covering basics of HIV and ART; follow-up of patients, assimilation of a follow-up, and practical work with a patient (including blood taking for CD4 counts and viral loads). Counselors, nurses and physicians will receive additional training, emphasizing side-effects and second-line treatment to treat patients with therapeutic failure of first-line therapy. The program will finance a diploma course for a pharmacy assistant to assist with a satellite dispensing service at the clinics to support the KZNDOH pharmacist at Hlabisa Hospital. This trainee was recruited locally in June 2007. Doctors and nurses working on the ART program will attend the AIDS Certification Course, run by another PEPFAR partner, the Foundation for Professional Development. Due to the shortage of staff in the clinics and due to the increasing number of patients and increasing workload, additional staffing in clinics and hospital will be provided.

ACTIVITY 4: Human Resources

Africa Centre staff provides clinical care alongside KZNDOH staff in the clinics in order to support the ongoing ART program and to facilitate skills transfer to build sustainability. The sustainability of the program largely depends on availability of skilled staff, which is difficult to attract to this rural area. The Africa Centre is continuously working on recruiting physicians and pharmacists. In FY 2008, Africa Centre staff in the ART program will be increased including nurses, HIV trainers, HIV counselors, doctors, social workers, 1 pharmacist, 1 dietician, M&E officers and data capturers. All staff are mentored and supervised by Africa Centre staff.

Activity Narrative: ACTIVITY 5: Surveillance Systems

The Africa Centre will establish clinic-based ART drug resistance surveillance. In order to choose the best second-line therapy, information about the drug resistance in the case of first-line therapy is needed. Routine ARV drug resistance testing is not part of the South African treatment plan. Including drug resistance testing in the ACHART program will directly benefit the patients. The findings may benefit other sites in resource-limited settings. If the Africa Centre finds that most treatment failures are due to resistance against stavudine (and not lamivudine or nevirapine), the overall quality of choice of second-line drugs may be improved without genetic drug resistance testing. PEPFAR funding will finance laboratory equipment and transport costs to set up ART drug resistance surveillance.

ACTIVITY 6: Quality Improvement

In June 2007 a team for Quality Management was introduced in all the clinics. This group provides leadership and support centrally and to the clinics. In FY 2008 this group will increase capacity to identify, develop and implement quality improvement interventions internal to the program as well as for identified problems at the sites being supported.

ACTIVITY 7: Systems Development

With increased funding the Monitoring Evaluation and Reporting systems will be further strengthened to support the internal and external data needs of the program. The existing databases will be reviewed and, if appropriate, adapted, and staff will be trained. Additional staff will be needed to cope with the increased number of data to be collected and used for improvement of the program.

ACTIVITY 8: HIV Awareness

Health education has to be prioritized in the sub-district. The knowledge about ART and other health issues must be improved. Initial analyses of Africa Centre data shows that a huge number of people don't know about ART and a large number of those who know about ART don't know where to get treatment. In July 2007 Africa Centre approached the Amakhosi (the highest traditional leaders in the area after the king) to involve them in the response to HIV. In this area traditional leaders are playing a major role. Billboards at different places will be placed with messages from the Amakhosi concerning testing and treatment. The improvement of this knowledge regarding testing and treatment will contribute to PEPFAR'S goals to increase the community access to ART services.

Africa Centre contributes to PEPFAR's 2-7-10 goals for South Africa by increasing community access to ART services by facilitating scale up of the SA Government efforts.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

AED-UGM will continue providing technical assistance (TA) and capacity building to new and ongoing sub-partner organizations using the same strategy as mentioned above.

AED-UGM has one sub-partner, Population Council, working in this program area. Given the fact that Population Council is an organization that has a strong organizational structure and is technically sound, AED-UGM views them as a partner who could potentially assist other sub-partners in the following ways: 1) sharing Strategic Planning and Organizational Management and Human Resources tools and expertise; 2) exposing them to ideas for project development/design; 3) sharing of administrative, financial and human resources updates; 4) helping them to explore ways to incorporate men into HIV and AIDS programming; 5) helping to improve scientific writing skills; and 6) sharing experiences in networking and advocacy.

With FY 2009 funding, AED-UGM will organize and conduct leadership seminars, dissemination workshops, forge twinning relationships and convene trainings where Population Council's expertise will be used to strengthen sub-partner organizations and expose them to best practices in HIV and AIDS service delivery, specifically in the areas of treatment and the continuum of care. Examples of planned activities in year two in this area are: 1) Leadership Seminar on Community Mobilization; 2) Leadership Seminar on HIV and AIDS operations research findings and thematic topics; 3) convening of dissemination workshop to share research findings with sub-partners; and 4) exchange visits/twinning relationship between Population Council and GRIP on Rape Crisis Interventions, exploring opportunities for increasing access and adherence to antiretroviral therapy (ART).

Although no domain scores were assigned when conducting the Population Council's capacity building (CB) assessment in year one, their staff emphasized the benefit and usefulness of attending the AED-UGM's Monitoring and Evaluation (M&E) workshops and would like to participate in future training of this nature. Additional areas where technical support would be helpful include: 1) index training for improving their filing systems, 2) accessing long-term support to address staff educational needs, and 3) exposure to research and thematic topics on HIV and AIDS-related issues. To date, the Population Council has received support from the Educational Training Fund (ETF) for participation in two courses: one on the Essentials of Human Resources and one on USAID Rules and Regulations; both offered by external training providers. It is anticipated that Population Council will continue to benefit from staff professional development courses sponsored by AED-UGM.

AED-UGM is a capacity building program which ensures that sub-partner organizations collaborate and coordinate with SAG. AED-UGM seeks to ensure that all sub-partner service delivery strategies are aligned with the four priority areas in the NSP, namely: (i) Prevention; (ii) Treatment, Care and Support; (iii) Research, Monitoring and Surveillance; and (iv) Human Rights and Access to Justice.

AED-UGM is committed to gender equality and has established systems, procedures and monitoring and evaluation instruments to ensure sub-partners are sensitive to this issue. Since gender equality and gender equity are concerned with ensuring that the needs of women, men, girls and boys are addressed in all phases of program planning, AED-UGM monitors the integration of gender concerns in situation analyses, the formulation of objectives, program activities and MER plans. Thus, AED-UGM goes beyond the mere counting of the number of females and males attending training courses by actively promoting gender equality and gender equity, and providing support to sub-partners to enable them to address this issue effectively. As part of this process, sub-partners are required to report on gender-related activities in their quarterly monitoring reports. Gender equality consultants will also be engaged to strengthen the expertise of AED-UGM in this area.

Sub-partner organizations sign MOUs with provincial and district departments. Details concerning the status of MOUs in different provinces will be provided in sub-partner COPs. AED-UGM ensures that sub-partners report progress on SAG collaboration efforts and MOU status on a quarterly basis.

SUMMARY: As an Umbrella Grants Management (UGM) partner, Academy for Education Development (AED) supports institutional capacity building, technical assistance and grants administration for indigenous organizations that implement PEPFAR programs. These partners and sub-partners consist of indigenous NGOs, FBOs, and CBOs that were selected through the Inter-Agency PEPFAR Annual Program Statement (APS) and have met the criteria for full and open competition. The main functions of the UGM program are: 1) to facilitate further scale-up of HIV and AIDS care services and (2) to develop indigenous capability, thus creating a more sustainable program. The emphasis area is Local Organization Capacity Development and the primary target populations are indigenous organizations. BACKGROUND: AED has extensive experience managing grant's programs on behalf of USAID with PEPFAR funds. Prior to award of the UGM under the South Africa APS, AED was already managing grant programs funded with PEPFAR dollars in Ghana and Honduras, and providing TA and capacity building to PEPFAR partners on palliative care and OVC work in Mozambique and Kenya. In addition, AED has been sourced as USAID's exclusive partner for capacity building to the 23 NGOs funded under the PEPFAR Round One New Partners Initiative. As such, AED is well experienced in providing TA and capacity building on the broad array of technical areas related to PEPFAR programs, monitoring and evaluation, organizational development and finance management. In addition, AED has also been a key PEPFAR implementing partner in South Africa and is thoroughly familiar with working on HIV and AIDS program within that context. As a UGM partner, AED will not directly implement program activities, but rather act as a grants administrator, technical assistance provider, and mentor for sub-recipients, who in turn carry out the assistance programs. AED closely collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grant mechanism. Although some of the partners work closely with various SAG Departments, AED's primary interface with the SAG is through the Senior Management Team (SMT), which includes key staff from USAID, National Departments of Health and Social Development, and representatives from the provincial departments. Under AED, between 6 and 11 indigenous partners will be supported via sub-grants and technical assistance. Treatment programs include patient uptake, counseling and testing, doctor

Activity Narrative: consultations, laboratory testing, treatment management, adherence support, patient counseling, telemedicine, and quality assurance monitoring. The treatment partners work in both the public and private sector. Partners equip government clinics and hospitals with human resources (doctors, nurses, pharmacists, and counselors), management systems and community mobilization and outreach. Partners assist with infrastructure renovations when required. These programs also offer specialized training to improve the clinical, management, and leadership of health professionals to deliver ART services. Treatment partners engage private doctors, traditional healers, church groups, and people living with HIV to extend and enhance HIV care and treatment. **ACTIVITIES AND EXPECTED RESULTS:** Separate COP entries describe the ARV services activities implemented by each partner managed through this process. Institutional capacity building of local organizations is a key feature of the umbrella grant mechanism and is designed to promote the sustainability of HIV and AIDS treatment programs. **Activity 1. Grants Management:** AED will award and administer grants to partners selected through the PEPFAR APS competitive process to implement HIV and AIDS activities, including treatment activities. This involves an array of related activities including award and administration of grants, monitoring of grant progress, meeting reporting requirements, financial oversight, ensuring compliance with USG regulations and grant closeout. AED will monitor ARV services program implementation and adherence to financial regulations. This involves provision of extensive technical assistance to partners on project development and implementation, financial management, monitoring and evaluation, and reporting. **ACTIVITY 2: Capacity Building:** AED will support institutional capacity building of indigenous organizations. (Capacity building activities are defined as activities that strengthen the skills of indigenous organizations to implement HIV and AIDS programs efficiently, with diminishing reliance on internationally-based technical assistance and support.) AED will support activities to improve the financial management, program management, quality assurance, strategic information (M&E) and reporting, and leadership and coordination of partner organizations implementing treatment activities. **Activity 2. Monitoring and Evaluation and Reporting:** AED will provide support to partners providing ARV services in monitoring and evaluation, in order to strengthen measurement of the implementation and impact of program activities. M&E support for ARV services partners include: measurement of program progress; provision of feedback for accountability and quality; and implementation of information management systems. In addition, AED will provide supportive supervision to provide guidance, monitoring, mentoring and oversight through site visits, technical assistance, and performance evaluation. The management of service delivery programs under this project will contribute to the PEPFAR goals of providing treatment to 2 million HIV-infected people; preventing 7 million HIV infections; and providing care to 10 million people, including orphans and vulnerable children.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Training will be provided to health care providers from various stakeholders (department of health (DOH), Municipalities, community-based organizations (CBOs)), nurses, doctors, pharmacists /pharmacist assistants, dieticians where available and data capturers. The outcomes of training are improved service delivery, role clarification and responsibility, strengthened partnership with stakeholders, increased enrolment of males, quality assurance, integration of services, as well as better coordination and monitoring of the HIV and AIDS programs, improved compliance of treatment and reduced HIV and AIDS prevalence. Quality assurance will be provided through continuous oversight and follow-up by the AIDSRelief agency members, field trip visits, annual antiretroviral therapy (ART) conference, and on-site support to clinical staff implementing the program.

Family-centered testing and care approach will be used where possible. Couple counseling and testing (CT) at CT and prevention of mother-to-child transmission (PMTCT) sites will be used to promote testing of men and to build their support for their female partners. It is also hoped that, through a community-based testing, increased outreach will be made to women and children in villages. Where possible, training and employment of women as health care workers to increase the confidentiality and comfort of women and girls seeking treatment will be emphasized.

Given that AIDSRelief sites operate in rural and remote areas, where technical capacity and infrastructure is lacking, heavy emphasis is put on provision of laboratory services through a quality service provider. To overcome this challenge, a Johannesburg-based Toga Laboratories, another PEPFAR-funded partner, has been selected as the laboratory service provider for laboratory tests to be conducted under the program. The company has been established by Prof. Des Martin and Dr. John Sims, long-time South African virology experts. Toga Laboratories has an ongoing quality assurance (QA) program to monitor and evaluate, objectively and systematically, the reliability of the laboratory data. There is an in-house laboratory quality unit which coordinates external quality assurance. For every test performed in the laboratory, there is a quality control plan stated in standard operating procedures (SOP). Internal quality controls (IQC) are performed daily on all instruments as well as for manual tests and recorded. External quality assessments include the UK National External Quality Assessment Scheme (UKNEQAS) as well as National Health Laboratory Services (NHLS) assessment programs, among others.

SUMMARY:Activities are implemented to support provision of quality ARV services under the comprehensive antiretroviral treatment (ART) program carried out by Catholic Relief Services (CRS) in 25 sites in 8 provinces in South Africa. Major emphasis will be on human capacity development and local organization capacity building. The target population includes people affected by HIV and AIDS as well as higher risk populations such as migrant workers and refugees.BACKGROUND: AIDSRelief (the Consortium led by Catholic Relief Services) has received Track 1 funding since FY 2004 to rapidly scale up antiretroviral therapy (ART) in 9 countries, including South Africa. Since FY 2005, South Africa in-country funding was received to supplement central funding. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and Institute for Youth Development South Africa (IYD-SA). ACTIVITIES AND EXPECTED RESULTS:With funding provided in FY 2008 AIDSRelief will continue implementing the activities in support of the South African Government (SAG) national ARV rollout. In the interest of maximizing available funds the focus will be on strengthening the existing sites providing services rather than on assessing and activating new sites. Utilizing technical assistance from AIDSRelief staff members and South African experts, ongoing support and guidance will be provided to sites in form of appropriate refresher medical training courses, patient tracking and reporting, monitoring and evaluation mechanisms and other necessary support. ARV services will be provided through the 25 sites to ARV patients through clinic-based and home-based activities to optimize quality of life for HIV-infected clients and their families. All the relevant healthcare providers and administrative support staff at the sites will be trained to implement the ART program, using government-approved training curricula. Staff who have already received initial training will undergo refresher courses (either in-house or external), coupled with exchange of training courses and materials between sites with active support from the local training provider, Kimera training center. Treatment adherence training is provided to all patients who are enrolled on the ART program.In most sites home-based care networks will follow up and support patients. This follow-up is conducted through direct visits to patients through the extensive home-based care outreach at the SACBC sites, while IYD-SA sites follow up through means of telephonic contact in most cases. In case the patient cannot be reached, a "treatment buddy" is contacted to inquire the whereabouts of the patients who did not come back for the monthly drug package. Inevitably, some patients become lost-to-follow-up in spite of all the efforts to locate them, due to migrating populations and illegal immigrants served by the program. This number currently stands at less than 4% of the patients ever enrolled on the program.Each site ensures that HIV-infected patients are screened for tuberculosis (TB) prior to placing them on antiretroviral treatment, and are referred to TB treatment if they tested positive. Screening and testing for TB is conducted in a number of different ways, and these testing methods are specific to each site. While screening is conducted by a medical professional at each of the sites, in most cases patients are referred to the nearby SAG medical facility for TB testing and are only enrolled in antiretroviral treatment once they have completed two months of TB treatment, or have been found not to have active TB.PEPFAR funding will also be used to support laboratory services, which are outsourced to a private provider, Toga Laboratories (a new PEPFAR partner since FY 2007). A courier service collects blood that is drawn at each site, and delivers these samples to the laboratories. Results are e-mailed or faxed back to the site within 48 hours of the laboratory receiving the blood samples. The program is designed to improve each site's capacity to implement the national ART program in the long-term, and to strengthen clinical, administrative, financial and strategic information systems. Sites will be assisted in developing appropriate policies and protocols and in setting up sound financial and strategic information systems. Each site will also develop a unique community mobilization plan for the ART program and implement it in collaboration with relevant community organizations and leaders. Many of the sites are already involved in HIV and AIDS community mobilization activities and these will be linked to ART services. These lessons learned will be of value to other partners working in the non-governmental organization (NGO) sector.All activities will continue to be implemented in close collaboration with the Department of Health HIV and AIDS Unit and the respective

Activity Narrative: provincial authorities to ensure coordination and information sharing, and this will directly contribute to the success of the SAG's own rollout and the goals of PEPFAR. These activities are also aimed at successful integration of AIDSRelief activities with those implemented by the South African Government, thus ensuring long-term sustainability. All sites operate under the terms of a Memorandum of Understanding (MOU) with the provincial Department of Health in which they operate, observing the national and provincial treatment protocols. There is a concerted effort at each site to ensure sustainability by having the SAG provide antiretroviral drugs, or by down referring stable patients into the SAG's primary healthcare clinics after providing training for the SAG clinic staff. St. Mary's Hospital, which accounts for more than a third of patient numbers, has already been accredited as a SAG rollout site. Sinosiso receives drugs from the National Department of Health due to its status as a down referral clinic for Stanger Hospital, and at a further two sites, Centocow and Bethal, all patients already receive drugs via the SAG rollout. Monthly statistics are shared with the South African National Department of Health, as well as with relevant provincial health departments in provinces where AIDSRelief implements the program. There is a concerted effort to include men and children in the program, and all sites have specific plans to increase enrolment, including couple counseling and using a family-based approach. Although there is no specific PMTCT program, eligible pregnant women are provided with triple therapy to ensure maximum viral suppression to prevent the transmission to the baby. Newborn babies are provided with monotherapy after birth. AIDSRelief sites are encouraged to provide babies with cotrimoxazole after 4-6 weeks of life, and PCR testing is conducted when relevant. Mothers are encouraged to use safe feeding practices as appropriate to individual circumstances. Most sites have clinic-based gardens to assist with nutrition programs, and several sites provide nutrition supplements, as per South African treatment guidelines. All sites provide ART access to non-South Africans, including refugees. Some of the AIDSRelief sites also receive PEPFAR and other funding through different sources for the provision of OVC care. The overlapping of these services provides OVC with access to both care and treatment services provided under the program. In terms of the continuous qualitative review of the program, the annual clinical evaluation is done on available patient data by two South African ART experts, who not only evaluate the data within the program but also compare it to other large resource-limited programs, such as the program in Khayelitsha. Even though prevention is not a specific program activity of the overall program, it is promoted through provision of information to patients regarding HIV and prevention of spreading the virus (prevention for positives). Secondly, skills training is provided to vulnerable populations, empowering them to make safer choices about their lives. Additionally, AB messages are shared with the target population, as well as accurate information regarding condoms is provided.

With supplemental funding in FY08, the following activities will be added:

- a) Open and staff a new wellness center in Winterveldt for HIV care and treatment services (satellite center)
- b) Provide additional space (parkhome) in Orange Farm for HIV care and treatment services
- c) Open a satellite HIV care and treatment program in Pary
- d) Implement a new patient data system to accurately collect routine HIV care and treatment data – including equipment where necessary.

Mechanism: Track 1

USG Agency: HHS/Health Resources
Services Administration

Program Area: Treatment: Adult Treatment

Program Budget Code: 09

Planned Funds: \$1,906,567

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

Activities funded with Track 1 funding is integrated with the local funding, and this comprehensive program (including progress and planned activities) are contained in the local funding COP entry.

AIDSRelief implements a comprehensive HIV care and treatment program in South Africa that is funded with Track 1 central funding, as well as South Africa COP funding. The activities do not differ across the funding mechanisms, and this entry is thus a repeat of the South Africa COP entry. All targets are reflected in the South Africa COP entry.

SUMMARY:

Activities are implemented to support provision of quality ARV services under the comprehensive antiretroviral treatment (ART) program carried out by Catholic Relief Services (CRS) in 25 sites in 8 provinces in South Africa. Major emphasis will be on human capacity development and local organization capacity building. The target population includes people affected by HIV and AIDS as well as higher risk populations such as migrant workers and refugees.

BACKGROUND:

AIDSRelief (the Consortium led by Catholic Relief Services) has received Track 1 funding since FY 2004 to rapidly scale up antiretroviral therapy (ART) in 9 countries, including South Africa. Since FY 2005, South Africa in-country funding was received to supplement central funding. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and Institute for Youth Development South Africa (IYD-SA).

ACTIVITIES AND EXPECTED RESULTS:

With funding provided in FY 2008 AIDSRelief will continue implementing the activities in support of the South African Government (SAG) national ARV rollout. In the interest of maximizing available funds the focus will be on strengthening the existing sites providing services rather than on assessing and activating new sites. Utilizing technical assistance from AIDSRelief staff members and South African experts, ongoing support and guidance will be provided to sites in form of appropriate refresher medical training courses, patient tracking and reporting, monitoring and evaluation mechanisms and other necessary support.

ARV services will be provided through the 25 sites to ARV patients through clinic-based and home-based activities to optimize quality of life for HIV-infected clients and their families. All the relevant healthcare providers and administrative support staff at the sites will be trained to implement the ART program, using government-approved training curricula. Staff who have already received initial training will undergo refresher courses (either in-house or external), coupled with exchange of training courses and materials between sites with active support from the local training provider, Kimera training center. Treatment adherence training is provided to all patients who are enrolled on the ART program.

In most sites home-based care networks will follow up and support patients. This follow-up is conducted through direct visits to patients through the extensive home-based care outreach at the SACBC sites, while IYD-SA sites follow up through means of telephonic contact in most cases. In case the patient cannot be reached, a "treatment buddy" is contacted to inquire the whereabouts of the patients who did not come back for the monthly drug package. Inevitably, some patients become lost-to-follow-up in spite of all the efforts to locate them, due to migrating populations and illegal immigrants served by the program. This number currently stands at less than 4% of the patients ever enrolled on the program.

Each site ensures that HIV-infected patients are screened for tuberculosis (TB) prior to placing them on antiretroviral treatment, and are referred to TB treatment if they tested positive. Screening and testing for TB is conducted in a number of different ways, and these testing methods are specific to each site. While screening is conducted by a medical professional at each of the sites, in most cases patients are referred to the nearby SAG medical facility for TB testing and are only enrolled in antiretroviral treatment once they have completed two months of TB treatment, or have been found not to have active TB.

PEPFAR funding will also be used to support laboratory services, which are outsourced to a private provider, Toga Laboratories (a new PEPFAR partner since FY 2007). A courier service collects blood that is drawn at each site, and delivers these samples to the laboratories. Results are e-mailed or faxed back to the site within 48 hours of the laboratory receiving the blood samples.

The program is designed to improve each site's capacity to implement the national ART program in the long-term, and to strengthen clinical, administrative, financial and strategic information systems. Sites will be assisted in developing appropriate policies and protocols and in setting up sound financial and strategic information systems. Each site will also develop a unique community mobilization plan for the ART program and implement it in collaboration with relevant community organizations and leaders. Many of the sites are already involved in HIV and AIDS community mobilization activities and these will be linked to ART services. These lessons learned will be of value to other partners working in the non-governmental organization (NGO) sector.

All activities will continue to be implemented in close collaboration with the Department of Health HIV and AIDS Unit and the respective provincial authorities to ensure coordination and information sharing, and this will directly contribute to the success of the SAG's own rollout and the goals of PEPFAR. These activities are also aimed at successful integration of AIDSRelief activities with those implemented by the South African Government, thus ensuring long-term sustainability.

All sites operate under the terms of a Memorandum of Understanding (MOU) with the provincial Department of Health in which they operate, observing the national and provincial treatment protocols. There is a concerted effort at each site to ensure sustainability by having the SAG provide antiretroviral drugs, or by

Activity Narrative: down referring stable patients into the SAG's primary healthcare clinics after providing training for the SAG clinic staff. St. Mary's Hospital, which accounts for more than a third of patient numbers, has already been accredited as a SAG rollout site. Sinosizo receives drugs from the National Department of Health due to its status as a down referral clinic for Stanger Hospital, and at a further two sites, Centocow and Bethal, all patients already receive drugs via the SAG rollout. Monthly statistics are shared with the South African National Department of Health, as well as with relevant provincial health departments in provinces where AIDSRelief implements the program.

There is a concerted effort to include men and children in the program, and all sites have specific plans to increase enrolment, including couple counseling and using a family-based approach. Although there is no specific PMTCT program, eligible pregnant women are provided with triple therapy to ensure maximum viral suppression to prevent the transmission to the baby. Newborn babies are provided with monotherapy after birth. AIDSRelief sites are encouraged to provide babies with cotrimoxazole after 4-6 weeks of life, and PCR testing is conducted when relevant. Mothers are encouraged to use safe feeding practices as appropriate to individual circumstances. Most sites have clinic-based gardens to assist with nutrition programs, and several sites provide nutrition supplements, as per South African treatment guidelines. All sites provide ART access to non-South Africans, including refugees. Some of the AIDSRelief sites also receive PEPFAR and other funding through different sources for the provision of OVC care. The overlapping of these services provides OVC with access to both care and treatment services provided under the program.

In terms of the continuous qualitative review of the program, the annual clinical evaluation is done on available patient data by two South African ART experts, who not only evaluate the data within the program but also compare it to other large resource-limited programs, such as the program in Khayelitsha.

Even though prevention is not a specific program activity of the overall program, it is promoted through provision of information to patients regarding HIV and prevention of spreading the virus (prevention for positives). Secondly, skills training is provided to vulnerable populations, empowering them to make safer choices about their lives. Additionally, AB messages are shared with the target population, as well as accurate information regarding condoms is provided.

The CRS treatment program supports the PEPFAR goal of treating 2 million people with antiretroviral drugs.

Table 3.3.09: Activities by Funding Mechansim

Mechanism ID: 2808.09	Mechanism: I-TECH
Prime Partner: University of Washington	USG Agency: HHS/Health Resources Services Administration
Funding Source: GHCS (State)	Program Area: Treatment: Adult Treatment
Budget Code: HTXS	Program Budget Code: 09
Activity ID: 3334.22682.09	Planned Funds: \$776,724
Activity System ID: 22682	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

It was determined that Activities 1-6 are now covered under Health Systems Strengthening. With FY 2009 funds, these activities will continue as described in the FY 2008 COP with expansion to new geographic areas as sites are graduated. In FY 2009 there will be an emphasis on developing graduating sites as mentors to new sites for sustainability.

Activity 7: Pharmacovigilance

Funds will be used to support pharmacovigilance capacity building. Health care workers will be trained on filling out the South African government forms for pharmacovigilance. Routine meetings will also be held with health care workers to highlight issues of data quality and interpretation of the data from the routine reporting for pharmacovigilance. The objective of this activity is to ultimately improve the quality of care that patients receive in public sector facilities.

SUMMARY:

I-TECH carries out activities to support the expansion of HIV and AIDS, tuberculosis (TB) and sexually transmitted infection (STI) care and treatment in the Eastern Cape (EC) through on-the-job clinical training/mentoring activities. The primary emphasis area for these activities is human capacity development; minor emphasis areas are strategic information and local organization capacity building. The primary target populations are doctors (public and private), pharmacists (public), and nurses (public)

BACKGROUND:

I-TECH has been working in the EC since 2003 to develop the capacity of clinicians in the care and treatment of HIV and AIDS, TB and STI. The activities described here were first funded by PEPFAR between FY 2004 and FY 2007. The EC Department of Health (ECDOH) specifically requested I-TECH to conduct on-the-job training and mentoring to augment didactic trainings conducted by the Eastern Cape Regional Training Centre (ECRTC) and other professional training organizations in the EC, as well as the placement of I-TECH mentors in the EC for longer periods of time (i.e., six to twelve months) to allow ongoing mentoring. Treatment/ARV Services activities were and will continue to be largely implemented by I-TECH's subcontractor, the University of California at San Diego (UCSD) Owen Clinic. I-TECH central office (Seattle) and South Africa country staff have and will continue to provide oversight and logistical support related to this activity.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Building and Program Sustainability: In-country Intensive Mentoring of the ECRTC Clinical Team

This activity continues the work begun in FY 2004 to mentor the EC RTC clinical teams in-country. FY 2008 PEPFAR funds will continue to support I-TECH's intensive mentoring model of the ECRTC's medical teams on a limited basis as the ECRTC medical teams' clinical care and mentoring capacities have improved. It is expected that up to three new RTC clinical team medical officers will be mentored by experienced ECRTC clinical team members and by year-round I-TECH UCSD mentors (see Activity 3). Specific activities for which FY 2008 PEPFAR funds will be used are itemized in Activity 2; Activity 1 will occur simultaneously with Activity 2.

ACTIVITY 2: Human Capacity Building: Educational support of EC clinicians via in-country clinical training/mentoring and monitoring

In FY 2008 I-TECH and UCSD mentor teams will be placed in the EC year-round to mentor the two full-time I-TECH clinical mentors (see Activity 6 below), the I-TECH mentoring coordinator (see Activity 4), and health care workers (HCW) in EC clinics (includes clinics targeted and not targeted by the ECRTC in their FY 2008 plan). The I-TECH and UCSD mentor teams will include one to two clinical mentors: up to six infectious disease or HIV fellows spending a minimum of two months during each rotation, and up to six expert UCSD HIV faculty physicians, pharmacists or nurse practitioners spending a minimum of a month during each rotation. FY 2008 funds will support UCSD Owen Clinic administrative staff time, and the salaries, travel, lodging and expenses for the Owen Clinic mentor teams. I-TECH UCSD mentors and the Owen Clinic Director will visit the Mpumalanga regions to provide clinical mentoring (see Palliative Care; HIV/TB). Depending on the results of I-TECH's Limpopo Needs Assessment, clinical mentoring may be provided in this province (see Other Policy/Systems Strengthening). Up to six mentors are allocated for these two activities.

ACTIVITY 3: Sustainability: Mentorship Coordinator

This activity began in FY 2007 whereby PEPFAR funds were used to hire a local mentorship coordinator in the EC to plan and coordinate the in-country logistics and support for the UCSD clinical mentors, and provide clinical mentoring to Eastern Cape HCW. In FY 2008, funds will be used to pay the coordinator's salary and in-country travel expenses, as well as one trip to the UCSD Owen Clinic for intensive mentoring.

ACTIVITY 4: Human Capacity Building and Sustainability: Precepting senior level EC clinicians at the Owen Clinic

This activity began in FY 2004 whereby PEPFAR funds were used to support the air travel, lodging and per diem of committed EC clinicians to travel to the Owen Clinic for a two-week intensive training on systems of care and clinical management. The intent of this activity is to develop EC clinician leadership to champion HIV treatment issues through the further development of clinical skills, and increased knowledge of systems of care and quality improvement methodologies. FY 2008 funds will support the air travel, lodging and per

Activity Narrative: diem to intensively train 2 ECRTC health care workers, the mentoring coordinator (see Activity 3), and the two full-time I-TECH South Africa doctors for two weeks each at the Owen Clinic on systems of care and clinical management issues (see Activity 6).

ACTIVITY 5: Human Capacity Building: Distance-based ongoing clinical consultation

This activity was first funded by PEPFAR in FY 2005. During UCSD/ECRTC trainings, EC clinicians are encouraged to contact the RTC team for clinical consultation as needed, who then forward the query and response to the UCSD Owen Clinical mentors for additional guidance before delivering their consultative advice. Achievements toward FY 2007 goals include the provision of 48 distance consultations to Eastern Cape HCW in the first months of FY 2007. In FY 2008, PEPFAR funds will support UCSD consultants' time (a portion of salaries) related to the time spent fielding consultations; estimated at five consults per week.

Activity 6: Human Capacity Building and Sustainability: Developing the treatment and mentoring capacity of two in-country clinical mentors

I-TECH's FY 2008 activities will be expanded to hire and mentor two doctors as full-time I-TECH mentors in the EC. Funds will be used to pay the doctors' salaries for twelve months and in-country travel expenses, as well as one trip each to the UCSD Owen Clinic for intensive mentoring.

ACTIVITY 7:

Funds will be used to support pharmacovigilance capacity building. Health care workers will be trained on filling out the South African government forms for pharmacovigilance. Routine meetings will also be held with health care workers to highlight issues of data quality and interpretation of the data from the routine reporting for pharmacovigilance. The objective of this activity it to ultimately improve the quality of care that patients receive in public sector facilities.

By training a large cadre of healthcare workers to provide ARV services, I-TECH will contribute to the PEPFAR goal of providing treatment to 2 million people by increasing access to quality HIV/AIDS/TB/STI care and treatment.

Budget Code: HTXS

Activity ID: 3282.22851.09

Activity System ID: 22851

Mechanism: In Support - CDC

USG Agency: HHS/Centers for Disease
Control & Prevention

Program Area: Treatment: Adult Treatment

Program Budget Code: 09

Planned Funds: \$847,600

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

With the appointment of a new Deputy Director-General responsible for oversight of the HIV & AIDS, TB, and Maternal and Child Health Program, it is expected that support to the Department of Health will increase in FY 2009, as it has already been seen in FY 2008, with increased support to the Free State and Eastern Cape Health Departments, and financial support set to expand to other provinces, including the North West province.

BACKGROUND:

As per the expanded vision in PEPFAR II, and the need to provide comprehensive support, funding to support all the components of the Comprehensive Plan for HIV and AIDS Care, Management and Treatment (CCMT), including integrating prevention with positives, maternal and child health, pediatric care, support and treatment, and TB-HIV integration.

ACTIVITIES AND EXPECTED RESULTS:

Activities commenced in FY 2008 and expected to continue in FY 2009 include:

- a) Implementing the community IMCI module through the capacity building of community health workers currently involved in supporting ART adherence at home and community level;
- b) Printing of revised guidelines on HIV care and treatment, including management of people living with HIV;
- c) Support for additional staff and related travel costs; and
- d) Community mapping of HIV care and treatment services.

SUMMARY:

PEPFAR funding is set aside to support the National Department of Health (NDOH) in the implementation of the Comprehensive Plan for HIV and AIDS Care, Management and Treatment, by providing financial and technical assistance to ensure greater access to antiretroviral treatment (ART).

BACKGROUND:

This is an ongoing activity in support of the National Department of Health, and has received PEPFAR funding since FY 2005. The activities are implemented by CDC staff supporting the National Department of Health, and will, when necessary, involve contracting out services.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: CDC Staff Member Costs

Staff and travel costs for a locally hired CDC staff member to provide support to the National Department of Health (including the nine provincial health departments) when required in the implementation of the Comprehensive Plan. This includes site visits to PEPFAR-supported treatment sites, and regular provincial consultations with PEPFAR partners working within a specific province to ensure coordination and integration with the South African Government (SAG).

ACTIVITY 2: Meetings with Stakeholders

At least six meetings will be held with external stakeholders, including those organizations supported by PEPFAR. These meetings are held to discuss new developments in ART, program progress, implementation challenges, and creating new partnerships. Provincial coordinators for ART programs are involved in these meetings (national meetings). In addition meetings are held at provincial level to strengthen coordination at local level by mapping service provision at district level, determine gaps, and direct support.

ACTIVITY 3: Communication Materials

FY 2008 funds will be used to develop and distribute communication and marketing materials to the nine provincial management teams and PEPFAR partners relating to ART. This will focus specifically on job aids to ensure patients are properly managed once they test HIV positive. It also includes the distribution of technical materials to strengthen the five priority areas: human capacity development; pediatric HIV care and treatment; scaling up HIV counseling and testing; TB/HIV integration; and initiating ART at primary health care level.

ACTIVITY 4: Training

FY 2008 PEPFAR funds will be used for training meetings as requested by the National Department of Health, including training in the integrated management of childhood illnesses (IMCI) with a focus on pediatric ART.

ACTIVITY 5: Longitudinal Surveillance

FY 2008 funding will be used to support the National Department of Health effort to implement longitudinal surveillance (in previous COPs referred to as LSTEP). This activity will supplement Department of Health funding for surveillance. The sample will include both PEPFAR and non-PEPFAR supported sites to ensure representivity. This will include a retrospective sample cohort of persons on treatment with 6- and 12-month outcome data, and the ongoing monitoring of those still on therapy (at 6-month intervals), and a prospective

Activity Narrative: cohort, which will collect information on a sample of people newly initiating ART and tracking the individuals over a period of time at 6-month intervals.

ACTIVITY 6: Monitoring and Evaluation

PEPFAR funds will be used to provide support to the Department of Health in the design and implementation of standardized pre-ART and ART registers. This activity will also include the training of data capturers to strengthen the collection of ART data at facility level.

These activities contribute to the implementation of the 2-7-10 PEPFAR goals by strengthening the capacity of the National Department of Health and the nine provincial health departments to implement the Comprehensive Plan, and ensure improved access to treatment.

Budget Code: HTXS	Program Budget Code: 09
Activity ID: 15944.22936.09	Planned Funds: \$97,090
Activity System ID: 22936	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

UGM non-governmental organization (NGO) Management and Sustainability:

Right to Care (RTC) will support sub-partners with established policy guidance and procedures that meet the requirements of both the South African labor law as well as the USAID regulations. All sub-partners will have access to the RTC human resources capacity.

Support of infrastructure is given through expertise within RTC for advice and consultation. Through various infrastructure projects, RTC has developed expertise in proper clinic flow, effective interior space design in both CCMT sites as well as TB clinics. Other sub-partners facing infrastructure challenges will be able to make best use of limited resources which are necessary in increasing clinic capacity. Sustainability of sub-grantees will be supported through RTC's continued relationship with the Department of Health to ensure that continued HIV and AIDS response is in line with the strategic plan for South Africa, ensuring that once the PEPFAR program is complete, that the activities of the NGO can be taken over by the South African Government.

Where systems are identified to be inadequate, RTC aims to capacitate sub-partner organizations to manage their programs independent of RTC. Within the implementation plan and budget, RTC has planned to provide financial reporting systems, management standard operating procedures, human resources policies and procedures, clinical guidelines, and monitoring evaluation systems that will ensure sustainability beyond RTC support.

Adult Antiretroviral Therapy (AART):

RTC will help sub-partners to accelerate the implementation of AART and to support non-governmental organization (NGO) treatment sites in districts where government provision has not yet been rolled out.

RTC, with its extensive treatment expertise, will give TA to sub-partners to ensure that each ART patient at sub-partner-supported facilities receives a minimum package of ART services, including clinical and pathology monitoring, adherence counseling and support, and follow-up of defaulting ART patients. Adherence activities focus on reducing stigma and encouraging disclosure in order to enhance drug compliance and to improve patient retention. Emphasis will be placed on an integrated, family approach, increasing the number of HIV-infected children and pregnant women on ARVs, couple counseling, prevention and disclosure, linkages and referrals to care for sexually transmitted infections (STIs), family planning, and TB, and enrollment and retention in care.

Sub-partner pediatric treatment funding will be used for: (1) human capacity development and salaries -- NGO and faith-based organization (FBO) clinics receive sub-awards for doctors, nurses, pharmacists and counselors (2) developing a training program for pharmacy assistants as human capacity development for the distribution of ARVs and HIV services; (3) addressing minor infrastructure needs where necessary at NGO, FBO sites, (4) procurement of health commodities; (5) procurement of laboratory services for pathology monitoring; (5) provision of ARVs and related medications (i.e. cotrimoxazole prophylaxis)

RTC supports its AART providers by disseminating policies and guidelines and sharing best practices. Ongoing quality assurance and supportive supervision is undertaken by centralized treatment experts. Clinical mentorship is provided in various forms. Doctors and nurses at sub-partner organization's sites can spend time working at Themba Lethu clinic or other RTC-supported government sites, call hotline numbers for urgent assistance, receive case-specific advice on patient management, and request mentors to see difficult cases alongside as part of the learning process.

This is a new activity in FY 2008.

SUMMARY:

Currently, the USG PEPFAR Task Force supports institutional capacity building of indigenous organizations that implement PEPFAR programs through four competitively selected Umbrella Grants Mechanisms: Pact, the Academy for Educational Development (AED), Family Health International (FHI) and Right to Care (RTC). The main purposes of these new umbrella organizations are to (1) facilitate further scale up of HIV treatment services; and (2) to develop indigenous capability, thus creating a more sustainable program. The major emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs), and community-based organizations (CBOs).

RTC will use PEPFAR funds to support one or more NGO treatment organizations through financial oversight, project management, human capacity development, training, mentorship programs, program development, strategic planning, and audit readiness. PEPFAR funds will support components of UGM within RTC, but the predominant focus will be on the pass through of funds to sub-grantee implementation.

BACKGROUND:

RTC currently supports 12 NGOs, and under the new UGM, additional organizations will be supported with FY 2008 funds. The following proposed activities are designed to support sub-grantee initiatives to implement the goals of PEPFAR and the South African Government's Comprehensive Plan. Over the last two years, RTC has developed an Umbrella Grants Management capacity while developing specific skill sets, competencies and capacity to support additional PEPFAR-funded organizations that will provide ARV services.

RTC will work with Sustainability Solutions Africa, a financial management company, to conduct pre-award assessments, and training in financial management and USAID regulatory compliance. RTC and the

Activity Narrative: Clinical HIV Research Unit, an extension of the current RTC PEPFAR-funded program, will provide technical assistance in medical issues.

There are four main areas of activity:

ACTIVITY 1: Program Planning

Needs assessment, and program and budget planning are conducted regularly with new partners. Site visits take place alongside sub-grantee staff to evaluate capacity, human resources, facility planning, and approaches to treatment and care systematically. This evaluation helps sub-grantees meet determined targets and ensure quality of care. The experience of RTC clinicians and program staff is extended to sub-grantees to help develop proper planning and forecasting, and to facilitate organizational and program growth.

ACTIVITY 2: Finance

The RTC finance department has developed systems to assist with sub-grantees' compliance and capacity development to manage PEPFAR funds effectively. Support given to sub-grantees will include a complete range of financial management tools, such as pre-award audits, regular budget reviews, and close-out procedures. RTC currently meets with sub-grantees annually to align financial planning with programmatic planning.

Regular oversight and support is extended to all sub-grantees, and monthly financial reports are required from sub-grantees. Periodic internal audits are conducted at the sites of all sub-grantees to establish the quality of financial management and asset control, and alignment with USAID financial management policies.

The RTC finance department has developed a state of the art financial software tool, which uses Business Intelligent Tools, to monitor and track all sub-grantee transactions against budget projections for modeling and cash flow. This integrated program will allow for responsible management of budgets at all sites.

ACTIVITY 3: Monitoring, Evaluation and Reporting

RTC's monitoring, evaluation & reporting (MER) system (standards, systems, procedures and tools) is established, documented and regularly updated. The system is based on best practices and quality criteria in the programmatic areas of ARV treatment, HIV care and support, HIV/TB, counseling and testing, outreach and training.

All sub-grantees will be provided with the support, training and technical assistance necessary to meet USAID reporting requirements effectively. This includes data quality assessments (DQAs).

ACTIVITY 4: Technical Support

The Clinical HIV Research Unit will provide additional technical assistance on treatment issues to new sub-grantees. Clinicians employed by NGOs will also be able to participate in the mentorship program that will include doctor training and regular rounds at the Helen Joseph Hospital.

RTC will train NGOs on established policies and procedures that meet the requirements of the South African labor laws as well as the USAID regulations.

RCT has had extensive experience in working on a variety of infrastructure projects, and the organization has developed collective expertise in proper clinic flow and effective interior space design in care and treatment sites, as well as in TB clinics. RCT staff will be able to advise sub-grantees on any infrastructure developments.

The training department within RTC has trained healthcare professionals at all levels within the various clinics and care organizations. Training will continue with doctors, nurses, social workers and counselors, as well as with traditional healers, community members, and non-health staff members. This training will continue to support new sub-grantees in increasing their expertise and capacity.

RTC's relationship with the Department of Health will continue to grow, to ensure that the response is in line with the strategic priorities for South Africa will ensure sustainability, and hopefully the program will be transferred to the South African government on completion of PEPFAR.

RTC aims to capacitate organizations who currently have inadequate programs and management systems. Training and support will be provided to all sub-grantees so that they will be able to manage their programs independently by the end of the training period. RTC plans to provide financial reporting systems, management standard operating procedures, human resources policies and procedures, clinical guidelines, and monitoring evaluation systems that will ensure sustainability beyond RTC support.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for these activities. As the Medical Research Council of South Africa (MRC) is dealing with research and not the implementation of programs, a decision was made during the PEPFAR South Africa Interagency Partner Evaluation to discontinue the TB/HIV multi-drug resistance budget as well as treatment, care and counseling activities, and put them under a TBD Funding Opportunity Announcement. Therefore there is no need to continue funding this program area with FY 2009 COP funds.

Activity ID: 15943.22895.09

Planned Funds: \$242,726

Activity System ID: 22895

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

1. After discussions with CDC South Africa and the National Department of Health, it was decided that the project be piloted in the Northern Cape first. Therefore, the project will be implemented in four clinics in the Northern Cape. The clinics will be selected by the provincial department of health (DOH).
2. The project sites should be part of the South African DOH antiretroviral (ARV) sites and not the Planned Parenthood Association of South Africa (PPASA) Youth-Friendly Services (YFS) clinics. The sites will function as satellite ARV clinics for young people. This approach will mean that Pathfinder can provide services rapidly, without undergoing lengthy ARV accreditation process for new clinics, and that the provincial Department of Health will be more likely to be partners in the project.
3. Shelter will be provided for youth by support groups and peers.
4. Doctors are to be provided and supported by the DOH.
5. Peer educators will do home visits to support young people on treatment and follow up with youth that are defaulting on treatment.

This is a new activity in FY 2008. SUMMARY: Pathfinder/Planned Parenthood Association of South Africa (PPASA) is a new PEPFAR partner (starting in FY 2008) that will expand access to youth-friendly ARV service delivery, including diagnosis and treatment of opportunistic infections and administration and monitoring of ART. Providers will help young clients become treatment literate and young people beginning ART will be linked to youth community home-based care (CHBC) activists to provide ongoing support for adherence. The emphasis areas for these activities are human capacity development, gender and local organizational capacity development. Specific target populations include young people between the ages of 15-24 years. All activities will be implemented by PPASA and services will be made available in PPASA youth clinics in KwaZulu-Natal, Gauteng, North West, and the Eastern Cape. All activities related to this project will be initiated in FY 2008. BACKGROUND: This project aims to relieve the over-burdened, understaffed hospitals by (1) providing care and support services through the PPASA youth clinics, and by (2) building the capacity of more PPASA service providers to offer HIV and AIDS care and treatment services. This initiative proposes to provide expanded, comprehensive HIV and AIDS clinical care and linkages to young people at four existing Youth-Friendly Services (YFS) sites. All the sites currently provide quality YFS, including treatment of sexually transmitted infections (STIs), which will continue in this project. For youth receiving ART, youth-friendly service providers will facilitate monitoring of illness stages with CD4 counts, adherence and drug resistance. Providers will help young clients become treatment literate, and young people beginning ART will be linked to youth CHBC activists for DOTS. ACTIVITY 1: Training of Health Care Providers on Youth-Friendly HIV and AIDS Care and Treatment. Nurses from the PPASA youth clinics will be trained in HIV and AIDS care and support including treatment of opportunistic infections and ART. To avoid creating parallel training programs, the project will form linkages with the existing Department of Health (DOH) training programs. ACTIVITY 2: ART Service Delivery for Youth. The project will conduct a thorough HIV and AIDS clinical care needs assessment of YFS clinics with the DOH and will equip clinics to offer services as needed (for example, partitioning and equipping additional treatment rooms). Regular counseling sessions and check-ups at the youth-friendly clinic will be encouraged for all youth living with HIV and AIDS. Counseling sessions will address psychosocial issues around coping with HIV and AIDS, including the person's conception and understanding of her/his illness and stage of illness; cultural beliefs around HIV and AIDS; other services utilized by the patient (e.g., traditional medicine); the client's living situation, support systems, and financial needs; occupational and legal concerns; and stigma (both self-stigma and perceived stigma of others). Young clients will be counseled on "living positively" with HIV and AIDS. For youth receiving ART, youth-friendly service providers will facilitate monitoring of illness stages, adherence and drug resistance. Providers will help young clients become treatment literate and those beginning ART will be linked to youth CHBC activists for DOTS. Young clients living with HIV and AIDS will be encouraged to visit the YFS clinic regularly and will also be linked to support groups and encouraged to become regular members. The project will also establish linkages between youth-friendly service points and referral hospitals and laboratories, as well as other referral facilities. In addition, service provider monthly supervision meetings will be conducted to follow up the providers to ensure that youth friendly approach is being practiced and also to avoid burnout. Periodic refresh trainings will also be conducted for the providers. Adherence support groups, where young people can exchange experiences and solutions, will be conducted at each of the four clinics. They will focus on: difficulties in taking ARVs (pills, frequency, time charts, food); difficulties in adhering to the services (tests, distance, financial resources and others); presentation and discussion of side effects of the drugs used; discussion on secondary prevention and reproductive counseling; the impact of stigma and discrimination and coping strategies; and nutrition and positive living. The project will assist these groups in building linkages with CHBC, income-generating activities (IGA), and nutrition support. ACTIVITY 3: Addressing Gender Issues. Service providers will receive training on gender issues related to young men and women's sexuality and sexual rights so they feel comfortable when accessing HIV and AIDS services. Training will include sound gender-based communication skills valued by youth of both sexes, such as confidentiality and an open-minded approach to questions instead of making pre-conceived judgments. Additional gender differences to be addressed include: sexually active young women and/or girls living with HIV must not be stigmatized by health providers who blame them for being too young to seek services. Because of their social and biological vulnerability to STIs and HIV, young women account for more new HIV infections than young men in South Africa - and thus are proportionately in greater need of care and support services. Yet, they are often denied access due to power differentials, financial constraints, lack of education, and/or stigma. Special care will be taken to provide youth-friendly, gender-sensitive services to these young people, including counseling, partner involvement and testing and stigma reduction. Efforts will be made to ensure that the number of male and female clients seeking HIV and AIDS care and treatment services is proportionate with the number in need, based on prevalence studies and VCT service statistics for young males and females. The female community peer educators will play an important role in this case, and equal numbers of male and female the peer educators will be recruited. In addition, peer educators will be

Activity Narrative: encouraged to increase their participation in public events. Pathfinder's experience in Mozambique has shown that it is useful to recruit a group of girls who were friends before and that involvement of the parents during the process of recruitment and training will increase peer education participation and retention. **ACTIVITY 4: Behavior Change Communication and Social Mobilization** The project will also train youth CHBC activists and key individuals on advocacy for the availability of ART drugs for all PLHIV, and especially for youth. Printed materials will be adapted to increase the demand for YFS and VCT and support treatment, such as a diary for young clients to record treatment protocols, dosages and side effects, as well as clinic appointments. These results contribute to the PEPFAR 2-7-10 goals by improving access to and quality of HIV and AIDS services and care for young people.

Activity ID: 22312.22869.09

Planned Funds: \$1,446,938

Activity System ID: 22869

Activity Narrative: SUMMARY:

The Southern African Catholic Bishops Conference (SACBC) is also currently a sub-partner under the Track 1 Catholic Relief Services (CRS) program. However, in FY 2009 the Track 1 CRS program will transition, and SACBC will become one of three local implementing partners that will have CRS funds and responsibilities transferred to it, and thus current funding levels will increase in FY 2009. These will be adjusted through reprogramming in FY 2009. The Adult Treatment activities are thus mostly contained in the CRS narrative, and the funded activities described in this COP narrative will address the efforts to prepare the SACBC to assume full responsibility for the treatment activities in FY 2009. These activities are:

ACTIVITY 1: TREATMENT

The SACBC has a major orphans and vulnerable children (OVC) program described elsewhere in the COP. Some of the SACBC already have co-located OVC and treatment services, and this will be scaled up in FY 2009. Appropriate staff at implementing sites will be identified for training around treatment issues to provide for improved HIV care and treatment service delivery at OVC, as some sites currently only refer people living with HIV (PLHIV) who qualify for treatment to appropriate local treatment centers. This training will be provided by the CRS/SACBC Track 1 program. Efforts will be made at all sites to identify people who qualify for treatment at an early stage to enable them to access services timeously.

ACTIVITY 2: GENDER MAINSTREAMING`

The program is aiming at ensuring equitable access for men and women to services, and address issues on stigma mitigation. The program will address the obstacles that women and girls face in accessing health care, ranging from cost of treatment, transportation, and child care, to appropriate appointment schedules, sufficient women health workers, and guarantees of privacy and confidentiality. Where possible, training and employment of women as health care workers to increase the confidentiality and comfort of women and girls seeking treatment will be emphasized. Men will be targeted as caregivers and edify their role in the society.

ACTIVITY 3: FAMILY-CENTERED APPROACH

A family-centered testing and care approach will be used where possible. Couple counseling and testing at sites will be used to promote testing of men and to build their support for their female partners. It is also hoped that, through community-based testing, increased outreach will be made to women and children in villages. There will be a renewed emphasis on the family-centered approach through: grouping family visits together, in providing psychosocial support, encouraging interactive family sessions, and assisting families with social service applications (child grants etc.) where possible.

Awareness campaigns and workshops will be conducted to address various family members in areas around treatment literacy, opportunistic infections, and linking nutrition with treatment.

ACTIVITY 4: CAPACITY BUILDING

Training of trainers will occur at the site level. Sites that are closer to each other will team up together to facilitate training. Existing health systems serving patients in HIV care and support will be strengthened.

There will be scaling up of linkages, coordination and referrals to programs like immunization and if necessary primary health care centers. The objective is to provide a comprehensive package of services that includes wellness care and ART to HIV-affected; with the view of increasing the proportion of people on treatment.

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

The overall project goal is to increase access and availability of safe and effective treatment of HIV and AIDS in the uninsured population of South Africa. The strategy to achieve this goal focuses on Human Capacity Development (HCD) through activities that are designed to strengthen the AIDS leadership and human resource (HR) management at the district level to deal with all aspects of improved service delivery.

BACKGROUND:

The South African Institute of Health Care Managers (SAIHCM) is a Not-for-Profit Association representing qualified health care managers. SAIHCM was founded with a vision to enhance and promote high standards of professional health care management in both the public and private sectors in South Africa. SAIHCM supports HCD through a series of interventions designed to strengthen leadership around HIV and AIDS and HR management. Coordination with provincial Departments of Health (DOH) takes place through interaction with District Health Managers to identify participants who will enroll in this program. Equal access to training activities will be ensured for all people. A gender focus will also be built into the work to be undertaken in the management development forums. In this context, participants will undertake exercises to assess gender aspects of their treatment project, looking at such issues as ensuring gender parity in uptake of testing and treatment, including gender in data collection and promoting activities where all counselors are trained on aspects relating to male norms and behavior..

To date, efforts to develop AIDS management and leadership in South Africa have focused on providing training, which is an obvious first step to developing managerial competencies. However, not all managers are able to attend such training, while others often are not aware of the fact that they do not have the required skills to effectively undertake their managerial tasks. The default health care manager in South Africa is a health care professional who has migrated into management (95% of AIDS managers surveyed in the University of Pretoria study referred to earlier met this profile).

This project is designed to supplement existing management training efforts, by various organizations, including PEPFAR partners, that focus on providing management qualifications, and to create an alternative management development method that will develop management competencies of managers who cannot enroll for formal academic qualifications. This project will also establish, at the district level, continued professional development structures that will serve all managers from the district.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Professional support services to qualified AIDS managers

The project will, on an annual basis, enroll 500 managers at a district level from both the public sector and civil society who have formal management qualifications, and therefore qualify as SAIHCM members for a one-year period. This will introduce them to a series of services customized to support the professional development of health care managers. These include: 1) a monthly health management journal; 2) access to the SAIHCM mentorship program; 3) an annual management conference and 4) regular newsletters via e-mail on health management issues and ethical issues 5) the annual top 25 health care leaders award. As part of this component, SAIHCM will conduct a survey to build a database of qualified health care managers in the country. It is anticipated that once managers have experienced the benefits of these services, they or their employer will take over the payment of membership fees in the following years.

ACTIVITY 2: Assessment of the training and development needs of AIDS managers

On an annual basis, 500 managers who have not received formal management training and managers will be targeted. This is an internally-focused activity where the individual manager takes stock of his or her own learning styles, preferences, strengths, weaknesses and development needs. These events are a sophisticated means of identifying and developing competencies which individuals and teams require taking on new roles effectively. It provides an in-depth picture of an individual by gathering data from many sources during a three-day event conducted by a skilled facilitator. The end result is that the management development needs of each participating health care manager are identified and converted into a personal development strategy that will include enrolling in formal courses, self study, selected reading and participating in peer learning events called Action Learning Sets (ALS).

ACTIVITY 3: Establishment of district forums for leadership development for AIDS managers.

SAIHCM will establish 50 Action Learning Sets per annum at the level of the health district. These are facilitated learning events for managers, which will take place every two months. These one-day sessions entail a continuous process of learning and reflection with the intention of collectively developing solutions to tangible problems. Learning is centered on the need to find solutions to a real problems faced by the managers in implementing AIDS projects. Learning is voluntary and learner-driven, while individual development is as important as finding the solution to the problem. Action Learning is an approach to management development pioneered by Reg Revans . It is based on his premise that "there can be no learning without action and no sober and deliberate action without learning. Revans described learning as having two elements: namely traditional instruction and critical reflection or questioning insight. He maintained that learning equals programmed learning plus questioning insights. The Action Learning Set (ALS) is designed to predominantly support the critical reflection component of learning. ALSes are learning groups comprised of 10-20 members, including a facilitator. The set will meet one day every 6-8 weeks. Attendance and commitment creates a culture of mutual support and challenge. Groups normally have a facilitator whose main responsibility is helping the group create a culture that is supportive and challenging. SAIHCM will further provide ALS members with access to a mentor, who will be an AIDS manager that has a formal management qualification and who has received a complimentary SAIHCM membership on the

Activity Narrative: basis of their willingness to fulfill this role. The supervision by a SAIHCM facilitator will only be required for the first six-month period. Learning is centered on the need to find solutions to real problems faced by the managers in implementing AIDS projects. Once the ALS structures have been established they continue under an elected group leader as forums for continuous professional development, peer support, mechanism to improve morale and forums where collaboration between managers from both the public and the private sector can be promoted. SAIHCM will continuously monitor that the ALS remain active and actively support group leaders to ensure continuation. SAIHCM will, on a two monthly basis, interact with group leaders via a dedicated web-based discussion forum and newsletter. The purpose of this interaction is to provide group leaders with subject matter for the bi-monthly meetings and share the hot topics for discussion identified by other districts. Annually, group leaders will convene at the SAIHCM Conference. Articles produced by or relevant to the ALSes will be published in the SAIHCM Journal to further share lessons learned with the broader health management community.

ACTIVITY 4: Workplace visits

Depending on need and funding SAIHCM will attempt to arrange a supervisory visit to the workplace of all the managers enrolled on this program during the first year of participation. The purpose of these visits will be to review that application of managerial competencies in the workplace with the participating manager, to help identify opportunities to improve service delivery as well as potential challenges and obstacles that these managers face that can be addressed in the monthly training sessions.

The anticipated outcomes of the project will be that every year: 400 AIDS managers who had never previously been trained in management will have participated in a formal assessment of the managerial competencies and other skills needed to function as AIDS Managers. They will have developed personal development plans and been channeled to formal training opportunities offered by PEPFAR training partners or enrolled in the district-based management development forums.

20 district-based development forums will have been established where AIDS managers from all sectors meet on a regular basis to participate in problem-solving brainstorming events and other Continuing Professional Development (CPD) events.

Implementation of this project will rely on developing partnerships with various role players at the district level involved in AIDS service delivery and capacity development.

Training institutions: SAIHCM already has a close working relationship with the Foundation for Professional Development (FPD), a private institution of higher education, and also a PEPFAR training partner. In this context SAIHCM provides alumni of FPD management training programs access to SAIHCM membership benefits. This relationship will be leveraged to create a conduit to channel managers into sponsored formal clinical and managerial training courses offered by FPD. SAIHCM will also actively engage other PEPFAR partners who offer training, using the PEPFAR training catalogue with the same objective. Any AIDS manager who is a graduate from a formal training program such as those offered by FPD, will also be invited to attend the ALSes as a way for them to engage in life-long learning.

PEPFAR Partners and Civil Society AIDS Service organizations: SAIHCM will also engage PEPFAR partners and other AIDS service organizations from civil society to invite their managers to participate in the project. An added benefit of involving civil society leaders and managers is that it will create a forum where the district-level leaders from both the public and the private sector will interact, leading to increased public-private partnerships.

Provincial Government: SAIHCM will work in partnership with the Human Resources Departments of the provincial Departments of Health in the all provinces to develop the capacity of AIDS managers at the district level based on the outcomes of the ALSes. The District Health Services competency framework is one that was introduced in the pilot phase with full support of provincial and National Health Department management. The Health Systems Framework will guide the project. All interventions will be aligned developing the competencies to implement this framework.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009, the support and clinic capacitation for efficient down referral and transfer to community clinics will be a priority. Together with other PEPFAR-supported capacitation programs in the area (RHRU and McCord Hospital), St. Mary's Hospital has established a defined geographical area that the hospital has committed to capacitate in order to address the down referral process. This geographical area consists of eight referral clinics, one of which St. Mary's will assist to obtain full accreditation to initiate patients on antiretroviral therapy (ART) in FY 2009. St. Mary's will ensure that clinics adopt a family approach to ARV treatment and care addressing partner and family member identification and testing. Children and couple counseling and testing (CT) training will be provided to staff in the clinic to assist with this approach to ART in the community.

As in FY 2008, two therapeutic counselors (TCs) will be located in each of the clinics and have been trained by St. Mary's in ART and CT. These TCs will ensure adequate support to patients referred to the community clinics and will transfer skills to clinic staff. The TC's role is also to support the patient in the home care setting, which includes screening for TB, offering CT to other family members, implement integrated management of childhood illness (IMCI) strategies and adherence. At least three clinics require additional clinical and counseling space and three park homes will be procured for these sites.

Screening for TB will be a priority, as well as the need for clinics to integrate TB and HIV care, and the provision of TB prophylaxis where indicated, and the promotion of cotrimoxazole prophylaxis if available. If the clinics are unable to provide adequate TB treatment and support, these patients will be referred to either St. Mary's Hospital or other institutions supporting TB care and treatment. Healthcare workers in the community clinics may require additional training and this will be linked into the training that St. Mary's Hospital healthcare workers will receive.

The challenge is to enroll those patients that are not ready/eligible for ART into a wellness program for periodic follow-up. Computer monitoring systems are currently being investigated by Catholic Relief Services (CRS), a PEPFAR partner, to assist with the tracking of all patients, "pre-ART" and for those on treatment. Data captureurs to manage this system will also be located in each of the clinics.

Experience in FY 2007 highlighted that clinics require assistance in terms of personnel. Locum budgets for nursing and a rotating doctor will be allocated to cover for shortage of staff when clinic staff are in training. St. Mary's will assist one clinic to obtain accreditation for ARV initiation, and there will be a need to assist with health care personnel (doctor, pharmacist, nurse) in order to ensure that the accreditation is obtained. The DOH will assume responsibility for these personnel costs beyond FY 2011.

Activity 4: Procurement of ARV Drugs

St. Mary's Hospital will be responsible for the procurement of ARV drugs for the patients that will be down referred to the community clinics; until such time that the referral clinic is accredited as an ARV initiation site. These drugs will be packaged at St. Mary's and distributed to down referred patients at the community clinic level.

Activity 5: Possible establishment of a laboratory service at clinic level

There are concerns that the National Health Laboratory Services (NHLS) may not be able to cope with the demand for laboratory services at a clinic level. There may be some need to establish a TOGA tainer at clinic points to assist with this demand. Discussions have not been held with the NHLS or with the DOH, but some discussion has occurred with TOGA Laboratories (a PEPFAR partner).

Modification to Activity 3 in FY 2009:

The hospital will focus less on patient care in-hospital and rehabilitation services and more on the support of the clinics in a more direct manner.

The activities will also directly address the Ethekwini district plans to have additional primary health care facilities providing ARVs by 2009/2010. The service provider recommended by the Department of Health is the provider contracted by the hospital for this support.

SUMMARY:

The proposed St. Mary's Hospital project addresses comprehensive and holistic HIV care and treatment, including antiretroviral treatment (ART) within a hospital setting, with a large focus on training at a community clinic level to ensure that stable patients, once down-referred from the hospital can be treated on a continuous basis at a community level. The major emphasis area for this project is human capacity and the development thereof both in the community as well as in the hospital. The expansion plans for FY 2008 is to provide holistic treatment and care to patients that are experiencing side-effects of ART as well as babies born to mothers that are HIV-infected (described elsewhere in the COP). The care and treatment is extended to the rehabilitation department for adults and children. Some focus will be on community participation, national media campaigns addressing preventative educational messages in partnership with other donors (also described elsewhere in the COP), linkages with other sectors, and the capacity development of local organizations. The primary target populations will be the general population, people affected by HIV and AIDS, discordant couples in special populations, the community, the South African Government (SAG), healthcare providers and other groups, pregnant women and children, partners of pregnant women and people infected with HIV and on treatment as well as children with rehabilitation needs that were born to HIV-infected mothers.

BACKGROUND:

Activity Narrative: Since 2003 St. Mary's hospital has successfully implemented an ART program based on holistic and comprehensive treatment of HIV and AIDS patients. This program was funded through another PEPFAR partner, Catholic Relief Services (CRS) as part of their Track 1 program. Since FY 2005, the USG has added additional funding to St. Mary's Hospital to focus on pregnant women.

Successful treatment of HIV and AIDS requires that patients maintain adherence to medication, incorporating overall wellbeing, including nutrition. The early stages of the treatment program allowed St. Mary's to maintain an average adherence rate of around 90%, which was largely due to a patient-centered model of care. However as the patient numbers have increased St. Mary's has realized that there is a greater need to provide patient support both in the community and to the community clinics. St. Mary's will aggressively address loss-to-follow-up, and ensure a more efficient down referral process of patients from the hospital setting to the community clinics. In the district that St. Mary's serves, it is estimated that 25,000 patients require immediate treatment. Just over 2,500 patients are currently in HIV care and just over 2,200 patients are on antiretroviral treatment at the hospital.

It has been noted that many patients on treatment are experiencing neurological side-effects to treatment that require services associated with rehabilitation both on an inpatient and outpatient basis. In addition there is a need to provide rehabilitation support to HIV-infected patients that are experiencing complications due to opportunistic infections. It is estimated that 60% of the patients attended to by the rehabilitation department are HIV-infected and require extensive rehabilitation support. The hospital delivers approximately 500 babies per month and many of these babies are to HIV-infected mothers resulting in the need for rehabilitation services to mother and infant at a ward and outpatients level. Follow-up is provided to the mother and child upon discharge from the hospital at weekly support clinics held at the PHC facility.

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Human Resource Capacity Training.

As an accredited SAG antiretroviral (ARV) rollout site and as an extension of the service level agreement the Hospital has with the Department of Health, St. Mary's will contribute to the success of the SAG ARV rollout plan through this project. The funding allows St. Mary's to continue to initiate patients on ART, and once stable, down refer them to the community clinics in the area. St. Mary's will assist with the training of health workers at clinic level to facilitate this. St. Mary's has identified local partners as well as the World Health Organization's Integrated Management of Adult Illnesses (IMAI) training toolkit as a vehicle for training. The toolkit makes use of people living with HIV (PLHIV) as expert trainers which are directly aligned to the success of St. Mary's ART program. All three sites within St. Mary's Hospital strongly emphasize human capacity development. Within the entire Hospital setting (including the three ART sites) patients who have tested HIV-positive but whose CD4 counts and staging preclude them from treatment form part of a wellness program. Opportunistic infections are treated at every point of care, and service and nutrition interventions are made, as per SAG protocols and guidelines. Social support services, which may take the form of social grants in accordance with the SAG guidelines, are also initiated as appropriate, providing patients with access to financial resources.

The community clinics surrounding St. Mary's are linked into St. Mary's via the referral patterns already established. The implementing organization will be St. Mary's Hospital and local partners will be recruited to assist with the WHO ART training modules. Gender issues will be addressed throughout the project as well as stigma and discrimination, twinning, the use of US-based volunteers from a training perspective, as stated in the palliative care section. Gender equity will become an increased focus as women are provided with resources (grants, nutrition) and capacitated to become self-sufficient. Through a partnership with the Treatment Action Campaign (TAC) male norms and behaviors will be addressed directly through patient education, encouraging prevention, 'know your status', and promoting family values. A comprehensive nutrition program will be implemented to boost immunity with the patient cohort which will be the responsibility of the dietician employed at St. Mary's Hospital, and is supported via a partnership with the KwaZulu-Natal Department of Health (DOH). As an accredited ARV rollout site this is a vital component to the success of the treatment program. A patient follow-up program, funded as part of the CRS activity treatment program, makes use of therapeutic counselors (TCs) in the community to support patients from St. Mary's Hospital. As the patient numbers have increased, St. Mary's acknowledges that additional human resources are required for patient follow-up and support activities. The current treatment activity program addresses the need to make use of TCs based in the community referral clinics, to help capacitate the clinics to offer support to all patients in the community. This will be part of the clinic strengthening activity plan. It is envisioned that the TCs will mentor community health care workers to ensure the long-term sustainability of ARV treatment in communities.

Activity 2: Pediatric Treatment.

As stated previously, St. Mary's is a DOH accredited ARV rollout site and the partnership will be enhanced and expanded through the additional PEPFAR funding. Within the antenatal clinic, patients who have received PMTCT are followed up post-delivery and if clinically appropriate, placed on antiretroviral treatment. This is a seamless program which also places the children of HIV-infected mothers on ART if clinically appropriate. The program also provides education and nutrition support in partnership with the KwaZulu-Natal DOH. Pediatric HIV care is strengthened through early testing and diagnosis. The hospital has secured the services of a volunteer pediatrician from Harvard Medical School twice a week. The pediatrician will treat HIV-infected children in-hospital and manage children as outpatients from the PHC facility. The pediatrician will also mentor clinical staff in the facility. The main challenge is polymerase chain reaction (PCR) testing and follow-up in this area, given that 19 clinics are being supported in the process. St. Mary's currently has a relationship with Toga Laboratories (a PEPFAR partner) and it is envisioned that counselors visiting clinics will refer patients requiring PCRs to the hospital's PMTCT program so that tests can be conducted through Toga Laboratories.

Activity Narrative: Activity 3: Rehabilitation Services.

The rehabilitation department consists of a physiotherapy department (inclusive of a speech therapist) and an occupational therapy department with a small community outreach service. Care and treatment will be provided to those in and outpatients experiencing ARV side-effects, primarily related to neurological conditions; and care and treatment to HIV-infected inpatients that are severely disabled, who have had strokes or heart attacks. Rehabilitation support is also required to babies experiencing developmental delays born to HIV-infected mothers. The areas of care will be at an inpatient hospital level and primary health care (PHC) level as an outpatient service. Many babies born in hospital are referred to the PHC facility for follow-up, and a clinic treatment day is held for babies experiencing developmental delays. Weekly outreach treatment, education and support clinics are offered to one of the larger referral clinics in the district as well as to children in an orphans and vulnerable children partner program.

By strengthening the down referral system, providing technical assistance to the public sector, and providing supportive treatment for patients on ARVs and affected by HIV and AIDS; St. Mary's hospital is contributing to the PEPFAR 2-7-10 goals.

Program Budget Code: 09

Activity ID: 19526.22823.09

Planned Funds: \$1,016,858

Activity System ID: 22823

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Tshepang Trust (Tshepang)'s general practitioner (GP) model was formulated out of a need by individuals to access treatment services in areas of close proximity to their places of abode for several important reasons:

Patients can access their treatment and medical care outside of working hours without having to miss work because they have had to stand in lines for long periods of time in a crowded healthcare setting. Patients do not have to worry about stigma, e.g. being seen by people they know queuing at an HIV clinic.

The GP model is simply a means to complement government services because it addresses two fundamental challenges that currently face the department of health, infrastructure and medical human resources which are currently lacking in public health facilities. Both the sessional and GP models are an effective short and immediate way for South Africa to reach its National Strategic Plan (NSP) targets. This is because 70% of the medical resources including HIV Clinical Management skills are in the private sector in the form of GPs versus 80% of South Africa's population that is dependent on the poorly-resourced public health care system.

Long-term sustainability depends on all HIV and AIDS patients being cared for by the state and when the public health care system is stronger and stable enough with systems in place to take on the challenges of care and treatment, Tshepang will, in cooperation with government, find ways of returning the patients currently seen at GP's rooms back to state facilities. Taking the challenges mentioned above into account, this can realistically take place in another three to four years. To take patients back to state facilities now would create more of a burden for the public health system rather than assist in ensuring that the country reaches its NSP treatment goals of ensuring that 80% of all individuals needing ART receive it by 2011.

All Tshepang-contracted GPs are skilled professionals who have been trained in HIV clinical management that acknowledges South African Government (SAG) standards and procedures for HIV care and management. Furthermore, Tshepang protocols on HIV disease management are based on the SAG national guidelines and the Tshepang model ideally (although not always possible) has been to utilize GPs who would also assist at local public sites in order to ensure that they understand clinic procedures and work according to national guidelines.

Tshepang started off as a sub-grantee of American Center for International Labor Solidarity (Solidarity Center) commissioned as a treatment partner in the Prevention Care and Treatment Access to South African Teachers (PCTA) program. The partners within the PCTA consisted of four South African teacher unions, the Academy for Education Development (AED), the Federation of American Teachers (AFT) and the Solidarity Center being the prime recipient of funding from PEPFAR for all these partners. Within this partnership teacher unions would refer their colleagues for HIV and AIDS treatment to Tshepang and later as the program evolved also referred them for testing. The funding cycle for the Solidarity Center grant came to an end in March 2007, but the Center gave Tshepang a no-cost extension to continue with testing and treatment services until December 2007.

In the meantime, a request for proposals was issued by PEPFAR via the CDC for a five-year cooperative agreement for a workplace intervention program (WIP) to run from FY 2007 until FY2012 and Tshepang applied. The organization was awarded the grant and could now receive direct funding from PEPFAR through CDC to provide counseling, care and antiretroviral therapy (ART) treatment to individuals in the workplace in order to continue with the treatment of teachers from the PCTA program but also extend the program to include Health Care workers and workers from the Small Medium Micro Enterprises (SMMEs), their spouses and immediate family dependents. WIP is based on the GP model. The funding cycle for WIP started in October 2007 but because of the no-cost extension mentioned earlier, the organization only started using its grant funds with effect from January 2008.

SUMMARY:

Tshepang is now moving towards a holistic approach to care and treatment with the cycle starting from routine counseling and testing as part of prevention and early detection as per national guidelines and the NSP, then care (which includes cotrimoxazole prophylaxis, TB screening and cervical cancer prevention) and ultimately ART. Adult treatment at Tshepang has always been family-orientated with primary members including their spouses and immediate dependents being enrolled into the program, however there have not been many dependents joining, since the program is a workplace program, not many individuals enrolling come with children into the program although they are catered for. For example between January and June 2008, only 41 dependents, 33 adults and 8 children have been enrolled onto the program versus the 654 that were enrolled as primary recipients. Tshepang aims to focus more on couple counseling and being more aggressive in enrolling the partners of recipients into treatment particularly men and children. This will be done through GPs as part of ongoing counseling during consultations and also through Patient Managers as they continue with adherence counseling on a monthly basis.

ACTIVITIES AND EXPECTED RESULTS:

Modified Activities:

In the FY 2009 COP, 1,350 individuals will be maintained on treatment plus additional 200 new initiations to offset individuals that might fall off the program. Tshepang believes that this will allow it to focus on incorporating the new activities and stringently monitoring adherence, treatment success and following up on pre ART enrolled people.

In terms of monitoring outcomes, the Trust will be increasing its efforts on monitoring 6, 12 and 24 monthly cohorts, ensuring that individuals timeously do their repeat blood tests for CD4 counts and viral loads. The Trust will also be focusing on recording major side effects and adverse events. Tshepang recognizes the need to focus more on monitoring and evaluation (M&E) and will endeavor to allocate at least 4% of its treatment budget towards M&E.

Activity Narrative: New Activities:

The Trust will also offer nutritional supplements in the form of multivitamins to its patients as a new activity that enhances current services.

INTEGRATED ACTIVITY FLAG:

SUMMARY:

This activity is on services rendered in order to make the provision and access to ARVS possible for the 1,000 individuals targeted for FY 2007. This activity includes doctor consultations for existing and new patients on ARVs, patient on a wellness program and laboratory services.

This activity is a follow-on to the partnership with the American Center for International Labor Solidarity. With FY 2007 PEPFAR funding, the USG issued an Annual Program Statement to solicit partners to provide comprehensive prevention, care and treatment services in a workplace setting. Tshepang Trust was selected as one of the partners to continue implementing HIV and AIDS workplace intervention. Treatment will continue to be provided to workers and their dependents living with HIV in selected small to medium enterprises (SMEs) in the health and education sector. Care and support for HIV-infected workers will be provided through wellness programs in workplaces and through referrals to community-based organizations.

BACKGROUND:

Whilst business has become somewhat more responsive to the needs of its employees to encourage testing for early detection and treatment of its employees in larger corporations, the reality is that there are still very low levels of counseling and testing in the workplace. Employees still do not trust that by enrolling in workplace HIV programs, they will not be discriminated against. The situation is worse in the small medium enterprises (SMEs) because unlike big corporations, SMEs are failing to follow the lead of their counterparts in providing counseling and testing services to their work force. As a result, SMEs need assistance in providing and developing a workplace response to HIV and AIDS.

The Tshepang Trust (also known as Tshepang) is the South African Medical Association (SAMA)'s HIV and AIDS program initiated to bridge the gap in medical resources using private general practitioners (GPs) in the public private partnership model in order to assist the South African government fight against HIV and AIDS. SAMA has more than 5000 private medical practitioners in the private practice trained in HIV clinical management. Tshepang has been in existence since June 2003 and is a registered local non governmental organization (ngo) operating as a trust under Section 21 of the South African Companies Act. This is a workplace program targeting small medium enterprises (SMEs) employees, their partners and dependents using general practitioners and their consulting rooms as sites. For this initiative Tshepang trust is in the process of forming collaborative relationships with two South African corporate companies to establish a HIV and AIDS workplace program. In addition to this initiative, Tshepang will work with the healthcare sector, targeting personnel in hospitals and clinics within the Gauteng area. Tshepang Trust currently has strong evidence of leadership support from the South African Government through a public private partnership with the Gauteng provincial department of health to enhance the scale up of HIV counseling and testing (CT) and treatment in Gauteng's ARV sites. Tshepang currently serves over serviced rural areas in South Africa utilizing general practitioners who are located mostly in rural areas. Using this model, Tshepang has developed a public-private partnership between SMEs where employees and their dependents can access private GPs in areas close to where they are employed without fear of discrimination of being absent from work. In addition all of the general practitioners are within reach of the targeted audiences and are local and indigenous and therefore able to relate to the target population according to their culture and in local languages. The geographical coverage area for this project is KwaZulu-Natal, Mpumalanga, and Eastern Cape province. The emphasis area for this workplace activity is development of networks, linkages, referral systems. The target population for this initiative is men and women of reproductive age working in SMEs, their partners and dependents. This includes factory workers, teachers working in the education sector and healthcare workers working in the public healthcare sector. The emphasis areas for this activity will be information, education, communication and development of network/linkages/referral systems.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: GP Network Model

Through a public-private partnership among workplaces, NGOs and government, participating workplace programs will employ the services of doctors to provide antiretroviral therapy (ART) to workers who qualify for treatment. The doctors will continue with refresher course training in HIV and AIDS clinical management and will have experience in drug purchasing, ART and PMTCT treatment and surveillance. The doctors will perform a clinical examination and staging, including taking blood for CD4 testing of patients. A viral load test will be done before the start of treatment. The treatment services will utilize South African Department of Health standards and guidelines. All patients will receive their drugs from the doctors' rooms. The Tshepang Trust will through its contracted dispensing and delivery service provider ensure that the delivery system keeps stock of and is able to deliver antiretroviral therapy medications to any physical address. Special care will be taken to ensure that patient confidentiality is not compromised.

By providing comprehensive ARV services, including patient eligibility testing and drug procurement, workplace HIV prevention programs will provide HIV-infected workers in small and medium enterprises in the health and education sector with care and treatment.

Activity Narrative: ACTIVITY 2: Treatment advocacy campaign

FY 2007 funding will be utilised to provide treatment literacy materials and information on treatment services available in the respective targeted areas. This may include links for patients to a toll free support line. Information on how to access testing and treatment services will be disseminated through SMEs, hospitals and the teachers' and healthcare workers' unions.

ACTIVITY 3: Providing ART services

Workers who are HIV-infected and require ART will be able to access these services through the Tshepang Trust. All workers will receive a unique identifier which will be used for tracking and monitoring the treatment services and protect the identity of the patient. The Tshepang Trust contracted GPs will provide the range of ART initiation services, including all relevant laboratory testing, and adherence counseling. The identified treatment partners will use South African Government treatment guidelines and protocols. About 150 individuals who are not working from the Orange Farm community will be included as part of the 500 existing patients on treatment.

ACTIVITY 4: Monitoring and reporting

The treatment partner will track all relevant patient data for monitoring and reporting purposes.

Providing comprehensive treatment services in a workplace setting will contribute to the PEPFAR 2-7-10 goals. These activities will also support the care and treatment objectives laid out in the USG Five-Year Plan for South Africa.

Program Budget Code: 09

Activity ID: 8260.22731.09

Planned Funds: \$631,088

Activity System ID: 22731

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The ongoing training and mentoring of Outreach Workers (OWs) will be expanded, and on-the-job training will be provided to ensure the incorporation of practical skills in the work situation. Xstrata will strengthen and implement the integration of drugs and lab costs into the department of health systems in three districts in Mpumalanga - Ngakala, Gert Sibande, Ehlanzeni (focusing in Breyten especially).

Antiretroviral therapy (ART) adherence training will be included as well as integrated to fit into skills applicable in the work situation.

FY 2009 funding will contribute to the additional evaluation and development of systems and program frameworks.

Focus will be shifted to include not only infrastructure development (space), but also the need to establish co-invested partnerships with local government to support health systems strengthening.

Xstrata will enhance the OW project through the identification and partnering of service providers already working in the communities providing community-based services such as home-based care, adherence counseling, referral for counseling and testing, support groups, nutrition counseling, and tracking and tracing of defaulters to enhance Adult Treatment services.

The OW program not only identifies other stakeholders, but builds relationships and creates a resource list of services offered in the community. This modification will allow for the development of a feedback and review mechanism to facilitate information sharing at a community and district level.

SUMMARY: Xstrata is a new PEPFAR partner, which received funding in FY 2007 for a public-private partnership with the Mpumalanga Department of Health (MPDOH). The implementing partner for this is Re-Action! Consulting (RAC). RAC will facilitate a co-investment partnership with Xstrata to provide support for strengthening targeted government clinic sites, continuing to improve access to basic preventive, clinical care and psychosocial support services in one district of Mpumalanga, extending into a second district during FY 2008. The project will build on a public-private mix model for strengthening HIV and TB service delivery that Xstrata and RAC has already begun to implement in the province with funding from Xstrata (dollar for dollar match with PEPFAR). Xstrata and RAC will work through established partnerships with local government, MPDOH, community groups and private providers. Project deliverables have been defined in response to specific requests for assistance from the MPDOH. Major emphasis will be given to development of human capacity development, local organization capacity building and strategic information. The target populations are underserved communities of men, women and children and people living with HIV and AIDS in Nkangala district, extending to a second district during FY 2008, where Xstrata Alloys has its operations. BACKGROUND: Xstrata Coal is a subsidiary of a multi-national mining group committed to practical ways of achieving sustainable development and contributing to the health and social welfare of employees and their communities. The company employs 4,000 people at 11 mines (collieries) located within the socio-economically deprived Coal Powerbelt region of Mpumalanga. Xstrata Alloys has more than 10,000 employees with operations in 3 provinces (Mpumalanga, Limpopo, and North West) and Swaziland. This funding partnership enables scaling up the community extension component of Xstrata's comprehensive workplace HIV and AIDS program that is managed by RAC. The project is based on implementing a public-private mix service-strengthening model of capacitating government providers within primary care clinic sites to deliver HIV-related preventive, clinical and psychosocial care services. FY 2008 funding will allow continued support to sites established in FY 2007 (working towards full site accreditation) and to expand the number of sites within two target districts. The scope of assistance is defined within a Memorandum of Understanding between Xstrata and the Mpumalanga Department of Health and Social Services (MPDOH), and responds to specific requests for support by the provincial department's HIV and AIDS Unit, as well as the district management teams. This fits within a broader range of interlinked corporate social investments being made by the Xstrata Group to support sustainable local development in these communities. The project will provide technical assistance, health workforce capacity development, clinic infrastructure improvements, strengthening of pharmaceutical supply management systems and service monitoring for public sector primary care clinics to deliver quality HIV-related preventive and clinical care services. This will contribute to strengthening district-level primary health care service networks and district service management, with a strong focus on improving human resource capacity, including through training and deploying community outreach workers to deliver household-level services. The project works in partnership with other PEPFAR partners in the province to achieve synergies and avoid duplicating activities. ACTIVITIES AND EXPECTED RESULTS: Four activity areas will be implemented to strengthen and scale up antiretroviral treatment provision at government health care sites within two districts of Mpumalanga. Service improvement plans will be implemented at each site based on specific service strengthening needs that are identified and agreed with District Management Teams and facility managers. This will result in these clinics being accredited by the Department of Health as antiretroviral treatment sites (for 'down referral' and/or treatment initiation) with stronger links to referral-level facilities. Referral linkages with antenatal clinic services will be improved to ensure continuing care of infected mothers and their children. Activities at Witbank Hospital will be coordinated with the Foundation for Professional Development (a PEPFAR partner). Discussions are also underway with private companies to commence activities in the Northern Cape. ACTIVITY 1: Strengthening primary health care and district hospital delivery of HIV-related treatment and related clinical care services A multi-skilled RAC Service Strengthening Team will undertake a detailed situation analyses (together with the district management team) within each target sub-district to identify specific service strengthening needs and prioritize sites for accreditation/down referral. Service improvement plans will be developed to systematically address these needs. Strong linkages will be created between these first-level sites and second-level facilities for appropriate referral of patients and 'down referral' of treatment, where necessary. Services will be improved overall to ensure that HIV-infected adults and children attending these sites have access HIV-related treatment, care and support interventions and that these services are appropriately integrated into routine primary care services, so that service capacity is strengthened overall. Physical upgrades to clinic infrastructure will be undertaken

Activity Narrative: through Xstrata co-investment and essential equipment will be procured. Health information management systems and patient monitoring systems will be strengthened through in-service training, technical assistance and procurement of equipment where necessary. Trained and supervised community outreach workers will be deployed to undertake household-level health risk assessments (with particularly emphasis on reaching women and children) and provide referrals for HIV treatment, treatment literacy, follow-up and adherence support within households and to recover treatment defaulters. Health worker training needs will be addressed through suitable in-service training delivered in collaboration with other PEPFAR partners, based on national standards and integrated management approaches. Technical assistance and training will be provided to improve public sector human resource management capacity so that health workers can be more effectively recruited to fill vacant positions at these sites. Critical staff positions will be filled to ensure that HIV treatment services are not compromised. Appropriate task-shifting will be encouraged. **ACTIVITY 2:** Direct HIV care and antiretroviral treatment provision A multi-disciplinary care team will continue scaling up delivery of chronic HIV care and treatment at the selected clinics in the province. MPDOH sites will be assisted with human resource capacity to deliver HIV services for patients initiated and already on antiretroviral treatment. Antiretroviral drugs to eligible community members at these sites will be provided by the MPDOH through a down referral mechanism. Access to TB diagnosis and treatment will be improved at supported sites by implementing TB/HIV collaborative activities such as active HIV screening of TB patients for early ART initiation. **ACTIVITY 3:** Community Support Linkages with community-based service organizations (including faith-based organizations and non-governmental organizations) will be strengthened and all providers will be encouraged to participate in delivering their service tasks in more coordinated ways through the 'public-private mix' approach (which RAC will support district management teams to oversee). Peer support groups will be established at all sites and linkages to the community will be strengthened through community outreach services. Community outreach workers will assist with patient retention in treatment programs by conducting home visits to assess why patients are defaulting on clinic visits and make appropriate referrals. Sustainability of this activity area for ongoing support to deliver antiretroviral treatment is assured through the public-private partnership (PPP) between Xstrata and the Mpumalanga Department of Health. By providing support for HIV treatment in underserved communities, Xstrata is contributing to the 2-7-10 PEPFAR goals.

With FY 2008 reprogramming funds, RAC will expand support for comprehensive HIV care and treatment services in an additional district in Mpumalanga (Gert Sibanda), and also expand the public-private mix model in 3 new provinces (Limpopo, North West and Northern Cape).

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

One main Regional Training Centre (RTC) mandate is to ensure training accreditation. The current training module and materials based on national guidelines will be formalized into a certificate and diploma qualification with technical support of partners such as ITECH, and will be offered by Walter Sisulu University. This will give recognition to the current training and develop career path for health workers RTC is training.

RTC will be scaling down direct patient care in future to concentrate on training. As advised by province, RTC will be setting up Centers of Excellence. RTC will work closely with the HIV Directorate and other relevant departments in the department of health to increase the current RTC onsite mentoring approach, to cover more sites for longer periods, and to improve other aspects of care, such as TB, infection control, integrated management of childhood illness (IMCI). RTC will work to establish district-based performance improvement projects, specialist clinics with wellness programs as centers of excellence, where clinicians can rotate for specified periods to acquire specific skills.

SUMMARY:

The Eastern Cape Regional Training Center (ECRTC) will use FY 2008 funds in the Eastern Cape to strengthen the capacity of healthcare workers (HCW), facility managers, social workers, doctors, nurses, lay counselors and community health workers (CHW); prepare new sites for accreditation; and provide mentoring to strengthen the provision of quality antiretroviral treatment (ART). Activities in this program area will expand by recruiting an extra centrally based physician and pharmacist to strengthen the existing teams and continue supporting the original 2 hospitals and 11 clinics in Mthatha. Three training, mentoring and support teams from ECRTC will be strengthened by recruiting an additional 2 clinical training officers, and will each continue to support a facility and its referral clinics for a period of four months to initially evaluate the treatment services training needs and provide targeted didactic training, ongoing mentoring and coaching by performance improvement officers on a continuous basis using standardized procedures manual and tools, when the lead training teams have moved on. The creation of a learning network will expand community support groups where PWAs will be trained to implement a basic HIV and AIDS care package including ART. The emphasis areas are human capacity development and local organization capacity building.

BACKGROUND:

The ECRTC was established through a service agreement between the prime partner Eastern Cape Department of Health (ECDOH) and Walter Sisulu University (WSU) to provide ongoing training for quality improvement in HIV care and treatment programs.

The function of the ECRTC has been to develop accredited training modules and care protocols for different categories of health workers based on National Department of Health guidelines. ECRTC has demonstrated and evaluated the HIV, TB and STI best practices continuum of prevention, care and treatment model in selected facilities, providing direct patient care and the opportunity for HCW to receive practical training. ECRTC provides technical assistance to the ECDOH regarding the expansion of its HIV intervention programs, and supports hospital and clinic site readiness for accreditation to provide comprehensive HIV care and treatment.

The primary target populations are the facility managers, doctors, nurses, social workers, lay counselors, CBO staff and community health workers.

During the past three years ECDOH has introduced a comprehensive HIV care and treatment program. After workshops alone HCW were unable to implement programs. A number of patients have been started on ART at hospital level, but there is a gap in preparing primary clinics to continue supporting patients (down referral). Many eligible patients are started late on ARVs which results in poor outcomes. There is limited awareness and skill among clinics to enable early diagnosis and entry into the care system. There are known drug-drug interactions in patients with co-treatment of ARVs and other drugs and a number of side-effects and complications are beginning to emerge. There is a need to provide facility-level mentoring support from more experienced clinicians.

The ECRTC has been working with provincial ART managers in developing and disseminating care protocols and will be providing support and working closely with the district and facility managers in introducing the process to increase skills capacity to improve the quality of HIV treatment.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008 ECRTC activities will continue to address the following activities: training; local organization capacity development; quality assurance; and supportive performance improvement supervision. Funding will be used to enhance the ECRTC strategy of training, preparation of new facilities for accreditation as ARV sites, and providing clinical mentoring to selected sites but also building patient Information management and training. ECRTC will use funds to employ and support administration and logistics of a comprehensive care training team consisting of a clinical director, three doctors, three nurse clinicians and three administrative assistants (for three teams), one each placed at the three satellite sites (Mthatha, Port Elizabeth, and East London). Each team will provide dedicated support to three district hospital sites and their referral clinics for a period of four months, and then move to the next three sites for the next four months, completing three cycles a year.

ECRTC will use funds to employ a research and M&E manager, information systems officer and a central information officer supporting the 3 teams and continued facility/clinics records management and reporting capacity building. The M&E team be responsible for monitoring and evaluation of all ECRTC activities,

Activity Narrative: through accurate measurement of results, designing M&E tools for the teams/clinics and knowledge database maintenance The activity will address the priority areas of human capacity development, improving skills of a care team at facilities (doctors, nurses, managers, social workers, health promoters and CHW) through targeted didactic training, case discussions and mentoring in assessing, initiation, follow-up and monitoring of patients on ARVs while considering and reviewing relevant local system issues. Ongoing support will continue with telephone consultations after the four months. ECRTC will train and mentor 35 facilitators from 7 NGOs who will cascade the training of a comprehensive curriculum for community health workers to include ART.

ECRTC training and mentoring will address data collection, maintaining accurate records, feedback and usage through quality improvement cycles to address early presentation, follow-up of patients for adherence, complications and pharmacovigilance.

Training of facility staff, a CBO and community health workers will emphasize follow-up and tracking mothers from the PMTCT program to enable PCR screening, early detection and referral of children into the care and treatment programs.

The primary objective of the project is sustainable, targeted human capacity development for the HCWs. ECRTC staff will also continue to develop and improve their knowledge and skills by having weekly academic discussions, attending relevant conferences and ongoing mentoring from local experts and visiting experts through collaboration with partners I-TECH and the Owen Clinic.

In the past twelve months with PEPFAR funds, ECRTC has developed protocols and models which have been introduced in the province as new sites are supported for accreditation. More than 27 treatment sites have been supported for accreditation and the ECRTC will continue to support accreditation of new sites in FY 2008. A system of improvement cycles has been introduced. A pharmacovigilance program has been piloted in two hospitals and nine clinics, which highlighted a number of complications as well as drug-related problems, which will be addressed through the training and mentoring program.

This activity contributes to the PEPFAR objective 2-7-10 by increasing the capacity of the public sector to effectively provide HIV care and treatment services. These activities are not at the site level but are more system strengthening activities and constitute what is considered 'indirect' support in the Eastern Cape province. Therefore there are no direct targets for numbers of people reached.

Program Budget Code: 10 - PDCS Care: Pediatric Care and Support

Total Planned Funding for Program Budget Code: \$7,192,004**Program Area Narrative:**

The vision for the PEPFAR South Africa team for Pediatric Care and Treatment is to support the South African Government (SAG) policies and programs to provide comprehensive HIV care and treatment services to all those in need. It is estimated that currently 5.7 million people in South Africa are HIV-infected, and that ~1.7 million are in need of treatment. A significant number of the HIV-infected are children living with HIV. According to the Human Sciences Research Council survey in 2005, there are an estimated 129,621 children aged 2-4 years and 214,102 children aged 5-9 living with HIV.

The 2003 Comprehensive Plan for HIV and AIDS Care, Management and Treatment (Comprehensive Plan) states that its primary aim is comprehensive prevention, care, and treatment for all in need with the target of universal access to antiretroviral treatment (ART) over a five-year implementation period (2004 – 2009). The goals of this plan are reiterated in the new South Africa National Strategic Plan for HIV & AIDS and STI, 2007-2011 (NSP). The plan emphasizes that children under 18 constitute 40% of the population of South Africa, making this a key target group for HIV prevention, care, and treatment services. The NSP aim for 2009 is to start 33,000 children on treatment and to provide care for 250,000 children.

The USG has contributed significantly to these goals and targets, and with the support of the PEPFAR program, 550,000 people are currently on ART in South Africa, of which 50,000 (10%) are children 15 and younger (30% of children on ART are under 5 years), and more than 1.4 million people receive appropriate care and support (C&S) including palliative care. South Africa has exceeded its PEPFAR treatment target set for September 2009 one year early and continues progress to meeting the care and support targets. The PEPFAR-funded treatment programs have maintained excellent retention in program since implementation in 2004. Cumulatively, only 15% of patients started on treatment have died, stopped ART, or were lost to follow-up. Treatment and care partners are progressively improving their capacity to measure outcomes.

Only 13.7% of South Africans have access to medical insurance. The estimated 1.2 million adults and children still in need of ART are primarily dependent on the public sector for care and treatment services. The number in need will continue to rise, especially in light of revised national guidelines raising the threshold for ART eligibility from a CD4 of 200 to 250.

Much more needs to be done to ensure that the ART coverage (currently estimated at 30%) comes closer to the targets set by the SAG. Maintaining the estimated 500,000 adults and children on treatment, and reaching the additional 1.2 million who need ART requires continuous investment in treatment services in South Africa.

The National Department of Health (NDOH) has allocated approximately \$410 million USD for the implementation of the Comprehensive Plan in FY 2009 (prevention, care, and treatment), mainly through conditional grants to the nine provinces. According to the NSP Costing Plan, the total need for funding for ART alone in 2009 is \$710 million for adults and an additional \$128 million for children (a total of \$838 million), clearly indicating the need for additional funding and support to the SAG and civil

society. Much of this funding is directed to the purchase of antiretroviral (ARV) drugs since all drugs for the public sector ART program are procured and supplied by the SAG. The SAG also provides, in some instances, the ARV drugs for non-governmental organizations (NGOs) and private sector programs with PEPFAR funding other service components. The USG is ideally positioned to support the implementation of the NSP by ensuring equitable access to quality HIV care and treatment through support to the SAG by PEPFAR-funded partners. Major donors (Ireland, DFID/United Kingdom, European Union and the Netherlands) contribute to care and treatment-related services, such as mass media communication campaigns, home-based care programs, and policy development in the National Department of Health, but the USG is the only donor funding direct ART services. Other contributing donors to the care and treatment program include Canadian International Development Agency, The Global Fund, The Elton John Foundation, and several public-private partnerships. The USG meets with the major donors several times per year in various fora to discuss activities, explore collaborations, and minimize duplication of effort.

The capacity to deliver pediatric care and ART services varies significantly within the country, although additional funding in FY 2008 has been devoted to improving access to pediatric care and ART, especially through training activities and technical assistance. These efforts will continue in FY 2009 where despite a budgetary reduction for PEPFAR in South Africa, services for mothers and children (prevention of mother-to-child transmission (PMTCT), orphans and vulnerable children (OVC), pediatric care and treatment) have been prioritized and in some cases funding has even increased.

PEPFAR partners continue their efforts to reach a pediatric target of 15% of the total treatment population by the end of FY 2009. By September 2010, PEPFAR South Africa is targeting 13% of pediatrics on treatment.

In addition to the human capacity development activities, emphasis in FY 2009 is placed on early diagnosis for infants and children, the referral of children from PMTCT programs to treatment services to integrate HIV and AIDS services more efficiently, onsite mentorship, and linkages between OVC programs and pediatric treatment programs. Based on OGAC guidance, partners are also incorporating nutrition support, especially for children. The NDOH has requested that community integrated management of childhood illnesses (IMCI) activities be integrated into the community component of care and treatment and this is reflected in the activities of care and treatment partners in FY 2009.

The key pediatric care and treatment priorities for the USG in FY 2009 are: 1) developing human capacity, especially at primary healthcare level; 2) strengthening decentralization of HIV care and treatment, including building capacity for nurse-initiated ART; 3) encouraging early identification of children in need for HIV care and treatment services (e.g., provider-initiated counseling and testing (CT)); 4) CD4 testing for those that test HIV positive and dried blood spot PCR at six weeks; 5) strengthening the capacity to diagnose and treat TB in children; 6) continuing to strengthen the integration of treatment programs within other health interventions (e.g., PMTCT, cervical cancer screening, and reproductive health); 7) providing cotrimoxazole prophylaxis to all HIV-exposed children from 6 weeks of age; 8) fast-tracking children eligible for ART; and 9) reducing loss to initiation of treatment of children that test HIV positive, and loss-to-follow-up once on treatment.

The key PEPFAR C&S priorities focusing on pediatrics in FY 2009 are to strengthen quality HIV and AIDS palliative care service delivery and to implement standards of care. PEPFAR will support this effort by: 1) strengthening the integration of the basic care package and family-centered services across all care and treatment programs for adults and children living with HIV; 2) increasing the number of trained formal and informal healthcare providers, building multidisciplinary teams to deliver quality care with pain and symptom control and improving human resource strategies; 3) building active referral systems between community home-based caregivers (CHBCs) and facility services; 4) developing quality assurance mechanisms, including integration of supervision systems and standardization of services and training; and 5) translating national policy, quality standards, and guidelines into action, particularly national adoption of the basic care package. PEPFAR partners will advocate for new national guidelines to improve access to pain management including the authority for nurse prescription. In collaboration with SAG, FY 2009 funds will scale-up direct delivery of quality palliative care services.

All PEPFAR-funded care and treatment partners (the majority of whom are local entities) follow SAG standards, policies and guidelines. The USG program continues to strengthen comprehensive high quality care for HIV-infected and affected people by: 1) scaling-up existing effective programs and best practice models in approximately 900 public, private, and NGO sites in all 9 provinces; 2) providing direct care and treatment services through prime partners and their sub-partners; 3) increasing the capacity of the SAG to develop, manage, and evaluate care and/or treatment programs, including recruiting additional health staff, training and mentoring health workers, improving information systems, conducting public health evaluations, and providing service infrastructure assistance; 4) increasing demand for and acceptance of ART through community mobilization; 5) ensuring integration of ART programs within palliative care, TB, reproductive health, STI, and PMTCT services; and 6) assisting in the accreditation of facilities for ART initiation.

The USG supports a holistic, family-centered approach to HIV and AIDS care that begins at the onset of HIV diagnosis, throughout the course of chronic illness, to end-of-life care. This is of particular importance when working with HIV-infected pediatric individuals. In order to ensure that all HIV-infected clients have access to basic care services and to minimize loss to initiation (currently at about 70%), PEPFAR partners will provide a basic package of services for all HIV-infected individuals. This package will include acceptance of status, disclosure, prevention with positives (PwP), psychosocial support, nutrition assessment and counseling, pain assessment and referral, treatment literacy and adherence counseling, and outreach services to trace clients who have defaulted from the program. Emphasis will be placed on ensuring that HIV-infected individuals who are eligible receive cotrimoxazole as per national guidelines. This package of services will be offered at community level through support groups for individuals and care givers. These support groups (primarily run by people living with HIV (PLHIV)) will serve as a link between the health facilities and the community to ensure a continuum of care. Counseling and testing sites will refer all clients (or their caregivers) testing positive for HIV to the support group in their area.

Human capacity in the health care system is under strain, and coordination between public and private sectors and facility and community-based care remains fragmented. FY 2009 investments will result in an improved continuum of clinical, psychological,

spiritual and social care, and prevention services for PLHIV. The NDOH leads and coordinates national efforts to advance palliative care. Partnering with the NDOH at all levels, PEPFAR partners will continue to support the integration of standardized quality palliative care services into primary health care as well as build HIV-related care services into CT, TB, ART, PMTCT, and prevention programs and reproductive health services, STI sites, workplaces, and CHBC sites, including for OVC. This will build on previous investments in supportive care to improve access to preventive care and basic clinical care services for PLHIV at the community level.

The minimum care standard for facilities includes the following elements of the preventive care package and other essential care interventions, including: 1) prophylaxis and treatment for opportunistic infections (OIs), per national guidelines - cotrimoxazole prophylaxis for stage III-IV disease, CD4<200 or HIV-exposed/infected children; TB screening and management, isoniazid preventive therapy in selected sites, and candidiasis screening and management where the Diflucan/Fluconazole partnership exists; 2) CT to partners and family members; 3) nutrition counseling, clinical measurement and monitoring, micronutrient support according to WHO guidelines, and wrap-around support; 4) STI care; 5) routine screening and management of pain and symptoms; 6) child survival interventions for HIV-infected children (e.g., immunizations, growth monitoring, and safe infant/young child nutrition); 7) integrated PwP strategies including messaging, condoms, support for disclosure of status, referral for family planning and PMTCT services, ART adherence education, leading healthy lives, reduction of risk behaviors, and reduced rates of HIV transmission; 8) provision of at least one element of psychological, social, or spiritual care, or prevention services (emphasizing the holistic approach); and 9) referrals to other services.

The minimum standard for services at CHBC levels includes messaging, mobilization, and referral (with follow-up) for the above mentioned services plus routine screening of all PLHIV and their family members (including OVC) for OIs, TB, symptoms and pain; prevention messaging and condom provision; personal hygiene strategies to reduce diarrheal disease, and distribution of insecticide-treated nets where appropriate. Home and community settings often facilitate delivery of a more comprehensive response including the provision of bereavement care, household support, and community support meetings. PEPFAR partners will continue to strengthen adherence to national standards with emphasis on relief of pain and symptoms and the provision of culturally appropriate end-of-life care. The package of services at facility and community levels also includes medication adherence support for ART, TB, and OI. At all levels, attention will be given to increasing gender equity in accessing HIV and AIDS programs, increasing male involvement in community programs, reaching pediatric patients, addressing stigma and discrimination, and building partnerships with local NGOs and faith and community-based organizations.

In FY 2009, the USG will continue to use a minimum requirement for someone having received C&S, including palliative care, which reflects a minimum standard of HIV-related services, aligning the program more closely to WHO standards. An HIV-infected individual must have received at least one form of clinical and one other type of non-clinical care. For HIV-affected family members, the minimum requirement would be that the individual receive services in at least two of the five categories of clinical, psychological, social and spiritual care, and prevention services. While quality is very difficult to measure through routine indicators, this reinforces the message that PEPFAR is not simply interested in counting the number of people reached, but trying to reach individuals with appropriate and quality care.

Table 3.3.10: Activities by Funding Mechanism

Mechanism ID: 4760.09	Mechanism: N/A
Prime Partner: St. Mary's Hospital	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: Pediatric Care and Support
Budget Code: PDCS	Program Budget Code: 10
Activity ID: 22812.09	Planned Funds: \$137,202
Activity System ID: 22812	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Assurance of dedicated palliative care team and trained personnel to ensure delivery of quality services for pediatric patients;
- Commodity procurement for HIV-exposed and infected children.

SUMMARY:

St. Mary's Hospital in Durban, KwaZulu-Natal will implement palliative care activities that encompass human resources, training and consumables, focused on children 0-15 years. A dedicated palliative care team will identify and provide clinical, spiritual, psychosocial, social and preventive support to the HIV-infected client and family. A hospital-wide education program will be initiated to enhance knowledge of palliative care practice. In addition a number of consumable items will be purchased to assist in managing pain and symptoms related to HIV and AIDS and ensuring comfort of persons living with HIV (PLHIV). The emphasis areas of the project are related in particular to human resource support for the palliative care team, training, commodity procurement and the development of networks/linkages/referral systems. The primary target population is pregnant mothers and children.

BACKGROUND:

This is a split program with adult care funded since FY 2007. The project is an expansion of the current palliative care program that is based at St. Mary's Hospital. The hospital, established in 1927, serves a peri-urban/rural community of 750,000 people, a third of which are HIV-infected. The community has a high unemployment rate of around 60% and an estimated 25,000 people in the community require anti-retroviral therapy (ART). On an annual basis approximately 700 children of St. Mary's inpatients require palliative care support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Dedicated Palliative Care Team and Trained personnel to Ensure Delivery of Quality Services

The overall objective of this activity is to ensure that patients who require palliative care and their affected families are adequately supported in the hospital and in their surrounding communities; including clinical, spiritual, psychological, social, and prevention support. Patients and families requiring palliative care will be identified in the inpatient, maternity section, pediatric outpatient and ART clinic, and hospice care settings. The HIV-related services offered by the hospital and its hospice service is based on the belief that the palliative care activity is central and automatically provides a network of services, from counseling and testing, stigma reduction, integrated preventions services, including prevention with positives, ART and adherence, counseling and support to the individual and family, end of life care, referral to other organizations and continuous education and support thereafter to all concerned. The palliative care team will work with other facility-based health providers to ensure that HIV-infected children in all facility settings are either provided or referred (with follow-up) for evidence-based preventive care interventions which include the following: OI screening and prophylaxis (including cotrimoxazole, TB screening/management), counseling and testing for clients and family members, safe water and personal hygiene strategies to reduce diarrheal disease, appropriate child survival interventions for HIV-infected children and nutrition counseling, clinical measurement, nutrition monitoring and targeted support based on WHO criteria for severely malnourished PLHIV. The package of services also includes basic pain and symptom management and facility-based support for adherence to OI medications (including cotrimoxazole prophylaxis and TB treatment) and antiretroviral therapy (ART).

Community and home-based psychological support, stigma reduction strategies and adherence support for OI medications and ART will be provided by therapeutic counselors (TCs) who are trained PLHIV, employed by the hospital that visit the patients and their families in the community. In addition to care for PLHIV, therapeutic counselors and hospital staff will also expand their provision of psychological, spiritual and social support of affected family members. A complex referral network to a number of organizations, inter alia the KwaZulu-Natal Department of Health (KZNDOH), the Ethekwini Metropolitan (Durban), other non-government organizations (NGOs), the Highway Hospice, and the Dream Centre exists and is used on a proactive basis. A dedicated palliative care professional nurse and pastoral care worker will manage this activity, with additional involvement of other members of the palliative care multi-disciplinary team including hospital doctors and nurses, a social worker and the community outreach coordinator. The palliative care program is managed and administered via the organizational arrangements pertaining to the hospital itself and relies on a multi-disciplinary team approach for service delivery.

St. Mary's has adopted a family approach to the treatment of HIV-infected children as all children are treated in the ARV family clinic. Siblings who may or may not be HIV-infected are also supported within the home setting through the TCs support visits as discussed above.

Training & Volunteer Engagement: The program relies on both volunteer and fulltime qualified and registered healthcare professionals who require technical support and training. St. Mary's hospice care program is a member of the PEPFAR-funded Hospice Palliative Care Association (HPCA) who is supporting St. Mary's with critical areas including staff training and clinical protocols so St. Mary's may meet the HPCA accreditation requirements essential to providing holistic quality health care to patients.

In FY 2009, St. Mary's will scale up its palliative care training for all health professionals, volunteers and PLHIV therapeutic counselors involved in palliative care service delivery. Clinical protocols designed and approved by the HPCA are used for support and clinical services for opportunistic infections and pain assessment and management. St. Mary's has a number of partnerships with US universities and interest and support from US-based volunteers. On average, four to six U.S. volunteers will be accommodated by St. Mary's on a monthly basis (supported with non-PEPFAR funds). A relationship is currently being

Activity Narrative: explored to link in with an active OVC program in the area that cares for children at drop-in centers in and around the community. St. Mary's will offer testing; counseling and treatment services; and the OVC program will provide the ongoing adherence support for the children. All palliative care support services will be offered by St. Mary's Hospital to children in care at the relevant drop-in centers.

In addition the school nurse who is a KZNDH employee will be trained to provide early identification services of children requiring palliative care support and then referral to the St. Mary's Hospital's care and support services.

The follow-up and linkages between all programs such as PMTCT, ART, schools, OVC programs and any other hospital-based or community-based programs will be strengthened so quality care and support services are provided to the children referred to St. Mary's Hospital.

ACTIVITY 2: Commodity Procurement

Provision has been made for palliative care medications and commodities which directly improve the comfort of PLHIV, including medications for appropriate pain and symptom control (additional morphine for pain control, syringe drivers, anti-nausea medications, cotrimoxazole and other drugs for symptom control and the clinical management of OIs, especially in the arena of TB). Provision for such palliative medications and supplies are included in this activity and are vital to the overall success of the program.

There will be a focus on the provision of cotrimoxazole (CTX) to HIV-exposed and infected children as an urgent priority, according to national guidelines for PMTCT. This will be at the ward level in-hospital, at the outpatient site within the Hospital, at the primary health care facility, family care ARV treatment clinic and promoted at all down referral treatment site clinics in the community. Children born of a HIV-infected mother advise Cotrimoxazole from the age of 6 weeks, which will be addressed at in-hospital and out-patient sites at St. Mary's Hospital.

Nutritional assessment will be provided to all children in-hospital at ward level and at the ARV family clinic. Provision will be made for those children that require multi-nutritional supplements, as well as therapeutic or supplementary feeding support for clinically malnourished patients. In the PMCTC activity program there is some provision for infant feeding support that is linked to the PMTCT programs.

These activities contribute directly to the overall PEPFAR objectives of 2-7-10 as HIV-infected people will be identified, appropriately treated, cared for and supported. Family members affected will benefit directly from counseling and support within the hospital environment as well as within the community setting during home visits.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

-Supporting the rapid expansion, uptake and decentralization of family centered HIV care and treatment services.

SUMMARY:

International Center for AIDS Care and Treatment Program at Columbia University (ICAP) will continue to partner with Stellenbosch University to support the South-to-South Partnership for Comprehensive Family HIV and AIDS Care and Treatment Training Initiative (S2S) and apply its PMTCT and Pediatric HIV Care and Treatment, and TB capacity building activities in 60 sites located in Limpopo, Northwest, Gauteng, Mpumalanga, Northern Cape, and Western Cape provinces. S2S's capacity building model emphasizes site level training; namely, continuous and supportive onsite presence, onsite dynamic skills-building events such as on-the-job training, clinical mentoring, modeling and site implementation workshops and case-based learning. The core activity for COP09 involves supporting the rapid expansion, uptake and decentralization of family centered HIV care and treatment services. This activity will be implemented in collaboration with the Foundation for Professional Development (FPD), BroadReach Healthcare, M2M and several Orphan and Vulnerable Children Organizations.

BACKGROUND:

A main focus of S2S support on the site level is to build provider and system capacity with a focus on continuous quality improvement. Shortages of health care workers are exacerbated by the gap between the knowledge and skills required to provide HIV and AIDS services. Additionally, poor design of facility systems and services, lack of patient scheduling systems, inefficient provider placement and scheduling and irregular supervision by senior management continue to weaken already stressed HIV services. S2S site level support is dynamic and continuously customized to consider site attributes and existing resources. During FY 2009 this capacity building model will support the continuation and expansion of the S2S Program.

ACTIVITIES and EXPECTED RESULTS:

Technical, Program, and Systems Capacity Building Approach: S2S will adopt a dynamic and contextualized strategy to support each implementing partner to operationalize programs with a family centered approach at the site level. The site support will be dynamic and continuously customized to address site attributes and existing resources. However, while the support and program area emphasis will vary, all designated sites will benefit from the following illustrative activities:

ACTIVITY 1: Linkages to follow-up, HIV care and treatment for HIV-exposed infants

S2S will support sites to develop infant follow-up services by capitalizing on existing infant programs to ensure continuity of care, early diagnosis, growth monitoring, and cotrimoxazole prophylaxis for infants. Those identified as HIV-infected will be referred to ART clinics for chronic care and follow-up. A system for tracking and assessing outcomes among HIV-exposed and at risk infants will be developed. The key components of S2S support will include: 1) early identification, follow-up and referral for diagnosis of HIV-exposed infants and young children in the under five clinics, paying special attention to provision of cotrimoxazole prophylaxis, vaccination, nutrition and growth monitoring and early HIV diagnosis; and 2) providing support for the development of systems that will link follow up of HIV-exposed and HIV-infected children with the under-five clinic services.

ACTIVITY 2: Early Infant Diagnosis

S2S will support the development and site level implementation of the system for supporting early infant diagnosis. This will include the development of services to offer early infant diagnosis, reporting tools, and HCW skills training on infant diagnosis including: 1) support early infant diagnosis program with PCR testing for all children <18 month identified through linkage with PMTCT program or rapid test screening; 2) enhance the logistics and transport system for DBS; 3) enhance PCR results reporting systems to decrease post-test counseling turnaround time; 4) ensure that families receive results promptly, accurately and as part of a counseling session; and 5) engage and retain infants who are breast fed in HIV care until final infection status is determined.

ACTIVITY 3: Comprehensive pediatric HIV care services (please refer to pediatric treatment program area for complete description of this program element that targets HIV-infected children on treatment)

S2S will build on site capacity by supporting systems and healthcare workers to institute program elements that consider the multiple and changing needs of pediatric clients. S2S will support sites to apply a developmental approach to pediatric care, understanding that abilities (cognitive and physical) evolve and mature over time and through various life stages and cycles. This should apply to all critical HIV care and treatment issues such as -adherence, disclosure, physical examination, normative laboratory values which change over time and over life stages.

ACTIVITY 4: Basic and Quality Pediatric Care

The platform for quality and comprehensive pediatric HIV care and treatment services is quality and comprehensive pediatric services. Since there is a need to engage non-pediatric trained clinicians to support Pediatric HIV services, S2S will support adult and other non-pediatric clinicians to learn the basic pediatric care skills in order to provide accurate and quality services. This will include supporting staff to understand and implement the corner stone of pediatric HIV assessment such as growth monitoring. This is a simple and very cost effective way of assessing any child's growth but most importantly to identify children

Activity Narrative: who are failing to thrive and need clinical interventions such as HAART to improve health status. Other care elements such as the pediatric physical exam, assessing the child's progress via the caregiver, and pediatric drug and laboratory basics will be emphasized.

HIV specific issues will include: 1) quality and continuous clinical care for all infected children; 2) monitoring and assessment of all infected children for treatment eligibility; 3) increased linkage and coordination between pediatric and adult care and treatment services; and 4) implementation of comprehensive care package for the HIV-exposed and infected child at all ARV sites, including cotrimoxazole prophylaxis, growth monitoring, and neuro-developmental assessments.

ACTIVITY 5: Neurodevelopmental Screening and Capacity Building

In FY 2009, ICAP will work to ensure that child development and pediatric neurodevelopment issues/approaches are integrated and applied in the comprehensive care of the HIV-infected child. Systems will be established and clinicians will learn how to offer comprehensive and integrated services to address the medical, developmental and/or behavioral challenges of the HIV-infected child. This includes developing and/or enhancing neurodevelopment and child development assessment, monitoring and management systems and tools.

ACTIVITY 6: Malaria

Where relevant, S2S can help strengthen malaria prevention interventions including 1) administering prophylaxis, 2) supplying bed nets to clients upon enrollment, 3) educating caregivers on prevention, warning signs, and action steps.

ACTIVITY 7: Sexual abuse

While sexual abuse is an under-reported mode of pediatric HIV transmission, it is increasingly important to have facilities be well equipped with quality services to address such a complex and fragile situation. S2S can provide support to deal with the acute cases and the more chronic cases where sexual abuse is suspect long after the initial incident(s). This will include the clinical management of cases such as HIV testing protocol, PEP, psychosocial support and the long term psychosocial counseling needed for the HIV-infected child and caregiver from sexual abuse.

ACTIVITY 8: Linkage, referral and coordination with care and treatment programs for caregivers and family members.

ICAP will enhance and support the coordination and integration of a HIV/AIDS family service model by S2S: 1) formalize linkage and relationship with adult ART facilities at facility and catchment area level; 2) initiate counseling and testing of care takers and household members of enrolled children and offer referrals to adults determined to be HIV-infected into care and treatment services and vice versa; 3) enhance the formal referral system between clinics and Adult ART sites; and 4) support a system of follow-up during pediatric visits to ensure referrals are activated.

ACTIVITY 9: Community HIV care for HIV-exposed and infected children

Since over 95% of a child's care is provided by caregivers, family members in the community, or OVC and community/faith-based organizations it is essential to ensure that those responsible for: 1) monitoring for danger/warning signs; 2) administering ARVs and other drugs; 3) ensuring the child comes to appointments; 4) providing the daily psychosocial and emotional support to the child; and 5) assuring that referral personnel are accurately educated and properly skilled. S2S will address this need in two ways 1) supporting clinic sites to orient caregivers on these issues and to implement caregiver skills building programs to support the child's care needs throughout the lifecycle 2) reaching out directly with OVC and community/faith-based organizations working with orphans and HIV-infected children in the community to support them to develop and maintain strong linkages to HIV care and treatment services, recognize signs and symptoms of HIV related illness, provide psychosocial support, monitor growth and child development stages (for warning signs and rapid referral to clinical services), support adherence to care and treatment for children, and either conduct or actively link with HIV testing services.

ACTIVITY 10: Pediatric HIV Case Finding

The focus of this activity is to support pediatric case finding at both clinical and non clinical settings such as health facilities and in the community by ensuring all children that have high risk for HIV infection are given an HIV test and if HIV-infected are rapidly engaged into HIV care and treatment services. This includes the children in the care of adults engaged in HIV treatment services, routine provider initiated HIV testing of hospitalized children, and strong and active linkages with community support groups and OVC associations to test all orphans and vulnerable children for HIV.

ACTIVITY 11: Pediatric HIV Testing in Clinical Settings

S2S can support active case finding in health facilities and clinical settings by: 1) supporting the implementation of provider initiated inpatient testing and counseling in all pediatric wards (especially malnutrition and TB/infectious disease), including offering testing and counseling for PCR tests for children less than eighteen months of age; 2) supporting ART facilities to actively screen for and engage children of all ART and PMTCT clients to be tested for HIV (This could be supported by introducing healthy family days at the ART facility where activities are implemented to encourage parents to bring in children, such as a child play area, child care whilst being seen by health workers, healthy family skills building sessions and healthy family commodities such as safe water tools); and 3) supporting HIV testing and counseling services at all points of encounter children have with clinical services, whether it be immunization, TB, under -5, malnutrition, physical and/or rehabilitative therapy.

Activity Narrative: ACTIVITY 12: Pediatric HIV Testing in Community and Nonclinical Settings

S2S can support active case finding in community and nonclinical settings such as OVC programs, faith-based and community-based service organizations by supporting staff and providers within those designated institutions: 1) to know the HIV status of all children under their care; 2) to screen for HIV risk and refer for testing at health facility; 3) perform HIV testing as part of admission intake, and/or 4) have clinical staff conduct HIV screening services on a scheduled basis at the OVC program.

Budget Code: PDCS

Program Budget Code: 10

Activity ID: 22824.09

Planned Funds: \$587,397

Activity System ID: 22824

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Support Free State, Gauteng, KwaZulu-Natal and North West provincial Departments of Health scale up pediatric care and support activities;
- Advocate for pediatric care and support services and engage more in policy, program, issue and constituency advocacy activities at all levels; and
- Engage in human capacity development around pediatric care and support activities.

SUMMARY:

In line with its global strategic vision, Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will advocate for the provision of quality sustainable pediatric care and support programs at all levels including the community. EGPAF will use FY 2009 PEPFAR funds to continue pediatric care and support to support its existing partners namely, National Department of Health (NDOH) and provincial DOH KwaZulu-Natal (KZN), Free State, North West and Gauteng, as well as McCord Hospital and AIDS Healthcare Foundation (AHF) in KZN. The key objectives are to expand the coverage of pediatric care services, increase the uptake of pediatric care services and ensure provision of quality pediatric care services, including follow-up of HIV-exposed infants, early infant diagnosis, and routine testing of children presenting at health care services. The primary emphasis area is human capacity development and expansion of services through training and task-shifting, quality improvement, development of networks, linkages, referral systems and strengthening M&E and health systems, and strengthening of local organizations. Primary populations to be targeted include infants, men and women, pregnant women, HIV-infected pregnant women, people living with HIV (PLHIV), and public and private healthcare providers.

BACKGROUND:

The long-term goal of the EGPAF Project HEART pediatric care and support program in South Africa is to ensure that all health facility-based and community-based pediatric care and support is aimed at extending and optimizing quality of life for HIV-infected children and their families throughout the continuum of illness through the provision of clinical, psychological, spiritual, social and prevention services. To improve quality of pediatric care and support service delivery, EGPAF will continue to support the national and provincial DOH by providing technical support, human capacity development, and infrastructure rehabilitation, where applicable. Priority areas include (a) Early infant diagnosis; (b) prevention and treatment of opportunistic infections and other HIV and AIDS-related complications, as well as pain and symptom relief; (c) Nutritional assessment and support; (d) Strengthening of links between facility-based and community-based care and support services; (e) Psychological, social, spiritual and prevention services provision; and (f) Strengthen monitoring and evaluation (M&E).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support Free State, Gauteng, KwaZulu-Natal and North West Provincial Departments of Health

- (a) Scale-up pediatric care and support activities. EGPAF will support the provision of age-appropriate services, using a family centered approach e.g. siblings of HIV-infected children will be tested.
- (b) Functional linkages between related programs will be established or strengthened including PMTCT, ART, maternal and child health (MCH), integrated management of childhood illnesses (IMCI), expanded program on immunization (EPI), TB and community-based activities.
- (c) Early identification of HIV exposed infants, PCR testing according to national PMTCT guidelines; provider initiated testing and counseling at all entry points.
- (d) Optimize provision of cotrimoxazole prophylaxis to HIV exposed and infected children from 4-6 weeks, as per national pediatric treatment guidelines.
- (e) Provision of a comprehensive prevention care package that includes nutritional assessment, counseling and support.
- (f) Diagnosis and clinical management of opportunistic infections (OIs) and co-morbidities as well as pain and symptom relief management.
- (g) TB case finding (for families), diagnosis, and treatment will be part of pediatric care and support services.
- (h) Support groups for children and their families will be strengthened/ established.
- (i) Work with DOH and relevant community-based organizations/ stakeholders to establish school-based programs that will educate learners and teachers about pediatric HIV and AIDS as well as care and support service available in the communities

ACTIVITY 2: Advocacy

Pediatric HIV and AIDS care and support awareness is suboptimal. Globally, EGPAF advocates for pediatric care and support and plans to engage more in policy, program, issue and constituency advocacy activities at all levels.

ACTIVITY 3: Human capacity development

Activity Narrative: (a) Pediatric care and support technical assistance will be provided to care and support community-based organizations (CBOs).

(b) Facility-based and community-based care and support personnel will be trained, mentored and coached to ensure quality care and support service provision.

(c) Additional staff will be hired to address program needs e.g. Program Officer Linkages, Program Officer-Nutrition.

Quality pediatric HIV care and support is essential and remains a challenge mainly due to inadequate human capacity. There is limited pediatric care and support skills among health care workers, EGPAF will train counselors, community health care workers, caregivers, and CBOs on pediatric care and support, with a strong focus on community IMCI, TB/HIV, management of opportunistic infections (OIs), early identification of infants and children and infant feeding. At service delivery level, EGPAF employs dietitians and nutrition advisors to provide comprehensive nutritional support based on needs identified. In addition to providing technical assistance, EGPAF will endeavor to strengthen CBOs and faith-based organizations (FBOs) in management, leadership and policy development.

Gender is a critical issue in care and support, with implications for the quality and effectiveness of the care provided and, the disproportionate burden on women and girls to provide care. EGPAF will work with relevant government departments and CBOs to identify child headed households, implement targeted programs to meet needs including programs which keep girls in school, help them manage households, address stigma and compensate for lost family income; programs that target men and boys and encourage their participation and responsibility in care-giving and household functions, as well as programs that work to reduce gender violence and promote human rights. Specific needs of children will be addressed.

All EGPAF supported pediatric care and support activities are in line with the National DOH policies and guidelines and the National Strategic Plan (NSP) 2007-2011 Priority Area 2, i.e. Treatment, Care and Support, goals 5,6, 7, and 8 and their objectives are taken into account. All EGPAF support is aimed at assisting DOH to scale up pediatric care and support services, determining HIV status of infants and children as early as possible and decreasing HIV and AIDS related pediatric morbidity and mortality.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

-A focus on strengthening implementer capacity to provide pediatric care and support services through training, community mapping, and improved clinical assessments.

BACKGROUND:

The focus on a family-centered approach to care and support of People Living with HIV/AIDS (PLHIV) and a focus on pediatric care and support will require that CARE and implementing partners' staff capacity is strengthened.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Training and supporting carers to provide appropriate support to caregivers for early identification and referrals for testing and counseling for children exposed to HIV; b) community mapping of the range of services available within the local municipality and district so that there is improved uptake and success rate of referrals for infants, children and adolescents' access to primary health care services, as well as HIV/AIDS related diagnostic services and treatment; c) improved clinical assessment and management of very ill children through appropriately trained and skilled clinicians and carers; and CARE's M&E tools and system is refined to track the survival rate of infants and under 5 year olds; and d) follow-up of infants born to HIV-infected mothers to ensure they attend health facilities for follow-up care as per national guidelines.

Table 3.3.10: Activities by Funding Mechanism

Mechanism ID: 190.09	Mechanism: N/A
Prime Partner: Aurum Health Research	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: Pediatric Care and Support
Budget Code: PDCS	Program Budget Code: 10
Activity ID: 22620.09	Planned Funds: \$97,090

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Adding adolescents to training programs related to couple counseling and family engagement;
- Strengthening the training of the current human resources; and
- Improving the human resource capacity for pediatrics by seconding skilled staff in public sector facilities.

SUMMARY:

This is a new program area in FY 2009. Aurum's pediatric care and support program provides care to children infected with HIV following HIV counseling and testing, and screening for treatment eligibility in accordance with South African government (SAG) guidelines. The facilities where pediatric care is provided include general practitioners (GP) clinics, non-governmental organization (NGO) clinics and public sector sites. These sites are located mainly in the Gauteng, North West, Mpumalanga and KwaZulu-Natal provinces. Children are also assessed for opportunistic infections and eligibility for ART and provided with preventive therapy i.e. INH and cotrimoxazole.

BACKGROUND:

This is an ongoing program funded by PEPFAR since October 2004. The PEPFAR-funded Aurum project aims to rapidly expand access to HIV care and treatment to South Africans living with HIV, and especially in areas (such as mining areas) where Aurum is familiar and other partners are less likely to work. Aurum has established a number of GP clinics which are capable of providing care to large numbers of HIV-infected individuals and achieving high quality results. In order to ensure sustainability of this model, Aurum has partnered with Faranani Solutions, a network of general practitioners from a previously disadvantaged population. Advantages of this model, now termed the Aurum model, are that Aurum has been able to secure lower consultation rates for GPs and GPs are encouraged to provide assistance at their local hospital clinics. The presence of trained individuals in these public health facilities will enable the transfer of knowledge to nurses and doctors in the public sector. It is hoped that this model can be used to rapidly scale up delivery of HIV services in South Africa, in partnership with government efforts. Sites are located throughout the country, but are concentrated in Gauteng, North West province and KwaZulu-Natal. There is only one site each in the Northern Cape and the Western Cape. A number of primary healthcare clinics attached to NGO and faith-based organizations (FBOs) have been established. Metro Evangelical Services, a sub-partner, is a FBO providing training, housing and health services for the homeless and street youth of Hillbrow, Johannesburg. An HIV center has been established to provide CT and HIV services to this population. In Gauteng, a contract has been concluded with Chris Hani-Baragwanath hospital for support and a contract for extension of these services to other parts of Gauteng is being negotiated with the provincial health departments. In the North West, Aurum supports the provision of HIV Care at Tshepong Hospital through the provision of medical and nursing staff. In addition, through the establishment of a walk-in clinic at Jade Square in Klerksdorp Aurum provides care for HIV patients that are not able to currently access care through the public hospital. In the Northern Cape, Aurum's public-private partnership with De Beers Consolidated Mines in the Danielskuil area has been discussed. In the Limpopo area, discussions are underway with Anglo Platinum and the Limpopo Department of Health to provide support to a down-referral clinic based in the Capricorn district close to one of the Anglo Platinum mines. A number of Aurum's sites, Caritas Care, MES and Duff Scott collaborate with the local health departments that provide funding for inpatient care to palliative care patients.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Aurum will focus on a family centered approach with gender being mainstreamed in the program. This will include training on couple counseling and family engagement. In addition Aurum intends on adding an adolescent focus so that this age group receives appropriate services in the public sector.

ACTIVITY 2:

The number of children accessing the South Africa Comprehensive Care, Management and Treatment (CCMT) program remains low in South Africa. Aurum will strengthen the training of the current human resources in order to multi-skill and encourage the family approach to CCMT which includes pediatrics. There is also a need to source pediatric expertise to improve access for children. The program will provide for pediatrics management onsite support especially to primary health care including integrated management of childhood illnesses (IMCI). There is also a need to integrate the PMTCT, IMCI and expanded program on immunization (EPI) with the Comprehensive Care, Management and Treatment program.

Aurum will ensure that both parents, especially the male parent, are involved in the management of the child by including the topic in the counseling training curriculum. This will also encourage men to participate in the HIV care program themselves and to test and be managed as a family. A gender module will be used for training all staff and mainstreaming gender into the program.

ACTIVITY 3:

Aurum supports human capacity development by seconding skilled staff in public sector facilities, who will be leveraged to encourage a family approach to HIV and TB management. Aurum will support community-based staff at four public sector sites to improve linkage to the community and four clinical staff at these sites to improve the human resource capacity for pediatrics. These sites will be in Gauteng, North West, Eastern Cape and Limpopo.

Activity System ID: 22560

Mechanism: N/A

USG Agency: U.S. Agency for International Development

Program Area: Care: Pediatric Care and Support

Program Budget Code: 10

Planned Funds: \$363,239

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Expanding PEPFAR-funded treatment, care and support activities to the Eastern Cape (EC);
- For all key staff, Absolute Return for Kids (ARK) will provide training and follow-up refresher courses covering all aspects of ARK's palliative care program;
- Patient advocates (PA) will ensure that all babies are brought back for their immunization and testing for HIV;
- Linking Pediatric testing and ART services to PMTCT and TB services;
- Ensuring internet connectivity at all sites to facilitate information management activities; and
- Referral systems will be strengthened.

SUMMARY:

ARK's focus is to provide a comprehensive palliative care package to HIV-infected mothers and their children through partnerships with government health facilities. ARK's primary emphasis areas are human capacity development, local organization capacity development, and construction/renovation. The target population is people living with HIV and AIDS.

BACKGROUND:

ARK is a charity organization whose mission is to facilitate and support delivery of accessible and sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and AIDS. In partnership with the KwaZulu-Natal Department of Health (KZNDH) ARK, as the implementing partner, has established an antiretroviral treatment program in government primary health facilities and hospitals. Specifically, ARK works with KZNDH to identify sites and areas for capacity building, including human resources, modest infrastructure support, and organizational capacity development.

ARK provides a comprehensive range of family-centered palliative care services to patients enrolled on ART and their children. These services are supported by improvements in the infrastructure of targeted sites, and the provision and training of human resources in partner health facilities to further strengthen their capacity to deliver quality care and support for HIV-infected caregivers and their children. ARK provides palliative care services in accordance with South African national treatment guidelines.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2009 ARK will expand PEPFAR-funded treatment, care and support activities to the Eastern Cape (EC). ARK has been supporting the EC from 2006 and is currently working in eleven sites delivering care and treatment activities and PMTCT services in one site.

FY 2009 PEPFAR funds will be used to strengthen pediatric support throughout KwaZulu-Natal (KZN) and the EC. ARK is planning to scale up pediatric ART services in the primary care sites to reduce the burden on the hospitals, as well as reduce waiting times for treatment. The community care component of ARK employs and trains patient advocates who support families, including provision of the basic preventative care package for HIV-infected children, testing and follow-up of HIV-exposed infants and children to ensure early identification and enrollment of children on ART. Additional components include ARK's Child Services component, which assists families to access birth certificates and SAG social grants. ARK will be working closely with the pediatric clinics to ensure integrated services and support for children and their families.

ACTIVITY 1: Human Capacity Development

For all key staff, ARK will provide training and follow-up refresher courses covering all aspects of ARK's palliative program including counseling and testing, screening for pain and symptoms, screening for opportunistic infections (OIs) including the provision of cotrimoxazole prophylaxis, symptom control and management of opportunistic and sexually transmitted infections, nutritional assessment and counseling, adherence support, as well as community access, prevention with positives, and referral. Specific training modules on clinical and care needs of children and adolescents is provided to clinical staff and patient advocates. A pediatrician at the ARK National office as well as pediatricians and pediatric nurses in the districts support clinical staff through training and mentoring to empower, up-skill and make staff more confident in treating children. Staff are invited and encouraged to attend formal training offered by external providers including other PEPFAR partners such as the Hospice Palliative Care Association (HPCA) and Foundation for Professional Development (FPD).

ACTIVITY 2: Clinical Care

ARK's palliative care program focuses on a network of clinics operating within a district, in order to create a sustainable and efficient system that supports the continuum of care and up and down referral. ARK-employed doctors and nurses provide comprehensive pediatric treatment management including patient uptake, doctor consultations, counseling and testing, TB screening and management, pain management and symptom control, treatment of opportunistic infections including the provision of cotrimoxazole, lab testing and patient and caregiver education. Pharmacists are responsible for the dispensing of medication. Pediatric ART and care services are linked to PMTCT and TB services. HIV-infected pregnant women will be educated and encouraged during pregnancy to undertake post delivery testing for their babies. All children born to HIV-infected mothers will be closely followed up for any evidence of early deterioration and will receive NVP and AZT as per PMTCT protocol. At the six week visit, all HIV exposed babies will have a PCR test done, will be given cotrimoxazole prophylaxis and multivitamins to await the PCR result. Babies testing negative will be offered a PCR at 12 weeks after weaning if breastfeeding and if still negative an ELISA at 18 months. HIV-infected babies will be immediately referred to ARK's ARV treatment program and will have access to cotrimoxazole prophylaxis, multivitamin supplements and general nutritional advice, and

Activity Narrative: breastfeeding counseling and support for the mother.

ACTIVITY 3: Family-Centered Care and Support Services

In an effort to encourage adherence among mothers and ongoing care for their infants and children, ARK's program takes an integrated maternal and child health care approach and extends care and support (including treatment literacy and prevention education) to all members of a patient's household. Together, facility-based counselors and patient advocates counsel mothers and their partners on treatment literacy, nutrition, TB prevention and referral for care, safe infant feeding practices, and safe sex. All HIV-infected pregnant women and HIV exposed infants will receive TB screening, prophylaxis and treatment if appropriate. Patient advocates offer services within homes and provide encouragement and support to male partners to serve as "adherence buddies" in the management of care during pregnancy and after delivery. Patient advocates are also trained to provide basic psychosocial support and link children and mothers to individual counseling services and/or support groups. The patient advocates (PA) will ensure that all babies are brought back for their immunization and testing for HIV will be actively encouraged by the community workers. Other children in the household will also be referred for testing.

ACTIVITY 4: Reporting and Quality Assurance/Improvement

ARK provides computers and employs data capturers at all sites. All sites will have internet connectivity to facilitate information management activities. Data is captured from patient folders and transferred to ARK's data center, allowing for ongoing evaluation and outcome analysis. Adherence rates, death rates and loss to follow-up are closely monitored. Quarterly updates are provided to the KZNDH and ECDOH and information is used within the clinics to strengthen service delivery. To ensure high standards and quality of care in line with the national guidelines, all ARK staff are provided onsite, on-the-job training. This is followed up with regular onsite mentorship and site evaluation by ARK's national executive and provincial management teams. Informal training sessions are conducted quarterly by national staff. The staff is also encouraged to attend formal external training courses offered by FPD.

ACTIVITY 5: Systems strengthening

Referral systems will be strengthened to ensure the easy, quick referral of patients between ARV, TB, PMTCT and pediatric ARV services. Tracing of lab results for early infant diagnosis will be conducted proactively to ensure that bottlenecks in the system are addressed with DOH and the National Health Laboratory Services (NHLS). Additional information management capacity will be added to sites including data capturers and computers as needed. TB infection control practices are standard at ARK-supported sites and include well-ventilated waiting areas and consulting rooms, safe sputum collection, and patient and staff education on safe cough etiquette and hygiene.

Table 3.3.10: Activities by Funding Mechanism

Mechanism ID: 224.09	Mechanism: CTR
Prime Partner: Family Health International	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Pediatric Care and Support
Budget Code: PDCS	Program Budget Code: 10
Activity ID: 22983.09	Planned Funds: \$97,090
Activity System ID: 22983	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Early identification and enrollment of children into care and support services; and
- Training of home-based care volunteers and professionals who will in turn provide training to the family members and caregivers to equip them to provide quality pediatric HIV care and support.

SUMMARY:

Family Health International (FHI) provides support to both community- and facility-based palliative care (PC) services at the primary care and hospital level, while strengthening the linkages between PC, counseling and testing and antiretroviral treatment for comprehensive care and support. FHI's interventions strengthen the physical, spiritual, social, psychological and integrated preventive aspects of pediatric PC, and leverage government resources through service networks to meet multiple care needs. Children often present to the health system with advanced disease and are members of families in need of knowledge and support related to HIV. By providing pediatric services in the communities where FHI has been providing PC activities, FHI will take a family-centered approach to pediatric palliative care through this program to ensure early identification and enrollment of children into care and support service through mobile service units' clinics to improve access to integrated services in remote HBC programs. This will improve the ability to address the multigenerational effects of HIV, integrate care, decrease stigma and promote family wellness benefiting infants, children, adolescents and their parents. Despite the crucial roles caregivers play, they are often not adequately equipped with the knowledge and skills they need to provide holistic care and support for HIV-exposed and HIV-infected children. Caregivers are not always aware of how to access care, support, and other child services like ART, TB treatment. FHI will carry out pediatric PC activities with government and community-based organizations (CBOs), the South African Council of Churches, South Africa Red Cross, Nightingale Hospice and Evelyn Lekganyane HBC. FHI will provide training of Home-based care volunteers and professionals who will in turn provide training to the family members and caregivers to enable them to provide quality pediatric HIV care and support. Training content will include: diagnosing common childhood illnesses, providing support and accessing ART, referral for appropriate services such as child protection services, social services like fostering and adoption and accessing child support grants

BACKGROUND:

Pediatrics includes HIV-exposed children (children born to HIV-infected mothers and not yet with a final infection status), "HIV-infected" children (known infected), and HIV-affected children (uninfected children in a family with one or both parents HIV-infected). A family centered approach to care and support in all five delivery categories of clinical/physical care, psychological care, spiritual care, social care and integrated prevention services will be encouraged. Children often present to the health system with advanced disease and are members of a family in need of knowledge and support related to HIV. Caregivers, who have been providing care to adults will need to learn about how to treat symptoms, assess pain and other problems as relevant for children. Managing care alongside parents and transferring skills is another key element of pediatric palliative care. A referral network with relevant services is also critical to providing pediatric palliative care and will need to be expanded to fill identified gaps. The areas of bereavement counseling for children whose parents were HIV-infected are often required and will be supported through the palliative care training. Disclosure support for parents will also be a component of the pediatric palliative care service. Working with other important persons in the child's life (teachers, friends, extended family) helps to bring both support to the child and also to those who would like to be of help but need to know how. The caregivers training and role will be expanded to support these important people. Adherence support for parents and children for ART will also be an area of the service.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthening government programs

FHI will continue to strengthen access to integrated services as a part of a comprehensive palliative care package for HIV-infected children and their families in Mpumalanga, KwaZulu-Natal, Limpopo, Northern Cape and Gauteng provinces. This includes the Integrated Community Palliative Care (ICPC) model in 2 provinces. Efforts will be made to ensure equitable access to child care services for both males and females. The activities expand existing services that CBOs and government care programs currently provide with an emphasis on promotion of the HIV preventive care package.

ACTIVITY 2: Strengthening community-based organizations

In the communities where FHI is working, pediatric PC services will provide for early identification and enrollment of children into care and support services, through mobile clinics to improve access to integrated services in remote HBC programs. FHI will carry out pediatric PC activities with government and community-based organizations (CBOs), the South African Council of Churches, South Africa Red Cross, Nightingale Hospice and Evelyn Lekganyane HBC.

ACTIVITY 3: Training of Home-based care volunteers and professionals

FHI will train home-based care volunteers and professionals who will in turn provide training to the family members and caregivers to equip them to provide quality pediatric HIV care and support. Training content will include: diagnosing common childhood illnesses, providing support and accessing ART, referral for appropriate services such as child protection services, social services like fostering and adoption and accessing child support grants. This activity will contribute to one of PEPFAR's goal of 10 million people in care.

Planned Funds: \$943,309

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- PEPFAR funds will also be used to structurally improve and maintain all RTC supported clinics;
- PEPFAR funds will be used for human capacity development and salaries at all pediatric care and support providers; and
- Using FY 2009 funds RTC will consolidate provincial centers of pediatric ART expertise established in FY 2008.

SUMMARY:

Following the emphasis in the National Strategic Plan 2007-2011, RTC will use FY 2009 PEPFAR funds to accelerate the scale-up of family-centered approaches to pediatric treatment, care and support. The specific aim is to increase the access to antiretroviral therapy for pediatrics from the current 7% of patients treated to 15%, in accordance with the National Strategic Plan (NSP) and the technical considerations for the FY 2009. Focus for the Pediatric treatment program will be to integrate into the adult treatment at all Department of Health, Comprehensive HIV/AIDS Care, Management and Treatment (CCMT) sites, supported by Right to Care. At the request of the provincial Department of Health (DOH) and implemented according to the memorandums of understanding (MOUs) with each province, RTC has increased the activity and budget emphasis towards pediatric treatment, care and support. The implementation is conducted in collaboration with the Hospital, District, Provincial and National Departments of Health (DOH). The guidelines that are available for the care and support of HIV exposed and HIV-infected children will be followed at all RTC supported sites.

BACKGROUND:

The Right to Care Pediatric Program was established in March 2008. Prior to this date, pediatric treatment was supported at all sites, with training and preceptorship received from ECHO. It became apparent that the scale of Right to Care program required a dedicated training and mentorship program within the organization. Dr. Leon Levin was recruited from private practice to join the organization as a full-time employee. Dr. Levin is one of only eight Pediatricians in South Africa who are experts in HIV treatment, antiretroviral therapy and infectious Diseases. Dr. Levin has been involved in HIV treatment with antiretroviral therapy for over 10 years; has established the largest cohort of patients on treatment in private practice; and established a specialized referral clinic for complex pediatric HIV cases on the East Rand of Johannesburg. PEPFAR funds are used to support access to this referral site for indigent public sector pediatric patients.

The major initial aim of this program was to increase the number of pediatric patients on antiretroviral therapy (ART) at all Right to Care assisted ART sites. According to December 2007 statistics, children under 14 years only represent about 7-8% of all patients on ART at Right to Care. The National Department of Health has called on all HIV and AIDS/STI/TB (HAST) directorates to ensure that at least 15% of all patients receiving ART are children.

The integrated program of pediatric and adolescent education, counseling and testing, care & support and ARV treatment will continue to be implemented using RTCs existing models of care:

- 1) In partnership with the National Department of Health (NDOH), capacity support for pediatric care and support at CCMT sites in five provinces i.e. Gauteng, Mpumalanga, Northern Cape, Limpopo, and Free State;
- 2) Strengthening the pediatric care component of FBO/NGO clinics, which target underserved populations in rural areas, industrial areas, and informal housing sectors;
- 3) Thusong, a private practitioner program for indigent patients where pediatric care is emphasized is the treatment model used in areas where there are no government systems in place. The Thusong pediatric program is not planned for expansion, patients have started to be transitioned into the government program and this will continue in FY 2008 and FY 2009. However, this program will remain operational to allow RTC to treat under this program where necessary; and
- 4) The employed sector, where RTC is providing HIV disease management services to >130,000 employees in >30 companies and pediatric dependents who are HIV exposed or infected are encouraged to enroll onto the workplace care and support program.

Since March 2008, the pediatric team has conducted needs assessments for pediatrics at 10 sites throughout the provinces. Training programs have been finalized for implementation and have been conducted on 3 occasions with 120 health care workers (HCWs) attending. The training provided includes the following broad areas of emphasis:

Since March 2008, the pediatric team has conducted needs assessments for pediatrics at 10 sites throughout the provinces. Training programs have been finalized for implementation and have been conducted on 3 occasions with 120 HCW attending. The training provided includes the following broad areas of emphasis:

- a. Diagnosis of HIV in infants and children
- b. Diagnosis and treatment of TB and other common opportunistic infections
- c. Laboratory monitoring of HIV disease in children
- d. Treatment initiation in children
- e. Pharmacology, dosing, formulation of ARVs in children
- f. Treatment adherence in children
- g. Adolescent counseling and adherence to treatment
- h. Family centered approach to ARVs including linkages to nutritional support program

Activity Narrative: Dr. Levin, Dr MacDonald and others have established mentoring support of treatment sites, with on-site management of patients supported by pediatric experience clinicians. Mentoring pediatricians are sent to sites throughout the network at regular intervals, providing both didactic continuing medical education, and practical bedside teaching. Ongoing support is provided with access to a mobile call-line for clinicians to receive specific advice from the treatment experts. This line is now available to all clinicians in RTC sites, with utilization increasing to 6 calls per day. In FY 2008 linkage will be established to the FPD supported HCW call center.

The pediatric program is linked to an increase in the activities under RTCs PMTCT program at sites throughout the five supported provinces. Particular emphasis is placed on the provision of infant PCR diagnosis to all infants exposed to HIV, and early treatment initiation for all children, to reduce early infant mortality. As the effectiveness of the PMTCT program is enhanced, with transmission of HIV reduced to less than 5%, children requiring treatment will decrease.

Through the development of treatment sites emphasis is placed on the family centered approach, with improved pre and post-natal care and mothers, their partners and children treated in the same clinic, this is in line with safe motherhood. Clinician training is focused on medical officer and primary health care nurse prescribed HIV treatment.

By providing pediatric training and implementation support to these sites RTC leverages NDOH resources to reach an increasing number of children. RTC supports these sites with infrastructure especially focus on renovating the facilities and making them child and adolescent friendly as well as support with staff, training, equipment and data management.

Through the provision of technical assistance, RTC has established a number of pediatric specific IT solutions, which will be ready for beta testing within RTC sites in October 2008. Particular emphasis in TherapyEdge-Pediatrics (TE-Peds) is the provision of treatment guidelines specific to children, yet accessible as part of the real-time integration of the data system at all sites, to all clinicians. TherapyEdge-Pediatrics improves disease management through guideline directed, expert systems and pediatric specific therapeutic intervention. The system provides enhanced clinic management, with the development of workflow processes that define roles and responsibilities enabling shifting, yet ensuring quality assurance. Through interfacing with the NHLS, Toga Laboratories, Lancet Laboratories and others, direct provision of laboratory results into the data system will enable real-time laboratory alerting. The data system provides overall health system strengthening with integration of guidelines and data collection according to IMCI WHO standard. RTC has already demonstrated that the use of TherapyEdge-HIV (TE-HIV) in adult patients has led to: (1) enhanced efficiencies in clinics with reduced waiting periods to <2hours in the largest HIV clinic in South Africa, Helen Joseph Hospital; (2) improvements in patient retention with a reduction in LTFU from 21% to 4%; (3) improvement in clinical quality with response to toxicity, virologic failure, dosing errors, drug interactions and TB diagnosis demonstrated (4) overall mortality, morbidity and viral load suppression rates have improved; (5) staffing: patient ratios required by Helen Joseph Hospital are approx. 25% of the ratios recommended by the DOH, due to the ability to shift and efficiencies of the clinic. Through enhanced guideline driven decision support, RTC will demonstrate the benefits of TE-Peds, in particular the more accurate prescription of drugs according rapidly changing weight, body surface area, and BMI in children growing with antiretroviral therapy. RTC continues to support the pharmacovigilance program of the Medicine Control Council for antiviral therapy in pediatric patients, through the provision of data from all of our sites.

ACTIVITIES AND EXPECTED RESULTS

RTC will use COP 09 funds to build on consolidating and expanding its support for pediatric care at government sites, NGO and FBO clinics/organizations and private sector programs. NGO and FBO clinics also use PEPFAR funds for laboratory monitoring of HIV pediatric and adolescent patients and for the procurement of health commodities such as medical equipment, ARVs, drugs for opportunistic infections, counseling and testing kits, and home-based care kits. RTC supports all pediatric care and support (C&S) providers by disseminating policies and guidelines and providing quality assurance through sharing best practices.

FY 2009 PEPFAR funds will be used for human capacity development and salaries at all C&S providers; (1) NGO and FBO clinics/organizations receive sub-awards earmarked for doctors, nurses, counselors and other healthcare workers; (2) RTC will not provide salary support to SAG staff, but rather the salaries of health care providers seconded to DOH facilities including support for doctors, nurses, data managers, counselors; and (3) a capitation fee-for-service arrangement exists with a network of private sector service providers for the Thusong program.

The program of pediatric care will have strong emphasis on diagnosing infants and children with HIV early and national guidelines on PCR testing will be followed. Family members, usually female caregivers, who require care will also be identified during this process and pregnant caregivers will be referred into PMTCT services. Couples counseling will be offered to parents who bring children to the clinics together and this will help to promote the testing of men. RTC will continue getting the children into care as soon as possible and starting them on ART early, especially young infants who are at high risk of dying. RTC support at the sites will ensure that a comprehensive package of preventive care is available to all HIV exposed infants and infected children and ensure that they receive CTX prophylaxis in a timely manner and that they are appropriately referred for immunizations according to the national guidelines. The staff who will be hired for the pediatric program will conduct nutritional assessments, nutritional counseling and refer appropriately for support, an important area of focus will also be TB screening, TB treatment and IPT for those under 5 who do not have active disease. This will include the clinical management of common opportunistic infections and other conditions affecting children with HIV and their management. Emphasis will be placed on quality assurance and assessing and improving the programs already in place.

PEPFAR funds will also be used to structurally improve and maintain all RTC supported clinics and these

Activity Narrative: will offer clinical and psychological and services to HIV-infected and affected children and their families with strong links to available social and spiritual services. PEPFAR funds will be used to facilitate partner linkages and a referral system between treatment sites-based care, and other non-medical C&S services. At each site RTC will identify a community-based care organization to add value to the counseling and testing program by tracking and tracing pregnant moms who are lost to initiation and PMTCT and by finding the babies of these mothers to assess them and ensure that they benefit from care. The care and support NGOs will also help to minimize the pediatric loss to follow up rate.

Using FY 2009 funds RTC will consolidate provincial centers of pediatric ART expertise established in FY 2008 in each province in order to allow staff from other sites to rotate through the centre of excellence and learn to treat and care for pediatric patients under supervision. In so doing staff from other clinics will acquire expertise in pediatric care and support and then take that expertise back to their own clinics where service delivery will be sustainable.

We would expect the number of pediatric patients on ART to increase at all RTC sites and reach the required 15% pediatric patients on ART to be achieved by the end of the FY 2009. In addition, the quality of pediatric care would continue to improve in FY 2009. By reaching patients with care and support services at various outlets, RTC will contribute to the PEPFAR goal of providing services to 10 million HIV-affected individuals.

Budget Code: PDCS	Program Budget Code: 10
Activity ID: 22791.09	Planned Funds: \$100,974

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Testing and counseling for infants, children and adolescents and their families;
- Provision of cotrimoxazole (CTX) to all HIV-exposed infants until HIV infection is excluded and infants are no longer at risk from breastfeeding and to all eligible HIV-infected children;
- Provision of a comprehensive prevention package;
- Building a system of referrals between PMTCT, ART, Maternal and Child Health (MCH), Integrated Management of Childhood Illness (IMCI), TB and Community care;
- Building competency and skills of the health care providers working within the pediatric services; and
- Ensuring development of best practice models in pediatric care at 46 sites.

SUMMARY:

The International Centre for AIDS Care and Treatment Programs (ICAP) will support the implementation and expansion of pediatric HIV care and support. The focus areas for this program will be training, technical assistance, supportive supervision, community education and quality assurance with minor emphasis on human resources and infrastructure development.

BACKGROUND:

ICAP has been supporting the comprehensive care of Persons Living with HIV/AIDS (PLHIV) since 2004 in support of the Eastern Cape Department of Health (ECDOH) and KwaZulu-Natal Department of Health (KZNDOH). ICAP supports early access to services, early diagnosis and enrolment and retention into care of children through provision of family focused comprehensive HIV care and treatment. HIV-exposed infants are tested using the dry blood spot (DBS) test for HIV DNA PCR at 6 weeks and 6 weeks post weaning for those breastfeeding. Older children are diagnosed with antibody tests as per South African Department of Health Guidelines. Clinicians are given initial training and are mentored on an ongoing basis to identify at risk babies as well as shown how to collect DBS specimens. ICAP is supporting comprehensive HIV care and treatment including the use of cotrimoxazole for all HIV-exposed and HIV-infected children until a definite exclusion of HIV has been made or those that are infected are stable on ART as per guidelines. Emphasis has been placed on integration of PMTCT, anti-retroviral therapy (ART) and primary health care (PHC) as well as TB clinics, to identify children that are HIV exposed or infected and then assess them for ART eligibility early initiation of ART for infants <12 months of age, and enroll them into care and support services. In FY 2009 this integration of services as well as step up of counseling of care givers to bring back children will be prioritized. ICAP will continue to provide technical assistance, mentoring and monitoring and evaluation of the activities at 46 sites. Essential clinical equipment will be procured and the pediatric record card together with the HIV care and treatment registers will be implemented to ensure quality of services provided.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: HIV Testing and Counseling for infants, children and adolescents and their families

- a. Support routine testing and counseling in every clinic area including well-baby clinic, pediatric inpatient settings, malnutrition units, TB clinics, and family assessments in adult ART clinics. Rapid HIV test kits will be made available, providers will be trained, and support and monitoring of the process provided by ICAP staff. Infants and children identified as HIV-infected will be enrolled in HIV care and treatment.
- b. Increased early infant diagnosis (EID) with DBS at the level of the PHC, pediatric inpatient wards, at TB clinics, PMTCT and post-Natal settings. A system for ensuring DBS test kit availability, as well as for enhancing caregiver counseling, will be developed and implemented.
- c. HIV counseling and testing (CT) extended to the families of pediatric patients at pediatric visits. The caregiver will be encouraged to bring additional family members. This process will be documented and evaluated.
- d. Refresher trainings for providers will be incorporated into monthly in-service trainings for sites and feeder clinics on identifying at-risk infants and children, as well as assessment, diagnosis and management of HIV exposed and infected children.
- e. Ongoing mentoring of health care providers on pediatric care and support. Focus will be on developing and maintaining provider competency. Precepting checklists will be used to follow provider competency over time.

ACTIVITY 2: Cotrimoxazole prophylaxis

Provision of cotrimoxazole (CTX) to all HIV-exposed infants until HIV infection is excluded and infants are no longer at risk from breastfeeding and to all eligible HIV-infected children. Accurate and consistent documentation of CTX will be ensured through refresher trainings, chart review and provider coaching. Reliability will be evaluated per the patient held cards. The Department of Health (DOH) and ICAP pharmaceutical advisors will work together to ensure proper stock level management to avoid stock outs of CTX. Counseling on the importance of bringing the children back for the 6 week follow-up for diagnosis and CTX prophylaxis will start during ANC and care givers will be provided with information on the benefits of CTX prophylaxis whenever they bring the children for other health care services. This information will form part of the counseling checklist, the use of which will be regularly reviewed.

ACTIVITY 3: Preventive Care Package

Ensure nutritional assessment, counseling, support and growth and developmental assessment at each clinical encounter through availability of weight scales, measuring tapes and height boards and training clinicians to accurately measure the anthropometric parameters, plot growth charts and diagnose growth failure and developmental delays. Dietary and social history will also be taken from care givers. The new pediatric care record cards with growth charts will be implemented for both exposed and infected infants

Activity Narrative: and children. ICAP will ensure accurate and consistent plotting of these charts, interpretation and that the growth parameters are accurately reflected in the care registers and patient held cards by regular charts and registers review. Nutritional support and safe feeding practices counseling will be given to care givers. Daily multi-micronutrient supplementation will be provided for the undernourished children and therapeutic or supplemental feeding as well as referral for ART for those with clinical malnutrition. These will include deworming and vitamin A supplementation as per SA guidelines. Infant feeding counseling and ongoing support will be provided to all pregnant women and those HIV-infected. Women will be advised on exclusive breastfeeding and ongoing support will be provided post delivery to ensure maximal survival of the HIV-exposed infants. Basic ante-natal clinic (ANC) training will be provided that emphasizes infant feeding counseling to all expectant mothers. HIV-infected mothers will be educated about exclusive breastfeeding, and breastfeeding will be encouraged where acceptable, feasible, affordable, sustainable and safe (AFASS) criteria are not met. Feeding counseling as well as the mothers feeding choice will be noted on the antenatal cards, on the Road to Health Cards of the infants and on the PMTCT registers. Peer educators and mentor mothers will provide support to the mothers and care givers. Routine and additional scheduled immunizations will be provided to all HIV exposed and HIV-infected children according to national guidelines. Screening for TB and active TB case finding, treatment and prophylaxis will be provided. Clinicians will be trained and mentored to assess all children in contact with adults with active PTB and screen them for TB at baseline using Tuberculin Skin Test (TST), gastric washings, sputum from older children and/ or chest x-rays. Special emphasis will be on children under the age of five, those with HIV infection, malnutrition and other immunosuppressive diseases. All HIV-infected children will be screened for TB each clinical encounter. Implementation of the pediatric record card will ensure prompting for TB symptom check. Children with TB infection will be treated and those without TB will be given isoniazid (INH) prophylaxis according to guidelines.

ACTIVITY 4: Functional referrals between PMTCT, ART, Maternal and Child Health (MCH), Integrated Management of Childhood Illness (IMCI), TB and Community care

Functional referral linkages between services will be established. Children will be assessed for eligibility for ART by laboratory and/or clinical assessment and referred as necessary. HIV exposed children will be followed up and final HIV status established using PCR. All infants <12 months of age who are HIV-infected will be fast tracked to initiate Highly active antiretroviral therapy (HAART). Pediatric support services will be incorporated into routine mother and child services. The HIV status will be documented on the child's Road to Health card using the SA DOH recommended PMTCT stamp and/ or share code as per guidelines for future reference. ICAP will ensure that formal referral forms are available and used to refer clients between facilities or services and will also ensure that such referrals are communicated to the referral sites. This will ensure continuous quality comprehensive care of the family unit. Mothers that were not on the PMTCT program and those that delivered at home and had their first post-natal HIV test will be assessed for ART eligibility and advised to bring their children for testing at six weeks. Formal referrals will be instituted between MOUs and primary health care facilities where follow up of infants and mothers occurs as well as between these facilities and hospitals, inpatient wards, ART sites and TB facilities. Measures such co-scheduling appointments and treatment and counseling the family members together to ensure adherence to care and follow up will be used to monitor this process. Community and home-based care referrals will be established to ensure continuity of care and to improve access to services. ICAP will collaborate with community-based organizations and use home-based care to follow up on clients in their communities for adherence counseling and ongoing support. These community health workers will educate communities and families on the benefits of adherence to care and follow up. In addition, ICAP will support the implementation of Household and community integrated management of childhood illness (HH/C & IMCI) to improve the first five years growth and development of pediatric clients through its adherence and social support component. Health care worker knowledge and skills in HH/C IMCI will be improved through training, technical support supervision, mentoring, and provision of adapted IMCI guidelines, tools and standard operating procedures (SOPs). ICAP will also work with communities, the Department of Health (DOH), nongovernmental organizations (NGOs), and community-based organizations (CBOs), to ensure improved health systems to deliver quality care and IMCI. The DMT, community leaders, community resource persons, households and child care givers will be sensitized and provided with skills that will ensure child growth and development, home management and appropriate health seeking behaviors including car for children affected by HIV and AIDS. Training and sensitization will be done through group education, community outreach activities, and home visits. Monitoring and evaluation of activities will inform the practice of quality care.

ICAP will work with DOH and other organizations in different districts to create external referrals directories (for example, Buffalo City External referrals Directory developed by ICAP). Adherence and social support referrals to care givers including issues of disclosure in children will be addressed. Counseling and support to the care givers as well as older children will be provided. This will include establishing adolescent-friendly services, such as: having a dedicated section or clinicians at site for consultation with adolescents, formation of adolescent support groups to assist them in dealing with acceptance of their HIV status, adherence issues in the context of their environment and changing physiological and biological states. This will also address issues of prevention as well as the transition from pediatric into adult programs as well as ART readiness and compliance for those already on ART.

ACTIVITY 5: Engaging stakeholders and other partners

The sustainability of the HIV care and support programs depends on ICAP collaborating with stakeholders. The stakeholders in this instance are particularly the South African Department of Health through the provincial ministries, district health teams (including HIV, AIDS, STI and TB [HAST] managers) as well as facility managers and teams. Shared responsibility and co-planning will ensure ownership and rollout of this program. ICAP will strengthen the current data feedback sessions with the facilities and providers and also continue to attend HAST and District Health Management Team (DMT) meetings where programmatic challenges are identified and solutions sought. ICAP will also endeavor to have regular focused meetings with the clinic supervisors and program managers to analyze successes and challenges and plan the necessary interventions. ICAP technical support teams will continue to support sites and mentor the site

Activity Narrative: teams and individual providers to ensure quality care of the pediatric HIV exposed and infected clients until site independence can be achieved and the sites are less reliant on the ICAP teams. ICAP will continue to work with partners of the South to South training program and the Ukwanda Stellenbosch University outreach program to build competency and skills of the health care providers working within the pediatric services.

ACTIVITY 6: Quality of Care

ICAP will ensure development of best practice models in pediatric care at 46 sites. Quality, comprehensive and family centered care will be ensured through capacity building at site and at provider level. This will include human resources, provider skills development, infrastructural support and equipment procurement. In essence ICAP will ensure that the minimum package of care (using the model) is in place at 46 sites. The program will also ensure accurate documentation of care and support services through the implementation of pediatric care record card and registers. The pediatric standards of care will be used to assess the implementation and the quality of care that is provided to HIV exposed and HIV-infected children. Monitoring and evaluation of the pediatric care and treatment services will also be a core activity.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.10: Activities by Funding Mechanism

Mechanism ID: 416.09	Mechanism: N/A
Prime Partner: Broadreach	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Pediatric Care and Support
Budget Code: PDCS	Program Budget Code: 10
Activity ID: 22631.09	Planned Funds: \$97,090
Activity System ID: 22631	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Infants and children by strengthening linkages with existing services;
- Increase routine offer and provider-initiated testing to identify HIV-infected children;
- Expanding wellness programs for HIV-infected infants and children not yet eligible for ART;
- Employing a pediatric AIDS care and treatment specialist who will ensure integration of pediatric initiatives across all BroadReach Healthcare (BRHC) PEPFAR-funded activities; and
- Strengthening of care and treatment programs for children and their families in Khayelitsha, the largest township in Cape Town.

SUMMARY:

BRHC's pediatric care and treatment activities include training and salary support for health professionals, management support, quality assurance, operations support, strategic communications, and community outreach to increase the number of children on anti-retroviral therapy (ART) on BRHC-supported anti-retroviral (ARV) programs. The activities described in this program area are linked closely with activities described under adult treatment, pediatric and adult care and support, TB/HIV, PMTCT, ARV drugs, and counseling and testing (CT). BRHC has been a recipient of PEPFAR funds to provide ARV services in South Africa since 2005.

BACKGROUND:

As of June 2008, the BRHC program operates in five provinces and has almost 20,000 people currently receiving treatment services. Of this total, 7.8% are pediatric patients (excludes Edendale Hospital where pediatric patients are reported by EGPAF). Under PEPFAR funding BRHC has two treatment programs designed to support expanded treatment capacity for the South African Government (SAG). The first program began in May 2005 and consists of three different models providing treatment to eligible patients through networks of private GPs. Two of the models represent partnerships between the public sector and private GPs. This program was designed to ease the burden on the public sector to provide treatment services by strategically leveraging capacity in the private sector in underserved areas. The second program, which began in November 2006, is a program of technical assistance to SAG hospitals to assist with expansion and scale-up of the availability of treatment services in the public sector. The funds requested in FY 2009 are primarily for activities under the second program working with public sector sites. All proposed activities will be aligned with the NSP, national ARV guidelines and other national guidelines governing the care and treatment of HIV-infected and affected people.

In late 2006, BRHC began capacity building work with SAG sites and was initially assigned to 4 hospital systems in KwaZulu-Natal (KZN). As of June 2008, BRHC was reporting data from a total of 110 sites, including 11 hospitals, 62 private GP practices and 37 SAG Primary Health Center/Community Health Center (PHCs/CHCs) across districts in Eastern Cape (EC), KZN, Mpumalanga (MP), Gauteng province (GP) and North West (NW). At the request of District Departments of Health, BRHC has committed to continued expansion and plans to be supporting 19 complete hospital systems by September 09. With FY 2009 funds, BRHC expects to be active at 250 palliative care sites, including 25 SAG hospital systems.

ACTIVITIES AND EXPECTED RESULTS:

Note: Pediatric patients will benefit from all of the activities described in program area "Adult Care and Support", and the activities described here. In the pediatric care and support program area BRHC is highlighting activities which are specifically targeted to pediatric patients:

ACTIVITY 1: Target infants and children by strengthening linkages with existing services
BRHC will employ both facility and community-level approaches to improving the integration of services and referral systems within facilities, and between facilities and communities. The goal is to ensure that at whatever point a pediatric patient accesses the health care system (Outpatient Department (OPD), in-patient wards, mobile CT, ante-natal clinic (ANC), TB clinic, community health worker, Home-based Care (HBC), well-child care, outreach program) that a comprehensive package of prevention, care and treatment services are made available to that child and his/her family and household members. These services will include cotrimoxazole prophylaxis from age 6 weeks for HIV-exposed infants, targeted prevention messages, nutritional counseling, micronutrient supplementation, and routine offer and provider initiated CT. The goal is to furthermore ensure coordination and referral mechanisms are in place such that pediatric patients and their caregivers are able to navigate the health and social welfare systems successfully, and that facilities are able to track and locate patients at any time throughout this process. Linkages with malaria, family planning, Maternal and Child Health (MCH), gender-based violence, Directly Observed Treatment/Therapy Short Course (DOTS) and nutrition programs will be strengthened. BRHC takes a family-centered approach to providing comprehensive care and treatment services and will intensify efforts in this area to build HIV and AIDS-competent communities. During FY 2009, BRHC will expand partnerships with NGOs and community-based organizations in the catchment areas of BRHC sites to ensure uninterrupted service delivery and community-level support for pediatric patients and their families. Training, institutional strengthening, M&E and other technical assistance and human resource support will be provided to NGOs/CBOs to enable them to meet the demand for community-based services for CT, prevention, home-based care, access to social grants and support for OVC. Part of this support will be towards ensuring that the proper community-based support systems are in place and strengthened to increase HIV awareness and to create demand for testing, by providing resources for ongoing education on treatment literacy, providing adherence support, and providing support to the families of HIV-infected pediatric patients. BRHC will play a critical role in providing coordination between SAG facilities and communities, creating sustainable coordination mechanisms and mutually beneficial partnerships. Most importantly, pediatric patients and their families will benefit from programs that aim to provide longer, healthier lives.

ACTIVITY 2: Increase routine offer and provider-initiated testing to identify HIV-infected children
BRHC will support SAG sites to target infants and children for HIV testing at all service entry points, especially ANC, maternity and in-patient pediatric wards. Protocols for the follow up of HIV-exposed infants

Activity Narrative: will adhere to national guidelines. BRHC support to facilities will focus heavily on integration of TB and HIV services, where routine offer of CT of HIV patients for TB and of TB patients for HIV is provided in accordance with national guidelines. Using family-centered approaches to comprehensive care and treatment services, BRHC will ensure the screening and treatment of children of people who test positive for HIV or TB. BRHC will build on existing DOTS infrastructure and community health workers to identify children for HIV care and support as part of routine interactions with the households of TB patients.

ACTIVITY 3: Clinical services and operations

BRHC will place particular emphasis this year on expanding wellness programs for HIV-infected infants and children not yet eligible for ART. The goal will be to ensure early referral and enrollment into comprehensive care programs for children who are HIV-exposed or HIV-infected. Wellness programs will provide a preventive care package, consisting at a minimum of: PCR testing for infants, cotrimoxazole prophylaxis, screening and treatment for opportunistic infections (OIs) (especially TB) ongoing counseling and psychosocial support, nutritional assessment and supplementation, pain assessment, provision of infant feeding support, and prevention messages as part of routine care. Wellness programs will also provide necessary referrals to other health services such as well child care, nutritional supplementation and immunization services as part of IMCI services. BRHC support to facilities will focus heavily on integration of TB and HIV services, and use the opportunity of ill adults attending health facilities to also reach their infants and children with screening and referrals for HIV and TB. BRHC will increase access to PCR testing by purchasing equipment where requested by district and provincial DOHs, or by strengthening transportation and referral systems. It will also build laboratory capacity for early infant diagnosis by providing technical assistance and human resources to improve quality assurance and testing turnaround times

ACTIVITY 4: Human capacity development

In FY 2009, BRHC will employ a pediatric AIDS care and treatment specialist who will ensure integration of pediatric initiatives across all BRHC PEPFAR-funded activities. The specialist will take the lead in supporting sites to pilot innovative approaches to increasing testing of children, improve quality of care for children, and will ensure consistent application of family-centered approaches to the care and treatment of children. BRHC will engage additional qualified clinical mentors and preceptors to ensure supportive supervision within the work setting at BRHC-supported health facilities.

BRHC will enhance training content on care and treatment of pediatric patients in existing BRHC training offerings. BRHC provides a combination of in-house and outsourced training courses aimed at ensuring quality delivery of treatment services in the SAG facilities it supports. All BRHC implemented or sponsored training courses use nationally certified or DOH-approved curricula. Most courses are modular and cover a range of relevant topics including CT, TB, ARV therapy, and management of OIs. Additionally, BRHC will partner with programs such as the South-2-South Partnership for Pediatric HIV Care and Treatment to leverage existing training courses and expertise. If requested by SAG and Regional Training Centers, BRHC will assist to create new courses specifically for the care and treatment of pediatric patients. Pediatric course content, either through existing modular or newly developed training courses, will be provided to all professional and lay staff who have routine contact with children, regardless of ward or department. Training will emphasize the importance of testing and early infant diagnosis for children entering the health system through any service point: in-patient wards, OPD, ANC, MCH services, TB clinic, and community-based services, as well as in providing a package of preventive care services specific to the needs of pediatric patients. BRHC will continue to provide salary support to SAG for clinical and lay staff on a temporary basis to fill critical vacancies. This support will be coupled with budgeting and planning technical assistance to assist SAG sites to take over full support of these staff in future budget cycles thereby ensuring program sustainability and continued growth. Through this mechanism BRHC will ensure adequate human resources are available for the care and treatment of pediatric patients at BRHC-supported SAG sites.

ACTIVITY 5: Outreach to Children in Khayelitsha

BRHC has been asked by the WC Department of Social Development to assist with strengthening of care and treatment programs for children and their families in Khayelitsha, the largest township in Cape Town. This activity involves strengthening the existing Sizis'ukhanyo (NGO) resource center to serve as a coordination and referral hub for children requiring a range of health, social and educational services. BRHC will train resource center staff to provide community education programs on HIV and AIDS, monitor referrals, and provide training to community members and parents/caregivers. Technical assistance from BRHC will be used to expand and solidify linkages between the departments of health, education and social development in the community, ensuring that children and their families can access the comprehensive HIV and support services that they need. Referrals and linkages with other NGOs and CBOs providing services for children in Khayelitsha will also be strengthened. The activity may also include providing health and wellness for services for HIV-infected and affected children in the resource centre itself. Details of this activity are still under development.

Activity 6: Information systems/M&E/Quality Improvement and Quality Assurance

BRHC will continue to support the use of interim software solutions for management of patient data at BRHC-supported SAG sites with the goal of empowering site level staff to use routinely collected statistics for planning and decision making. In anticipation of national, provincial or district-level decisions mandating software for electronic patient record systems, BRHC aims to provide temporary solutions that improve the ability of sites to meet SAG reporting requirements. Information systems build on existing paper-based and register systems, providing added value by improving data quality and information use. Special attention will be paid to the challenges posed by monitoring and tracking of pediatric patients, from identification of HIV-exposed babies before birth, to PCR testing, to the commencement of pediatric treatment if necessary. Information systems will be designed to closely track mother-infant pairs as they move through the health system from pregnancy to well-child care, ensuring timely and comprehensive prevention, care and treatment services are provided to both. In FY 2009 BRHC will expand systematic quality assurance and quality improvement (QA/QI) approaches across all public sector sites. The purpose of this activity is to promote consistent quality of care for all HIV-infected and affected pediatric patients who seek services in the public sector, and to provide ongoing monitoring and support of training that has been provided. BRHC

Activity Narrative: will focus on the use of patient outcomes to monitor the progress and quality of programs. Pediatric patients will be monitored according to the following age bands: 0-2, 2-4 and 5-15 years of age.

New/Continuing Activity: New Activity

Continuing Activity:

Emphasis Areas

Construction/Renovation

Mechanism ID: 397.09

Mechanism: N/A

Prime Partner: Africa Center for Health and Population Studies

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Care: Pediatric Care and Support

Budget Code: PDCS

Program Budget Code: 10

Activity ID: 22591.09

Planned Funds: \$388,362

Activity System ID: 22591

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

- Expand activities home-based care (HBC) services to include social and legal services for children;
- Dietician will train HBC workers and support groups on nutrition care and support for pediatric clients;
- Anthropometric tools required for nutritional assessment of pediatric clients will be procured; and
- Long-term food strategies will be developed to ensure ongoing nutritional support for pediatric clients.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Africa Centre (AC) will expand activities home-based care (HBC) services with the appointment of a social worker for assisting in social (access to social security services for women and children as indicated in the NSP) and legal protection of pediatric patients.

ACTIVITY 2:

The dietician will train HBC workers and support groups on nutrition care and support. A referral system between the community and the clinic and food security projects will be implemented. This will be used to refer children and adults with poor nutritional status to and from the clinic and community and will strengthen efforts to manage malnutrition in the community.

Africa Centre will develop food and nutrition policies and guidelines adapted from the South Africa Government (SAG) nutrition policies which are applied to the local, rural community settings. This will cover both adults (pregnant women) and children.

The dietician in the program will train nurses, counselors, Home-based Caregivers and support group members in nutritional assessment and counseling and tools. For example, the nutrition risk score will be used to identify children at risk of malnutrition and will refer these children for food security support.

ACTIVITY 3:

Anthropometric tools required (adult and pediatric scales, stadiometers, mid upper arm circumference [MUAC] measuring tapes, and measuring mats) to conduct effective nutritional assessments will be procured with PEPFAR funding. Children will be weighed at all visits and during the well-baby clinics. Nurses will be trained on IMCI as a tool to manage malnutrition and other childhood illnesses.

ACTIVITY 4:

For long-term food security, support groups will be getting guidance on how to establish community gardens. All adults with HIV and TB will be referred to these support groups. All children with poor nutritional status will be referred to the Supplementary Feeding Scheme (PEM Scheme) and their mothers will also be referred to support groups to benefit from the Food Security Programs.

Program Area: Care: Pediatric Care and Support

Program Budget Code: 10

Planned Funds: \$97,090

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Coordinate adaptation of an advanced training module to ensure delivery of quality pediatric HIV and AIDS care services; and
- Water and sanitation will be integrated into the pediatric care model.

SUMMARY:

Comprehensive care for HIV in children has lagged behind in the Eastern Cape province. FY 2009 funds will be used to address these deficits.

BACKGROUND:

The Eastern Cape Regional Training Center (RTC) will use FY 2009 funds in the Eastern Cape to employ a person and support travel to focus coordinate and follow through on development of sustainable skills capacity for health workers to provide holistic care for children, through provision of support and training for improvement of health systems of pediatric care in the Eastern Cape.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

RTC staff will coordinate adaptation of an advanced training module which will be delivered through didactic training, clinical discussions, internal workshops, ongoing mentoring and performance improvement meetings with staff of facilities and their feeder clinics and in so doing, creating a learning network across the local service areas (LSAs) of operation. This will facilitate health workers to deliver quality pediatric HIV and AIDS care and enhance their capacity to participate effectively in all levels of HIV and AIDS care. The emphasis areas include the quality of counseling, cotrimoxazole prophylaxis, infant feeding, immunizations, early diagnosis and maintaining accurate records, ensuring follow up of PMTCT infants, performance of PCR and referral to initiate ARV treatment and social support.

ACTIVITY 2:

Water and sanitation (hand washing, proper storage of water, safe preparation of infant feed) will also be integrated into the pediatric care model. Diarrheal disease is a major concern in the Eastern Cape Province especially among pediatrics. Water and sanitation will be a focal point of all training and quality improvement activities at facility, community and district level. Practical demonstration will be necessary during support group and wellness mentoring in some home visits.

This training module will be formalized into a certificate and diploma qualification with technical support of partners such as the University of Washington's I-TECH and be offered by Walter Sisulu University.

The primary target populations are families, doctors, nurses and community health workers.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Recruitment and training of an additional 40 Outreach Workers to assist HIV-infected children access home-based care and support services; and
- Link the existing community outreach program to treatment and prevention programs.

SUMMARY:

Re-Action! will support the Mpumalanga Department of Health (DOH) with the scaling-up and expansion of pediatric care and support services. Services offered at local clinics will be linked to the first level of interaction within households through Community Outreach Workers.

BACKGROUND:

The Outreach Worker (OW) program is a direct entry point for HIV-infected children to access home-based care, referral, treatment and support groups. This is initiated by the "I know the way to live" campaign whereby individuals have the opportunity to test for HIV at home. In addition, the OWs conduct follow-up visits identifying potential health risks in the households, as well as the tracking and tracing of defaulters. Re-Action is already through its Public, Private Mix Methodology collaborating with the Department of Social Services, Churches and NGOs in Mpumalanga.

ACTIVITIES AND EXPECTED RESULTS:

Re-Action! will: 1) source, recruit and train an additional 40 OWs, as they are regarded as an important link between the community and district health facilities and are directly involved in developing the community intervention strategies; 2) link the existing community outreach program to treatment and prevention programs at a clinical level ensuring effective cross-referral and patient follow-up; and 3) build the capacity and skills of health care professionals and Outreach Workers (OWs) in the management and treatment of pediatrics; 4) skills upgrading will take place through training, mentoring and technical assistance (the duration, process and methodology will be finalized once an assessment has taken place as well as around the ongoing needs of the health care professionals and outreach Workers); 5) increase the number of OWs that deliver community-based and household targeted pediatric care and support services; 6) conduct household needs assessments identifying potential health risks; and 7) increasing TB case finding for families by increasing the number of household visits conducted in the community.

The quality and psychosocial management of HIV-infected individuals underscores the Re-Action! program and the OWs are thereby supervised by a professional nurse, thus ensuring the quality and clinical accuracy of palliative care services rendered at household level. The expansion of the program into 3 additional sites in Mpumalanga will require the recruitment of 2 professional nurses and 1 social worker as shared program resources.

Nutritional assessments and counseling support is key to the day-to-day management of HIV-infected children and Re-Action! will recruit a dietician as a shared program resource across all program areas, with specific focus on the identification of pediatrics with nutritional deficiencies. OWs in the community will work in close collaboration with the clinical staff and will follow-up on an individual level.

The activities have been modified in the following ways:

- The ongoing and expanded training and mentoring of OWs to ensure the incorporation of pediatric care, support and treatment skills in day-to-day counseling at a household level.
- Enhancing the OW project through the identification and partnering of service providers already working in the communities providing pediatric and child support community-based services such as home-based care, adherence counseling, referral for counseling and testing, support groups for care givers, nutrition counseling, and tracking and tracing of defaulters to enhance overall treatment services.

Expected Results: Re-Action through its activities expects that 120 children with HIV/AIDS at a grassroots level will be identified earlier and therefore access care and treatment regarding HIV/AIDS and TB.

Table 3.3.10: Activities by Funding Mechanism

Mechanism ID: 4749.09	Mechanism: N/A
Prime Partner: Ingwavuma Orphan Care	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: Pediatric Care and Support
Budget Code: PDCS	Program Budget Code: 10
Activity ID: 23520.09	Planned Funds: \$51,167
Activity System ID: 23520	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

-Expanding the availability of pediatric services in the target area and increase human resources devoted to pediatric HIV care and treatment.

SUMMARY:

Ingwavuma Orphan Care (IOC) activities are carried out to improve the current pediatric home-based care project through training of lay caregivers and to provide medical support in the way training nurses and provision of medical supplies. An in-patient unit with 10 residential beds and day care facilities will be established.

BACKGROUND:

This project started in 2002 and was expanded in 2003 to include additional patients and caregivers. IOC is a member of the Hospice and Palliative Care Association (HPCA) and has benefited indirectly from PEPFAR through mentoring and support of the HPCA medical director and professional nurse. IOC became a PEPFAR partner in FY 2007. The project works closely with Mosvold Hospital and its clinics in KwaZulu-Natal, with referrals in both directions. The hospital supplies the project with drugs, food and nursing supplies. The project is also partially funded by the provincial Department of Health/European Union Partnership. Most of the caregivers are women and the project provides them with education and a regular income. Male caregivers provide good role models to show that men can also be caring and look after the sick.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Improving/Expanding Health Services

IOC will use PEPFAR funding to continue to improve and expand its health services. IOC employs four nurses, a chaplain to offer spiritual support and 25 paid caregivers. All staff are paid adequately and care is taken to provide good working conditions in order to retain staff in this remote rural area. This project offers pre-employment and in service training and employment for volunteers, all of whom are affected by HIV, as home-based caregivers. The home-based caregivers live in their own communities spread across 2,100 square kilometers of the health district. They work in teams of 1-4 caregivers plus several local untrained volunteers. They visit people who are ill, providing basic nursing care and ensuring delivery of the elements of the preventive care package that includes: psychological, social and spiritual care. Family members are taught basic nursing techniques and about hygiene and nutrition. The caregivers distribute items such as gloves to promote infection control. If they suspect that a patient is HIV-infected, they will counsel them about the need for testing and encourage disclosure and testing of the whole family. Clients who test positive are then referred to the nearby local Department of Health (DOH) clinics and hospital for administration of ARVs. Caregivers follow up on referrals to ensure that patients have received the necessary care and understand medication instructions. Effort will be made to ensure equitable access to care services for both men and women. The teams of caregivers are visited by the nurses and chaplain 1-4 times a month ensuring the delivery of elements of the basic care package. The nurses and chaplain, together with the caregivers, then visit the clients needing specialized care. The nurse carries a basic supply of drugs, including cotrimoxazole, pain medication and treatment for opportunistic infections. The doctor oversees the dispensary. Nurses collect sputum samples if TB is suspected and deliver the samples to the nearest clinic for analysis. If the results are positive, the clients are referred to the DOH clinic for DOTS. The chaplain visits clients who request spiritual support. The project also advocates to government sources for HIV-affected families who do not have enough food. The open and caring attitude of the caregivers helps to reduce discrimination and stigma against those who are HIV-infected. The caregivers counsel relatives and neighbors who exhibit discriminatory behavior against the clients. Vulnerable children in the families are identified and referred to the OVC branch of the project. Bereavement support is provided, if necessary. PEPFAR funding will contribute to the support of the clients through medical personnel and medical supplies. This funding enhances the support already given to the project through the DOH, which contributes to some of the existing caregivers' salaries and project running costs. Quality of care will be further improved to provide the basic care package to encompass clients who are HIV-infected but asymptomatic.

ACTIVITY 2: Caregiver Training

The main objective of the training is to increase skills in delivery of quality palliative care services including pediatric palliative care. Lay caregivers are trained by a former home-based caregiver, who is assisted by the nursing staff, paralegals, a social worker, and other staff. Subjects covered in the training include HIV counseling, basic nursing, TB and ARV support, screening for pain and symptoms in children and methods of encouraging clients to start and continue taking ARVs or TB medication properly.

ACTIVITY 3: Renovation of training center and expanded office facility

The purpose of this activity is to renovate buildings at a new center which will allow the integration of all the activities of Ingwavuma Orphan Care at the geographical center of the area in which it works. Current offices were built to accommodate 7 staff while by 2009 there will be around 50. The current offices will be converted to a full time training center, providing much needed infrastructure and services in the area. The training center will be used by the organization to train staff, volunteers and community members for many of the PEPFAR-related activities. Changes to the building will include landscaping the grounds and purchasing appropriate furniture. Funding for renovation is expected to cost no more than 10% of funding for this program area.

Much of this year will be devoted to development of an in-patient and day care pediatric unit. The capital

Activity Narrative: costs are being paid for by other funders. The pediatric section will have 10 beds. Children with all palliative care needs will be assisted but it is expected that the majority will have AIDS and/or TB. This is the only such unit in KwaZulu-Natal. The District DOH is fully in support of this project and has promised to send a representative to the strategic planning meeting with an aim to contribute to resource mobilization. The building will be completed and equipped. This is a continuation of the capital project which is due to start in 2008. Policies and procedures will be developed in accordance with South African government policies, and staff will be recruited and trained in pediatric palliative care, childhood development, infection control, bereavement support and other relevant topics. The unit will accept referrals from Department of Health institutions and also from the community palliative care program. The unit will be used to provide palliative care to terminally ill children and their families. It may provide end of life care and also respite care to the families. ART will be provided by the DOH.

ACTIVITY 4: Support Groups

Support groups will be continued to provide the basic care package. Support groups are aimed at children and their caregivers. Groups meet once a month. Groups are led by a support group facilitator, but members of the groups are encouraged to take the lead over time. This will be a place where the basic care package is implemented as well as integrated prevention strategies. A curriculum has been developed which assists the children to understand HIV and to accept their status. Children are provided with health care and nutritional support as well as psychological support at the groups. The nutritional status of the children is monitored and the children are provided with nutritional and micro nutrient supplements if required. The children attending will be screened every six months for TB and referred for further investigation if needed to the government hospital.

In the above activities, People Living with HIV/AIDS (PLHIV) will receive at least one clinical and one other category of palliative care service. Palliative care to family members will be provided in at least two of the five categories of palliative care services.

The support groups teach the caregivers and the children about ARVs and give them adherence support through constantly reminding them to take their pills, peer support and monitoring whether the children are attending the clinic regularly. The children are screened for TB and caregivers are taught about the symptoms of TB in children. Those who are taking treatment are monitored to ensure that they adhere to treatment until it is completed. The in patient unit will provide palliative care for children who are reaching the end of their life and cannot be cared for adequately at home due to social, financial or medical reasons. The unit will provide good quality care with adequate symptom relief as well as spiritual, social and psychological support.

These results contribute to the overall PEPFAR objectives of 2-7-10 by increasing the number of people trained as home-based caregivers, increasing the number of people receiving palliative care, and increasing the quality of palliative care services.

Funding Source: GHCS (State)	Program Area: Care: Pediatric Care and Support
Budget Code: PDCS	Program Budget Code: 10
Activity ID: 23518.09	Planned Funds: \$392,488
Activity System ID: 23518	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

-The establishment of the Pediatric Palliative Care Training and Resource Center in collaboration with all project partners and the Department of Pediatrics of the University of the Free State.

SUMMARY:

The Hospice Palliative Care Association of South Africa (HPCA), founded in 1988, currently has 70 member hospices throughout South Africa (SA), each member being an independent entity. The HPCA Mission is to provide and enhance the provision of sustainable, accessible, quality palliative care. The target population is orphans and vulnerable children (OVC). The emphasis areas are human capacity development (training) and local organizational capacity building. PEPFAR funding will be used to strengthen the capacity of HPCA member hospices to provide pediatric palliative care to vulnerable children through identifying hospices that provide care for OVC. The St Nicholas Bana Pele Children's Network (SNBPCN) project, in partnership with St Nicholas Children's Hospice in Bloemfontein, a sub-partner, will improve the quality of life of OVC by providing quality Pediatric Palliative Care in the Motheo and Xhariep Districts of the Free State, and increase identification of HIV-infected children and improve access to antiretroviral therapy for them. Pediatric Care is provided to HIV-infected children and those exposed to malnutrition, low birth weight, HIV-related disabilities, and infectious diarrhea. These children are admitted to the in-patient units. Many children move between the Pediatric and OVC programs as their condition changes.

BACKGROUND:

HPCA strengthens existing services and develops new services through direct funding to member hospices to promote accessibility and availability of palliative care in SA. HPCA personnel at national, provincial and district levels continue to provide the infrastructure and coordination to develop and strengthen palliative care programs within member hospices, and government and non-government organizations. PEPFAR funding has allowed the training of 329 trainees in Pediatric Palliative Care from October 2007 to July 2008. These trainees include Doctors, Social Workers, Trainers, Professional Nurses, Enrolled Nurses, Home-based Caregivers and Managers. The major focus of PEPFAR funding in FY 2009 is to provide direct palliative care to patients and their families, to assess quality of palliative care, assist in the development of new services, provide support to the care providers, and provide training in palliative care. In FY 2008 an OVC funding component has been added to the HPCA program, to ensure that children infected and affected by HIV and any other life-limiting conditions will be identified, supported, receive pediatric palliative care and antiretroviral therapy and, where necessary, referred for further support.

ACTIVITY 1: St. Nicholas Bana Pele Children's Network (SNBPCN) project

In FY 2009 HPCA will be managing the SNBPCN grant with advice and support from AED. HPCA will provide mentorship to St Nicholas to build capacity within that hospice. Capacity Building for the SNBPCN project will also include the appointment of new staff in the Free State to coordinate the project. Capacity building in the communities will take place to identify and care for HIV-infected children through education and training from the hospice wellness centers. The wellness centers are health drop-in facilities to promote and monitor health. Holistic services are provided, including weighing of babies, nutritional advice, and immunization. Education in the homes and in community groups will also be provided in order that communities can develop the capacity to provide care for these vulnerable children and use community resources including local primary health care clinics. PEPFAR funding for the SNBPCN project, will be used to improve the quality of life of OVC who require Pediatric Palliative Care in the Motheo and Xhariep Districts of the Free State, increase identification of HIV-infected children and improve access to antiretroviral therapy through a strengthened referral system and the establishment of a cooperative network consisting of relevant government departments, the antiretroviral program, faith-based organizations and other non-profit organizations. OVC palliative care patients will receive direct support and family members will receive psychosocial, emotional and spiritual care into the bereavement period.

Training for the SNBPCN project: A Pediatric Palliative Care Training and Resource Center will be established in collaboration with all project partners and the Department of Pediatrics of the University of the Free State. The objective is to promote palliative care for children and provide a resource for the Free State Province for expert advice and support. Materials on palliative care for children will be developed and used for training. Community capacity will be improved through training and services from eight community Wellness Centers in impoverished areas linked to the development of a Pediatric Palliative Care Training and Resource Centre, together with the Department of Pediatrics and Family Medicine. Prevention education will be provided with the faith-based organizations to reach young people and training in palliative care for children will be given to individuals. This activity will be supported by an array of monitoring and evaluation activities to assist in monitoring the progress and measuring the results. Monitoring and Evaluation expertise will be provided for Pediatric Palliative Care by HPCA.

ACTIVITY 2: Capacity Building

HPCA will provide capacity building expertise to the member hospices which provide Pediatric Palliative Care. The HPCA curricula for Pediatric Palliative Care has been reviewed and updated. This specialized training will be provided by the 10 HPCA Centers of Palliative Learning (CPLs) and HPCA Regional Education Forums.

ACTIVITY 3: Pediatric Palliative Care Services

The pediatric care services will be provided as follows: identification of OVC infected by HIV, accessing grants, assistance with foster care placements, assisting with access to education, HIV prevention information, education and counseling, health care including pain and symptom management, Anti

Activity Narrative: Retroviral Therapy (ARV) and TB Medication supervision, day care, support to Child and Youth-Headed Households, bereavement support, resilience and memory training, spiritual, emotional and psychosocial care, and support for elderly caregivers, home-based care, in-patient care and early childhood development programs. HPCA member hospices will provide the following Pediatric services: psychosocial, emotional and spiritual support will be provided to family members with identification of very vulnerable households such as those headed by children and young people, or the elderly.

This activity will be supported by appropriate Monitoring, Evaluation and Reporting (M&E) activities and tools to measure progress. Other support activities are improving access to ARVs, monitoring and adherence of ARVs, nutritional interventions and facilitating access to social grants. Funds will be used for direct funding for nurses, social workers, and social auxiliary workers and for transport and administration costs of these human resources. Focus will be on the girl-child and the role of the female caregiver, including the role of the grandmothers in support of OVC. This program will be for five specific pediatric services and seven integrated pediatric services, with at least one per province.

This program will also focus on strengthening of existing comprehensive and or extensive pediatric programs through direct funding. Linkages to other services such as TB treatment, ARV treatment and support will be integrated into the OVC services.

ACTIVITY 4: Advocacy and Liaison

HPCA will liaise with corporate social investment programs and Government to strengthen and increase funding for the care and protection of OVC infected by HIV. Where OVC support services are required which are outside the scope of hospice expertise, e.g. child protection and nutrition, HPCA will identify suitable partners with the technical expertise and resources to provide these services and to strengthen HPCA OVC programs. The SNBPCN project will promote Pediatric palliative care for children and raise public awareness. Links through existing Child Care Forums will be strengthened through liaison with the Department of Social Development.

ACTIVITY 5: Pediatric Palliative Care Training;

The Pediatric Palliative Care training will be strengthened to include the South Africa PEPFAR OVC indicators, gender issues etc. Existing Pediatric Training curricula will be revised and expanded. Pediatric palliative care training courses will include the following: Definitions of pediatric palliative care, Conditions requiring pediatric palliative care, Models of pediatric palliative care,

The Rights of the Child, Palliative care within the context of childhood development, Pain management in children, Symptom management, Nutrition, young person's understanding of death, Communication with children, Emotions of the child and family members, Spiritual care and support of the child, young person and family, Bereavement support including resilience and memory approaches, Social and legal issues relating to children and young people. Ethical issues Core competencies and practical experience, and the mapping of family members (similar to a family tree), to determine the support structure which each child has in their home environment.

With the increased funding to HPCA for pediatric palliative care for children, forty (40) sites will be identified for support and development of pediatric care programs. These sites will be in all 9 provinces and will be spread among urban and rural sites. Preference will be given to areas where there are no children's palliative care programs with the long-term aim to have a children's palliative care program in all health districts and sub-districts in South Africa.

A Pediatric Palliative Care Officer will be employed to support hospices in the development of their programs and collaborate on the development of materials and a training curriculum.

The St Nicholas Bana Pele Children's Network will be established in the Motheo and Xhariep Districts of the Free State with a strong referral system between programs caring for children for effective supervision and follow-up of all HIV-infected and affected children, working together with the Departments of Social Development and Health, as well as Faith-based and community-based organizations, in the province. Eight community centers with early childhood development services, and services for the children and families, will be developed.

Two grandmother support groups will be established and developed.

Through these activities, HPCA supports the vision outlined in USG's South African Five Year Strategy to expand access to quality pediatric palliative care services thereby contributing to the 2-10-7 goal of providing care to 10 million people affected by HIV.

Prime Partner: Foundation for Professional Development

Funding Source: GHCS (State)

Budget Code: PDCS

Activity ID: 23058.09

Activity System ID: 23058

Mechanism: N/A

USG Agency: U.S. Agency for International Development

Program Area: Care: Pediatric Care and Support

Program Budget Code: 10

Planned Funds: \$94,178

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:
-Expansion of pediatric HIV care and support services;
-Promotion of family-centered services;
-Addressing the palliative care needs of pediatric PLHIV;
-Linking pediatric TB screening and treatment services; and
-Expansion of the ART clinical quality assurance system.

SUMMARY:

Funding will be used to support the expansion of pediatric HIV care and support services and to strengthen pediatric HCD within all the provinces where FPD works.

BACKGROUND:

This is a continuation and expansion of work started in the previous COPs. Activities in support of pediatric HIV care and support focus on: strengthening and integrating public and civil society service delivery models for People Living with HIV/AIDS (PLHIV); collaborating with SAG to build sustainable human and institutional capacity to support integrated pediatric HIV care and support services; promoting age-appropriate and family-centered services through the integration of infant, child, adolescent and parental wellness programs; supporting surveillance activities monitoring continuity of care and integration with PMTCT, ANC and MCH programs; and expanding FPD's pediatric specialist mentoring and referral support to strengthen doctor and nurse capacity to provide quality pediatric HIV care and support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Increase pediatric enrollment in HIV care

Activities to increase pediatric enrollment in HIV care aim to establish strong linkages between HIV-related care sites and community-based CBOs, FBOs and NGOs with a focus on HIV-exposed and HIV-infected children and caregivers; FPD will work with community-based partners to support community awareness and mobilization campaigns in support of pediatric HIV care and treatment; the model has proven to be extremely cost-effective as it leverages substantial philanthropic and volunteer resources.

ACTIVITY 2: Pediatric HIV care and support program

Key components of the pediatric HIV care and support program area include age-appropriate: integrated preventive services, psychological care, spiritual care, social care, as well as quality HIV clinical care. All FPD-supported pediatric HIV-related care sites provide a basic package of care including clinical care services (clinical monitoring and staging, CD4 counts, Viral Load assessments, co-trimoxazole prophylactic treatment, vitamins A and zinc supplementation, etc).

ACTIVITY 3: Promotion of family-centered services

New activities during the COP will target the promotion of family-centered services. Activities include: piloting booking systems that allow families to gain access to services on the same day at the same time as a family unit; encouraging CT services for all family members; strengthening integration of services between different service partners within a site; and expanding the linkages between FPD and PMTCT partners, such as Mothers to Mothers and Elizabeth Glaser, in order to ensure the seamless referral from PMTCT programs to pediatric HIV care programs. FPD has a relationship with Mothers to Mothers and South to South - South Africa. Mother to Mothers supports PMTCT programs in FPD-partnered SAG facilities in North West Province; South to South provides technical assistance to FPD-partnered SAG facilities for PMTCT and clinical pediatric HIV care where FPD and SAG have identified a need for additional assistance.

ACTIVITY 4: Addressing palliative care needs of pediatric People Living with HIV/AIDS (PLHIV)

FPD will also focus on addressing the palliative care needs of pediatric PLHIV. FPD aims to link a dedicated hospice to each treatment site and to establish a system whereby FPD-employed clinical staff does ward rounds in order to ensure a continuum of care between treatment sites and hospices for all pediatric HIV patients.

The electronic medical record (EMR) that is utilized by FPD-partnered ART clinics will be expanded to encompass general pediatric HIV care and wellness activities and be available at all ART sites and be piloted at two pediatric HIV-palliative care sites which provide basic package of care components (e.g. psychological care, spiritual care and social care). The EMR was developed at the direct request of the Tshwane District of Health in order to strengthen and harmonize facility-based monitoring systems while ensuring that data quality and data use are integral components of the process. Key activities for the EMR include strengthening the integration of various HIV service points (CT, TB, HIV-palliative care, ART) and optimizing inter-connectivity with existing SA DOH systems (District Health Information Systems; National Health Laboratory Systems). In support of these activities, FPD will place a strong emphasis on didactic training and ongoing on-site mentorship to build sustainable, local monitoring and evaluation (M&E) and Health Management Information System (HMIS) systems.

The electronic medical record (EMR) is supported on an integrated virtual private network (VPN) which allows for the electronic transfer and/or access of data between different HIV service points. This inter-connectivity holds great potential in terms of monitoring service integration and continuity of care within a district. In the EMR, the electronic HIV and AIDS data will be held in a physically and technically secure environment with minimum data repositories and limited individual access. Data access will be determined

Activity Narrative: by designated user roles and rights. The existing defaulter tracer module will support active tracing of missed appointments, mitigate loss to HIV care and work in support of appropriate and early ART initiation of HIV-infected and HIV-exposed children. Additional steps to ensure retention include ensuring the establishment of PLHIV-led support groups that will support pediatric patients and care-givers on issues such as disclosure, nutrition, alcohol, safe sex and family planning, status acceptance, treatment literacy and adherence counseling.

ACTIVITY 5: Link to pediatric TB screening and treatment services

Due to the high prevalence of Tuberculosis and infectious diseases in the community the following activities will be supported in collaboration with DOH facilities: (1) routine TB screening and active case finding in all pediatric HIV care settings; (2) implementation of the isoniazid (INH) prophylaxis program for HIV-exposed and HIV-infected children; and (3) active monitoring of immunization status and ensuring that all children's vaccination is up-to-date. There are a number of challenges associated with the management of TB-HIV collaboration; FPD will focus on training and mentoring to improve the management of these systems, including: the supply chain for INH prophylaxis, as well as data management for SAG TB registers.

ACTIVITY 6: Expansion of the ART clinical quality assurance system

The ART clinical quality assurance system that has been developed through collaboration between FPD and JHPIEGO will be expanded to all facilities offering pediatric HIV care and support. This system uses a standards-based measurement and rating (SBMR) approach with an aim to identify and respond to challenges to improve quality of pediatric HIV care. SBMR activities will be implemented by facility staff on a routine basis and by external auditors periodically.

Program Area: Care: Pediatric Care and Support

Budget Code: PDCS

Program Budget Code: 10

Activity ID: 22700.09

Planned Funds: \$261,361

Activity System ID: 22700

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Ensure the provision of a basic care package to HIV-exposed children;
- Identify all HIV-exposed children of adults in HIV care and support; and
- Strengthen health systems serving patients in HIV care and support.

SUMMARY:

Activities under the Pediatric Care and Support program activity support the provision of comprehensive antiretroviral treatment (ART) program carried out by Catholic Relief Services (CRS) in 24 field sites in seven provinces in South Africa. The area of emphasis is the improvement of care and support to HIV-exposed children in the program, ensuring their wellness. The field sites target those in need of these services, who live in the catchment area of the site, and who cannot access the services in the public sector. The major emphasis area is to provide linkages with other sectors and initiatives and ensuring that children receive the much-needed care in line with national guidelines. These will include; early diagnosis, cotrimoxazole prophylaxis, antiretroviral treatment and Integrated Management of Childhood Illnesses (IMCI) related services. All HIV-exposed children in HIV care and support should be provided with related services for wellness, opportunistic infection (OI) and TB treatment and prevention and nutritional supplementation. Minor emphasis areas are household member involvement, nutritional counseling, community mobilization/participation, development of networks/linkages/referral systems, and human resources. The main target populations are HIV-exposed children and their families as well as caregivers.

BACKGROUND:

AIDSRelief (the Consortium led by CRS) received Track 1 funding in FY 2004 to rapidly scale up ART in nine countries, including South Africa. Since FY 2005 South Africa COP funding was received to supplement central funding, with continued funding applied for under FY 2009. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and the Institute for Youth Development South Africa (IYD-SA).

Currently, about eight percent of individuals in Care and Support are children. Many of the rural areas AIDSRelief serves are resource poor and care and services are scarce due to the remote and rural nature of these locations. AIDSRelief is trying to address this by identifying HIV exposed children while providing home-based care, as well as putting increased focus on family-centered VCT. In addition, AIDSRelief will involve all cadres of healthcare workers at selected sites to identify pregnant women and HIV-exposed children's needs. Where the AIDSRelief sites cannot provide the services a functional referral system will be put into place.

ACTIVITIES AND EXPECTED RESULTS:

AIDSRelief sites will focus on identifying HIV exposed children in the communities they serve. Early identification, screening and referral will be emphasized. Every community health care worker will identify vulnerable children in the household they visit. Children will be identified and registered. Parents will be counseled and motivated to have children tested. PCR testing will be offered from 6 weeks of the infant's life for the first year. Thereafter rapid testing will be used.

ACTIVITY 1:

The basic care package to HIV-exposed children includes the following activities:

- Ensure children are fully immunized and refer to primary health care (PHC) where needed;
- Early HIV diagnosis (using serum PCR);
- Cotrimoxazole provision to all HIV exposed children from six weeks until they are confirmed HIV-negative;
- Nutritional support to all children born to HIV-infected parents;
- TB screening for all children;
- TB treatment where necessary,
- IPT if active TB has been excluded (where possible);
- Ensure/refer all children in need of birth registration;
- Assist families with social service applications (child grants etc.) where possible; and
- Integrated Management of Childhood Illnesses (IMCI) and Vitamin A supplementation.

ACTIVITY 2:

Identify all HIV-exposed children of adults in HIV care and support:

- Continue to provide early identification and treatment/referral for opportunistic infections (OIs);
- Continue to provide community support (psychosocial and spiritual);
- Renewed emphasis on family-centered approach through; grouping family visits together; encouraging partner and HIV-exposed children to join women in care and support activities; and encouraging interactive family sessions.

ACTIVITY 3:

Strengthen health systems serving patients in HIV care and support:

- Strengthen linkages, coordination and referrals to OVC programs, immunization and well-baby clinics; primary health care (PHC) facilities, TB clinics, STI clinics, local health and social services; and
- Provide training and technical assistance to staff in the health system.

ACTIVITY 4:

Cotrimoxazole and TB prophylaxis will be provided in line with South African government (SAG) policies.

Activity Narrative: The "Road to Health" card will be used to document interventions according to SAG guidelines. The National Strategic Plan (NSP) target is to provide an appropriate package of treatment, care and support services to 80% of people living with HIV and their families by 2011 in order to reduce morbidity and mortality as well as other impacts of HIV and AIDS. In order to meet this target the AIDSRelief sites will pay attention to the following key issues: Focusing on specific issues and groups: prevention of mother-to-child transmission, care of children and HIV-infected pregnant women, and wellness management of people before they become eligible for ART.

ACTIVITY 5:

The program focus on family centered care and will involve parents and caregivers by involving partners (through increased partner testing, male support, prevention and interventions in regards to gender-based violence), including support groups for HIV-infected pregnant women and mothers. Other activities, where applicable, will include programs targeting partners of pregnant women and providing information to men on PMTCT, counseling and testing (CT), prevention and other health issues and encouraging couples counseling and testing in an attempt to increase men's involvement in HIV and AIDS treatment and care programs and to reduce stigma and violence against women. The approaches will include couple counseling and testing at CT and PMTCT sites with the view of promoting testing of men as well as building their support for their female partners, where possible. Efforts will be made to include health worker trainings to recognize signs of gender-based violence, to provide appropriate counseling and referral services to social, legal, and community-based support groups, as well as training and employment of women as health care providers to increase the confidentiality and comfort of women and girls seeking treatment for HIV.

Given that AIDSRelief sites operate in rural and remote areas, where technical capacity and infrastructure is lacking, heavy emphasis is put on provision of laboratory services through a quality service provider. To overcome this challenge, Johannesburg-based Toga Laboratories, another PEPFAR-funded partner, has been selected as the laboratory service provider for laboratory tests to be conducted under the program. The company has been established by Prof. Des Martin and Dr. John Sims, long-time South African virology experts. Toga Laboratories has an on-going quality assurance (QA) program to monitor and evaluate, objectively and systematically, the reliability of the laboratory data. There is an in-house laboratory quality unit which coordinates external quality assurance. For every test performed in the laboratory, there is a quality control plan stated in standard operating procedures (SOP). Internal quality controls (IQC) are performed daily on all instruments as well as for manual tests and recorded. External quality assessments include the UK National External Quality Assessment Scheme (UKNEQAS) as well as National Health Laboratory Services (NHLS) assessment programs, among others.

Program Budget Code: 10

Activity ID: 23860.09

Planned Funds: \$526,454

Activity System ID: 23860

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

-Piloting improved models of care at selected Thuthuzela Care Centers (TCCs) to inform SOCA's national "blueprint" for TCC care services and future Women's Justice and Empowerment Initiative (WJEL) program implementation.

SUMMARY:

USAID, through RTI, will provide support to strengthen the HIV-related clinical, psychological and social care services for the TCCs for child rape victims in all provinces.

BACKGROUND:

This is the third year of support to the TCCs. Thuthuzela means "to comfort" in isiXhosa; TCCs are multi-disciplinary centers that provide comprehensive care for rape survivors with an emphasis on women and children.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

RTI will help the Sexual Offences and Community Affairs (SOCA) Unit of the National Prosecuting Authority (NPA) to establish 8 new TCCs in FY 2009, 8 in 2010 and 7 in 2011, for a total of 23 TCCs, and fund three core staff in each TCC. The program focuses on refurbishment of TCCs in order to meet health and TCC blueprint standards. RTI understands that the funds cannot be used for new construction without special waivers.

ACTIVITY 2:

RTI will orient and train TCC staff, doctors and forensic nurses; provide both core multi-disciplinary training and on-site training; and support all TCC staff by conducting training focusing on: delivery of post-exposure prophylaxis (PEP), HIV counseling and testing (CT), protocols for care and treatment of victims and follow-on psycho-social counseling for TB, PEP, ARV and secondary prevention adherence.

ACTIVITY 3:

Through the grants component, RTI will support referral systems for treatment and care and follow-on psycho-social counseling for children who tested positive by providing assistance to non-governmental organizations (NGOs) and working closely with them.

ACTIVITY 4:

With additional funding from the PEPFAR Special Initiative on Sexual Gender-based Violence, RTI will pilot improved models of care at selected TCCs to inform SOCA's national "blueprint" for TCC care services and future WJEL program implementation. RTI will also develop pilot models based on existing best practices in rape care currently offered through the SAG's Department of Health and NGO-supported services.

ACTIVITY 5:

RTI will strengthen health care services at TCCs, with special attention to improving PEP adherence and health care follow-up and referrals and explore strategies for explicitly raising community awareness of TCC services and for strengthening TCC linkages with community networks to help facilitate child victims' access to services.

Development

Program Area: Care: Pediatric Care and
Support

Program Budget Code: 10

Planned Funds: \$873,814

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Establish and staff a Perinatal HIV Research Unit (PHRU) adolescent clinic; and
- Scale up treatment for HIV-infected and HIV-exposed children.

SUMMARY:

The PHRU will use PEPFAR funds to continue to provide quality holistic care for HIV-infected and HIV-exposed children (0 - 14 years) comprising elements in the preventive care package, medical care and psychosocial support categories in Gauteng, rural Limpopo, rural Mpumalanga and Western Cape provinces. Children are identified through the prevention of mother to child transmission (PMTCT) and counseling and testing (CT) programs. Early infant diagnosis at 4-6 weeks. Children are monitored, prepared and referred for antiretroviral (ARV) treatment. Linkages to CT, the PMTCT and referral to ARV services will be strengthened. A family-centered approach targets HIV-infected adults, children and infants.

BACKGROUND:

Since 2002, PHRU has established and supported palliative care programs in Gauteng, rural Limpopo and Mpumalanga, and the Western Cape provinces for children identified as HIV-infected through PMTCT and CT (also funded by PEPFAR). Very young infants are referred to specialized services care. Primary health care nurses are the main providers of care under physician supervision. The Department of Health (DOH) guidelines for HIV care and laboratory testing are used to ensure compatibility with South African Government (SAG) treatment sites. In South Africa, a care program covers the period from testing positive through end of life care. A holistic family centered approach is taken comprising elements of the preventive care package for adults and children, clinical services, psychosocial support, healthy lifestyle promotion and preparation and transition of clients onto ARV treatment when required. These programs are predominately accessed by women; however PHRU is attempting to redress this imbalance. Men are encouraged to participate through CT programs which specifically target men. Clients are encouraged to bring partners, children and other family members. A focus of the program is to identify HIV-infected infants and children and to provide family-centered care and support. Quality assurance, client retention, monitoring and evaluation are integral parts of the program. The aim of the programs is to delay progression of HIV to AIDS by providing palliative care and support to HIV-infected clients who do not yet qualify for ARV treatment. Care includes: screening for active TB, preventative treatment for latent TB infection, cotrimoxazole prophylaxis for opportunistic infections (OIs), syphilis screening, symptomatic screening for syndromic STIs, screening for cervical cancer, provision of family planning and regular CD4 counts. Opportunistic illnesses are treated using a formulary based on the South African Essential Drug List. Support for clients, their families and community members is provided through support groups and education sessions at all sites covering issues such as basic HIV and AIDS information, HIV services, PMTCT, ARV treatment, opportunistic infections, TB, prevention, disclosure, prevention, nutrition, stigma, positive living and adherence. At the end June 2008, with PEPFAR funding PHRU supports 4696 children (0-14) out of a total of 27238 people in care, 17.8%. This exceeds the target set by PEPFAR and the National Strategic Plan (NSP).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: PHRU clinic Soweto, Gauteng

The Pediatric Wellness Program has been supported by funding through PEPFAR since 2002. Currently 1062 children (0-14) are enrolled in the program. Since 2004, a focus has been to identify children requiring care, ARV treatment and psychosocial support through linkages to PMTCT and infant testing at 4-6 weeks using PCR (as per SAG guidelines). Children receive care, growth monitoring and routine immunizations. Support programs assist caregivers and children, in particular around issues of bereavement, disclosure, dealing with stigma and discrimination, positive living and life skills.

ACTIVITY 2: Adolescents

This activity is cross-cutting since the primary focus is on prevention of adolescents getting infected with HIV in the first place (see CT program area) but inevitably some adolescents will be identified as HIV-infected through CT activities, and these adolescents will be referred to appropriate care and treatment programs. Depending on the age of the adolescent, and the major activity at the site they are included under Pediatric or Adult care, treatment and support.

Adolescents have special healthcare needs which they are often reluctant to address; some of these are sexuality, pregnancy, drug and alcohol abuse, sexually transmitted infections (STI), gender and mental health issues, coercion, violence, transgenerational sex and abuse. They are at high risk of contacting HIV and other STIs. PHRU has established a specialized adolescent clinic PHRU to address these needs with PEPFAR funding by offering comprehensive counseling and care services that are youth-friendly, confidential and empowering to clients so that they are able to make informed and responsible healthcare choices, including being empowered to abstain and delay sexual debut. Through CT, education and counseling, PHRU increases awareness of HIV. The clinic in Soweto is based close to places to where adolescents congregate. Pregnancy in adolescents is a concern and the program will ensure that these young mothers receive a continuum of care during and after their pregnancy. Services comprise CT and confidential and free care; information, education and counseling on sexual and reproductive health; health information; counseling and appropriate referral for violence abuse and mental health issues; contraceptive information and counseling on individual choices; STI information, including information on effective prevention; and syndromic management of STIs. PEPFAR funds will be used to establish and staff this project.

Activity Narrative: ACTIVITY 3: Support government facilities, Gauteng, Rural Mpumalanga/Limpopo, Western Cape.

In partnership with provincial Departments of Health the PHRU supports government facilities to scale up treatment for HIV-infected and HIV-exposed children. The special needs of children are taken into account and the package described above is implemented either by the PHRU or their sub-partners in the various sites that PHRU supports.

PEPFAR funds support these programs to improve linkages to primary care clinics for down referral, and to provide holistic care and support to people on ART and their families. Training, mentoring and support to staff in these facilities is a focus area.

In all of the above activities, people living with HIV (PLHIV) will receive at least one clinical and one other category of palliative care service. Palliative care to family members of PLHIV or orphans and vulnerable children (OVC) will be provided in at least two of the five categories of palliative care services.

PHRU has run three very successful Priorities in AIDS Care and Treatment (PACT) conferences which are targeted to public sector health care workers (doctors, nurses and pharmacists) and program and facility managers. These conferences have different themes and are very practical in nature. They have been well received by participants who find that they are able to take away useful information and knowledge to improve the quality of care and treatment access at their facilities. Through these conferences PHRU been able to disseminate it's research findings and HIV-prevention, care and treatment experiences and has invited other PEPFAR partners to share their experiences, knowledge and best practices. Over 800 people have attended these conferences.

These activities directly contribute to the PEPFAR 2-7-10 goals by improving access to and quality of palliative care for HIV-infected individuals and their families.

Funding Source: GHCS (State)	Program Area: Care: Pediatric Care and Support
Budget Code: PDCS	Program Budget Code: 10

Activity ID: 23894.09

Planned Funds: \$174,763

Activity System ID: 23894

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Establishing Quality Improvement Teams at the District / Facility Level; and
- Recruitment of medical staff tasked with the provision of clinic services.
- Expansion of support services to include counseling on remaining HIV negative, Prevention with Positives (PwP), HIV wellness programs;
- Development of accredited HIV and AIDS and home-based care training materials; and
- Development, revision and implementation of the National HIV and AIDS guidelines.

SUMMARY:

While HCI will continue to focus on the five key activities described above, the emphasis during FY 2009 will be on expanding these activities in the manner described below.

BACKGROUND:

HCI will continue to build of activities described in FY 2008. The expansion of activities seek to build on program strengths in HCD and clinical and support services.

ACTIVITES AND EXPECTED RESULTS:

ACTIVITY 1: Establish Quality Improvement Teams at the District / Facility Level

By improving and institutionalizing the formation of Quality Improvement teams at a facility and district level, HCI staff is involved in providing the knowledge and skills required for leadership and sustainability for the program. This is an ongoing initiative, which is specific to each area / district/ province, due to the variable nature of the different stakeholders involved and geographic location of HCI-supported sites / districts.

ACTIVITY 2: Human Capacity Development

As HCI is already in the process of recruiting and placing medical staff in health facilities, these medical staff will be tasked with provision of clinical services to HIV-infected clients on a day-to-day basis and provision of training and mentoring for health facility staff regarding HIV and AIDS care, with specific reference to ART treatment, care and support services on a weekly and monthly basis. As part of HCI's sustainability initiatives, HCI staff seek to build capacity and develop local skills, by providing training and support to DOH clinic staff (doctors, nurses, counselors, pharmacists, etc.) to ensure that providers have appropriate knowledge and skills to deliver quality HIV and AIDS services to all HIV-infected clients enrolled on the program / eligible for ART treatment and care. HCI staff and DOH staff meet regularly to ensure that any additional knowledge regarding newer ART medication / treatment options and research findings are readily shared.

ACTIVITY 3: Strengthening supervision systems

HCI has been extensively involved in revision of the Clinic Supervision Manual for health care facilities, and will continue to lead the implementation and monitoring of supervision systems within the country, by training district and facility-level supervisors in QA methods and facilitative supervision techniques for improving the quality of HIV and AIDS services and follow-up services.

ACTIVITY 4: Care support groups

HCI has been involved in providing assistance to implement, run and facilitate community and facility-based care support groups at all HCI-supported health care sites in the five provinces. In FY 2009, it is envisioned that this support will be expanded to include counseling on remaining HIV negative, Prevention with Positives (PwP), HIV wellness programs, care for the caregivers' activities and community outreach programs / projects.

ACTIVITY 5: Training

In FY 2009, HCI staff will work to develop accredited HIV and AIDS and home-based care training materials, including a comprehensive package of manuals, posters, flip charts and job aids. The development of these materials will include modules on basic HIV, staging of HIV disease, care of HIV-infected individuals, eligibility for ART, initiation of ART in both adult and pediatric patients, disclosure, adherence issues, poly-pharmacy (addressing concomitant administration of medication), living positively with HIV and TB/HIV co-infection.

In addition, HCI will revise existing QA training materials and expand on proposed training initiatives to include QA/QI methodology for all cadres of health care staff, including informal staff such as community workers, lay counselors and home-based carers. This is particularly important at PHC facilities where HIV-infected clients interact with a wide range of formal and informal health staff.

ACTIVITY 6: Referrals and Linkages

Building on lessons from previous experiences, HCI is able to facilitate linkages between different stakeholders within the health system, by coordinating and providing leadership.

To improve existing referral networks, HCI staff members will identify and strengthen linkages between PMTCT, CT, FP, STI, TB and ART treatment sites. By working with health facility staff at different levels of care, HCI staff will advocate for the development of integrated referral and follow-up networks. All staff at these sites will be responsible for referring HIV-infected clients for onward care, treatment and support, while staff at ART sites is responsible for care, treatment, support and follow-up of these patients. It is

Activity Narrative: essential to ensure that all patients receive optimal care and remain within the health care system, ensuring compliance / adherence with treatment and an improved quality of life.

ACTIVITY 7: Policy

URC/QAP will actively participate in the development, revision and implementation of the National HIV and AIDS guidelines, Continuum of Care for HIV-infected people and HIV and AIDS, monitoring and evaluation framework policy in collaboration with the national and provincial DOH staff, to ensure long term sustainability of this program.

Activity System ID: 23611

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

- Evaluating and referring children coming for regular immunizations and offering counseling and testing;
- Tracked infants from the time of discharge to ensure that they are tested at 6 weeks of age;
- Training of healthcare workers at frontline sites and working closely with them around case-finding to ensure sustainability;
- Expansion of monitoring and evaluation tools to monitor clinical outcomes
- Conducting workshops to equip counselors in working with children and passing their skills onto other practitioners
- Increasing participation of adolescents in clinic activities.

SUMMARY:

The success of pediatric ARV treatment scale-up depends on a comprehensive approach. In particular, Reproductive Health and HIV Research Unit (RHRU) and its sub-partner Enhancing Children's HIV Outcomes (ECHO). (RHRU-ECHO) continues to strive to strengthen referrals and linkages from other programs such as PMTCT and primary health care programs like TB, Maternal, Child and Women's Health (MCWH), Integrated Management of Childhood Illness (IMCI), and Expanded Program on Immunization (EPI) in an effort to ensure that more children are identified for care. This program will maintain focus on improving these linkages through direct support, and intensive training of doctors, nurses, and other health care professionals. In recognition of the fact that pediatric ART cannot be provided in isolation of caregivers, our program aims to provide a family-centered approach to care.

RHRU and its sub-partner ECHO will continue to provide care and support to 3 provinces which include Gauteng (11 sites), KwaZulu-Natal (10 sites), Limpopo (9 sites) and the North West province (4 sites). The program activities described in detail below will also be implemented across site networks which include referral sites and other surrounding clinics.

BACKGROUND:

Activities described in this section will be undertaken by RHRU and its partner ECHO. RHRU, a unit of the University of the Witwatersrand in Johannesburg, currently provides technical support to the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa, which includes the national ARV roll-out. RHRU has provided regular on-site support, direct treatment, training and quality improvement to Department of Health sites in three provinces. RHRU will continue these activities, and will continue both an inner city program (Johannesburg), a district-wide program (Durban), and a more discrete site-based provincial program (North-West Province) focusing on providing support to complete up and down treatment referral networks. ECHO is attached to the University of the Witwatersrand in Johannesburg and has worked as a sub-partner to the RHRU since FY 2005. RHRU and ECHO have provided direct antiretroviral treatment for thousands of children, strengthening and improve state health systems. RHRU and ECHO provide technical support to (and are involved in policy development and advocacy for) pediatric care with the National and Provincial Departments of Health (DoH), with strong representation on the South African National AIDS Council (SANAC). The organizations have expanded their program to include Prevention of Mother to Child Transmission (PMTCT), pediatric HIV treatment, emphasis on psychosocial and nutritional support and training and have been an integral part of the program since inception and the joint program now operates from Gauteng with teams in the more rural North-West.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Case-finding

RHRU-ECHO, across all sites, will continue supporting this program by interacting with all the pediatric entry points at hospitals and clinics. These include among others; the pediatric wards, out-patient departments, EPI and IMCI clinics, nutrition departments and maternity wards. At each of these points, RHRU-ECHO will be ensuring that active counseling and testing of caregivers of exposed children and infants takes place. At pediatric and general out-patient departments, RHRU-ECHO staff will work with DoH staff in order to increase awareness around typical signs and symptoms of HIV in children presenting there. In pediatric inpatient wards, RHRU-ECHO will be involved with regular ward rounds where testing and counseling of children will take place. There will also be regular updated training of ward staff around identification of children.

At EPI clinics, RHRU-ECHO will be involved in evaluating children coming for regular immunizations and offering counseling and testing which will include HIV exposed babies, symptomatic babies and also those children born to parents with possible HIV infection. HIV counseling and testing will also be provided within IMCI clinics, and access to cotrimoxazole prophylaxis for HIV-exposed babies evaluated.

RHRU-ECHO will also support the PMTCT programs at these sites to ensure that all HIV exposed infants receive appointments and are actively traced to confirm their HIV status by 6 weeks of age through polymerase chain reaction (PCR) testing, according to the national PMTCT guidelines.

All infants who test positive will be referred to, and actively followed to ensure that they attend ARV sites. At each of these points, baseline information will be collected using a standardized tool which is already being piloted at some sites in Gauteng.

The activities at these points will include giving routine HIV-related health talks to patients attending the clinics, counseling caregivers and performing HIV testing (DNA PCR, rapid or ELISA) with appropriate access to cotrimoxazole and access to ART where indicated for HIV exposed and/or sick infants and for older children. Caregivers will also be offered testing if their HIV status is unknown. If HIV-infected, they will

Activity Narrative: have CD4 testing and referral for treatment if necessary; they too will be actively traced into care.

RHRU-ECHO will be involved with training of healthcare workers at frontline sites and working closely with them around case-finding to ensure sustainability. This will take the form of mentorship as well as regular CMEs (Continuing Medical Education).

In the Johannesburg Inner city and in KZN, RHRU and ECHO will be participating in testing campaigns. These will take place on an ongoing basis, where infants and children and their families will be tested and referred into care if HIV-infected. The above will also apply to Limpopo where the RHRU team will support the clinics surrounding Mankweng hospital. In the North-West, the RHRU-ECHO team will be going out to selected clinics in Mafikeng, Ratlou and Disobotla where they will be working closely with the PMTCT team in ensuring testing and counseling of HIV exposed infants and children. The team will be conducting continuing medical education (CME) around identification of children who need to be tested and on referrals to the ARV site for those who are eligible.

ACTIVITY 2: Links to other programs

RHRU-ECHO will utilize referral forms which are currently being piloted at some sites and which will be used to track patients from the time they are tested to when they receive their results, to the point where they arrive at the ARV site if eligible. Data is being entered, manipulated, and fed back to nurses at the sites, and is used for program monitoring and evaluation purposes.

In terms of linking of referrals from PMTCT, mothers and babies will be tracked from the time of discharge to ensure that they are tested at 6 weeks of age or re-tested after cessation of breastfeeding to the point where they are referred to an ART site if necessary. This will be monitored on a weekly basis by the RHRU-ECHO staff visiting the various service points.

ACTIVITY 3: Clinical monitoring and management of Opportunistic Infections (OIs) and other co-morbidities

RHRU-ECHO medical staff receives ongoing medical education and are able to monitor clinical events in children with HIV, including opportunistic infections, immune reconstitution inflammatory syndrome and treatment side effects. Clinicians at all sites will continue to have regular case meetings to discuss management of complicated cases. There is an active continuing medical education program for internal clinical staff which also forms part of training curriculum for clinicians working at the sites where RHRU offers support, and for other partners. RHRU actively trains primary health care nurses who not only are able to diagnose, stage, initiate and maintain ART in children, but are also equipped to identify and appropriately refer complicated cases. There is an active academic program and clinicians are encouraged to report on interesting cases or events occurring within clinic populations in scientific journals.

ACTIVITY 4: Quality Control

As part of quality control, RHRU-ECHO, across all its sites, will continue to conduct file audits at least bi-annually. These will be conducted using randomized sampling. Currently large program audits are conducted at the larger sites, and data on outcomes of children on ART is available at these facilities.

ACTIVITY 5: Family support

It is not possible to provide pediatric care and support in isolation of caregivers. RHRU-ECHO aims to provide comprehensive family support at all sites. At secondary and primary care levels, pediatric clinics are integrated with adult clinics and parents can receive care for their own illnesses simultaneously. This is often done in partnership with RHRU clinicians. At tertiary sites pediatric and adult clinics still run separately. However, the imminent creation of a family HIV and TB unit at Chris Hani Baragwanath Hospital will ensure a more comprehensive approach to family care. This will occur in a facility which will be designed to maximize infection control. This flagship program may be replicated in other facilities where RHRU works through collaborations with other partner organizations.

Of fundamental importance is the provision of psychological and social care in order to enable families to provide the necessary support for HIV-infected children. This clinic-based program aims to support caregivers in addressing important aspects of treatment such as disclosure of a child's HIV status and adherence to treatment.

The program is based on the development of support groups which will cover relevant topics. Group work is a necessity due to space and time constraints for individual counseling sessions. A "tool box" of approaches for use in support group work will be provided for which indicators have been developed for purposes of monitoring and evaluation.

ACTIVITY 6: Improve Service Quality

In an epidemic where so many children and adults are infected, focusing on increasing numbers in care without assuring quality is a challenge to all healthcare providers. Through active tracing and monitoring, RHRU is able, at their larger sites, to assess the quality of care in terms of numbers retained in the program, viral load suppression rates, clinical and immunological responses as well as mortality rates. Through expansion of these tools, RHRU will continue to monitor these outcomes, thereby informing the quality of programs at all sites where RHRU operates.

The quality of psychosocial program and training activities will continue to be evaluated.

ACTIVITY 7: Support groups

Group Support of Children

Activity Narrative: In addition to psychological support provided through individual counseling and play therapy, children benefit from participation in programs that encourage emotional literacy and the expression of feelings. This is encouraged through group work at facility level where there are opportunities for play, dance and art. This program includes workshops to equip counselors in working with children and passing their skills onto other practitioners. It is proposed that a series of workshops structured to provide a safe holding environment provide healthcare workers with the opportunity to explore the tools and application of art therapy specific to working with South African children infected and affected by HIV and AIDS. These will be designed to assist participants with the application and integration of arts-based interventions on a broader scale.

Group Support for Adolescents

The availability of antiretroviral treatment has meant that increasing numbers of perinatally infected children are surviving into adolescence and beyond. This population has specific needs and challenges that are related to this stage of development. The adolescent program aims to introduce "stand alone" youth friendly services in clinics where numbers justify the introduction of such services. Activities include peer counselor training, peer education programs, school holiday programs, community-based peer support groups and caregiver-adolescent workshops aimed at building communication between adolescents and their caregivers.

We aim to increase the meaningful participation of this population in clinic activities and more broadly to encourage initiatives such as community-based peer support groups that foster community mobilization through the development of networks. In achieving an aim is to partner with OVC organizations. In addition adolescents are assisting in coping with everyday challenges through programs that focus on themes such as gender and sexuality.

The above program was piloted during 2007-2008. This will be rolled out to three additional sites during the FY 2008-2009, increasing to all sites in 2009-10. The implementation of this orientation will require the training of multi-disciplinary teams to provide youth friendly services that include reproductive health. Monitoring and evaluation is according to indicators set out in existing models for the development of gold standard youth friendly services (YFS).

Caregiver support groups

Support groups for parents are ongoing at tertiary centers. Activities include an early developmental stimulation program for caregivers of young children in collaboration with speech therapists and physiotherapists working at the tertiary sites. Caregiver support will be expanded and rolled out at other sites.

Activity System ID: 23584	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

-Strengthening of pediatric care and support services in the following areas: 1) training; 2) health systems strengthening; 3) increased case findings; 4) technical support; 5) improved adolescent care; 6) improved pediatric referral systems; and 7) improved monitoring and evaluation of pediatric services.

SUMMARY:

McCord/Zoe-Life (MZL) will build capacity in two municipal clinics and two NGOs in the eThekweni District to provide a comprehensive primary health care/ support package for children with HIV. This will include clinical and psychosocial support in line with integrated management of childhood illness (IMCI) and community IMCI (CIMCI) goals and will ensure a family centered integrated model of care, both in primary health care settings as well as with strong community linkages

BACKGROUND:

The South African Department of Health Antenatal HIV Seroprevalence Survey, 2007 estimated the prevalence rate in KZN adults at 37.4%. Most recent estimates from the Actuarial Society of South Africa (ASSA) model suggest that the overall prevalence of 1.2% in 2000 has almost doubled to 2.1% in 2006 for children under the age of 18 years. The prevalence rates differ across age groups and it is clear that younger children in the 0–5 year age group are most at risk of infection. The rate in the 0–5 year olds is 1.8 times more (almost double) than the overall rate for all children (0 - 17 years). The HIV prevalence rate in the 0–5 year age group increased from 2.2% in 2000 to 3.6% in 2006. For children in the 6-12 year age group, the prevalence increased from 0.1% to 1.0% during the same time period. The prevalence rate for the 13-17 year age group stayed almost the same for this period - 1.0% in 2000 and 1.1% in 2006. Based on the demographic statistics of 2005, approximately 215,000 children under the age of five years and close to 55,000 children between the ages of six and 12 years are currently living with HIV infection. In total the model estimates that approximately 360,000 children are living with HIV infection. According to UNAIDS, there were around 280,000 children aged below 15 living with HIV in South Africa in 2007. Most of these are undiagnosed. According to UNICEF, 260 children are born infected with HIV every day in South Africa. Most die before their second birthday. The AIDS Law Project, based in Johannesburg, estimated that 50,000 children in South Africa were in need of antiretroviral drugs at the beginning of 2006, but that only around 10,000 were receiving them. UNAIDS estimates that at the end of 2005, children accounted for 8% of those receiving antiretroviral drugs in South Africa. If the numbers of children requiring ARV therapy is so high, then it follows that the numbers requiring care and support would be even higher. Challenges for pediatric care at a primary health level include lack of sufficiently trained health care personnel and inadequate facilities, the vertical nature of typical ART clinics, which make it difficult for children to be identified and referred into appropriate care services. Challenges relating to services being offered to different family members at different sites, poor linkages promoting the appropriate referral of children to HIV care and treatment, lack of clarity regarding guardianship and authority over children accessing care and treatment, slow movement of expanding care and treatment from tertiary level to secondary and primary health care facilities (i.e. down-referrals), lack of confidence and hands on experience at primary care level, and lack of onsite mentorship to build capacity in staff to move from a pediatrician led to nurse-driven model of care and treatment to children are some of the challenges facing South African services. The need for a more integrated family care -orientated intervention at primary level as well as more efficient community-based interventions is key in order to identify children and incorporate them into primary health level care without compromising their quality of care or need for specialized care and support.

The McCord/Zoe-Life team (MZL) will implement this new program area. McCord (MH) will provide technical support. Zoe-Life (ZL) will be the implementing partner. Other partners will include; iThemba Lethu (iTl) a local NGO providing prevention skills at 4 nearby local schools as well as running 2 transition homes for children abandoned or orphaned as a result of HIV (Orphans and vulnerable children-OVC); BigShoes (BS), a Johannesburg-based organization which has started work in Durban and has a vision to improve the medical care of orphaned and vulnerable children affected by HIV and AIDS both within the community of a children's home and the wider community. BS provides both pediatric palliative care and specialist medical pediatric services for orphaned and vulnerable children (OVC) including HIV testing, age assessments, medical reports for adoption and anti-retroviral treatment. MZL will partner with BS to increase linkages with OVC and to augment services provided by BS to ensure a comprehensive service. ZL will assist with psychosocial support services for these children. ZL will partner with iTl to support case finding within the schools, to offer testing, and to provide support to the Youth workers to provide psychosocial support to infected and affected children. In the eTM clinics and NGOs, the aims of the program will be to identify HIV exposed children as early as possible, to integrate them into a supported IMCI-based care program, and to offer a comprehensive range of services which will ensure quality of life, optimal health and development, and psychosocial support for themselves as well as their family members or care givers. Each NGO should identify at least one school or avenue through which children can be identified and supported both clinically and psychosocially, including strengthening referral systems, CIMCI capacity and implementing psychosocial outcomes-based support groups.

ACTIVITIES AND EXPECTED RESULTS:

A technical support team focused on pediatric care will provide support for the following activities:

ACTIVITY 1: TRAINING

Counselors, nurses and community workers at supported sites will be trained in the following areas: a. Case finding - early diagnosis of children and infants, optimizing entry points for case finding (immunization, IMCI, PMTCT, TB clinic, community IMCI) use of dry blood spot (DBS) PCR tests, counseling children and their caregivers with regard to testing b. Clinical care of the HIV-infected child (IMCI-based) c. Psychosocial care of the HIV-infected child and their family (disclosure and stigma, dealing with chronic illness, trauma

Activity Narrative: counseling, using play and art as a counseling technique, developmental screening and referral, accessing social assistance, care of the caregiver, incorporating healthy living into the family, bereavement and grief counseling) ZL will explore the use of blended training to limit the amount of time HCW need to be absent from the clinics. Training will be both off site and onsite and will be accompanied by ongoing technical support.

ACTIVITY 2: IMPLEMENTATION SUPPORT-MENTORSHIP AND PRECEPTORSHIP

This is a key element to ensure sustained capacity onsite and to build HCW confidence. After being trained, counselors, nurses and community workers at supported sites will engage in a mentorship program, where they will be mentored closely in acquiring tangible technical skills and confidence to adequately prepare them to provide pediatric HIV care. This will be achieved this by partnering with institutions such as University of KwaZulu-Natal (UKZN) and MH. It may also include offering rotations for final year medical students or Pediatrics registrars as part of a community level rotation.

ACTIVITY 3: HEALTH SYSTEMS STRENGTHENING

MZL will aim to address the regulatory environment to ensure that the statutes and regulations with regard to pharmacy and nursing acts support a nurse driven model of care.

ACTIVITY 4: INCREASE CASE FINDING

The technical team, comprising a Pediatric Nurse, counselor and a part-time IMCI trained Pediatrician, will provide onsite support to clinics and NGOs to set up sustainable systems within each site to identify HIV exposed children at different entry points, including children of women in PMTCT programs, infants and children being immunized, children with TB and symptomatic children identified through IMCI and community IMCI. Linkages with OVC will be made where infected or vulnerable children from the OVC community will be tested and linked with care and support offered at clinics and NGOs. This will take place through the two partnering organizations, BS and iLT, as well as the NGOs and their linkages with local schools, day care centers or other organizations that are identified in the communities.

ACTIVITY 5: TECHNICAL SUPPORT

Support will be given to nurses to take bloods from children and to use DBS-PCRs to test infants. Resources and tools will be developed or sourced to assist health care workers (HCWs) to remember diagnostic algorithms for children and infants.

ACTIVITY 6: ADOLESCENT CARE

Special attention will be given to identifying adolescents at risk, and to increase case finding in this population. Outreaches to schools may be undertaken as a means to identify school going children at risk. Partnerships with organizations already working with adolescents will be strengthened (such as iTL) NGOs and clinics will be assisted to develop adolescent friendly services. Linkages with schools will be focused on encouraging healthy sexual choices, addressing sexual coercion in young women and increasing access to services for HIV-infected school-going children

ACTIVITY 7: REFERRALS

The technical team will strengthen referrals, both within facilities (TB, PMTCT, CARE, IMCI) and between facilities (Primary care to ARV clinics/Pediatric facilities/ Specialist clinics) to ensure retention to care as well as quality and completeness of care. Children found to be HIV-infected will be referred for psychosocial support, and will be actively referred to a case manager within each clinic or NGO. Multidisciplinary team meetings focusing on pediatric HIV will be initiated to ensure ownership of cases to reduce loss to follow up and increase HCW accountability for tracking and care. Where possible, multiple referrals will be minimized and as many services as possible offered at one site. A family centered model will be adopted so that parents or siblings can also be cared for by the same HCW on the same day, to reduce costs and to minimize loss to follow-up.

ACTIVITY 8. CLINICAL CARE

The Pediatric team will strengthen site capacity to provide a basic clinical care package for children, which would include provision of cotrimoxazole for all HIV exposed children and infants, CD4% at time of diagnosis and routinely thereafter, nutritional assessments and support, development assessments, immunizations and early detection and treatment of OIs including TB. These activities would be achieved within the broader goals of strengthening IMCI implementation and use at all sites. Systems will be strengthened to support the regular procurement of multi-micronutrient supplementation

ACTIVITY 9: PSYCHOSOCIAL AND SPIRITUAL CARE

The MZL team will set up a child friendly area, either at the clinics, or at a community site nearby. Psychosocial support will be offered to children and caregivers and will take the form of an outcomes-based support group with a curriculum covering aspects of child development, disclosure, nutritional assessment and support, adherence to care, healthy homes, clean water and accessing social services. The groups will use play and art as a medium for the children. This will have an additional benefit in terms of cognitive and motor development, and will assist with developmental screening. Sessions will also incorporate clinical screening including TB screening, weighing and symptom screening and if needed ongoing CD4% bloods. Psychological, emotional or developmental issues that cannot be addressed within the groups will be referred appropriately. It is hoped that this safe forum will encourage children and caregivers to engage with services and include their partners and other children. Caregiver support will also be provided. It is also the aim that these groups can be moved into the community once children are well and stable, and therefore do

Activity Narrative: not need to come to the clinics regularly. This will ease the burden on the health system whilst keeping children in care, and will also address infection control. Community IMCI programs (CHCWs or HBCs) can also refer children to these groups. Linkages will be made with community-based organizations or churches to participate in facilitating the groups, so that sustainability can start to be addressed, and community-based continuity can be facilitated through these organizations providing home visit support. ZL will also explore funding from the corporate sector through their corporate social investment funds to provide ongoing resources for consumables (art, paper, play-dough) and possibly food. This again addresses sustainability.

ACTIVITY 10: MONITORING AND TRACKING

ZL/MH would like to explore monitoring and evaluation systems for children at primary health level. The current patient records for endorsed by the Department of Health were designed for use primarily for adult HIV patient management. Children at eTM and most primary health facilities do not have a clinic held record, and their progress is predominantly held on a road to health chart. The recommended IMCI forms are not available at eTM sites or NGOs. A single user friendly yet accurate and reliable system needs to be developed based on IMCI guidelines yet incorporating HIV care and tracking components for a primary health setting. ZL/MH will engage with KZN-based pediatricians, the MCH team at the Provincial Health Department and other organizations working on this issue to collaborate and develop tools, forms and a system that will service the pediatric population. In addition to a paper-based system, ZL will engage with other partners to look at electronic tools to assist with tracking and M E such as hand held devices and GPS systems.

MZL will focus on the following activities which support gender: 1) encouraging fathers of children enrolled in care and support to play an active role in both child rearing and the health of their children; 2) creating a safe environment in which women and children can disclose their status to partners, and in which they are able to disclose and deal with sexual coercion and sexual abuse; and 3) women caregivers of children in the program will be assisted with family planning choices.

Program Budget Code: 10

Activity ID: 23122.09

Planned Funds: \$56,507

Activity System ID: 23122

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2008 COP activities will be expanded to include:

-A focus on differentiating and strengthening the qualitative and quantitative aspects of pediatric care and support services, as well as reporting of results and findings.

SUMMARY:

HIVCare will use FY 2009 PEPFAR funds to work with the Free State Department of Health to provide antiretroviral treatment in a private health facility to patients who do not have medical insurance and who are referred from the public sector waiting lists for treatment. The Medicross Medical Centre, a well equipped private primary health care center, provides the main resource base and in conjunction with thirteen other sites, will provide an effective means of properly distributing ART to patients who are either referred from public sector facilities or who access the sites by word of mouth. The emphasis areas for this program will be human capacity development and local organization capacity building. The target population includes the infants and children of men and women (infected and affected), factory workers and other employed persons, and government employees - specifically teachers, nurses and other health workers (who do not have medical insurance). A further specific population that will be targeted will be secondary school children. The most significant target group is those persons that cannot access services in the public health system.

BACKGROUND:

PEPFAR funding for the HIVCare project commenced in June 2005. The main thrust of the activity was to match the Free State Department of Health (FSDOH) with partners from the private sector (in this case Netcare, the largest private sector health provider in South Africa) in order to build private sector capacity and absorb some of the burden from public sector facilities. Many FSDOH centers have waiting lists of people for ARV treatment. Patients from these waiting lists who meet the eligibility criteria for this program are referred from those public sector clinics to one of the primary health centers throughout the Free State province for treatment. The FSDOH is a collaborating partner in this public-private partnership.

In Sub Saharan Africa, AIDS has become one of the leading causes of death among children under 5 years. A recent Actuarial Society of South Africa (ASSA) study revealed an incidence of HIV among children at birth of 4.1%. Patients that are enrolled will proportionately increase the percentage of pediatric patients on the program. As a population group, this sector remains underserved.

The HIVCare treatment sites will provide all medical services related to the delivery of HIV care and treatment. Management and coordination activities will be provided by HIVCare. The majority of patients will be referred from public clinics in the FSDOH network to the HIVCare centers based on the following criteria: (1) Clinical (CD4 <200 cells/mm³ or WHO stage III or IV, [South African National Guidelines]); (2) Inability to pay (lack of private insurance or state coverage); and (3) Capacity constraints at referring clinic. Patients are referred in general by adult treatment centers.

During the course of the treatment of adults, HIVCare was, of necessity, required to treat and manage the children of existing patients. This was later formalized and the children of patients are now routinely tested and included in the treatment program. At that time treatment for HIV and related conditions at the time was not readily available to young children within local structures and only one specialized pediatric clinic existed. In late 2007 HIVCare launched a dedicated site for Voluntary Counseling & Testing (VCT) and treatment of adolescents (12-18 years).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Patients referred to the program receive PEPFAR-funded consultations and exams from HIVCare physicians, who will also order relevant tests and refer patients to expert specialists when necessary. The package of care also includes counseling and testing (for patients who do not know their status and including early PCR testing for babies), adherence counseling, and access to therapeutic nutrition support as per the national guidelines and OGAC guidance. An initiative aimed at improving overall compliance and treatment efficacy is the distribution with the medication of a parcel of nutritional supplements. The supplements provide a single fortified meal per day for each of the indigent patients on ART and aids in the absorption of the medication. Patients are assessed based upon their body mass index (BMI) and general condition. The patients meeting the pediatric clinical criteria are enrolled onto the program. Patients presenting directly at the HIVCare treatment center and are found to be in need of TB treatment or treatment of an opportunistic infection are addressed unless hospitalization is required. Similarly radiography and pathology for investigative procedures are available.

ACTIVITY 2:

Due to the high (up to 19%) prevalence of HIV among teenagers in the Free State province, HIVCare introduced a large VCT program targeted at this population group. The Youth Clinic provides on site ancillary services, such as psychologists and social workers. In addition the clinic promotes abstinence, being faithful, responsible condom use and informs on family planning. Young women are referred to State family planning sites for contraception where needed.

Data is shared with the FSDOH on two levels. Firstly data on all new patients enrolled onto ART is provided by the pharmacy to the provincial authorities. Secondly a return is submitted to the National Department of Health, with a copy to the Provincial FSDOH, giving the data of all those on the program. Additionally, a representative of HIVCare attends the monthly provincial HIV task team meetings.

Activity Narrative: ACTIVITY 3:

By providing comprehensive ARV services to patients and promoting ARV services for a large population of underserved people living with HIV (who do not have private insurance) and school age children, HIVCare is contributing to the PEPFAR goals of placing 2 million people on ARV treatment and providing care for 10 million others who are infected with HIV. These activities also support care and treatment objectives outlined in the USG Five-Year Strategy for South Africa by expanding public-private partnerships and expanding care to an underserved population. The HIVCare program was initiated as a Public Private Partnership between the Department of Health in the Free State, PEPFAR and Netcare Pty Ltd. In terms of this partnership, some of the patient burden of State amenities would be alleviated through the use of private sector primary health facilities throughout the province. In summary, the PPP places the following obligations on the three parties. Netcare's HIVCare program provides all medical services related to the delivery of HIV care and treatment through its primary health sites in the province, funding for the treatment of patients is provided by PEPFAR and the Free State Department of Health provides technical support, hospitalizations and specialist treatment where required. The activity has been modified since inception in two key focus areas:

1-The qualitative aspects of patient care. i.e.:

- a) Ameliorate TB education, screening and follow-up.
- b) Bringing the whole family into care: A family centered approach is followed with patients encouraged to bring their partners and children in and to have them tested for HIV. Days are organized for the testing of patient's children (children represent actually 5% of the patients in the adult clinic and at the doctors network.
- c) Referrals are mainly from State primary health centers with children often in a poor physical condition upon presenting at the clinic.
- d) Primary caregivers are biological mothers, grandmothers or aunts. Attention is to be given to contacting these caregivers through day care, PMTCT clinics and church groupings.
- e) Efforts around the family are mainly centered on the Youth Clinic established by HIVCare with FY 2007 funding, where access to social workers is made possible as needed.
- f) The family needs of the Youth Clinic differs from that of the ART sites in that parental consent issues predominate at the Youth Clinic while at the ART sites, partner participation and testing are key concerns

2-The quantitative aspects of patient care. i.e.:

- a) The program currently supports ART at 15 primary health clinics, a Youth Clinic as well as two dedicated ART clinics.
- b) A special children's register is to be maintained at the ART sites and Youth Clinic.

Two specific challenges that are being addressed in the current period are firstly to monitor adherence effectively particularly where the mother, as caregiver, is also ill and secondly the early identification of HIV positive children. These are being addressed through visits to churches, local nursery schools and churches in the townships and strong linkages with other facilities.

The sustainability of the Youth Clinic is provided for in the current inclusive Memorandum of Understanding that is pending with the FSDOH.

Mechanism ID: 10470.09	Mechanism: NPI
Prime Partner: Sophumelela	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: Pediatric Care and Support
Budget Code: PDCS	Program Budget Code: 10
Activity ID: 24736.09	Planned Funds: \$0
Activity System ID: 24736	

Activity Narrative: SUMMARY:

The Sophumelela Clinic Incorporated (SCI) has just received funds under the New Partnership Initiative. Funds were received and activities only commenced in September 2008. SCI has been a sub-partner under the Catholic Relief Services (CRS) Track 1 award for the past four years. Additional funds are being used to support pediatric care activities not covered under the current award with CRS. Through this program SCI will increase the quality of life for the terminal patients and their families and as SCI assists with the care for the dying and helping families through the bereavement process.

BACKGROUND:

SCI is a non-profit faith based organization that was formed by the First City Baptist Church, Buffalo City, Eastern Cape, South Africa in 2005. SCI exists to provide comprehensive clinical, social and spiritual care to HIV impacted people and their families in a faith environment within the greater Buffalo City Metropolis. SCI began as, and is currently, an ARV roll out Sub-Contractor under the AIDS Relief PEPFAR Track 1 Treatment and Care grant to Catholic Relief services. Soon after opening the ARV clinic the decision was made to form an NGO. This was done because of the recognition that the simple provision of ARVs to patients attending our existing clinic did not address their many individual needs and social problems. From its inception the vision of SCI was to provide comprehensive and holistic care services to people infected and affected by HIV/AIDS.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Hospice Care

With FY 2008 funds, a hospice care facility will be developed with the aim that patients will die with dignity rather than the unfathomable situations they are finding themselves in at present, as is so often the case, in a cold shack with no ablution facilities or personal care. This facility would create beds for public hospital patients to die with dignity as terminal patients are discharged from hospital as only emergencies are admitted currently because of the medical overload caused by the HIV pandemic. This facility will be available for both adults and children.

ACTIVITY 2: Home-based Care

SCI will continue to use the same models that have been successful in its current ARV program. Home-based care workers have approximately 30 patients and their families to visit each month. Their main objective is to monitor adherence and provide social support. Patients include those enrolled in SCI's ARV clinic, partner NGOs and public health facilities. These patients include both adults and children. In addition, children of adult patients will be targeted for HIV-related care and will be referred for other services offered through the SCI OVC program.

Activity Narrative: SUMMARY:

McCord/Zoe-Life (MH/ZL) will build capacity in two eThekweni Municipality (eTM) clinics and two non-governmental organizations (NGOs) in the eThekweni District to provide a comprehensive primary health care and support package for children with HIV, including care of children on ART. This will include clinical and psychosocial support in line with Integrated Management of Childhood Illness (IMCI) and Community (CIMCI) goals and will ensure a family-centered integrated model of care, both in primary health care settings as well as with strong community linkages.

BACKGROUND:

The South African Department of Health Study 2007 estimated the prevalence rate in KwaZulu-Natal (KZN) adults at 37.4%. Most recent estimates from the Actuarial Society of South Africa (ASSA) model suggest that the overall prevalence of 1.2% in 2000 has almost doubled to 2.1% in 2006 for children under the age of 18 years. The prevalence rates differ across age groups and it is clear that younger children in the 0 - 5-year age group are most at risk of infection. The rate in the 0 - 5-year olds is 1.8 times more (almost double) than the overall rate for all children (0 - 17 years). Based on the demographic statistics of 2005, approximately 215,000 children under the age of five years and close to 55,000 children between the ages of six and 12 years are currently living with HIV infection. In total the model estimates that approximately 360,000 children are living with HIV infection. According to UNAIDS, there were around 280,000 children aged below 15 living with HIV in South Africa in 2007. Most of these are undiagnosed. According to UNICEF, 260 children are born HIV-infected every day in South Africa. Most die before their second birthday. The AIDS Law Project, based in Johannesburg, estimated that 50,000 children in South Africa were in need of antiretroviral drugs at the beginning of 2006, but that only around 10,000 were receiving them. UNAIDS estimates that at the end of 2005, children accounted for 8% of those receiving antiretroviral drugs in South Africa.

Challenges for pediatric care at a primary health level include lack of sufficiently trained health care personnel and facilities that are not child friendly. Health care workers (HCWs) at primary health care level are not encouraged by pediatricians to care for children on antiretroviral therapy (ART) at these facilities - this is reflected in the slow movement of expanding care and treatment from tertiary level to secondary and primary health care facilities. Tertiary and secondary facilities do not provide support or mentorship to increase confidence and hands-on experience at primary care level so that services can move from a pediatrician led to nurse-driven model of care and treatment to children. The need for a more integrated family care-orientated intervention at primary level as well as more efficient community-based interventions is key in order to identify children and incorporate them into primary health level care without compromising their quality of care or need for specialized care and support.

This new program area will be implemented by the McCord/Zoe-Life team. ZL will identify two interested clinics and two NGOs that are interested in and suitable to care for children on ART. McCord Hospital (MH) will provide technical support to care for the children and mentor staff. Zoe-Life will be the implementing partner. Other partners may include CHIVA, a UK-based organization providing technical support in KZN, iThemba Lethu (iTL) a local NGO providing prevention skills at four nearby local schools as well as running two transition homes for children abandoned or orphaned as a result of HIV (OVC); and BigShoes (BS), a Johannesburg-based organization which has started work in Durban and has a vision to improve the medical care of orphaned and vulnerable children affected by HIV and AIDS both within the community of a children's home and the wider community. Bigshoes (BS) provides both pediatric palliative care and specialist medical pediatric services for orphaned and vulnerable children including HIV testing, age assessments, medical reports for adoption and antiretroviral treatment. (OVC). ZL will promote the implementation of a family-centered treatment model and the initiation of children on ART at the sites. Initially, children will be seen by a visiting clinician who would work closely with an IMCI-trained nurse on-site who would eventually be able to initiate children under supportive supervision of the clinician. ZL will train counselors and community health workers (CHWs) to assist with psychosocial support services for these children and their caregivers, which would include treatment literacy and adherence support. Children would be recruited into the treatment program via a range of entry points. The first would be to target children of women attending prevention of mother-to-child (PMTCT) services. Infants attending well baby follow-up programs and immunization visits will be targeted for testing and integration into care. Children identified through IMCI services will be offered testing and CD4%. Children on ART at MH who are able to be decentralized will also be included in the ART program. Lastly, children of adults in care and treatment will be found through active case finding. The aims of the program will be to identify HIV-exposed children as early as possible, to integrate them into a supported IMCI-based care program, and to offer a comprehensive range of services including ART to those who qualify which will ensure quality of life, optimal health and development, and psychosocial support for themselves as well as their family members or caregivers.

ACTIVITIES AND EXPECTED RESULTS:

A technical support team focused on pediatric care will provide support for the following activities:

Activity 1: TRAINING

Counselors, nurses and community workers at supported sites will be trained in the following areas: (a) Case finding - early diagnosis of children and infants, optimizing entry points for case finding (immunization, IMCI, PMTCT, TB clinic, community IMCI) use of dried blood spot (DBS) and polymerase chain reaction (PCR) tests, counseling children and their caregivers with regard to testing (b) Clinical care of the HIV-infected child on ART (c) Psychosocial care of the HIV-infected child on ART and their family (disclosure and stigma, dealing with chronic illness, adherence counseling, using play and art as a counseling technique). ZL will explore the use of blended training to limit the amount of time health-care workers (HCWs) need to be absent from the clinics. Training will be both off-site and on-site and will be accompanied by ongoing technical support

Activity Narrative: Activity 2: INCREASE CASE FINDING

The technical team, comprising a pediatric nurse, counselor and a part-time IMCI-trained pediatrician, will provide on-site support to clinics and NGOs to set up sustainable systems within each site to identify HIV-exposed children at different entry points, including children of women in PMTCT programs, infants and children being immunized, children with TB and symptomatic children identified through IMCI and community IMCI. Linkages with orphans and vulnerable children (OVC) will be made where children from the OVC community will be tested and linked with care and support offered at clinics and NGOs. This will take place through the two partnering organizations, BS and iTL, as well as the non-governmental organizations (NGOs) and their linkages with local schools, day care centers or other organizations that are identified in the communities.

Activity 3: MENTORSHIP AND PRECEPTORSHIP

This is a key element to how ZL builds capacity within a site. After being trained, counselors, nurses and community workers at supported sites will engage in a mentorship program with the ZL technical team, where they will be mentored closely in acquiring tangible technical skills and confidence on site as to adequately prepare them in providing pediatric HIV care.

Activity 4: TECHNICAL SUPPORT

Support will be given to nurses to take blood from children and to use DBS-PCRs to test infants. Laboratory capacity will be strengthened through ensuring that HCWs are trained in specimen-taking, transport and delivery of results. Resources and tools will be developed or sourced to assist HCWs to remember diagnostic and treatment algorithms for children and infants.

Activity 5: ADOLESCENT CARE

Special attention will be given to identifying adolescents requiring ART, and to increase case finding in this population. Outreaches to schools may be undertaken as a means to identify school going children at risk. Partnerships with organizations already working with adolescents will be strengthened (such as iTL) NGOs and clinics will be assisted to develop adolescent friendly services.

Activity 6: REFERRALS

The technical team will strengthen referrals, both within facilities (TB, PMTCT, Care, IMCI) and between facilities, (Primary care to ARV clinics/Pediatric facilities/ Specialist clinics) to ensure retention of care as well as quality and completeness of care. Children requiring ART will be referred appropriately depending on severity of illness, either to a tertiary center or the site ART service. Children on ART on site will be referred for psychosocial support, and will be actively referred to a case manager within each clinic or NGO. Multidisciplinary team meetings focusing on Pediatric HIV will be initiated to ensure ownership of cases to reduce loss to follow up and increase HCW accountability for tracking and care. Where possible, multiple referrals will be minimized and as many services as possible offered at one site. A family-centered model will be adopted so that parents or siblings can also be cared for by the same HCW on the same day wherever possible, to reduce costs and to minimize loss to follow-up.

Activity 7: CLINICAL CARE

The Pediatric team will strengthen site capacity to provide a ART clinical care, which would include provision of cotrimoxazole, regular CD4% and viral load nutritional assessments and support, and routine and ongoing TB screening. These activities would be achieved within the broader goals of strengthening IMCI implementation and use at all sites. Systems will be strengthened to support the regular procurement of multi-micronutrient supplementation

Activity 8: PSYCHOSOCIAL AND SPIRITUAL CARE

The ZL team will set up a child friendly area, either at the clinics, or at a community site nearby. Psychosocial support will be offered to children and caregivers and will take the form of an outcomes based support group for children on ART and their caregivers. The curriculum will cover essential aspects of child development, disclosure, nutritional assessment and support, adherence to care and treatment, management of side effects, healthy homes, clean water and accessing social services. The groups will use play and art as a medium for the children. This will have an additional benefit in terms of cognitive and motor development, and will assist with developmental screening. Sessions will also incorporate clinical screening including TB screening, weighing and symptom screening and if needed ongoing CD4% bloods and adherence monitoring. Psychological, emotional or developmental issues that cannot be addressed within the groups will be referred appropriately. It is hoped that this safe forum will encourage children and caregivers to engage with services and include their partners and other children. Caregiver support will also be provided. It is also the aim that these groups can be moved into the community once children are well and stable, and therefore do not need to come to the clinics regularly. This will ease the burden on the health system whilst keeping children in care, and will also address infection control. Community IMCI programs, CHWs or home-based carers (HBCs) can also refer children on ART to these groups. Linkages will be made with community-based organizations or churches to participate in facilitating the groups, so that sustainability can start to be addressed, and community-based continuity can be facilitated through these organizations providing home visit adherence support. ZL will also explore funding from corporates through their corporate social investment funds to provide ongoing resources for consumables (art, paper, play dough) and possibly food. This again addresses sustainability.

Activity 9: MONITORING AND TRACKING

ZL/MH would like to explore monitoring and evaluation systems for children at primary health level. Current patient records for HIV management endorsed by the Department of Health were designed for are used primarily by adults. Children at eTM and most primary health facilities do not have a clinic held record, and their progress is predominantly held on a road to health chart. IMCI forms which are recommended are not available at eTM sites or NGOs. A single user-friendly yet accurate and reliable system needs to be developed for both children in care and children on treatment, based on IMCI guidelines yet incorporating HIV care, treatment and tracking components for a primary health setting. ZL/MH will engage with KZN based pediatricians, the MCH team at the provincial Health Department and other organizations working on this issue to collaborate and develop tools, forms and a system that will comprehensively service the

Activity Narrative: pediatric population. In addition to a paper based system, ZL will engage with other partners to look at electronic tools to assist with tracking and M E such as hand held devices and GPS systems.

Activity 10: NUTRITIONAL SUPPORT

ZL will develop and implement a nutrition screening tool for clinical use within pediatric treatment services, at pediatric psychosocial and education sessions and support groups to ensure anthropometric assessment and appropriate interventions. ZL will provide technical support to access micronutrient supplementation for nutritionally compromised HIV-infected children enrolled in the programs C.ZL will develop guidelines for primary level and community-based HCWs as well as training courses and resources for HCWs to provide integrated nutritional assessments and counseling for children on treatment.

Activity 11: GENDER

Gender related activities will include providing a safe environment for children especially adolescents to discuss sexual aspirations with appropriate counsel. Fathers of children on ART will be actively encouraged to participate in the health decision making processes of their children.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

Activity System ID: 23613

Activity Narrative: SUMMARY:

RHRU and its sub-partner, Enhancing Children's HIV Outcomes (ECHO), will continue to provide care and support to 4 provinces which include Gauteng (11 sites), KwaZulu-Natal (10 sites), Limpopo (9 sites) and the North West (4 sites). The program activities described in detail below will also be implemented across site networks which include the referral sites and other surrounding clinics. Services target people living with HIV (PLHIV) and their families, including children, pregnant women, caregivers, doctors, nurses, traditional healers, and other healthcare workers.

BACKGROUND:

Activities described in this section will be undertaken by RHRU and its partner, ECHO. RHRU, a unit of the University of the Witwatersrand in Johannesburg, currently provides technical support to the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa, which includes the national ARV roll-out. RHRU has provided regular on-site support, direct treatment, training and quality improvement to Department of Health sites in three provinces. RHRU will continue these activities, and will continue both an inner city program (Johannesburg), a district-wide program (Durban), and a more discrete site-based provincial program (North West province) focusing on providing support to complete up and down treatment referral networks. ECHO is attached to the University of the Witwatersrand in Johannesburg and has worked as a sub-partner to the Reproductive Health and HIV Research Unit (RHRU) since FY 2005. RHRU and ECHO have provided direct antiretroviral treatment for thousands of children, strengthening and improve state health systems. RHRU and ECHO provide technical support to, and are involved in policy development and advocacy for pediatric care with the National and provincial Departments of Health (DOH), with strong representation on SANAC. The organizations have expanded their programs to include Prevention of Mother-to-Child Transmission (PMTCT), pediatric HIV treatment, emphasis on psychosocial and nutritional support and training and have been an integral part of the program since inception and the joint program now operates from Gauteng with teams in a the more rural North West. The success of pediatric ARV treatment scale-up depends on a comprehensive approach. In particular, RHRU and its sub-partner ECHO (RHRU-ECHO) continues to strive to strengthen referrals and linkages from other programs such as PMTCT and primary health care programs like TB, MCH, IMCI, EPI in an effort to ensure that more children are identified for care. This program will maintain focus on improving these linkages through direct support, and intensive training of doctors, nurses, and other health care professionals. In recognition of the fact that pediatric ART cannot be provided in isolation of caregivers, our program aims to provide a family-centered approach to care.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Increase access to treatment

There are currently almost 9,000 children who have been started on ARV treatment through support from ECHO and RHRU. The SA DOH goal is to increase the proportion of children on ART to 15% of all people on ART. This has already been exceeded in some areas where ECHO and RHRU are involved and as partners continue to strive towards, and advocate for ensuring all children who are in need receive ART. Despite improvements in the PMTCT program, which will likely reduce the numbers of HIV-infected infants, it is believed that through active case management there will still be increasing numbers of HIV-infected children being referred for ART. RHRU and ECHO teams consisting of doctors, nurse clinicians, counselors will continue to support urban and rural sites in KZN, Gauteng, Limpopo and North West province, in alignment where possible, with sites where RHRU provides adult services. RHRU and ECHO will also continue to provide technical assistance and service provision at tertiary facilities. This work takes place within DOH facilities and RHRU and ECHO staff work closely with the DOH staff at all the sites. In KZN and Gauteng, sites will continue to be supported by pediatric nurses, pediatricians, psychologist, social workers and dieticians in addition to generalist doctors and nurses. Data capturers will provide data support and management services under the monitoring and Evaluation section. The utilization of Mobile Clinical Support Teams (MCST) will continue throughout outreach sites, and as ART accredited sites demonstrate capacity to provide treatment and care for children without the support of the ECHO and RHRU teams, additional sites will be identified and the MCST will assist with mentoring staff at accredited sites to manage HIV-infected children.

ACTIVITY 2: Loss-to-follow-up

Defaulter tracers will be based at all pediatric ART facilities to track all defaulters. Ongoing networking and collaboration with other NGOs to assist with tracing of defaulters will occur. Also of concern are children who are booked at sites but never show at the clinics. There is a high mortality in these children and renewed efforts will be made to ensure that children who are booked for appointments are seen at the treatment site, and urgently traced if they miss the appointment.

ACTIVITY 3. Quality assurance

The whole care pathway will be emphasized at all service points, which will include prevention, counseling and testing, diagnosis and management of opportunistic infections including TB.

In terms of quality improvement, sites will conduct regular multidisciplinary activities which will look at improving quality of care provided. Systems are being rolled out to ensure that outcomes of children of treatment at all ART sites are being monitored.

ACTIVITY 4: Nutrition support

Nutritional support will continue to take the form of nutritional assessment and counseling of 'at risk infants and children' as well as the provision of therapeutic or supplementary feeding support for clinically malnourished patients in Durban and at Harriet Shezi Clinic in Gauteng. ECHO and RHRU dieticians will

Activity Narrative: continue to mentor DOH dieticians at outreach sites to ensure that malnourished children receive appropriate interventions.

ACTIVITY 5: Tuberculosis (TB)

TB screening and diagnosis will continue to take place in accordance with the National TB Program guidelines with the provision of INH preventive therapy to HIV-infected children exposed to sputum smear-positive TB wherever necessary. In hospital settings, RHRU and ECHO will continue to work closely with the pediatrics departments in the wards to monitor children in the wards already on ART and those needing ART. If necessary, children will be started on ART whilst still in the wards. All children that have been identified as being HIV-infected will continue to be referred immediately to the ARV site for further management. This will include sick children identified through Integrated Management of Childhood Illness (IMCI) programs as well as those presenting at EPI clinics.

ACTIVITY 6: Quality of care

As part of quality control, RHRU and ECHO will continue to conduct file audits at least bi-annually. These will be conducted using randomized sampling. Currently large program audits are occurring at the bigger sites and data on outcomes of children on ART is available at these facilities. In terms of quality monitoring, viral load suppression rates will be looked at, as well as overall clinical outcomes a mortality rates.

ACTIVITY 7: Monitoring and Evaluation

RHRU and ECHO aims to strengthen monitoring activities as current services are often fragmented and make monitoring and evaluation a challenge. With the implementation of case management and tracking, RHRU and ECHO will assist sites in piloting and implementing data collection tools designed by DOH. The aim is to strengthen the existing mechanisms within the DOH services for monitoring and evaluation. This will most likely better inform treatment and support programs. RHRU and ECHO will thereby support South Africa's Five-Year Strategy by expanding access to HIV services, improving pediatric care service delivery, and increasing the number of children accessing care and treatment.

ACTIVITY 8: Human Capacity Development

RHRU staff will continue to train clinicians (doctors and primary health care nurses) providing antiretroviral therapy on pediatric specific treatment issues through didactic courses and through on-site mentorship. RHRU staff, because of their direct involvement and leadership in guidelines development (both for South Africa and technical advice to WHO), are well placed to continue to train ARV clinicians as the guidelines change and are updated. ECHO staff will continue to provide the pediatric component of the RHRU two-week training course that runs quarterly. ECHO staff through the Mobile Clinical Support Teams will continue to provide on-site mentorship at outreach ART sites. Clinicians working with other partners and the pediatrics department will also rotate through tertiary ART sites and will continue to be mentored in this way. Weekly continuing medical education programs aimed at increasing clinical capacity of nurses and doctors will continue to be held; as will weekly case discussions where complicated cases are addressed in a multidisciplinary forum. RHRU staff also will continue to lead development of the University of the Witwatersrand Faculty of Health Sciences first year medical student curriculum which exposes students to an understanding of antiretroviral therapy, among other topics. In KwaZulu-Natal, RHRU staff provides direct on-site training and mentoring to Department of Health (DOH) staff in pediatric HIV treatment and care at RHRU-supported health facilities.

Mechanism: HCI

USG Agency: U.S. Agency for International Development

Program Area: Treatment: Pediatric Treatment

Program Budget Code: 11

Planned Funds: \$405,275

Activity Narrative: SUMMARY:

Through training, mentoring and the introduction of quality assurance (QA) tools and approaches, Health Care Improvement (HCI), the follow-on to the URC/Quality Assurance Project (QAP), will work with 65 South African Department of Health (DOH) antiretroviral therapy (ART) sites in five provinces (Eastern Cape, KwaZulu-Natal, Limpopo, Mpumalanga and North West) to improve provider and patient compliance with ART treatment guidelines and improve the delivery of quality ARV treatment services to HIV clients. The essential elements of HCI support include technical compliance with evidence-based norms and standards, interpersonal communication and counseling and increasing organizational efficiency. The emphasis area for this activity is human capacity development. The activity targets public and private health care workers, and people living with HIV (PLHIV).

BACKGROUND:

HCI is currently training healthcare providers in 25 DOH ART service delivery sites in the use of QA tools and approaches for increasing compliance with ART guidelines. HCI has developed a number of QA tools for healthcare facilities offering ART services. HCI will increase the number of DOH ART-accredited facilities that it supports in the five provinces to improve the quality of care provided to all clients on ART. To strengthen HIV and AIDS services at facility level, HCI plans to enhance community-based support for ART patients to ensure treatment adherence and active facility-based quality improvement using QA tools and approaches. In addition, HCI will hire sessional medical staff in facilities in the 5 provinces to provide ART services. These providers will serve as mentors to DOH staff for six months to a year. This strategy will create local capacity to provide treatment services over time. HCI will assist healthcare facilities to develop operational strategies to improve the care, treatment and follow-up of children and adolescents on ART. HCI will also capacitate local community-based organizations (CBOs) and home-based care organizations (HBOs) to integrate QA tools and approaches for improved quality of their home-based care management and follow-up of ART patients.

ACTIVITIES AND EXPECTED RESULTS:

While HCI will continue to focus on four key activities described before, the emphasis during FY 2009 will be on expanding these and other activities, in the following ways:

ACTIVITY 1: Establish Quality Improvement Teams at District / Facility Level

By improving and institutionalizing the formation of quality improvement (QI) teams at a facility and district level, HCI staff is involved in providing the knowledge and skills required for leadership and sustainability for the program. This is an ongoing initiative, which is specific to each area, district, or province, due to the variable nature of the different stakeholders involved and geographic location of HCI-supported sites / districts.

ACTIVITY 2: Training

With FY 2009 funds, HCI staff will work to develop Continued Professional Development (CPD) -accredited ART training materials, including a comprehensive package of manuals, posters, flip charts and job aids. The development of these materials will include modules on eligibility for ART, initiation of ART in both adult and pediatric patients, disclosure, ART adherence issues, poly-pharmacy (addressing concomitant administration of medication) and specific ART challenges.

In addition, HCI will revise existing QA training materials and expand on proposed training initiatives to include QA/QI methodology for all cadres of health care staff, including informal staff such as community workers, lay counselors and home-based carers. This is particularly important at PHC facilities where HIV-infected clients interact with a wide range of formal and informal health staff.

The measurement of quality is also highlighted with emphasis placed on the indicators used to monitor clinical performance, such as interruption rates for HIV-infected clients on ART and the proportion of HIV-infected clients on ART who are linked to treatment supporters, which impacts directly on the continuum of care and the quality of care provided to clients. Improvement and institutionalization of quality within the context of ART services is also an important issue.

Participants are given skills for applying these principles in the work setting by focused training on monitoring quality of service provision and measurement, data analysis and interpretation, reporting / feedback, and improvement techniques. These are learnt practically through the use of role plays and specific case studies. Participants work in groups to identify quality gaps within the case studies and make recommendations for quality improvement strategies in the ART service based on these.

In addition, participants, either individually or as a group, are provided with raw data and are required to analyze / interpret the data from the data sheets, graphically illustrate their analysis and make quality improvement plans based on them.

ACTIVITY 3: Human Capacity Development

HCI staff specifically undertakes human capacity development activities for health facility staff within HCI-supported districts. These activities include formal training workshops, regular fortnightly support visits, identification of knowledge and skills gaps and on-site mentoring and coaching activities by HCI staff. Training, as defined by HCI, includes two days of formal training sessions, for which registers are maintained by HCI Coordinators. HCI training involves specific quality assurance methods and quality improvement techniques.

As HCI is already in the process of recruiting and placing medical staff in health facilities, these medical

Activity Narrative: staff will be tasked with provision of clinical services to HIV-infected pediatric clients on a day-to-day basis and provision of training and mentoring for health facility staff regarding HIV and AIDS care, with specific reference to ART treatment and care services on a weekly and monthly basis. As part of HCI's sustainability initiatives, HCI staff seek to build capacity and develop local skills, by providing training and support to DOH clinic staff (doctors, nurses, counselors, pharmacists, etc.) to ensure that providers have appropriate knowledge and skills to deliver quality ART services to all ART clients enrolled on the program / eligible for ART treatment and care. HCI staff and DOH staff meet regularly to ensure that any additional knowledge regarding newer ART medication/treatment options, specific pediatric interventions and research findings are readily shared.

ACTIVITY 4: Referrals and Linkages

Building on lessons from previous experiences, HCI is able to facilitate linkages between different stakeholders within the health system, by coordinating and providing leadership.

To improve existing referral networks, HCI staff members will identify and strengthen linkages between prevention of mother-to-child transmission (PMTCT), counseling and testing (CT) and ARV treatment sites, by working with health facility staff at different levels of care and advocating for the development of integrated referral and follow-up networks. All staff at PMTCT and CT sites will be responsible for referring HIV-infected mothers and their newborns for onward care, treatment and support, while staff at ARV sites is responsible for care, treatment, support and follow-up of these patients. It is essential to ensure that all patients receive optimal care and remain within the health care system, ensuring compliance / adherence with treatment and an improved quality of life.

HCI staff will also ensure that health care workers are capacitated to ensure appropriate infant care follow-up, opportunistic infection (OI) prophylaxis, and basic preventive care to HIV-exposed infants identified in the PMTCT programs, as well as capacitating community-based tracers to identify and follow-up PMTCT, TB or ART defaulters, including HIV-exposed babies who have been 'lost to follow-up'.

HCI plans to strengthen linkages between Orphans and Vulnerable Children (OVC) programs, routine maternal and child health services and ART services. It is envisaged that this will serve to identify and strengthen existing networks; highlight gaps in the quality of services provided; and provide information about the feasibility of incorporating relatively rapid QA approaches into ongoing OVC programs.

HCI will work with DOH staff to strengthen facility-community linkages with the objective of addressing issues of psychosocial support, stigma reduction and prevention of domestic violence for HIV-infected pregnant women. This will involve working with community-based workers/tracers to improve the visibility of PMTCT and CT activities, increasing routine offers of voluntary counseling and testing (VCT) in communities through education (in facilities and door-to-door/household visits), and hosting opportunities for clinic staff and community members to showcase improvement activities and encourage support for improvement initiatives.

ACTIVITY 5: Strengthening supervision systems:

HCI has been extensively involved in revision of the Clinic Supervision Manual for health care facilities, and will continue to lead the implementation and monitoring of supervision systems within the country, by training district and facility-level supervisors in QA methods and facilitative supervision techniques for improving the quality of ART and follow-up services. This is particularly important in the context of pediatric ART, as there has been minimal supervision of these programs in the past.

ACTIVITY 5: Policy:

HCI will actively participate in the development, revision and implementation of the National ART guidelines, ART monitoring and evaluation framework, ART adherence tool and ART-accreditation policy in collaboration with the national and provincial DOH staff to ensure long term sustainability of this program.

Program Area: Treatment: Pediatric Treatment

Program Budget Code: 11

Planned Funds: \$22,331

Activity Narrative: SUMMARY:

This activity will continue antiretroviral therapy (ART) and HIV clinical management for approximately 1,500 South African National Defense Force (SANDF) personnel and family member dependents, including children, that were previously receiving ART via the Phidisa II clinical trial. The Phidisa II clinical trial, initiated in 2004, compared four combination ART arms and was terminated in December 2007. 1,400 patients have been transferred, beginning in April 2008, to an observational cohort study entitled Phidisa IA, with continued research collection. The Phidisa Project established the infrastructure, staffing, and procedures for ART and HIV clinical management capability at all three of the South African Military Health Service (SAMHS) hospitals, and in three rural sickbays. With the national roll-out, the strategy of the SAMHS Masibambisane Program has been to extend the geographical coverage of ART primarily to rural sites other than the Phidisa clinic and to have a well defined presence in the three SAMHS hospitals. In these hospitals, the Phidisa Project is managing the majority of HIV-infected SANDF personnel and dependent family members; however, a transition has begun to ultimately transfer routine HIV management and care of these patients to the SAMHS. This has been slowed primarily due to lack of uniformed human services to staff these clinics. The SAMHS has been challenged in filling these much needed posts for doctors, nurses, and pharmacists - despite active recruitment. The Charisma Phidisa staff continues to be one source of recruitment, although the numbers have been small. A more feasible strategy for sustainability will be the addition of SANDF resources to support the key Charisma personnel necessary. To this end, co-location and integration of the Phidisa clinic and the SAMHS ARV roll-out clinic is in process. In two of the three hospital sites, where the SAMHS roll-out is also available, patients newly initiated on ART are offered a choice of participating in the Phidisa observational cohort or being followed by the SAMHS roll-out. In those rural sick bays that are Phidisa Project only, patients who choose not to be enrolled in Phidisa 1a are managed by the Phidisa clinic staff, without research collection. HIV management will continue to be comprehensive, with opportunistic infection (OI) prophylaxis and treatment given according to the South African national guidelines. There will continue to be a translation and communication of the Project Phidisa research findings to the SAMHS and to the greater South African and PEPFAR professional community.

BACKGROUND:

Project Phidisa initiated Protocol II, a randomized clinical trial, in January 2004 at the request of SANDF with the support of the US Ambassador to South Africa and the US Department of Defense (DOD). In addition to answering scientific questions important to South Africa, including a comparison on efficacy and toxicity of South African Government ART regimens, this protocol also helped SAMHS provide access to ARVs for SANDF personnel and their family members. Through Phidisa and implementation of this protocol capacity to deliver ART has been developed in all three military hospitals and at three rural military sick bays. Approximately 1,800 SANDF personnel and their family members have been randomized to one of four ART regimens over the past five years. Civilian South African health care personnel, including physicians, nurses, pharmacists, and clinical administrative support personnel have been recruited, trained, and retained to augment a core of SAMHS military health care personnel. The clinical trial sites and staff were the only ART capacity within the SAMHS through 2005 and were critical to SAMHS being able to expand ARV care with PEPFAR support over the last two years. Building on Phidisa's foundation, the SAMHS ARV roll-out has generated additional intrinsic capacity, which now includes different clinical sites. Due to unanticipated slower endpoint accrual, NIH/NIAID, SANDF, and US DoD came to an agreement to terminate the trial and to mine existing data for scientific results. A very high priority for SAMHS is to maintain HIV care and treatment for Phidisa-recruited participants, and to maintain the infrastructure and human resources that have been developed. Medical staff recruitment can be particularly challenging for the SANDF, with additional screenings and delays due to military policies. These shortages have been overcome with employment by civilians through an indigenous NGO, Charisma, which has been able to comply with SANDF screenings and policies. ARV clinics have been successfully manned, with integration of the Charisma staff with the SAMHS clinical personnel. These six clinical sites will remain a training site for the SAMHS ARV-rollout clinical staff.

Additionally, since 2004, Lancet Laboratory has provided laboratory support and performed virological, immunological, serological, and safety laboratory tests and procedures under the certification by South African National Accreditation System (SANAS).

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Retention of clinical staff and capacity at the six ART sites

PEPFAR funds support a percentage of the cost (ranging from 10% to 50%) of five physicians, 7 full time and 1 part-time pharmacists, nine nurses, and a part-time laboratory technician. Recruitment of these clinical personnel has been done in close coordination with the SAMHS in order to appropriately hire staff in accordance with the South African military guidelines so that these individuals can be transitioned into SAMHS uniformed or SAMHS civilian personnel. This process has complicated the hiring process for Charisma, and it is acknowledged that the transition to South African military support is lengthy (1 - 2 years). However, it directly addresses building indigenous SAMHS HIV treatment and care capacity. PEPFAR funds will support periodic training of staff in clinical management and quality assurance.

SAMHS Masibambisane ARV roll-out capacity, which has begun at the three SAMHS hospital sites, will be increased with FY 2009 funding. All three hospitals will have co-located clinics with an ultimate goal of sufficient SAMHS human resource capability (uniformed and civilian) to adequately manage routine HIV ART care and management for active duty members and their families.

Activity 2: Patient Care

Pediatric patients will be prescribed drugs according to South African Government guidelines. Regular scheduled follow-up is crucial for patients receiving ART, in order to assess responses to treatment as well

Activity Narrative: as to detect side effects. Procurement of laboratory support for ART management will be provided through Lancet, through Science Applications International Corporation (SAIC). Assessment of responses to ART will include measurement of immunologic status (CD4 count) and virologic response (viral load), every six months or with treatment failure. This information is critical to detect treatment success or failure. In the cases where patients' CD4 count has risen to > 200 cells/mm3 for more than three months, prophylaxis against *Pneumocystis jirovecii* pneumonia can be discontinued.

Lancet also has carried out all laboratory data reporting, arranged courier service for all clinical samples from all six SAMHS sites, maintains samples, and keeps a historical database of all results.

At the military hospitals where there are pediatric clinics, HIV-infected children will be referred to those clinics for treatment and care. For sites where there are no pediatric clinics, children under 14 years of age will receive antiretroviral treatment via the PHIDISA clinic.

These activities will contribute to the number of persons receiving treatment and care in the military, and support the PEPFAR 2-7-10 goals.

Development

Funding Source: GHCS (State)

Program Area: Treatment: Pediatric Treatment

Budget Code: PDTX

Program Budget Code: 11

Activity ID: 23695.09

Planned Funds: \$4,320,526

Activity System ID: 23695

Activity Narrative: SUMMARY:

The Perinatal HIV Research Unit (PHRU) has been involved in Pediatric Care since 1996. The PHRU provides comprehensive care and support for children (0-14) living with HIV. PHRU will use PEPFAR funds to provide high quality, holistic ARV treatment and psychosocial support in Soweto (Gauteng), rural Limpopo and Mpumalanga, and the Western Cape. PHRU will also use PEPFAR funds to provide personnel, infrastructure, training and ARV drugs for these services. Clients are provided with TB screening, ARV treatment, pre-treatment literacy, adherence counseling and access to adherence support groups. Immunization, growth monitoring, nutrition and assessments for other illnesses form part of the package. Linkages from counseling and testing (CT), prevention of mother-to-child transmission (PMTCT), and palliative care services will be strengthened. Linkages to child and maternal health, immunization and TB services are supported to ensure holistic care and sustainability. A family-centered approach targets HIV-infected adults and children. Men are actively encouraged to take part in their children's well-being and treatment.

BACKGROUND:

Since 1998 PHRU has provided comprehensive treatment, care and support to people living with HIV (PLHIV). Since 2004, PEPFAR funding has supported ARV treatment and South African Government (SAG) ARV treatment sites in Gauteng, rural Limpopo and Mpumalanga, and Western Cape provinces. PHRU purchases ARV drugs and provides treatment for adults and children infected with HIV. PHRU's family-centered approach encourages clients to bring partners and other family members for testing and treatment. PHRU is expanding activities to scale up government ARV treatment sites and to investigate down referral systems. With PEPFAR funds, PHRU will work with provincial health departments to ensure safe transfer of participants to ongoing care within the SAG roll-out program. PHRU will support, train and mentor health-care workers involved in the management, care and treatment of HIV-infected individuals. All programs follow national guidelines for ARV treatment. PHRU provides regular training on HIV-treatment issues such as adherence, medical treatment, and appropriate regimens. A non-governmental organization (NGO) partner, HIVSA, provides all sites in Soweto and Mpumalanga with psychosocial support programs providing community-based support, support groups and education. They cover issues such as basic HIV and AIDS information, HIV services and treatment, treatment literacy, adherence, positive living, nutrition, prevention, opportunistic infections and TB. The comprehensive care approach leads to stigma reduction, increased disclosure, and improved adherence to ART. Throughout the comprehensive program, PHRU has established a continuous set of assessment functions to improve the quality of care at ART service sites.

ACTIVITIES AND EXPECTED RESULTS:

All of the activities described in this section are on-going and will be expanded with FY 2009 funds.

ACTIVITY 1: Children, PHRU Clinic and Soweto

The PHRU identifies HIV-infected children who need treatment through PMTCT, CT, Pediatric Care and Support services and children of adults who are already on treatment. PHRU has been actively involved in expanding testing of infants using PCR at 4-6 weeks (see Pediatric Care and Support) and rapidly putting young infants onto treatment. As part of a comprehensive family-entered approach, these children are put onto treatment following SAG treatment guidelines with ARVs purchased by PHRU according to United States Government (USG) and SAG guidelines. Men are actively encouraged to take part in their children's well-being and treatment. PHRU and Department of Health (DOH) staff are trained on an ongoing basis in pediatric ARV treatment. PHRU was instrumental in changing pediatric treatment policy through the NIH-funded Comprehensive International Program of Research on AIDS (CIPRA) Children with HIV Early Antiretroviral Therapy (CHER) study which showed that HIV-infected infants under one year should be started on treatment as soon as they are identified as being HIV-infected. Refurbishing and renovation may be required as the program expands.

ACTIVITY 2: Adolescents

This activity is cross-cutting since the primary focus is on prevention of adolescents getting infected with HIV in the first place (see CT program area) but inevitably adolescents will test HIV-positive through CT activities, and these adolescents will be referred to appropriate care and treatment programs. Depending on the age of the adolescent, and the major activity at the site, they are included under Pediatric or Adult care, treatment and support.

Adolescents have special healthcare needs which they are often reluctant to address; some of these are sexuality, pregnancy, drug and alcohol abuse, sexually transmitted infections (STI), gender and mental health issues, coercion, violence, transgenerational sex and abuse. They are at high risk of contracting HIV and other STIs. Through a specialized adolescent clinic PHRU will continue to address these needs with PEPFAR funding by offering comprehensive counseling and care services that are youth-friendly, confidential and empowering to clients so that they may make informed and responsible healthcare choices, including being empowered to abstain and delay sexual debut. Through CT, education and on-going counseling, PHRU increases adolescent's awareness of HIV. The clinic called Kganya Motsha (Shine Young One) in Soweto is based close to places to where adolescents congregate. Services comprise CT and confidential and free care; HIV care, support and treatment; TB screening and referral for TB treatment; information, education and counseling on sexual and reproductive health; health information; counseling and appropriate referral for violence abuse and mental health issues; contraceptive information and counseling on individual choices; STI information, including information on effective prevention; and syndromic management of STIs. In addition, the clinic staff go to schools and NGOs in the area providing CT, education and training for adolescent HIV-prevention and care. PEPFAR funds will be used to continue with this work.

ACTIVITY 3: Support government facilities in Gauteng, Rural Mpumalanga and Limpopo and Western

South Africa Page 1033

Activity Narrative: Cape.

In partnership with provincial Departments of Health the PHRU supports government facilities to scale up treatment for HIV-infected and HIV-exposed children. The special needs of children are taken into account and the package described above is implemented either by the PHRU or their sub-partners in the various sites that we are supporting. Refurbishing and renovation may be required as the program expands.

Supporting sites in less well resourced and rural areas forms part of PHRU's pediatric strategy.

PEPFAR funds support these programs to improve linkages to primary care clinics for down referral, and to provide holistic care and support to people on ART and their families. Children are identified in the National Strategic Plan to be targeted for treatment. Training, mentoring and support to staff in these facilities are focus areas.

ACTIVITY 4: Human Capacity Development for Task Shifting

The PHRU activities supports human capacity development (HCD). Most of the activities focus on building the public health service to increase access and to improve HIV services in partnership with the relevant DOH, and is integral in the planning of workshops, in-service training and mentoring, task shifting strategies, retention and performance assessment.

South Africa has a deficit of skilled health and managerial personnel. This has necessarily meant that lower level staff takes on tasks that were originally done by higher level staff. An example is that many lay counselors now are expected to take clients vitals, and take care of all their counseling needs. Task-shifting is therefore an essential component to scaling up HIV-services. The PHRU assists in the training and mentoring of this process. PHRU has trained pharmacy assistants to dispense ARV drugs under the supervision of a pharmacist which has increased the capacity of clinic pharmacies to provide treatment services in the primary care clinics.

Lay counselors form the backbone of HIV services in South Africa. These counselors generally have a high school certificate and have undergone a lay counseling course. As the need for HIV services increases so does the reliance on these health care workers. Increasingly they are expected to take on more responsibilities in the clinics. Many of these counselors work on a voluntary basis receiving only a stipend. Until now there has been no career path for these counselors, with the result that many leave the profession once they find a higher paying job. PHRU together with its sub-partner HIVSA has developed a training course such that these counselors can now become accredited at different levels. This is a big step forward as HIV-services become increasingly dependent on this level of staff.

These activities will contribute substantially to the PEPFAR 2-7-10 goal of providing ARV treatment to two million people by supporting SAG treatment sites.

Activity System ID: 23769

Mechanism: N/A

USG Agency: U.S. Agency for International Development

Program Area: Treatment: Pediatric Treatment

Program Budget Code: 11

Planned Funds: \$315,544

Activity Narrative: SUMMARY:

ARV services are being rolled out in a phased approach in South Africa; however, barriers to accessing treatment remain at the community and health facility level, particularly for children and OVC. Data from public sector sites also reveal that counseling and testing (CT) is not acting as an effective entry point for treatment, care and support services due to poor linkages and referral systems. The Population Council (PC) will address issues concerning accessing treatment through three key activities with an emphasis on linkage and referral networks. The emphasis areas are human capacity development, local organization capacity building and wraparound (health).

BACKGROUND:

Access to HIV and AIDS treatment for children (0-14 years) is lagging far behind that of adults in South Africa. An estimated 240,000 children suffer from HIV and AIDS and only 8% receive ART treatment. Reasons for this lack of access include: 1) Limited programs aimed at improving access to pediatric HIV services, including HIV voluntary counseling and testing (VCT) for children; 2) Caregivers who are not aware of pediatric HIV and AIDS services; 3) HIV-infected children receiving services after becoming symptomatic of HIV infection; and 4) Limited and underutilized PMTCT/Plus programs that only provide services for infant HIV infection. The Population Council will address both the quality of service delivery and client utilization issues that limit access to pediatric HIV services for children aged 0-14 years. PC will focus on evaluating and scaling-up interventions aimed at strengthening referral systems to HIV services for infants, children, and OVC in a variety of service delivery settings. In addition, we will build human capacity to improve the integration of pediatric HIV services into existing HIV services. Further, we will address challenges faced by caregivers in accessing HIV care for children and OVC.

ACTIVITIES AND EXPECTED RESULTS:

Due to Population Council Strategic Planning and PEPFAR SA technical considerations, activities and budget for activity 1 and 2 have been moved from Adult Treatment to Pediatric Treatment. PC will modify, and consolidate two existing pilot projects, the Family Centered Approach (FCA) and the Caregiver project, to improve access to pediatric counseling and testing and ultimately link children found to be positive to HIV care and treatment services. Through these projects, we will address three key areas with an emphasis on: strengthening and building referral networks; human capacity development (intervention at health facilities); local organization capacity building; and wraparounds (health).

The FCA project aims to actively involve HIV-infected adults in the referral of family members, spouses, and children to VCT and other HIV services. This approach addresses the family's critical role in the early identification and continued treatment of HIV-infected children. The FCA intervention will be conducted at several clinical service delivery points, focusing on HIV-infected caregivers who are new or currently enrolled in ART programs. Providers trained in this approach will encourage HIV-infected caregivers to seek counseling and testing services for their spouses and children of unknown status. Through training service providers, this project will also build capacity and structure within selected clinics for improved linkages to pediatric HIV services.

The Caregiver project will maximize the use of existing FCA and linked clinic infrastructure to increase HIV testing of high-risk children age 0-14 by referring their caregivers from South African Social Security Agency (SASSA) pay points. Currently the Caregiver project uses SASSA grant pay points to explore the feasibility of caregiver referrals to linked FCA pediatric HIV services. The Caregiver project aims to build these types of referral networks for caregivers in a variety of non-clinical and community-based service delivery settings including additional SASSA sites, improving access to linked pediatric HIV services, particularly for OVC and children who are more likely to be HIV-infected.

Currently both pilot projects are underway in the North West and the Eastern Cape provinces. The FCA project is implemented in 5 sites: Cecilia Makiwane Hospital, Potsdam Clinic, Nu1 and Nu12 clinics and Tapologo clinics. The Caregiver project is being implemented at the SASSA grant pay points in Native units 1, 10, 12, 15, Potsdam, Tsitsing, Mogajana and Boitekong paypoints.

With FY 2009 funding, the proposed projects will be expanded to new regions of the Eastern Cape. In these regions, PC will focus on three major municipalities: Ndlambe, Makana & Nelson Mandela. This will be done in collaboration with the Department of Health and the SASSA.

Overall, these projects will contribute to increasing the number of children, including OVC, who receive VCT and HIV care and treatment. In addition, they will strengthen the family and caregiver role in seeking and utilizing pediatric HIV services. In FY 2009, PC will provide FCA training to service providers in pediatric settings in selected health facilities that are providing ART services. This training will improve linkages to pediatric services and aid in the integration of family services within a clinical setting. Additionally, through the linked Caregiver activities, we will build and strengthen referral systems at government agencies and other community-based organizations to increase HIV counseling and testing for infants, OVC, and children of unknown HIV status in non-clinical settings.

ACTIVITY 1:

The Caregiver/FCA project will improve access to pediatric counseling, testing, and treatment through a Family Centered Approach and referral of caregivers from SASSA sites.

In COP FY 2009, PC will focus on refining the FCA intervention, improving linkages to pediatric HIV services from various clinical service delivery points, strengthening pediatric tools and services offered to maximize access, and modifying provider trainings to better address the necessity of testing immediate family members, such as spouses and children of unknown HIV status. The linked Caregiver Project will focus on strengthening referral systems from SASSA sites to linked FCA clinics, incorporating SASSA employee training to streamline referrals, exploring new non-clinical venues appropriate for pediatric HIV service referral, and modifying referral card systems used to monitor the success of the intervention, to maximize HIV service access for infants, OVC, and children through engaging their caregivers.

Activity Narrative: ACTIVITY 2:

In order to ensure that quality pediatric services are available at selected FCA clinics, PC will ensure protocols are followed, and use existing pediatric site assessment tools, standard operating procedures, forms, and referral tools to determine the quality of services and capacity of the facility for delivering pediatric HIV services. PC will also modify the provider FCA training manual based on findings from COP FY 2008 activities. This revised manual will act as a resource for all providers and will be provided to sites beyond the sites of introduction, incorporating issues related to stigma and status disclosure, pediatric ART literacy, care, pediatric nutrition, and psychosocial support.

ACTIVITY 3:

The FCA will build human capacity by conducting trainings with providers. These curricula will include trainings on how to enable their patients to understand the necessity of bringing other family members in for VCT and/or treatment and care. The FCA program will additionally improve referral linkages for children age 0-14 at key clinical based entry points including PMTCT, ART, and VCT (post-test counseling) through increasing the number of staff trained in the FCA approach. The program will also strengthen the capacity of families to care for infants, children, and OVC by prolonging the lives of parents and caregivers and by providing economic, psychosocial, and other risk reduction support to OVC and their families and caregivers.

ACTIVITY 4:

Providers will continue to strengthen and implement the patient referral card system for encouraging family members and spouses of unknown HIV status to access linked VCT services. While this activity previously increased the number of new patients seen at FCA clinics by 10%, PC will further modify recruitment tools (i.e., referral cards) and provider training based on COP FY 2008 pilot findings to maximize utilization.

ACTIVITY 5:

4) The Caregiver project will continue to build, strengthen, and modify the referral card system at SASSA sites, encouraging caregivers to access linked HIV counseling and testing services. With a continued presence at SASSA sites, it is expected that caregivers will be more likely to access these services and refers other caregivers. In addition, the caregiver project will explore other community-based venues or government agencies where access to caregivers caring for children at higher risk for HIV might be found.

ACTIVITY 6:

The PC Caregiver staff will continue to encourage and advise caregivers of children aged 0-14 at SASSA pay points, and other government and community organizations, to access HIV testing services for children aged 0-14 of unknown status in their care. In addition, PC will conduct referral trainings with SASSA employees. SASSA employees will be trained to refer appropriate caregiver grant recipients to pediatric HIV services. This will increase the capacity of SASSA employees to integrate caregiver referrals into their routine distribution of grants and decrease the necessity of hiring additional staff to perform these functions at SASSA sites.

ACTIVITY 7:

With FY 2009 funding, PC will continue to collect demographic information and describe characteristics of caregivers of children and OVC accessing SASSA services and other government or community-based organizations. PC will use this information to continually improve our ability to predict the likely users of the referral card system and to improve the approach.

Mechanism: N/A

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Treatment: Pediatric Treatment

Program Budget Code: 11

Planned Funds: \$97,090

Activity Narrative: SUMMARY:

This is a new activity in FY 2009. Activities are planned and implemented in partnership with Department of Health coordinators for HIV and AIDS, STIs and TB (HAST) at all levels of government. TB Care Association (TBCA) will be supporting 11 ART sites in two provinces (Western Cape and KwaZulu-Natal) through clinical care support and/or community-based adherence support: two in West Coast District; five in Cape Town Metro District; one TB Hospital in Cape Town, and three in Sisonke District, KwaZulu-Natal (KZN). In FY 2009/10, TBCA will provide support to an additional three sites in Enhlanzeni district, Mpumalanga. Training and mentoring on topics to ensure provision of quality care will be provided: clinical care, social support, monitoring and evaluation (M&E), and health system support. Referral systems, including community adherence support and coordination of services between hospital and primary health care (PHC), will be strengthened through human resources, capacity development and programmatic support. Children infected and affected by HIV will be the beneficiaries of this PEPFAR-supported program.

BACKGROUND:

TBCA has been providing community-based counseling, support, and TB treatment support in the Western Cape since 1992. Support for HIV care and treatment services in KwaZulu-Natal and Mpumalanga is a new initiative. Training and mentoring activities will be done in collaboration with the National Department of Health (NDOH). Support has been requested by the provincial Departments of Health and all program activities will occur within public health facilities. Essential drugs and ARVs will be procured through NDOH, and the National Health Laboratory Service (NHLS), through the NDOH, will provide laboratory services.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: Integration of Services and Quality Assurance

The first activity is human capacity development, focusing on integration of the pediatric HIV program into primary healthcare services. Under the guidance of the clinical coordinator, six TBCA-employed nurse mentors with extensive experience in HIV care and treatment will work closely with the NDOH to identify training/mentoring needs. NDOH clinicians will be trained through didactic and mentoring sessions, on topics including identification and counseling of victims of abuse, early infant diagnosis, provision of cotrimoxazole prophylaxis for HIV-exposed and infected infants, TB screening and assessment in children, reducing stigma, and integration of services. HIV testing, care and treatment will be strengthened by ensuring all clinicians involved in patient care (doctors, nurses, pharmacists) in all areas of patient care services (outpatient services, pediatrics, TB, family planning, antenatal services) are clinically competent in managing HIV-infected children. A quality assurance program will be implemented through support of the NDOH multi-disciplinary team meetings, provision of clinical updates and in-service mentoring, and introduction of a formal routine chart review, in collaboration with clinic managers. National and provincial standards of care and guidelines will be followed.

ACTIVITY 2: Community-based Adherence Support

This activity will strengthen community involvement in HIV care and treatment services through outreach services provided by community health workers (CHWs). In consultation with the DOH, TBCA has either directly employed or will employ one community team leader (CTL) per facility supported and supports CHWs in each catchment area. Community-based adherence support is provided through sub-contracts with home-based care organizations operable in the community, or directly by TBCA. TBCA trains the CHWs on priority health issues so that they are multi-skilled to provide integrated community care. The role of the CHWs is to promote information, education, communication (IEC) in the communities they serve. IEC activities aim to increase awareness of the availability of comprehensive HIV services; to promote HIV prevention, including prevention with positives; to ensure family-centered care through referrals of family members affected by HIV; and to ensure community-level follow-up of patients who have not returned for routine care (in collaboration with M&E). Existing community groups will be encouraged to participate, and through collaboration with existing home-based care programs, community-based wellness programs will encourage patients to seek routine care. The team leaders and TBCA-employed nurse mentors facilitate links with social development programs, nutritional support programs, and other governmental and non-governmental services.

ACTIVITY 3: Strengthening Clinical Services through Monitoring and Evaluation (M&E) Support

TBCA assists with monitoring and evaluation activities of the national comprehensive HIV care and treatment program at supported sites. The above mentioned facility-based CTL assists with TB/HIV reporting. Coordination of M&E with clinical services will ensure prompt follow-up of children enrolled in care and treatment and who do not return to clinic. Data collection is facilitated through provision of computers to each clinic. Training needs related to capturing quality data will be identified and addressed. Gender equity in the HIV program will be revealed through collection of data showing breakdown of males and females receiving prevention, care and treatment services. The CTLs have direct communication with CHWs to ensure follow-up of children referred for services.

ACTIVITY 4: Provision of South African Qualifications Authority (SAQA) accredited training

In FY 2007/08, TBCA began the process of seeking formal accreditation as a training provider with the Health and Welfare Sector Education and Training Authority (HWSETA). It is anticipated that in FY 2008/09, approval will be granted and provision of accredited trainings at National Qualifications Framework (NQF) level four and five will be offered to community health workers, non-governmental organizations, and provincial governments as needs are identified. The goal of training will be to improve pediatric TB and HIV case finding and adherence.

ACTIVITY 5: Support to Brooklyn Chest Hospital for Management of Multi-Drug Resistant (MDR)/Extensive

Activity Narrative: Drug Resistant (XDR) TB and HIV

Clinical and psychosocial support will be provided to Brooklyn Chest TB Hospital in the form of two social auxiliary workers who will counsel MDR/XDR TB patients and run group sessions in the hospital wards. We will employ two lay counselors who will counsel MDRTB patients attending the outpatients department. These staff will be report to hospital management and be fully integrated into a multidisciplinary team. Training and mentorship will be provided for clinicians to improve HIV care and treatment for co-infected hospitalized children. TB Care employs three edu-care teachers to provide early childhood development and stimulation to hospitalized pediatric TB and TB/HIV patients. There are currently 48 children hospitalized, 70% of whom are between three months and five years old. Many have TB and meningitis with mental disabilities due to late presentation and diagnosis. Funds will be used to improve the physical environment of the hospital to be more pleasant for patients who are hospitalized for long periods of time. Referral systems will be put in place to ensure that discharged pediatric patients complete their treatment, attend follow up visits and receive community-based adherence support.

Table 3.3.11: Activities by Funding Mechansim

Mechanism ID: 7301.09	Mechanism: UGM
Prime Partner: Right To Care, South Africa	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Treatment: Pediatric Treatment
Budget Code: PDTX	Program Budget Code: 11
Activity ID: 22943.09	Planned Funds: \$97,090
Activity System ID: 22943	

Activity Narrative: SUMMARY:

Right to Care (RTC)'s Umbrella Grants Management (UGM) project will support several sub-partner organizations through financial oversight, project management, human capacity development, training, mentorship programs, program development, treatment expertise, and strategic planning in providing Pediatric HIV Care and Support (PCS) services. With the variety of program activities that RTC currently implements or oversees, they have developed a wide base of skills and capacity to manage a range of organization activities, including organizations that provide prevention, training, HIV treatment care and support, pediatric care and treatment, cervical cancer screening, care for orphans and vulnerable children (OVC), home-based care and TB care and treatment.

BACKGROUND:

The following proposed activities are designed to support sub-partner initiatives to implement the goals of PEPFAR and the South African government's (SAG) Comprehensive Plan. Over the last two years, RTC has developed a UGM capacity while developing specific skill sets, competencies and capacity to support many PEPFAR sub-grantee organizations. RTC has developed in-house capacity in financial management, pre-award assessments, training functions in financial management and USAID regulatory compliance. In addition, the technical expertise in medical aspects will be supported by internal RTC capacity and through the Clinical HIV Research Unit, an extension of the ongoing activities of the current RTC grant.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: UGM Technical Assistance and Quality Assurance

Needs assessment and program planning will be done on a regular basis with sub-partners. Site visits will be conducted alongside sub-partner staff to systematically evaluate needs of capacity, human resources, facility planning, approaches to programmatic areas such as treatment and care, in order to effectively reach determined targets and quality of care. The needs assessments will use the experience of RTC clinicians and program staff to develop proper planning and forecasting to facilitate patient growth. Programmatic technical assistance will be provided on an ongoing basis, with clinical mentors responding to requests and providing treatment updates, ongoing training, updated guidelines, and case-specific support.

ACTIVITY 2: UGM Financial Management

The finance department at RTC has developed systems to support sub-partners that enable compliance and capacity to manage PEPFAR funds effectively. Support includes a complete range of necessary financial management. RTC will meet with sub-partners annually to align financial and programmatic planning.

Regular oversight and support will be given with monthly financial reports required for all sub-partners. Periodic internal audits will also be conducted at the sites of all sub-partners to establish the quality of financial management and human resources (HR) management, review of asset control and alignment with USAID financial management policies.

The finance department at RTC has developed a state-of-the-art financial software tool, which uses Business Intelligent Tools, to monitor and track all sub-partner transactions against budget projections for modeling and cash flow. This integrated program will allow proper management of budget at all sites. Combined with the monthly financial reports, RTC will be able to use this system to produce up-to-date fund accountability statements and fund balances for its sub-partners.

ACTIVITY 3: UGM Monitoring and Evaluation

RTC's monitoring, evaluation and reporting (MER) system (standards, systems, procedures and tools) is established, documented and continuously improved, based on best practices and quality criteria, in the programmatic areas of Adult Treatment, Adult Care and Support, Pediatric Treatment, Pediatric Care and Support, TB/HIV, Voluntary Counseling and Testing (VCT), Outreach and Training.

All implementation sub-grantees/programs will be provided with support, training and technical assistance to necessary for sub-partners to effectively meet USAID reporting requirements. In addition, RTC programmatic experts will monitor the reports for quality assurance.

ACTIVITY 4: UGM NGO Management and Sustainability

RTC supports NGOs with established policy guidance and procedures that meet the requirements of both the South African labor law as well as the USAID regulations. All sub-partners will have access to the RTC human resources capacity.

Support of infrastructure will be given through expertise within RTC for advice and consultation. Through various infrastructure projects, RTC has developed expertise in proper clinic flow, effective interior space design in both CCMT sites as well as TB clinics. Other sub-partners facing infrastructure challenges will be able to make best use of limited resources which are necessary in increasing clinic capacity. Sustainability of sub-grantees will be supported through RTC's continued relationship with the Department of Health to ensure that continued HIV and AIDS response is in line with the strategic plan for South Africa, ensuring that once the PEPFAR program is complete, that the activities of the NGO can be taken over by the South African government.

Where systems are identified to be inadequate, RTC aims to capacitate NGO organizations to manage their programs independent of RTC. Within the implementation plan and budget, RTC has planned to provide financial reporting systems, management SOPs, human resources policies and procedures, clinical

Activity Narrative: guidelines, and monitoring evaluation systems that will ensure sustainability beyond RTC support.

ACTIVITY 5: Technical Assistance (TA) for Pediatric Antiretroviral Therapy (PART):

RTC will help sub-partners to accelerate the implementation of PART at NGO treatment sites in districts where government provision has not yet been rolled out.

RTC, with its extensive treatment expertise, will give TA to sub-partners to ensure that each pediatric ART patient at sub-partner-supported facilities receives a minimum package of ART services, including clinical and pathology monitoring, adherence counseling and support, and follow-up of defaulting ART patients. Adherence activities will include a focus on reducing stigma and encouraging disclosure in order to enhance drug compliance and to improve patient retention. At many RTC supported NGO sites, support groups are helping families to deal with the issue of disclosure to older children. Emphasis will be placed on an integrated, family approach, increasing the number of HIV-infected children and pregnant women on ARVs, couple counseling, prevention and disclosure, linkages and referrals to care for STIs, family planning, and TB, and enrollment and retention in care.

Sub-partner pediatric treatment funds will be used for: (1) human capacity development and salaries -- NGO and FBO clinics receive sub-awards for doctors, nurses, pharmacists and counselors (2) developing a training program for pharmacy assistants as human capacity development for the distribution of ARVs and HIV services; (3) addressing minor infrastructure needs where necessary at NGO, FBO sites; (4) procurement of health commodities; (5) procurement of laboratory services for pathology monitoring; and (6) provision of ARVs and related medications (i.e. cotrimoxazole prophylaxis).

RTC will support its PART providers by disseminating policies and guidelines and sharing best practices. Ongoing quality assurance, clinical mentorship, and supportive supervision will be undertaken by centralized treatment experts. Doctors and nurses at sub-partner organizations' sites can spend time working at Themba Lethu clinic or other RTC-supported government sites, call hotline numbers for urgent assistance, receive case-specific advice on patient management, and request mentors to see difficult cases alongside as part of the learning process.

Table 3.3.11: Activities by Funding Mechanism

Mechanism ID: 193.09

Mechanism: N/A

Prime Partner: Elizabeth Glaser Pediatric
AIDS Foundation

Funding Source: GHCS (State)

Budget Code: PDTX

Activity ID: 22825.09

Activity System ID: 22825

USG Agency: HHS/Centers for Disease
Control & Prevention

Program Area: Treatment: Pediatric Treatment

Program Budget Code: 11

Planned Funds: \$1,688,083

Activity Narrative: SUMMARY:

The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will use FY 2009 PEPFAR funds to support its existing care and treatment partners namely, National Department of Health (NDOH) and provincial DOH Kwazulu-Natal (KZN), Free State, North West and Gauteng, as well as McCord Hospital and AIDS Healthcare Foundation (AHF) in KZN. EGPAF plans to scale up pediatric treatment services and ensure access to those who need it. The emphasis areas for this activity are human capacity development and strategic information. EGPAF will provide training on early infant diagnosis, pediatric HIV clinical staging, diagnosis and ART in children as well as provide additional staff where required. Primary populations include infants, young children, and adolescents. The geographic focus is on KwaZulu-Natal, Free State, Gauteng and North West.

BACKGROUND:

EGPAF pediatric treatment services will be closely linked to PMTCT, pediatric care and support, integrated management of childhood illnesses (IMCI), well baby clinics, TB, adolescent services and other outpatient services to optimize early identification of infants and children. EGPAF aims to have all eligible HIV-infected children initiated on HAART in a timely manner, and improve their life expectancy and quality of life. EGPAF recognizes the gap in the provision of pediatric treatment services and will support the DOH in ensuring that pediatric care and treatment is prioritized. As part of the global EGPAF initiative, EGPAF is developing a country-specific pediatric framework that articulates the major issues in scaling up pediatric treatment within a family-centered approach as well as mobilizes resources to complement those provided by the DOH. EGPAF will provide technical assistance and other resources to ensure the provision of comprehensive and quality treatment services for all HIV-infected children.

ACTIVITIES AND EXPECTED RESULTS,

In general, pediatric treatment is still a hospital-based service. The skills limitations and lack of confidence amongst health care professionals has resulted in the pediatric HIV and AIDS management being perceived as difficult. Human capacity development activities will mainly focus on skills development or transfer, in an effort to build confidence amongst health care professionals. Practical clinical skills, i.e. examination of infants and children, clinical staging, and venesection, need to be strengthened. Didactic training, bedside clinical training, preceptorship, on-site coaching, mentoring and supportive supervision will be provided. An integrated training approach will be applied and thus the trainings will include adherence counseling, TB/HIV and early infant diagnosis to ensure comprehensive and quality care.

Gender is a critical issue in treatment, care and support, with implications for the quality and effectiveness of the care provided and, the disproportionate burden on women and girls to provide care. EGPAF will work with relevant government departments and community-based organizations (CBOs) to identify child-headed households, implement targeted programs to meet needs including programs which keep girls in school, help them manage households, address stigma and compensate for lost family income; programs that target men and boys and encourage their participation and responsibility in care-giving and household functions, as well as programs that work to reduce gender violence and promote human rights. Specific needs of children will be addressed. The Project HEART South Africa male-to-female ratio of children on treatment is 1:1.

ACTIVITY 1: Advocacy:

Media campaigns carried out by other organizations, including the DOH, have little or no pediatric focus, hence suboptimal pediatric awareness. Globally, EGPAF advocates for pediatric treatment and engages in technical policy activities at all levels of service delivery. Information on early identification, referral and treatment of HIV-infected infants and children, treatment literacy and adherence support will be communicated. The importance of cotrimoxazole prophylaxis in preventing opportunistic infections (OIs) will be highlighted.

ACTIVITY 2: Set up Mobile Clinical Support Units (MCSUs):

In order to improve the pediatric treatment coverage, EGPAF will promote the establishment of MCSUs at all EGPAF-supported antiretroviral (ART) initiation sites to ensure access and availability of pediatric treatment services in rural and farming communities. The MCSU will be managed and coordinated within the DOH treatment program.

ACTIVITY 3: Facility-based quality improvement (QI):

Multi-disciplinary teams that include clinical and non-clinical health care workers will be established at all ART initiation sites to scale up and improve the quality of pediatric treatment services. Monthly QI meetings that focus on improving the quality of pediatric treatment services will be conducted.

ACTIVITY 4: Down Referral Process and Accreditation.

EGPAF will assist DOH to down refer stable pediatric patients and their families to local primary health care clinics.

ACTIVITY 5: Community linkages and referrals.

As part of the chronic care model, EGPAF will endeavor to strengthen community-based treatment support services and ensure effective referrals between health establishments and community-based services.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

Activity Narrative: EGPAF overall support is in line with National DOH pediatric treatment policies and guidelines, The National Strategic Plan (NSP) 2007-2011 Priority Area 2, Treatment, Care and Support, goals 6 and 7 are taken into consideration

Table 3.3.11: Activities by Funding Mechanism

Mechanism ID: 4760.09

Mechanism: N/A

Prime Partner: St. Mary's Hospital

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Treatment: Pediatric Treatment

Budget Code: PDTX

Program Budget Code: 11

Activity ID: 22813.09

Planned Funds: \$284,514

Activity System ID: 22813

Activity Narrative: SUMMARY:

The proposed St. Mary's Hospital project addresses comprehensive and holistic HIV care and treatment, including antiretroviral treatment (ART) within a hospital setting, with a large focus on training at a community clinic level to ensure that stable patients, once down-referred from the hospital can be treated on a continuous basis at a community level. The major emphasis area for this project is human capacity and the development thereof both in the community as well as in the hospital. The expansion plans for FY 2009 is to provide holistic treatment and care to patients that are experiencing side effects of ART as well as babies born to mothers that are HIV-infected.

BACKGROUND:

Since 2003, St. Mary's hospital has successfully implemented an ART program based on holistic and comprehensive treatment of HIV and AIDS patients. This program was funded through another PEPFAR partner, Catholic Relief Services (CRS) as part of their Track 1 program. Since FY 2005, the USG has added additional funding to St. Mary's Hospital to focus on pregnant women and their children.

Successful treatment of HIV and AIDS requires that patients maintain adherence to medication, incorporating overall wellbeing, including nutrition. The early stages of the treatment program allowed St. Mary's to maintain an average adherence rate of around 90%, which was largely due to a patient-centered model of care. However as the patient numbers have increased St. Mary's has realized that there is a greater need to provide patient support both in the community and to the community clinics. St. Mary's will aggressively address loss-to-follow-up, and ensure a more efficient down referral process of patients from the hospital setting to the community clinics. Just over 300 pediatric patients are currently in HIV care and treatment.

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Human Resource Capacity Training.

As an accredited South African Government (SAG) antiretroviral (ARV) roll-out site and as an extension of the service level agreement the Hospital has with the Department of Health, St. Mary's will contribute to the success of the SAG ARV roll-out plan through this project. The funding allows St. Mary's to continue to initiate patients on ART, and once stable, down refer them to the community clinics in the area. St. Mary's will assist with the training of health workers at clinic level to facilitate this. St. Mary's has identified local partners to facilitate this process.

The community clinics surrounding St. Mary's are linked into St. Mary's via the referral patterns already established. The implementing organization will be St. Mary's Hospital and local partners will be recruited to assist with the ART training modules. A comprehensive nutrition program will be implemented to boost immunity with the patient cohort which will be the responsibility of the dietician employed at St. Mary's Hospital. As an accredited ARV roll-out site this is a vital component to the success of the treatment program. A patient follow-up program, funded as part of the CRS activity treatment program, makes use of therapeutic counselors (TCs) in the community to support patients from St. Mary's Hospital. As the patient numbers have increased, St. Mary's acknowledges that additional human resources are required for patient follow-up and support activities. The current treatment activity program addresses the need to make use of TCs based in the community referral clinics, to help capacitate the clinics to offer support to all patients in the community. This will be part of the clinic strengthening activity plan. It is envisioned that the TCs will mentor community health care workers to ensure the long-term sustainability of ARV treatment in communities.

Activity 2: Pediatric Treatment

As stated previously, St. Mary's is a DOH-accredited ARV roll-out site and the partnership will be enhanced and expanded through the additional PEPFAR funding.

Early infant diagnosis of HIV will occur at inpatient and outpatient settings within the hospital. The areas addressed are; children's ward pediatric outpatients, the primary health care facility (PHC) and the prevention of mother-to-child (PMTCT) program. Sick children admitted to hospital will initially be 'flagged' at pediatric outpatients and counseling and testing (CT) services will be offered to mother and child in this department. If the child is admitted to children's ward and if no CT services were offered through the pediatric outpatients department then CT services will be offered in children's ward. All other children admitted to children's ward who were not admitted first through pediatric outpatients will be offered CT services at ward level. The PHC facility and PMTCT will offer CT services and thereby identify children that require care, support and possible ARV treatment. Polymerase chain reaction (PCR) testing with dried blood spots will be offered for children age 6 weeks - 6 months; at 9 - 12 months and antibody test will be offered and at 15 - 18 months and older routine antibody testing. These tests will be sent to the National Health Laboratory Services (NHLS), and will be offered at all levels of service as discussed above. As with the criteria for CT, routine pediatric testing will be implemented at all hospital service settings.

The hospital is accredited as a baby-friendly hospital so repeat testing will be the norm for those children who test HIV-negative but have ongoing exposure through breastfeeding. Within the antenatal clinic, patients who have received PMTCT are followed up post-delivery and if clinically appropriate, placed on antiretroviral treatment. This is a seamless program which also places the children of HIV-infected mothers on ART if clinically appropriate. The program also provides education and nutrition support in partnership with the KwaZulu-Natal DOH. A full-time dietician is on site to assess HIV-infected pediatric patients requiring nutritional supplements as well as to advise the mother and extended family on the nutritional needs of the child upon discharge.

There may be possible shortages of cotrimoxazole; however, pediatric HIV-exposed infants will be

Activity Narrative: prioritized as patients receiving the treatment as of 6 weeks of age. Should this national shortage persist, children will still be prioritized. HIV-infected patients will be identified and referred at the various service settings within the hospital to the ARV pediatric treatment clinic within St. Mary's Hospital. If the patient is admitted at ward level, the treatment will commence at ward level. Referral to the ARV treatment clinic will occur once the child is discharged from the hospital in-patient facility. TC home-based care and support will ensure address adherence to the drugs, the need to manage any side effects to drugs as well as general support in the home setting.

As discussed in the TB activity plan, HIV and TB are fully integrated services within the hospital. Diagnosis and treatment of children will occur at all settings where pediatric care is offered. Screening for TB and HIV will be routine within the hospital, as well as in the community through the TCs that are visiting the homes of referred patients from the hospital. There will be a focus on the provisions of Isoniazid (INH) preventive therapy to all HIV-infected children exposed to sputum smear positive TB.

During FY 2007/2008, the hospital had secured the services of a volunteer pediatrician from Harvard Medical School twice a week. The pediatrician treated HIV-infected children in-hospital and managed children as outpatients from the PHC facility. The pediatrician also mentored clinical staff in the facility, which has allowed clinical staff to be more focused on pediatric care and treatment.

TCs dedicated to pediatric care; and health care workers in the community clinics that provide home-based care support will be trained in Integrated Management of Childhood Illnesses (IMCI) strategies. It is envisioned that this training will equip the TCs and home-based care workers with sufficient information to provide adequate support and basic care to pediatric patients in the community. This training will also be transferred to the community at large when home visits occur. If there is a need, the referral of the patient to a more appropriate facility will be advised.

The activities will also address health promotion in the schools which is part of the Ethekwini District Health Plan. Schools will be visited by the school nurse and therapeutic counselors who will address counseling and testing as well the need for referral to clinics and the hospital in the case of the possible need for treatment.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

By strengthening the down referral system, providing technical assistance to the public sector, and providing supportive treatment for patients on ARVs and affected by HIV and AIDS, St. Mary's hospital is contributing to the PEPFAR 2-7-10 goals.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.11: Activities by Funding Mechansim

Mechanism ID: 226.09	Mechanism: N/A
Prime Partner: Foundation for Professional Development	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Treatment: Pediatric Treatment
Budget Code: PDTX	Program Budget Code: 11
Activity ID: 23059.09	Planned Funds: \$1,723,660
Activity System ID: 23059	

Activity Narrative: SUMMARY:

The Foundation for Professional Development (FPD) program supports the public sector expansion of access to comprehensive HIV and AIDS care by focusing on provision of care, and through human capacity development (HCD). Activities supporting improved and expanded service delivery in public sector ART clinics include the provision of staff, clinical and management training, equipment, technical assistance, mentoring, and refurbishment of facilities. Additional HCD activities include an international volunteer and an intern program. The emphasis areas for these activities are Human Capacity Development, Local Organization Capacity Building and Workplace Programs. Target populations for the activities include people living with HIV (PLHIV) and the business community. The activities also target most at risk populations.

BACKGROUND:

FPD is a South African private institution of higher education working exclusively in the health sector in Southern Africa. Since FY 2005, FPD has supported treatment for thousands of PLHIV and training for thousands of healthcare providers and managers delivering ART and related services. Coordination with provincial Departments of Health (DOH) takes place through Memorandums of Understanding (MOUs). FPD provides substantial assistance initially to public sector facilities and works towards a diminished role over time, working towards sustainability at the sites. Sub-agreements are used for supporting a national HIV consumer line (HIV 911). Gender issues are embedded in all aspects of the project and include collecting gender specific data in treatment programs, linkages with NGOs working in the gender field, counseling and testing (CT) services that specifically focus on couple counseling, domestic violence and abuse detection.

Other issues addressed by this project are: 1) Male norms and behaviors that are addressed in the counseling provided at ART sites. All staff actively work towards reducing violence and coercion by identifying victims of violence; 2) stigma and discrimination is addressed in counseling and training programs; and 3) volunteers, including Peace Corps volunteers, will be involved at treatment sites.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

FPD is implementing a comprehensive care and CT model that works to increase early infant diagnosis and to increase the proportion of children on ART to 15%. This is a continuation of work started in previous COPs. The current pediatric target will remain at 10%.

ACTIVITY 2:

Key pediatric care and treatment activities entail: providing adequate and appropriate human resources to provide pediatric HIV care and treatment; improving early infant diagnosis of HIV and follow-up within all appropriate settings; strengthening linkages with prevention of mother-to-child transmission (PMTCT), antenatal care (ANC), maternal and child health (MCH), well-baby clinics, and pediatric wards; supporting surveillance activities, monitoring continuity of care and integration with PMTCT and ANC programs; identifying (through pediatric HIV testing services) and initiating HIV-infected children under two years of age on ART; implementing routine TB screening and treatment for TB in HIV-infected children and families; providing INH prevention therapy to HIV-infected children exposed to sputum smear-positive TB; ensuring that all pediatric patients receive cotrimoxazole prophylaxis; providing nutrition support including multi-micronutrient supplements and supplementary feeding, if indicated; promoting age-appropriate and family-centered services through the integration of infant, child, adolescent and parental ART programs; piloting booking systems to allow a family group to gain access to all service on the same day; supporting FPD pediatric specialist mentoring and referral support to strengthen general practitioner and nurse capacity to provide quality pediatric HIV care and support; supporting pediatric program monitoring by age groups (0-2, 2-4, 5-15 years of age).

ACTIVITY 3:

Another key activity area focuses on expanding the linkages between FPD and PMTCT partners such as Mothers to Mothers and Elizabeth Glaser Pediatric AIDS Foundation in order to ensure the seamless referral from PMTCT programs to pediatric HIV care and treatment programs. FPD has a relationship with Mothers to Mothers and South to South - South Africa. Mother to Mothers supports PMTCT programs in FPD-partnered SAG facilities in North West province; South to South provides technical assistance to FPD-partnered South African Government (SAG) facilities for PMTCT and clinical pediatric treatment where FPD and SAG have identified a need for additional assistance.

ACTIVITY 4:

The electronic medical record (EMR) that is utilized by FPD-partnered ART clinics will be expanded to encompass specialized pediatric treatment activities and be available at all ART sites. The EMR was developed at the direct request of the Tshwane District of Health in order to strengthen and harmonize facility-based monitoring systems while ensuring that data quality and data use are integral components of the process. Key activities for the EMR include strengthening the integration of various HIV service points (CT, TB, HIV-palliative care, ART) and optimize inter-connectivity with existing South African Department of Health (DOH) systems (District Health Information Systems; National Health Laboratory Systems). In support of these activities, FPD will place a strong emphasis on didactic training and ongoing on-site mentorship to build sustainable, local monitoring and evaluation and HMIS systems.

The electronic medical record (EMR) is supported on an integrated virtual private network (VPN) which allows for the electronic transfer and/or access of data between different HIV service points. This inter-connectivity holds great potential in terms of monitoring service integration and continuity of care within a district. In the EMR, the electronic HIV and AIDS data will be held in a physically and technically secure environment with minimum data repositories and limited individual access. Data access will be determined by designated user roles and rights. The existing defaulter tracer module will support active tracing of

Activity Narrative: pediatric patients who missed appointments and mitigate loss to follow-up. Additional steps to ensure retention include ensuring the establishment of PLHIV-led support groups that will support pediatric patients and care-givers on issues such as disclosure, nutrition, alcohol, safe sex and family planning, status acceptance, treatment literacy and adherence.

ACTIVITY 5:

The ART clinical quality assurance system that has been developed through collaboration between FPD and JHPIEGO will be expanded to all facilities offering pediatric treatment services. This system uses a standards based measurement and rating (SBMR) approach with an aim to identify and respond to challenges to improve quality of pediatric treatment. SBMR activities will be implemented by facility staff on a routine basis and by external auditors periodically.

Program Budget Code: 11

Activity ID: 23195.09

Planned Funds: \$1,121,395

Activity System ID: 23195

Activity Narrative: SUMMARY: Management Sciences for Health's (MSH) Strengthening Pharmaceutical Services (SPS) project will support the South African Government's (SAG) Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment (CCMT). SPS improves the reliable provision of ARV services and other related services; monitors progress towards compliance with pharmaceutical legislation and ARV accreditation requirements for provincial health facilities; trains pharmacists and pharmacist assistants in basic principles of HIV and AIDS management; trains health personnel in conducting medicine use evaluations, using adherence to antiretroviral treatment (ART) measurement tools; supports the review of national standard treatment guidelines (STGs) for HIV and AIDS, TB, STI and other diseases; strengthens the provincial implementation of pharmaceutical therapeutic committees and medicine information centers; and strengthens pharmacovigilance reporting. The emphasis areas are human capacity development and wraparound programs. Target populations include National AIDS Control Program staff, policy makers, public and private health care workers (especially pharmacists), people living with HIV (PLHIV) and their families, orphans and vulnerable children (OVC) and the general population of children, youth and adults. SPS will work in all nine provinces to support national, provincial and local government pharmaceutical services as well as the Department of Correctional Services. Opportunities for collaboration with the Supply Chain Management System (SCMS) Project will be explored.

BACKGROUND:

Since FY 2004, RPM Plus has been working in close collaboration with the National Department of Health Pharmaceutical Policy and Planning (NDOH-PPP) Unit, and provincial and local government pharmaceutical services to support the delivery of pharmaceutical services at all levels. The following activities are a continuation of the activities initiated since FY 2004. Systems and models have been developed and tested. With FY 2009 funding, SPS will continue the implementation of these on a larger scale and monitor the impact on the delivery of ART at accredited sites. These activities have received the full support of the NDOH-PPP unit and the provincial pharmaceutical services.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Standard Treatment Guidelines and Rational Drug Use

SPS will assist the NDOH in reviewing pediatric STGs and the primary health care Essential Drugs List (EDL) on an ongoing basis as well as assist the provinces in promoting these STGs. SPS will also conduct provincial workshops on rational drug use; strengthen provincial, district and institutional pharmaceutical and therapeutic committees (PTCs); assist with the development of provincial formularies; train staff in basic principles of pharmacy economics and the use of evidence-based principles for drug selection; and implement provincial medicines information centers.

ACTIVITY 2: Adherence

The need to ensure optimum treatment outcomes and prevent resistance to ARVs is an important goal of pediatric HIV management which relies strongly on the availability of adequate systems to monitor adherence to treatment regimens. Identifying the complex issues around treatment adherence is important for children, caregivers and providers. SPS has developed significant experience in this area following the successful development and implementation of an adherence assessment tool for adults and will continue working with key provincial and national counterparts and partners to develop optimum adherence monitoring tools and identify interventions to support treatment adherence. These efforts will also contribute to the overall strengthening of the health system as pediatric medication adherence monitoring and support measures are generic tools that may be applied to settings providing treatment for other chronic pediatric diseases.

ACTIVITY 3: Pediatric Pharmacovigilance.

Strengthening pharmacovigilance measures to ensure the safe and effective use of ARVs and other medicines used in pediatric patients with HIV and AIDS is an important goal of the National HIV/AIDS program. The training of health-care workers in the identification, diagnosis, management, prevention and reporting of HIV medication-related adverse effects in pediatric patients is critical to improving healthcare outcomes in this vulnerable population. SPS has developed training materials to meet this need and will conduct training programs to build capacity by providing skills and knowledge to HIV and AIDS program managers on the safe use of antiretroviral agents and related medicines in pediatric patients. In addition, SPS will provide technical assistance to facility-based HIV and AIDS programs on the planning and implementation of surveillance activities in this area of pharmacovigilance, with subsequent follow-up at the provincial and national levels. SPS will support focused surveillance activities and operational research relating to key pediatric drug safety issues through collaboration with university academic and research departments and other key stakeholders and partners.

ACTIVITY 4: Training of Pharmacy and Nursing Personnel from ART and PMTCT sites

There is an urgent need to strengthen capacity among pharmacy and nursing personnel to manage pediatric patients on ARVs. The SPS HIV/AIDS Pharmaceutical Management and PMTCT training courses, intended for pharmacy and nursing personnel, address this need. Course materials focus on, amongst others, prevention of mother-to-child transmission (PMTCT), follow-up care and testing of exposed infants, management of TB/HIV, and food and nutrition guidance.

ACTIVITY 5: Monitoring of Pediatric ARVs and TB Drugs and Patient Management

SPS will implement systems (manual and computerized) to monitor the use of pediatric ARVs and related medicines, management of patients as well as provide training to provincial pharmacy and nursing personnel in quantifying requirements for pediatric ARVs and related medicines.

Program Budget Code: 11

Planned Funds: \$186,472

Activity Narrative: SUMMARY:

HIVCare will use FY 2009 PEPFAR funds to work with the Free State Department of Health (FSDOH) to provide antiretroviral treatment in a private health facility to patients who do not have medical insurance and who are referred from the public sector waiting lists for treatment. The Medicross Medical Centre, a well-equipped private primary healthcare center, provides the main resource base and in conjunction with thirteen other sites, will provide an effective means of properly distributing antiretroviral therapy (ART) to patients who are either referred from public sector facilities or who access the sites by word of mouth. The emphasis areas for this program will be human capacity development and local organization capacity building. The target population includes the infants and children of men and women (infected and affected), factory workers and other employed persons, and government employees - specifically teachers, nurses and other health workers (who do not have medical insurance). A further specific population that will be targeted will be secondary school children. The most significant target group is those persons that cannot access services in the public health system.

BACKGROUND:

PEPFAR funding for the HIVCare project commenced in June 2005. The main thrust of the activity was to match the FSDOH with partners from the private sector (in this case Netcare, the largest private sector health provider in South Africa) in order to build private sector capacity and absorb some of the burden from public sector facilities. Many FSDOH centers have waiting lists of people for ARV treatment. Patients from these waiting lists who meet the eligibility criteria for this program are referred from those public sector clinics to one of the primary health centers throughout the Free State province for treatment. The FSDOH is a collaborating partner in this public-private partnership. In terms of this partnership, some of the patient burden of State amenities would be alleviated through the use of private sector primary health facilities throughout the province. In summary, the PPP places the following obligations on the three parties. Netcare's HIVCare program provides all medical services related to the delivery of HIV care and treatment through its primary health sites in the province, funding for the treatment of patients is provided by PEPFAR and the Free State Department of Health provides technical support, hospitalizations and specialist treatment where required.

In Sub-Saharan Africa, AIDS has become one of the leading causes of death among children under five years old. A recent Actuarial Society of South Africa (ASSA) study revealed an incidence of HIV among children at birth of 4.1%. Patients that are enrolled will proportionately increase the percentage of pediatric patients on the program. As a population group, this sector remains underserved.

The HIVCare treatment sites will provide all medical services related to the delivery of HIV care and treatment. Management and coordination activities will be provided by HIVCare. The majority of patients will be referred from public clinics in the FSDOH network to the HIVCare centers based on the following criteria: (1) Clinical (CD4 <200 cells/mm³ or WHO stage III or IV, (South African National Guidelines)); (2) Inability to pay (lack of private insurance or state coverage) and (3) Capacity constraints at referring clinic. Patients are referred in general by adult treatment centers.

During the course of the treatment of adults, HIVCare was, by necessity, required to treat and manage the children of existing patients. This was later formalized and the children of patients are now routinely tested and included in the treatment program. At that time treatment for HIV and related conditions at the time was not readily available to young children within local structures and only one specialized pediatric clinic existed. In late 2007 HIVCare launched a dedicated Youth Clinic for Voluntary Counseling and Testing (VCT) and treatment of adolescents (12-18 years).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Pediatric Treatment

Patients referred to the program receive PEPFAR-funded consultations and exams from HIVCare physicians, who will also order relevant tests and refer patients to expert specialists when necessary. The package of care also includes counseling and testing (for patients who do not know their status and including early Polymerase Chain Reaction (PCR) testing for babies), adherence counseling, and access to therapeutic nutrition support as per the national guidelines and OGAC guidance. An initiative aimed at improving overall compliance and treatment efficacy is the distribution with the medication of a parcel of nutritional supplements. The supplements provide a single fortified meal per day for each of the indigent patients on ART and aids in the absorption of the medication. Patients are assessed based upon their body mass index (BMI) and general condition. The patients meeting the pediatric clinical criteria are enrolled onto the program. Where patients present directly at the HIVCare treatment center and are found to be in need of TB treatment or treatment of an opportunistic infection, this is addressed unless hospitalization is required. Similarly radiography and pathology for investigative procedures is available.

ACTIVITY 2: Youth Clinic

Due to the high (up to 19%) prevalence of HIV amongst teenagers in the Free State province, HIVCare introduced a large VCT program targeted at this population group. The Youth Clinic provides on-site ancillary services such as psychologists and social workers. In addition, the clinic promotes abstinence, being faithful, responsible condom use and informs on family planning. Young women are referred to public sector family planning sites for contraception where needed.

ACTIVITY 3: Data Sharing

Data is shared with the FSDOH on two levels. Firstly data on all new patients enrolled onto ART is provided by the pharmacy to the provincial authorities. Secondly a return is submitted to the National Department of Health, with a copy to the provincial FSDOH, giving the data of all those on the program. In addition to this, a representative of HIVCare attends the monthly provincial HIV task team meetings. The sustainability of the Youth Clinic is provided for in the current inclusive Memorandum of Understanding that is pending with the FSDOH.

Activity Narrative: ACTIVITY 4: Patient Care

The activity has been modified since inception in two key focus areas – the qualitative aspects of patient care, and the quantitative aspects of patient care.

In terms of the qualitative aspects of patient care, activities are focused on:

- a) TB education, screening and follow-up.
- b) Bringing the whole family into care: A family-centered approach is followed with patients encouraged to bring their partners and children in and to have them tested for HIV. Days are organized for the testing of patient's children (children represent actually 5% of the patients in the adult clinic and at the doctors network.
- c) Referrals mainly from primary health centers.
- d) Contacting primary caregivers (e.g. biological mothers, grandmothers or aunts) through day care, PMTCT clinics and church groupings to bring children for health screening.

The program currently supports ART at 15 primary health clinics, a Youth Clinic as well as two dedicated ART clinics. A special children's register is to be maintained at the ART sites and the Youth Clinic.

Two specific challenges that are being addressed in the current period are firstly to monitor adherence effectively particularly where the mother, as caregiver, is also ill and secondly the early identification of HIV-infected children. These are being addressed through visits to churches, local nursery schools and churches in the townships and strong linkages with other facilities.

By providing comprehensive ARV services to patients and promoting ARV services for a large population of underserved people living with HIV (who do not have private insurance) and school-age children, HIVCare is contributing to the PEPFAR goals of placing two million people on ARV treatment and providing care for ten million others who are infected with HIV. These activities also support care and treatment objectives outlined in the USG Five-Year Strategy for South Africa by expanding public-private partnerships and expanding care to an underserved population.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.11: Activities by Funding Mechanism

Mechanism ID: 4763.09	Mechanism: N/A
Prime Partner: Xstrata Coal SA & Re-Action!	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Treatment: Pediatric Treatment
Budget Code: PDTX	Program Budget Code: 11
Activity ID: 22740.09	Planned Funds: \$97,090
Activity System ID: 22740	

Activity Narrative: SUMMARY:

Xstrata is a new PEPFAR partner which has received funding since FY 2007 for a public-private partnership with the Mpumalanga Department of Health (MPDOH). The implementing partner for this is Re-Action! Consulting (RAC). RAC will facilitate a co-investment partnership with Xstrata to provide support for strengthening targeted government clinic sites, continuing to improve access to basic preventive, clinical care and psychosocial support services in Mpumalanga. The project will build on a public-private mix model for strengthening HIV and TB service delivery that Xstrata and RAC has already begun to implement in the province with funding from Xstrata (dollar for dollar match with PEPFAR).

Xstrata and RAC will work through established partnerships with local government, MPDOH, community groups and private providers. Project deliverables have been defined in response to specific requests for assistance from the MPDOH. Major emphasis will be given to development of health workforce capacity, with minor focus on community mobilization/participation, building linkages with other sectors, local organization capacity development and strategic information. In FY 2009 expansion into other provinces is planned.

BACKGROUND:

Xstrata Coal is a subsidiary of a multi-national mining group committed to practical ways of achieving sustainable development and contributing to the health and social welfare of employees and their communities. The company employs 4,000 people at 11 mines (collieries) located within the socio-economically deprived Coal Powerbelt region of Mpumalanga. Xstrata Alloys has more than 10,000 employees with operations in three provinces of South Africa (Mpumalanga, Limpopo, and North West) and Swaziland. This funding partnership enables scaling up the community extension component of Xstrata's comprehensive workplace HIV and AIDS program that is managed by RAC. The project is based on implementing a public-private mix service-strengthening model of capacitating government providers within primary care clinic sites to deliver HIV-related preventive, clinical and psychosocial care services. The scope of assistance is defined within a Memorandum of Understanding between Xstrata and the Mpumalanga Department of Health and Social Services, and responds to specific requests for support by the provincial department's HIV and AIDS Unit, as well as the district management teams. This fits within a broader range of interlinked corporate social investments being made by the Xstrata Group to support sustainable local development in these communities.

The project will provide technical assistance, health workforce capacity development, clinic infrastructure improvements, strengthening of pharmaceutical supply management systems and service monitoring for public sector primary care clinics to deliver quality HIV-related preventive and clinical care services, with an increased focus in FY 2009 on children. This will contribute to strengthening district-level primary health care service networks and district service management, with a strong focus on improving human resource capacity, including through training and deploying community outreach workers to deliver household-level services. The project works in partnership with other PEPFAR contractors in the province to achieve synergies and avoid duplicating activities.

ACTIVITIES AND EXPECTED RESULTS:

There are currently very few children initiated on treatment in Mpumalanga, and this is thus an important area of focus in FY 2009. Re-Action! Consulting (RAC) will work in partnership with the District Management Teams (DMTs) in the provinces of Mpumalanga, Limpopo, North West and Northern Cape to develop and establish a task mix for pediatric treatment service delivery.

ACTIVITY 1: Human Capacity Development

In partnership with the DMTs, RAC will support the Department of Health (DOH) with the sourcing, recruitment, training and supervision of critical health care professionals. RAC will also focus on the re-training of existing personnel, not only in pediatric HIV care and treatment, but also on-the-job training such as the collection of treatment data and reporting, advanced counseling and program management skills.

ACTIVITY 2: Site Assessments

At a strategic level the RAC program team will undertake a joint assessment for each service provider site/group of competencies development needs (behavioral, skills, systems). RAC will establish these partnerships with the aim of strengthening existing pediatric HIV treatment programs in the specific provinces, training of and providing supportive supervision to health care professionals, and facilitating behavior change interventions focused on individual households and OVC households in the community.

ACTIVITY 3: Community Identification

Based on the district based health service/ response improvements plans and RAC's experience in five existing sites, the model of door-to-door voluntary counseling and testing, OVC and pediatric identification and referral will be rolled out into three additional sites. This community-based approach focuses on the family and the early identification of and enrollment of children into treatment programs. RAC aims to increase the number of children identified and enrolled on treatment. At all of the eight clinics, emphasis will be placed on the integration of TB/HIV services and RAC will ensure that all services are implemented as per the relevant guidelines.

ACTIVITY 4: Accreditation

In partnership with the provincial health departments, the RAC program team will identify and engage available service sites and providers (public sector and non-government, including private general practitioners (GPs), community-based organizations (CBOs), and traditional healers). RAC facilitated the accreditation of the Bernice Samuel Hospital as a antiretroviral therapy (ART) initiation site and another three sites have been established as down referral sites from the Witbank Hospital Wellness Clinic. As part of health systems strengthening activities relating to treatment, RAC will facilitate the accreditation of the existing down referral sites to initiation sites for HIV treatment, as well as facilitate the process of three new

Activity Narrative: sites being developed as either down referral or initiation sites for HIV treatment, as per the national accreditation guidelines and the National Strategic Plan (NSP).

ACTIVITY 5: Outreach Workers

The OW project is a direct entry point for HIV-infected children to access home-based care, referral, treatment and support groups. This is initiated by the "I know! the way to live" campaign whereby individuals have the opportunity to test for HIV at home. In addition, the OWs conduct follow-up visits identifying potential health risks in the households, as well as the tracking and tracing of defaulters. The quality and clinical management of HIV-infected children underscores the RAC program and the outreach workers (OWs) are supervised by a professional nurse, thus ensuring the quality and clinical accuracy of palliative care services rendered at household level. The expansion of the program into three additional sites in Mpumalanga will require the recruitment of two professional nurses and one social worker as shared program resources.

ACTIVITY 5: Nutrition

Nutritional assessments are key to the clinical management of HIV-infected adults and children and RAC will recruit a dietician as a shared program resource across all program areas. The activities have been modified in the following ways: the ongoing and expanded training and mentoring of OWs to ensure the incorporation of pediatric care, support and treatment skills in day-to-day counseling at a household level. RAC will enhance the OW project through the identification and partnering of service providers already working in the communities, providing pediatric and child support community-based services such as home-based care, adherence counseling, referral for counseling and testing, support groups for caregivers, nutrition counseling, and tracking and tracing of defaulters to enhance overall treatment services.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

Mechanism ID: 9626.09

Mechanism: N/A

Prime Partner: Walter Sisulu University

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Treatment: Pediatric Treatment

Budget Code: PDTX

Program Budget Code: 11

Activity ID: 22720.09

Planned Funds: \$194,181

Activity System ID: 22720

Activity Narrative: SUMMARY AND BACKGROUND:

The Eastern Cape Regional Training Center (ECRTC) was established through a service agreement between the prime partner Eastern Cape Department of Health (ECDOH) and Walter Sisulu University (WSU) to provide ongoing training for quality improvement in HIV care and treatment programs.

The function of the ECRTC has been to develop accredited training modules and care protocols for different categories of health workers based on National Department of Health guidelines. ECRTC has demonstrated and evaluated the HIV, TB and STI best practices continuum of prevention, care and treatment model in selected facilities, providing direct patient care and the opportunity for HCW to receive practical training. ECRTC provides technical assistance to the ECDOH regarding the expansion of its HIV intervention programs, and supports hospital and clinic site readiness for accreditation to provide comprehensive HIV care and treatment.

The primary target populations are the facility managers, doctors, nurses, social workers, lay counselors, CBO staff and community health workers.

ACTIVITY 1: Training

Pediatric treatment has been issue in the Eastern Cape Province since the launch of the National Strategic Plan in 2003. Clinicians are hesitant in initiating pediatrics on to ART. ECRTC will train clinicians at district level (doctors and nurses) on pediatric ART with the aim to improve access at district level to pediatric ART. ECRTC will develop and package a module on pediatric diagnosis, initiation and monitoring of ARV treatment, to form part of certificate courses offered by Walter Sisulu University. Sections relevant to nutrition, integrated management of childhood illnesses, laboratory services, counseling and testing, drug stock management, etc. will be covered in the curriculum.

Other PEPFAR-funded partners including I-TECH will be requested to provide technical support. The training package will include mentorship and support from the Nelson Mandela Hospital Infectious Disease unit.

ACTIVITY 2: Ongoing Support

ECRTC will establish ongoing support for clinical teams at district level to improve quality of and confidence of clinicians in providing pediatric ART. This support will be in the form of monthly case presentations and discussions and online (telephonic support) to clinicians in rural areas. ECRTC will also facilitate regular mentoring visits by pediatricians experienced in pediatric ART from the Nelson Mandela Hospital and the ECRTC mentoring staff to district hospitals and community health centers to strengthen their capacity and improve quality of pediatric ART in these areas.

ECRTC will employ a dedicated doctor and pharmacist to provide training development coordination, clinical consultations, training and advice on HIV and AIDS, with particular emphasis on pediatric ARV treatment.

ACTIVITY 3: ART Monitoring

ECRTC will interface the currently developed electronic medical record with the IDART pharmacy dispensing software from Cell Life. The combined software will be deployed in 6 current facilities, including putting equipment in facilities/ sites supported by a dedicated data capturer. This will enable great improvements in the current record system with information that will highlight the trends in pediatric care.

ACTIVITY 4: Performance Improvement

The ECRTC will provide support to improve skills and quality of care through Plan-Do-See-Act (PDSA) cycles and monthly improvement meetings incorporating two sub-districts. Focus will include increasing PMTCT uptake, quality of counseling, maintaining accurate records, ensuring follow-up of newborn infants, infant feeding, performance of PCR and referral to ARV treatment and social support. The training and mentoring will be targeted at care teams including managers, doctors, nurses and community health workers and will consider and review relevant system issues. Demonstration models are set up develop practical knowledge of care programs. Lessons learned from such a model will inform the current changes in the development of a pediatric care and treatment training model and also provide hands-on practical experience in training health workers.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

Funding Source: GHCS (State)	Program Area: Treatment: Pediatric Treatment
Budget Code: PDTX	Program Budget Code: 11
Activity ID: 22592.09	Planned Funds: \$292,728
Activity System ID: 22592	

Activity Narrative: SUMMARY:

The Africa Centre Hlabisa antiretroviral treatment (ACHART) program aims to deliver safe, efficient, equitable and sustainable pediatric antiretroviral therapy (ART) to all children who need it in the Hlabisa district through the district health department of rural KwaZulu-Natal. The target population for the pediatric treatment program is all infants and children born to HIV positive women and children living with HIV (PLHIV). The emphasis area of this program is human capacity development, renovation of clinics, and local organization capacity building.

BACKGROUND:

The ACHART Program is a partnership between the KwaZulu-Natal (KZN) Department of Health (DOH) and the Africa Centre, a population research department of the University of KwaZulu-Natal. The DOH program is based in Hlabisa sub-district, and provides health care to 220,000 people at a government hospital and 16 fixed peripheral clinics. The ACHART Program is embedded in the DOH ART roll-out where the Africa Centre and KZNDOH work to complement each other's abilities and resources in providing ART. The Africa Centre has expertise in infectious diseases and management that are not available at the district DOH. In addition to clinical staff and infrastructure, the district DOH provides the necessary drugs and laboratory testing for effective rollout.

With FY 2009 funds, the Africa Centre will continue to support the provision of ART including provision to children and expand its support for the KZNDOH. Increased attention will be given to improving the proportion of children on treatment.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support to South African Government (SAG)

The ART program is jointly run by the KZNDOH and Africa Centre. The Africa Centre contributes human resources and co-finances facility needs and supplies. The Africa Centre supports the KZNDOH with strategic planning and the implementation of the South African Government (SAG) National Strategic Plan 2007-2011 for HIV & AIDS and STI. This includes the establishment of an up and down referral system that ensures that HIV-infected infants and children are treated at the optimal level of care at each stage of the disease. The Africa Centre support further extends to operating the supply chain of drugs from the central pharmacy to the peripheral clinics and the transport of blood samples and TB samples from the peripheral clinics to the central laboratories.

In addition to this, Africa Centre also supports the monitoring and evaluation (M&E) of the ART program and the development of management and treatment algorithms. Monitoring, evaluation and reporting of the program will be done using both PEPFAR and the SAG (DOH) indicators. Reports on progress will be submitted to both PEPFAR and the SAG.

With FY 2009 funding, additional support will include park-homes (inexpensive portable prefab long-lasting structures) which will be set up in peripheral clinics where patient load exceeds facility capacity. Operational assistance will be in the form of funding to support training of staff, transport, logistics, IT support and administrative assistance to smaller peripheral clinics.

ACTIVITY 2: Pediatric ARV Treatment

The Africa Centre will continue to support the expansion of the pediatric ART program at Hlabisa hospital and the 16 KZNDOH clinics. The pediatric ARV treatment is following the DOH pediatric guidelines including screening for TB.

Through counseling and testing (CT), TB and the mobile ART and palliative care programs, the Africa Centre will work to increase uptake of ART among targeted communities. Africa Centre will conduct polymerase chain reaction (PCR) testing on all HIV exposed babies at six weeks after delivery and provide them with cotrimoxazole. Mobile teams of nurses and counselors will provide ART in the clinics, and community mobilization activities will be used to enhance community awareness and uptake of services. The Africa Centre will investigate the best possible way to roll out pediatric ART in the mobile clinics, which are serving the population. The mobile ART team will twin with the DOH mobile clinic team, and visit the service points together.

In FY 2009, additional mobile teams will visit clinics bi-weekly to provide onsite training, assess complicated patients, and do quality assurance checks. This process will institute a continuous process of quality improvement. Data capturers, supervised by the M&E officer, will move with these teams to capture data from the clinics. A doctor will join the mobile team to initiate patients on ART at smaller clinics and assist with treatment of side-effects and adverse events. All patients will be trained in prevention of HIV transmission and the importance of treatment adherence. Prophylaxis against common opportunistic infections includes cotrimoxazole prophylaxis in all exposed children and children who are not on treatment. Data from these activities will be monitored to ensure that clients receive comprehensive services and that all eligible children are put on prophylaxis at the earliest opportunity.

Two mobile teams of the DOH are tracking TB patients who don't pick up their treatment. Africa Centre will integrate the tracking of TB patients by forming two more teams. With that support all four teams are then able to track TB and HIV patients, thus preventing duplication of tracking and expanding the coverage of both groups of patients.

Africa Centre plans to increase pediatric ART uptake from the current 10% coverage to 15%. Nurses and counselors who will provide ART services in the mobile clinics and a tracking nurse will be appointed.

Activity Narrative: The pediatric and family clinic that is only done in two of the sixteen clinics will be expanded to two other clinics, and the dietician will also see some of the children referred by the pediatrician. Two of the AC physicians (one is a Wellcome Trust-funded pediatrician) will continue to support the DOH by visiting the pediatric ward at Hlabisa hospital daily. These children are discharged from the hospital and followed up by Africa Centre physicians at the pediatric/family clinics.

Pediatric anthropometric tools, including Mid-Upper Arm Circumference (MUAC) tapes to conduct effective nutritional assessment, will be procured with PEPFAR funding, and this will assist in improving the proportion of children provided with food support.

Africa Centre will also work with the Mothers to Mothers Program that is in three of the 16 clinics to ensure that mothers of exposed children are monitored and followed up.

With the integration of the Africa Centre tracking team and the DOH TB tracking team and greater involvement of PLHIV (support groups), tracking of children lost-to-follow-up for PCR testing will be improved.

ACTIVITY 3: Nutrition support

Africa Centre will develop food and nutrition policies and guidelines adapted from the SAG nutrition policies which are adapted to the local, rural community with a special target on children. The Africa Centre will make formula available to mothers who are unable to breastfeed their babies.

The dietician in the program will train nurses, counselors and Home Based Caregivers and support group members in nutritional assessment and counseling and tools like the nutrition risk score will be used to identify children's risk of malnutrition and for proper referral for food security support.

Anthropometric tools required (pediatric scales and stadiometers) to conduct effective nutritional assessment will be procured with PEPFAR funding. Children will be weighed and screened at all visits.

For long term food security, support groups will receive guidance on how to establish community gardens. Micronutrient supplementation will be made available following DOH and WHO guidelines. The supplements will have both meal and multivitamin supplements.

Food parcels and vitamin and mineral enriched porridge, which will provide between 60 - 80% of the recommended daily amount of food according to the SAG guidelines, will be made available for severely malnourished infants and nutritional status will be assessed using the nutrition risk score. Africa Centre will provide food parcels and meal supplements in emergency situations or instances where the SAG cannot provide for this. This is part of strategies to mitigate the impact of poverty.

ACTIVITY 4: Human Capacity Development

KZNDOH and Africa Centre counselors and nurses who work on the program will receive training on HIV and ART. The baseline course is based on the KZNDOH curriculum and comprises four sessions of three hours each, covering basics of HIV and ART; follow-up of patients, assimilation of a follow-up, and practical work with a patient (including blood taking for CD4 counts and viral loads). Counselors, nurses and physicians will receive additional training, emphasizing side-effects and second-line treatment to treat patients with therapeutic failure of first-line therapy. The program will finance a diploma course for a pharmacy assistant to assist with a satellite dispensing service at the clinics to support the KZNDOH pharmacist at Hlabisa Hospital. This trainee was recruited locally in June 2007. Doctors and nurses working on the ART program will attend the AIDS Certification Course, run by another PEPFAR partner, the Foundation for Professional Development.

Both Africa Centre and DOH nurses will be trained in integrated management of childhood illness (IMCI) (an effective strategy for identifying children exposed to HIV and TB), provider-initiated testing and counseling (PITC) for children, which will increase the proportion of HIV-infected children on treatment and those receiving cotrimoxazole, safe infant and young child feeding practices to prevent mixed feeding and reduce the under-five Infant Mortality Rate, and the WHO Ten Steps to manage Malnutrition over and above the pediatric ART training.

Due to the shortage of staff in the clinics and due to the increasing number of patients and increasing workload, additional staffing in clinics and hospital will be provided.

ACTIVITY 5: Human Resources

Africa Centre staff provides clinical care alongside KZNDOH staff in the clinics in order to support the ongoing ART program and to facilitate skills transfer to build sustainability. The sustainability of the program largely depends on availability of skilled staff, which is difficult to attract to this rural area. The Africa Centre is continuously working on recruiting physicians and pharmacists. In FY 2009, Africa Centre staff in the ART program will be increased including nurses, HIV trainers, HIV counselors, doctors, social workers, one pharmacist, one dietician, M&E officers and data capturers. All staff are mentored and supervised by Africa Centre staff.

ACTIVITY 6: Quality Improvement

In June 2007, a team for Quality Management was introduced in all the clinics. This group provides leadership and support centrally and to the clinics. With FY 2009 funding, this group will increase capacity to identify, develop and implement quality improvement interventions internal to the program as well as for identified problems at the sites being supported.

Activity Narrative: ACTIVITY 7: Systems Development

With increased funding the Monitoring, Evaluation and Reporting systems will be further strengthened to support the internal and external data needs of the program. The existing databases will be reviewed and, if appropriate, adapted, and staff will be trained. Additional staff will be needed to cope with the increased number of data to be collected and used for improvement of the program.

ACTIVITY 8: HIV Awareness

Health education has to be prioritized in the sub-district. The knowledge about ART and other health issues must be improved. Initial analyses of Africa Centre data shows that a huge number of people do not know about ART and a large number of those who know about ART don't know where to get treatment. In July 2007, Africa Centre approached the Amakhosi (the highest traditional leaders in the area after the king) to involve them in the response to HIV. In this area traditional leaders are playing a major role. Billboards at different places will be placed with messages from the Amakhosi concerning testing and treatment. The improvement of this knowledge regarding testing and treatment will contribute to PEPFAR'S goals to increase the community access to ART services.

Africa Centre contributes to PEPFAR's 2-7-10 goals for South Africa by increasing community access to ART services by facilitating scale up of the SA Government efforts.

Activity System ID: 22632

Activity Narrative: SUMMARY:

BroadReach Healthcare's (BRHC) pediatric antiretroviral (ARV) services activities include training and salary support for health professionals, management support, quality assurance, operations support, strategic communications, and community outreach to increase the number of children on antiretroviral therapy (ART) on BRHC-supported ARV programs. The activities described in this program area are linked closely with activities described under adult treatment, pediatric and adult care and support, TB/HIV, prevention of mother-to-child transmission (PMTCT), ARV drugs, and counseling and testing (CT). BRHC has been a recipient of PEPFAR funds to provide ARV services in South Africa since 2005.

BACKGROUND:

As of June 2008, the BRHC program operates in five provinces and has almost 20,000 people currently receiving treatment services. Of this total, 7.8% are pediatric patients (excludes Edendale Hospital where peds are reported by EGPAF). Under PEPFAR funding BRHC has two treatment programs designed to support expanded treatment capacity for the South African government (SAG). The first program began in May 2005 and consists of three different models providing treatment to eligible patients through networks of private general practitioners (GPs). Two of the models represent partnerships between the public sector and private GPs. This program was designed to ease the burden on the public sector to provide treatment services by strategically leveraging capacity in the private sector in underserved areas. The second program, which began in November 2006, is a program of technical assistance to South African Government (SAG) hospitals to assist with expansion and scale-up of the availability of treatment services in the public sector. The funds requested in FY 2009 are primarily for activities under the second program working with public sector sites. All proposed activities will be aligned with the National Strategic Plan, national ARV guidelines and other national guidelines governing the care and treatment of HIV-infected and affected people. BRHC's overall goal under this program area is to promote creative, sustainable and comprehensive pediatric treatment programs that improve the quality of life of people living with HIV (PLHIV) and increase resilience in the public health care system in South Africa.

In late 2006, BRHC began capacity building work with SAG sites and was initially assigned to four hospital systems KwaZulu-Natal (KZN). As of June 2008, BRHC was reporting data from a total of 110 sites, including 11 hospitals, 62 private GP practices and 37 SAG clinics across districts in Eastern Cape province, KZN, Mpumalanga province, Gauteng province, and North West province. At the request of District Departments of Health, BRHC has committed to continued expansion and plans to be supporting 19 complete hospital systems by September 2009. With FY 2009 funds, BRHC expects to be active at 180 treatment sites, including 25 SAG hospital systems.

BRHC approaches all of its work with the concept of developing scalable solutions which can help to bolster SAG's HIV and AIDS efforts across the country. To do this, BRHC breaks down the problem into demand-side and supply-side. Demand-side addresses the patients and communities to ensure that solutions are in place to mobilize, generate demand for testing, provide education including treatment literacy, provide ongoing adherence and psychosocial support to PLHIV and the affected/unaffected community members. BRHC generally does this by training and capacitating community organizations such as PLHIV support groups, faith-based organizations, non-governmental organizations (NGOs), and SAG facilities to carry out these activities. The supply-side addresses the provider of services such as hospitals, clinics, health-care workers, labs, pharmacies, etc. and focuses on solutions such as training, service delivery integration and re-engineering, operations improvement, equipment and infrastructure upgrade, etc.

ACTIVITIES AND EXPECTED RESULTS:

Note: Pediatric patients will benefit from all of the activities described in program area 'Adult Treatment.' In the pediatric treatment program area BRHC is highlighting activities which are specifically targeted to pediatric patients:

ACTIVITY 1: Target infants and children by strengthening linkages with existing services

BRHC will employ both facility- and community-level approaches to improving the integration of services and referral systems within facilities, and between facilities and communities. The goal is to ensure that at whatever point a pediatric patient accesses the health care system (out-patient departments (OPDs), in-patient wards, mobile CT, antenatal care (ANC), TB clinics, community health worker, home-based care, well-child care) that a comprehensive package of prevention, care and treatment services are made available to that child and his/her family and household members. These services will include cotrimoxazole prophylaxis from age 6 weeks for HIV-exposed infants, targeted prevention messages, nutritional counseling, micronutrient supplementation, and routine offer and provider-initiated CT. The goal is to furthermore ensure coordination and referral mechanisms are in place such that pediatric patients and their caregivers are able to navigate the health and social welfare systems successfully, and that facilities are able to track and locate patients at any time throughout this process. Linkages with family planning, maternal and child health (MCH), gender-based violence, directly-observed treatment, short-course (DOTS) and nutrition programs will be strengthened.

BRHC takes a family-centered approach to providing comprehensive care and treatment services and will intensify efforts in this area to build HIV and AIDS-competent communities. During FY 2009, BRHC will expand partnerships with NGOs and community-based organizations in the catchment areas of BRHC sites to ensure uninterrupted service delivery and community-level support for pediatric patients and their families. Training, institutional strengthening, monitoring and evaluation (M&E) and other technical assistance and human resource support will be provided to NGOs/community-based organizations (CBOs) to enable them to meet the demand for community-based services for CT, prevention, home-based care, access to social grants and support for OVC. BRHC will play a critical role in providing coordination between SAG facilities and communities, creating sustainable coordination mechanisms and mutually beneficial partnerships. Most importantly, pediatric patients and their families will benefit from programs that aim to provide longer, healthier lives.

Activity Narrative: ACTIVITY 2: Increase routine offer and provider-initiated testing to identify HIV-infected children

BRHC will support SAG sites to target infants and children for HIV testing at all service entry points, especially ANC, maternity and in-patient pediatric wards. Protocols for the follow up of HIV-exposed infants will adhere to national guidelines. BRHC support to facilities will focus heavily on integration of TB and HIV services, where routine offer of CT of HIV patients for TB, and of TB patients for HIV is provided in accordance with national guidelines. Using family-centered approaches to comprehensive care and treatment services, BRHC will ensure the screening and treatment of children of people who test positive for HIV or TB. BRHC will build on existing DOTS infrastructure and community health workers to identify children for HIV testing as part of routine interactions with the households of TB patients.

ACTIVITY 3: Clinical services and operations

BRHC will build laboratory capacity for early infant diagnosis by providing technical assistance and human resources to improve quality assurance and testing turn around times. As enrollment of pediatric patients scales up, BRHC will work with SAG sites to project ARV and commodities requirements to ensure an uninterrupted supply of pediatric formulations. All ARVs and medical commodities used at BRHC-supported SAG facilities are procured through SAG.

ACTIVITY 4: Human capacity development

With FY 2009 funding, BRHC will employ a pediatric AIDS care and treatment specialist who will ensure integration of pediatric initiatives across all BRHC PEPFAR-funded activities. The specialist will take the lead in supporting sites to pilot innovative approaches to increasing testing of children, improve quality of care for children, and will ensure consistent application of family-centered approaches to the care and treatment of children. BRHC will engage additional qualified clinical mentors and preceptors to ensure supportive supervision within the work setting at BRHC-supported health facilities.

BRHC will enhance training content on care and treatment of children in existing BRHC training offerings. BRHC provides a combination of in-house and outsourced training courses aimed at ensuring quality delivery of treatment services in the SAG facilities it supports. All BRHC implemented or sponsored training courses use nationally certified or DOH-approved curricula. Most courses are modular and cover a range of relevant topics including CT, TB, ARV therapy, and management of opportunistic infections. Additionally, BRHC will partner with programs such as the South-2-South Partnership for Pediatric HIV Care and Treatment to leverage existing training courses and expertise. If requested by SAG and Regional Training Centers, BRHC will assist to create new courses specifically for the care and treatment of pediatric patients. Pediatric course content, either through existing modular or newly developed training courses, will be provided to all professional and lay staff who have routine contact with children, regardless of ward or department. Training will emphasize the importance of testing and early infant diagnosis for children entering the health system through any service point - in-patient wards, OPD, ANC, MCH services, TB clinic, and community-based services.

BRHC will continue to provide salary support to SAG for clinical and lay staff on a temporary basis to fill critical vacancies. This support will be coupled with budgeting and planning technical assistance to assist SAG sites to take over full support of these staff in future budget cycles thereby ensuring program sustainability and continued growth. Through this mechanism BRHC will ensure adequate human resources are available for the care and treatment of pediatric patients at BRHC-supported SAG sites.

ACTIVITY 5: Outreach to Children in Khayelitsha

BRHC has been asked by the Western Cape Department of Social Development to assist with strengthening of care and treatment programs for children and their families in Khayelitsha, the largest township in Cape Town. This activity involves strengthening the existing Sizis'ukhanyo (NGO) resource center to serve as a coordination and referral hub for children requiring a range of health, social and educational services. BRHC will train resource center staff to provide community education programs on HIV and AIDS, monitor referrals, and provide training to community members and parents/caregivers. Technical assistance from BRHC will be used to expand and solidify linkages between the departments of health, education and social development in the community, ensuring that children and their families can access the comprehensive HIV and support services that they need. Referrals and linkages with other NGOs and CBOs providing services for children in Khayelitsha will also be strengthened. The activity may also include providing health and wellness services for HIV-infected and affected children in the resource centre itself. Details of this activity are still under development.

ACTIVITY 6: Information systems/M&E/Quality Improvement and Quality Assurance

BRHC will continue to support the use of interim software solutions for management of patient data at BRHC-supported SAG sites with the goal of empowering site level staff to use routinely collected statistics for planning and decision making. In anticipation of national, provincial or district-level decisions mandating software for electronic patient record systems, BRHC aims to provide temporary solutions that improve the ability of sites to meet SAG reporting requirements. Information systems build on existing paper-based and register systems, providing added value by improving data quality and information use. Special attention will be paid to the challenges posed by monitoring and tracking of pediatric patients, from identification of HIV-exposed babies before birth, to polymerase chain reaction (PCR) testing, to the commencement of pediatric treatment if necessary. Information systems will be designed to closely track mother-infant pairs as they move through the health system from pregnancy to well-child care, ensuring timely and comprehensive prevention, care and treatment services are provided to both and loss to initiation is minimal.

With FY 2009 funding, BRHC will expand systematic quality assurance and quality improvement (QA/QI) approaches across all public sector sites. The purpose of this activity is to promote consistent quality of care for all HIV-infected and affected pediatric patients who seek services in the public sector, and to provide

Activity Narrative: ongoing monitoring and support of training that has been provided. BRHC will focus on the use of patient treatment outcomes - especially viral load suppression, patient retention, and patient adherence- to monitor the progress and quality of programs. Pediatric patients will be monitored according to the following age bands: 0-2, 2-4 and 5-15 years of age.

Activity Narrative: SUMMARY

The high burden of pediatric Human Immunodeficiency Virus (HIV) infection in sub-Saharan Africa has stimulated a re-alignment of HIV programs, and increased the focus on entry points into, and integration with, pediatric care and treatment have increased in importance. The scope of such programs extends from strengthened Prevention of Mother-to-Child Transmission of HIV (PMTCT) delivery, through early infant diagnosis and follow-up, to robust, adolescent-friendly care. Initiation of Antiretroviral Therapy (ART) in HIV-infected children under the age of 12 months will be encouraged. ICAP has been working with pediatricians in the Eastern Cape to down-refer children stabilized on ART from tertiary facilities to Primary Health Care and Community Health Centers.

BACKGROUND

Without treatment, 50% of HIV-infected children are dead by the age of two years, and mortality reaches 75% by five years due to inter-current infections such as TB, diarrheal illnesses, malaria and malnutrition. In addition, HIV infection adversely affects a child's growth and neurological development. The Columbia University International Center for AIDS Care and Treatment Programs (ICAP), with PEPFAR funding, has been supporting comprehensive HIV care and treatment activities since 2004. The cooperative arrangement was initially limited to the Eastern Cape, but has subsequently spread to facilities in KwaZulu-Natal and will be expanding into Free State and Northern Cape in the later half of FY 2008 COP implementation. During FY 2009 COP implementation, ICAP will further expand site support activities into the Northern Cape, and reinforce pediatric HIV care and treatment programs at the current facilities by increasing early infant diagnosis and raising the proportion of children on ART to 15% of all people on ART in South Africa.

ACTIVITIES AND EXPECTED RESULTS

The following four program activities will be implemented with FY 2009 funding to support a safe, evidence-based, sustainable, comprehensive ART service for children:

ACTIVITY 1: Strengthen case identification and patient management, including linkages between health services and referral mechanisms.

Public healthcare facilities offer a broad range of services, all of which are accessed by HIV-infected adults, such as ANC, maternal and obstetric units (MOU), TB, sexually transmitted infections (STIs) and Family Planning Clinics. In FY 2010, ICAP will support the heightening of awareness of HIV exposure and encourage routine counseling and testing and appropriate referrals, so that HIV-exposed infants can be identified.

ICAP staff will train and refresh all providers in Pediatric HIV Care and Treatment, and will monitor progress of providers in appropriately starting ART in eligible children. (Additional training details are in Activity 3 below). Emphasis will be on ascertaining ART eligibility on clinical grounds, in addition to relying on laboratory data. Initiation of eligible children onto ART will be carefully monitored by Nurse Mentors and Clinical Advisors, and remedial action will be taken when gaps are identified. In addition, ICAP will regularly review and develop Pediatric Standards of Care tools to prioritize initiation of children on ART.

ICAP staff will similarly monitor treatment failure in children taking ART. The indications that an ART regimen is failing can be divided into clinical, immunological and virological categories. ICAP will assist in the training of healthcare providers to recognize treatment failure, by regular mentoring and in-service trainings. It is incumbent for service providers to understand that poor adherence is the commonest reason for failure, and adherence strengthening should be explored initially. ICAP will develop and adapt referral and supervisory systems to manage and monitor patients on ART, and support data recording and reporting systems.

ICAP will train all facility staff in Provider-Initiated Counseling and Testing (PICT), and support the procurement of rapid test kits. Facilities will be systematically surveyed in each region by ICAP site support staff to dynamically determine gaps in PICT training and test kit availability.

In conjunction with PICT training, regular in-service training sessions arranged by ICAP Nurse Mentors will provide opportunities for clinicians from different service areas in the facility to develop more formal referral mechanisms. Emphasis will be placed on cross referral between TB and HIV services, and between immunization/well baby clinics and ART clinics.

Efforts will be made to include PICT providers and representatives of referral endpoints in multidisciplinary teams at sites. These efforts will be coordinated by the Nurse Mentors.

Although ICAP will continue to support the implementation of facility paper-based ART registers to capture ART indicators, the expansion of the Health Information System Program (HISP) ART software will be encouraged for the capturing and collating of HIV program data. These data will facilitate patient management in areas of identifying gaps in services, tracing and tracking, and targeting intervention efforts for special groups of children.

ICAP will continue to collaborate with the Eastern Cape Department of Health (ECDOH) and other partners in the Eastern Cape on the implementation of standard pediatric patient records that include comprehensive HIV care and treatment, routine health maintenance, and TB screening.

ICAP multidisciplinary regional teams will provide systematic on-site mentorship to clinicians, pharmacists, and data captureurs. These mentorship efforts will focus on competency of on-site staff. Each site will have a systematic plan for addressing gaps under the coordination of the Nurse Mentors.

ICAP Clinical Teams will be available by telephone and in person to assist in the management of

Activity Narrative: complicated cases.

ACTIVITY 2: Improve Follow-up of HIV-exposed Infants and Enhance Early Infant Diagnosis (EID).

ICAP has been strengthening EID by training PMTCT nurses in polymerase chain reaction (PCR) testing through the use of dried blood spots (DBS), appropriate referral of patients into care, and provision of cotrimoxazole.

With FY 2009 funding, ICAP will encourage early infant diagnosis by close tracking of HIV-exposed infants identified from PMTCT programs at follow-up in all appropriate settings, such as immunization or well-baby clinics and pediatric wards. In addition, ICAP will develop appropriate monitoring mechanisms to ensure that follow-up appointments are kept. (Please refer to Activity 4 in the Pediatric Care and Support Section, and Activity 3 in the Prevention Section).

All HIV-exposed infants will be commenced on cotrimoxazole at 6 weeks of age, will be closely followed up, receive routine growth monitoring, counseling and support on infant feeding. (Please refer to Activities 2 and 3 in the Pediatric Care and Support Section.)

In addition, ICAP will promote routine testing of sick children, either within Integrated Management of Childhood Illness (IMCI) settings, or hospitalized children with histories compatible with HIV or an opportunistic infection (OI). HIV testing will be provided through polymerase chain reaction (PCR) testing with dried blood spots (DBS) or plasma in infants younger than six months, and antibody testing in older infants and children. A definitive diagnosis will be made in all HIV-exposed infants by 18 months as HIV-infected children should be commenced on ART before the age of two years. Testing algorithms will include recommendations for repeat testing of children who test HIV-negative but have ongoing HIV exposure through breastfeeding, and children who test HIV-positive on antibody tests performed before 18 months of age. (Please refer to Activities 1 and 4 in the Pediatric Care and Support Section.) ICAP will assist in the development of formal linkages between general pediatric OPD clinics, pediatric in-patient wards and the ART clinic. These linkages will be regularly monitored and their efficacy evaluated by ICAP Clinical Advisors.

In terms of TB/HIV co-infection, ICAP will contribute to the coordination between TB and HIV programs at public health facilities to ensure a continuum of care for co-infected individuals. ICAP will assist in decreasing of the burden of TB in people living with HIV (PLHIV) by ensuring routine screening for TB disease, fast-tracking diagnosis and treatment of active TB disease, and preventing the development of drug resistance. (Please refer to Activity 3 in the Pediatric Care and Support Section for more details.) ICAP will support training of health care providers in identification of drug interactions, toxicities and adherence difficulties of increased pill burdens. Through regular in-service training and clinical mentoring, clinicians should follow country guidelines for ART drugs, but avoid altering recommended TB regimens.

Nutritional support of HIV-exposed and infected-children should expand on the training, counseling and choices made by mothers post-delivery. Mothers who have opted for exclusive breast-feeding and rapid weaning at six months will receive ongoing counseling at every clinic visit, and be assisted in achieving the rapid weaning. Mothers who opt for formula feeding will require additional feeding options from four to six months. ICAP will provide adherence and feeding counseling from mentor mothers. Care providers will be trained to recognize growth failure early by proper completion of growth charts. (Please refer to Activity 3 in the Pediatric Care and Support Section.)

In collaboration with other partners such as the Departments of Education and Social Welfare, community-based organizations (CBOs) and faith-based organizations (FBOs), ICAP will provide outreach services through OVC programs to HIV-exposed and infected children. Such services may include HIV testing, TB and other OI screening, clinical staging, care and treatment. ICAP will assist in the tracking of all affected infants by developing relevant tools for documentation, monitoring and evaluation.

ACTIVITY 3: Support Training in Pediatric HIV Care and Treatment.

In FY 2008, the ICAP partnership with Stellenbosch University and Tygerberg Hospital has trained 25 South African clinicians, both nurses and doctors, in comprehensive pediatric HIV care and treatment. An additional eight clinicians are yet to attend the two-week course. The clinicians support children seen at a variety of out-patient clinics, including both primary and tertiary facilities.

In FY 2009, these clinicians will be encouraged to develop facility-based training programs for their colleagues and other members of the multi-disciplinary team. This type of in-service training, which will incorporate didactic teaching, precepting, mentoring and case-based review, will minimize disruption of service delivery.

ICAP will continue to use local pediatricians in training and mentoring of staff through regular clinical meetings.

In areas where local expertise is lacking, ICAP will assist in the provision of sessional doctors for service delivery.

ICAP will support the development of monitoring and evaluation tools for training such as self-assessment checklists.

ACTIVITY 4: Encourage Down Referral of Stable patients to Primary Health Care Clinics (PHCs).

In FY 2008, the decentralization of pediatric ART services in the Eastern Cape was commenced.

In FY 2009, in collaboration with the ECDOH and Stellenbosch University, ICAP will continue to improve

Activity Narrative: retention of patients in care and treatment, reduce patients lost-to-follow-up, and increase the clinical pediatric skills of staff at smaller facilities. This will facilitate the down referral of patients who have been stabilized on ART. Regular refresher in-service trainings in pediatric care and treatment will be coordinated by the Nurse Mentors and Clinical Advisors. The multidisciplinary meetings will be encouraged to address clinical issues, as well as logistical challenges.

ICAP will assist in the development of tools to improve adherence to ART at all levels of care and treatment. Care providers will be trained in the establishment of adherence programs aimed at the patient and the family, drug issues such formulation and toxicity, and healthcare system strengthening which will encourage the establishment of long-term relationships among children, their families, and the clinic staff. All members of the MDT will provide counseling, tracking and follow-up of children. Disclosure of the child's illness forms an essential part of regular follow-up. ICAP will assist clinicians to be appropriately trained and sensitized to the process.

ICAP, through the site support teams, will assist the PHC service providers recognize ART treatment failure, and ensure the provision of mechanisms for up-referral.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

Activity System ID: 22982

Activity Narrative: SUMMARY:

Following the emphasis in the National Strategic Plan 2007-2011 (NSP), Right to Care (RTC) will use FY 2009 COP PEPFAR funds to accelerate the scale up of family-centered approaches to pediatric treatment, care and support. The specific aim is to increase the access to antiretroviral therapy for pediatrics from the current 7% of patients treated to 15%, in accordance with the NSP and the technical considerations for the FY 2009 COP. Focus for the pediatric treatment program will be to integrate into the adult treatment at all Department of Health (DOH), Comprehensive HIV and AIDS Care, Management and Treatment (CCMT) sites, supported by Right to Care. At the request of the provincial DOH and implemented according to the Memoranda of Understanding (MOU) with each province, RTC has increased the activity and budget emphasis towards pediatric treatment, care and support. The implementation is conducted in collaboration with the hospital, district, provincial and national Departments of Health. The guidelines that are available for the care and support of HIV-exposed and HIV-infected children will be followed at all RTC supported sites.

BACKGROUND:

The Right to Care Pediatric Programme was established in March 2008. Prior to this date, pediatric treatment was supported at all sites, with training and preceptorship received from Enhancing Children's HIV Outcomes (ECHO). It became apparent that the scale of the Right to Care program required a dedicated training and mentorship program within the organization. Dr Leon Levin was recruited from private practice to join the organization as a full-time employee. Dr Levin is one of only eight pediatricians in South Africa who are experts in HIV treatment, antiretroviral therapy and infectious diseases. Dr Levin has been involved in HIV treatment with antiretroviral therapy for over 10 years, has established the largest cohort of patients on treatment in private practice, and established a specialized referral clinic for complex pediatric HIV cases on the East Rand of Johannesburg. PEPFAR funds are used to support access to this referral site for indigent public sector pediatric patients.

The major initial aim of this program was to increase the number of pediatric patients on antiretroviral therapy (ART) at all Right to Care-assisted ART sites. According to December 2007 statistics, children under 14 years only represent about 7-8% of all patients on ART at Right to Care. The National Department of Health has called on all HAST directorates to ensure that at least 15% of all patients receiving ART are children.

The integrated program of pediatric and adolescent education, counseling and testing, care and support and ARV treatment will continue to be implemented using RTC's existing models of care:

- (1) In partnership with the National Department of Health (NDOH), capacity support for pediatric care and support at CCMT sites in five provinces i.e. Gauteng, Mpumalanga, Northern Cape and Free State.
- (2) Strengthening the pediatric care component of Faith-Based Organization (FBO) and Non-governmental organization (NGO) clinics which target underserved populations in rural areas, industrial areas, and informal housing sectors.
- (3) Thusong, a private practitioner program for indigent patients where pediatric care is emphasized is the treatment model used in areas where there are no government systems in place. The Thusong pediatric program is not planned for expansion, patients have started to be transitioned into the government program and this will continue in FY 2008 and FY 2009. However, this program will remain operational to allow RTC to treat under this program where necessary.
- (4) The employed sector, where RTC is providing HIV disease management services to >130,000 employees in >30 companies and pediatric dependents who are HIV-exposed or infected are encouraged to enroll onto the care program.

Since March 2008, the pediatric team has conducted needs assessments for children at 10 sites throughout the provinces. Training programs have been finalized for implementation and have been conducted on three occasions with 120 HCW attending. The training provided includes the following broad areas of emphasis:

- a. Diagnosis of HIV in infants and children
- b. Diagnosis and treatment of common opportunistic infections
- c. Laboratory monitoring of HIV disease in children
- d. Treatment initiation in children
- e. Pharmacology, dosing, formulation of ARVs in children
- f. Treatment adherence in children
- g. Adolescent counseling and adherence to treatment
- h. Family-centered approach to ARVs

Dr Levin, Dr MacDonald and others have established mentoring support of treatment sites, with on-site management of patients supported by pediatric experience clinicians. Mentoring pediatricians are sent to sites throughout the network at regular intervals, providing both didactic continuing medical education, and practical bedside teaching. Ongoing support is provided with access to a mobile call-line for clinicians to receive specific advice from the treatment experts. This line is now available to all clinicians in RTC sites, with utilization increasing to six calls per day. In FY 2008, linkages will be established to the FPD supported HCW call center.

The pediatric program is linked to an increase in the activities under RTC's Prevention of Mother-to-Child (PMTCT) program at sites throughout the five supported provinces. Particular emphasis is placed on the provision of infant Polymerase Chain Reaction (PCR) testing to all infants exposed to HIV, and early treatment initiation for all children, to reduce early infant mortality. As the effectiveness of the PMTCT program is enhanced, with transmission of HIV reduced to less than 5%, children requiring treatment will decrease.

Activity Narrative: Through the development of treatment sites emphasis is placed on the family-centered approach, with mothers, their partners, and children treated in the same clinic. Clinician training is focused on medical officer and primary health care nurse prescribed HIV treatment.

By providing pediatric training and implementation support to these sites RTC leverages NDOH resources to reach an increasing number of children. RTC supports these sites with infrastructure, including staff, training, equipment, data management, and making the facilities child- and adolescent-friendly.

Through the provision of technical assistance, RTC has established a number of pediatric-specific IT solutions, which will be ready for beta testing within RTC sites in October 2008. Particular emphasis in TherapyEdge-Paediatrics (TE-Paeds) is the provision of treatment guidelines specific to children, yet accessible as part of the live real-time integration of the data system at all sites, to all clinicians. TherapyEdge-Paediatrics improves disease management through guideline-directed, expert systems and pediatric-specific therapeutic intervention. The system provides enhanced clinic management, with the development of workflow processes that define roles and responsibilities enabling task shifting yet ensuring quality assurance. Through interfacing with the NHLS, Toga Laboratories, Lancet Laboratories and others, direct provision of laboratory results into the data system will enable real-time laboratory alerting. The data system provides overall health system strengthening with integration of guidelines and data collection according to IMCI WHO standard. RTC has already demonstrated that the use of TE-HIV in adult patients has led to: (1) enhanced efficiencies in clinics with reduced waiting periods to less than two hours in the largest HIV clinic in South Africa, Helen Joseph Hospital; (2) improvements in patient retention with a reduction in loss-to-follow-up (LTFU) from 21% to 4%; (3) improvement in clinical quality with response to toxicity, virologic failure, dosing errors, drug interactions and TB diagnosis demonstrated (4) overall mortality, morbidity and viral load suppression rates have improved; (5) staff-to-patient ratios required by Helen Joseph Hospital are approximately 25% of the ratios recommended by the DOH, due to the ability to task shift and efficiencies of the clinic. Through enhanced guideline-driven decision support, RTC will demonstrate the benefits of TE-Paeds. In particular, the more accurate prescription of drugs according rapidly changing weight, body surface area, and BMI in children growing with antiretroviral therapy. RTC continues to support the pharmaco-vigilance program of the Medicine Control Council for antiviral therapy in pediatric patients, through the provision of data from all of our sites.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Increasing Access to Pediatric Support, Care and Treatment

RTC will use FY 2009 COP funds to build on consolidating and expanding its support for pediatric care at government sites, NGO and FBO clinics/organizations and private sector programs. RTC currently supports five provinces. At the request of the DOH in the provinces Gauteng, Mpumalanga, Northern Cape, Free State, and Limpopo, both funding and activity emphasis will be placed on increasing access to pediatric support, care and treatment at each of these sites.

NGO and FBO clinics also use PEPFAR funds for laboratory monitoring of HIV pediatric and adolescent patients and for the procurement of health commodities such as medical equipment, ARVs, drugs for opportunistic infections, counseling and testing kits, and home-based care kits. RTC supports all the Care and Support (C&S) providers by disseminating policies and guidelines and providing quality assurance through sharing best practices.

The program of pediatric care and treatment, through linkages with the PMTCT program, will have strong emphasis on diagnosing infants and children with HIV early and national guidelines on PCR testing will be followed. Family members who require care, including fathers, will also be identified during this process and pregnant caregivers will be referred into PMTCT and care services resulting in the promotion safe motherhood. RTC will continue getting the children into care as soon as possible and starting on ART early, especially in young infants who are at high risk of dying. RTC supports the roll-out of the Children with HIV Early Antiretroviral Therapy (CHER) study results demonstrating a reduction in early mortality in children initiated on ART at or after six weeks of age. RTC support at the sites will ensure that a comprehensive package of preventive care is available to all HIV-exposed infants and infected children and ensure that they receive cotrimoxazole prophylaxis and that they are appropriately referred for immunizations according to the national guidelines thereby increasing child survival. The staff who are hired for the pediatric program will conduct nutritional assessments, nutritional counseling and refer appropriately for support, an important area of focus will also be TB screening, treatment and prophylaxis for those under five who do not have active disease. This will include the clinical management of common opportunistic infections and other conditions affecting children with HIV and their management. Emphasis will be placed on quality assurance and assessing and program monitoring in order to improve the programs already in place.

ACTIVITY 2: Infrastructure and Human Capacity Development

FY 2009 PEPFAR funds will be used for infrastructure, human capacity development and salaries at all C&S providers; (1) NGO and FBO clinics/organizations receive sub-awards earmarked for doctors, nurses, counselors and other health-care workers; (2) RTC will not provide salary support to SAG staff, but rather the salaries of health care providers seconded to DOH facilities including support for doctors, nurses, data managers, counselors; and (3) a capitation fee-for-service arrangement exists with a network of private sector service providers for the Thusong program.

Using FY 2009 COP funds, RTC will consolidate already-established provincial centers of pediatric ART expertise, maintained within family clinics, in order to allow staff from other sites to rotate through the centre of excellence and learn to treat and care for pediatric patients under supervision. In so doing staff from other clinics will acquire expertise in pediatric care and support and then take that expertise back to their own clinics where service delivery will be sustainable.

PEPFAR funds will also be used to maintain the infrastructure of all RTC-supported clinics, which will offer clinical and psychological and services to HIV-infected and affected children and their families with strong links to available social and spiritual services. NGO and FBO clinics also use PEPFAR funds for laboratory

Activity Narrative: monitoring of HIV-infected and exposed pediatric patients and for the procurement of health commodities such as medical equipment, ARVs, drugs for opportunistic infections.

ACTIVITY 3: Linkages and Referrals

PEPFAR funds will be used to facilitate partner linkages and a referral system between treatment sites-based care, and other non-medical C&S services. At each site, RTC will identify a community-based care organization to add value to the counseling and testing program by tracking and tracing pregnant moms who are lost to initiation and PMTCT and by finding the babies of these mothers to assess them and ensure that they benefit from care. The care and support NGOs will also help to minimize the pediatric loss to follow up rate.

We would expect the number of pediatric patients on ART to increase at all RTC sites and reach the required 15% pediatric patients on ART to be achieved by the end of FY 2010. In addition, the quality of pediatric care would continue to improve in FY 2010. By reaching patients with care and support services at various outlets, RTC will contribute to the PEPFAR goal of providing services to 10 million HIV-affected individuals.

Budget Code: PDTX	Program Budget Code: 11
Activity ID: 22559.09	Planned Funds: \$508,501

Activity Narrative: SUMMARY:

ARK's focus is to provide ART and accompanying support to HIV-infected caregivers of children, their spouses, and children. Primary emphasis areas are renovation, human capacity development, and local organization capacity building. Target populations include OVC, people living with HIV (PLHIV), HIV-infected pregnant women, HIV-affected families, and caregivers.

BACKGROUND:

ARK is a charity organization whose mission is to facilitate and support delivery of accessible and sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and AIDS. In partnership with the KwaZulu-Natal Department of Health (KZNDOH), ARK, as the implementing partner, has established an antiretroviral treatment (ART) program in government primary health facilities and hospitals. Specifically, ARK works with the KZNDOH to identify sites and areas for capacity building, including human resources, modest infrastructure support, and organizational capacity development. ARK provides treatment in accordance with national treatment guidelines.

In FY 2009, ARK will expand PEPFAR-funded treatment, care and support activities to the Eastern Cape (EC). ARK has been supporting the EC from 2006 and is currently working in eleven sites delivering care and treatment activities and PMTCT services in one site.

FY 2009 PEPFAR funds will be used to strengthen pediatric support throughout KZN and the EC. ARK is planning to scale up pediatric ART services in the primary care sites to reduce the burden on the hospitals as well as reduce waiting times for treatment. The community care component of ARK employs and trains patient advocates who support families including provision of the basic preventative care package for HIV-infected children, testing and follow-up of HIV-exposed infants and children to ensure early identification and enrollment of children on ART, and referral to a range of social services including ARK's Child Services component which assists families to accessing birth certificates and South African Government (SAG) social grants and will be working closely with the pediatric clinics to ensure integrated services and support for children and their families.

ACTIVITIES AND EXPECTED RESULTS:

ARK's primary objective is to keep mothers alive to continue caring for their children. The primary caregiver's continued survival and potential ability to earn a living while receiving ARV treatment will have a substantial impact on the extended family.

ACTIVITY 1: Support to KwaZulu-Natal Department of Health (KZNDOH) and Eastern Cape Department of Health (ECDOH)

ARK works with the KZNDOH and ECDOH to develop the necessary processes and systems to manage the ARV program, to ensure that the model created is scalable, sustainable and replicable elsewhere. ARK's ARV program focuses on a network of clinics operating within a district, in order to create a sustainable and efficient system that supports the continuum of care and up and down referral. Capacity-building is site-specific. Upon identification of a site, an analysis of the needs of each site will be done with respect to staffing (doctors, nurses, pharmacists and pharmacy assistants), clinical equipment, management systems, patient advocacy and temporary structures. The most pressing requirements are met in order to speed up the ability of patients to receive treatment. Where necessary, ARK provides support in the ARV site and pharmacy accreditation process.

Referral systems will be strengthened to provide effective referral of patients between ARV, TB, PMTCT and pediatric ARV services to ensure that mothers and infants testing positive will be referred for early care and treatment, and people co-infected with HIV and TB receive early diagnosis and appropriate care. TB infection control practices are standard at ARK-supported sites and include well-ventilated waiting areas and consulting rooms, safe sputum collection, and patient and staff education on safe cough etiquette and hygiene.

Tracing of lab results for HIV-infected pregnant women and HIV-exposed infants for early infant diagnosis will be conducted proactively to ensure that bottlenecks in the system are addressed with DOH and the National Health Laboratory Services (NHLS).

ACTIVITY 2: Human Resources

ARK conducts a thorough needs analysis of human resource capacity prior to initiating support to the treatment program at each site. Once it has been determined that KZNDOH has budgeted for the identified posts needed within a period of three years, ARK recruits all the necessary medical staff required for the successful roll-out of ART. The staff recruited vary from site to site but include doctors, nurses, pharmacists and pharmacy assistants. In addition, ARK employs data capturers for monitoring and evaluation of the program.

ACTIVITY 3: Family-Centered Treatment Services

ARK supports a family-centered approach that integrates care for the whole family to ensure access to all appropriate services. ARK facilitates the integration process for ART, TB, other palliative care, and maternal HIV services. ARK's PMTCT program will link into the adult ART and pediatric care component.

ARK assists in the treatment of all HIV-infected adults and children requiring ART. ARK-employed doctors and nurses are responsible for treatment management, patient consultations and the treatment of opportunistic and sexually transmitted infections. Pharmacists are responsible for the dispensing of

Activity Narrative: medication. ARK will also be providing integrated services for HIV and PMTCT as well as integrating TB with HIV. All patients testing positive at the sites will have access to same day CD4 count. They will then be brought back within one week for a review of the CD4 result as well as for their clinical staging. Those eligible for treatment on the basis of the CD4 count as well as the WHO staging will start treatment.

While patients are being assessed for treatment, a patient advocate (PA) from ARK's palliative care program is allocated to the patient. The PA conducts a pre-treatment home visit and provides ongoing support to the patient and his/her family. All patients eligible for ART need to meet both medical and psychosocial criteria before starting therapy. The psychosocial criteria are designed to ensure that the patient is prepared and ready to adhere to ART. All patients being assessed undergo a treatment literacy program and are educated about positive living. Patients are encouraged to motivate their partners/spouses to get tested and, if necessary, enter the treatment program. Although ARK's treatment target population is predominantly mothers and children, increased attention is being given to encourage and increase male partner (and men in general) participation. Should a patient be non-adherent or lost-to-follow-up, the PA will investigate the reasons for this, acting as the link between the patient and the clinic.

Pregnant women will also have access to testing. HIV-infected pregnant women will receive comprehensive HIV care including TB and other OI screening and treatment, cotrimoxazole prophylaxis and rapid enrollment for those eligible for ART. All HIV-infected pregnant women and HIV-exposed infants who have a TB contact will receive TB screening, prophylaxis and treatment if appropriate.

TB services will be supported so that all patients presenting with TB symptoms are counseled and tested for HIV. All HIV patients are also routinely screened for TB and other opportunistic infections. Patient advocates provide TB prevention education and engage family members in assisting with treatment adherence measures as part of creating a supportive environment that encourages full disclosure and minimizes stigma within the family.

ACTIVITY 4: Pediatrics

Pediatric ART services will focus on improved child survival activities with specific reference to improved diagnosis and treatment of TB, recommended Vitamin A supplementation, routine immunization and the integrated management of childhood diseases. HIV-infected parents and caregivers will be encouraged and educated by the medical staff and patient advocates to get their children tested and to enter the treatment program where indicated. Staff will be trained to refer HIV-infected mothers and their babies to the ARK ART program, ensuring access to full ART services when indicated. All children born to HIV-infected mothers will be closely followed up for any evidence of early deterioration and will receive NVP and AZT as per PMTCT protocol. All HIV-exposed infants will receive the basic preventative care package including infant feeding and nutrition counseling, cotrimoxazole prophylaxis, early testing, and TB screening, prophylaxis and treatment. At the six week visit, all HIV-exposed babies will have a PCR test done, will be given cotrimoxazole prophylaxis and multivitamins to await the PCR result. Formula fed babies that test negative will be offered an Elisa at 18 months. Breast fed babies if tested negative will be offered a PCR at 12 weeks after weaning and if still negative an Elisa at 18 months.

HIV-infected babies will be immediately referred to ARK's ARV treatment program. Babies and children will be assessed and managed by staff on-site and referred for care to secondary and tertiary institutions if needed. Children identified through ARK's Child Services program will be referred to the clinic by community care workers and social workers.

ACTIVITY 5: Reporting and Quality Assurance/Improvement

ARK provides computers and employs data capturers at all sites. Data is captured from patient folders and transferred to ARK's data center, allowing for ongoing evaluation and outcome analysis. Adherence rates, death rates and loss-to-follow-up are closely monitored. Quarterly updates are provided to the KZNDH and ECDOH and information is used within the clinics to strengthen service delivery. Additional information management capacity will be added to sites including data capturers and computers. All sites will have internet connectivity to facilitate information management activities. To ensure high standards and quality of care in line with the national guidelines, all ARK staff are provided on-site, on-the-job training. This is followed up with regular on-site mentorship and site evaluation by ARK's national executive and provincial management teams. Informal training sessions are conducted quarterly by national staff. Staff are also encouraged to attend formal external training courses offered by FPD.

ACTIVITY 6: Construction and Renovation

In those clinics where space is a bottleneck to service delivery, ARK will assist the facility with the provision of space in the form of temporary infrastructure, or renovating existing rooms to ensure more efficient patient flow.

These activities contribute to PEPFAR's 2-7-10 goals by increasing the number of South African children on treatment.

Human Capacity Development

Estimated amount of funding that is planned for Human Capacity Development \$26,187

Public Health Evaluation**Food and Nutrition: Policy, Tools, and Service Delivery****Food and Nutrition: Commodities****Economic Strengthening****Education****Water****Table 3.3.11: Activities by Funding Mechanism****Mechanism ID:** 190.09**Prime Partner:** Aurum Health Research**Funding Source:** GHCS (State)**Budget Code:** PDTX**Activity ID:** 22621.09**Activity System ID:** 22621**Mechanism:** N/A**USG Agency:** HHS/Centers for Disease Control & Prevention**Program Area:** Treatment: Pediatric Treatment**Program Budget Code:** 11**Planned Funds:** \$1,067,995

Activity Narrative: SUMMARY:

This is a new program area for Aurum in FY 2009. This activity provides support services at public facilities providing antiretroviral therapy (ART) as part of the national roll-out of HIV care and treatment at primary health centers, clinical trial sites and general practitioner (GP) practices. ART is provided in accordance with the National Department of Health (NDOH) guidelines. The primary target populations are HIV-infected children. The Small and Medium Enterprises (SME) Project will provide treatment to targeted SME employees, taxi drivers, market traders and their partners and dependents.

BACKGROUND:

Aurum has received PEPFAR funding since FY 2004, providing access to HIV care and treatment in the public, private and NGO sector. This activity takes place in the following NDOH ARV sites: (1) Madwaleni Hospital, Eastern Cape; (2) Tshepong Hospital, North West; (3) Chris Hani-Baragwanath Hospital, Gauteng; and (4) Thembisa Hospital, Gauteng. Aurum plans to provide support for down referral in the following areas: North West province (Kanana clinic), Limpopo province (Mathe-bathe clinic), Madwaleni-linked primary health centers, Gauteng down referral program and Northern Cape (Danielskuil clinic).

A number of sub-partners are involved in implementation of this activity:

1. Auranani Network: this network supports treatment of people without medical insurance in general practitioner (GP) sites.
2. MES Impilo, a faith-based organization based in Hillbrow, Johannesburg, functions as a home-based care center for the homeless population of Hillbrow, including street youth.
3. Medical Research Council (MRC) site based in KwaZulu-Natal provides HIV services to prevention trial participants (microbicides, diaphragms) who are found on screening to be HIV-infected.
4. De Beers Consolidated Diamond Mines has developed a public-private partnership in the town of Danielskuil, Northern Cape where contractors and partners of employees are treated for HIV.
5. S Buys will be involved with procurement, dispensing and distribution of medications and will provide pharmacy support at the Chris Hani-Baragwanath Hospital.
6. Toga Laboratories will assist with laboratory testing. Toga has negotiated with Bayer to secure reduced pricing for viral load testing for the Aurum program. Toga is piloting a new initiative to place point-of-care lactate tests at some of Aurum facilities to facilitate early recognition of ART adverse events.
7. Kimera Solutions will provide specialist HIV clinical support to doctors in the form of training and on-site mentoring with regular site visits.

ACTIVITIES AND EXPECTED RESULTS:

The Aurum program provides the majority of its support in settings that do not provide for easy access to children (e.g. workplaces and prisons), but in FY 2009 will make concerted efforts to scale up support for pediatric care and treatment. These activities will complement the already strong adult care and treatment program, and will utilize many of the same strategies described in the Adult Treatment COP section as it relates to drug and laboratory services, monitoring and evaluation, and quality improvement.

ACTIVITY 1: Provision of ARVs to Children

Aurum aims to increase the number of pediatric patients receiving treatment and encourage support from both parents. Additionally, Aurum will incorporate a family-centered approach to care and treatment through integrated care, support and treatment. This will be linked to closer community-level linkages and the development of different levels of services from the primary health care (PHC) level to district and the integration of services such as EPI (expanded program on immunization), IMCI (integrated management of childhood illnesses) and family planning.

Aurum is actively encouraging partners to provide services to children, which includes HIV PCR testing for children born to HIV-infected mothers at 6 weeks. All HIV-exposed infants will also at this point be provided with cotrimoxazole prophylaxis in line with South African Government pediatric treatment guidelines.

A focus is to ensure that general practitioners are providing outreach and support to orphaned and vulnerable children to ensure early access to HIV care and treatment.

ACTIVITY 2: Monitoring and Evaluation (M&E)

M&E is a central component of the Aurum program. Every patient contact is recorded on a standardized form and a unique patient identifier is allocated by the central Aurum office. The information is then couriered or faxed to the central office where the data is captured in a database. Monitoring visits take place at the sites to ensure adherence to guidelines and completeness of data collection. Quarterly reports are produced for all stakeholders.

ACTIVITY 3: Human Capacity Development

The number of children accessing the Comprehensive HIV Care, Management and Treatment (CCMT) public sector ART program remains low in South Africa. Aurum will strengthen the training of the current human resource in order to multi skill and encourage the family approach to CCMT which includes pediatrics. There is a need to source pediatric expertise to improve access for children. The program will provide for pediatrics management on site support especially to primary health care including integrated management of childhood illnesses (IMCI).

To ensure that both parents are involved in the management of the child, this topic will be included in the counseling training curriculum. This will also encourage men to participate in the HIV care program themselves and to test and be managed as a family. This will include training of staff including community

Activity Narrative: members on gender.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

Program Budget Code: 11

Activity ID: 22803.09

Planned Funds: \$679,633

Activity System ID: 22803

Activity Narrative: SUMMARY:

The International Center for AIDS Care and Treatment Program at Columbia University (ICAP) will continue to partner with Stellenbosch University to support the South-to-South Partnership for Comprehensive Family HIV and AIDS Care and Treatment Training Initiative (S2S) and apply its PMTCT and Pediatric HIV Care and Treatment, and TB capacity building activities in 60 sites located in Limpopo, North West, Gauteng, Mpumalanga, Northern Cape, and Western Cape provinces. S2S's capacity building model emphasizes site-level training; namely, continuous and supportive on-site presence, on-site dynamic skills-building events such as on-the-job training, clinical mentoring, modeling and site implementation workshops and case-based learning. The core activity for FY 2009 COP involves supporting the rapid expansion, uptake and decentralization of family-centered HIV care and treatment services. This activity will be implemented in collaboration with the Foundation for Professional Development (FPD), BroadReach Healthcare, Mothers 2 Mothers (M2M) and several orphan and vulnerable children organizations.

BACKGROUND:

A main focus of S2S support at the site level is to build provider and system capacity with a focus on continuous quality improvement. Shortages of health care workers are exacerbated by the gap between the knowledge and skills required to provide HIV and AIDS services. Additionally, poor design of facility systems and services, lack of patient scheduling systems, inefficient provider placement and scheduling and irregular supervision by senior management continue to weaken already stressed HIV services. S2S site level support is dynamic and continuously customized to consider site attributes and existing resources. During FY 2009 COP this capacity building model will support the continuation and expansion of the S2S Program.

ACTIVITIES and EXPECTED RESULTS:

Technical, Program, and Systems Capacity Building Approach: S2S will adopt a dynamic and contextualized strategy to support each implementing partner to operationalize programs with a family-centered approach at the site level. The site support will be dynamic and continuously customized to address site attributes and existing resources. However, while the support and program area emphasis will vary, all designated sites will benefit from the following illustrative activities:

ACTIVITY 1: Comprehensive Pediatric HIV Care and Treatment Services

ICAP will build on-site capacity by supporting systems and health-care workers to institute program elements that consider the multiple and changing needs of pediatric clients. ICAP will support:

- 1) Quality and continuous clinical care for all infected children
- 2) Monitoring and assessment of all infected children for treatment eligibility
- 3) Continuous assessment of all children enrolled in care and treatment services for treatment complications, outcomes, and failure
- 4) Increased linkage and coordination between pediatric and adult care and treatment services
- 5) Implementation of comprehensive care package for the HIV-infected child at all ARV sites, including cotrimoxazole prophylaxis, growth monitoring, and neuro-developmental assessments
- 6) Pediatric adherence and psychosocial programs, including support groups for HIV-infected children on treatment

ACTIVITY 2: Psychiatric and Psychological Issues and Support

The HIV-infected child is at increased risk for primary or secondary psychiatric and psychological conditions and problems. This includes depression, mood and psychotic disorders, and anxiety directly related to a variety of factors including: the HIV infection, HAART, predisposing conditions, and/or the environmental/social circumstance the child is exposed to. This important but oftentimes overlooked issue greatly affects a child's ability to adhere to care and treatment, understand his/her condition, integrate seamlessly into society, progress well in school and form healthy social and familial relationships with those around them. Consequently, we will aim to draw this issue to the forefront as a key component of quality HIV care and treatment services and not an auxiliary pediatric service that should be integrated into the competency of all health-care workers and providers to at a minimum assess and refer for additional support.

Adolescents: Depending on the population, clinics will be designed to support HIV-infected adolescents, targeting psychosocial and supportive activities for their specific needs

ACTIVITY 3: Pediatric Pain/Symptom Relief Assessment and Management

Pain and symptom relief in HIV-infected infants and children often go improperly assessed and poorly treated for various reasons. ICAP will support targeted sites to institute systems to accurately assess, classify and treat the pain and symptoms pediatric clients commonly experience. This will include conducting proper history and physical with the child (and as relevant with caregiver) to assess the source and potential cause of symptoms and pain, providing tools to measure pain in children including self-report tools and behavioral measures, supporting supply chain of necessary drugs.

ACTIVITY 4: Sexual abuse

While sexual abuse is an under-reported mode of pediatric HIV transmission, it is increasingly important to have facilities be well equipped with quality services to address such a complex and fragile situation. ICAP can provide support to deal with the acute cases and the more chronic cases where sexual abuse is suspect long after the initial incident(s). This will include the clinical management of cases such as HIV testing protocol, PEP, psychosocial support and the long term psychosocial counseling needed for the HIV-infected child and caregiver from sexual abuse.

ACTIVITY 5: Cross-Cutting Issues

Following is an illustrative list of crosscutting issues that affect all aspects of family-centered HIV care and will need to be considered and contextualized for each specific service, especially as they apply to pregnant women and children.

Activity Narrative: Strengthening laboratory services: S2S will work with implementing partners and the site to improve HIV related laboratory services that directly impact the delivery of family-centered C&T services such as rapid HIV tests, CD4 cell count, early infant HIV testing.

Strengthening pharmacy and other commodities services: As necessary, S2S can support sites to improve the supply chain management of ARVs, infant formula and other HIV related drugs in order to ensure adequate stocks for the projected increase in pregnant women and children in need of drugs and its complementary commodities. Site staff will be supported to dispense and inventory drugs (AZT, NVP CTX etc.) if they will be issued at the place of service delivery.

Adherence and Psychosocial Support: Adherence and psychosocial support is the cornerstone to successful HIV C&T services, especially for the pregnant woman and her family. It will be critical to ensure that an HIV-infected women eligible for ART during her pregnancy are successfully maintained on treatment during and after her pregnancy and likely during her subsequent pregnancies so that her clinical status is maintained and MTCT rates are reduced. Consequently, S2S can work closely with partners to establish site level programs that will consider various models and approaches to comprehensive psychosocial and adherence programs for families, but particularly women and children. High adherence rates are found where a range of interventions are implemented and therefore, multiple strategies can be implemented including:

Development of comprehensive psychosocial and adherence program: Evidence shows that a single intervention to support the multitude of issues that impact adherence is not enough, as a result, services will be developed that address the needs of the new, mature and defaulted client. As much as possible, an individualized approach to adherence will be considered due to the variety of risk factors for non-adherence. Additionally, on-site support programs that target HIV-infected pregnant women, mothers and female PLHIV of childbearing age can be implemented to discuss and resolve issues unique to the HIV-infected women, including challenges to C&T such as adherence, disclosure, infant feeding support, and other issues. This will serve as a platform for PLHIV to access support and real-life solutions from one another through the facilitation of experienced site level staff.

MDT approach to adherence support: S2S can strengthen the roles of specific health-care workers to support adherence and psychosocial programs, including pharmacists, counselors, nurses and doctors. Currently, psychosocial and adherence support is limited to counselors and pharmacists and S2S can help integrate this focus into part of each cadres routine practice.

Education, behavior and support: Adherence interventions aim to inform people about HIV treatment to generate behavior change through incentives, suggestions or emotional support. S2S will employ cognitive, behavioral and affective interventions to support adherence by developing, piloting and distributing these tools on site.

Client adherence tools: S2S will work with site level staff and PLHIV to design context specific reminders, aids, and monitoring tools to support adherence.

Pharmacy procurement support: Complex medication regimens can compromise adherence for clients with multiple psychosocial issues. S2S will work closely with pharmacies and dispensaries to ensure that fixed dose combinations are procured and when feasible prioritized for clients at high risk for non-adherence.

Community linkages: S2S can develop linkages with community-based organizations and health workers to support clients by developing realistic approaches to adhering to C&T services. Active outreach programs can be conducted in the community to locate and engage persons in C&T that miss scheduled clinic visits. Additionally, pregnant women (and their exposed infants) that do not present after delivery as scheduled can be traced into the community and supported to return for follow up care.

Client Follow-up Systems: S2S can provide support to sites that do not have systems and resources to directly identify, contact, trace and support defaulting clients. For example, if an outlet site does not have access to a direct telephone line to make outside calls and communicate with clients who have access to telephones or with community-based workers to support client follow-up, S2S can support the site to establish a system to use cellular phones to enhance client adherence, follow-up and retention. S2S can support sites to implement a multifaceted program to follow up and track women and children who are lost to follow up. This may include empowering active involvement of PLHIV in improvement and design of family-centered services: S2S will explore the feasibility of engaging clients and caregivers into a routine process of giving inputs and feedback to the site they receive services in the form of a formal community advisory board.

Program Area: Treatment: Pediatric Treatment

Program Budget Code: 11

Planned Funds: \$484,205

Activity Narrative: SUMMARY:

Activities under the pediatric care and support program activity support the provision of comprehensive HIV prevention, care and treatment program carried out by Catholic Relief Services (CRS) in 24 field sites in 8 provinces in South Africa. The field sites target those in need of these services, who live in the catchment area of the site, and who cannot access the services in the public sector. The major emphasis area is to provide linkages with other sectors and initiatives and ensuring that children receive the much-needed care and treatment in line with national guidelines. All high-risk HIV-exposed children in HIV care and support should be provided with related services for wellness, opportunistic infection (OI) and TB treatment and prevention and nutritional supplementation. The main target populations are HIV-exposed and HIV-infected children and their families as well as caregivers.

BACKGROUND:

AIDSRelief (the Consortium led by CRS) received Track 1 funding in FY 2004 to rapidly scale up ART in nine countries, including South Africa. Since FY 2005, South Africa PEPFAR funding was received to supplement central funding, with continued funding applied for under the FY 2009 COP. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and the Institute for Youth Development South Africa (IYD-SA).

Many of the rural areas AIDSRelief serves are resource poor and antenatal care, PMTCT and HIV care and treatment services are scarce due to the remote and rural nature of these locations. AIDSRelief is trying to address this by identifying HIV-exposed children while providing home-based care, as well as putting increased focus on family-centered voluntary counseling and testing (VCT). In addition, AIDSRelief will involve all cadres of health-care workers at selected sites to identify pregnant women and HIV-exposed children's needs. Where the AIDSRelief sites cannot provide the services a functional referral system will be put into place.

All AIDSRelief sites provide pediatric care and treatment services in line with the South African Government pediatric ART guidelines, and in some sites receive pediatric drugs directly from the relevant provincial health department.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Pediatric Focus

AIDSRelief provides integrated HIV care and treatment services mainly in small, rural non-governmental organization (NGO) and Church-based settings. This is supplemented by a very strong home-based care program that provides follow-up care in the home setting. Currently 8% of patients on ART in the AIDSRelief program are children (with 42% of those under 5). AIDSRelief will put greater emphasis on pediatric treatment in FY 2009 and increase the pediatric targets to 15% of all patients on treatment. This will be achieved through forming linkages with PMTCT programs, as this is the entry point into pediatric treatment.

The next challenge is diagnosing children due to difficulties in drawing blood from children, therefore nurses will be trained or re-trained in this area.

Home-based carers will identify HIV-exposed children and assist families in bringing them to treatment site for required services, such as cotrimoxazole, opportunistic infection, or ARV treatment. Emphasis will be placed on community awareness regarding the importance of early diagnosis and treatment of children.

ACTIVITY 2: Community Care

In FY 2009, there will be renewed emphasis on patients in the wellness phase (patients in care who do not qualify for ART yet), tracking patients in care, using community health care workers to identify household dependants, renewed emphasis on family-centered care and involvement of men, and increased screening conducted in community by home-based carers entering homes.

AIDSRelief is supporting community programs involving the local church structures in these rural areas, at the grassroots level and through active community participation. In doing so, the staffing and infrastructure challenges are overcome through task shifting by training of community health care workers (by identifying children in the community in need of care and treatment, cotrimoxazole, TB prophylaxis, vitamin A supplementation, nutritional support, OVC care and ART, growth monitoring and Integrated Management of Childhood Illnesses (IMCI) and ART initiation by nurses. This assistance is provided through mentor programs and training. The lack of infrastructure challenges are overcome by working through the existing local Church structures and, in special circumstances, provision of limited additional work space through purchase of parkhomes (movable containers). Additionally, space limitations are overcome through working directly in the affected communities in order to improve access to services.

ACTIVITY 3: Human Capacity Development

Training will be provided to health care providers from various stakeholders such as the Department of Health (DOH), municipalities, community-based organizations (CBOs), nurses, doctors, pharmacists /pharmacist assistants, dieticians where available and data capturers. The outcomes of training are improved service delivery, role clarification and responsibility, strengthened partnership with stakeholders, increased pediatric enrolment, quality assurance, integration of services, as well as better coordination and monitoring of the HIV and AIDS programs, improved compliance of treatment and reduced HIV prevalence. Quality assurance will be provided through continuous oversight and follow-up by the AIDSRelief agency members, field trip visits, the annual ART conference, and on-site support to clinical staff implementing the program.

ACTIVITY 4: Family-Centered Approach

The family-centered testing and care approach will be used where possible. Couple counseling and testing at counseling and testing (CT) and PMTCT sites will be used to promote testing of men and to build their support for their female partners. It is also hoped that, through a community-based testing program, increased outreach will be made to women and children in villages. Where possible, training and

Activity Narrative: employment of women as health care workers to increase the confidentiality and comfort of women and girls seeking treatment will be emphasized.

ACTIVITY 5: Laboratory Support

Given that AIDSRelief sites operate in rural and remote areas, where technical capacity and infrastructure is lacking, heavy emphasis is put on provision of laboratory services through a quality service provider. To overcome this challenge, a Johannesburg-based organization, Toga Laboratories, another PEPFAR-funded partner, has been selected as the laboratory service provider for laboratory tests to be conducted under the program. The company has been established by Prof. Des Martin and Dr. John Sims, long-time South African virology experts. Toga Laboratories has an ongoing quality assurance (QA) program to monitor and evaluate, objectively and systematically, the reliability of the laboratory data. There is an in-house laboratory quality unit which coordinates external quality assurance. For every test performed in the laboratory, there is a quality control plan stated in standard operating procedures (SOP). Internal quality controls (IQC) are performed daily on all instruments as well as for manual tests and recorded. External quality assessments include the UK National External Quality Assessment Scheme (UKNEQAS) as well as National Health Laboratory Services (NHLS) assessment programs, among others.

ACTIVITY 6: Gender Issues

AIDSRelief will strive to identify child/adolescent-headed households and caregivers, and implementing targeted programs to meet needs, including programs to keep girls in schools, help them manage households, address stigma, and compensate for lost of family income.

Some elements of pediatric treatment are also addressed in more details in other linked areas of the COP, including Pediatric Care and Support, Counseling and Testing, ARV Drugs, and Adult Treatment.

Program Budget Code: 12 - HVTB Care: TB/HIV

Total Planned Funding for Program Budget Code: \$37,322,363

Program Area Narrative:

South Africa has one of the highest estimated TB rates in the world, ranking fourth among the 22 high burden countries. According to 2006 National TB Programme (NTP) data, there were more than 341,165 reported cases of TB, at a rate of 628 per 100,000 population. The real prevalence is unknown but the WHO estimates it to be much higher than these statistics.

Of all new and re-treatment cases notified in 2006, only 110,235 or 31% were tested for HIV. Of those, 55% tested positive. Of the detected HIV-infected TB patients, 98% received cotrimoxazole therapy, and 40% had initiated antiretroviral treatment (ART). Systematic TB screening among people living with HIV (PLHIV) has been low; 29% of patients screened were infected with TB. Isoniazid Preventive Therapy (IPT) is not widely implemented.

Multi- and extensively drug-resistant TB (MDR/XDR-TB) continue to create many challenges for the South African government (SAG). Between 2004 and early 2007, South Africa reported 898 cases of XDR-TB. Due to lack of culture and drug susceptibility

testing (DST) services in Limpopo and Mpumalanga, these provinces did not report any cases during that period. The total number of reported drug-resistant cases may represent a small proportion of the actual incidence. Reported case fatality rate among HIV-infected individuals with MDR/XDR-TB is alarmingly high. In 2006, Ghandi et al. (2006), reported 95% mortality among HIV-infected patients with XDR-TB in KwaZulu-Natal. The median survival was 16 days from time of diagnosis, and this was established among 42 patients with confirmed dates of death. (Gandhi, et al.) This has serious public health consequences, for South Africa and the African region.

NTP results in 2006 show a case detection rate of sputum positive TB cases at 71%. Nevertheless, there has been little progress in treatment outcomes; cure rate for new smear positive cases is still low at 58% and the overall treatment success rate is 71%, lower than the African regional rate of 76%. Default rates at 10% are high. High treatment interruption rates of drug-sensitive TB and consequent low cure rates, together with the HIV epidemic, have contributed to the emergence of drug-resistant strains, which require urgent attention.

South Africa adopted the WHO DOTS Strategy in 1996, and since 2006, the DOTS Strategy has been expanded to all districts. Phased implementation of TB/HIV collaborative activities by sub-districts started in 2002. The aim was to focus on the primary health care level and build capacity among staff to manage co-infected patients and thus prevent unnecessary hospital admissions and deaths. By end of 2006/7, 211 sub-districts were implementing TB and HIV activities (87%). In 2005, the SAG declared TB a national crisis and developed the TB Crisis Management Plan focusing on three provinces Gauteng, KwaZulu-Natal, and Eastern Cape, with four districts having the highest burden of TB and poor treatment outcomes. The SAG intensified efforts to reinforce service delivery systems and processes at facility levels and to increase community awareness and engagement in TB control. Since then, two crisis districts have graduated from the crisis level.

In 2007, the National Department of Health (NDOH) created a separate directorate for NTP and finalized a five-year strategic plan, the South Africa National TB Strategic Plan for, 2007-2011 (NTP), which highlights TB/HIV. Additionally, the South Africa National Strategic Plan for HIV & AIDS and STI, 2007-2011 (NSP) espouses integration of TB and HIV services as essential to ensuring that co-infected patients receive appropriate care and treatment. SAG investment in TB control is significant, but due to decentralized funding channeled through provincial treasuries, NTP is unable to quantify the resources committed to TB control. Sixty-eight percent of total central level funding for TB is dedicated to MDR-TB.

Although interaction between TB and HIV has been recognized and collaborative efforts are being scaled-up, TB and HIV programs continue to be implemented separately. As outlined in NTP's strategic document, collaborative activities between NTP and HIV & AIDS and STI departments has not been fully realized because of lack of written formal guidelines on collaboration, and limited integration of services at health facilities. This includes inadequate technical support, guidelines, and registers for monitoring and evaluating integrated TB and HIV services. Other constraints to effective TB/HIV collaboration include: 1) human resource constraints at district and facility levels and within laboratory services; 2) lack of decentralization of laboratory networks (services and systems) resulting in decreased access to sputum smear microscopy, delays in reporting results, scarce and overburdened culture and DST services, and communication challenges between NTP and laboratories; 3) different program approaches and cultures of TB and HIV services (i.e., TB services are decentralized into primary health-care clinics, are nurse-driven, and TB control occurs at facility level, which lacks wide-spread community engagement, while HIV and AIDS care services are usually hospital-based, physician-driven, and have established linkages with communities); 4) threat of nosocomial transmission of TB and MDR/XDR-TB, with evidence of facility and community transmission in the context of large-scale HIV care and treatment programs; 5) little attention to appropriate TB infection control measures in healthcare facilities and congregate settings, although NTP has recently developed TB infection control policy and guidelines; 6) TB/HIV records not fully integrated at facility level, especially in HIV clinical and care settings as entry-point to TB management; and 7) referral and counter referral systems between TB and HIV programs are not yet in place. Improved collaboration between TB and HIV programs is required to ensure access to integrated quality-assured diagnostic, care, and prevention services for PLHIV and those at risk for TB infection and disease.

USG activities are consistent with NDOH and WHO TB/HIV policies and guidelines and continue to build on past achievements. PEPFAR will scale-up efforts that improve effective coordination at all levels; decrease burden of TB among PLHIV; decrease burden of HIV among TB patients; improve prevention, detection, and management of MDR/XDR TB in HIV-infected patients; strengthen laboratory services and networks; and strengthen health systems to ensure quality and sustainable care.

USG resources and technical assistance complement NDOH efforts in a broad range of TB/HIV activities at organizational and service delivery levels. At an organizational level, USG supports the strengthening of mechanisms for collaboration at all levels, and developing and implementing strategies to address TB/HIV, and MDR/XDR TB. PEPFAR will continue to support NDOH's efforts to improve linkages for joint policy development, planning, implementing, and monitoring TB/HIV integrated activities. Other activities include improved surveillance of TB/HIV and MDR-TB and enhanced human resource development that respond to needs posed by integrated TB/HIV programs. Activities at service delivery level include those that streamline continuity of care for co-infected patients by ensuring effective referral linkages between TB and HIV services as well as between these services and community and home-based care. To decrease burden of TB in PLHIV, USG-supported activities will include scaling up the three Is. This includes: a) intensified TB case finding in HIV services (e.g., VCT, PMTCT, and OVC, strengthening referrals to TB program for diagnosis and treatment, or provide TB treatment in settings where appropriate); b) IPT for clients in whom TB has been ruled out; and c) infection control (IC). TB IC (aligned with the WHO-10 point plan) will include training, developing policy, assessing facilities, and purchasing equipment. In addition, nutritional support (e.g., food gardens), health education, and empowerment programs are supported. To decrease the burden of HIV in TB patients, activities will include scaling-up provider-initiated HIV counseling and testing in TB clinics, prompt referral to HIV treatment and care services for those dually infected, cotrimoxazole for co-infected patients and in some instances, initiation of ART within TB clinics, including facilities that provide MDR treatment.

Activities to prevent, detect, and manage MDR/XDR TB patients build on current efforts outlined in NTP's Strategic Plan and will

feature scaling-up TB IC practices in health care and congregate settings and community-based DOT (CB-DOT) through USG-supported initiatives, such as home-based care. In addition, systems will be strengthened to improve timely access to quality assured culture and DST and to improve coordination with provincial health departments to ensure appropriate case management of all suspected and confirmed MDR/XDR TB patients. Social mobilization efforts that inform and engage communities to reduce stigma, improve early access to diagnosis and care of TB and HIV, and enhance CB-DOT will also be supported. TB/HIV and MDR surveillance efforts include enhancement of the electronic TB register (ETR.Net) software that renders measurement of TB treatment outcomes by HIV status. TB/HIV and MDR data collection tools have been revised, and the new tools should help encourage widespread TB/HIV and MDR surveillance.

The USG, in collaboration with NDOH and National Health Laboratory Services (NHLS), supports strengthening laboratory services to ensure effective health systems response to appropriate and timely referral and counter referral. This includes activities that enhance good practices in sputum collection, improve turn-around-times for test results for sputum smear microscopy and culture; ensure availability of HIV test kits, and enhance quality assurance programs. New initiatives to improve information systems to enhance program and clinical management include the design, development, and pilot test of an integrated electronic TB/HIV Patient Management System. Features of this system are automation of routine TB registers, suspect TB-Register, pre-ART and ART-registers, electronic interfaces between laboratory and program registers for uploading laboratory requests and downloading laboratory results, which can also produce reports at facility, districts, provincial and national levels. The USG supports NHLS by leveraging resources for accelerating implementation of rapid PCR assay that allows for typing of TB strains in a short time.

Emerging concerns about interaction between TB, HIV, and drug resistance came to the forefront in 2006. Efforts to understand and control these threats have begun and will be accelerated through 2009. The USG also supports several public health evaluations to identify improved methods for rapid screening and diagnosis of TB in co-infected patients and to improve referral networks between HIV and TB services.

With regards to sustainability, the USG works closely with NDOH to enhance collaboration, develop policies and tools, and build capacity of service providers. The USG will work closely with public and private sector partners to capture best practices and to ensure that these support policy development. Increased emphasis on strengthening management systems, such as human capacity development, planning, supportive supervision, monitoring, and evaluation will also help to sustain gains.

The USG TB/HIV program is complemented with non-PEPFAR funds through USAID's Operational Plan (OP) for TB. USAID provides extensive support to implementing NTP's TB Strategic Plan at all levels. This includes development, implementation, and scale-up of service delivery models to address challenges from increasing TB/HIV and MDR/XDR TB incidences, as well as strategies to improve linkages with communities. These efforts are reinforced at community level through implementation of culturally sensitive social mobilization activities. USAID's OP provides extensive assistance to crisis districts and continues to support expansion of strong public-private partnerships. USAID is also supporting the development of training materials for management of TB in children. Mechanisms, such as TB/HIV Task Force, are well established to enhance coordination within and among the PEPFAR team.

The PEPFAR TB/HIV team continues to liaise with international donors and complement activities with agency-specific non-PEPFAR funded activities to ensure collaboration. Several international donors support TB/HIV activities, including Belgian Technical Corporation, UK Department for International Development, Italian Institute of Health, Japanese International Cooperation Agency, Bill and Melinda Gates Foundation, The Global Fund, and the European Union. Recent information indicates that there is some donor overlap. In 2008/2009, PEPFAR will increase coordination efforts to reduce duplication of efforts and resources. Collection and review of up-to-date information on donor supported TB/HIV activities will feed into PEPFAR's efforts to develop a country-specific TB/HIV strategic plan in collaboration with the NDOH by March 2009. The plan will be driven by the NTP and NSP, as well as by OGAC and WHO TB/HIV guidelines. A task force, with representation from SAG, USG and implementing partners, will meet regularly to influence the development of USG's TB/HIV strategic plan. In addition, a two-day workshop with TB/HIV implementing partners will be held in early 2009 to provide a venue for sharing best practices, discuss common issues and gaps in TB/HIV, and make recommendations that will feed into the plan. This plan will inform PEPFAR II planning as a South Africa inter-agency team and will establish networking mechanisms among partners to support sharing of best practices.

PEPFAR will ensure regular monitoring and supervision of OGAC program indicators, through regular site visits by multidisciplinary teams (TB and HIV) and development and implementation of a standard checklist for these site visits. These activities will be enhanced through the South African PEPFAR Partner Assessment Contract in FY 2009. In addition, all Activity Managers will ensure that all assessment and/or training modules include appropriate components of TB/HIV integration and management.

TB/HIV programming will be prioritized in FY 2009. Since FY 2006, USG efforts to address TB/HIV services have been expanded. In FY 2008, over \$30 million was invested in TB/HIV, approximately 5% of the PEPFAR budget in South Africa. In keeping with OGAC guidance to expand TB/HIV programming, close to \$31 million is requested in FY 2009 by 34 mostly indigenous, partners.

Budget Code: HVTB

Activity ID: 8183.22710.09

Activity System ID: 22710

Program Area: Care: TB/HIV

Program Budget Code: 12

Planned Funds: \$709,176

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In close collaboration with government partners, the scope of activities has been substantially increased from those described in FY 2008. Some of the interventions will be implemented in all primary health clinics (100 City Health Directorate Clinics), others in the 22 high-burden clinics in Cape Town (clinics with more than 375 TB cases annually). Multi-sectoral interventions are also planned to take place in one community and the two clinics serving this community. Thus, interventions will be focused upon 24 clinics in the area.

All these facilities provide services to the most impoverished communities in Cape Town, with high burdens of TB and HIV. These facilities offer TB services, voluntary counseling and testing (VCT), and HIV care, including screening and referral for antiretroviral therapy (ART). Some of these facilities are also nationally accredited ART sites. Those clinics that do not provide ART, refer clients to accredited ART sites, but may continue TB treatment for the patient. All interventions address the priorities identified by the government.

Five objectives will be addressed in collaboration with government partners:

OBJECTIVE 1: Improve TB and HIV Care by Increasing TB Case Finding

1. Implement an electronic data system of National Health Laboratory Services (NHLS) results to measure smear-positive case finding ratios among TB suspects citywide.
2. Establish baseline case finding ratios using the sputum smear results from NHLS at City, sub-district and facility level and set incremental targets for improvement.
3. Implement new VCT registers citywide. The new VCT register conforms to National Department of Health (NDOH) guidelines, and reports will be made available to the Department.
4. Monitor VCT (including TB screening at VCT) in 24 facilities. [Target 1: Number/Percentage of clients who received counseling and testing for HIV and received their results - 44,550 (92%). Baseline 07-08: 46,118 counseled with 41,813 (91%) tested. Target Assumes 5% increase in numbers counseled annually and 1% increase in percentage tested.] [Target 2: Number / Percentage of clients screened for TB at VCT 88%. Q2 '08 Audit: 83%. Target 5% improvement annually.] [Target 3: Percentage of symptomatic clients with TB tests done 60% (Up from 51% in Q2 2008)]
5. Do routine screening for TB at every HIV clinical visit at 24 facilities. [Target: 60% (Q2 2008 TB-HIV Audit 45%).] Clients diagnosed with TB will commence TB treatment at the same health facility where they receive HIV care.
6. Train 100 general practitioners on TB screening and establish referral networks for clients diagnosed with TB. General practitioners will be provided with contact details of all clinics in Cape Town and advised to confirm attendance with the facility manager telephonically, and to keep a record of this confirmation.
7. Establish a public-private partnership with pharmacies and general practitioners at four service points to undertake TB screening. Attention will be given to putting appropriate infection control measures in place at these service points to protect staff and clients.
8. Undertake contact tracing and screening to increase case detection in two selected sites (i.e., Ravensmead and Uitsig).

OBJECTIVE 2: Improve TB and HIV Care by Reducing Primary TB Default Rates

1. Establish an electronic/paper-based system of sputum results from NHLS to identify and track primary TB defaulters in 100 clinics.
2. Determine primary default rates in 100 clinics.
3. Print, distribute and use TB suspect cards at 100 facilities to improve return of TB suspects.
4. Undertake telephonic/SMS/community-based follow-up of primary defaulters in 100 clinics.
5. Monitor default rates at selected sites and develop targeted intervention to reduce default rates by 50% of baseline levels (baseline levels are still to be established using NHLS database).

OBJECTIVE 3: Improve TB and HIV Care by Improving Infection Control

1. Establish external sputum booths at 100 health facilities.
2. Pilot "front of house" staff to do health promotion, advise clients about cough etiquette, direct clients to services, and ensure that clients leaving the clinic have accessed the required services required. This will be implemented six health facilities.
3. Implement fast track systems for TB suspects and clients on directly observed therapy at 12 facilities.
4. Conduct a risk assessment for TB transmission and infection control at 12 facilities using the NDOH risk assessment tool.
5. Review and modify infection control plans in health facilities to reduce nosocomial transmission of TB in 12 facilities and to meet standards established in the NDOH TB Infection Control Guidelines.
6. Train staff in the use of the NDOH's TB Infection Control Guidelines in 12 facilities.

Activity Narrative: 7. Undertake community awareness program on TB transmission in selected areas to reduce transmission in households. [Target: Reach 20% of households.]

OBJECTIVE 4: Improve TB and HIV care by maintaining/improving TB cure and completion rates for HIV-positive and HIV-negative clients and providing appropriate HIV care to the co-infected.

1. Provide supervision to 24 facilities offering TB and HIV care.
2. Implement structured counseling for newly diagnosed TB clients at 24 facilities.
3. Provide HIV testing as the standard of care among TB clients at 24 facilities. [Target: 13,204 (83%) tested from baseline of 79%.]
4. Provide the basic package of HIV care to co-infected TB clients in 24 facilities. [Targets: 60% HIV-positive TB clients with CD4 and WHO staging (baseline 46%); 90% HIV-infected TB clients receiving cotrimoxazole prophylaxis (baseline 87%); 50% HIV-infected TB clients who require highly active antiretroviral treatment (HAART) receive or are referred for HAART (no baseline data available).]
5. Train 24 staff to improve the quality and completeness of routine TB program data.
6. Monitor treatment outcomes for new smear-positive TB and develop targeted interventions to improve outcomes. [Targets: New smear positive cure rate 75%; New smear positive success rate 81% (baseline 73% and 79% respectively).]
7. Monitor treatment outcomes for re-treatment of smear-positive TB and develop targeted interventions to improve these. [Targets: Re-treatment smear positive cure rate 59%; Re-treatment smear positive completion rate 66% (baseline 57% and 64% respectively).]
8. Estimate total smear positive success rates among co-infected clients (as outcomes are not monitored by HIV status). [Target 77% from baseline of 75%.]

OBJECTIVE 5: Improve TB and HIV care by reducing susceptibility to TB amongst those with HIV:

1. Establish standard package of HIV care at 24 health facilities, including isoniazid preventive therapy, screening and referral and provision of ART [Target: 60% of clients screened with CD4 and WHO stage (Baseline Q2 '08 Audit 39% WHO Staging done); 60% HIV-positive clients who require HAART receive or are referred for HAART (Baseline Q2 '08 Audit 49%).]
2. Implement multi-sectoral interventions to promote healthy lifestyles in two selected areas. Interventions will include sensible drinking; smoking cessation; mitigate drug addiction; and HIV prevention. [Target 4 interventions]

SUMMARY:

The Desmond Tutu TB Center has developed a project focused on improving the integration of TB and HIV services by expanding access to HIV-related services to large numbers of TB clients in the Western Cape (WC) and intensifying case finding for TB among HIV-infected clients. The major emphasis area is human capacity development through training of staff and managers, development of networks, linkages and appropriate referral systems. The target populations include policy makers, program managers and the general population with specific focus on HIV-infected and TB-infected and diseased adults and children. The project addresses the dual challenges of reducing HIV transmission in communities and minimizing the impact of HIV on individuals and of reducing the TB burden by increasing case-finding and ensuring appropriate TB care.

BACKGROUND:

The extremely high TB rates in the Western Cape, and the increasing prevalence of HIV have led to the health system being put under extreme pressure resulting in a failure to cope with the dual epidemics. Therefore it is necessary to develop effective and feasible strategies that can be adopted by health services to increase access to services and improve the quality of care for people with HIV and TB. This project, implemented in existing government health services, aims to complement, enhance and support these services. It is nested in six Western Cape communities that form part of the Zamstar project (part of the CREATE consortium funded by the Bill and Melinda Gates Foundation through a grant to the Johns Hopkins University) that works to reduce the prevalence of TB by improving integration of HIV and TB services. This project has already established community advisory boards and stakeholder support. The PEPFAR funded project links with the Zamstar project by implementing complementary activities focused on HIV and TB such as routine screening for TB at CT, improved access to TB and HIV care, improved quality of services and collaboration between HIV and TB services at facility level. The project scope has been revised from that submitted in COP07 to address evolving community and health service needs. All activities of the Desmond Tutu TB Centre, including the present project, are implemented in close collaboration with the Western Cape Department of Health, Cape Town City Health Department and non-governmental organizations (NGOs).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Routine Screening for TB through CT services

Activity Narrative: Symptomatic screening for TB during CT is current policy. If clients are symptomatic, they are sent to the nurse for investigation. There is no routine data at present to show whether symptomatic clients had sputum samples taken, whether a TB diagnosis was made and TB treatment commenced. An operational evaluation of routine data has been undertaken to assess the efficacy of TB screening at CT as a possible means of increasing TB case-finding. This evaluation has shown that symptomatic screening does take place at CT but that gaps exist in the follow up, particularly with clients having the appropriate sputa taken. Based on the outcome of the evaluation, appropriate training for lay-counselors is being undertaken to help improve the quality of counseling provided to TB and HIV clients at health facilities throughout the City of Cape Town and West Coast-Winelands Districts. Systems will be strengthened to facilitate sputum testing for symptomatic clients identified at VCT. These systems will be implemented at the routine CT centers in clinics and in the 6 PEPFAR-funded Community Flexi-Hour CT Sites. The Audit Tool for evaluation of TB and HIV services will be used to assess whether clients had a symptomatic screen at CT and if symptomatic, whether the appropriate TB tests were done.

ACTIVITY 2: Improve TB/HIV Services at Facility Level

This activity focuses on improving health services and care of people infected and affected with HIV and TB by providing in-service training and ensuring the implementation of current guidelines. For TB clients: that all are offered CT; that those who test positive undergo a baseline evaluation, including WHO staging, CD4 counts, PAP, RPR; that cotrimoxazole prophylaxis, management of concurrent opportunistic infections and referral for antiretrovirals are provided as required. For all HIV-infected clients: In addition to being provided this package of care, that all clients are screened for TB at every clinical visit, including the use of sputum culture in symptomatic clients who are smear negative. In 2008 particular attention will be paid to HIV testing among children with TB and appropriate HIV care for those who are positive. TB services for persons living with HIV and HIV services for TB clients are enhanced and monitored through a system of quality assessment and improvement. The project uses an audit tool that has been developed by the Cape Town City Health Department, Provincial Department of Health and the University of the Western Cape, thus ensuring skills transfer and sustainability. This tool uses the "Conditions for Effectiveness" framework to evaluate availability, capacity, access, initial use of services, continuity of care, quality and impact of TB, HIV and STI services. The tool uses regular audit of clinical folders to identify whether the package of TB and HIV services have been appropriately provided to clients. In-service training and on-site supervision will be used to improve the delivery of these services. Project staff work closely with the health authorities to improve the data management system used to evaluate TB services to those with HIV, and HIV services to those with TB. Project staff advocate for improved monitoring of HIV services to TB clients through the electronic TB register. The skills of facility managers and staff will be developed to improve their ability to evaluate routine data and information from the audit. Staff will be taught a participative planning process to help improve collaboration between the services and to use the data to drive quality improvements in both TB and HIV services. The transfer of appropriate skills will empower people and build local capacity, and in turn, this will help ensure sustainability after completion of the proposed project. The lay counselors will also learn to provide effective counseling to TB suspects and clients, and this will help alleviate time pressures on the nursing staff and allow them to concentrate on professional tasks. It is anticipated that this activity will result in improved job satisfaction among nurses and have a positive influence on the morale of staff. This project contributes to the PEPFAR goals by strengthening linkages between HIV and TB, by encouraging TB patients to undergo HIV testing, by identifying those who are co-infected and, by ensuring treatment, care and support. In addition, the project contributes to PEPFAR goals by providing messages on HIV transmission to schools and communities at large.

Activity ID: 7962.22716.09

Planned Funds: \$194,181

Activity System ID: 22716

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Eastern Cape Regional Training Center (RTC) will expand COP 2008 activities to include:

- RTC will employ a dedicated medical doctor, nurse preceptor and trainer to provide training development coordination, clinical consultations, training and advice on HIV and AIDS in the field of TB/HIV.
- RTC will develop and package a module on TB/HIV diagnosis and treatment, and infection control to form part of certificate courses offered by Walter Sisulu University.

SUMMARY:

The Eastern Cape Regional Training Center (RTC) will use FY 2008 funds in the Eastern Cape to strengthen the capacity of health care workers (HCW), facility managers, social workers, doctors, nurses, lay counselors and community health workers (CHW), including DOT supporters, to deliver quality TB/HIV services. Three teams from RTC will each support a facility and its feeder clinics for a period of four months to initially evaluate the TB/HIV training needs and provide targeted didactic training according to the NTP policies and guidelines, ongoing mentoring and coaching using standardized procedure manuals and tools. NGO facilitators will be trained to implement a level four comprehensive community health worker curriculum incorporating HIV and TB. Primary emphasis will be given to training, quality assurance and supportive performance improvement supervision, and information and reporting systems strengthening at facility level.

BACKGROUND:

RTC was established through a service agreement between the prime partner Eastern Cape Department of Health (ECDOH) and the Walter Sisulu University (WSU) to provide ongoing training for quality improvement in HIV and TB care programs.

The function of RTC has been to develop accredited training modules and care protocols for different categories of health workers based on National Department of Health guidelines. RTC has demonstrated and evaluated the HIV, TB and STI best practices continuum of prevention, care and treatment model in selected facilities, providing direct patient care and the opportunity for HCW to receive practical training. RTC provides technical assistance to the ECDOH regarding the expansion of its HIV intervention programs supporting Eastern Cape hospital/clinic site readiness for accreditation to provide comprehensive HIV care and treatment.

During the past three years ECDOH has introduced a comprehensive program for HIV care. From observations during RTC activities in clinics and communities, more than 70 percent of TB patients are HIV-infected and there seems to be a gap in screening all TB patients for HIV and early identification of TB in HIV patients who are presenting in facilities. Patients present late for care, already with severe complications. No clinical prophylaxis of TB is currently provided. There is limited awareness and skill among the communities to enable early entry into the care system. There are known drug-drug interactions in patients with co-treatment of ARV and TB drugs. There is an opportunity to combine follow-up of TB patients with patients on ARVs at community level.

RTC has been working with ECDOH managers in developing and disseminating care protocols and will be providing support and working closely with the district and facility managers to increase skills capacity to improve the quality of TB/HIV treatment and support services at facilities and community level.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008 RTC will continue to address the following areas: training; local organization capacity development; quality assurance; and supportive Supervision and performance improvement. Funding will be used to enhance the RTC strategy of training preparation of new provincial sites for accreditation as ARV sites and providing clinical mentoring to increased sites. RTC will continue supporting training administration and logistics of a comprehensive care training team allocated to provide dedicated support to three district hospital sites and at least five feeder clinics, for a period of four months, which will then move to the next three sites for the next four months, completing three cycles a year. The intensity of support and Performance Improvement supervision will increase with introduction of a performance improvement officer, a critical efficiency improvement position in the teams. Information and reporting improvement will be achieved by appointing an information officer, whose primary responsibility will be facility information and reporting systems improvement.

During this period the team will work with and support the facility managers to initially evaluate the TB/HIV palliative care services training needs, adapt standardized protocols and procedures for local facilities, and provide targeted didactic training, ongoing mentoring and coaching using standardized protocols and operating procedure manuals. The activity will address the priority areas of human capacity development, improving skills of a care team including managers, doctors, social workers, health promoters, CHW, DOT supporters and nurses at a facility and its feeder clinics through targeted didactic, case discussions, mentoring and community follow-up of patients with facility staff while considering and reviewing relevant local system issues. Focus will also be given to building patient information and reporting capacity at facilities. This activity is aimed at strengthening the recording and reporting system for TB and TB/HIV at facility level; coaching clinic staff on correct data entry and reporting. Ongoing support will continue through telephone consultations and special need visits after 4 months. RTC will train and mentor 35 facilitators from 7 NGOs who will cascade the training of a comprehensive level four curriculum for community health workers who will be providing community awareness for TB/HIV symptoms and follow-up of both patients for HIV and TB treatment adherence.

Activity Narrative: RTC will hold three-monthly sessions with three local CBOs at each facility to articulate their role and function in TB treatment services and enhance their knowledge and skills required to function in that role.

The RTC team will develop simplified TB screening algorithms for HIV patients at clinics and support the improved provision of INH prophylaxis, early detection and better management of TB/HIV in clinics. RTC training and mentoring will address the establishment of wellness programs at each facility to encourage community follow-up, nutrition advice, infection control, referrals to clinics and social support at community level. RTC through its M&E function will strengthen records management and reporting in TB/HIV clinics, RTC will continue to piloting the Patient information database management systems at IDC -Mthatha with a view of rolling it out to other partner hospitals and clinics to improve patient tracking and records management.

RTC training and mentoring will address data collection, maintaining accurate records, feedback and usage through quality improvement cycles to address early presentation, and follow-up and referral of patients on TB treatment.

RTC is an ECDOH initiative based at the Walter Sisulu University and conducts training at public facilities. RTC has and will continue to provide technical assistance to the province through regular meetings and assignments from province managers as well as training for managers.

The PEPFAR funding is helping to establish the program on a firm footing where it can continue with ECDOH funding.

The primary objective of the project is sustainable targeted human capacity development for all health workers. RTC staff will also continue to improve their knowledge and skills by having weekly academic discussions, two internal workshops, attending relevant conferences and ongoing mentoring from another PEPFAR partner, I-TECH.

This activity contributes to the PEPFAR objective of 2-7-10 by increasing the number of people in care and strengthening the linkages between HIV and TB programs.

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Care: TB/HIV

Budget Code: HVTB

Program Budget Code: 12

Activity ID: 3276.22938.09

Planned Funds: \$3,348,032

Activity System ID: 22938

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Right to Care (RTC), in support of the South African government's TB program and the World Health Organization's policy on collaborative TB/HIV activities, has developed and implemented a model of TB/HIV integration through TB focal point activities at provincial and district hospitals, and at local primary care clinics. At the request of the Department of Health (DOH) RTC will help the government to expand the TB/HIV integration model in FY 2009.

In FY 2009, RTC will scale up the TB/HIV integrated package to all sites in the six provinces. This will include: (a) enhanced uptake of Isoniazid Preventative Therapy; (b) evaluating and implementing improved infection control practices at all antiretroviral and TB facilities to prevent nosocomial transmission of TB; (c) support the development of drug-resistant TB treatment at Sizwe Hospital; (d) improve data collection and system linkages between treatment points and the laboratory; and (e) strengthen laboratory services to implement the TB/HIV program.

TB Focal Point Scale-up: The DOH has asked RTC to expand TB Focal Point in sites in six provinces. Scaled up activities will include (1) increased access to HIV counseling and testing for patients with TB; (2) intensified case finding through TB symptom screening at all points of contact with patients; (3) improved access to induced sputum for TB diagnosis in HIV-infected individuals through specialized sputum induction rooms that comply with occupational and environment safety standards, thus enhancing infection control and increasing the sensitivity of sputum testing; (4) improved linkages between the HIV and TB programs at each of the sites through referral, notification and follow-up; (5) infrastructure support to develop TB sputum induction rooms with appropriate infection control procedures to prevent the transmission of TB; and (6) targeting faith-based and non-governmental clinics focusing on underserved populations in rural areas, industrial areas and informal housing sectors. The programs will promote sustainability through training of health care-workers and partnerships with the National Department of Health (NDOH) to fund the ongoing running cost and staff components. PEPFAR funds will enable long-term sustainability through training, human capacity development and infrastructure support at all RTC-supported TB/HIV clinics.

RTC will focus on improving monitoring and evaluation (M&E) methods and data collection tools to demonstrate the integration outcomes of TB/HIV integration. A successful RTC technical assistance team has been established to continue to expand the activities from the key sites, to include all sites in the RTC network.

Pediatric TB/HIV Care: An experienced pediatrician leads the RTC pediatric care and support program. Training health-care workers (HCW) to enhance the diagnosis and treatment of TB in children will be focused upon. In addition, training will include skills to improve clinical recognition of TB, specimen collection and treatment with both TB and antiretroviral treatment.

Implementation of the DOH government policy and guideline for Isoniazid Preventative Therapy: RTC will provide appropriate training to HCWs and family members, aimed at increasing the delivery of IPT and treatment adherence. Duration of IPT will follow the NDOH guidelines.

Improved Infection Control: To prevent nosocomial infection of TB in clinical facilities supported by RTC, an emphasis will be on introducing best practices for infection control. This will focus on urgent referral of TB suspects out of the clinic to prevent transmission, ventilation, ultra-violet lights, masks and regular staff screening for TB.

Drug-resistant TB: At the request of the Gauteng DOH, Sizwe, the provincial MDR/XDR-TB referral hospital, is supported by RTC. RTC will continue activities at Sizwe. The DOH has requested support for a second MDR/XDR-TB hospital. The planned activities include: (1) continuing to contribute to the overall activities at Sizwe linked to the development of new treatment options for MDR/XDR-TB. Research is funded by the pharmaceutical industry, National Institutes of Health and European Union (e.g., TMC207-TiDP13 phase 2 clinical trial currently underway at Sizwe); (2) supporting a prospective trial to evaluate the use of line-probe assay PCR testing to monitor patients on MDR/XDR-TB treatment with the aim of reducing hospital stay; (3) improving data collection (using DOH staffed vehicles) and linkages with laboratories to facilitate rapid referral of MDR/XDR-TB patients; (4) adhering to the TB Strategic Plan for South Africa 2007-2011, where emphasis will be placed on occupational development and income generation projects for patients admitted to MDR/XDR-TB facilities; (5) enhancing data collection and linkages to facilitate tracing contacts of MDR/XDR-TB patients; and (6) examining the feasibility of community-based treatment of MDR-TB with strong DOT support as was successfully implemented in Lima, Peru. FY 2009 activities will pursue the development of such a model and a potential demonstration project in one of the townships of South Africa.

Strengthening Laboratory Services: RTC will, in line with recent NDOH guidelines, support the line-probe assay using PCR methods on all culture positive specimens. This will facilitate the rapid diagnosis of TB and early diagnosis of M/XDR-TB. As on the South African incidence of drug resistant TB increases, further expansion of the laboratory infrastructure is required to meet the demand for PCR services. RTC aims to strengthen access to PCR testing through the central laboratory services of the Department of Molecular Biology, Contract Laboratory Services, and Wits Health Consortium. Activities will establish the laboratory infrastructure, provide technical assistance, training of laboratory personnel, and disseminate the DOH and NHLS guidelines for PCR testing. The sustainability of the laboratory including staffing, pathologist support, and laboratory consumables will be provided by the NHLS and clinical treatment sites. Linking laboratory results to patients is critically important. FY 2009 funds will be used to enhance the quality and quantity of TB diagnosis, including rapid turn-around time for sputum samples to less than three hours, use of LED microscopy and fluorescent staining methods, and linkage of results to the patient. Throughout the process, from specimen collection to the final culture result, enhanced attention will be paid to improved infection control and biosafety standards for TB.

Activity Narrative: SUMMARY:

Right to Care (RTC) will use FY 2008 PEPFAR funds in five provinces to strengthen the capacity of healthcare providers to deliver TB/HIV services, identify TB and HIV co-infected individuals, and improve the overall quality of clinical and community-based healthcare services. The major areas of emphasis are human capacity development and local organization capacity building. Target populations include people infected with TB/HIV, public health care providers and local organizations.

BACKGROUND:

Throughout South Africa, active TB incidence rates are rising, reaching 608 per 100,000 per annum. HIV-infected patients are at significant risk for developing TB, and 58% of patients attending TB clinics have been identified as HIV-infected. Of primary importance is the identification of TB in HIV infected individuals, with over 60 percent of co-infected patients being sputum negative. Improved and early diagnosis of TB in HIV-infected individuals improves outcomes of morbidity and mortality. Co-infected individuals need to be initiated on antiretroviral therapy, according to standard treatment guidelines, to ensure improvement in mortality, morbidity and TB cure rates. RTC will support the South African government's TB program and the World Health Organization's policy on collaborative TB/HIV activities.

Since FY 2006 RTC has received funding for TB/HIV and plans to integrate the services for TB/HIV for all co-infected patients at sites throughout the RTC network with the FY 2008 funding. The additional activities at each of the sites will be: (1) access to HIV counseling and testing for patients with TB, (2) improved access to induced sputum for TB diagnosis in HIV-infected individuals, (3) improved linkages between the HIV and TB programs at each of the sites through referral, notification and follow-up; (4) infrastructure support to develop TB sputum rooms with appropriate infection control procedures to prevent the transmission of TB. Activities are currently limited by budget to the sites at Themba Lethu Clinic, Sizwe Hospital, Kimberley Hospital, Shongwe and 4 NGO sites. (5) FBO/NGO clinics focusing on underserved populations in rural areas, industrial areas and informal housing sectors as well as targeted gender specific support groups and family centered approaches will be targeted. The programs will promote sustainability through training of health care workers and partnerships with the National Department of Health (NDOH) to partially fund the ongoing running cost and staff components, over time.

ACTIVITIES AND EXPECTED RESULTS:

RTC will continue to work with the national and provincial departments of health and specifically with the HAST (HIV, AIDS STI, and TB) managers to prioritize interventions designed to address weaknesses (identified by the departments of health) in the DOTS and TB/HIV programs. RTC will focus on improving policy adherence and patient follow-up. Individuals will be hired for each site as tracers to track patients and ensure that referrals are completed. RTC is setting aside funding to develop (with other relevant partners or agreement counterparts) standardized tools to ensure that policies and guidelines recommended by NDOH are followed, including guidelines for infection control. RTC will continue to integrate TB/HIV interventions with existing agreement programs as they work seamlessly and side by side with government employees at government facilities.

With FY 2008 funding, the program will be expanded to all sites in the RTC network. RTC support to government sites will include infrastructure, human capacity development, salaries and training. Technical assistance will be provided to improve the integration of TB and HIV services and referral between the sites treating each of the diseases. In all cases where RTC provides salary support an agreement is made with the facility where positions will be created and funded by provinces in due course. Oftentimes a government position has been created, but not filled, and RTC supports a consultant to fill the position until such time as the province successfully recruits for it.

PEPFAR funds will enable long-term sustainability through support of, salaries, training and human capacity development at all RTC-supported TB/HIV clinics, in the form of sub-awards for NGO and FBO clinics and direct salary support for government sites. PEPFAR funds will also be used to adapt existing training materials to specific TB/HIV issues, and address infrastructure needs, such as HIV counseling rooms in TB clinics and specialized sputum induction rooms that comply with occupational and environmental safety standards. This will enhance both safety of obtaining sputum samples and increase sensitivity for positive sputum test.

At TB/HIV treatment sites, emphasis will be placed on identification of co-infected individuals, through promoting routine HIV counseling and testing for TB patients and TB screening of HIV patients who present with risk factors. Co-infected patients will be evaluated for correct application of ARVs and TB medications. Those on combined ARV and TB treatment will be monitored for the development of Immune Reconstitution Inflammatory Syndrome. Emphasis is placed on adherence support to address the increased risk of non-compliance due to high pill burden, and overlapping toxicities, particularly hepatotoxicity. Human capacity development in the management of anticipated drug interactions and shared adverse effects is an additional expected result. Family and community support network will be educated and trained in basic TB knowledge to help support the client with his/her treatment to improve compliance.

In addition to sputum collection, the implementation of low-cost, high through-put, digital, mobile chest x-ray technology, access to screening x-rays will be improved at rural, distant sites and in underserved populations. FY 2008 PEPFAR funding will be used to purchase and equip one mobile x-ray facility to assist the program in rural Northern Cape and Mpumalanga provinces. While x-ray is not a microbiological diagnosis, it is a simple method to augment diagnosis. TB bactecs and bone marrow procedures are not planned for the sites at present.

Although the current government policy includes access to INH for primary TB prophylaxis, most clinics do not have the required capacity or experience to provide this. INH is provided to Helen Joseph by the provincial government. RTC will evaluate INH prophylaxis at the Helen Joseph Hospital using evidence-

Activity Narrative: based locally relevant data collected within the unit. In collaboration with the local National Health Laboratory Services ongoing monitoring of the evolution of mycobacterial resistance and effect on incidence of TB at the hospital will be undertaken. PEPFAR funds will be used for human capacity development, consultant and sessional salaries and infrastructure, but not for the purchase of INH prophylaxis.

RTC and several of its sub-partners will also continue to incorporate TB/HIV training in ART courses for doctors, nurses and lay counselors to ensure quality of care.

Through induced sputum and chest x-ray, this program will improve TB case finding, improved sputum diagnosis and early TB treatment initiation. Through improved adherence to TB treatment, and improved notification and referral, the aim is to improve TB cure rates. Through improved HIV counseling and testing and referral to ARV treatment, overall TB cure rates and mortality outcomes are anticipated.

Overall the planned activities include monitoring and evaluating the outcomes of the integration of TB and HIV services on patients' outcomes, hospital stays, and mycobacterial outcomes of cure and resistance.

By reaching patients with TB/HIV therapy at various outlets, RTC will contribute to the PEPFAR goal of providing services to 10 million HIV-affected individuals. In addition, the activities support the USG Five-Year Strategy for South Africa by training health care workers in TB/HIV services, significantly strengthening these services and their integration into HIV and primary health care services.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for these activities. As the Medical Research Council of South Africa (MRC) is dealing with research and not the implementation of programs, a decision was made during the PEPFAR South Africa Interagency Partner Evaluation to discontinue the TB/HIV multi-drug resistance budget as well as treatment, care and counseling activities, and put them under a TBD Funding Opportunity Announcement. Therefore there is no need to continue funding this program area with FY 2009 COP funds.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Technical, Program, and Systems Capacity Building Approach: The South to South Partnership for Comprehensive Pediatric HIV Care and Treatment Initiative (S2S) will adopt a dynamic and contextualized strategy to support each implementing partner to implement programs with a family-centered approach at the site level. The site support will be dynamic and continuously customized to address site attributes and existing resources. However, while the support and program area emphasis will vary, all designated sites will benefit from the following illustrative activities:

TB/HIV and the family: Considering the TB burden in South Africa, S2S can support the integration of routine TB screening for all pediatric clients by introducing the regular use of simple screening questionnaires, symptom checklists, evaluation of household contacts and referral algorithms. S2S can also help strengthen linkages between TB prevention and treatment programs including (1) referral of clients and family for assessment, (2) administering prophylaxis, and (3) educating clients and caregivers on prevention, warning signs and actions steps. Following is additional detail on each component:

- Administer brief TB screening questionnaire evaluating signs and symptoms of TB (prolonged cough, weight loss, family contact, fevers) at first visit and regular intervals thereafter;

- Routinely screen all children for history of adult household contact with symptoms of TB or receiving treatment for TB;

- Administer brief TB screening twice yearly to adult caretakers attending the pediatric clinic; and

- Establish referral mechanisms for further evaluation and diagnosis of children and family members with a positive screen for TB.

Furthermore, S2S will also work with site staff to ensure that all children under 5 years living in the household of an adult or an orphanage with active TB disease are evaluated for TB infection and, if found to be well, receive isoniazid (INH) prophylaxis. Co-treatment of HIV and TB is particularly complex especially in young children when diagnosis is difficult and drug-drug interactions are common. Similarly, diagnosis and treatment of TB during pregnancy poses unique challenges. S2S will support site staff to co-manage these infections in children and pregnant women including monitoring toxicities, modifying doses, enhancing and monitoring adherence and assessing clinical outcomes.

TB/HIV and Pregnant Women: TB disease and infection is under-recognized during pregnancy and can lead to significant maternal and infant morbidity and mortality. S2S can support the integration of routine TB screening for all women attending antenatal care (ANC) services by introducing the regular use of simple screening questionnaires, symptom checklists, evaluation of household contacts and referral algorithms. S2S can also help strengthen linkages between TB prevention and treatment programs including (1) referral of clients and family for assessment, (2) administering prophylaxis, and (3) educating clients and caregivers on prevention, warning signs and actions steps. Following is additional detail on each component:

- Administer brief TB screening questionnaire evaluating signs and symptoms of TB (prolonged cough, poor weight gain or weight loss, family contact, fevers) and history of household contacts with symptoms of TB at first ANC visit; and

- Establish referral mechanisms for further evaluation and diagnosis of pregnant woman and her children and family members with a positive screen for TB.

Furthermore, S2S will work with site staff to ensure that all children and partners of pregnant women identified with TB are screened and receive prophylaxis when applicable. The diagnosis and treatment of TB during pregnancy poses unique challenges. S2S will support site staff to co-manage these infections among pregnant women including monitoring toxicities, modifying doses, enhancing and monitoring adherence, and assessing clinical outcomes.

Testing for TB with HIV: To foster greater integration and synergy between HIV and TB services, where relevant, S2S can support the introduction of routine HIV testing for all children and family members being treated for TB.

Supporting TB Infection Control: S2S will support infection control in the context of the family unit at the health facility, in the community and at home. This includes supporting facilities to implement appropriate infection control procedures (within the context of existing resources) and supporting facility staff to properly counsel and support clients to protect others and themselves. This includes (1) supporting safe sputum collection by working with sites to identify a safe and confidential space to collect sputum; (2) supporting health workers on how to counsel and educate clients on cough etiquette and hygiene; and (3) supporting site staff to implement a protocol to screen all clients for TB, prioritize the triage of women and children who are TB suspect and ensure active referral to TB clinic for rapid screening and treatment if necessary.

SUMMARY:

Activities support implementation and expansion of best-practice models for integration of tuberculosis (TB) and HIV services in public sector facilities in Eastern Cape (EC) and KwaZulu-Natal (KZN). TB/HIV activities are implemented through technical assistance and will result in a decrease of TB in HIV-infected children and adults, increase prevention and early detection of TB in HIV-infected children and adults, and provide overall support to provincial TB/HIV activities. The emphasis area for this program will be human resources. The target population will include infants, children and youth (non-OVC), men and women (including pregnant women and family planning clients), people living with HIV (PLHIV) and public and private sectors.

BACKGROUND:

Columbia University (Columbia) began TB/HIV integration activities in FY 2006. Health facilities initially identified in EC included 3 TB hospitals (Nkqubela, Fort Grey and Empilweni Hospitals) and 8 HIV care and treatment sites (Holy Cross, St. Patrick's, Rietvlei, Cecilia Makhiwane, Frere, Dora Nginza and Livingstone Hospitals, Ikhwezi Lokusa Wellness Center). In the TB hospitals inpatients are counseled and tested for HIV, initiated on cotrimoxazole prophylaxis if they are found to be HIV-infected and if they are eligible,

Activity Narrative: started on antiretroviral treatment (ART). On discharge from TB hospitals, patients are linked to primary health care clinics or nearest facility where they can access HIV and TB treatment services. In FY 2006, Columbia began training of nurses, doctors and lay health workers on TB/HIV integration in both programmatic and clinical aspects: active TB case finding among HIV-infected patients, ART for eligible TB/HIV co-infected clients, and leveraging existing referral services to provide comprehensive HIV support. In FY 2008 Columbia will continue to implement activities in these 3 TB hospitals and 38 HIV care and treatment sites, for a total of 42 health facilities, in EC and KZN. Four new health facilities in Free State (FS) will be identified in FY 2008 for TB/HIV support. In FY 2007, Columbia formed a new partnership with Yale University AIDS Program in support of TB/HIV integration activities in Tugela Ferry, KZN, which will continue in FY 2008.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: TB hospitals in Eastern Cape

Activities will include:

1. Provide ongoing TB/HIV clinical support by conducting didactic and onsite TB/HIV training for doctors, nurses and lay health staff to improve knowledge and practice around managing TB/HIV patients. Provide clinical mentorship through case presentations and discussion.
2. Continue to support the hiring and placement of doctors, nurses, and peer educators to improve uptake of HIV counseling and testing and to increase enrollment of TB/HIV co-infected patients into ART.
3. Provide technical support for monitoring and evaluation (M&E) activities by implementing a system to track/monitor referrals and patients between HIV and TB programs. This activity includes training and use of the pre-ART and ART facility registers.

ACTIVITY 2: HIV Care and Treatment Sites

Activities in the 38 HIV care and treatment sites will be focused on strengthening:

1. TB case-finding among clients enrolled into HIV care and ART. Columbia is in the process of implementing a facility held patient record that captures information on TB case finding within the patient record. Columbia is training doctors and nurses in the supported facilities to use the patient record to improve TB/HIV clinical care and treatment. These staff will be routinely mentored by Columbia nurse mentors/clinical advisors.
2. Referral linkages with the TB program to initiate TB therapy for those in HIV care and/or ART. The Columbia supported community health centers and primary health clinics (PHCs) with HIV care and treatment services also have TB services on site where Columbia supports TB services by improving referrals of TB/HIV co-infected clients on ART to on site TB services to receive TB treatment. This includes development of a referral slip to the TB services and also ensuring the facility held patient record in the HIV clinic is updated with the relevant TB information.

With FY 2008 reprogramming funding, Columbia will support infection control activities in the EC.

ACTIVITY 3: Yale University Partnership

Columbia will partner with the Yale University to develop the following services at the Church of Scotland Hospital (COSH), Tugela Ferry:

1. Increase HIV counseling and testing (CT) of clients accessing TB services in the COSH. This will be implemented through the introduction of various models of provider-initiated CT at the TB treatment programs (drawing on experiences from other settings) that is inclusive of training of TB treatment staff in HIV CT, training in HIV pre- and post-test counseling with establishment of strong linkages to laboratory HIV diagnostic services, and training of TB treatment staff in the referral of TB patients to CT services.
2. Prevent the development of multidrug-resistant tuberculosis (MDR-TB) cases and improving treatment completion rates by strengthening the existing TB DOTS program and integrating with HIV treatment. Under the Yale partnership the program components for this specific program activity will include:
 - Defining the baseline TB treatment completion and cure rates
 - Overall program improvement by: providing routine HIV counseling and testing, developing effective TB screening tools for HIV-infected patients, use of a standardized once-daily ARV regimen to be administered concurrently with standard TB regimen for TB/HIV co-infected patients, using modified observed therapy, family and community-based health workers as treatment supporters, providing TB treatment literacy materials at ART initiation and training of case management teams to strengthen treatment follow-up and completion by tracing defaulters in the community
3. Prevent nosocomial transmission of MDR-TB and extensively drug-resistant tuberculosis (XDR-TB) by instituting infection control. This will include; a. evaluation of nosocomial spread of MDR and XDR-TB by supporting sputum culture testing on all new and suspected TB cases (months 0, 2, 6), spoligotyping on selected isolates and confirmed MDR-TB isolates to determine timing of acquisition and possibility of nosocomial spread; spoligotyping of sensitive TB isolates and non HIV infected TB patients to determine if KZN strain confined only to MDR and XDR and HIV or more widely distributed; b. Improve program implementation by screening HIV-infected patients for TB, creating isolation facilities, improving air handling within wards, educating healthcare staff in personal infection control practices and provide personal protective equipment to minimize their risk, minimizing number of TB patients hospitalized, decreasing the length of stay for all TB patients by developing and evaluating protocols for earlier hospital discharge, and increase community-based care for TB treatment to absorb shift of TB care from inpatient to outpatient

Activity Narrative: setting.

4. Implement a decentralized MDR-TB treatment program. Patients found to have MDR-TB travel 120 km to Durban to be admitted to King George V Hospital for second line therapy however the average waiting time for a bed is 2-3 weeks. Key components would include: Sputum culture testing on all suspected and confirmed TB cases in both inpatient and outpatient settings to identify cases of MDR-TB; Initiate a treatment program to provide second line TB treatment locally; Develop a contact tracing program for all MDR-TB and re-treatment cases to identify MDR-TB cases in community; spoligotyping MDR-TB isolates

5. Screen for active TB among HIV-infected patients through use of standardized screening questionnaires and/or algorithms by all types of healthcare workers followed by standardized follow-up and diagnostic algorithms of TB suspects and supported by the introduction of effective recording and reporting systems for these activities.

Originally support to COSH was to include a PHE, but as this PHE was not approved, the funding is reprogrammed back into the TB-HIV services to support service delivery in Tugela Ferry, in partnership with Yale.

ACTIVITY 4: Scale up use of TB screening tool at HIV care and treatment facilities

Columbia will ensure that the PHC record (which incorporates TB signs and symptoms) is used at all supported HIV care and treatment outlets. This TB screening tool will improve the quality of TB services provided at the HIV clinic and also increase TB case finding in this high risk population. In addition, this activity will dovetail with the proposed TB screening PHE about to be conducted in select health facilities.

ACTIVITY 5: Targeted TB prevention and control strategies

TB infection control activities targeted at 2 health facilities in EC (Motherwell Community Health Centre in Port Elizabeth and Cecilia Makiwane Hospital in East London). The objective of this activity is to minimize the risk of nosocomial TB transmission through minimizing source infectiousness. Activities include: assessing TB infection control procedures for gaps and needs for each facility; establishing work practice, clinical management and administrative procedures to minimize the nosocomial transmission of TB; assessing the impact of these interventions; and developing practice manual and educational tools for health care workers. New health facilities in FS will be determined in collaboration with the Health Department to receive support for TB/HIV and proposed activities to be implemented include those outlined above.

Table 3.3.12: Activities by Funding Mechanism

Mechanism ID: 4632.09	Mechanism: N/A
Prime Partner: South African Clothing & Textile Workers' Union	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: TB/HIV
Budget Code: HVTB	Program Budget Code: 12
Activity ID: 22866.09	Planned Funds: \$48,545
Activity System ID: 22866	

Activity Narrative: SUMMARY:

The Southern African Clothing and Textile Workers Union (SACTWU) project has received PEPFAR funding in previous years through a sub-agreement with the Solidarity Center. In FY 2008, SACTWU started receiving direct PEPFAR funding. SACTWU has a well-structured training program, initiated in 1999, that has evolved within the dynamics of the industry and includes basic facts on HIV, AIDS, abstinence, being faithful and condom use. The major emphasis area of the activity is training. Target populations include factory workers and people affected by HIV, HIV-infected adults, especially women, and the business community.

BACKGROUND:

SACTWU is South Africa's largest trade union organizing textile and clothing workers. It also organizes footwear, leather and retail workers and has a membership of approximately 110,000 members nationally. Sixty-six percent of SACTWU's membership is female with the majority aged between 20 and 60 (i.e., the greatest population infected and affected by HIV and AIDS).

The SACTWU AIDS Project, known as SACTWU Worker Health Program, is a national program that provides prevention and care services in five provinces: KwaZulu-Natal, Western Cape, Gauteng, Eastern Cape and Free State. This Project was initiated in 1999 and developed as a national comprehensive program, with an initial focus on prevention. It has matured over the years to the point where it now has a well-structured comprehensive training program, provides workplace theater, in house voluntary counseling and testing (VCT) services, access to a social worker in KwaZulu-Natal, income-generating workshops, a primary package of care through the VCT services, and home-based care through its regional nurses and a home-based care network in KwaZulu-Natal and the Western Cape. The nurses provide some level of support in the home through home visits, but this activity is mainly implemented by the home-based care network that provides ongoing home-level support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

Another PEPFAR partner, TB Care Association, has committed to provide 50 home-based caregivers with DOTS training for TB/HIV, which is in accordance with the South African Tuberculosis Strategic Plan for South Africa, 2007-2011. This training will be in addition to home-based care training.

SACTWU's VCT/home-based care manager will be trained as a master trainer on the PALSA Plus training program offered the Western Cape Department of Health. This training program covers all key TB activities such as routine screening of all VCT and people living with HIV (PLHIV); counseling for all TB suspect clients; TB infection control; HIV/TB co-infection management; isoniazid prophylaxis and effective recording and reporting. The master trainer will provide PALSA Plus training to 30 professional nurses employed at SACTWU service outlets in the five provinces in which SACTWU is based. All "master" training materials will be provided by the Western Cape Department of Health.

In order to provide a quality home-based care program and to ensure true quality of care, unemployed, ex-SACTWU members will be trained on the national accredited home-based care program. This will consist of a full-time six-week home-based care and mentorship course, which will then be complemented with DOTS training. In accordance with the national guidelines, service outlet staff will be trained and provided with continuous education, home-based caregivers will be trained in accordance with the DOTS strategy and National Department of Health's TB policies and guidelines.

ACTIVITY 2: Workplace Theater

A fulltime drama group based in KwaZulu-Natal provides workplace theater at factories during tea and lunch breaks. Different scripts have been developed addressing aspects of HIV, with one script focused on TB topics. It is anticipated that the TB script will be delivered at a minimum of two factories per month.

ACTIVITY 3: Screening and Testing

Routine TB screening is conducted on all clients provided with VCT and all self-referred TB suspects are routinely offered HIV counseling and testing. Sputum testing is conducted where indicated and all TB clients are referred to Department of Health (DOH) facilities for treatment. Referrals are conducted by way of initial telephonic contact made by the referring clinician to the DOH facility. Where possible, an appointment is made. The client is then given a referral letter and instructed to deliver this letter to the clinician at the referred DOH facility. Again, wherever possible, the patient is given the name and details of the actual clinician to whom they have been referred.

VCT is currently conducted at factories in all five provinces. From July 2008 TB screening will also be routinely offered to workers, thereby extending the reach and access to TB screening. DOH TB suspect registers are currently completed and statistics reported on in the Western Cape and KwaZulu-Natal. Discussions are currently being held with the provincial Departments of Health in Gauteng, Eastern Cape, and Free State to sign MOU/service level agreements to enable SACTWU to expand current services, ensure effective referral and cross referral linkages between TB and HIV service outlets, and to initiate effective reporting systems in these provinces.

ACTIVITY 4: Palliative Care

Home-based caregivers will be trained to undertake early identification and referral of TB suspect clients and provide a defaulter tracing system for TB programs. In order to provide comprehensive and quality services to SACTWU members and their families suffering from TB/HIV, SACTWU has recently negotiated

Activity Narrative: and signed an MOU to build capacity and support at St Luke's Hospice in the Western Cape. SACTWU is currently in negotiation with a similar facility in KwaZulu-Natal. With SACTWU's support, St Luke's has been able to reopen a 10-bed ward that has been closed due to a lack of funding. Although SACTWU members will be provided with preferential access to these services, the use hereof will be extended to any HIV/TB individual requiring care. St Luke's is a TB step-down facility.

All HIV clients in which TB has been ruled out will be routinely provided with isoniazid prophylaxis therapy. Negotiations are also underway with the Departments of Health in the Western Cape and KwaZulu-Natal to cover the costs of Isoniazid treatment.

ACTIVITY 5: Infection Control

SACTWU's interventions are in line with the National TB Infection Control Guidelines which promote the reduction of TB transmission through prompt recognition, initiation of treatment, and referral of suspect TB clients. In line with these guidelines, risk assessments will be conducted at all service outlets followed up with a written TB infection prevention and control plan. In accordance with the guidelines, service outlet staff will be trained and provided with continuous education, home based caregivers will be trained in accordance with the DOTS strategy and National Department of Health's TB policies and guidelines.

Table 3.3.12: Activities by Funding Mechanism

Mechanism ID: 500.09	Mechanism: In Support - CDC
Prime Partner: National Department of Health, South Africa	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: TB/HIV
Budget Code: HVTB	Program Budget Code: 12
Activity ID: 3045.22849.09	Planned Funds: \$2,569,548
Activity System ID: 22849	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The National Department of Health (NDOH) Activities 9-13 will be completed and will not be funded with FY 2009 funds.

FY 2009 activities will seek to enhance TB/HIV support for the NDOH and provincial Departments of Health. An example of such an activity is currently being undertaken in one district in the Eastern Cape where PEPFAR partners are working collaboratively to implement an integrated TB/HIV program. This activity will be expanded to other provinces in FY 2009. Other proposed activities are to collaborate with stakeholders to expand provision of training focused on HIV counseling and testing, and quality management systems, TB infection control, TB specimen collection, isoniazid preventive therapy, TB screening, and TB/HIV recording and reporting. Where feasible, training will be delivered through the existing Regional Training Centers. United States government staff will work with provincial departments of health on advocacy, counseling, social mobilization and improving TB/HIV referral systems. Technical assistance will also be provided to primary schools that have been selected by the South African government as Health Promoting Schools for TB/HIV training and other support as requested.

Finally, geographic information systems (GIS) mapping activities for PEPFAR partners will be scaled up to guide partners' expansion of TB/HIV activities strategically.

SUMMARY:

Tuberculosis (TB) is the leading cause of death among people living with HIV/AIDS, and addressing TB/HIV is an important part of meeting the Emergency Plan 2-7-10 goals. CDC/PEPFAR carries out additional activities to strengthen and enhance TB/HIV activities in support of the South Africa National Department of Health (NDOH). Activities supported with these funds focus on TB/HIV program and laboratory support.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Technical Assistance CDC staff will provide technical assistance to the NDOH and related organizations regarding TB/HIV program and laboratory activities. Staff needs consist of one CDC direct-hire, 2 locally-employed staff (TB/HIV clinical coordinator and TB/HIV monitoring and evaluation advisor), 2 contractors (TB/HIV laboratory officer and TB/HIV laboratory training advisor).

ACTIVITY 2:

TB/HIV Surveillance The ETR.Net is the software application conceived and managed by the NDOH National TB Control Program (NTCP) and reflects program-defined needs and inputs. This has been developed by WamTechnology CC, a South African private information technology firm. WamTechnology works with CDC South Africa and the NTCP to develop software and provide support for the ETR.Net. This software has been modified to track HIV testing and care services among TB patients. The TB/HIV module will be fully implemented during FY 2008. Expected results include strengthening of TB/HIV recording and reporting system to include patient-level data collection on TB/HIV (TB patients counseled and tested for HIV, started on cotrimoxazole (CTX), referred for HIV care and starting antiretroviral treatment (ART). This will in turn be used to bolster referral systems between services leading to more comprehensive care for TB/HIV patients.

ACTIVITY 3:

MDR/XDR reporting Funds will be used to improve reporting and surveillance systems for drug-resistant TB cases. In collaboration with the NDOH, funds will be used to expand the number of users using a web-based system to improve the management and reporting of MDR and XDR-TB cases, data mining activities, and surveillance analysis of drug-resistant TB cases. Data linkages with the laboratory information management systems within the National Health Laboratory Services will be expanded.

ACTIVITY 4:

Infection Control In collaboration with the NDOH, funds will support the implementation of a national TB infection control plan including a national training agenda, standardized training materials, involvement of other partners (universities, research centers) to accelerate provision of trainings within South Africa. Expansion of activities will also support expansion of an infection control warmline and/or technical assistance unit for ongoing technical assistance requests from provinces and partners.

ACTIVITY 5:

TB/HIV Pediatric clinical management In collaboration and with support from the NDOH, funds will be used to develop a standardized pediatric TB/HIV clinical management training course materials reflecting SA NDOH and WHO guidelines, initiate efforts to provide access to training via online services, and to implement a warmline consultation service to provide pediatric TB/HIV clinical management guidance to providers.

ACTIVITY 6:

TB/HIV integration In collaboration with the NDOH, expand implementation of field-based DOT program in 4 districts with high default rates. Efforts would include treatment monitoring in addition to patient tracking and management using Community health care workers. Project would be evaluated and compared to other

Activity Narrative: DOT models.

ACTIVITY 7:

MDR/TB/HIV clinical management In collaboration and with support from the NDOH, funds will be used to expand efforts to provide access to MDR/TB/HIV clinical management training, and continued support for a warmline consultation service to provide MDR/XDR/TB/HIV clinical management guidance to providers.

ACTIVITY 8:

TB/HIV Strategic Plan Funds will be used to support the implementation and monitoring of the TB/HIV strategic plan for South Africa PEPFAR partners.

ACTIVITY 9:

TB/HIV Laboratory Quality Assurance In collaboration with the National Health Laboratory System (NHLS) and the National Institute of Communicable Diseases (NICD), funds will be used to strengthening quality assurance measures among laboratories and to strengthening existing and initiating new External Quality Assurance (EQA) programs related to HIV and TB diagnostics. Activities will support measures to strengthen reviews, measuring clinical performance, reporting indicators, and disseminating performance reviews for action.

ACTIVITY 10:

TB/HIV Regional Laboratory Training Center (RLTC) With the availability of significant HIV and TB technical and scientific resources within South Africa, NICD and NHLS are both well placed to continue to provide regional laboratory support within Sub-Saharan Africa in these areas. Funds will be used, in collaboration with NICD and NHLS to expand and strengthen existing TB and HIV regional support mechanisms and enhance further collaboration with other PEPFAR-funded countries through the established RLTC. Regional support will include TB and HIV related laboratory services and training initiatives.

ACTIVITY 11:

TB/HIV Laboratory capacity In collaboration and with support from the NDOH, PDOH, NHLS, and NICD, funds will be used to increase the national coverage of HIV and TB diagnostics and treatment monitoring capabilities. Efforts will also include strengthening laboratory reporting systems and specimen transport needs in support of rural clinics and laboratories. Efforts will focus to address existing gaps in laboratory testing outreach and penetration.

ACTIVITY 12:

Laboratory Policy Standards In collaboration and with support from the NDOH, PDOH, NHLS, NICD, National Institute of Occupational Health (NIOH), South African National Accreditation System (SANAS), and the Medical Research Council (MRC), funds will be used to encourage and support the development and implementation of a South African National Laboratory Strategy Plan. The plan will provide the vehicle for establishing minimum standards and/or requirements for any laboratory (public/private) that performs tests on human specimens and certify through issuance of a certificate those laboratories that meet the certificate requirements. Efforts will also attempt to synchronize infection control standards and policies across all TB/HIV laboratories.

ACTIVITY 13:

New TB/HIV Automation and Technologies In collaboration and with support from the NHLS and NICD through co-funding, funds will be used to assess existing, validate, and implement new automated laboratory diagnostic equipment and high capacity instrumentation for TB and HIV. Activities will be carried out to increase laboratory through-put for infant PCR, viral load, and TB diagnostics to meet increased demand, as well as strengthening NHLS's ability to improve diagnostic, reporting and surveillance activities in relation to TB and HIV.

New/Continuing Activity: Continuing Activity

Table 3.3.12: Activities by Funding Mechansim

Mechanism ID: 2808.09	Mechanism: I-TECH
Prime Partner: University of Washington	USG Agency: HHS/Health Resources Services Administration
Funding Source: GHCS (State)	Program Area: Care: TB/HIV
Budget Code: HVTB	Program Budget Code: 12
Activity ID: 12464.22681.09	Planned Funds: \$593,320
Activity System ID: 22681	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The International Training and Education Center on HIV (I-TECH) will expand COP 2008 activities in the following ways affecting TB/HIV training and mentoring, and the integration of TB and HIV curricula activities in the Mpumalanga and Limpopo Departments of Health (DOH) and their Health Professions Quality Assurance (HPQA) Centres.

I-TECH will implement and evaluate two one-and-a-half day TB/HIV and clinical treatment update training courses, consisting of 80 participants in total, for Mpumalanga and Limpopo DOH, HPQA Centres. The target audience will consist of HPQA Centre trainers, provincial DOH district trainers, and project managers (i.e., doctors and nurses from Mpumalanga and Limpopo antiretroviral treatment (ART) clinics). Content of the courses will include guidelines for palliative care, screening for TB in people living with HIV (PLHIV), implementation of isoniazid preventative therapy, HIV counseling for TB suspects, diagnosis and management of TB in PLHIV including HIV-resistance drug interactions, and HIV in pediatric care. Such updates were conducted in the Eastern Cape, and described in COP 2008. Newly employed Eastern Cape HPQA Centre trainers, Department of health district trainers and project managers may attend the trainings in Limpopo or Mpumalanga provided sufficient space and funding.

An integrated training model for the Mpumalanga DOH's HPQA includes (1) development of a basic HIV & AIDS, STI and TB (HAST) in-service training curriculum; (2) modification of a specialized TB/HIV training curriculum based on current South African National Department of Health treatment guidelines; (3) identification of selection criteria for enrollment into the TB/HIV specialized course; (4) development of course certificates; and (5) evaluation tools. To build the Mpumalanga DOH human capacity, I-TECH curriculum specialists will work with a dedicated Mpumalanga DOH team to facilitate the TB/HIV curriculum integration process, develop or revise curricula, prepare TB/HIV materials for clinical review and pilot testing, and provide technical assistance on evaluation processes, tools and certificates. The integrated plan and developed or revised curricula will be shared with the National Department of Health, the Limpopo and Eastern Cape HPQA Centres, and finally, will be promoted to the other six provincial HPQA Centres. I-TECH is working with the Mpumalanga DOH to build momentum, vision, and commitment to development of in-house capacity for production of quality curriculum materials.

In FY 2009, I-TECH will provide technical assistance on TB/HIV curriculum integration to the six remaining provinces. FY 2009 funds will be used to support salaries for the Limpopo, Mpumalanga and Eastern Cape DOH HPQA Centres, to hire one medical officer per site.

I-TECH will develop, implement, and evaluate two three-day interactive mentoring-of-mentors' workshops conducted for the Eastern Cape, Limpopo, and Mpumalanga DOH HPQA Centre mentors (i.e., doctors, nurses, pharmacists). The course aims to develop effective mentoring (on-the-job) skills and to improve the mentor's TB/HIV clinical decision-making skills. The first two days will be dedicated to strengthening mentoring skills using a newly published I-TECH clinical mentoring curriculum adapted for South Africa. The third day will focus on updated TB/HIV clinical content, using case study presentations and discussions intended to improve service delivery (e.g., intensified case-finding, the scale up of isoniazid preventive therapy, TB infection control guidelines, and screening questions), and decrease the burden of HIV in patients with TB disease (e.g., referral of all TB patients identified as HIV-infected for care and treatment, provider-initiated counseling and testing, detection and proper management of multi- and extensively drug-resistant TB (MDR/XDR TB) in HIV-infected patients). Mentors from the remaining provincial HPQA Centres and provinces may attend given sufficient space and funding.

A two-person I-TECH/University of California, San Diego (UCSD) mentoring team (including one infectious disease clinician and one nurse practitioner) will conduct three one-month mentoring-of-mentor visits to Mpumalanga. The team will accompany the Mpumalanga DOH Training Advisor, medical doctor and other HPQA clinical team mentors (i.e., medical officers, nurses, pharmacists) to three clinics (one week per clinic each month for three months) to provide on-site TB/HIV care and treatment mentoring. The UCSD team will mentor up to two doctors and two nurses per site (12 total) and consult total of 50 patients with TB and HIV per week. Clinic shadowing will be augmented by bedside rounds, case study discussions, and distance learning supported by HIV physician experts. This highly interactive training/mentoring model is consistent with I-TECH's best practices for changing knowledge into practice, and allows health care workers to obtain the specialized knowledge and TB/HIV clinical decision-making skills specific to their actual job responsibilities (e.g., the early detection of HIV in TB patients (including pregnant women and children) and vice versa, the management of TB in the HIV-infected patient, the management of MDR/XDR TB in HIV-infected patients). TB infection control will be assessed at each clinic and recommendations reported to clinic administrators.

If the Limpopo DOH HPQA Centre hires doctors, nurses, and pharmacist mentors, I-TECH will support a two-person mentoring team from UCSD to conduct two one-month mentoring-of-mentor visits. They will accompany Limpopo DOH HPQA mentors to three ART clinics (one week per clinic each month for two months) to provide on-site mentoring to the HPQA Centre mentors. The team will mentor two doctors and two nurses per site (12 total) on TB/HIV care and treatment and consult 50 patients per week. The same interactive methods used in Mpumalanga will be employed.

Expected outcomes or impact of these intensive mentoring visits include improved clinical practice and service delivery, improved mentoring skills, and capacity building of DH HPQA Centres on development and implementation of clinical mentoring programs.

Eastern Cape I-TECH/UCSD mentoring activities will continue as described in the COP 2008 model, but in June 2009, it will transition to concentrated support of pre-service programs, curriculum, and faculty development at the Walter Sisulu University (WSU), School of Medicine. By the end of FY 2009, it is expected that the Eastern Cape HPQA Centre clinical team members will be working toward or will have received post-graduate diplomas in HIV and AIDS from WSU, and through this program and I-TECH/UCSD mentoring since 2004 will have the TB/HIV care and treatment knowledge, skills and experience to mentor

Activity Narrative: other health-care providers. This approach is consistent with I-TECH's goal of clinical mentoring programs, which is to build the skills of local clinicians to become clinical mentors themselves. The HIV/AIDS fellowship program in concert with a well established HPQA clinical mentoring team and model supports an increased number of health-care workers providing quality TB and HIV services in the Eastern Cape.

In FY 2009, I-TECH will identify and establish agreements with effective South African ART clinics expert in providing quality TB/HIV care and treatment to provide preceptorship experiences to HPQA health-care providers and staff, reflective of I-TECH's commitment to build capacity of pre-service and in-service clinical education opportunities within South Africa.

The above-mentioned activities also apply to the Health Systems Strengthening program area.

SUMMARY:

The International Training and Education Center on HIV (I-TECH) FY 2008 COP activities will be expanded to include technical assistance (TA) activities to enhance the Mpumalanga Department of Health (DOH) RTC's organizational and human capacity to train Mpumalanga health care workers (HCW with the primary target audience being doctors and nurses) on the care and treatment of concomitant HIV and TB and thereby increase access to quality concomitant TB/HIV care and treatment in the province. Funds will be used to support the technical (e.g., the development/modification of TB/HIV curricula in accordance with national guidelines; curricula accreditation) and human capacity development of the Mpumalanga DOH RTC (MRTC) to train Mpumalanga HCW on HIV/AIDS, tuberculosis (TB) and sexually transmitted infections (STIs) care and treatment. The primary emphasis area for these activities is local organization capacity building to affect the care and treatment of patients with HIV and TB. Human capacity development and strategic information are secondary emphasis areas. The primary target organization is a host country provincial government organization and its medical teams comprised of doctors and nurses.

BACKGROUND:

I-TECH has been supported by PEPFAR for the past five years to work in the Eastern Cape province, with the invitation and support of the South Africa (SA) National DOH and EC DOH, to develop the organizational and human capacity of the EC RTC to train/mentor clinicians in the care and treatment of HIV, AIDS, TB and STI. Organizational TA to the EC RTC included strategic planning, infrastructure development, human resource development and management, small grant or proposal development, the development of memoranda of understanding, financial management, marketing, health management information systems, and disseminating best practices to improve program efficiency and effectiveness. These activities will be extended to Mpumalanga province in FY 2008 and implemented by the primary partner. Human capacity development of the EC RTC included the longitudinal mentoring of its clinical teams by experienced I-TECH HIV specialists and infectious disease clinicians on the care and treatment of HIV/AIDS/TB/STI and the art of effectively mentoring others. These clinical human capacity development activities will be extended to the MRTC in FY 2008 and will be implemented by I-TECH's sub-contractor, the University of California at San Diego (UCSD) Owen Clinic.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Building, In-country Mentoring of the Mpumalanga Regional Training Centre (MRTC) Clinical Team

This activity expands I-TECH's in-country mentoring program to Mpumalanga. FY 2008 funds will be used to mentor MRTC clinical staff to develop their mentoring skills as well as their clinical skills in the treatment of concomitant TB/HIV patients, complex case management, rapidly emerging treatment complications, and evidence-based clinical decision-making. Six I-TECH UCSD mentors will individually accompany MRTC medical team members as they travel to sites in the province to provide onsite mentoring to Mpumalanga clinicians while seeing together up to 50 patients per week. Mentoring will also include technical assistance centered on systems strengthening provided to MRTC RTC sites/feeder clinics. FY 2008 PEPFAR funds will support UCSD Owen Clinic administrative staff time, and the salaries, travel, lodging and expenses for six infectious disease or HIV specialists to travel to Mpumalanga during FY 2007 for one month stays.

ACTIVITY 2: Program Sustainability: In-country Mentoring of the Mpumalanga Regional Training Centre (MRTC) Clinical Team to Develop and Update Curricula

FY 2007 PEPFAR funds supported a needs assessment of the Mpumalanga HCW TB/HIV training needs. In 2008, the results will be utilized to assist the MRTC to develop/modify and accredit its TB and HIV training courses for health care providers, and develop training plans. In addition, I-TECH will respond to other training needs of the MRTC HCW based on the results of the needs assessment, such as TB/HIV/STI curricula revision and update. Training will be provided through a high-level training specialist who will mentor MRTC staff to update curricula according to provincial and national guidelines. This transfer of skills activity will include developing and strengthening monitoring and evaluation of training programs in this region. FY 2008 funds will be used to support the salary, travel and lodging cost of a training technical expert. Contingent upon the availability of FY 2008 funds and depending on the training needs of MRTC HCW, additional training will be provided through sponsorship at national or international training summits, study tours, or other preceptorships.

ACTIVITY 3: Human Capacity Building: Distance-based ongoing clinical consultation

This activity was first funded for the Eastern Cape RTC by PEPFAR in FY 2005. During UCSD/RTC trainings, EC clinicians are encouraged to contact the RTC team for clinical consultation as needed, who then forward the query and response to the UCSD Owen Clinical mentors for additional guidance before

Activity Narrative: delivering their consultative advice. In FY 2008, PEPFAR funds will be used to expand this activity to the Mpumalanga RTC HCW. Funds will support UCSD consultants' time (a portion of salaries) related to the time spent fielding consultations; estimated at five consults per week.

These activities contribute to the overall PEPFAR 2-7-10 goals and to program sustainability by improving the organizational and human capacity of the MRTC to effectively treat affected patients and mentor other HCW on the care and treatment of concomitant TB/HIV care and treatment, thereby increasing both access to and the quality of TB/HIV care and treatment.

Activity System ID: 22674

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The University of the Western Cape (UWC) program is part of University Technical Assistance Program aimed at strengthening human capacity development and ensuring sustainability of efforts in multiple program areas.

The activities under this program focus on health system and education system strengthening to support THE TB/HIV program. A key emphasis is on improving access to information for district-based clinicians to diagnose and treat TB and HIV more rapidly and effectively. The project will also improve access to information and build the capacity of clinicians in understanding drug resistant HIV strains. The education sector is highlighted as a key focus for information, education and communication activities, through an intervention that builds capacity through training teachers, learners, and parents (as members of school governing boards) to become health promoters and providers of care and support by providing multi-media and interactive information.

ACTIVITY 1: A Web-Assisted Consultation Service to Support TB/HIV Clinicians in Southern Africa

TB is the most common opportunistic infection and most important cause of death in people infected with HIV in Southern Africa. Information for the clinical management of multi- and extensively drug-resistant TB (MDR/XDR-TB) is changing very quickly and it is difficult for clinicians to access this information. This project will develop and pilot a remote web-assisted consultation service for TB/HIV diagnosis and treatment. This service will build the capacity of clinicians in Southern Africa to provide optimized TB/HIV care. Using FY 2009 funds, the web system will be modified and enhanced based on the use of the system, and the information from the training and utilization workshops. Eighteen clinicians and clinical nurse practitioners (one doctor and one clinical nurse practitioner from each of the nine provinces) will be trained to review the system.

ACTIVITY 2: Molecular Surveillance by Accurate Detection of HIV-1 Drug Resistance Mutations in Patients on Antiretroviral Treatment in Southern Africa: An Informatics Approach

Scaling up access to antiretroviral therapy (ART) in Southern Africa to extend survival among the HIV-infected is a significant challenge, requiring considerable increases in expertise and skilled implementation. Major challenges to success include monitoring and evaluation (M&E) of patient adherence and the prevalence of drug resistance in treated cohorts. Bioinformatics methods are widely used in developed countries to identify drug resistance mutations in HIV patients on ART. These methods are the basis upon which policy guidelines are set in order to inform the clinician when to switch antiretroviral (ARV) drug regimens affected by the appearance of resistance mutations. The identification of the levels of ARV drug resistance in an epidemic is used to define the first and second line ART regimens that are most effective to treatment.

In FY 2008, the system will have been designed and software developed, data will have been gathered and the initial database populated. Twenty clinicians from public and private ART sites around South Africa will have participated in a training workshop. In FY 2009, the system will be adapted and finalized and the web-assisted interface for HIV drug resistance analysis will be made available at <http://hivweb.sanbi.ac.za>.

This project will establish web-based tools to provide accurate detection and monitoring of the spread of drug resistance mutations in patients on ART in Southern Africa. The project will transfer developed drug resistance databases technology developed by UWC's partners at Stanford University and at REGA Institute (Leuven, Belgium) to the South African National Bioinformatics Institute (SANBI)/UWC. The system under development will provide an accessible web portal for decision support for ART regimen switching in resource-constrained environments where laboratory/molecular markers such as CD4 count, viral load and resistance mutation data are not available. Core components of the Stanford HIV database will be transferred to SANBI/UWC. These components include SQL databases and a number of software applications. The SANBI/UWC server will contain a read-only copy of the public version of the Stanford database and a password-protected local server that will be used to store and analyze Southern African HIV-1 sequences. A number of software applications and scripts will be transferred to the SANBI server, including the Drug Interpretation Interface and the ART-AiDE (<http://hivdb.stanford.edu/>). These two software applications are commonly used to identify drug resistance mutations and to manage clinical and treatment data. The REGA database will be used as the local South African database to manage both treatment and sequence data (<http://www.kuleuven.be/regal/>). The participants of the Southern African Treatment Network (<http://www.saturn4hiv.org>) in South Africa will deposit and share their sequences and clinical data on treatment cohorts. SANBI/UWC will apply bioinformatics techniques to determine the prevalence of drug resistance mutations in treated individuals in Southern Africa. The interfaces to the Stanford and REGA databases and analysis tools will be available for secure medical and controlled public usage at the SANBI/UWC website. The SANBI/UWC website will also give access to HIV sequences and treatment information from public databases.

SANBI/UWC, REGA and Stanford personnel will train a minimum of thirty clinicians in the country to use the web interface tools to manage patients on ART. The clinicians will be trained through distance learning and a hands-on workshop on how to use the web portal for management of patients on ART.

The project will also monitor and evaluate the prevalence and spread of drug resistance mutation in Southern African population, and use this data to inform public health policy decisions.

The system will be continuously optimized based on feedback from users and workshop participants. Monthly data will be collected to identify where requests for assistance are logged (thus evaluating whether the target audience is being reached), and to monitor the types of queries being submitted and the response time to queries. Consultations with the Department of Health and Department of Science and Technology will be undertaken to secure resources to maintain the system beyond 2010.

Activity Narrative: ACTIVITY 3: A Web-Based HIV/TB Educational Program for South African School Learners

There is a very high proportion of young South Africans at risk of HIV and TB. South Africa is ranked eighth in the world for the number of TB cases and the Western Cape has the highest number of cases in South Africa. Of the total population, 49% of the at-risk populations are children and youth under 18 years of age. Currently there is insufficient information on TB and HIV in schools.

A web-based interactive TB/HIV educational program for schoolchildren at secondary school level will be developed, and the Health Promoting Schools that are part of the overall UWC program will be used to test the educational program.

This activity will include three pre-selected pilot schools, all part of the Health Promoting Schools program (see COP 2008). The schools include St Andrews Secondary School, Elswood Secondary School and Ravensmead Secondary School, all located in Cape Town and all operating under the auspices of the Western Cape Department of Education. An interactive web-based educational program will be developed to educate learners on the causes of HIV and TB, including topics of prevention, risk factors, testing, and treatment. The three schools are equipped with computer laboratories that have access to the internet, and are therefore able to pilot and develop the program. Educational content will be presented in an engaging format that encourages incorporation into school lessons, particularly into the Life Orientation curriculum that is already taught at these schools. Thirty teachers in the pilot schools will receive training on the use of the web-based educational software. Thirty learners from the pilot schools will test the web-based software to assess comprehensiveness of content and user friendliness of the software. Bug-fixing and modifications to the web-based software will be based on teacher and learner feedback. The grades 8-9 educational material will be presented in English, and subsequently translated and presented in isiXhosa and Afrikaans. The interactive material will be presented to the Department of Education for assessment and validation. This project will collaborate with the national and provincial Departments of Health and Education; consultations will be held with both Departments regarding dissemination and continued utilization of the tool beyond 2010.

The project contributes to PEPFAR's targets by increasing the quality of service delivery in the diagnosis, treatment and palliative care of TB/HIV patients. It provides a web-based support system that will benefit clinicians working in remote service districts and will increase the knowledge of those within the education system. This system will aim to prevent TB and HIV infection, promote effective referral mechanisms for treatment and care for those affected by HIV and TB and those who are within the school system.

Summary

The University of Western Cape (UWC) is implementing multiple activities aimed at improving human capacity development to address HIV and AIDS in South Africa.

BACKGROUND

The 2004 report of the Joint Learning Initiative on health human resources states that "after a century of most spectacular health advances in human history, Human survival gains are being lost because of feeble national health systems. The HIV and AIDS emergency has undoubtedly contributed to this problem, particularly in South Africa. The pressure on health care workers is immense and with the crisis of attrition and out-migration of personnel, systems in South Africa are challenged as never before. This has been placed in stark relief by the urgent need to respond to HIV and AIDS epidemic, and especially the current imperative to deliver antiretroviral therapy (ART) to large numbers of sick people who are often living in areas where health systems have been poorly developed. This project focuses on strengthening and expanding the development and implementation of comprehensive HIV and AIDS prevention in South Africa in order to mitigate the impact of the HIV and AIDS epidemic. The emphasis area for these activities is human capacity development, training, including pre-service and in-service training. The minor emphasis area is local organization capacity building. Target populations include public and private sector health care workers and youth attending secondary schools.

ACTIVITIES AND EXPECTED RESULTS:

HIV and AIDS require a comprehensive approach with a view beyond the health system. Consistent with this approach, the activities in this program area demonstrate a multi sectoral approach to targeting a variety of health professionals. There are two separate activities in the program area.

Activity 1: A web resource to support TB/HIV Clinicians in South Africa

TB is the most common opportunistic infection and most important cause of death in people infected with HIV in South Africa. Information for clinical management of multiple drug resistant TB (MDR), and extensively drug resistant TB (XDR) is changing very quickly and it is difficult for clinicians to access this information. This project will develop and pilot a remote web-assisted consultation service for TB/HIV will diagnosis and treatment. This service will build the capacity of clinicians in Southern Africa to provide optimal TB/HIV care. A specialist consultative service and information of relevance to clinicians necessary to support accurate TB/HIV diagnosis, treatment and palliative care will be provided as a single web-accessible system. The system will offer a web-based consultation service to which clinicians can send in questions on how to manage problem cases and receive responses from recognized experts. The site will provide links to existing clinical guidelines, a photo library with images of clinical presentations and relevant data-mined information of the most recent updates from scientific literature. 20 Clinicians from various service outlets dealing with TB/HIV will be trained in efficient use of the system and will participate in the pilot. The system will be modified after the pilot and 90 clinicians will be trained in the use of the final system.

Activity 2: Addressing TB/HIV through the development of health promoting schools

A holistic approach is needed to address TB/HIV effectively. The World Health Organization has noted that

Activity Narrative: "the school is an extraordinary setting through which to improve the health of student, school personnel, families and members of the community." The UWC Health Promoting Schools Forum is a partnership between academics at UWC, the Western Cape Reference Group for Health Promoting Schools, the Western Cape Department of education (WCED) and the Western Cape Department of Health. This forum has been active in supporting the development of health promoting schools in the Western Cape. There are currently 130 health promoting schools in the Western Cape. WCED has identified 21 communities as being in particular need of multi-sectoral interventions through Western Cape Social Transformation program. The broad goal of this activity is to reduce the spread of TB/HIV in the school community. The specific aim of the activity is to build and strengthen human capacity among all in the school community. The purpose of this activity is to ensure the establishment of health promoting secondary schools, to facilitate the development of TB/HIV policies in the schools and to facilitate a process of developing healthy psychosocial and physical environment in the school community, and to improve knowledge in the school community related to TB/HIV.

Activity System ID: 22647

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Catholic Relief Services (CRS) FY 2008 activities will be continued in FY 2009, with the following modifications:

There will be increased focus on tracking and screening patients requiring tuberculosis (TB) treatment. Where TB treatment is not provided at the AIDSRelief facility, referrals to South African Government (SAG) clinics will be made and conscious efforts to followup on the outcome of TB treatment and subsequent inclusion on antiretroviral treatment (ART) where necessary. Discussions are currently in place with the SAG to provide TB drugs for several AIDSRelief sites. At the moment, however, the majority of AIDSRelief sites are not providing TB treatment. AIDSRelief staff will undertake to screen all patients in the community and at the facility; if TB symptoms are detected the patients will be tested for TB, and all patients with TB symptoms and/or new patients will be asked to provide sputum for Acid-Fast Bacilli (AFB) testing and culture in accordance with South African TB guidelines. Because of the well-known fact that severely immuno-compromised patients have a high prevalence of sputum-negative TB, AIDSRelief is trying to work within the SAG guidelines and increasing its efforts for early diagnosis within the home-based care network; however this still presents a challenge in terms of diagnosing patients requiring ART.

In cases where active TB is diagnosed, patients will receive TB medication at a public facility, with AIDSRelief staff, in conjunction with the SAG TB clinic, providing directly observed treatment short-course (DOTS) in the community.

AIDSRelief recognizes the high number of co-infections and high mortality due to TB. Community care workers will be trained to conduct home-based care screening of basic TB symptoms and refer for testing where necessary. Professional healthcare workers will be trained to treat and appropriately transfer or refer patients in need of TB treatment. Activities will include training for nurses, doctors, and counselors with specific TB diagnosis and treatment issues as a primary focus. The plan includes training for lay and community healthcare workers to provide TB identification and to encourage early identification of TB patients in need of ART as part of the provision of holistic health care service, in line with SAG National Department of Health guidelines. Salaries will include those for lay and community healthcare workers and a limited number of clinical staff (primarily nurses and doctors) to implement the program activities, as well as increased focus on INH prophylaxis.

Family-centered testing and care approach will be used where possible. Couple counseling and testing (CT) at CT and prevention of mother-to-child transmission (PMTCT) sites will be used to promote testing of men and to build their support for their female partners. It is also hoped that, through a community based testing, increased outreach will be made to women and children in villages in identifying patients in need of TB treatment. Where possible, training and employment of women as health care workers to increase the confidentiality and comfort of women and girls seeking treatment will be emphasized .

The community-based screening and referral has already been piloted at two AIDSRelief sites (Winterveldt Hope for Life and Orange Farm) in conjunction with CDC, and in FY 2009, AIDSRelief aims to roll out this innovative approach to several other treatment sites.

Given that AIDSRelief sites operate in rural and remote areas, where technical capacity and infrastructure is lacking, heavy emphasis is put on provision of laboratory services through a quality service provider. To overcome this challenge, a Johannesburg-based PEPFAR partner, Toga Laboratories, has been selected as the laboratory service provider for laboratory tests to be conducted under the program. The company has been established by Prof. Des Martin and Dr. John Sims, long-time South African virology experts. Toga Laboratories has an on-going quality assurance program to monitor and evaluate, objectively and systematically, the reliability of the laboratory data. There is an in-house laboratory quality unit that coordinates external quality assurance. For every test performed in the laboratory, there is a quality control plan stated in standard operating procedures. Internal quality controls are performed daily on all instruments as well as for manual tests and recorded. External quality assessments include the UK National External Quality Assessment Scheme as well as National Health Laboratory Services assessment programs, among others.

Isoniazid (INH) prophylaxis for TB will be provided to HIV-positive adults with latent TB according to SA Government guidelines, as well as to children exposed to the disease where possible.

In cooperation with Dr. Norbert Ndjeka of an AIDSRelief treatment site at Bela Bela (Limpopo Province) and advisor to the National Department of Health (NDOH) on multiple drug-resistant TB AIDSRelief sites will be assisted to draw up their infection control plans in line with NDOH guidelines to minimize the spread of TB in healthcare settings and curb mortality due to TB-HIV coinfection.

SUMMARY:

Activities are implemented to support provision of TB diagnosis under the comprehensive antiretroviral treatment (ART) program carried out by Catholic Relief Services (CRS) in 25 field sites in 8 provinces in South Africa. The focus of the activity is on diagnosing patients with TB so that they can be referred to the South African Government TB program for treatment, and commence with ART while on TB treatment as soon as the doctor at the site sees this as being medically feasible. The field sites target those in need of these services, who live in the catchment area of the site, and who lack the financial means to access services elsewhere.

BACKGROUND:

AIDSRelief (the Consortium led by Catholic Relief Services) received Track 1 funding in FY 2004 to rapidly South Africa Page 1113

Activity Narrative: scale-up antiretroviral therapy in nine countries, including South Africa. In FY 2005, FY 2006 and FY 2007, South Africa COP funding was received to supplement central funding, with continued funding applied for in FY 2008. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and the Institute for Youth Development South Africa (IYD-SA).

All sites operate under the terms of a Memorandum of Understanding (MOU) with the provincial Department of Health (DOH) in which they operate, observing the national and provincial health protocols. There is a concerted effort at each site to ensure coordination with the South African Government (SAG) and sustainability by diagnosing TB in potential ART patients, referring them to nearby SAG TB treatment facilities, and commencing ART once the patients are ready.

ACTIVITIES AND EXPECTED RESULTS:

With funding provided in FY 2008 AIDSRelief will continue implementing the activities in support of the South African national ARV rollout. Of the 25 existing field sites, activated in program year 1 (Mar '04 - Mar '05), two have transferred all their ART patients to SAG rollout facilities in FY 2006, and have ceased providing treatment. Two new field sites have been activated in FY 2007 to replace these sites and to enroll additional ART patients in support of the SAG rollout plan.

Utilizing technical assistance from AIDSRelief staff members and South African experts, ongoing support and guidance will be provided to sites in the form of appropriate refresher medical training courses, patient tracking and reporting, monitoring and evaluation mechanisms and other necessary support.

All TB treatment in South Africa is provided for free by the SAG. Screening of TB patients is problematic in NGO sites, but this programmatic area is strengthened with CDC-Atlanta technical assistance and increased focus in FY 2008. AIDSRelief will screen all patients who present themselves to field sites for TB, and will perform laboratory smear microscopy and culture (if indicated according to NDOH algorithms) on those suspected of having TB. If laboratory tests are positive, they will be referred to the SAG TB program for treatment, as per the agreement with the government. This activity includes additional training and commodities for the vast network of home-based carers to implement a single TB screening algorithm within the home setting, which improves referrals.

As part of the home-based care training, all home-based carers have to complete a module in TB DOTS. Most of them were selected as ART adherence monitors in the first place because of the considerable experience they have gained over the years in implementing the TB DOTS program.

AIDS (in itself and its relation to TB/HIV) is stigmatized in many South African communities because of the association with death. This is because the perception exists that AIDS inevitably leads to death. As the number of patients on treatment has grown, and as communities see that those on treatment are living normal, healthy lives, stigma is decreasing visibly and more and more patients are presenting themselves to be tested, either in VCT, or if they know that they are positive, to have their CD4 counts tested and see whether they qualify for treatment. This process has been accelerated by the way in which patients on treatment at each site are used as community peer educators and counselors.

As described earlier, all activities will be implemented in close collaboration with the South African Government's health authorities to ensure coordination and information sharing, thus directly contributing to the success of the SAG rollout and the goals of PEPFAR. These activities are also aimed at successful integration of AIDSRelief activities into those implemented by the SAG, thus ensuring long-term sustainability.

Funding Source: GHCS (State)	Program Area: Care: TB/HIV
Budget Code: HVTB	Program Budget Code: 12
Activity ID: 7913.22569.09	Planned Funds: \$291,271
Activity System ID: 22569	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Africa Centre for Health and Population Studies (Hlabisa ART Programme) first implemented TB/HIV activities in FY 2007. Africa Centre will continue to coordinate TB and HIV programs in FY 2009.

All clients receiving HIV and AIDS services are routinely screened for TB (through intensive case finding) and all TB positive patients receive provider-initiated HIV counseling and testing. The possibility of referral for X-rays by a private physician has made accessibility to TB diagnoses much easier.

Africa Centre has supported the Department of Health (DOH) in several ways since 2007. Africa Centre has ensured good practices in collection of quality sputum specimens, and collecting sputum in all the clinics each day, so that clients with TB symptoms can be fast tracked for diagnosis and thus, TB treatment as soon as possible. Training for all health-care workers is essential, and this has been done in collaboration with the DOH. Training materials on key topics are either adapted to the local context or if necessary newly developed.

In FY 2008, the provision of Isoniazid Preventive Therapy was be piloted and eventually rolled out to all eligible HIV-infected persons in whom active TB disease has been ruled out.

Infection control plans will be developed in partnership with the DOH. This will enable the clinics to prevent the transmission of TB among PLHIV as well as among health-care providers. Infection control plans will be based on national and international guidelines.

The home-based care program will refer all clients receiving HIV services that are TB suspects to the clinic to undertake TB diagnosis and referral. DOTS and patient support, contact tracing and coordination with the South African government's HIV program will be strengthened.

SUMMARY:

The Hlabisa antiretroviral treatment (ART) program aims to deliver safe, effective, efficient, equitable and sustainable ART to all who need it in Hlabisa district in rural KwaZulu-Natal. The program emphasizes the integration of the government PMTCT and Care and Treatment Programs. An important part of the Care and Treatment Program is the diagnosis and management of TB. Co-infection rates are high and the Medical Research Council estimates that 58% of people with TB also have HIV. The target population is people affected by HIV and AIDS. The major emphasis area is development of linkages and referral systems.

BACKGROUND:

The Africa Centre for Health and Population Studies (Hlabisa ART Programme) is a partnership between the KwaZulu-Natal (KZN) Department of Health (DOH) and the Africa Centre, a population research department of the University of KwaZulu-Natal. The DOH program is based in Hlabisa sub-District, a rural health district in northern KZN, and provides healthcare to 220,000 people at one government district hospital and 14 fixed peripheral clinics. The comprehensive ART Program, which includes TB services, is embedded in the DOH antiretroviral therapy roll-out. TB/HIV services are considered part of the comprehensive ART roll-out. The Africa Centre and KZN DOH work to complement each others' abilities and resources in providing TB/HIV and related services. The Africa Centre has expertise in infectious diseases and management that is not available at the district DOH. In addition to clinical staff and infrastructure, the district DOH provides the necessary TB/HIV drugs and laboratory testing for effective roll-out.

With FY 2008 funds, the Africa Centre will continue to partner with the district DOH to improve and expand TB/HIV services by providing additional human resources and training. In addition, Africa Centre will continue to provide comprehensive and integrated services for TB/HIV, palliative care, PMTCT, CT and ART.

With FY 2008 funding the Africa Centre will improve TB and HIV screening and diagnosis for patients and their families. Specifically, Africa Centre involvement will strengthen the TB/HIV Program, palliative care, provision of ART and CT. Increased attention will be given to address gender issues through a greater involvement of men and to promote TB and ART services among men and children.

ACTIVITIES AND EXPECTED RESULTS:

Africa Centre will continue to work with the national and provincial Departments of Health and specifically with the HAST (HIV, AIDS STI, and TB) managers to prioritize interventions designed to address weaknesses (identified by the departments of health) in the DOTS and TB/HIV programs. Africa Centre will focus on improving policy adherence and patient follow-up. Individuals will be hired for each site as tracers to track patients and ensure that referrals are completed. Africa Centre is setting aside funding to develop (with other relevant partners or agreement counterparts) standardized tools to ensure that policies and guidelines recommended by NDOH are followed, including guidelines for infection control. Africa Centre will continue to integrate TB/HIV interventions with existing agreement programs as Africa Centre works seamlessly and side by side with government employees at government facilities.

ACTIVITY 1: Partnership with South African Government

Africa Centre will expand TB/HIV screening and diagnosis services in collaboration with the DOH TB program and will explore other options for TB screening (including CT and PMTCT). Services will be expanded at all 14 facilities. The Africa Centre will work closely with the DOH to ensure that all patients who

Activity Narrative: enter the ART program are screened for TB and treated, if necessary. In addition, Africa Centre will provide training and mentorship to medical staff in order to strengthen the referral of people who receive DOTS for HIV testing.

ACTIVITY 2: Screening and Diagnosis

As part of general patient work-up for the ART program, Africa Centre-placed staff in close collaboration with DOH physicians and nurses will ensure that all patients in the ART program receive TB screening and diagnosis. For those individuals who are unable to produce sputum for TB diagnosis, Africa Centre and DOH staff in line with current SAG standard practice will refer patients for chest x-rays. Currently, patients either incur large transportation costs or pay for the chest x-rays out of their own pockets at private providers. In FY 2006 the ART program contracted a private physician in Mtubatuba sub-District to provide chest x-rays for free for patients in the ART program. This has substantially reduced the expenses and time costs of a large proportion of ART patients in having chest x-rays. Contracting the services of more accessible service providers ensures increased access to the service for patients who need it.

ACTIVITY 3: Treatment

All individuals in the ART program who are diagnosed with TB are treated through the DOT support program in close collaboration with the existing DOH TB program. Africa Centre, in addition to initiating TB screening in all individuals who are enrolled in the ART program, monitors the completion of TB treatment both in individuals in the monitoring cohort and before ART initiation.

In accordance with the South African national HIV and AIDS treatment guidelines, all HIV-infected patients who are coinfecting with TB will receive a full course of TB treatment independent of their HIV stage. In addition, before TB patients can receive ART, they will have been treated for TB (for two months if CD4 count >50, at least for two weeks if CD4 count <50). All patients who receive treatment for TB will also receive cotrimoxazole prophylaxis. A family centered approach will be adopted. Given the contagious nature of TB, patients with TB will be encouraged to bring their families in to be screened. Africa Centre will use this approach to increase male participation.

ACTIVITY 4: Human Capacity Development

The mobile team initiative started in FY 2006 with the goal to provide ART in all 15 DOH clinics, instead of only in 3 DOH clinics as in FY 2005. In FY 2008, this concept will be extended to provide home-based palliative care, with a team consisting of nurses, counselors, social worker and the assistance of a physician when required. Home-based palliative care will include educating patients about the need to screen for TB and to treat TB, if necessary.

The target population for home-based care is non-ambulatory patients who cannot access treatment in clinics and ambulatory patients who request a home visit, for instance to involve their partners and other family members in their care. The team will be able to provide ART and symptom relief, including symptomatic management of pain. The social worker will provide social counseling and information to the household on how to access available government psychosocial services (food aid, social workers, and government grants).

The nurses and the social workers who form the palliative care mobile team will receive intensive training. A baseline course is based on the DOH curriculum and is comprised of four sessions of three hours each; covering the basics of HIV and ART and TB, follow up of patients, and practical issues (including blood taking for CD4 counts and viral loads). In addition, the mobile care team will be specifically trained in administering and managing palliative care in the family setting.

This training will be further supported with clinic visits from training officers, during which the officers will monitor counseling and provide individual mentoring. In addition, nurses and treatment counselors will be encouraged to participate in short courses covering, the management of ART side effects, TB and HIV, and pediatric ART and TB. Counselors and nurses will be trained to provide TB care with a focus on the family.

ACTIVITY 5: Referrals and linkages

Counselors will be trained on available government support structures to link PLHIV and their families to other government programs, like ART services, PMTCT clinics, food aid and social workers, who can assist the families with applying for government grants. All patients who have TB will be tested for HIV and referred to the ART clinic if tested positive.

Individuals presenting to the DOH TB program independently from the ART program, will be routinely referred to CT. In order to start this activity, TB staff will be systematically and repeatedly informed where to access CT and how to talk to patients about HIV.

These activities will contribute to the PEPFAR goals of 2-7-10 by contributing to the goal of 10 million people receiving care through PEPFAR assistance.

Funding Source: GHCS (State)	Program Area: Care: TB/HIV
Budget Code: HVTB	Program Budget Code: 12
Activity ID: 9444.23046.09	Planned Funds: \$952,312
Activity System ID: 23046	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

TB and families: In line with the Reproductive Health Research Unit's (RHRU) strategy to increase counseling and testing (CT) services to family members of HIV-infected people, TB screening and contact tracing will be offered as well. This will be coupled with updated TB screening protocols at selected sites that move beyond identification of chronic coughs to fast-tracking sputum tests.

Facilitated Referral: RHRU will work with the Department of Health (DOH) to strengthen referral mechanisms. Where patients are referred for diagnosis and treatment, opportunities will be sought to promote, as best practice, escorted referral to ensure that patients reach the other side of the service compendium.

Infection Control: TB infection control measures are essential to prevent the spread of M. tuberculosis to vulnerable patients, health-care workers and communities. In light of the emergence and spread of drug-resistant TB, the establishment of facilities that are safe from TB has become a priority. RHRU will promote and implement improved TB infection control practices. These will include improved administrative (good workplace practice including the triaging of coughing patients by on-site case finders), environmental (good ventilation) and personal respiratory protection (DOH and WHO approved masks). At selected sites where the provision of adequate natural ventilation is not possible, RHRU will support the provision of UV radiation or filtration systems. Training will be provided to health-care workers (adherence to infection control plans, triaging of patients and proper procedures for collection and handling of sputum samples) and patients (cough etiquette, community awareness and the importance of testing family and partners).

Prevention of TB Disease: RHRU will continue work with primary health-care facilities and staff to identify clients eligible for prevention of TB by INH prophylactic therapy, using the TB/HIV integration register and the INH prophylaxis register. In addition, RHRU will work with DOH staff to adapt the INH prophylaxis guidelines where appropriate.

Drug Resistant TB: RHRU will work with the National Health Laboratory Services (NHLS) laboratories and DOH to identify multi- and extensively drug-resistant TB (MDR/XDR-TB) cases (through newer PCR-based diagnostic testing) and facilitate appropriate management of these cases, including HIV testing, commencement of antiretroviral treatment, contact tracing and referral for management of TB disease. RHRU will work with stakeholders to implement guidelines for management of contacts of MDR/XDR-TB patients.

SUMMARY:

The Reproductive Health Research Unit's (RHRU) TB-HIV activities include the ongoing provision of TB clinical services and the expansion of referral networks and service integration in a deprived inner city area of Johannesburg, South Africa. In addition, in KwaZulu-Natal (KZN), the RHRU is supporting implementation of ARV services at two TB hospitals (Don McKenzie & Charles James, where over 80% of TB patients are coinfecting with HIV). Lastly, RHRU will pilot a program to provide a health screening program to health care workers in the inner city of Johannesburg, to ensure a healthy workforce and early referral and management of chronic disease. Emphasis areas include human capacity development and local organization capacity building. Target populations include PLHIV, adults and children.

BACKGROUND:

RHRU, a unit of the University of the Witwatersrand in Johannesburg, currently provides technical support to the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa, which includes the national ARV rollout. Under PEPFAR funding since FY 2004, RHRU has provided regular on-site support, direct treatment, training and quality improvement to DOH sites in 3 provinces. They will continue these activities, which include inner city, district wide and rural programs focusing on providing support to complete up and down treatment referral networks. In addition, RHRU will continue the provision of counseling and testing (CT), palliative care, and prevention services. RHRU continues to develop models of service delivery that can be replicated and expanded, and produces findings from lessons learned and targeted evaluations to disseminate and share with others. It should be noted that the success of ARV treatment scale-up depends on the comprehensive approach detailed in other program areas. In particular, the strengthening of referral from other primary healthcare programs such as TB, family planning, antenatal/postnatal and STI treatment is critical. Basic Health Care and Support is an integral part of this system, and the RHRU will focus this part of its program on PLHIV, in impoverished areas such as the Hillbrow neighborhood in Johannesburg, and at PHC clinics in Durban, and rural areas of the North West province by delivering high quality palliative care, psychosocial support, and intensive training of doctors, nurses, and other health care professionals. Furthermore, RHRU will continue to develop strategies to address underserved communities affected by HIV, such as couples, high risk groups such as adolescents, and gender-based interventions with women at risk, including pregnant women, sex workers, and men. Although approximately 58% of TB patients in South Africa are HIV infected, published data have shown that a low number of patients are referred from surrounding TB sites to ARV services. A large percentage of these patients will qualify for immediate ARV treatment, and represent an untapped population requiring immediate access to ARVs. RHRU has been working with health authorities to provide TB clinical services and training, with the support of Emergency Plan-funding. RHRU has integrated TB into general palliative care training, and trained thousands of health providers in these areas in previous years. In addition, RHRU programs assist in treating HIV-infected people for TB. In FY 2008, RHRU will build on this program by continuing to train health care providers, and continuing to emphasize TB and HIV integration as part of on-site technical support to ARV treatment sites and primary health care clinics and their referral facilities.

ACTIVITIES AND EXPECTED RESULTS:

Activity Narrative: RHRU will continue to work with the national and provincial departments of health and specifically with the HAST (HIV, AIDS STI, and TB) managers to prioritize interventions designed to address weaknesses (identified by the departments of health) in the DOTS and TB/HIV programs. RHRU will focus on improving policy adherence and patient follow-up. Individuals will be hired for each site as tracers to track patients and ensure that referrals are completed. RHRU is setting aside funding to develop (with other relevant partners or agreement counterparts) standardized tools to ensure that policies and guidelines recommended by NDOH are followed, including guidelines for infection control. RHRU will continue to integrate TB/HIV interventions with existing agreement programs as they work seamlessly and side by side with government employees at government facilities.

ACTIVITY 1: TB Treatment Support & Integration

Tuberculosis treatment represents an ideal opportunity for entry in to an ARV program. Patients being treated for TB have to deal with the public health system entry, daily adherence, drug toxicity, and regular follow-up evaluation, all of which are key components of the ARV program. Ensuring that health care workers understand that referral from TB sites should be seamless, and encouraging patients to test for HIV through the DOH program, will ensure a constant stream of well-prepared co-infected patients entering the system.

ACTIVITY 2: TB Referral & Staging

RHRU's teams will continue to work within the existing TB services in 3 provinces to expand CT, CD4 staging, initiation of opportunistic infection prophylaxis (cotrimoxazole) and preliminary ARV adherence advice. RHRU will also facilitate direct referral of correctly staged patients into ARV treatment sites, and ensure that other patients accessing ARVs in RHRU sites in the 2 provinces are referred for TB treatment where necessary. Additionally, in the case of very immuno-compromised patients with TB who require ARVs relatively quickly in terms of national guidelines, RHRU will train health care workers to recognize this urgency and refer accordingly, while working with accepting ARV sites to similarly treat these cases with urgency.

ACTIVITY 3: Human Capacity Development

RHRU will continue to develop and scale up TB/HIV training programs for TB service providers operating at all levels of facilities in the provinces in which RHRU works. The primary focus will be on increasing access to ARV services from TB services through continual training and engagement with TB managers. RHRU anticipates that this approach will maintain a steady stream of patients into their ARV programs (see ARV Services section for more information).

ACTIVITY 4: Health Maintenance Program for Health Care Workers

RHRU will continue to provide screening for TB, HIV and chronic diseases among health care workers in City of Johannesburg health facilities, to ensure the preservation of human capacity and to determine the risk of TB infection among this important group. In FY 2008, RHRU will continue to undertake M&E activities to inform and develop quality TB/HIV care. RHRU will be in a position to conduct Public Health Evaluations (PHE) of some of its TB-HIV related projects in FY 2008-2009. For each PHE, a detailed proposal will be developed and submitted to PEPFAR for review and funding approval. This activity will contribute to both the vision outlined in South Africa's 5 Year Strategy and to the 2-7-10 goals by identifying and directing more people to ART, and by increasing access to care.

Mechanism: TB - TASC

USG Agency: U.S. Agency for International Development

Program Area: Care: TB/HIV

Program Budget Code: 12

Planned Funds: \$4,462,849

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The proposed COP for 2009 includes the following modifications to the activities based on the PEPFAR South Africa Interagency Partner Evaluation's recommendation of separating TASC II TB activities from PEPFAR activities, and dropping some of the activities.

The following activities have been removed from PEPFAR's COP 2009 but will still be implemented using other United States government resources:

- ACTIVITY 3: Strengthen Laboratory Services
- ACTIVITY 6: Strengthen Surveillance of MDR/XDR-TB
- ACTIVITY 8: Strengthen Services for Pediatric Patients

Changes have been made to the following activities:

ACTIVITY 1: Guidelines/Policy Development and Systems Strengthening in Public and Private Sectors

URC will not use PEPFAR funds to ensure correct implementation of multi-drug resistant (MDR-TB) recording and reporting tools in all MDR-TB units in the country. Nor will funds be used to train health-care workers and information officers on tools, and printing and dissemination of these tools. All other activities remain the same.

ACTIVITY 2: Reduce Stigma and Discrimination

URC will not use PEPFAR funds to provide small grants to local faith-based and community-based organizations to integrate TB and HIV activities and to provide nutritional support to individuals to encourage treatment adherence. Further, URC will not fund organizations to undertake advocacy and public education to create awareness of TB/HIV dual infections and need for early screening, nor will funding be allocated to home-based care groups to provide adherence support to co-infected patients on TB and antiretroviral (ARV) drugs. All other activities remain the same.

ACTIVITY 5: Strengthen Implementation of TB/HIV Infection Control Policies and Guidelines

This activity title has been changed to: "Strengthen Efforts to decrease the Burden of TB in People Living with HIV and AIDS by Accelerating the Implementation of the '3 Is' "

URC will assist districts and facilities to provide intensified case finding in all HIV-infected patients by ensuring that all clients receiving HIV services (voluntary counseling and testing, antenatal care, sexually transmitted infections, ARV) are routinely screened for TB disease and all those with an initial positive TB screen are referred for TB diagnostic services and those that are diagnosed with TB, receive treatment according to the national TB control guidelines. URC will continue to provide training to community-based health workers to promote early identification and referral of TB suspects, patient treatment support, default tracing and linkages with primary health-care facilities. URC will support the scale-up of isoniazid preventive therapy (IPT) by ensuring that supported facilities provide IPT to all HIV-infected people in whom TB disease has been ruled out, according to the national guidelines, ensuring that health-care workers are appropriately trained in the delivery of IPT. Through grassroots advocacy and social mobilization, RC will ensure that clear messages are conveyed to the patient, family and caregivers about the importance of adhering to and completing prophylactic therapy as well as reporting any potential side effects. Family members and close contacts of active TB patients, are screened for TB and if active disease is ruled out, IPT is provided.

URC will work with the National TB Programme to ensure implementation of infection control activities. Other activities will include development of information and education materials for TB infection control in work settings and in the community; and assistance to facilities to develop, implement and monitor infection control policies and plans (administrative, environmental, and personal protection) like safe sputum collection, promoting cough etiquette and cough hygiene, assessing patient flow and separation of TB suspects from other patients and open windows to improve room air ventilation.

SUMMARY:

TASC II TB Project (TASC II TB), managed by University Research Co., LLC, works with all levels of Department of Health (DOH) to increase screening, referral, treatment, and follow-up of TB and TB/HIV co-infected patients. Activities are designed to improve TB/HIV coordinated activities at program management and service delivery levels. TASC II TB provides support in development of operational policies and capacity development in laboratory, clinical skills, and community outreach. At service delivery level, emphasis is on integrating TB screening at HIV testing sites and vice versa as well as ensuring that TB/HIV co-infected patients are put on appropriate treatment regimens as well as referred for ARV treatment and follow-up services. Limited support is provided to community and home-based care groups to increase awareness of TB/HIV coinfections and need for early screening and follow-up. Emphasis is on human capacity development.

BACKGROUND:

This is an ongoing activity and is part of a larger USAID-funded TB project started in September 2004, with TB/HIV activities funded by PEPFAR. TASC II TB is currently working at all levels of DOH in 5 provinces to improve coordination of TB and HIV strategic and operational planning to integrate TB and HIV services into primary health care; strengthen laboratory services to support comprehensive TB and HIV diagnosis and care; develop new approaches to improve collaboration between TB and HIV programs; and improve

Activity Narrative: coordination between public and private sector to respond to the dual epidemic. TB/HIV strategy is implemented using a collaborative approach to rapidly scale-up integrated TB/HIV services in targeted provinces. Focus is on increasing access to counseling and testing (CT) for TB patients and early referral for ARV therapy, and improve TB detection in HIV-infected people. TASC II TB will work closely with PEPFAR partners involved in palliative care including basic health services for people living with HIV and AIDS (PLHIV). The project will assist partners in integrating TB case management in basic health packages for PLHIV. TASC II TB will also work with USAID partners providing services to children to integrate TB and TB/HIV care algorithms in pediatric and well-baby care for HIV-infected infants and children. This will include working with Medical Care Development International (MCDI), Integrated Primary Health Care (IPHC), and other partners providing care and support for orphans and vulnerable children (OVC).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Guidelines/Policy Development and Systems Strengthening in Public and Private Sectors

TASC II TB will continue working with National TB Program (NTP) and HIV and AIDS Unit at national and provincial levels in developing and refining operational policies on TB/HIV coordinated activities. This includes policies on treatment of co-infected patients. By providing on-going training and mentoring support, TASC II TB will assist health facilities and health care workers to improve compliance with national guidelines and protocols for screening, treatment and follow-up of TB/HIV co-infected patients. A cadre of Master Trainers will be developed in each province to improve knowledge and skills of healthcare workers. Managers and service providers will be trained to improve knowledge and skills in TB/HIV management and service delivery issues; strengthen capacity of private providers and medical schemes to better manage co-infected patients by ensuring that TB services are included as part of a comprehensive package of services; improve HIV services in TB facilities by promoting provider-initiated CT, and appropriate staging and referral of HIV-infected individuals. This will also ensure expansion of CT uptake among TB patients. Referral systems will be strengthened at district level between health and social services. Private practitioners will be trained on MDR-TB and TB/HIV management. Systems will be put in place to ensure prompt diagnosis and appropriate treatment. Links will also be developed between private practitioners and district TB coordinators to ensure proper monitoring and reporting of TB/HIV co-infected patients. Funds will also be used to ensure correct implementation of MDR/TB recording and reporting tools in all MDR-TB units in the country. This will include training of healthcare workers and information officers on tools, and printing and dissemination of these tools. TASC II TB will assist facilities and districts in reviewing performance data to ensure all TB and HIV patients are screened for coinfections and co-infected patients are provided with appropriate treatment and referrals.

ACTIVITY 2: Reduce Stigma and Discrimination

TASC II TB will support grassroots advocacy through CBOs/FBOs to counter stigma and promote a supportive environment for people with TB and HIV by implementing community-based awareness campaigns. The project will promote early diagnosis of TB among PLHIV by promoting routine TB screening of HIV-infected patients and CT among TB patients. Small grants will be provided to local FBOs and CBOs to integrate TB and HIV activities and provide nutritional support to individuals to encourage treatment adherence, and also allow organizations to undertake advocacy and public education to create awareness of TB/HIV dual infections and need for early screening. Home-based care groups will be funded to provide adherence support to co-infected patients on TB and ARV drugs. Advocacy materials will be developed. The project will fund local CBOs/NGOs for placing HIV counselors in all MDR-TB units to promote HIV testing of all hospitalized TB patients. In addition, the project will also work with sessional doctors to stage and manage co-infected patients and fast track access to ART for TB patients.

ACTIVITY 3: Strengthen Laboratory Services

The project will work with NTP and National Health Laboratory Services (NHLS) at service delivery level to improve availability and quality of laboratory services critical for identifying TB among HIV-infected individuals. Specific activities will include: 1) enhancing skills of laboratory staff in preparing and reading smears; 2) placement of a laboratory quality assurance system to improve sensitivity and specificity of sputum checking; and 3) development of a simple laboratory information system, linked with the electronic TB Register (ETR) to track turn-around-time of specimens sent to laboratory. Working with NTP, NHLS, World Health Organization (WHO) and Medical Research Council (MRC), laboratory TB policies and guidelines will be updated to be in line with international standards and the STOP TB strategy. The project will work with other partners to train districts and facilities on MDR-TB surveillance data collection and reporting.

ACTIVITY 4: Monitoring and Surveillance

The project will work with NDOH to strengthen recording and reporting systems for TB and HIV by training healthcare workers in implementation of revised TB and HIV registers, data collection and analysis, and on-going problem solving functions. TB TASC will strengthen capacity of provincial, district and local service area (LSA) health offices to establish functional HIV and AIDS, STI and TB (HAST) committees in order to strengthen monitoring, supervision, and surveillance of TB and HIV by using an approach of continuous feedback and mentoring of service providers. The project will also work with National DOH to strengthen and improve TB and HIV monitoring through use of ETR. TASC II TB will work with DOH to monitor TB and HIV programs as well as cross-referrals for TB/HIV and ARV treatment. Technical support will be provided to health facilities and CBOs and FBOs in integrating TB and HIV with other health services to reduce missed opportunities and improve continuum of care by promoting routine CT to TB patients and routine TB screening for HIV people including pregnant women

ACTIVITY 5: Strengthen Implementation of TB/HIV Infection Control Policies and Guidelines

TASC II TB will work with WHO and NTP to finalize the development of infection control guidelines for TB

Activity Narrative: program. This will be followed by training of primary health care managers and service personnel including doctors, nurses and allied health workers on the implementation of the national policy and guidelines. Information and education materials for TB infection control in work settings will be developed for health care workers.

ACTIVITY 6: Strengthen Surveillance of MDR/XDR-TB

TASC II TB will work with NTP as well as local universities to improve and expand surveillance of MDR/XDR-TB in the country. Assistance will be provided to design a simple framework to collect and analyze data on MDR/XDR patients in each province. In addition, mechanisms will be developed and implemented for contact tracing of MDR patients to minimize risk of nosocomial transmission. Close contacts of MDR/XDR-TB patients will be put under close surveillance and appropriate prophylactic treatment if needed.

ACTIVITY 7: Promote Linkages with Palliative Care

TASC II TB will work with PEPFAR partners responsible for delivery of basic health care for PLHIV to integrate TB screening, diagnosis, treatment and follow-up as part of their routine care and management of HIV clients. PEPFAR partners will be helped to ensure all HIV infected clients are regularly screened for TB and those with bacilli are put on TB treatment, and also in management of TB/HIV patients. TASC II TB will provide training and follow-up support to these partners.

ACTIVITY 8: Strengthen Services for Pediatric Patients

TASC II TB will work with USG partners working on child health issues to improve quality of services. Partners will be trained in management of pediatric TB including suspecting and referring for TB diagnosis. Key partners may include groups receiving USAID funds as well as other PEPFAR partners tasked with OVC care and support.

Program Area: Care: TB/HIV

Budget Code: HVTB

Program Budget Code: 12

Activity ID: 6544.22998.09

Planned Funds: \$0

Activity System ID: 22998

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. The National Department of Correctional Services is in its fourth year of funding with a very high carryover amount. All the proposed FY 2009 activities will be supported using carryover funds. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Department of Correctional Services' FY 2008 COP will be expanded to include:

- Development and implementation of TB strategies and policies;
- Training for all health professionals in the management of TB with specific reference to the correctional environment; and
- Implementation of an electronic TB register.

SUMMARY:

PEPFAR funds will be used by the National Department of Correctional Services (DCS) to train professional nurses in the management of tuberculosis (TB) and patients who are on the antiretroviral treatment (ART) program. The major emphasis of this activity will be training, with minor emphasis on community mobilization and participation; development of network/linkage/referral systems; information, education and communication; linkages with other sectors and initiatives; and local organization capacity development. The populations will include men and women of productive age, people living with HIV (PLHIV) and their caregivers.

BACKGROUND:

This is an initial project. Currently there are about 635 professional nurses in the DCS. This project will train about half of them to provide on-site primary healthcare services in the management of TB and for patients who are on ART. South Africa has a fairly extensive and mobile correctional center population. Overcrowding in Correctional Centers creates ideal conditions for the transmission of communicable diseases such as TB.

ACTIVITY 1: Training of the Professional Nurses in the Management of TB

This is a continuation of the activity as indicated in COP FY 2007. A number of nurses have been trained in the Management of TB. This has improved patient care in the Correctional Centers. Nurses that have not been trained will be included in this training initiative. It is envisaged that the training will lay a firm foundation for improved service delivery and the effective management of tuberculosis in Correctional Centers.

ACTIVITY 2: Appointment of Communicable Disease Control Management Area Coordinators

A need has been identified to appoint 12 Communicable Disease Control Management Area Coordinators on contract. The appointment of the above-mentioned officials will ensure improved Communicable Disease Control. The Communicable Disease Control Coordinator will be responsible for the planning, implementation, monitoring and evaluation of communicable diseases programs and services at a Management Area level. They will also ensure program analysis, formulation and evaluation as well as budgetary management for the program. They will further more liaise with relevant stakeholders at a national, provincial, district and local level. These positions will be absorbed in the DCS establishment to ensure continuation of services and programs.

ACTIVITY 3: TB/HIV Campaigns in Correctional Centers

TB/HIV campaigns will be held in all the 36 Centers of Excellence to raise awareness on the impact that this epidemic has as well as to equip offenders and members with the necessary knowledge. This will add value to the prevention and management of TB and HIV among offenders and members. It is envisaged that the raising of awareness on TB will decrease the level of stigmatization and discrimination as well as to encourage offenders who are on TB treatment to continue and finish their treatment. If offenders can be made aware that having TB does not necessarily mean you have HIV as well. Should the offender have TB and HIV he must be made aware that TB is curable although HIV is not. The DOT support program will also be encouraged and offenders will be motivated to have a DOT supporter.

Table 3.3.12: Activities by Funding Mechanism

Mechanism ID: 4763.09

Mechanism: N/A

Prime Partner: Xstrata Coal SA & Re-Action!

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Care: TB/HIV

Budget Code: HVTB

Program Budget Code: 12

Activity ID: 22741.09

Planned Funds: \$533,998

Activity System ID: 22741

Activity Narrative: SUMMARY:

Re-Action! will support the District Management Team in the Mpumalanga province in three districts (Ngakala, Gert Sibande and Ehlanzeni) with the development and integration of adherence support for individuals co-infected with TB and HIV at a household level through building capacity in the Outreach Worker project to deliver household driven services. Re-Action! will further support the district management system by improving the capacity of health-care professionals to collect quality of data that relates to TB diagnosis and treatment of patients receiving HIV services.

BACKGROUND:

Re-Action! will assist the Department of Health to integrate TB/HIV service delivery through a public-private mix (PPM) within the Mpumalanga province and into three additional provinces (Limpopo, North-West and Northern Cape) in eight health districts. This will focus on district-level integration of HIV and TB interventions and the improvement of existing services in public health care facilities.

Through the PPM Health Systems Strengthening approach, Re-Action! will integrate public and private sector contributors to address identified systems constraints to scaling up HIV and TB services within the target districts. This is conducted in partnership with District Health Management Teams and local government. It includes strengthening facility and community-based health services in both the public and non-state sector, to increase points of access to care, support and treatment services, improve service linkages and align basic service planning and delivery with government plans and programs.

Expansion of these partnerships into the additional provinces will be a developmental activity leading to signing of partnership and co-investment agreements with companies and memoranda of understanding (MOU) with the provincial Departments of Health.

ACTIVITIES AND EXPECTED RESULTS

Health systems strengthening activities will include:

1. Promote understanding of the PPM approach to TB/HIV control, as recommended in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011, through technical assistance.
2. Train health workers in eight facilities on TB/HIV service delivery.
3. Strengthen supply of isoniazid for isoniazid preventive therapy (IPT) at service sites.
4. Implement PPM for TB/HIV service activities (TB screening, referral and DOTS) at seven private sector sites (i.e., five GPs, two Company Occupational Health Clinics) with supportive supervision.
5. Implement the appropriate TB/HIV task mix (screening, referral and DOTS) among community outreach workers and through household-level care and support.
6. Strengthen TB reporting and surveillance at all provider sites in the district.
7. Document progress and establish good practices through service quality improvement activities. This requires appointing a Health Advisor and procuring specific additional external technical assistance, as required. Reaction! will promote increased awareness and capacity of the HIV & AIDS, STI and TB team within target health districts for strengthening implementation of TB/HIV collaborative activities, including IPT and preventing occupational TB exposure.

Re-Action!, as the implementing agency for co-invested PPM, aimed to scale up the efforts of co-invested partners, and to mainstream health and sustainability activities through the providing upstream support for strengthening local government Primary Health Care Clinics (PHCC); expanding access to HIV and TB prevention, diagnosis, treatment, care, support and education; increasing human resource capacity to deliver primary health care services and to raise the quality of standards of HIV and AIDS and TB prevention, diagnosis, treatment, care, support and education; partnering with other PEPFAR partners, to facilitate synergies in implementing project activities sustainably; expanding existing community outreach activities to individual households; increasing access and opportunity for HIV voluntary counseling and testing; partnering with TB/HIV collaborative service activities such as the DOTS project led by the Department of Health; renovating existing government PHCC and facilities; preparing PHCC for accreditation; building local capacity; promoting and strengthening country strategic objectives; and developing new PPM networks and brokering co-invested funding.

Table 3.3.12: Activities by Funding Mechanism

Mechanism ID: 416.09

Mechanism: N/A

Prime Partner: Broadreach

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Care: TB/HIV

Budget Code: HVTB

Program Budget Code: 12

Activity ID: 7939.22616.09

Planned Funds: \$1,412,666

Activity System ID: 22616

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The National Department of Health (NDOH) has asked BroadReach Health Care (BRHC) to expand support to 19 complete hospital systems. BRHC will support 250 palliative care sites, including 25 South African government (SAG) hospital systems in FY 2009. Although BRHC has only reported TB data from four sites in 2008, all sites provide TB services or refer TB suspects for services. All proposed activities will be aligned with the updated SAG guidelines and updated policies and guidelines will be implemented.

ACTIVITY 1:

BRHC will continue to build capacity, but the number of SAG facilities will be increased. Training for healthcare workers on isoniazid preventive therapy (IPT), intensified case finding (ICF), DOT and patient support, TB infection control, prevention, diagnosis and management of MDR/XDR-TB, operational integration of HIV and TB services, diagnostic algorithms and procedures to diagnose smear negative, extra pulmonary and pediatric TB will be provided. All training will be SAG-accredited. Additionally, BRHC will train home-based care workers to ensure that they receive accredited training, and for those who qualify, a refresher training course.

BRHC will scale up its interventions to cover more communities and topics. BRHC will continue to partner with SAG facilities, community- and faith-based organizations, PLHIV support groups, and NGOs to provide training of trainer courses and patient/community training programs, to develop staff and volunteers within these organizations and communities who can (i) raise awareness about TB/HIV prevention and control; (ii) serve to provide education, infection control, treatment literacy training in SAG facilities and in the community to those who are TB/HIV infected and affected; and (iii) provide ongoing adherence support including DOTS. BRHC will continue to produce SAG approved patient videos, speaking books, flipcharts, posters, treatment diaries, etc.

ACTIVITY 2:

BRHC will cover more areas and address more issues at the national, provincial and district levels. BRHC has assisted with developing strategic plans for rolling out comprehensive HIV/AIDS programming, including TB. BRHC will continue to do this and focus on assisting the SAG to (i) develop and implement SAG approved models such as health-care worker participation in prevention and adherence; (ii) linkages at all levels of SAG including laboratories; (iii) down-referral approaches; and (iv) human resource planning, training materials and approaches.

ACTIVITY 3:

BRHC will continue to integrate and upgrade services at TB and HIV facilities, including joint planning, supervision, staffing, medical records, protocols and procedures, fast-track processes for suspected clients, monitoring of outcomes and referral systems, and equipment/infrastructure upgrade. BRHC will support SAG hospitals, community and primary health clinics to ensure continuity of care for patients up and down the referral chain by strengthening or establishing referral systems. BRHC will ensure that ICF, IPT and TB infection control procedures are implemented correctly across sites through clinical mentorship and quality assurance activities. Activities to ensure IPT is provided according to national guidelines will be simultaneously addressed in ARV and TB clinics, and in patient settings.

In alignment with SAG district and provincial priorities, BRHC will support TB/HIV interventions at primary and community health clinics, and at secondary level public health facilities. BRHC technical assistance will be focused intensively at two hospitals: Dunstan Farrell (KwaZulu-Natal) and Umlamli (Eastern Cape). Support will include risk assessments for TB transmission using the SAG TB Infection Control Guidelines and assessment tools. Following assessments, BRHC will assist sites to implement infection control procedures through changes to patient flow, fast tracking of TB suspects, cough etiquette and improved ventilation. Infection control procedures will be tailored to the facility.

BRHC will strengthen the lab lifecycle including appropriate and safe sputum/specimen collection, timely specimen transport, improved reporting of results from labs to clinics, upgrade lab equipment and infrastructure, and ensure that all staff are trained in accordance with SAG policies. BRHC will assist laboratories at sites to adhere to QA procedures for sputum smear microscopy. BRHC will work with the National Health Laboratory Service to decentralize sputum smear microscopy services as requested by DOH, and where deemed necessary to improve accessibility to TB diagnostic services.

ACTIVITY 4: QUALITY ASSURANCE

BRHC will expand M&E programs with emphasis on new reporting systems for the new PEPFAR TB/HIV indicators, monitoring integration of services, implementation of and coordination of reporting systems within SAG at all levels, and staff augmentation to support these efforts.

SUMMARY:

BroadReach Healthcare's (BRHC) activities include doctor consultations, lab testing, adherence support, patient counseling, remote decision support, quality assurance monitoring, training for both patients and health professionals, support groups and data management.

BACKGROUND:

PEPFAR funds support BRHC initiatives that provide HIV and AIDS clinical management, care and support services to HIV-infected individuals in areas where the SAG rollout has not yet been implemented and assists ART rollout in the public sector. BRHC taps private sector health professionals to provide comprehensive care and treatment, fostering capacity-building initiatives within the public health system, and supporting community-based programs. BRHC leverages PLHIV support programs to identify and assist with treatment literacy, adherence support and ongoing community mobilization, prevention education activities, and positive living initiatives. BRHC also works to build capacity in public health facilities, focusing efforts on human capacity development (HCD) activities, including clinical didactic training, clinical mentorships, patient training and operational assistance training. BRHC is expanding its provision of staff

Activity Narrative: and infrastructure support to SAG facilities. Finally, BRHC is expanding its involvement in the design of scaleable down referral models in partnership with faith-based organizations (FBOs), community-based organizations (CBOs), and public-private partnerships (PPPs).

ACTIVITIES AND EXPECTED RESULTS:

BRHC will continue to work with the national and provincial Departments of Health and specifically with the HAST (HIV, AIDS STI, and TB) managers to prioritize interventions designed to address weaknesses (identified by the departments of health) in the (directly observed therapy short-course) DOTS and TB/HIV programs. BRHC will focus on improving policy adherence and patient follow-up. Individuals will be hired for each site as tracers to track patients and ensure that referrals are completed. BRHC is setting aside funding to develop (with other relevant partners or agreement counterparts) standardized tools to ensure that policies and guidelines recommended by NDOH are followed, including guidelines for infection control. BRHC will continue to integrate TB/HIV interventions with existing agreement programs as BRHC works seamlessly and side by side with government employees at government facilities.

ACTIVITY 1: Human Capacity Development (HCD)

This program aims to provide TB care and treatment for HIV-infected patients by strengthening the TB skills of health professionals through didactic training and clinical mentorships focusing on TB, TB/HIV coinfection and systems integration. Health professionals will also receive decision support and training from the BRHC clinical expert panel and disease management system for difficult cases. At the local level, HCD efforts will target the communities in which the program operates by providing training and information, education and communication (IEC) to patients and support group facilitators on TB, as well as HIV/AIDS, ART, adherence, living positively, and accessing clinical psychosocial support and linkages to other sectors and initiatives in their communities.

ACTIVITY 2: Support to SAG

This program will support the SAG TB program to increase the capacity of facilities in the testing and identification of TB patients. This will be accomplished through general healthcare financing which could include commodity procurement such as screening equipment to salary support of TB-focused clinical staff. Salary support would be given in line with government facility rates along with transition plans for the government facility to absorb the staff into their budget within a finite period. Alternatively staff would be financed on a contract basis while plans were implemented in government facilities to accommodate staffing needs. Further assistance could be given in assisting with health professional recruitment and developing retention strategies, as well as supporting BRHC network doctors who assist with TB/HIV care and treatment within government health facilities in their communities in order to increase treatment capacity. Training of these doctors assists with sustainability as it provides ongoing stable support to government facilities and allows government infrastructure to cope with fluctuating need through the provision of sessionals. Finally, BRHC will support SAG TB/HIV efforts through infrastructure upgrade by building and/or refurbishing hospital/clinic/lab space and purchasing equipment as needed, in order to support government clinic activities such as screening, diagnosis and closely supervised treatment. The approach would be to address the individual needs of each facility within areas where BroadReach provides assistance in the form of ARV treatment or CT services across the provinces.

BRHC activities in support of TB treatment will be guided by consultations at national, provincial and district level re: government identified shortcomings in TB programs. These interventions may include human resource support, equipment, facility-specific policy development and business systems according to SAG articulated needs. BRHC program support priorities will reflect SAG-identified priorities. Moreover, BRHC HIV and TB/HIV integrated activities will build on and support pre-existing initiatives at sites, and integrate with the facility, and district, provincial and national TB and TB/HIV programs. TB/HIV services will also be integrated with all other related care and support services offered at facility level.

ACTIVITY 3: Referral Networks

Additional support to SAG will be provided in the form of systems strengthening around TB/HIV activities. This will include improvement of referral linkages between the private sector general practitioners (GPs) and public sector facilities that treat BRHC patients for TB infection in the BRHC Comprehensive Care model. In addition, BRHC may work with government sites to facilitate linkages between TB and HIV clinics, as well as creating capacity and linkages within communities to support BRHC patients with TB/HIV coinfection within the context of a BRHC supported public-private partnership with Daimler Chrysler (PPP). These linkages will be established by implementing referral processes between caregivers by holding workshops, creating referral material (referral forms that inform the receiving provider where the patient originated and the findings of the original provider), and informing various groups of activities in the area. Processes will specify whether HIV patients with TB are referred to HIV clinics or TB clinics or vice versa. The expected outcome is that patients are treated holistically and not in isolation by various providers. Since these diseases are closely linked it is important that the treating physician treats the patient for TB and HIV so that s/he is able to manage treatment regimes. BRHC will institute processes to ensure smooth referrals and coordinated patient management for co-infected patients. These processes may include employing TB/HIV case managers, integrating HIV and TB databases to facilitate patient tracking, support DOTS programs, utilize home-based carers to monitor and support patients. Patients with TB should have access to HIV testing and should they require ARV therapy, they would need to be treated or referred to an ARV facility.

ACTIVITY 4: Quality Assurance/Quality Improvement (QA/QI)

TB/HIV activities will benefit from the same level of oversight and quality control as all other aspects of the BRHC treatment program including regular internal data and systems audits, collection of patient level surveillance data, exception reports, doctor-specific feedback report, and doctor decision making support, and community-based modified DOTS programs. TB/HIV quality assurance is further enhanced by the tracking of co-infected patients through screening, diagnosis and treatment through the use of improved clinical forms and referral forms. A clinical oversight committee provides any guidance to GPs regarding complicated cases presenting with TB/HIV coinfection. Data collection and reporting on TB, and TB/HIV coinfection will be integrated into ARV Program management reports to ensure constant monitoring of patients and to facilitate program improvement.

Activity Narrative: All BRHC activities articulated in the FY 2007 COP will be scaled up significantly through partnerships with 15 SAG hospital systems (which include hospitals and affiliated CHCs and PHCs). With FY 08 funding, activities will be expanded/enhanced (i.e. no new activities) as follows:

- BRHC supports QA/QI at each of its public sector partner hospitals through QA assessments, systems re-engineering, and the development of reporting systems that provide program management feedback to improve program performance.
- As part of systems re-engineering BRHC will focus on improving integration between HIV/AIDS treatment programs and TB programs for testing, treatment coordination and referrals.
- Strengthen down referral activities between public sector hospital partners and their affiliated clinics by re-engineering referral processes, improved data management and patient tracking, and training.
- Training for health professionals at all public sector sites (hospitals and PHCs) covers TB/HIV co-management.
- HIV/AIDS literacy training for patients as part of community mobilization.
- Staff augmentation: BRHC will provide additional salary support to fill key positions within SAG partner hospital sites. BRHC will also work with the site to motivate for the creation of permanent posts where needed and ensure that BRHC/PEPFAR supported staff are incorporated into subsequent site budgets to ensure a sustainable staffing solution.

Mechanism: N/A

USG Agency: HHS/Centers for Disease
Control & Prevention

Program Area: Care: TB/HIV

Program Budget Code: 12

Planned Funds: \$934,981

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Aurum will scale up integrated TB/HIV services in the Tembisa sub-district in Gauteng. Tembisa Hospital will be the central activity, but Winnie Mandela Clinic and Tembisa Main Clinic will also receive support. Aurum will focus on linkage of services between HIV/TB, intensive case finding, INH provision and infection control. Aurum will develop networks of care in Gauteng, North West, Eastern Cape and Limpopo, supporting the down-referral process for ART and linkages among levels of TB/HIV services. This will include training and mentoring health-care staff on co-infection, the use of INH and infection control.

Aurum will support testing health-care workers for TB and HIV. At the site level, Aurum will support community-based staff for TB/HIV activities and staff at district, community health center (CHC) and primary health care (PHC) levels. Infection control will be assessed at health-care provision sites accompanied by, where necessary, training and infrastructural support. TB/HIV coordinators will be trained and supported to strengthen linkages from the district level to PHC. These positions will be supported in collaboration with the Department of Health (DOH) and be placed within the DOH to support TB-HIV integration. In addition, at the site level Aurum will support the TB/HIV focal points in developing appropriate training and resources to manage TB/HIV integration more effectively. Aurum will support laboratory staff so that the increased burden of smears and TB diagnostics will be absorbed in the scale-up. Staff at the site level will be trained in intensive case finding and recognition of TB suspects. INH will be provided at the clinic level and will be linked to the current down-referral sites in the four provinces. A provider- and client-centered model linked to training, patient education and improved management will be used. This will be linked to the TB/HIV focal points and the proposed TB/HIV coordinators at the managerial level.

The linkage to directly observed therapy (DOT) will be facilitated by the down-referral networks that this program will develop and has developed. The existing DOT program will be supported through managerial support and staff training.

TB/HIV activities will focus on human capacity development at four tertiary and secondary sites with TB/HIV focal points and 14 CHC sites, including four prisons. Training and mentoring of public sector staff will be provided at supported public sector sites including Tshepong Hospital and Orkney Clinic (North West), Chris Hani Bara Hospital, Tembisa Hospital, Tembisa Main Clinic (Gauteng) and Madwaleni Hospital (Eastern Cape). These activities will also be conducted at eight of the down-referral sites in Ekurhuleni Northern district, the current general practitioner project and three down-referral sites in the Eastern Cape linked to Madwaleni Hospital.

Support for staffing plans and task shifting will be initiated at all sites and levels of service. Mentoring and training will include TB/HIV integration, infection control, staff TB testing, INH provision, and intensive case finding. SME employees, peer educators, managers and owners will receive education and training on the identification and management of TB. Occupational health nurses in the SME program will be trained to become treatment supporters and directly observed therapy short course (DOTS) monitors for HIV-infected employees who are receiving anti-TB treatment supporting existing DOH DOTS programs.

Linking TB screening and CT aim to bring services closer to populations at risk. This will be achieved through mobile testing and fixed site services. Individuals who test positive for TB will be referred to Aurum-supported public sector centers.

In terms of the National TB Strategic Plan, Aurum will support (a) political and managerial efforts, where Aurum and the chairs of District Health Councils, clinic staff and community will prioritize TB and TB/HIV interventions through focused planning, improvement of data feedback and responsiveness; (b) resource mobilization; (c) effective program management of the TB and TB/HIV program at the district, sub-district and health facility levels; (d) improved case detection through smear microscopy and cultures by developing the capacity of the sub-district and district levels, maintaining sputum smear microscopy as the diagnostic mainstay, and ensuring that lab and health-care staff are trained in diagnoses, and in addition, Aurum will consider models of devolving lab services to lower levels of service and support the DOH in this effort; (e) supervision and patient support; (f) standardized reporting and recording system, including the paper-based revised TB data collection tools, TB register, suspect registers, patient cards, facility cards and referral forms that include HIV and their implementation at the clinic level; (g) strengthening the health system's existing processes and systems to function and deliver district level targets, while training and capacity building of staff and systems that will directly affect related health outputs for the district; and (h) advocacy, communication and social mobilization efforts through development of gender module to train healthcare staff and to incorporate gender into programming at all levels of care, including linkage to partner testing and TB screening, involving families in the TB HIV continuum.

Providing TB identification, prophylaxis and treatment support services to selected mobile male populations that drive taxis within commercial hubs in Gauteng, Mpumalanga and Limpopo will enable increased identification of TB cases, prevent the spread of TB within taxis, and allow taxi drivers to continue to work while taking medication. All data will be disaggregated by gender. Formative assessment on gender and TB/HIV will be done and gender-specific interventions will be operationalized based on findings.

SUMMARY:

Aurum's TB/HIV program aims to integrate HIV care with TB prevention and treatment. This integration is planned at all the HIV treatment sites which include general practitioners' clinics and community clinics throughout the country. In addition, Aurum plans to improve TB/HIV integration at Chris Hani-Baragwanath Hospital in Gauteng by providing support to the TB clinic in the form of nursing staff and data management support. In addition, Aurum plans to work with the Platinum mining industry to insure TB/HIV integration within the mining health services and to provide mobile services to contacts of miners who are treated with TB. In the Eastern Cape, Aurum intends to provide support to Themba TB hospital to ensure they receive accreditation to provide HIV services. TB/HIV Care is a new activity under the SME Project. The screening and identification of TB cases among the employed sector and taxi drivers is of particular importance as

Activity Narrative: they come into contact with a large number of people each day and successful treatment will result in the prevention of several new infections. In addition, successful identification and treatment of TB in the employed sector, including Traders and Taxi drivers will ensure they continue to be economically active and are able to support themselves and their dependents and continue to run a viable business. SMEs contribute half of the total employment in South Africa and 75% of the employed people in Johannesburg utilize Taxis to commute to and from work.

BACKGROUND:

The main focus of the Aurum program in the public, private and NGO sector is to provide HIV care and treatment to a large number of persons in a cost-effective standardized manner ensuring a high quality of counseling, patient care and patient monitoring. The model is centrally coordinated and designed to be implemented on a large scale where the peripheral sites are in resource-constrained settings and lack HIV specialists, information technology (IT) infrastructure, and laboratory and pharmacy capacity. Aurum has developed a centralized system of support which includes the following: (1) training of all levels of healthcare workers to ensure capacity building of clinicians to manage patients in resource-poor settings with remote HIV specialist support; (2) provision and maintenance of guidelines for HIV preventive therapy (including INH and cotrimoxazole), treatment of adults and children, prevention of mother-to-child transmission and voluntary counseling and testing; (3) clinical and administrative support through site visits by staff involved in psychological support, training, clinical support and monitoring data management system; and (4) centralized distribution of medication and laboratory testing.

In most areas, clients are referred to the public health clinics for definitive diagnosis and treatment of TB. Aurum is initiating a program where healthcare workers at sites are able to diagnose TB patients using algorithms and guidelines that are in line with the NDOH. Healthcare workers then refer patients to public sector clinics for treatment. In addition, patients who test HIV-infected under the counseling and testing program will be screened for TB.

ACTIVITIES AND EXPECTED RESULTS:

There are seven main activities in this program area.

ACTIVITY 1: TB Preventive Therapy for HIV-infected Individuals

CD4 count testing is done 6-monthly or 3-monthly in patients with CD4 above or below 350 respectively. Patients are given TB preventive therapy with 300mg isoniazid taken daily for 6 months after exclusion of TB, repeated every 2 years. Aurum expects that a minimum of 10% of all palliative care patients will require TB preventive therapy. This integration will be implemented at all the HIV treatment sites run by general practitioners and community clinics throughout the country. Sites include the Metro Evangelical Services Clinic, which provides services for the homeless population and street youth of Hillbrow, Johannesburg, and the Medical Research Council (MRC) sites, providing care primarily to women. Aurum's sites are located primarily in Gauteng, North West and KwaZulu-Natal. There are sites in all the other provinces but only one site in each of Northern Cape and Western Cape

ACTIVITY 2: Diagnosis and Treatment of TB in the HIV-infected

When initiating the ARV program or the palliative care program, a symptom screen and a chest radiograph will be done on each patient. At each clinic visit, there is symptom screening by trained nurses. Guidelines for screening tuberculosis will be followed and monitored. An evaluation of current screening practices is currently underway and this will be used to ensure improved monitoring of screening and standardization of the TB screening process. At Tshepong hospital the project will be enrolling new patients who are started on treatment onto a TB screening process (including symptom screening, sputum testing and chest radiography) to identify the most appropriate screening methods.

ACTIVITY 3: Support for HIV-TB integration services at Chris Hani-Baragwanath hospital

Aurum will provide support to provide TB/HIV integration services at the Chris Hani-Baragwanath hospital, a large government hospital in Gauteng. Aurum will employ a nurse and counselor who will provide HIV counseling and testing to all TB patients and ensure referral of those who test positive to the HIV clinic. In addition, Aurum will develop a data system that will assist in ensuring successful incorporation of these patients in the HIV care program.

ACTIVITY 4: Public-Private Partnership within Platinum Mining Industry

Aurum is establishing a partnership with Anglo Platinum and other platinum mining companies to strengthen their TB/HIV integration activities within their mining facilities. In addition, a program to trace dependents and household contacts of miners diagnosed with TB will be introduced. This program will include household visits with HIV education and counseling, HIV testing, TB screening and referral for TB and HIV services. Aurum aims to visit around 800 households with approximately 5 persons per household. In addition, public TB services in the communities will be strengthened to cope with the increased workload. Originally support to the platinum mining industry was to include a PHE, but as this PHE was not approved, the funding is reprogrammed back into the TB-HIV services to support service delivery in this industry.

ACTIVITY 5: Support at Eastern Cape Themba TB hospital

Aurum will provide support to the Eastern Cape Themba hospital to assist them to obtain accreditation for the national CCMT program. This support will include provision of limited renovation, staff and technical support.

ACTIVITY 6: TB screening at Johannesburg Correctional Facility

Activity Narrative: Aurum will be undertaking a TB and HIV screening project at Johannesburg Correctional Facility. This will determine HIV and TB prevalence and appropriateness of various screening methods. In addition it will determine yield and cost-effectiveness of routine screening within the prison. This will be started with FY 2007 funding and completed in FY 2008. The project is expected to provide information that may lead to routine screening in other facilities.

ACTIVITY 7: TB Activities in the SME Project

People identified as HIV infected through the counselling and testing process performed by the SME Project will be screened for the presence of TB symptoms and referred for treatment to the nearest TB centre for follow-up. At some sites, sputum collection will be performed according to South African government protocols and the clients will then be informed of the results and referred for treatment. All HIV positive clients who do not have active TB will be offered IPT and training on the use of IPT will be provided to Aurum clinical staff, counselors, peer educators and staff at occupational health clinics. Education sessions to SME employees will include the simple identification of TB symptoms, importance of treatment and importance of IPT in HIV and their contacts.

ACTIVITY 8: Tembisa HIV-TB Integration

Aurum will implement an integrated TB-HIV model for Tembisa (outside Johannesburg) that will utilize the principles of intensive case finding, isoniazid prophylaxis and infection control to improve TB-HIV services at Tembisa hospital, Tembisa Main Clinic and Winnie Mandela Clinic. Additional clinics in the sub-district will also be identified for strengthening activities. This activity would aim to engage private and civil society partners to ensure horizontal integration at the household level, utilizing mobile services and capacity development of clinics.

Budget Code: HVTB

Program Budget Code: 12

Activity ID: 3320.22749.09

Planned Funds: \$2,674,713

Activity System ID: 22749

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

All the 46 HIV care, support and treatment sites supported by the International Center for AIDS Care and Treatment Programs (ICAP) at Columbia University will provide tuberculosis (TB)/HIV integration interventions including screening, referrals and TB infection control. The aim will be (a) to ensure at least 90% of HIV-infected patients at the sites are screened for TB at the initial and follow up visits; (b) to ensure at least 80% of TB/HIV co-infected eligible patients are on cotrimoxazole preventive therapy; (c) to ensure at least 90% of TB patients are offered routine HIV counseling and testing; and (d) to facilitate TB infection control at all these facilities. The program will adapt a comprehensive, family focused, and continuous minimum package of care for TB and HIV co-infection management at each of the 46 sites to provide high quality TB/HIV care. The minimum package will include (a) a focus on the family as the foundation of care; (b) optimized use of a multidisciplinary team of providers, lab and pharmacy staff, and administrative support staff; (c) emphasis on adherence and prevention; (d) strong linkages across various clinical service and strong linkages with community resources and organizations. ICAP will also focus on strengthening of the health systems at the provincial, district, sub district/Local Service Area (LSA) and facility level to ensure effective management of TB/HIV co-infection and creating appropriate conditions for the implementation of related TB/HIV integrated activities.

The following activities will be implemented:

- a) ICAP will support the interventions to reduce the burden of HIV among the TB patients, families and community. Only three hospitals will be supported on management of TB patients co-infected with HIV, while ICAP will collaborate and ensure functional referrals for TB management with other PEPFAR partners in the remaining 39 sites. ICAP will support the following activities in COSH, Nkqubela and Empilweni Hospitals:
- (i) Routine HIV testing and counseling.
 - (ii) Cotrimoxazole preventive therapy for HIV-infected TB patients.
 - (iii) Linkages and functional referral system with the HIV care and treatment programs. The program will strengthen the routine counseling and testing at the TB facilities, clinical staging and laboratory assessment of co-infected patients, cotrimoxazole prophylaxis, preparation of eligible co-infected patients for highly active antiretroviral therapy (HAART), and initiation of HAART. The patients will then be transferred to the nearest antiretroviral treatment (ART) service point and follow-ups will be done through home-visits by the lay counselors, field caregivers, and peer educators.
 - (iv) Isoniazid preventive therapy (IPT) for TB exposed children.
 - (v) Home visits to screen for TB and HIV. ICAP will review and adapt available tools with the SAG and other PEPFAR partners.
 - (vi) ART for those who qualify.
- b) ICAP will support the following activities to reduce the burden of TB among the people living with HIV, their families and community:
- (i) Intensified TB case finding among all clients receiving HIV services at the 46 health facilities, including counseling and testing units, prevention of mother-to-child transmission services, other units in the facility, and pediatric services.
 - (ii) Isoniazid preventive therapy for tuberculin test positive clients.
 - (iii) ART for eligible clients.
 - (iv) Linkages between TB diagnosis and TB treatment programs. All patients starting HIV care and treatment programs will be screened for TB and those found with TB infection will be referred for diagnosis and TB treatment at the nearest clinic.
- c) Integration of TB-HIV Services at the community level: ICAP will support the full range of services, linking the activities at clinic and the home. The activities will improve the coordination of counseling and testing, HIV treatment and care, TB diagnosis and care and prevention of mother-to-child HIV transmission services.
- d) Support the establishment of a sustainable mechanism for collaboration and coordination among the government institutions (province, district, LSA and the health facilities), implementing partners, and the beneficiaries.
- f) Conduct/strengthen surveillance of HIV prevalence among TB patients and HIV among TB patients including monitoring and evaluation activities.
- g) Based on lessons learnt from the current ICAP TB Infection Control (TBIC) projects TBIC will be re-conceptualized to focus on clinical actions by the health-care providers themselves that promote rapid identification of TB disease, rapid initiation of TB treatment and ensuring adherence with treatment until completion. Simple design elements will also be addressed to minimize nosocomial transmission of TB in all the 46 facilities.
- h) The Yale University partnership at Tugela Ferry will continue, with an extension of coverage and follow-up regarding patients with MDR and XDR TB.

SUMMARY:

Activities support implementation and expansion of best-practice models for integration of TB and HIV services in public sector facilities in Eastern Cape and KwaZulu-Natal. TB/HIV activities are implemented through technical assistance and will result in a decrease of TB in HIV-infected children and adults, increase prevention and early detection of TB in HIV-infected children and adults, and provide overall support to provincial TB/HIV activities. The emphasis area for this program will be human resources. The target population will include infants, children and youth (non-OVC), men and women (including pregnant women and family planning clients), people living with HIV (PLHIV) and public and private sectors.

BACKGROUND:

Columbia University (Columbia) began TB/HIV integration activities in FY 2006. Health facilities initially identified in Eastern Cape included 3 TB hospitals (Nkqubela, Fort Grey and Empilweni Hospitals) and 8

Activity Narrative: HIV care and treatment sites (Holy Cross, St. Patrick's, Rietvlei, Cecilia Makhiwane, Frere, Dora Nginza and Livingstone Hospitals, Ikhwezi Lokusa Wellness Center). In the TB hospitals inpatients are counseled and tested for HIV, initiated on cotrimoxazole prophylaxis if they are found to be HIV-infected and if they are eligible, started on antiretroviral treatment (ART). On discharge from TB hospitals, patients are linked to primary health care clinics or nearest facility where they can access HIV and TB treatment services. Patients from Empilweni TB hospital are referred to any of seven primary health clinics in Port Elizabeth. In FY 2006, Columbia began training of nurses, doctors and lay health workers on TB/HIV integration in both programmatic and clinical aspects: active TB case finding among HIV-infected patients, ART for eligible TB/HIV co-infected clients, and leveraging existing referral services to provide comprehensive HIV support. In FY 2008 Columbia will continue to implement activities in these 3 TB hospitals and 38 HIV care and treatment sites, for a total of 42 health facilities, in the Eastern Cape and KwaZulu-Natal. Four new health facilities in Free State will be identified in FY 2008 for TB/HIV support. In FY 2007, Columbia formed a new partnership with Yale University AIDS Program in support of TB/HIV integration activities in Tugela Ferry, KwaZulu-Natal, which will continue in FY 2008.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: TB hospitals in Eastern Cape

Activities will include:

1. Provide ongoing TB/HIV clinical support by conducting didactic and onsite TB/HIV training for doctors, nurses and lay health staff to improve knowledge and practice around managing TB/HIV patients. Provide clinical mentorship through case presentations and discussion.
2. Continue to support the hiring and placement of doctors, nurses, and peer educators to improve uptake of HIV counseling and testing and to increase enrollment of TB/HIV co-infected patients into ART.
3. Provide technical support for monitoring and evaluation (M&E) activities by implementing a system to track/monitor referrals and patients between HIV and TB programs. This activity includes training and use of the pre-ART and ART facility registers.

ACTIVITY 2: HIV Care and Treatment Sites

Activities in the 38 HIV care and treatment sites will be focused on strengthening:

1. TB case-finding among clients enrolled into HIV care and ART. Columbia is in the process of implementing a facility held patient record that captures information on TB case finding within the patient record. Columbia is training doctors and nurses in the supported facilities to use the patient record to improve TB/HIV clinical care and treatment. These staff will be routinely mentored by Columbia nurse mentors/clinical advisors.
2. Referral linkages with the TB program to initiate TB therapy for those in HIV care and/or ART. The Columbia supported community health centers and primary health clinics (PHCs) with HIV care and treatment services also have TB services on site where Columbia supports TB services by improving referrals of TB/HIV co-infected clients on ART to on site TB services to receive TB treatment. This includes development of a referral slip to the TB services and also ensuring the facility held patient record in the HIV clinic is updated with the relevant TB information.

ACTIVITY 3: Yale University Partnership

Columbia will partner with the Yale University to develop the following services at the Church of Scotland Hospital (COSH), Tugela Ferry (KwaZulu-Natal):

1. Increase HIV counseling and testing (CT) of clients accessing TB services in the COSH. This will be implemented through the introduction of various models of provider-initiated CT at the TB treatment programs (drawing on experiences from other settings) that is inclusive of training of TB treatment staff in HIV CT, training in HIV pre- and post-test counseling with establishment of strong linkages to laboratory HIV diagnostic services, and training of TB treatment staff in the referral of TB patients to CT services.
2. Prevent the development of multidrug-resistant tuberculosis (MDR-TB) cases and improving treatment completion rates by strengthening the existing TB DOTS program and integrating with HIV treatment. Under the Yale partnership the program components for this specific program activity will include:
 - Defining the baseline TB treatment completion and cure rates
 - Overall program improvement by: providing routine HIV counseling and testing, developing effective TB screening tools for HIV-infected patients, use of a standardized once-daily ARV regimen to be administered concurrently with standard TB regimen for TB/HIV co-infected patients, using modified observed therapy, family and community-based health workers as treatment supporters, providing TB treatment literacy materials at ART initiation and training of case management teams to strengthen treatment follow-up and completion by tracing defaulters in the community
3. Prevent nosocomial transmission of MDR-TB and extensively drug-resistant tuberculosis (XDR-TB) by instituting infection control. This will include; a. evaluation of nosocomial spread of MDR and XDR-TB by supporting sputum culture testing on all new and suspected TB cases (months 0, 2, 6), spoligotyping on selected isolates and confirmed MDR-TB isolates to determine timing of acquisition and possibility of nosocomial spread; spoligotyping of sensitive TB isolates and non HIV infected TB patients to determine if KZN strain confined only to MDR and XDR and HIV or more widely distributed; b. Improve program implementation by screening HIV-infected patients for TB, creating isolation facilities, improving air handling within wards, educating healthcare staff in personal infection control practices and provide personal protective equipment to minimize their risk, minimizing number of TB patients hospitalized, decreasing the

Activity Narrative: length of stay for all TB patients by developing and evaluating protocols for earlier hospital discharge, and increase community-based care for TB treatment to absorb shift of TB care from inpatient to outpatient setting.

4. Implement a decentralized MDR-TB treatment program. Patients found to have MDR-TB travel 120 km to Durban to be admitted to King George V Hospital for second line therapy however the average waiting time for a bed is 2-3 weeks. Key components would include: Sputum culture testing on all suspected and confirmed TB cases in both inpatient and outpatient settings to identify cases of MDR-TB; Initiate a treatment program to provide second line TB treatment locally; Develop a contact tracing program for all MDR-TB and re-treatment cases to identify MDR-TB cases in community; spoligotyping MDR-TB isolates

5. Screen for active TB among HIV-infected patients through use of standardized screening questionnaires and/or algorithms by all types of healthcare workers followed by standardized follow-up and diagnostic algorithms of TB suspects and supported by the introduction of effective recording and reporting systems for these activities.

In FY 2008 Columbia will embark on these additional activities:

ACTIVITY 4: Scale up use of TB screening tool at HIV care and treatment facilities

Columbia will ensure that the PHC record (which incorporates TB signs and symptoms) is used at all supported HIV care and treatment outlets. This TB screening tool will improve the quality of TB services provided at the HIV clinic and also increase TB case finding in this high risk population. In addition, this activity will dovetail with the proposed TB screening PHE about to be conducted in select health facilities.

ACTIVITY 5: Targeted TB prevention and control strategies

TB infection control activities targeted at 2 health facilities in the Eastern Cape (Motherwell Community Health Centre in Port Elizabeth and Cecilia Makiwane Hospital in East London). The objective of this activity is to minimize the risk of nosocomial TB transmission through minimizing source infectiousness. Activities include: assessing TB infection control procedures for gaps and needs for each facility; establishing work practice, clinical management and administrative procedures to minimize the nosocomial transmission of TB; assessing the impact of these interventions; and developing practice manual and educational tools for health care workers. New health facilities in Free State will be determined in collaboration with the Free State Health Department to receive support for TB/HIV and proposed activities to be implemented include those outlined above.

By providing palliative care TB/HIV support to co-infected persons in Eastern Cape, KwaZulu-Natal and Free State, Columbia's activities will contribute to the realization of the PEPFAR goal of providing care to 10 million people.

Control & Prevention**Funding Source:** GHCS (State)**Program Area:** Care: TB/HIV**Budget Code:** HVTB**Program Budget Code:** 12**Activity ID:** 7968.22765.09**Planned Funds:** \$1,038,868**Activity System ID:** 22765

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activities started in FY 2008 will continue in FY 2009, with the following additional emphases.

There are ongoing challenges with the delivery of TB and HIV services. TB and HIV services are usually provided at different service points and it is difficult for people living with HIV co-infected with TB to receive services in two different programs. As antiretroviral treatment (ART) services become more decentralized, TB and HIV services may be co-located in the same facility or premises. Efforts to improve access to clinical care must be linked to community and home-based care to ensure early detection, timely initiation and completion of TB treatment. The integration of services together with TB infection control (IC) measures will help decrease the transmission of TB and multi-drug resistant (MDR-TB). Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will assist the Department of Health (DOH) at site level in developing and implementing policies, plans and human capacity for TB IC based on international and national guidelines on TB IC. Safe sputum collection will be ensured, cough etiquette and hygiene will be promoted, patient flow assessed and TB suspects triaged for fast-tracking or separation from other patients. Room air ventilation will be improved where required. EGPAF will collaborate with the DOH and other relevant stakeholders in developing and implementing a TB IC training strategy.

Intensified case finding will be provided in all HIV infected patients. All clients receiving HIV services (i.e., prevention of mother-to-child transmission (PMTCT), voluntary counseling and testing (VCT), pediatric services, etc.) will be routinely screened for TB disease. People with an initial positive TB screen will be referred for TB diagnostic services and those diagnosed with TB, initiated on TB treatment using DOTS-based national TB control strategy and international standards for TB care. Systems for tracking and patient referrals and follow-up between TB and HIV services will be strengthened. Home-based care workers and community healthcare workers community health-care workers will be trained so that they are able to undertake early identification and referral of TB suspects, provision of directly observed treatment (DOT) and patient support, defaulter tracing and coordination with TB and HIV programs. Supportive supervisory systems linked with the health-care facilities will be strengthened.

Isoniazid preventive therapy (IPT) will be provided to all HIV-infected persons in whom TB has been ruled out as per national guidelines, policies and protocols for IPT. Health-care workers will be appropriately trained in the delivery of IPT, and the service will include clear messages to patients, family and caregivers. The importance of completing prophylactic therapy and reporting any side effects will be reinforced. All family members and close contacts of active TB patients, especially children under five will be screened for TB and if active disease is ruled out, IPT will be provided.

There will be a strong focus on capacity building around the management of TB/HIV in children to ensure that children are identified early and managed accordingly. EGPAF will ensure that pediatric specific TB diagnostic tools, treatment guidelines and protocols are in place at all sites. Ongoing technical support will be provided to address challenges in service provision and strategies to improve TB/HIV documentation and reporting will be explored.

Human capacity is critical in providing comprehensive TB/HIV services. TB/HIV human capacity development activities will include task shifting, training on TB and HIV collaboration, MDR-TB and XDR-TB, TB/HIV in children, TB IC, nutritional support, with a strong focus on quality improvement. EGPAF will use an integrated training approach to reduce missed opportunities at both entry points. Community health-care workers will be capacitated to provide comprehensive support to TB/HIV services through task shifting. Expected outcomes include improved TB screening as part of the home and community based care, defaulter tracing, adherence support, as well effective referrals and follow-up. Efforts to scale-up IPT will be strengthened. Onsite mentoring, coaching and supportive supervision will continue.

EGPAF will work with DOH to ensure equitable access for both women and men to TB and HIV services. TB screening will be offered to all HIV-infected pregnant women in the PMTCT setting. Linkages with reproductive health programs for female-headed households and caregivers will be strengthened. Programs for older women caregivers that provide support networks and access to productive resources will be targeted. Programs that target men/ boys and encourage their participation and responsibility in care-giving and household functions, their support for female caregivers and their recognition of the burden of care as well as programs that reduce gender-based violence and promote human rights will be implemented. Specific needs of men and women will be addressed

EGPAF overall TB/ HIV support is provided in line the national DOH TB/HIV policies and guidelines as well as the HIV & AIDS and STI Strategic Plan for South Africa, 2007 – 2011, Priority Area 2, Treatment, Care and Support, goal 6, objective 6.3 which aims to ensure effective management of TB/HIV co-infection. All EGPAF support is aimed at assisting DOH to reduce TB/HIV co-infection rate and comprehensively manage TB/HIV co-infection.

SUMMARY:

The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will support all of its care and treatment partners in addressing the barriers to increasing case detection and cure rates in TB co-infected HIV-infected patients. The program intends to strengthen collaboration between TB control initiatives and HIV and AIDS programs at EGPAF supported sites in KwaZulu-Natal, Gauteng, Free State and North West. EGPAF receives both Track 1 and Track 2 (South Africa) PEPFAR funding. The primary emphasis areas for activities are human capacity development and expansion of services through training and task shifting, quality improvement, development of networks, linkages, referral systems and strengthening local organization, development of infrastructure, policy and guidelines, and health information systems strengthening. Primary populations to be targeted include infants, men and women, both pregnant and not, people living with HIV (PLHIV), and public and private healthcare providers.

Activity Narrative: BACKGROUND:

Tuberculosis (TB) poses a serious threat to the public health and economic well-being of South Africans and in the advent of HIV, affects the most productive segments of the population, as well as disproportionately affects the poor. The HIV and AIDS epidemic in South Africa has further complicated control and treatment of TB. Although the South Africa National TB Control Program (NTCP) has made significant progress over the past several years, it still faces challenges in increasing case detection and cure rates. Key barriers include a lack of community understanding about the disease, limited access to services, inadequate provider knowledge and compliance with DOTS, and patient adherence to treatment.

The program's key focus will be at the district, municipal, and community levels. EGPAF will:

1. Assist stakeholders and partners to strengthen local capacity to detect, treat, and prevent TB.
2. Develop community-based strategies to identify potential TB cases and ensure early referrals for diagnosis and treatment.
3. Assist sites to integrate TB services with HIV and other healthcare services.
4. Support and develop community-based approaches to ensure treatment adherence.

ACTIVITIES AND EXPECTED RESULTS:

EGPAF will strengthen linkages between healthcare centers and community DOT supporters to reduce treatment interruption rates and improve treatment adherence. EGPAF will establish mechanisms for collaboration between TB and HIV services by providing counseling and testing within TB services, and screening HIV-infected individuals for TB.

EGPAF will assist in strengthening the technical capacity at the sites where the comprehensive care management and treatment programs are being supported. The key activities will involve the integration of TB services, VCT services, and antiretroviral treatment (ART) services, at primary health care and hospital level. These activities will be included in the site TB control and evaluation plans.

Mechanisms for integration are:

1. Support the district/site TB/HIV coordinator to expand and improve the referral linkages between TB and CT.

For all TB patients, provider initiated HIV testing and counseling will be offered and HIV-infected patients referred to CT. CD4 count and ART initiation will be carried at TB service points where possible. Cotrimoxazole prophylaxis will also be made available. All HIV-infected patients will be screened for TB, and referred to TB service points. Where possible, anti-TB treatment will be initiated in CT setting.

2. Assist in the development and implementation plan for TB/HIV at sites at which EGPAF will be providing comprehensive HIV and AIDS services.

The plan will include human capacity development through training. Health care providers at TB and CT service points will be trained in both TB and HIV management so that they can provide a comprehensive package of care. Use of community-based care and support initiatives will be explored to improve adherence and compliance

3. Assist in developing and strengthening monitoring and evaluation of referral systems for TB/HIV related activities.

EGPAF promotes the use of referral registers between service points e.g. VCT register reflecting the service point a patient was referred from e.g. TB, as well as TB and CT registers showing referrals between the two service points. At TB service points, HIV tests and CD4 counts done are recorded in registers to facilitate referral. All confirmed TB cases diagnosed at CT service points are recorded in registers and immediately referred to TB service points. Where possible, electronic TB registers will be maintained

4. For monitoring and evaluation, a core set of indicators, based on national guidelines for monitoring and evaluation of collaborative TB/HIV activities will be used to measure the success of the program.

EGPAF will support the following activities to reduce the burden of HIV in TB patients (adults and pediatrics):

1. HIV counseling and testing for all TB cases

2. Increased screening rates of TB for all HIV-infected patients within existing care and treatment sites and services. Intensified case finding methods include screening for symptoms and signs of TB i.e. cough for more than 2 or 3 weeks, fever, night sweats, recent weight loss, lymphadenopathy, routine three sputum samples for Acid-Fast Bacilli (AFB), chest x-ray, TB culture may be used to confirm smear-negative pulmonary TB. When TB diagnosis is confirmed, TB notification is done. All HIV-infected patients with confirmed TB are referred (referral given) to TB service points for initiation of anti-TB treatment according to national ARV treatment guidelines. All TB referrals are recorded in the TB registers. In addition to the above screening methods, primary health care (PHC) facilities are encouraged to use TB Suspect Registers, which are in the form of a questionnaire, to screen for TB.

3. Provision of cotrimoxazole preventive therapy to TB patients with HIV infection as part of the

Activity Narrative: comprehensive care and treatment program.

4. Provision of antiretroviral therapy and anti-TB treatment to eligible TB patients with HIV infection, will be carried out according to national ARV treatment guidelines. Staff will be trained on managing patients co-infected with HIV and TB.

5. Provision of care and support services to TB patients with HIV infection. All TB patients diagnosed HIV-infected are provided with cotrimoxazole prophylaxis. Prevention with positives activities are implemented and nutritional support provided in the form nutritional supplements, education, and food parcels.

6. Provision of isoniazid preventive therapy as part of the package of care for PLHIV when active TB is excluded. Currently, INH prophylaxis is mainly offered in the clinical setting. In its geographic areas of support, EGPAF will facilitate the provision of INH prophylaxis under DOT, as well as through home-based care programs, where possible.

EGPAF will assist the National TB Control Program to strengthen information systems, supervision, and program management. EGPAF will work with provincial, district, municipal, and community health systems to build or strengthen capacity to prevent, detect, and treat TB. Human capacity development through training and task-shifting (e.g. DOT staff giving INH prophylaxis). Mentoring, coaching and preceptorships will be used to ensure skills transfer in all areas including M&E, which will lead to a more sustainable program

Emphasis will be put on strengthening linkages with home-based care organizations and community healthcare workers to identify suspected TB cases, ensure early referrals for diagnosis and treatment, as well as support treatment adherence through DOT.

With FY08 reprogramming funding, EGPAF will address infection control support (assessment, technical assistance, training); and pediatric TB (training and mentoring) in the Free State and North West provinces.

By supporting HIV care and treatment services, EGPAF contributes to the 2-7-10 goals of PEPFAR and the USG South Africa Five-Year Strategic Plan.

Table 3.3.12: Activities by Funding Mechanism

Mechanism ID: 4625.09	Mechanism: N/A
Prime Partner: McCord Hospital	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: TB/HIV
Budget Code: HVTB	Program Budget Code: 12
Activity ID: 7910.23186.09	Planned Funds: \$143,364
Activity System ID: 23186	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Since there is a high prevalence of TB in the communities, increasing the effectiveness of the community home-based caregivers will assist in decreasing the number of undiagnosed TB cases and thus the spread of TB in the community. Zoe-Life (ZL) will facilitate linkages between community home-based care and the nearest clinics, share knowledge (symptom screening tools) with the existing community health groups, and encourage the utilization and help with the procurement of existing information, communication and education materials by the community.

NEW ACTIVITY: Scale up isoniazid preventive therapy (IPT): The recent National Department of Health (NDOH) TB guidelines strongly recommend the implementation of IPT for HIV-infected people in all primary health-care facilities. However, currently there is poor communication from NDOH to the eThekweni Municipality (eTM) on protocols and implementation practices. In addition, eTM has a poor record of basic TB program management with poor treatment completion rates. Together with policy uncertainties and poor program management, the environment is not currently conducive to the implementation of IPT. Currently, none of the ZL-supported sites are implementing this policy. (It is the belief of the author that no clinics in the eThekweni district are implementing IPT.) ZL will ensure that the health environment is conducive to IPT implementation through supporting best practice with regard to TB management, and supporting clinics to strengthen and improve both case finding and treatment success. Thereafter, in collaboration with eTM management, ZL will train the nurses from the 12 sites in applying the IPT, following the national guidelines. Ongoing support and training follow up will be offered to the health-care providers to ensure correct implementation of IPT. Procurement and a consistent supply of Isoniazid is vital for the effectiveness of this policy, therefore ZL will assist in setting up efficient pharmacy systems at the sites level. Appropriate linkages at all levels within pharmaceutical services will be strengthened.

MODIFIED ACTIVITY: Infection control: Currently, at ZL sites there is an insufficient TB infection control: poor ventilation, inadequate TB patient flow, health-care workers lacking training and awareness, lack of education and informative materials for patients on basic infection control (e.g., cough etiquette/hygiene). ZL will support the clinics to implement a set of administrative control measures (i.e., early recognition of TB suspects or confirmed cases through screening all clients entering the facility; separation of TB suspects into separated and well ventilated waiting area; improved TB/HIV integration in the facility, particularly screening of HIV clients at all clinic visits) and environmental control measures which will allow good natural ventilation, thus reducing the risk of TB infection at the facility level. Training on TB infection control of all clinic staff will be delivered, with emphasis on the NDOH's infection, prevention and control policy and strategy. Facilities will be supported to develop an infection control plan and assessment tool.

NEW ACTIVITY: Pediatric TB/HIV care: ZL will support the sites to increase TB diagnosis, treatment and prophylaxis for children. Clinic nurses will be trained to properly screen adult TB patients for identification of under 5's contacts during history taking and provide prophylactic treatment to these children. Training on existing pediatric TB protocols will be delivered with reinforcement of their implementation through an intense mentorship support. Early diagnosis of TB in children at primary health-care clinics will be strengthened through ensuring availability of the tuberculin skin test (TST) and training of the nurses in the use and reading of the TST.

DOTS SUPPORT: There is currently a DOTS system in place at all clinics. This will be strengthened through multidisciplinary case meetings and onsite training -- which will include the DOTS supporters -- in a bid to strengthen case management, accountability and patient tracking through community and clinic based case management.

GENDER: ZL will continue to address gender by ensuring that men have access to primary health interventions, and particularly to TB/HIV screening. This will be achieved through increasing access in the workplace, as well as by extending opening hours of facilities. One non-governmental organization currently opens after hours and on weekends for this purpose. ZL will work with other sites to increase number of sites that are open after hours.

SUMMARY:

McCord/Zoe Life activities will build capacity in four municipal clinics, three non-government organizations (NGOs) and a corporate outreach program in Durban to provide proactive and integrated TB/HIV services within the framework of a primary health decentralized HIV care and treatment program. Emphasis areas include: development of referral systems between vertical HIV-related programs and other health services; local organization capacity development; and development of a workplace program.

BACKGROUND:

The prevalence of tuberculosis (TB) in KwaZulu-Natal (KZN) is high, with 60% of TB clients co-infected with HIV. Local TB programs are vertical programs that do not integrate HIV and TB care. An outbreak of multidrug-resistant tuberculosis (MDR-TB) along with poor treatment completion rates highlights the challenges of TB management in KZN. The tools used for diagnosis of TB where an estimated 75% of active TB is extrapulmonary and/or sputum negative pulmonary TB are limited to sputum microscopy for AFB. Chest x-rays (CXR) do help with diagnosis, but is not confirmatory, and the CXR picture of pulmonary TB in HIV is not the classic picture. Diagnosis is often complicated by other infections such as pneumocystis carinii pneumonia (PCP). The yield on sputum culture for TB is higher, especially with sputum negative on microscopy, and the yield of AFB on blood cultures in extrapulmonary and sputum negative TB is also fairly high. The best tool at this stage, however, is the clinician with a high index of suspicion for TB. Effective management of TB is one of the most important upcoming fields of care in South Africa. This new project will be implemented by the McCord/Zoe Life team and seeks to integrate HIV and TB care using National Department of Health (NDOH) guidelines and best practice models to provide a seamless continuum of

Activity Narrative: care to clients co-infected with TB and HIV. Gender will be addressed by increasing access to TB screening in the workplace, increasing TB screening for women in PMTCT projects and in women's income generating projects run through the NGOs. The project will also provide TB/HIV care to refugees.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

Counselors and clinical staff will be trained in provider-initiated CT, and this service will be offered to all TB-infected clients accessing care at the municipal clinics, and to TB patients accessing services at NGO sites. Counselors will be trained to enroll all HIV-infected clients into wellness/ARV services and to refer for CD4 screening. Counselors will be trained to screen for TB during any contact with an HIV-infected client and to refer appropriately. Nurses working in prevention of mother-to-child transmission (PMTCT) or sexually transmitted infections (STI) NGOs will be cross-trained to screen all HIV-infected clients at each contact and to refer appropriately for quick diagnosis, treatment and CD4 monitoring. They will be trained to provide focused wellness and adherence counseling to patients co-infected with TB and HIV. Staff working within clinic-based TB programs will be trained in integrated TB/HIV management and reporting, including provision of cotrimoxazole. Staff at NGOs will be trained to screen for TB in community settings and provide community-based wellness training, dual testing for TB/HIV, and household adherence support for TB/HIV.

ACTIVITY 2: Increase screening of TB in all HIV-related settings including community

This activity will provide technical support for counselors, community workers and nurses to routinely screen for TB in PMTCT, CT, palliative care and ARV services using a simple symptom-based screening tool.

ACTIVITY 3: Mentorship and supervision of staff

Mentorship and supervision of staff will provide integrated active case management of TB/HIV with multidisciplinary service provision in palliative care and ARV services where required. Staff will be assisted to integrate all patients with TB/HIV into comprehensive HIV management services with contact tracing, screening and partner/family testing encouraged as standard of care. Sites will be assisted to provide cotrimoxazole to all TB/HIV clients.

ACTIVITY 4: Linkages and referrals

McCord/Zoe Life will assist in strengthening linkages and referrals to ensure full range of HIV care and treatment services (including extrapulmonary TB) are available without loss of continuity of care or patients lost to follow-up.

ACTIVITY 5: Development of workplace program and mobile clinic

Staff and employees participating in the HIV workplace program will be trained to understand the link between HIV and TB. Employees accessing the workplace CT services will be screened for TB by history and symptom screening. Occupational nurses will be trained to screen for TB per protocol in the management of HIV. Additional funding will be sought to equip a mobile clinic with a mobile x-ray machine and microscopy. This unit will be used to provide TB and HIV screening and diagnosis to all workers accessing the workplace wellness program. Funding will be sought through industry and international funding to purchase this equipment which is vital to managing TB in the workplace. Until this is a reality, linkages between workplace programs and referral centers for treatment will be established. Where possible, TB treatment will be initiated onsite and TB rates reported to the district TB program.

ACTIVITY 6: Development and strengthening of M&E system

An M&E system should have the capacity to track HIV-infected clients receiving TB treatment, to ensure tracking of visits, active case management and retrieval of TB patients. The system will require strengthening of linkages between the municipal clinics, the Durban TB clinic and the DOTS workers. A patient-held record for communication between health facilities will be used in conjunction with the pharmacies and providers at the health facilities to ensure continuity of care in all services.

ACTIVITY 7: Sharing best-practices

McCord/Zoe Life will engage with provincial and district TB coordinating bodies to share best-practices to improve services. This includes revisiting diagnostic algorithms, accessing funding to pilot better diagnostic testing algorithms and expanding treatment centers.

ACTIVITY 8:

Staff will be trained and technical support provided to implement sustainable and affordable infection control policies and measures within each environment.

Sustainability is addressed through development of integrated services within existing public health facilities, establishment of linkages and referral pathways making access to diagnosis of TB easier, and through cost sharing in workplace programs.

Through integrated TB/HIV services, McCord Hospital/Zoe Life expects to increase provider-initiated HIV testing through the municipal TB services to all TB patients, expecting 40-60% of TB patients to be HIV infected. Any HIV-infected client on TB treatment will be offered the full spectrum of palliative care services and be referred to for ARV services according to provincial treatment guidelines. All HIV-infected clients will be screened for TB. It is expected that 20% of all HIV-infected clients will require TB treatment. In the NGO setting the goal is to increase community-based referral for TB screening, adherence support and

Activity Narrative: strengthening of referral systems. In the workplace, the goal is to increase workplace screening, diagnosis and treatment of TB in the HIV workplace program through mobile onsite services.

The McCord Hospital activities contribute to the 2-7-10 PEPFAR goals and the USG South Africa Five-Year Strategic Plan by strengthening the public sector and expanding access to care and treatment.

Activity System ID: 23156

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Tuberculosis (TB) Task Team

The Hospice Palliative Care Association of South Africa (HPCA) will organize an interdisciplinary TB task team comprising seven members, which will report to HPCA Management Committee (MANCO) via the Patient Care Committee. This committee will include three patient care representatives, one person from the monitoring and evaluation (M&E) committee and one each from the Organisation Development, Pediatric, and Education and Training committees. The professional team members will compile the terms of reference for this committee, and the team's mandate will be to:

1. Assess the current level of integration of HIV and TB services in member hospice programs;
2. Identify best practices among member hospices;
3. Facilitate the implementation of recommendations that emanated from the HPCA conference workshop on how to incorporate a TB focus into palliative care programs;
4. Review and adapt current HPCA TB Guidelines in a palliative care context;
5. Facilitate the collection of relevant data;
6. Monitor the implementation of the HPCA TB Guidelines in hospices receiving TB funding;
7. Evaluate the effectiveness of the TB Task Team and submit a report to the patient care committee on completion of the first year;
8. Explore the potential for regional TB task teams; and
9. Liaise with the HPCA Education Committee regarding the identification and meeting of TB training needs.

TB Task Team meetings will be linked to Patient Care Committee meetings to save costs. It is anticipated that during 2009 there will be a series of regional TB workshops to address:

1. Increasing case finding;
2. Implementing infection control;
3. Conducting risk Assessment;
4. Integrating services with examples of best practice; and
5. Accessing, documenting and using information.

SUMMARY:
