The Hospice Palliative Care Association of South Africa (HPCA) currently has 75 member hospices throughout South Africa (SA), each an independent legal entity. The Mission of HPCA is to provide and enhance the provision of sustainable, accessible, quality palliative care. PEPFAR funds will strengthen the capacity of member hospices and other governmental and non-governmental organizations to provide quality services to HIV-infected persons.

BACKGROUND:

HPCA strengthens existing services and develops new services through direct funding to member hospices to promote accessibility and availability of palliative care in SA, including work with religious leaders and member hospices that are faith-based organizations. HPCA personnel at national, provincial and district levels continue to provide the infrastructure and coordination to develop and strengthen palliative care programs within member hospices, the formal health care sector and NGOs. Improved collaboration between HPCA and National Department of Health (NDOH) is a key objective, aimed at optimum utilization of scarce palliative care resources. FY 2006 funding has allowed the training of 7,108 individuals from October 2006 to July 2007. The major focus of FY 2008 funding will be to provide direct palliative care to patients and their families, to assess quality of palliative care, assist in the development of new services, provide support to the care providers and provide training in palliative care. The services provided by HPCA members for TB care are included in Palliative Care where the HIV patient is also diagnosed with TB.

ACTIVITY 1: Patient Care

Patients' adherence to uninterrupted treatment is encouraged and monitored. It is the practice of HPCA member hospices and development sites to integrate TB care of the patient with HIV care, and the HPCA training courses include DOTS training for home-based carers. HIV patients receiving HIV-related care are routinely referred for TB screening. They are also referred to the local clinic or district hospitals for TB medication and followed up through the home-based care network. Many hospices use the DOTS-based national TB control strategy, in collaboration with the provincial Department of Health. HPCA also supports efforts to prevent and manage drug-resistant TB among HIV-infected TB patients. TB infection controls are implemented at hospice sites, such as maximized ventilation as an environmental control measure. Exposure to TB is an occupational hazard in the course of caring for patients. HPCA has developed guidelines for the Prevention of Transmission of Tuberculosis for staff in member hospices. The HPCA guidelines recommend that all HIV-infected patients be tested for TB before admission to a hospice program and that those with TB should be on TB treatment for 2 weeks before being considered for admission to a hospice in-patient unit, for the protection of staff and other patients. HPCA and its members will also focus on strengthening the relationships with public TB clinics to ensure appropriate referral and follow-up mechanisms are in place for TB patients. In FY 2008 PEPFAR funding will be used to build on existing TB services provided by member hospices by enhancing and expanding them. Joint TB/HIV activities will be implemented at member sites. All patients receiving HIV care and treatment support will be routinely referred for TB screening and followed up as appropriate.

ACTIVITY 2: TB Training

This activity will entail additional training of hospice staff and home-based care worker in TB screening, TB

Activity Narrative: testing, treatment and infection prevention. No additional staff will need to be employed for the TB program. HPCA's existing training structures of Centers of Palliative Learning and the Regional Education Forums will be utilized and the TB aspects will be incorporated in the palliative care curriculum. Training will be given in accordance with national standards and will include TB screening, TB testing and treatment, prevention of infection, and environmental controls. Because of multidrug-resistant (MDR) and Extensively Drug Resistant (XDR) strains of TB, intensive training and Guidelines for HPCA members will be provided. Workshops will be held regionally presenting optimum environmental controls. Funding will be used for this additional training and possibly also to assist member hospices with ventilation equipment, irradiation lighting and respirator masks as appropriate. Both of the above TB activities will be monitored and evaluated on an ongoing basis. The target populations for this activity are people living with HIV and AIDS and the emphasis area is human capacity development as both pre-service and in-service training will be provided to all HPCA staff members and their affiliate organizations.

HPCA supports the USG South Africa Five-Year Strategy to expand access to quality palliative care services and improve quality of palliative care and HBC services, and thereby contributes to the 2-7-10 goal of providing care to 10 million people affected by HIV.

Budget Code: HVTB

Activity ID: 13774.23070.09

Activity System ID: 23070

Program Area: Care: TB/HIV

Program Budget Code: 12

Planned Funds: \$211,900

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

HIVCare will continue with FY 2008 activities, with the following modifications:

- a) The TB program has been enhanced through audits of infection control and adapting HIVCare clinics to the required standard of infection control. This is in accordance with the WHO Guidelines for the Prevention of Tuberculosis in Healthcare Facilities in Resource-Limited Settings, 1999. One of the HIVCare facilities is in a commercial center in central Bloemfontein and it is critical that the structure of the building is adapted to the South African standards for infection control. All TB treatment is provided free of charge to all patients.
- b) HIVCare will provide basic screening of all patients through questionnaires (using the Columbia University TB screening questionnaire) in waiting rooms will be implemented. Several studies have shown that this strategy helps in the early triage and diagnosis of TB patients.
- c) HIVCare will screen all patients with symptoms of TB disease in waiting areas, in accordance with the WHO's Tuberculosis Infection Control in the Era of Expanding HIV Care and Treatment.
- d) Advocate against TB discrimination and promote masks for TB infected patients to use while in the clinics.
- e) HIVCare will implement surveillance of staff (annual chest X-ray and Mantoux tests) and educate health-care workers about signs and symptoms of TB. Chest radiograph and tuberculin skin test screening, although difficult to interpret immediately, serve as adequate baseline measurements in case of later suspected infection.
- f) Specific education on TB through posters, brochures and lectures within the support groups will be provided.
- g) HIVCare will focus on enhancing access to TB prevention with INH, after excluding active TB through physical examination, TB sputum, chest X-ray and liver function tests.
- h) HIVCare will provide DOT to patients with TB. DOT is provided across many varied sites and in different circumstances by health-care workers, and treatment systems are individualized.
- i) Monitoring TB adherence has been added to the duties of designated case managers and this indicator has been included in HIVCare's Management Information System (MIS).
- j) HIVCare will screen all members of a TB patient's household for TB as per existing protocols.

This activity will be conducted at the three clinics including the adolescent clinic, and at all sites within the General Practitioner's network. This approach is especially effective in rural areas where TB prevalence is high.

SUMMARY:

HIVCare will use FY 2008 funds to work with the Free State Department of Health (FSDOH) to provide antiretroviral treatment and care in private health facilities to patients who do not have medical insurance, either through referrals from the public sector, or self-referrals. The Free State has mainly a rural population, with only two major metropolitan areas (Bloemfontein and Welkom). In addition, the government rollout of HIV care and treatment has been geographically limited, with only one site in each of the five districts.

Since 2005 and the start of the program, patients have been referred from the State facilities to the HIVCare centers mostly already staged for HIV and assessed for TB. Following an analysis of lost to follow-up cases, HIVCare determined that splitting HIV and TB treatment and monitoring resulted in delays with access and adversely impacts on compliance. In coordination with the TB department of the FSDOH, TB assessment and treatment is to be integrated into HIVCare activities. Following technical input from the FSDOH, the centers chosen for TB treatment sites are suitable and certain recommendations have been made. These recommendations include separate facilities for patients and staff, air circulation and extraction processes in the clinic and a separate area for sputum collection. Various policies relating to infection control have been provided by the FSDOH for HIVCare implementation and these policies have been adopted within the centers' operational procedures.

The clinic is in possession of all of the necessary forms and registers, supplied by the FSDOH, to comply and integrate its TB service with theirs. Staff in the HIVCare centers are experienced public health nurses and refresher training is to be provided in TB management by the local FSDOH offices.

Staff are routinely monitored on an annual basis for TB infection including the requisite chest x-ray.

The major emphasis area for this program will be the provision of comprehensive care and support to persons infected with HIV as well as the improvement of referral systems, with minor emphasis given to quality assurance & supportive supervision, food and nutrition support as well as commodity procurement. The target population includes men and women; families (including infants and children) of those infected and affected factory workers and other employed persons, and government employees - specifically teachers, nurses and other health workers (without medical insurance). A further specific population that will be targeted will be secondary school children. The most significant target group is those persons in the economically active age group of the population that cannot access services in the public health system due to the high demand for services. Additional attention is to be given to the screening and treatment of TB

Activity Narrative: among the patients attending the program. The linkage with the youth center will ensure that HIVCare has a larger proportion of younger persons being attended to, specifically adolescents aged 10-14 and 15-24. This focus on the youth should further encourage some involvement with the street youth and it is anticipated that the program will be marketed among those NGOs working with the street youth as

BACKGROUND:

Since 2005, the main thrust of the activity was to match the FSDOH with partners from the private sector (in this case Netcare, the largest private sector health provider in South Africa, through their primary health centers) in order to build private sector capacity and absorb some of the burden from state facilities. Many FSDOH centers have waiting lists of people waiting to go on ARV treatment. The Free State Province has a large prevalence of TB because of the number of deep mining activities in the area. MDR and XDR-TB have been identified in the province. As a result, a large proportion of newly identified patients are co-infected with TB. In the past all patients were referred back to government facilities to initiate TB treatment prior to beginning on ART with the HIVCare program. Aside from the general delay that this caused, some confusion among patients occurred. In addition, the inconvenience of further travel expenses and waiting periods to access the TB treatment resulted in many patients simply abandoning treatment and not returning to the clinic.

The Medicross Medical Centre in Bloemfontein, a well-equipped private primary health center, provides the main resource base and in conjunction with three other sites in Bloemfontein and another one in Welkom, will provide an effective means of providing TB treatment to patients who are either referred from state facilities or who access the sites by word of mouth.

ACTIVITIES AND EXPECTED RESULTS:

Following consultation with the FSDOH, the activities of the clinic operations have been expanded to include TB screening, related laboratory sampling and clinical treatment of TB using DOTS. Patients from these waiting lists who meet the eligibility criteria for this program are referred from those public sector clinics to one of the three HIVCare primary health centers in Bloemfontein and one in Welkom for TB treatment. The FSDOH is a collaborating partner in this public-private partnership.

All pathology samples will be tested by the National Health Laboratory Service and all statistics relating to TB treatment will be forwarded to the TB department for inclusion in national figures.

Patients referred to the program receive PEPFAR-funded consultations and exams from HIVCare center physicians, who will also order relevant tests and refer patients to expert specialists when necessary. Based on the partnership with the FSDOH and the services requested that HIVCare provide, HIVCare centers do not provide free treatment for complex opportunistic infections, although some prophylaxis is provided (e.g. cotrimoxazole) and HIVCare staff will treat minor infections and HIV conditions that do not require investigative procedures or hospitalization.

Patients are still able to access public health facilities for more serious opportunistic infections/hospitalizations. Likewise, treatment for tuberculosis (TB) can be obtained from the centers. In those instances where patients are referred back to government facilities, a referral letter is provided from the treatment center to the public clinic with a request for information about the patient's TB regimen. Due to the close working relationship and partnership between HIVCare and the FSDOH facilities, this referral process is seamless. Very sick patients that are unable to access the centers will be able to receive their medication via the HIVCare linkage with the Red Cross home-based carers.

HIVCare's activities to integrate TB and HIV care contribute to the PEPFAR 2-7-10 goals.

Activity ID: 13964.23078.09

Planned Funds: \$747,597

Activity System ID: 23078

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Community Mobilization

The Turntable Trust, based in KwaZulu-Natal province works with clinical staff, peer educators and community outreach workers to undertake community outreach in schools, its youth center, at workplaces, farms, health facilities and at community gatherings to promote TB/HIV literacy to the surrounding communities as well as referrals to local community centers.

Lesedi Lechabile works within a wider primary health-care setting where TB/HIV services are already on offer through their TB clinic and therefore will not expand into the area of TB/HIV as initially intended.

ACTIVITY 2: Mass Media

Trailblazers has been fully absorbed by the South African Broadcasting Corporation. Funding for Trailblazers are being directed towards the production of a new drama series, Circles, which will highlight the linkage between TB and HIV.

ACTIVITY 3: Advocacy

Johns Hopkins University Center for Communication Programs' new partner, Health-E, undertakes in-depth media coverage on key issues affecting the health and wellbeing of South Africans and will continue to report on issues relating to TB/HIV.

SUMMARY:

Johns Hopkins University Center for Communication Programs (JHU/CCP), coordinates the work of 20 South African partners and provides technical assistance and capacity building to mobilize and educate communities and clinicians about the linkages between Tuberculosis (TB) and HIV. The focus is TB literacy, and training clinicians through distance learning. The target populations for this activity are adult men and women (including pregnant women) living with HIV (PLHIV), discordant couples, volunteers, public health workers, and community-based, faith-based and non-governmental organizations. The major emphasis area will be human capacity development and other activities will include community mobilization, information, education and communication and training. Findings from the 2008 National HIV and AIDS Communication Survey will help focus TB interventions and assist in improving understanding regarding TB and its treatment. The survey will provide a valuable baseline to further develop present communication interventions on TB.

BACKGROUND:

This is the first year that JHU/CCP will undertake community mobilization and mass media in support of TB/HIV that builds upon the successful four year program and ongoing partnerships that have utilized interpersonal communication and mass media in support of treatment literacy, adherence and clinician training. Eight of the twenty partners that work with JHU/CCP will be engaged in work on TB/HIV including the South African Broadcasting Corporation (SABC), Mindset Health Channel (MHC), Community Health and Media Trust (CHMT), LifeLine, The Valley Trust (TVT), DramAidE, Lesedi Lechabile, Mothusimpilo, Lighthouse foundation and ABC Ulwazi. The work will be in coordination with other PEPFAR funded partners such as URC's TB TASCII Project and the National Department of Health (NDOH) TB Sub-Directorate. All these interventions seek to undertake public awareness and education around the dual epidemics of TB/HIV using interpersonal communication interventions and mass media. The awareness and educational programs will be reinforced within health care facilities through interventions that provide more human input into the care and support of TB patients in their interactions with the public health system and upon their return to their communities. One of the weaknesses of the current care package is that patients are only provided with verbal guidance on how to access health care services and there is very little follow-up once they leave the health care facility. All community outreach workers will provide step-by-step assistance to each individual patient and walk them through the health system. By providing one-on-one assistance this will ensure that patients do not "get lost" which enhances the probability of them receiving adequate care and support including accessing treatment. The same outreach workers will do home and community follow-up to ensure that patients are compliant with their treatment regimens. It is anticipated that this will ensure better initiation completion rate of treatment rates among TB patients.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Community Mobilization

CHMT, with PEPFAR funding, has developed a series of video and print materials for people affected by and living with HIV, their caregivers and communities that includes material on TB. PEPFAR funding assists CHMT to revise and update the TB-HIV component of these materials. The materials are used in group sessions and workshops facilitated by 92 Treatment Literacy and Prevention Practitioners (TLPPs) (72 funded by PEPFAR and 20 NDOH) within the TB and ART clinics where they encourage TB patients to be tested for HIV and HIV patients to be screened for TB. The treatment literacy work of the TLPPs within clinical settings task shifts the responsibility of the management of treatment literacy for patients living with HIV from health practitioners thus freeing them up to provide to provide improved clinical services. TLPPs provide capacity building and mentoring to local community-based organizations to use the treatment literacy material in strengthening their support for people living with HIV. This intervention has received National Department of Health (NDOH) approval.

The Mindset Health Channel (MHC) is a public-private partnership that provides information directly into health clinics, targeting patients in waiting rooms with general information, and healthcare providers with

Activity Narrative: training and technical information. JHU/CCP continues its collaboration with MHC which, at the beginning of FY 2008, will be in more than 400 health facilities. Existing material will be revised and updated, including treatment videos, web content and print materials in up to five languages for healthcare workers at these sites. CHMT treatment literacy practitioners spend half their time with patients in ARV rollout and downstream referral sites that have the MHC.

Mindset uses its onsite access to clinicians to build their capacity to deliver quality TB services in line with national protocols. This includes encouraging TB patients to be tested for HIV and for HIV patients to be screened for TB, adherence messages for persons on treatment, treatment support education for families and individuals supporting those on treatment. Other issues covered include prevention with positives with emphasis on discordant couples. Information includes adherence for treatment.

Both Mindset and CHMT material have been developed through public-private partnerships including; business (MTN, Liberty Foundation and Sunday Times) as well as assistance from government and parastatals (e.g. NDOH, SABC).

DramAidE utilizes HIV-infected Health Promoters in 23 tertiary institutions in South Africa to undertake community sensitization efforts among students on campuses using events such as World TB Day and through their support groups of students living with HIV around the need to be screened for TB and adherence to TB treatment.

Lesedi Lechabile and Mothusimpilo trains their peer educators working in mobile clinics and one static site to provide counseling to vulnerable women, mine workers and people living with HIV on the need for TB screening and treatment adherence in the mining districts of the Free State and North West Provinces. They undertake community sensitization and mobilization around TB/HIV.

Lighthouse Foundation (LF) trains its peer educators and community facilitators to work in the 13 informal settlements in the Madibeng District of the North West Province to undertake community sensitization efforts using their door-to-door campaigns and community events. LF uses events such as World TB Day and their support groups of students living with HIV to disseminate messages around the need to be screened for TB and adherence to TB treatment.

ACTIVITY 2: Media support for community mobilization

ABC Ulwazi produces a radio talk show series tailored to 60 different community radio stations. Special emphasis is on treatment adherence and establishing support systems for those people who have TB. Each episode ends with a summary and clear messages on the topic discussed.

SABC continues the theme of treatment through two programs: Trailblazers, a 13 episode TV series highlighting success stories including best practices in this area; and a new 26 episode adult TV drama series. Both TV programs are accompanied by radio talk shows (on 9 local language stations) as well as web-based content. The storylines focus on TB and HIV treatment and prevention with positives.

JHU/CCP contributes substantially towards meeting the vision outlined in the USG PEPFAR Five-Year Strategy for South Africa by ensuring that 1) all persons who are screened for TB are tested for HIV and that all persons living with HIV are screened for TB; 2) that TB patients and patients living with HIV have access to TB/HIV services; 3) implementing joint TB/HIV information, education and communication activities. By training individuals to deliver quality TB/HIV services this activity contributes to the PEPFAR goal of putting two million HIV-infected people on treatment. This activity also contributes towards the objectives of the National Strategic Plan for South Africa through ensuring that 80% of people have access to appropriate treatment, care and support services through the effective management of TB and HIV coinfection.

Estimated amount of funding that is planned for Human Capacity Development \$77,000

Public Health Evaluation**Food and Nutrition: Policy, Tools, and Service Delivery****Food and Nutrition: Commodities****Economic Strengthening****Education****Water****Table 3.3.12: Activities by Funding Mechanism****Mechanism ID:** 4760.09**Prime Partner:** St. Mary's Hospital**Funding Source:** GHCS (State)**Budget Code:** HVTB**Activity ID:** 22814.09**Activity System ID:** 22814**Mechanism:** N/A**USG Agency:** HHS/Centers for Disease Control & Prevention**Program Area:** Care: TB/HIV**Program Budget Code:** 12**Planned Funds:** \$145,636

Activity Narrative: SUMMARY:

St. Mary's Hospital in Durban, KwaZulu-Natal will continue with TB screening services to the community to encourage patients' referral to the hospital for treatment as well as screening for HIV. The activities will encompass human resources, training and laboratory supplies. The emphasis area of this activity is to provide, identify and intensify TB case findings at all levels in the hospital, and at local and community clinic level. The activities will also address the need for various screening tests for TB.

BACKGROUND:

This is a new program activity funded in FY 2009, although St. Mary's has received previous PEPFAR funding as a sub-partner to another PEPFAR partner, Catholic Relief Services. This activity will enhance the antiretroviral treatment (ART) programmatic area as well as be incorporated into prevention of mother-to-child transmission (PMTCT), and palliative care programs that were funded by PEPFAR in FY 2007. The South African government supports the program as St. Mary's Hospital has a service level agreement with the provincial Department of Health and the Hospital is in partnership with the District Office of the Department of Health to provide HIV and AIDS training to all clinical staff over the next two years.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: TB and HIV Training

There is a need to provide additional training to therapeutic counselors, counselors and community health-care workers that address the need to address referrals to the hospital effectively, as well as follow-up on patients down referred to the community clinics. The therapeutic counselors will be used to improve TB case findings in the community. This training will also address the need for counselors and nursing staff in all programmatic areas to screen all HIV patients for TB. This training will also extend into the community for effective management of TB patients in the home.

Comprehensive TB training will also be provided to hospital staff as a focus, especially for pediatric cases, which will be in-hospital at ward level, in the pediatric outpatients department, and at the primary health-care facility.

The hospital has an onsite nursing college, which will ensure TB is a focus at the level of nurse education. The student nurses complete their practical training at the hospital so this training will automatically filter into the hospital. The training of all health-care workers, including therapeutic counselors, will also include the importance of the delivery of isoniazid preventive therapy. Training specialists from Georgetown University are currently enhancing the nurse's training program at the college.

ACTIVITY 2: Screening Patients for TB

There is an integrated approach to the treatment of TB and HIV at all ward levels in the facility. This will ensure that all TB patients will be routinely tested for HIV, and all newly diagnosed HIV-infected clients at the facility will be screened for TB. Clinical TB screening will include sputum collection and if required further culture analysis, any other laboratory screening tests and chest X-rays. Effective referrals and follow-up is required; these should be linked in with the Department of Health as well as the therapeutic counselors in the community as discussed in activity one.

As discussed earlier, the ART program and the TB services program are fully integrated within all the services at the hospital. This allows a more efficient service for patients co-infected with TB and HIV. The therapeutic counselors who visit ART patients at their homes will be trained to assist with early detection of TB, the referral for timely initiation, and will assist with monitoring the adherence to the TB treatment. The continuum of care for individuals who are co-infected with TB and HIV will be provided at all levels of care, within the hospital, at the outpatient clinics, and within the community at a home-based care level.

Linkages and referrals will be strengthened between the clinics and the hospital. The Department of Health has provided the hospital with two on-site health-care workers to coordinate the services among the hospital, clinics and the community. Together with the Department of Health's tracer teams and the therapeutic counselors, there will be a focus on addressing linkages for patients requiring TB support services, as well as adherence to treatment.

These activities will also link in with the counseling and testing programmatic area as well as the treatment programmatic area using mobile clinics. Access to TB screening and HIV testing will be conducted in the community. All statistical data on TB are managed and submitted to the Department of Health through the monthly district office statistical submissions.

ACTIVITY 3: Procurement of Drugs

Due to the possible shortages of cotrimoxazole, St. Mary's Hospital will prioritize HIV-infected TB patients as one patient cohort that requires the drug as a matter of necessity. If this national shortage persists, TB patients will continue to be prioritized.

IPT will be provided to all HIV-infected persons in whom TB disease has been ruled out according to national guidelines. This will be a focus at all levels of care, starting at the home setting identified by therapeutic counselors right through to the community clinics and hospital where the patients have been referred. Registers and data management will remain a key element in ensuring this linkage.

ACTIVITY 4: TB Infection Control

St. Mary's Hospital will continue to implement TB infection control policies at supported service delivery

Activity Narrative: points at hospital level and will assist down-referral clinics to develop their own TB infection control policies and plans (administrative, environmental, and personal protection).

These activities augment the current PEPFAR funded ART program funded through Catholic Relief Services.

Mechanism: N/A

Prime Partner: Foundation for Professional Development

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Care: TB/HIV

Budget Code: HVTB

Program Budget Code: 12

Activity ID: 7986.22958.09

Planned Funds: \$1,015,236

Activity System ID: 22958

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Foundation for Professional Development (FPD) aim to second TB nurses into antiretroviral treatment (ART) clinics was not a realistic goal that could be implemented in FPD-partnered facilities. Following lessons learned lay counselors and caregivers would be trained to do routine TB symptom screening and to refer TB suspects to nurses, doctors and/or the TB focal point for further investigation. Screening for TB symptoms is well established at FPD-supported counseling and testing (CT) and ART sites, and strong referral linkages are in place between CT, ART, Outpatient Departments and the TB focal points. Lay counselors will also be tasked to (1) manage CT and ART-based TB suspect registers; (2) verify the number of TB suspects in CT and ART-based TB suspect registers against the number investigated for TB in the TB focal point's daily patient register; and (3) follow up people living with HIV (PLHIV) identified as TB suspects based on TB symptom screening to ensure completion of TB referral from the ART and CT entry points. The same system used for TB referral at the aforementioned sites will be expanded to prevention of mother-to-child transmission (PMTCT) sites. TB symptom screening will form part of the routine assessment of all pregnant women at FPD-supported facilities. Pregnant TB suspects will be referred to the TB focal point for investigation and further management.

Emphasis will be placed on constant in-service training and mentoring of staff on TB/HIV collaboration and TB infection prevention and control. Nurses trained in TB/HIV collaboration and infection prevention and control will be deployed to offer technical support and continuous on-site mentoring in the different districts supported by FPD. These nurses will also comprise part of the in-service training program at the different facilities.

Activities in support of TB/HIV collaboration include (a) ensuring that all nurses and doctors at HIV care sites are trained in TB/HIV and are competent in the diagnosis, management and treatment of TB and the appropriate referral processes; (b) improving infection control and exploring facility-specific ways of limiting PLHIV exposure to TB; (c) supporting adherence counseling activities for ART and TB treatment; and (d) strengthening linkages to family planning and reproductive health (FP/RH) and PMTCT services for individuals on TB treatment and/or ART. Infection control is a priority. FPD will assist SAG to conduct facility assessments, to develop and monitor facility infection control plans; and to facilitate in-service TB infection control training of all staff. Funding will be used to improve ventilation, install UV lights, N95 respirators, kits for fit-testing, smoke tubes and sputum collection booths, where indicated, as well as to develop communication and social mobilization strategies around TB-HIV co-infection.

Efforts will also be made on a facility-by-facility basis to introduce an appointment system with patients at block times to reduce the number of patients in waiting rooms. This complies with South African infection guidelines. Patients will be screened for TB symptoms upon arrival and TB suspects will be fast-tracked to avoid exposing other patients to TB bacilli. Patients will also be instructed about cough-etiquette. At ART and CT sites, systems will be put in place to triage and fast track potential TB patients for assessment and treatment.

FPD will also extend support services to CT and TB focal points at the primary care level within an ART clinic's catchment area in order to strengthen CT service provision for newly diagnosed TB patients.

The electronic medical record (EMR), already utilized at ART sites, will be expanded to include a TB module, and rolled out at major TB treatment facilities. The EMR will improve TB/HIV patient management, and FPD will work closely with provincial TB program in support of this activity. The EMR was developed at the request of the Tshwane District of Health to strengthen and harmonize facility-based monitoring systems while ensuring that data quality and data use are integral components of the process. The EMR is critical in strengthening the integration of various HIV service points (CT, TB, HIV palliative care, ART) and optimizing inter-connectivity with existing South African DOH systems (e.g., Electronic TB Register). In support of these activities, FPD will place a strong emphasis on didactic training and ongoing on-site mentorship to build sustainable, local monitoring and evaluation (M&E) and health management information systems (HMIS). Key outputs include (a) in-systems alerts for HIV patients identified as TB suspects who do not complete the referral to the TB focal point (e.g., TB investigation); (b) integration of ART clinic and TB focal point data management systems onto a single electronic platform; (c) improved access to TB data for HIV clinicians; (d) effective referral and cross-referral linkages among program areas; (e) utilization of the defaulter tracing module to track TB patients regardless of HIV status; and (f) improved capacity to monitor continuity of care and barriers of access between the HIV and TB service points.

SUMMARY:

The program supports the expansion of access to comprehensive HIV and AIDS care by focusing on service delivery and Human Capacity Development with a view to increasing the detection and treatment of patients with TB and HIV coinfection. The emphasis areas for these activities are construction/renovation and HCD. The target populations for these activities include people living with HIV and AIDS (PLHIV), and most at risk populations.

BACKGROUND:

The Foundation for Professional Development (FPD) is a South African Private Institution of Higher Education working exclusively in the health sector in Southern Africa. PEPFAR funding has allowed large scale training and antiretroviral treatment to take place over the past year. FPD supports ART sites that are in high TB prevalence areas with case rates ranging from 300-1500:100,000 and as such there is a need to integrate TB and HIV services, improve the diagnosis and treatment of TB and provide training to health care professionals on TB/HIV in FY 2008. FPD provided training to over 800 clinicians and nurses on the management of TB/HIV during FY 06 and introduced programs in all the ARV clinics it supports to increase the identification of TB/HIV co-infected individuals while in FY 2007 the emphasis is on strengthening TB

Activity Narrative: treatment sites with regard to identification of HIV co-infected individuals an initiation of ART at such sites. Treatment related activities are closely coordinated with provincial Departments of Health (DOH) through memorandums of understanding (MOUs) with provincial DOH and through close coordination with district TB programs. National Department of Health (NDOH) guidelines are also incorporated in all activities and training programs. A gender focus is built into all aspects of the project ranging from ensuring gender parity in uptake of testing and treatment, including gender in data collection, all counselors will be trained on aspects relating to male norms and behavior and equal access to training activities will be ensured. It is envisaged that FPD will be the main project implementer; however, sub-agreements with CBOs and FBOs may be used to increase community participation and to increase CT for TB and HIV. This project will place specific emphasis on gender issues in the context of the CT activities. All CT staff will be trained and provided with counseling tools in order to equip them to undertake couple counseling, identify, counsel and refer victims of sexual abuse and violence, and reduction of stigma and discrimination. Most of these activities will be aimed at strengthening the public healthcare system, promoting closer cooperation between the public sector and civil society institutions, and developing human capacity. Activities will offer sustainable and long-term benefits for the South African healthcare system.

ACTIVITIES AND EXPECTED RESULTS:

FPD will continue to work with the national and provincial departments of health and specifically with the HAST (HIV, AIDS STI, and TB) managers to prioritize interventions designed to address weaknesses (identified by the departments of health) in the DOTS and TB/HIV programs. FPD will focus on improving policy adherence and patient follow-up. Individuals will be hired for each site as tracers to track patients and ensure that referrals are completed. FPD is setting aside funding to develop (with other relevant partners or agreement counterparts) standardized tools to ensure that policies and guidelines recommended by NDOH are followed, including guidelines for infection control. FPD will continue to integrate TB/HIV interventions with existing agreement programs as they work seamlessly and side by side with government employees at government facilities.

ACTIVITY 1: Support to South African Government

PEPFAR funds will be used for human resources at public sector ART sites and surrounding TB clinics. Funds will be utilized predominantly and in the form of salary support for FPD staff seconded to these sites. Sustainability will be ensured through strengthening systems and developing and supplementing capacity of existing government staff to increase identification of TB/HIV co-infected individuals, through promoting routine HIV CT for TB patients and routine TB screening of HIV patients at ART treatment sites. This will allow in time withdrawal of FPD seconded staff. Emphasis will also be placed on strengthening systems and developing and supplementing capacity to increase identification of TB/HIV co-infected individuals, through promoting routine HIV counseling and testing (CT) for TB patients and routine TB screening of HIV patients at TB treatment sites. Dedicated and cross-trained TB/HIV counselors will be placed at all TB sites who will actively promote CT among TB patients. TB Nurses will be deployed to all ARV sites and tasked with increasing the diagnosis of TB, especially sputum-infected TB in patients receiving ART. TB screening will be done by nurses following a protocol of history taking, routine sputum specimens, and x-rays as needed, and suspected smear-negative TB will be referred to an infectious disease clinician. These dedicated nurses will also ensure a fast track for patients requiring TB therapy and will maintain contact with patients to ensure they are not lost to ART. Co-infected patients who are on ARV treatment and TB treatment simultaneously will receive additional clinical monitoring due to the increased risk of Immune Reconstitution Syndrome, and challenges in the profiling of side effects. Emphasis is placed on adherence support to address the heightened risk of non-compliance due to high pill burden, and to cope with higher incidence of side effects due to drug interaction and overlapping hepatotoxicity. This activity plays an institutional strengthening role at TB sites with a view to such sites becoming ART down referral sites. PEPFAR funds will also be used to address minor infrastructure needs e.g. sputum rooms, nebulization apparatus and mobile x-ray facilities to improve the diagnosis and infection control of TB transmission. Funds will be utilized for culture and sensitivity tests where MDR-TB is suspected if government protocols or facility budgets do not make provision for such testing.

ACTIVITY 2: Outreach

Active TB case finding will be utilized at selected sites to increase uptake of TB and HIV testing among contacts of patients with TB and HIV coinfection. Dedicated staff (mentioned in Activity 1) will actively trace all contacts of TB patients on treatment to encourage the participation of these contacts in CT for both TB and HIV. **ACTIVITY 3: Human Capacity Development.** This activity ensures a cadre of skilled healthcare practitioners, in predominantly government service, who are able to provide care to PLHIV who are co-infected with TB. Healthcare workers will be trained on various subjects such as: clinical management of AIDS and TB, Management of CT, Palliative care, and Adherence and Workplace, using a proven short course training methodology that provides training close to participants work. PLHIV form part of the faculty to help with stigma reduction among participants and to articulate the needs of PLHIV. To maintain knowledge, an alumni program of newsletters and regular refresher sessions has been developed. Given the high risk that MDR-TB poses for immune compromised individuals, particular emphasis will be placed on training facility managers, facility designers and clinical managers on infection control. Training takes place in all provinces for both public and civil society organizations, for public sector training such training is coordinated with relevant HR Departments. **ACTIVITY 4: Referral and linkages.** The strengthening and expansion of referral networks and linkages with care and treatment services for clients identified TB/HIV co-infected will be a central focus of the project. Linkages with community mobilization and outreach activities will be initiated to promote the uptake of both TB and HIV CT services PEPFAR funds may be utilized in the form of sub-awards for NGOs working in the field of DOT support and community outreach.

FY 2008 COP activities will expand on the activities successfully started in previous years. FPD will contribute to the PEPFAR goals of 2-7-10 by developing the capacity of organizations to expand access to ART services for adults and children, building capacity for monitoring ART service delivery and reaching thousands of individuals with care and ART.

Mechanism: UGM

USG Agency: U.S. Agency for International Development

Program Area: Care: TB/HIV

Program Budget Code: 12

Planned Funds: \$97,090

Activity Narrative: SUMMARY:

Right to Care (RTC)'s Umbrella Grants Management (UGM) project will support several sub-partner organizations through financial oversight, project management, human capacity development, training, mentorship programs, program development, treatment expertise, and strategic planning in providing Adult HIV Care and Support (ACS) services. RTC currently implements or oversees a wide variety of program areas, and in response, has developed a wide base of skills and capacity to manage a range of organization activities, including organizations that provide prevention, training, HIV treatment care and support, pediatric care and treatment, cervical cancer screening, care for orphans and vulnerable children (OVC), home-based care and TB care and treatment.

BACKGROUND:

The following proposed activities are designed to support sub-partner initiatives to implement the goals of PEPFAR and the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP). During the past two years, RTC has developed a UGM capacity while developing specific skill sets, competencies and capacity to support many sub-grantee organizations. RTC has developed in-house capacity in financial management, pre-award assessments, training functions in financial management and USAID regulatory compliance. In addition, the technical expertise in medical aspects will be supported by internal RTC capacity and through the Clinical HIV Research Unit, an extension of the ongoing activities of the current RTC grant.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: UGM Technical Assistance and Quality Assurance

Needs assessment and program planning will be done on a regular basis with sub-partners. Site visits will be conducted alongside sub-partner staff to evaluate needs of capacity, human resources, facility planning, approaches to programmatic areas such as treatment and care, in order to reach determined targets and quality of care. The needs assessments will use the experience of RTC clinicians and program staff to develop proper planning and forecasting to facilitate patient growth. Programmatic technical assistance will be provided on an on-going basis, with clinical mentors responding to requests and providing treatment updates, on-going training, updated guidelines, and case-specific support.

ACTIVITY 2: UGM Financial Management

The finance department at RTC has developed systems to support sub-partners that enable compliance and capacity to manage PEPFAR funds effectively. Support includes a complete range of necessary financial management. RTC will meet with sub-partners annually to align financial and programmatic planning.

Regular oversight and support will be given with monthly financial reports required for all sub-partners. Periodic internal audits will also be conducted at the sites of all sub-partners to establish the quality of financial management and human resources (HR) management, review of asset control and alignment with USAID financial management policies.

The finance department at RTC has developed a state-of-the-art financial software tool, which uses Business Intelligent Tools, to monitor and track all sub-partner transactions against budget projections for modeling and cash flow. This integrated program will allow proper management of budget at all sites. Combined with the monthly financial reports, RTC will be able to use this system to produce up-to-date fund accountability statements and fund balances for its sub-partners.

ACTIVITY 3: UGM Monitoring and Evaluation

RTC's monitoring, evaluation and reporting (MER) system (standards, systems, procedures and tools) is established, documented and continuously improved, based on best practices and quality criteria, in the programmatic areas of Adult Treatment, Adult Care and Support, Pediatric Treatment, Pediatric Care and Support, TB/HIV, VCT, Outreach and Training.

All implementation sub-grantees/programs will be provided with the support, training, and technical assistance necessary for sub-partners to meet USAID reporting requirements effectively. In addition, RTC programmatic experts will monitor the reports for quality assurance.

ACTIVITY 4: UGM NGO Management and Sustainability

RTC supports non-governmental organizations (NGOs) with established policy guidance and procedures that meet the requirements of the South African labor law as well as the USAID regulations. All sub-partners will have access to the RTC human resources capacity.

Support of infrastructure will be given through expertise within RTC for advice and consultation. Through various infrastructure projects, RTC has developed expertise in proper clinic flow, effective interior space design in both Comprehensive Care Management and Treatment sites as well as TB clinics. Other sub-partners facing infrastructure challenges will be able to make best use of limited resources which are necessary in increasing clinic capacity. Sustainability of sub-grantees will be supported through RTC's continued relationship with the Department of Health to ensure that continued HIV and AIDS response is in line with the strategic plan for South Africa, ensuring that once the PEPFAR program is complete, that the activities of the NGO can be taken over by the South African government.

Where systems are identified as inadequate, RTC aims to capacitate NGOs to manage their programs independently of RTC. Within the implementation plan and budget, RTC has planned to provide financial

Activity Narrative: reporting systems, management standard operating procedures, human resources policies and procedures, clinical guidelines, and M&E and evaluation systems that will ensure sustainability beyond RTC support.

ACTIVITY 5: Technical Assistance for TB/HIV

RTC supports the South African government's TB program and the World Health Organization's policy on collaborative TB/HIV activities. RTC will provide technical assistance (TA) to sub-partners on integration of the services aimed at TB/HIV co-infected patients at sub-partner NGO or faith-based organization (FBO) sites. Sub-partner PEPFAR-funded TB/HIV activities at the sites will include (1) access to HIV counseling and testing for patients with TB, (2) improved linkages between the HIV and TB programs at each of the sites through referral, notification, and follow-up; and (3) appropriate infection control procedures to prevent the transmission of TB. FBO/NGO clinics focusing on underserved populations in rural areas, industrial areas and informal housing sectors as well as targeted gender specific support groups and family-centered approaches will be targeted. The programs will promote sustainability through training health-care workers and partnerships with the National Department of Health (NDOH) to provide partial funding for the ongoing running costs and staff components over time.

Sub-partner TB/HIV treatment activities will emphasize identification of co-infected individuals, through promoting routine HIV counseling and testing for TB patients and TB screening of HIV patients who present with risk factors. Co-infected patients will be evaluated for correct application of ARVs and TB medications. Those on combined ARV and TB treatment will be monitored for the development of Immune Reconstitution Inflammatory Syndrome. Emphasis is placed on adherence support to address the increased risk of non-compliance due to high pill burden, and overlapping toxicities, particularly hepatotoxicity. Human capacity development in the management of anticipated drug interactions and shared adverse effects is an additional expected result.

At sub-partner TB/HIV treatment sites, the family and community support network will be educated and trained in basic TB knowledge to help screen clients and family members of clients for TB and to refer for testing and treatment, to trace family members of patients with TB, and to support the client with his/her treatment to improve compliance. NGO clinics that have not been accredited to provide TB services will strengthen referral links to government clinics that provide TB services so that co-infection can be managed.

Budget Code: HVTB

Program Budget Code: 12

Activity ID: 12473.22857.09

Planned Funds: \$0

Activity System ID: 22857

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is being funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. This will no longer be funded in FY 2009 due to the existing National Institute for Communicable Diseases (NICD) Cooperative Agreement ending. A new Cooperative Agreement is now in place with the National Health Laboratory Service (NHLS), the parent organization for the NICD, and a smaller Funding Opportunity Announcement is being developed with the Sexually Transmitted Infections Reference Center (STIRC), an STD division within the NICD. The TB/HIV funds earmarked for FY 2009 have been moved into LAB for FY 2009, so that there are only 2 program areas for NHLS in FY 2009, LAB and SI. All existing program activities in these areas will be supported under the new NHLS Cooperative Agreement in the FY 2009 COP. Care, treatment, and a smaller SI budget will continue to be supported, but through a new TBD COP entry for a NICD continuation (STIRC) in FY 2009. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Program Budget Code: 12

Activity ID: 24475.09

Planned Funds: \$1,553,447

Activity System ID: 24475

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Project Integrate will expand to Sisonke district, KwaZulu-Natal (KZN) in FY 2008 and Ehlanzeni district, Mpumalanga in FY 2009.

ACTIVITY 1: A tracking system is used to ensure that referred clients visit health facilities. Clients receive referral cards that are left at the clinic, reviewed by community team leaders (CTLs) who meet with community health workers (CHWs) weekly to check if all referred clients attended the clinic. CHWs trace clients and encourage them to attend.

The collection of sputa at non-clinical VCT sites in collaboration with the Cape Town and Metro health services will be piloted. Two sputum samples will be collected from TB suspects and sent for smear microscopy (TB culture for HIV-infected clients). Clients will be asked to return for their results in 3 days and sign an informed consent to allow a CHW to visit at home. Clients with positive sputum smears or who remain symptomatic with negative sputum smears will be referred to a clinic. Tuberculosis Care Association (TBCA) data capturers and CTLs will track referrals to ensure continuity of care. Due to limited space in facilities, TBCA will hire one CTL per facility who will work as a data capturer as well. TBCA will ensure the implementation of CT quality assurance programs aligned with national standards.

ACTIVITY 2: TBCA will assist the Department of Health (DOH) in accrediting TB clinical and primary care facilities to provide antiretroviral treatment (ART). The nurse mentors will be trained as trainers for PALSAs Plus and STRETCH, approved by the DOH.

ACTIVITY 3: Continuity of care for co-infected patients will be ensured by improving referral systems. CHWs provide adherence support for patients on TB and ART, and will promote VCT, screen for TB, refer TB suspects and recall patients who miss appointments for care and treatment. CTLs provide adherence counseling for TB and ART and refer patients to CHWs for adherence support.

ACTIVITY 4: TBCA will support the DOH to conduct TB/HIV/STI audits. If requested by the DOH, the School of Public Health, UWC will be subcontracted. The audit tool will be modified for rural areas and be used at baseline, and after a year, in KZN.

ACTIVITY 5: TBCA will sub-contract the Health Systems Research Unit, MRC to monitor and evaluate integrated TB/HIV adherence support. The Health Economics Unit of the University of Cape Town will be sub-contracted to measure the cost-effectiveness of integrated adherence support.

NEW ACTIVITIES:

An infection control nurse will coordinate home assessments and counseling of MDR/XDR-TB patients and their families. Under direction of the DOH, the nurse will assist facilities to conduct risk assessments and develop infection control plans based on national and Global TB/HIV Working Group guidelines. These include advocacy campaigns, infection control, safe sputum collection, cough hygiene, triaging TB suspects, assuring rapid diagnosis and initiation of treatment, improving room air ventilation, protecting health workers, building capacity, and monitoring infection control. Community-based infection control plans include educational materials promoting cough hygiene; open windows; early identification of TB suspects; early diagnosis and treatment; and completing treatment. TBCA is developing a workplace policy for its health workers who will be offered VCT and TB screening. Eligible HIV-infected workers will be offered IPT.

TBCA will support Brooklyn Chest Hospital with two auxiliary social workers who will counsel MDR/XDR-TB patients and run group sessions in the wards, and two lay counselors who will provide adherence counseling to MDR-TB patients. Clinicians will be trained and mentored to improve HIV care and treatment for hospitalized TB patients. Three educate teachers will provide early childhood development to hospitalized pediatric TB patients. Many have TB meningitis and mental disabilities due to late presentation. The hospital will be upgraded to accommodate long-term patients. Referral systems will ensure that discharged MDR/XDR-TB patients complete their treatment, attend follow up visits and receive community-based adherence support. TBCA will support Cape Town in piloting community-based MDR-TB treatment.

TBCA will provide TB/HIV education, VCT, TB screening linked to VCT, clinical mentorship, adherence support and referral to offenders who are discharged on TB treatment or ART. An application has been submitted to the Western Cape Correctional Services for quality assurance approval.

TB patients identify a support person in the workplace and TBCA's Health Promotion Coordinator provides on-site training and education on TB and HIV to the supporters and colleagues.

TBCA hopes to receive accreditation as a training provider with Health and Welfare Sector Education and Training Authority in FY 2009. Trainings at will be offered to CHWs, NGOs, and provincial governments on TB and HIV prevention and adherence support.

SUMMARY:

Activities will be carried out to screen people for TB in non-clinical counseling and testing (CT) and in clinical sites and to ensure referral for care. The project will support care and treatment services at three hospital-based clinics and eight primary health clinics (PHC). Clinical training and mentorship will be provided to screen HIV-infected people for TB, provide appropriate TB treatment, and to screen for isoniazid preventive therapy (IPT) to prevent TB. CHWs will educate community members about the symptoms of TB and the importance of seeking care and completing TB treatment. They will screen community members for TB symptoms of TB and STIs and refer symptomatic people to health services. Community adherence support will be provided by CHWs for TB treatment, for prophylaxis (IPT and cotrimoxazole) and for ART. The adherence support model used for ART will be piloted with TB patients. BACKGROUND: TB Care

Activity Narrative: Association (TBCA) will implement this activity in collaboration with provincial and district departments of health. TBCA has been providing community-based counseling, emergency material relief and TB treatment support in the Western Cape since 1992. The Western Cape province has requested support from TBCA for the West Coast Winelands district because the burden of TB with HIV coinfection is high. TBCA is exploring the possibility of expanding activities to the Northern Cape province as well.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: TB and STI Case Finding Linked to VCT.

VCT will be provided in non-clinical sites including workplaces. During CT, counselors will routinely screen for TB and STIs, utilizing a questionnaire. Clients who have TB symptoms will be given 2 sputum containers by the nurse counselor and a referral letter to go immediately to their nearest health facility. Clients with STI symptoms will also be given a referral letter to their nearest health facility. The CT register will have additional columns to indicate if clients have TB or STI symptoms as well as a column to determine if the patient presents at the health facility to which they are referred. PEPFAR funds will be used to employ one data capturer for each supported health facility to assist with recording laboratory results and to trace people with positive TB smears to ensure that they are initiated on treatment. The data capturer will also be responsible for informing the CT teams and community health workers (CHWs) if referred patients attend the facilities to which they have been referred.

ACTIVITY 2: Improve the Quality of TB/HIV Care and Treatment.

TB/HIV clinical training & mentoring will be provided for all relevant health care workers, in accordance with the South African National TB Control Program guidelines and national guidelines for HIV care, utilizing materials adopted by the Western Cape Department of Health (i.e. PALS plus). Training will focus on the co-management of TB, HIV and STIs. Health care providers will also be trained to routinely counsel TB patients about the benefits of knowing their HIV status and to give patients the opportunity to test or to opt out of testing. HIV-infected TB patients will be offered cotrimoxazole prophylaxis and will have a CD4 count done as part of screening for antiretroviral therapy (ART). The new NTCP TB register will be introduced to register all TB patients, to document their HIV status, and to record which TB patients are started on cotrimoxazole and screened for ART. Health workers who provide care for TB patients will be trained on the prevention and management of opportunistic infections, on ART and on the new TB register. Health workers, who provide HIV care, including pediatric services, will be trained to screen all HIV-infected clients for TB and to screen asymptomatic patients for IPT. HIV-infected individuals with symptoms of TB will be provided with diagnostic services at the level of care where screened (i.e. ART clinic), including TB culture. Recording and reporting of TB status will occur at the closest TB treatment clinic. TBCA will work closely with DOH to integrate services, to allow co-infected patients to seek care at one point of service. Under the guidance of the clinical coordinator, two nurse mentors will visit health facilities on a regular basis to provide supervisory support to ensure optimal co-management of HIV, TB and STIs. These visits will reinforce didactic training and will assist health staff in facilities to solve clinical problems they encounter through case studies. Nurse mentors will also liaise with the in each facility to assist with monitoring referrals to ensure a continuum of care between communities, clinics and hospitals. Training and mentoring initiatives will address clinical issues identified through quality assurance reviews.

ACTIVITY 3: Improve TB and ART Case Holding through Community-based Adherence Support.

The policy of the Western Cape Department of Health is to provide funding for multi-skilled community health workers (CHWs) rather than community workers that focus on vertical program. CHWs will be trained on priority health issues to provide integrated community care. They will be responsible for the following activities: HIV prevention and condom distribution; Education on STI symptoms and the importance of seeking treatment for STIs; Promotion of HIV voluntary counseling and testing, particularly for pregnant women; Infant feeding counseling; Education on TB symptoms and the importance of seeking treatment for TB; Screening community members for TB and STI symptoms and referring suspects to health facilities; Education on the importance of adhering to prophylaxis (isoniazid and cotrimoxazole), antiretroviral treatment and TB treatment; Monitoring and providing adherence support to TB patients and HIV-infected clients taking prophylaxis or ARVs with modified directly observed treatment (DOT); Home-based care; Identification of malnourished children and referral to health facilities; Assistance in obtaining social support grants; Referral to support services to address substance abuse and domestic violence; Stigma and discrimination towards people living with HIV will be addressed through the efforts of community mobilizers and CHWs who will increase awareness of HIV in their communities utilizing IEC strategies. The TB Alliance DOTS Support Association (TADSA) will be a partner in the formative assessment of adherence support services. The first step will be to identify existing organizations that are providing home-based care services in the area. Where possible, existing home-based carers will be recruited and trained to provide more comprehensive care as CHWs. Carers who are already engaged in home-based care and who receive a stipend from the provincial government will integrate the new activities into their existing functions. In areas where there are no home-based care organizations, CHWs will be recruited from the communities in the catchment areas of the facilities. Stipends for CHWs will be funded from the PEPFAR budget, at a similar rate to what the Provincial Government pays. This will ensure sustainability for when the program is taken over by the government. TBCA has a well developed system of financial controls for managing the payment of stipends. Approximately ten CHWs and one community team leader will be employed per health facility, depending on the estimated burden of TB & HIV in the community (see Activity 4). Health facilities will inform TBCA community team leaders of all patients who are initiated on prophylaxis, ART or TB treatment. Community team leaders will identify a CHW who lives close to the patient and arrange for the CHW to meet the patient. Patients on treatment will be visited by a CHW daily for the first two weeks of treatment, then weekly up to eight weeks of treatment, then every two weeks (modified DOT). CHWs will identify any potential adherence problems, try to address them with the patient and inform the health professionals of issues that need to be addressed (e.g., side effects).

ACTIVITY 4: Assessment of Quality of Services.

Activity Narrative: The University of the Western Cape, School of Public Health, will be sub-contracted to evaluate the quality of TB/HIV/STI services. This will be done by conducting facility audits using an integrated TB/HIV/STI evaluation tool at the beginning of the project, at one year and at the end of the project. The quality of services will also be assessed through routine TB and HIV monitoring and evaluation. Existing forms and registers will be reviewed and, if necessary, be revised, piloted and implemented to collect information for key indicators. District and facility managers will be assisted in monitoring progress in achieving agreed upon targets. A baseline survey will be done to assess demographics, TB and HIV education and stigma as well as health seeking behaviors and uptake of VCT. This survey will be repeated at the end of the project to assess the impact of the services provided.

ACTIVITY 5: Improving HIV and TB treatment Adherence and Outcomes.

Drawing on ART adherence promotion models this project evaluates a pilot program using lay health workers to support adherence to TB treatment in Cape Town. The pilot replicates what are seen as the key elements of the ART adherence model: intensive treatment counseling and preparation sessions by trained lay adherence counselors; the use of a 'buddy' to support patients; and frequent lay treatment supporters visits to help patients manage problems that arise during treatment. A qualitative assessment will be done of the feasibility and acceptability of the adherence model. TB treatment outcomes using the adherence model will be compared with treatment outcomes with the standard of care (directly observed treatment).

Program Budget Code: 12

Planned Funds: ■

Activity Narrative: SUMMARY:

These activities have previously been implemented by the Medical Research Council (MRC). However, this year these activities will be re-competed and a partner yet to be determined will be implementing them to continue the work started by the MRC.

The partner will carry out activities to support a comprehensive best-practice approach to integrated TB/HIV care at existing sites and new sites in KwaZulu-Natal, North West, Eastern Cape, Western Cape and Mpumalanga. The project aims to improve access to HIV care and treatment for TB patients by strengthening the role of TB services as an entry point for delivery of HIV and AIDS care, and by expanding TB screening to people living with HIV (PLHIV). Project results and lessons learnt will be shared with the national and provincial Departments of Health to inform existing policies and guidelines on TB/HIV care. TB patients and PLHIV are the key target populations and include pregnant women (referred to prevention of mother-to-child transmission (PMTCT) services) and children (receiving antiretroviral treatment (ART) if indicated).

Activities in FY 2009 will continue in applying a best-practice model to integrated TB/HIV care with TB services as the entry point to comprehensive HIV care. Activities in the currently supported sites will be continued; in addition sites in the Northern Cape will be added as well as additional sites in the supported districts to expand the services to patients and the community. Additional activities will focus on continued TB/HIV training for professional staff and lay counselors and will include infection control training. It will also focus on awareness campaigns in the community to decrease stigma, outreach to communities to ensure counseling and testing access, patient tracing to ensure adherence as well as streamlining of monitoring and evaluation activities and the implementation of standardized clinical forms to ensure quality of care and reliable data collection systems.

BACKGROUND:

The MRC initiated a best-practice approach to integrated TB/HIV care with FY 2004 PEPFAR funding. Early activities included a systematic description of barriers faced by TB patients co-infected with HIV in an accredited ART site, and in FY 2005, activities were focused on the development and implementation of a best-practice model. Preliminary results from the model site confirmed the benefits of an integrated TB/HIV approach, reflected in a drastic reduction in patient mortality, improved quality of life for TB patients living with HIV and prolonged survival rates. Results also confirm the safety and efficacy of dual regimens, showing that ART can safely be instituted within the first month of TB treatment. Activities in the established sites will continue in FY 2009. The best-practice approach will be expanded to additional sites in FY 2009 (i.e. one site in Mpumalanga, two sites in the Western Cape, one site in the Eastern Cape and one in the North West). The best-practices model drew from lessons learn in the start-up sites, such as the need for essential human resources, the importance of negotiated partnerships with health departments, and the challenges posed by dual stigmatization and discrimination. The new sites are characterized by extreme poverty, poor health infrastructure, cross border migration and limited health care access. Meeting the challenges of an integrated TB/HIV approach in such settings will be specifically addressed, as will strengthening down-referral capacity in existing sites.

ACTIVITIES AND EXPECTED RESULTS:

Activities include provider-initiated HIV CT; TB screening by symptoms and sputum investigations; referral to appropriate services such as PMTCT, sexually transmitted infection (STI) and partner counseling programs; and enrollment of patients in relevant HIV care and treatment programs. Two activities will be implemented:

ACTIVITY 1: Best-Practice Model

The partner will support implementation of a best-practice model of integrated TB/HIV care in sites providing TB and HIV services. This approach involves: (1) clinical management (counseling and testing (CT), ART, management of adverse drug effects, STI management, preventive therapy); (2) nursing care (TB screening, patient education, treatment adherence, HIV prevention); (3) integrated TB/HIV information, education and communication; (4) nutrition intervention; and (5) palliative care and support. Activities include site renovation to meet South African accreditation requirements for ARV roll out, site and supervisory staff training, hiring key personnel, development of patient educational materials, commodities procurement, and establishment of appropriate referral links, including those with governmental ARV sites to ensure continuity of care. The partner will monitor CT practices, strengths and weaknesses of TB/HIV referral systems, human resources and conventional TB treatment outcomes. The partner will implement ongoing quality assessments through onsite supervision and external quality assurance mechanisms such as checklists. Regular feedback meetings will be held with project staff and Provincial representatives in the relevant programs to identify potential problems and to facilitate corrective action. Stigma around HIV, AIDS and TB is specifically addressed through patient education and targeted interventions such as peer group counseling and advocacy campaigns. Results from the project will facilitate evidence-based policy formulation on expansion of integrated TB/HIV care, improve access to HIV care by co-infected TB patients, and increase TB case finding among PLHIV. Implementation of lessons learnt in the best-practice approach will facilitate rapid identification of systems and operational needs, and allow for corrective action. Results of this expanded approach to integrated TB/HIV management will facilitate national scale-up of comprehensive programs for dually-infected patients. This activity will strengthen TB services as a point of delivery of ART, by ensuring that human, financial and infrastructure needs for integrated TB/HIV programs are met through equitable allocation of scarce resources and through analyzes of cost effectiveness and cost benefit. Increased TB case finding in HIV settings is a crucial component of disease control; yet largely lacking in routine health services. In FY 2008 the project will continue to evaluate strategies for active TB case finding in vulnerable populations and assess implications for TB and HIV control programs. PEPFAR funding will also be used to implement an integrated electronic patient information system at the sites to support routine data collection, facilitate patient referral and allow data transfer to the national routine TB recording and

Activity Narrative: reporting system, which is now integrating HIV testing and service data.

ACTIVITY 2: Community TB/HIV Case Finding and Holding Among Women in PMTCT

This activity will identify pregnant women in the 34 project clusters and provide peer support to each of these households until the infants reach 6 months of age. Community peer supporters will educate households on symptoms of TB, cure rates, and adherence to TB treatment. They will refer household members with TB symptoms to health services for diagnosis. Children under 5 years who are TB contacts will be referred for TB preventive therapy, and HIV-infected mothers will be encouraged to take HIV-exposed infants for CPT, PCR testing and screening for ART. In addition, adherence support for all household members on TB treatment, to pregnant women/mothers taking ART and infants on CPT or ART will be provided. PEPFAR funds will provide stipends to peer supporters and allow for supervision/mentoring of peer supporters and transport to visit mothers in the clusters. Expected results include: recruitment of HIV-infected women, provision of community peer support and referral of TB suspects.

Program Budget Code: 12

Activity ID: 23714.09

Planned Funds: \$43,691

Activity System ID: 23714

Activity Narrative: SUMMARY:

The TB/HIV program area is a new activity for Tshepang in FY 2009. Although the organization has always taken care of HIV-infected individuals, it has not screened patients for TB nor has it offered preventative therapy or treatment for TB patients, instead referring patients to access these services in public sector TB clinics. In FY 2009 Tshepang will be providing TB screening to a thousand individuals, providing Isoniazid Preventive Therapy (IPT) and referring TB cases for treatment at nearby public TB treatment sites with follow-up mechanisms through Tshepang Patient Managers and utilization trained nurses as adherence counselors.

BACKGROUND:

The Tshepang Trust (Tshepang), a non-profit organization, is the South African Medical Association's HIV and AIDS program. Its mission is to utilize private general practitioners (GPs) to increase HIV testing and treatment access to individuals dependent on the public health-care system, using a public private partnership model with the South African government. It provides medical human resources by mobilizing HIV clinical management trained GPs using two models of care, a sessional model where GPs are placed on a sessional basis in public antiretroviral treatment (ART) clinics, and a private GP model where (ideally) the same GPs are utilized to test and treat patients in their private consulting rooms in order to alleviate the burden of care and treatment associated with shortage of infrastructure (e.g., consulting rooms, long queues, and stigmatization experienced in public health-care facilities).

The GP model was formulated out of a need by individuals to access treatment services close to their homes and workplaces. This is important because (a) patients can access their treatment and medical care outside working hours without having to miss work (public health-care facilities are characterized by long queues and lengthy waiting times, and crowded settings), and (b) patients need not be concerned about stigmatization, by for example, being seen by people they know at an HIV clinic.

The GP model complements government services because it addresses two fundamental challenges that currently face the Department of Health's public facilities: infrastructure and medical human resources. Both the sessional and GP models are an effective short and immediate way for South Africa to reach its HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP) targets. Approximately 70% of the medical resources including HIV Clinical Management skills and GPs operate in the private sector. This is in stark contrast to 80% of South Africa's population that is dependent on the poorly resourced public health-care system.

Long-term sustainability depends on all HIV patients being cared for by the state and once the public health-care system has stabilized, Tshepang will, in cooperation with the government, find ways to return GP's patients to state facilities. This may take place within three to four years. All Tshepang-contracted GPs are skilled professionals who have been trained in HIV clinical management aligned with South African government standards and procedures. Furthermore, Tshepang protocols on HIV disease management are based on the national guidelines and the Tshepang model ideally (although not always possible) has been able to utilize GPs work at public sites in addition to private practice to ensure that they understand clinic procedures and work according to national guidelines.

Tshepang has received PEPFAR funding through the American Center for International Labor Solidarity commissioned as a treatment partner in the Prevention Care and Treatment Access to South African Teachers program. This funding ended in March 2007, but Tshepang was given a no cost extension to continue with testing and treatment services until December 2007. A five-year cooperative agreement for a workplace intervention program was granted in FY 2007 and activities included counseling, care and ART treatment to individuals in the workplace.

ACTIVITIES AND EXPECTED RESULTS:

The Tshepang Trust recognizes the need for a comprehensive approach to HIV management and the need to work in collaboration with other partners to ensure the delivery of a comprehensive health-care package to HIV-infected individuals. To this effect, Tshepang has had a long-standing relationship with the Treatment Action Campaign utilizing its counselors at grassroots level to bring the required psychosocial care and adherence support in some areas of operation within the program. Tshepang has trained nurses in voluntary counseling testing and adherence counseling with the purpose of aligning them with the GPs to take care of the psychosocial needs of patients and their families within the program. It has been Tshepang's experience that some patients, (particularly the relatively elite ones) like teachers and nurses might not want assigned counselors due to fear of stigma; however, these services will continue to be made available to them. In addition, a telephone line for counseling offered by Tshepang Patient Managers on a monthly basis will be maintained.

The Tshepang Trust acknowledges that the program has been up till now more treatment focused but it is progressing to be more comprehensive. With effect from October 1, 2008, all HIV-infected patients enrolled for HIV palliative care but not legible for ART will be seen by GPs more regularly. This will involve patient monthly visits for cotrimoxazole prophylaxis to restore and maintain the individuals' immune system and delay the need for ART, TB screening and TB prophylaxis, cervical cancer screening and general patient clinical assessment. Tshepang's approach has also evolved to include prevention and in-depth adherence counseling for patients on treatment. Currently Tshepang is providing voluntary counseling and testing for early detection and positive prevention, encouraging routine family counseling including couples and children, prevention education that incorporates abstinence, being faithful and correct and consistent condom use messages (i.e., abstinence including delaying sexual debut, being faithful, female empowerment, male reaffirmation and condomising (as a last resort)) through the "stick to one partner" campaign to be launched at the beginning of 2009.

USG Agency: U.S. Agency for International Development

Program Area: Care: TB/HIV

Program Budget Code: 12

Planned Funds: \$656,890

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

While Health Care Improvement (HCI), the follow-on to the URC/Quality Assurance Project (QAP), will continue to focus on the five key activities described above, the emphasis during FY 2009 will be on expanding these and other activities as follows:

ACTIVITY 1: Establish Quality Improvement Teams at the Facility Level

By improving and institutionalizing the formation of quality improvement (QI) teams at a facility and district level, HCI staff is involved in providing the knowledge and skills required for leadership and sustainability for the program. These teams, with HCI support, are responsible for implementing facility plans for improving access to TB screening, treatment and follow-up among people living with HIV (PLHIV). Each facility team conducts rapid ongoing assessments to identify and to address quality gaps in current services for screening, treating and following up of PLHIV for TB. This is an ongoing initiative, which is specific to each area/district/province, due to the variable nature of the different stakeholders involved and geographic location of HCI-supported sites and districts.

ACTIVITY 2: Training

In FY 2009, HCI staff will work to develop accredited HIV and AIDS, TB HIV and home-based care training materials, including a comprehensive package of manuals, posters, flip charts and job aids. The development of these materials will include modules on basic HIV and TB, staging of HIV disease, care of TB/HIV co-infected individuals, eligibility and initiation of antiretroviral treatment (ART) in adult and pediatric co-infected patients, disclosure, adherence issues, poly-pharmacy (addressing concomitant administration of medication), living positively with HIV and TB/HIV.

In addition, HCI will revise existing quality assurance (QA) training materials and expand on proposed training initiatives to include QA/QI methodology for all cadres of health-care staff, including informal staff such as community workers, lay counselors and home-based caregivers. This is particularly important at primary health-care facilities where co-infected clients interact with a wide range of formal and informal health staff.

ACTIVITY 3: Human Capacity Development

HCI is already recruiting and placing medical staff in health facilities, and these staff will be tasked to provide of clinical services to TB/HIV-infected clients on a day-to-day basis. In addition, staff will provide training and mentoring to health facility staff on HIV and AIDS care, with specific reference to TB/HIV and ART and care services on a weekly and monthly basis. As part of HCI's sustainability initiatives, HCI staff seek to build capacity and develop local skills, by providing training and support to Department of Health (DOH) clinic staff (i.e., doctors, nurses, counselors, pharmacists, etc.) to ensure that providers have appropriate knowledge and skills to deliver quality TB/HIV services to all co-infected clients enrolled on the program. HCI staff and DOH staff meet regularly to ensure that information regarding newer treatment options and research findings are readily shared.

ACTIVITY 4: Strengthening Supervision Systems

HCI has been extensively involved in revision of the Clinic Supervision Manual for health-care facilities, and will continue to lead the implementation and monitoring of supervision systems within the country, by training district and facility supervisors in QA methods and facilitative supervision techniques for improving the quality of TB/HIV and follow-up services.

ACTIVITY 5: Care Support Groups

HCI has provided assistance in the implementation and facilitation of community- and facility-based care support groups at all HCI-supported health-care sites in the five provinces. In FY 2009, it is envisioned that this support will be expanded to include counseling on remaining HIV negative, Prevention with Positives (PwP), HIV wellness programs, care for the caregivers, and community outreach programs.

ACTIVITY 6: Referrals and Linkages

Building on lessons from previous experiences, HCI is able to facilitate linkages between different stakeholders within the health system, by coordinating and providing leadership.

To improve existing referral networks, HCI staff members will identify and strengthen linkages between prevention of mother-to-child HIV transmission, counseling and testing, family planning, sexually transmitted infections, TB and ART sites, by working with health facility staff at different levels of care and advocating for the development of integrated referral and follow-up networks. All staff at these sites will be responsible for referring TB/HIV-infected clients for onward care, treatment and support, while staff at ART sites is responsible for care, treatment, support and follow-up of these patients. It is essential to ensure that all patients receive optimal care and remain within the health care system, ensuring adherence to treatment and an improved quality of life.

ACTIVITY 7: Policy:

HCI will actively participate in the development, revision and implementation of the National TB/HIV guidelines, Continuum of Care for HIV-infected people and the HIV and AIDS Monitoring and Evaluation Framework Policy in collaboration with the national and provincial DOH staff, to ensure long-term sustainability of this program.

Activity Narrative: SUMMARY:

University Research Co., LLC / Quality Assurance Project (URC/QAP) will work with the Department of Health (DOH) through training, mentoring and introduction of quality assurance (QA) tools/approaches to improve the quality of services for Tuberculosis/HIV (TB/HIV) for co-infected patients in 100 DOH health facilities in 5 provinces. The essential elements of Quality Assurance support include strategies to improve technical compliance with evidence-based norms and standards as well as improving interpersonal communication and counseling and increasing organizational efficiency. The major emphasis area for this activity is quality assurance/supportive supervision with minor emphasis on development of network/linkages/referral systems, training and needs assessment. The activity targets public health workers, NGOs and community leaders, program managers, volunteers and people living with HIV (PLHIV).

BACKGROUND:

Since 2001, URC/QAP has worked with the DOH to improve the quality of TB services. A number of challenges continue to hamper the TB/HIV program, including provider knowledge and skills about TB, poor access to laboratories and poor supervision and follow-up of patients on treatment. The rising TB burden in South Africa (SA) as well as the emerging XDR epidemic is further complicating treatment of TB/HIV co-infected patients. The large pool of TB/HIV co-infected patients necessitates the development of creative strategies to address TB/HIV as a single entity and develop suitable service delivery models. URC/QAP will assist 100 health facilities in 5 provinces to improve screening, referral, treatment, and follow-up of PLHIV to identify those co-infected with TB in line with NDOH standards and guidelines. URC/QAP will assist facilities offering HIV services to better integrate TB screening and treatment services into their programs. URC/QAP will also provide small grants to selected local community-based organizations/home-based organizations (CBOs/HBOs) to integrate TB screening, referral and follow-up into their home-based care programs for PLHIV.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Establish Facility-Level Quality Improvement Teams

URC/QAP will work with each facility to identify core teams representing TB and HIV service providers as well as other staff. These teams, with support from URC/QAP coordinators and district staff, will be responsible for implementing facility plans for improving access to TB screening, treatment and follow-up among PLHIV. Each facility team along with URC/QAP staff will conduct rapid ongoing assessments to identify and address quality gaps in current services for screening, treating and following up of PLHIV for TB. URC/QAP will assist the facility teams in the 5 provinces to increase HIV counseling and testing (CT) for TB patients, utilizing various models for CT, including provider-initiated CT with opt-out option. URC/QAP will assist teams in developing a strategic plan for improving access to quality TB services for PLHIV at all levels, including provision of cotrimoxazole prophylaxis for co-infected TB/HIV patients. URC/QAP will facilitate linkages to ARV treatment for eligible clients by training facility staff on the NDOH National guidelines; and training facility staff in QA methods specific to TB and HIV; designing with facility staff referral improvement plans, including strengthening networks with CBOs/HBOs to improve referral patterns. URC/QAP is already in the process of developing a continuum of care model to ensure cross referral, with improved case finding/case detection rates, and continuity of care, with improved follow up and DOT support for all TB/HIV co-infected patients. Emphasis will also be placed on DOTS support/treatment adherence to prevent multidrug-resistant TB among PLHIV. At the national level, URC/QAP will continue assisting the South Africa National Tuberculosis Control Program (NTCP) in the implementation of the NDOH guidelines for management of HIV-infected TB patients and will utilize this data to support and advance the concept of best practice TB/HIV models of care.

ACTIVITY 2: Training

URC/QAP will train health care providers to screen all HIV-infected clients for symptoms of active TB and support referral of all TB suspects for diagnosis and treatment. It is expected that this will lead to the development of a model protocol which will then be shared with other PEPFAR partners. In collaboration with facility staff, URC/QAP will support "fast-tracking" of clients with TB symptoms for appropriate diagnostic tests to assure timely treatment and to reduce the risk of nosocomial transmission to susceptible PLHIV. URC/QAP will also work with facility staff on the development of a "retrieval" or back-referral system to assure that TB patients continue to access HIV-care within facilities and CBOs/HBOs.

ACTIVITY 3: Human Capacity Development

URC/QAP will provide job-aids such as wall charts to improve compliance with national TB guidelines. URC/QAP will work with CBOs/HBOs to develop strategies for providing TB screening, referrals and DOT support as part of their home-based programs. URC/QAP will train facility and CBO/FBO staff in analyzing their performance (outputs) and quality (compliance) indicators. On a monthly basis staff will use trend lines to see if the interventions are having the desired results of increasing identification of co-infected patients. URC/QAP will visit each facility/CBO/HBO at least twice a month to provide onsite mentoring to staff. This will focus on improving skills of staff in TB screening/treatment as well as ensuring that improvement plans are being implemented correctly. During these visits URC/QAP will review program performance data.

ACTIVITY 4: Building Sustainability

URC/QAP will train district and facility-level supervisors in QA methods and facilitative supervision techniques for improving the quality of TB/HIV coordinated activities at facility and community-levels. To address the short-and long-term human resource needs to manage the enormous burden of HIV-infected TB patients, URC/QAP will work with CBOs/HBOs and health care facilities to provide DOT supporters in order to improve follow-up of co-infected patients as well as provide home-based care for these patients.

Activity Narrative: URC/QAP will also conduct quarterly assessments in each facility/CBO/FBO to assess whether staff is in compliance with national guidelines.

ACTIVITY 5: Infection Prevention and Control

URC/QAP sees itself as an integral part of the network of IC delivery, as quality initiatives span a wide range of health systems and processes. This is important to reduce the incidence of nosocomial infections in both in- and out-patient settings. URC/QAP is part of the National Committee of infection prevention and control and will work in partnership with the TASC II TB project and other partners to support the NTP to finalize the development of infection control guidelines for TB program. URC/QAP will provide training and support to QAP-supported facilities in 5 provinces to strengthen infection prevention and control on the implementation of the national policy and guidelines. In addition URC/QAP will be involved in the development and dissemination of information and education materials for TB infection control in work settings for health care workers. In addition, URC/QAP staff will be involved in the dissemination and implementation of the TB/HIV infection control policy guidelines within all facilities and home-based and faith-based organizations supported by URC/QAP.

URC/QAP will assist PEPFAR in reaching the vision outlined in the USG Five-Year Strategy for South Africa by facilitating the expansion of HIV CT to high risk groups (TB patients) and increasing recognition of TB in PLHIV. URC/QAP work contributes to the PEPFAR goal of providing care to 10 million people affected by HIV.

USG Agency: U.S. Agency for International
Development

Program Area: Care: TB/HIV

Program Budget Code: 12

Planned Funds: \$847,600

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Perinatal HIV Research Unit (PHRU) integrated TB/HIV issues into all PEPFAR-funded program areas. With the emergence of multi- and extensively drug-resistant (MDR/XDR-TB) health-care workers and HIV-infected people are at increased risk of contracting these resistant strains. PHRU will intensify TB/HIV training for health workers, particularly focusing on the prevention, detection, and management of MDR- and XDR-TB, and will ensure that workplaces implement and adhere to TB infection control procedures. Active case finding is being done in a number of facilities.

PHRU will work with the Department of Health (DOH) to encourage HIV counseling and testing of TB-infected clients in accordance with guidelines. PHRU will continue to support TB facilities to test for and treat HIV infection at TB treatment sites such as Charles Hurwitz in Soweto and Brooklyn Chest.

TB screening will be expanded in all PHRU programs, including adult and pediatric, with emphasis on isoniazid preventive therapy for TB-negative HIV-infected clients and appropriate referral for TB-infected clients. Clients diagnosed with active TB will be encouraged to bring in family members and close contacts to screen for TB infection. PHRU will emphasize TB screening for pregnant women and pediatric clients.

TB-positive clients will be tracked to ensure that they start TB-treatment and will be followed to completion.

PHRU follows international and national research on best practices, and diligently implements new developments into policy. PHRU includes these best practices in all training and workshops.

SUMMARY:

The approach taken by the Perinatal HIV Research Unit (PHRU) is one of comprehensive, high quality care and support for PLHIV. PHRU will use PEPFAR funds to continue its TB services to patients accessing care in Soweto (Gauteng), rural Limpopo/Mpumalanga Provinces and in the Western Cape. The TB/HIV program is integrated into all programs by providing screening, referring people with active TB to National TB treatment sites and providing preventative treatment for latent TB. The program is also linked to National TB treatment sites providing HIV care and treatment. The major emphasis areas are human capacity development and local organization capacity building. The primary target populations are HIV-infected adults and children.

BACKGROUND:

PHRU established palliative care programs in Soweto (Gauteng) and in rural Limpopo and Mpumalanga and have partnered with organizations in the Western Cape to provide care and support to people identified as HIV-infected through PMTCT and CT. High rates of TB in South Africa continue to be challenging and MDR-TB is considered to be on the rise. The PHRU will strengthen its emphasis on diagnosis of TB via its PMTCT program (through screening during CT when possible), and through screening of all patients testing positive. Once tested positive, all patients enter a wellness program where they will be screened and treated according to WHO protocols for TB. In South Africa, a wellness program covers the period from testing positive to needing treatment. The high HIV prevalence in South Africa requires a cost-effective package of care and support for people with HIV prior to ARV treatment. Primary health care nurses are the main providers of care under physician supervision in these programs. The programs follow the Department of Health guidelines for HIV care and laboratory testing to ensure compatibility with South African Government treatment sites. The programs have been approved by the medical ethical review board of the University of the Witwatersrand. The aim of the programs is to delay the progression of HIV to AIDS by providing palliative care and support to HIV-infected clients who do not yet qualify for ARV treatment. Care includes: elements of the preventive care package, screening for active TB, preventative treatment for latent TB infection, cotrimoxazole prophylaxis for opportunistic infections, syphilis screening, symptomatic screening for syndromic STIs, screening for cervical cancer, provision of family planning and regular CD4 counts. Opportunistic illnesses are treated using a formulary based on the South African Essential Drug List. Support for clients, their families and community members is provided by support groups and education sessions at all sites covering issues such as basic HIV and AIDS information, HIV services, PMTCT, ARV treatment, opportunistic infections, TB, prevention, disclosure, nutrition, stigma positive living and adherence. Training of professional and lay staff takes place on a regular basis.

ACTIVITIES AND EXPECTED RESULTS:

PHRU will continue to work with the national and provincial departments of health and specifically with the HAST (HIV, AIDS STI, and TB) managers to prioritize interventions designed to address weaknesses (identified by the departments of health) in the DOTS and TB/HIV programs. PHRU will focus on improving policy adherence and patient follow-up. Individuals will be hired for each site as tracers to track patients and ensure that referrals are completed. PHRU is setting aside funding to develop (with other relevant partners or agreement counterparts) standardized tools to ensure that policies and guidelines recommended by NDOH are followed, including guidelines for infection control. PHRU will continue to integrate TB/HIV interventions with existing agreement programs as they work seamlessly and side by side with government employees at government facilities.

ACTIVITY 1: Soweto, Gauteng

In 2002 a care program was initiated in Soweto, a large urban area south-west of Johannesburg with very high HIV prevalence (30% in the ante-natal clinics). A holistic approach is provided to all enrolled in the wellness program and covers clinical services, psychosocial support, and healthy lifestyle promotion, including exercise, nutrition, and decreasing the use of alcohol and tobacco. To date over 4,500 adults have accessed the program with PEPFAR support. Support groups and education sessions, run by HIVSA, are

Activity Narrative: available to all clients. All clients are symptom screened for TB at each visit and are referred for TB treatment to the government TB treatment clinics. PHRU is supporting the Charles Hurwitz Hospital, a government TB treatment facility, to integrate TB and HIV care and treatment. Expanding the program with FY 2008 funds, PHRU proposes to link TB screening into PMTCT service in Soweto and screen all pregnant women for active TB and refer those with positive results to government TB treatment sites. PHRU will work with public facilities to ensure that care for both TB and HIV is monitored and coordinated. Training for health care professionals working at PHRU and its partners (including the provincial Department of Health) in all aspects of HIV palliative care takes place on an ongoing basis.

ACTIVITY 2: Bushbuckridge, Rural Mpumalanga/Limpopo

Bushbuckridge district in Mpumalanga/Limpopo is one of the poorest in South Africa. Access to information and HIV healthcare and support is a basic need for all people living with HIV. PHRU in partnership with Rural AIDS Development Action Research Program (RADAR) and HIVSA established a wellness clinic at Tintswalo hospital and a district-wide support network for people living with HIV and AIDS. Since 2003, over 2,000 people have accessed the wellness clinic and more than 2,500 have accessed the support groups. A training program has been implemented to train nurses and lay facilitators, counselors and NGOs to provide effective support to people living with HIV and AIDS and basic education on HIV, TB, CT, HIV services and related issues to the broader community and build the capacity of linked local organizations. All clients are screened for active TB at each visit.

ACTIVITY 3: Tzaneen, Rural Limpopo

Since 2003, the University of Limpopo has been supporting the Department of Health to develop a wellness program based in primary healthcare clinics in Tzaneen District. In 2004 PHRU partnered with University of Limpopo to formalize and expand the program. PHRU has mentored the program, assisted with training health workers and has provided infrastructural support. In addition, HIVSA has provided training to support group members to enable them to run more effective support groups, and provide better information to people in the district. The program takes a district health approach and aims to operate throughout the district. Over 600 people have enrolled in the program and more than 100 have been referred to ART sites for ARV treatment. People on treatment are supported at primary care clinics through this program. The program will be expanded to other sub-districts in the Tzaneen area. All clients attending Wellness services will be screened for active TB at each visit. US-based volunteers have supported this program.

ACTIVITY 4: Western Cape

In 2006 PHRU partnered with a number of organizations in the Western Cape including the University of Stellenbosch, Red Cross Children's Hospital and the Desmond Tutu HIV/AIDS Foundation. The aim is to support government ART sites to scale-up and develop down referral systems. PHRU will continue to screen HIV-infected clients for TB and those who are found to be co-infected will be referred to public sites for treatment. Expansion of these activities is planned. These activities will contribute to the PEPFAR 2-7-10 goals by providing TB/HIV care and services to HIV-affected people.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

CAPRISA AIDS Treatment (CAT) Program at the eThekweni site has been enhanced in the following way:

PEPFAR-funded patients receiving tuberculosis (TB) care through the Prince Cyril Zulu Communicable Disease Clinic (PCZCDC) have been identified to receive field-based DOT. Extensive analysis of the areas with poor performance in TB treatment completion and cure rates was undertaken. The area of Welberdacht in Durban was identified as being most in need of a TB-related intervention. Meetings with the relevant community leaders and CAPRISA management were held to establish links within the community and identify ways to integrate the program within the community. Field workers, trackers, a program coordinator and community liaison officers have been identified. Training on TB infection control and management has been conducted with team members by a representative of the local municipality. CAPRISA is currently securing TB drugs to be used for field-based directly observed therapy (DOT). These will be acquired from the TB services at PCZCDC.

BACKGROUND:

CAPRISA was established in 2002 as a not for profit AIDS research organization by five major partner institutions: University of KwaZulu-Natal, University of Cape Town, University of Western Cape, National Institute for Communicable Diseases, and Columbia University. The headquarters of CAPRISA are located in the Doris Duke Medical Research Institute at the Nelson R Mandela School of Medicine, University of KwaZulu-Natal. The PEPFAR-funded CAT Program was initially started as a supplemental effort to deal with the large volume of HIV-infected clients that were screened out of CAPRISA's other research studies. It has since evolved into one of the pillars of CAPRISA and is evidence of the ongoing commitment to provide comprehensive services to communities. The CAT Program was initiated in June 2004 and currently provides an integrated package of prevention and treatment services. The program also provides an innovative method of providing ART by integrating the TB and HIV care as well as counseling and testing, family planning, sexually transmitted infections (STI) treatment, prophylaxis and treatment for opportunistic infections (OIs), and other HIV associated conditions at both a rural and urban site.

The CAPRISA eThekweni Clinical Research Site is attached to the Prince Cyril Zulu Communicable Disease Clinic (CDC) which is a large local government clinic for the diagnosis and treatment of STIs and TB, for which it provides free treatment. The HAART provision at this clinic integrates TB and HIV care into the existing TB control program. This allows for the opportunity to initiate HIV care and HAART for patients identified as HIV infected during TB treatment as well as to be able to continue such management for those who develop TB during HIV treatment. Patients are either self referred, or enter the HIV care continuum via the adjoining TB or STI services.

South Africa in general and the province of KwaZulu-Natal (KZN) in particular has seen a dramatic rise in the prevalence of TB which has largely been fuelled by the HIV epidemic. Due to the large scale of the TB epidemic, and the large number of patients attending designated TB facilities, in last few years, there has been many operational changes in the way TB is managed at the eThekweni Prince Cyril Zulu Communicable Disease Clinic (PCZCDC). For the most part, patients are referred from PCZCDC to their communities for DOT for TB. There has however been a significant reduction in treatment completion rates and cure rates for TB, largely as a result of a loss to follow-up of patients referred out to community facilities to receive their supervised treatment. The burden of daily DOT has financial implications for patients, in terms of transport costs, as well as employed patients' ability to present for treatment daily. Consequently, there has been a shift to community-based supervised DOT, the success of which has not yet been measured.

Retention to the ART treatment program, as well as measurable ART treatment outcomes, which draws from the same population of patients, has been surprisingly good, mostly as a result of good tracking efforts by fieldworkers.

PEPFAR-funded patients receiving TB/HIV care through the CAT program will be identified to receive field-based DOT. Patient visits will be conducted by fieldworkers, and an adherence assessment as well as an observation of DOT will be made. Patients who do not adhere to treatment x will be referred back to clinic, for specialized adherence education and support.

Fieldworkers will be employed via the CAPRISA Community Program and will be supervised by CAPRISA Community Liaison Officers. A treatment program coordinator will provide additional oversight, as well as assist with record collation and management. In-house trainers and coordinators will be identified. Trackers will be employed via the CAPRISA community research support group which is made up of community organizations and key stake holders from the community that are working in the field of HIV/AIDS and TB. A program of training of these field workers will be implemented prior to project start up. An ongoing monitoring and evaluation system will form part of the proposal to establish efficacy and effectiveness of field-based DOT. A comprehensive proposal for the expanded field-based DOT is being developed. TB drugs used for field-based DOT will be acquired from the TB services at PCZCDC. HIV-infected patients receiving ART and TB therapy via the eThekweni CAT program will be selected. Those unwilling to participate, or require daily clinic visits, or have MDR-TB will be excluded.

Currently all clinic information regarding TB diagnosis, clinical course and management is recorded on an electronic database available to both the TB services as well as the CAT. All treatment outcomes derived via the field-based DOT program will be entered and updated onto this electronic system. This will allow us to do efficacy and outcome analysis. It will also form the basis of doing quality assurance reviews. Additionally, a process will be developed to examine the cost-effectiveness of implementing field-based DOT.

Activity Narrative: These results contribute to the PEPFAR 2-7-10 goals by providing facility-based HIV-related palliative care to HIV-infected individuals by providing clinical prophylaxis and treatment for TB/HIV co-infected patients prior to initiation of ARVs.

Table 3.3.12: Activities by Funding Mechanism

Mechanism ID: 10269.09	Mechanism: TBD Africare Follow On
Prime Partner: To Be Determined	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: TB/HIV
Budget Code: HVTB	Program Budget Code: 12
Activity ID: 23699.09	Planned Funds: ██████████
Activity System ID: 23699	

Activity Narrative: SUMMARY:

Africare's Injongo Yethu Project encourages identification of HIV infection among TB clients, and TB disease detection and management among HIV clients. Major emphasis is on local organization development of clinics in the Hewu Hospital catchment area in the Eastern Cape and the feeder clinics for Frontier Hospital and Glen Grey Hospital. Emphasis of project interventions is also on training, monitoring and evaluation support through information technology development (the ARV and HIV electronic register) and developing supportive supervision. FY 2008 will include Nkonkobe LSA and a selection of the clinics feeding those hospitals.

BACKGROUND:

This is an follow-on activity that has received some support for training of nurses in TB and HIV care and an orientation of Service Corps Volunteers on the frequency of HIV infection among TB clients. Activities will focus on providing tools and mechanisms to improve the quality of home- and facility-based management of TB screening and management in HIV-infected clients, and HIV screening and management for clients on TB treatment. Tools for monitoring, supportive supervision and referral will also be provided.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Improve HIV Testing Rates of TB Clients

This activity will support development of a standard HIV education flip -chart for TB clients similar to the CDC-supported antenatal care (ANC) counseling guide that achieved much success in Botswana. Nurses from 10 clinics will be recruited to field-test the flip chart and the counseling routine and note any effect on HIV testing among TB clients. Nurses will be encouraged to offer counseling at the initiation of TB therapy and after the two-month intensive treatment phase to clients who had declined testing at initiation. South African government DOT supporters from selected clinics will be provided with additional basic HIV and AIDS training, particularly for those not recently trained or provided with an update and refresher course. The flip chart piloted by clinics will be made available to DOT supporters from the same clinics in order to further encourage HIV testing among the TB clients.

ACTIVITY 2: Improve TB Screening Among HIV Clients

Active TB screening will be implemented in home-based care along with an orientation of HIV chronic care nurses on TB screening. In addition, key support group members will be trained to help screen for pulmonary TB and key signs of non-pulmonary TB and refer to the clinic. Increased screening will be captured in the home-based caregiver records and the clinic chronic care record.

ACTIVITY 3: Training and Capacity Building

To ensure effective integration of TB and HIV care, doctors and nurses from Hewu Hospital, Sada Community Health Clinic, Frontier Hospital and Glen Grey Hospital will be prioritized for updated training on TB and HIV co-management, using recent WHO and NDOH materials. Training for doctors will be open to 20 local general practitioners. Routine technical information packets consisting of e-newsletters, tools and guides from PEPFAR partners, publications from USG cooperating agencies, such as WHO and the AIDS Vaccine Bulletin will be collated and distributed to the doctors, HIV service managers and nurses in antiretroviral treatment clinics. The project will subscribe to newsletters and training materials from various membership organizations on behalf of the health-care providers at the three hospitals.

ACTIVITY 4: Strengthen Organizational and Supervisory Support for TB and HIV Integration

The project will support the Chris Hani District HIV, AIDS, STI, TB (HAST) committee to create objectives and a standing agenda item for monitoring progress toward integration of TB and HIV services. Development of tools to monitor and evaluate the effectiveness of integration will be advocated.

ACTIVITY 5: Ensure and Monitor Cotrimoxazole Therapy Implementation

Cotrimoxazole therapy is widely given to HIV clients, but the effects are not routinely monitored. To ensure that all appropriate clients benefit from cotrimoxazole, relevant data elements will be included in the HIV patient electronic register and therapy will be included in the algorithms as will the proposed HIV client care plans.

ACTIVITY 6: Effective Monitoring of TB and HIV-infected Patients

The flow of information and documentation of information between services to HIV-infected and TB patients will be assessed for bottlenecks and potential for losing follow-up of clients using client flow analysis and current client records to find where clients drop out of the system and delays are experienced. Africare will collaborate with another PEPFAR partner, QAP to capitalize on, and to reinforce, principles and processes of quality assurance that will allow facility teams to uncover their local constraints and to plan solutions.

ACTIVITY 7: Support to TB Clients as Potential or Diagnosed HIV Clients

TB clients will be informed of, and welcomed to the new HIV support groups at the clinics. It is understood that some TB clients are not ready to be tested for HIV and might find support to do so in the group. FY 2009 activities will also include dissemination of the new TB guidelines, accompanied by refresher training for hospital and private doctors.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.12: Activities by Funding Mechanism

Mechanism ID: 588.09

Prime Partner: Management Sciences for Health

Funding Source: GHCS (State)

Budget Code: HVTB

Activity ID: 7856.23105.09

Activity System ID: 23105

Mechanism: Strengthening Pharmaceutical Systems

USG Agency: U.S. Agency for International Development

Program Area: Care: TB/HIV

Program Budget Code: 12

Planned Funds: \$485,452

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Strengthening Pharmaceutical Systems (SPS) has made the following changes to the COP 2008 narrative:

BACKGROUND: The sentence in COP 2008, "The smear negative rate at the end of treatment in South Africa, 51%, remains well below the WHO target of 85%. These smear positive patients remain infective and continue to spread TB; people infected with HIV are particularly vulnerable to acquiring TB."

It should read as follows:

"The TB cure rate in South Africa, 51%, remains well below the WHO target of 85%. Smear positive patients remain infective and continue to spread TB; people infected with HIV are particularly vulnerable to acquiring TB."

ACTIVITY 2: Adherence to Treatment and Rational Use of Medicines

SPS has developed an antiretroviral adherence assessment tool in close collaboration with the National Department of Health's HIV/AIDS Directorate. This tool was fully tested and validated. It is currently being deployed to sentinel sites in all provinces and included in the new national Standard Treatment Guidelines (STGs). This one-page tool provides health personnel with a reliable and quick to administer method to follow up patient adherence to treatment using four different complementary measures (Self-Reporting, Visual Analog Scale, Pill Identification and Pill Count) and if required, to develop a patient specific adherence improvement plan. In South Africa, DOTS is the method of choice for TB patients to ensure adherence to treatment, however it has not been as successful as anticipated. SPS, in collaboration with the national and provincial managers of the TB program will explore opportunities to adapt the SPS Adherence Monitoring tool for TB patients as a complementary method to DOTS and/or as another way of monitoring adherence were DOTS cannot be implemented. Any full-scale implementation will be preceded by a pilot phase and evaluation.

ACTIVITY 3: Quantification

SPS will develop morbidity-based quantification models for multi-drug resistant (MDR-TB). Extensively drug-resistant (XDR-TB) will also be considered once STGs are finalized.

ACTIVITY 4: TB/HIV Infection Control

"Settings" refers to health service delivery points.

SPS will include a specific TB Infection Control module into ICAT. The "National TB Infection Control Guidelines", the "National Infection Prevention and Control Policy and Strategy", "A Policy on Quality in Health Care for South Africa" and other reference documents developed by other partners such as TB TASC will be used to support this work.

The scaling up of isoniazid preventive therapy (IPT) will necessitate the review of protocols to ensure that all health-care workers are trained appropriately.

SPS is currently collaborating with the National TB Programme (NTP) in the development and implementation of surveillance systems for drug-related morbidity and mortality at MDR and XDR treatment sites. SPS will support the NTP in developing a framework for focused surveillance of MDR and XDR-related adverse drug reactions at sentinel sites in the various provinces. Support for this initiative will be provided through training of personnel at identified sites in each province, support for implementation of data management systems at MDR and XDR TB sites and support for the establishment of a framework for data assessment at national level.

The SPS TB medicine management training program is aimed at optimizing the implementation of TB services through strengthening integration with key programs including HIV and AIDS and pharmaceutical services. The training program is aimed at pharmacy and nursing personnel and has an important focus on forecasting, procurement, storage, and distribution of TB-related medicines and supplies. Participants are trained to identify critical issues in systems and policies that may facilitate or hinder services and TB commodity security, and to recognize areas for improvement, and provide intervention options. The training program also focuses on safety monitoring in TB treated patients.

All training materials developed or updated by SPS will be field tested and submitted for accreditation to the South African Pharmacy Council once finalized.

SUMMARY:

MSH has been awarded the RPM Plus follow-on: Strengthening Pharmaceutical Systems (SPS), therefore all RPM Plus activities for FY 2008 will be undertaken by SPS. SPS will assist the National Department of Health TB sub-directorate to strengthen drug supply management for TB and more specifically the management of TB patient on ARVs by training health workers supporting the TB program on clinical pharmacology related to TB/HIV coinfection, and improving infection control, adherence monitoring, adverse drug-event reporting, medication errors and referral system(s) at selected government institutions (hospitals, community health centers, primary health care clinics). SPS will also train pharmacists on estimating requirements for ARV and TB medicines. The major area of emphasis include training and task shifting, as pharmacists and pharmacist assistants will take on greater roles in TB/HIV care.

BACKGROUND:

Activity Narrative: RPM Plus has been working very closely with the National Department of Health Pharmaceutical Policy and Planning Directorate since 2004 to support the delivery of pharmaceutical services at all levels (national, provincial, district, institutional). This included training TB provincial coordinators (and pharmacists) on Drug Supply Management for TB in collaboration with the National TB sub-directorate. The coexistence of TB and HIV infections has made the treatment of patients on ARVs more complex and health personnel need to be trained to manage it. Moreover, a national plan has been developed to address what has been described as the "TB Crisis," making TB and HIV management a priority. The smear negative rate at the end of treatment in South Africa, 51%, remains well below the WHO target of 85%. These smear positive patients remain infective and continue to spread TB; people infected with HIV are particularly vulnerable to acquiring TB. It therefore follows that against the background of the high HIV prevalence rate in South Africa it is important to reduce the infectious reservoirs within the community. Currently only 63% of patients complete their course of treatment and the South African Medical Research Council estimates that 6.7% of previously treated patients are resistant. The financial burden of multidrug-resistant TB (MDR-TB) is considerable -- the usual course of treatment costs approximately \$60 while that of MDR is approximately \$3,500. In addition the social impact is considerable as these patients are hospitalized in isolation facilities for long periods of time. Recently extensively drug-resistant (XDR-TB) has been identified in South Africa which requires highly specialized treatment facilities and medicines. In December 2005, RPM Plus published the "Managing Pharmaceuticals and Commodities for Tuberculosis; A Guide for National Tuberculosis Programs". This publication was shared with the National TB sub-directorate and they have expressed interest in using these guidelines to support their own program. All these activities will be conducted in close collaboration with the directorates dealing with TB, HIV and AIDS and Quality Assurance at the National level. The Department of Correctional Services and local governments have requested support from SPS to strengthen the role of pharmacy personnel in supporting the TB program.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Drug Supply Management for TB

RPM Plus has experience with ARV supply management in South Africa. As other projects are involved in the actual patient care and medication administration, SPS will assure that the medications are where they need to be and tracked appropriately. SPS will perform a similar function in the TB/HIV program area. In FY 2007 RPM Plus adapted the Drug Supply Management for TB training material they developed to include topics related to the treatment of TB patients on ART. The training program covers clinical pharmacology principles and other relevant issues such as: drug-to-drug interactions between Rifampicin and different classes of ARVs; immune reconstitution inflammatory syndrome (IRIS); rationale for changing ART regimen in the presence of TB; assessment of tolerance to TB drugs; increased toxicity; adherence to both ARV and TB treatment; and counseling. One National and nine provincial workshops will be conducted for doctors, pharmacists, and nurses involved in the management and implementation of the National TB program. The integrated computerized drug supply management system developed by RPM Plus (RxSolution) will be implemented at selected TB hospitals. The implementation of this system will assist these institutions in providing data for the National TB indicators; this will also assist in validating the data captured on the National Electronic TB Register (ETR) for these facilities and provide detailed information on patient treatment. This activity will assist with the overall monitoring and evaluation of the TB program.

ACTIVITY 2: Adherence to Treatment and Rational Use of Medicines

SPS will directly assist selected institutions that are providing TB treatment to implement adherence monitoring systems for TB patients on ARVs. This will include recognition, treatment and reporting of adverse drug events (ADR) and medication errors reporting, and quality improvement strategy. The institutions will be selected in consultation with provincial DOH, and will most likely be located in Eastern Cape, KwaZulu-Natal, and Gauteng - priority provinces in the National TB Crisis Plan. SPS will also strengthen the referral system for TB patients to access ARVs. SPS will provide assistance to the Eastern Cape and Mpumalanga provincial Departments of Health to develop and pilot a standardized adherence package for TB patients. The ARV adherence assessment tool recently developed by RPM Plus will be adapted by SPS for use in TB patients by both the patient as well as the treatment supporter. Training will be provided to staff in the application of the adherence package for MDR and XDR-TB patients. Finally technical support will be provided to the MDR-TB facilities in order to improve referral mechanisms, comply with regulatory requirement pertaining to XDR treatments, reporting and quality improvement of medication errors and the reporting and management of adverse drug events. In 2006 RPM Plus medication error surveillance systems identified an ongoing trend of prescribing errors in hospitalized TB patients. In order to further define the required rational prescribing interventions, Drug Utilization Reviews (DUR) will be conducted at selected sites. The findings will then be used in the planning and execution of a TB rational prescribing intervention at the hospital level. This is significant because an increasing number of patients who are HIV-infected require initiation of TB treatment at the hospital level. The piloting of the DUR tool has revealed deficiencies in the pharmacy discharge procedures and patients are sent home with treatment without the necessary referral to DOTS. SPS will develop guidelines to improve referral to DOTS supporter. In the Eastern Cape SPS will use the Medicines Information center at Rhodes university to provide patient and prescribing information for MDR and XDR-TB medications. Furthermore this service will provide support to pharmacists and prescribers in assessing drug interactions. SPS will be training pharmacy personnel (and other health workers) on the management of both TB and HIV/AIDS (see ARV Services) to support the national effort in integrating TB and HIV programs within the national health services.

ACTIVITY 3: Quantification

The management of TB in HIV-infected patients is critical since TB is the number one opportunistic infection and the leading cause of death for HIV-infected clients - making the availability of TB medicines critical. SPS will train provincial and district pharmacists in the use of morbidity-based quantification models for the quantification of TB medicines using TB National Standard Treatment Guidelines (STGs). Pharmacists will be trained. This activity will also assist in monitoring prescription trends against National TB STGs.

Activity Narrative: ACTIVITY 4: TB/HIV Infection Control

TB infection control, given the high burden of HIV co-morbidity, has been identified as a critical area needing support. RPM Plus has developed an Infection Control Assessment Tool (ICAT) which will be used to assess infection control practices in these settings. SPS will train health workers on implementing TB infection control measures and procedures at facilities where TB/HIV services are provided. As a follow-up an Infection Control improvement plan will be developed to address gaps identified using the ICAT. Opportunities to work with other PEPFAR partners will be explored. This is done in collaboration with the National Department for Quality Assurance.

All these activities contribute to the PEPFAR 2-7-10 goals by improving the treatment of patients with TB and HIV infection and supporting the national effort in dealing with the "TB crisis".

Activity System ID: 23101

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. PEPFAR funds were allocated to TB/HIV through the Integrated Primary Health Care Project (IPHC), a collaborative project between the National Department of Health, the provincial Departments of Health in the Eastern Cape, KwaZulu-Natal, Limpopo, Mpumalanga and North West provinces and the United States Agency for International Development (USAID) awarded in 2004 and extended until December 2010 to Management Sciences for Health (MSH). Since this project has a ceiling which cannot be exceeded, no further funding can be added since the contract has reached its ceiling. MSH will work with the DOH to ensure that activities are sustainable to the maximum extent possible. The TB/HIV activities of MSH will be completed according to schedule in 2010. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Program Area Narrative:

South Africa's HIV pandemic continues to create a rapidly growing number of vulnerable children who are without adult protection and have uncertain futures. Of South Africa's 18.2 million children (38% of the population), about 3.8 million children have lost one or both parents (21% percent of all children). (SA Child Gauge 2007/2008, Children Institute, University of Cape Town.) The burden of HIV and AIDS on children has greatly increased in the last five years with the number of orphans increasing substantially by 750,000 due to the effects of the HIV epidemic. While it is estimated that 1.4 million children have been orphaned by AIDS, a much larger number are considered to be highly vulnerable to the pandemic that surrounds them, according to 2007 Actuarial Society of South Africa estimates using a 2003 model.

Working in all nine provinces, the United States government (USG) approach supports programs that are firmly aligned with and in support of the South African strategies that include the "Policy Framework for Orphans and Vulnerable Children made Vulnerable by HIV and AIDS in South Africa", (July 2005), the "National Action Plan for Orphans and Vulnerable Children and Other Children Made Vulnerable by HIV and AIDS ((NAPOVC)," the "National Guidelines for Social Services to Children Infected and Affected by HIV/AIDS," and the "South Africa National Strategic Plan for HIV & AIDS and STI, 2007 -2011." In November 2007, the Children's Amendment Act no. 41 of 2007 was passed, which provides a framework for a comprehensive range of social services needed to support vulnerable children and their families. At the core of the Children's Act is the South African government's commitment to delivering social services that will strengthen and support families and communities to care for and protect children.

The USG provides direct assistance to the Department of Social Development (DOSD) and works together with both local and international partners to improve and scale-up existing, effective OVC programs to provide protection, care and support services to orphans and other vulnerable children (OVC). At the end of March 2008, 23 PEPFAR partners had reached 215,056 OVC with primary and supplementary direct services. In addition, 10,978 OVC were reached indirectly and 17,418 individual caregivers were trained to provide quality services to OVC.

USG programs in support of the DOSD maintain a focus on the child through the family and the household. Families are the most influential force in the lives of children and adolescents. This is central to the USG program in South Africa and to the activities supported by Hands at Work, Child Welfare, World Vision, and other PEPFAR-funded OVC partners. These OVC programs aim to strengthen the capacity of the family and the community. This family focus is a critical opportunity to expand reach to other members of the family and the community and is an opportunity to integrate the OVC programs with other prevention, treatment, and care interventions. In FY 2009, care for the caregivers continues to be a central area of focus for USG partners, in addition to continued training of volunteers, caregivers, and community-based organizations to address service delivery issues. The National Association of Child Care Workers (NACCW) "Isibindi" Child and Youth Care workers model of care ensures that antiretroviral treatment (ART) is available for adults and children as part of their delaying orphanhood program. Child and youth care workers are trained to identify households and families that require clinical services and through a system of referrals to a network of clinical care services specifically linked to Isibindi. Ensure that mothers and caregivers get tested early and access ART. This intervention has resulted in mothers accessing ART and 294 children (October-March) being assisted to access pediatric ART and their households receiving home-based care and adherence support. USG-supported OVC programs continue to link with pediatric and adult treatment programs. Initially this is done through voluntary counseling and testing (VCT) programs to encourage HIV testing of OVC and their caregivers to ensure that both HIV-infected OVC and their caregivers have access to treatment and palliative care services. In FY 2009 The USG will continue to work with OVC partners like Children in Distress (CINDI) to highlight the scale-up and integration of OVC interventions in prevention of mother-to-child transmission (PMTCT), VCT, treatment, and wrap around programs.

To ensure quality, the USG has defined direct service provision as each child receiving a minimum of three services from a menu of eight services. These include targeted, short-term food and nutritional support; shelter and care; child protection; assistance in accessing healthcare; psychosocial support; increased access to education and vocational training (including school fees, uniforms, tutoring etc.); assistance in accessing economic support (accessing social grants, income-generation projects, etc.); and community mobilization. In FY 2009, the USG will support the DOSD to review and develop quality standards for these basic services. Once developed and shared with stakeholders, these standards will reflect an expected level of service delivery and performance and will be used to assess the overall impact of services provided to each child. These standards will be used by DOSD and partners to define quality and to measure and improve services provided to children to ensure a positive impact. Save the Children UK is currently field-testing a quality assessment tool using a modified version of the Child Well Being Assessment tool, which has now been simplified and translated into one of the local languages.

Better data and increased understanding of the multi-faceted needs of adolescent OVC and identification of OVC interventions that are effective in addressing these needs are critical to the scale-up of service delivery for OVC in South Africa. The scale-up of services for OVC is desperately needed to maximize impact and minimize wasted expense. Program design and resource allocation needs to be guided by a base of documented evidence. To fully implement National Plans of Action for OVC, governments, donors, and program managers need information on how to reach more OVC more cost effectively with services

that improve their well-being. Working hand in hand with the DOSD, the USG will participate in a public health evaluation that will evaluate programs for adolescent OVC with the overall goal of improving the impact of service delivery for this highly vulnerable and underserved population. This activity will enhance USG and DOSD programmatic efforts by providing a better understanding of the situation of adolescent OVC, identifying best practices for meeting their needs, and documenting promising practices.

Working with the DOSD, the USG will provide documented evidence of the effectiveness of the DOSD recommended models of care for vulnerable children. The USG will support the DOSD in documenting the Child Care Forum (CCF) model to respond to the increasing needs of children and to provide support to OVC at the community level. CCFs are a mechanism to build capacity in community-based systems for sustaining care and support to OVC and households over the long term. Prior to the scale-up and replication of this model, the USG will assist the DOSD in providing evidence of the effects and effectiveness of this model of care. The same process will also be used for the NACCW Isibindi model, which is implemented as a social franchise with the NACCW entering into formal partnerships with implementing organizations linking DOSD, the donor, the community, and implementing partner in a network of social delivery. This model has encouraged the private sector to fund Isibindi projects, often co-funding them with DOSD. Initial documented evidence on the model shows the impact of the activities undertaken and the multi-disciplinary approach that allows resources to be accessed from multiple sources (both government and non-government). The Isibindi model is an award-winning best practice model of care that the DOSD would like to scale-up and replicate.

USG partners will focus on improving the quality of OVC program interventions, strengthening coordination of care especially at the district level, and expanding initiatives that reach especially vulnerable children (e.g., under fives, disabled children). Several USG-funded programs have developed focused interventions to reach the especially vulnerable child. For example, NACCW has been working to reach disabled children and has trained disability facilitators to identify, refer and provide ongoing therapeutic services to disabled children. Several USG partners in FY 2009, e.g., South African Catholic Bishop Conference and Woz'obona Childhood Community Service Group, will replicate this intervention. In addition, USG assistance has and will continue to focus on reaching especially vulnerable populations through Early Childhood Development Interventions with Nurturing Orphans for Humanity (NOAH), CARE-South Africa's local sub partners, Hands at Work, and Woz'obona Childhood Community Service Group.

In collaboration with DOSD, USG has begun the development of a vulnerable children service directory and web database, which will be completed in FY 2009. The directory will increase the level and effectiveness of referrals for vulnerable children to receive comprehensive services. As part of this activity, service delivery mapping will be done, which will provide information that the USG and DOSD will utilize in strategic positioning of expanded or new service sites for OVC.

The USG supports programs that focus on supporting child-headed households, such as safe parks and other safety zones for providing young girls with sustained interaction from a trusted adult; and providing information on life skills and HIV prevention education. The USG continues to support the Vhutshilo (Tshivenda, meaning "life") peer education program, a structured 13-session curriculum based peer led prevention and support group intervention for vulnerable 10 – 13 years olds using 16-19 year old peer educators. This program has been replicated in several other OVC programs. The program promotes resilience in vulnerable children by building or strengthening social structures through which young vulnerable children learn new skills, receive and provide support from their peers in similar circumstances and build trust to maintain strong social connections. In FY 2009, the USG will assess the impact of this peer education intervention in terms of its psychological and HIV prevention education effects on vulnerable children. This activity will be a basic programmatic evaluation and to the extent possible, threats to internal validity will be managed.

In FY 2009, USG will continue to bring OVC partners and the DOSD together in annual meetings to disseminate and share promising practices and innovations. This provides an opportunity for partners to build their knowledge base, hear innovative interventions, share lessons learned and emerging good practices, and note the results from research in the OVC arena. In 2008, the USG documented the successful voluntary savings and loan methodology that allows poor rural women to save and make small loans in a closed savings environment in video format to allow for widespread sharing between partners. With technical assistance from MEASURE Evaluation, the USG developed and documented 32 case studies on the various OVC program models within South Africa. A synthesis report considering results from all 32 case studies will help to identify various strategies in meeting the needs of OVC and their guardians, highlight gaps in service delivery, and identify best practices relating to improving the effectiveness and increasing the scale of OVC interventions. The USG and the DOSD hosted the Nigeria OVC team both Government and USG), providing a learning opportunity for south-to-south sharing that resulted in strong links and learning between the two programs.

In South Africa, the USAID Prevention and OVC Team lead serves as the OVC program focal point and is supported by a two-person OVC technical team with a small OVC working group to monitor and review USG OVC activities in South Africa.

In FY 2009, USG assistance will continue to build local capacity, encourage coordination, and support DOSD strategic programming. While several OVC partners have developed innovative gender and child participation interventions (e.g., NACCW's girl child program and World Vision's The Courage to Become Me program) most partners still face a challenge in incorporating gender into their day-to-day implementation of activities. In FY 2009, the USG will focus on providing technical skills and training in gender integration to enable the partners to integrate gender into all their activities (especially in the area of vocational training). Working to shift gender roles, OVC partners will be encouraged to include gender equality into implementation of their program and working in communities, to have discussions and take action for a more gender equitable community. Having adequate systems and processes in place to measure progress and quality in the area of monitoring and evaluation is critical in assuring that positive impact is being made in improving the well being of OVC. Increased human capacity development efforts are needed in this area. USG will continue training to build the human resource capacity of both the partners as well DOSD in the area of monitoring and evaluation.

The USG continues to work closely with UNICEF, including sharing information and assessment results. The USG program in

South Africa continues to complement the efforts of the DOSD and other donors to leverage resources and to ensure that there is no duplication of effort.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 10617.09	Mechanism: CERI
Prime Partner: Children's Emergency Relief International	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 24966.09	Planned Funds: \$0
Activity System ID: 24966	

Activity Narrative: SUMMARY:

Children's Emergency Relief International (CERI) will continue its partnership with the Sinomlando Centre for Oral History and Memory Work in Africa (Sinomlando Centre) to provide a training program designed to enhance resilience and nurture identity in orphans and vulnerable children, particularly those who have lost parents or primary caregivers to AIDS. Resilience can be defined as a child's ability and capacity to recover his/her well-being and life potential in spite of suffering through one or more life misfortunes. This will be achieved using the memory-box methodology. CERI received funding for the project in April of 2008 through the New Partners Initiative. Start-up occurred in July 2008.

BACKGROUND:

The Sinomlando Centre is a university-based training and mentoring program which equips staff and volunteers from OVC organizations in memory work and psychosocial support to OVC. Since its inception in 2000 it has developed a full range of training modules that include: awareness, memory work and evaluation workshops; Capacity Building Project (CBP); and refresher courses. The course consists of six modules: Memory Work, Counseling, HIV and AIDS, Play Skills, Interviewing and Transcribing and Community-based Organization Management. This model has been used for more than four years in the KwaZulu-Natal, Gauteng and Eastern Cape provinces. The foundation is the CBP course in which trainees learn to become "Memory Work Trainers" (MWT) with a view to conducting workshops for volunteers in their respective areas. The trainees are given technical training and mentoring in the field. The training is based on the "Memory Box" methodology which is a family-centered psychosocial intervention which facilitates intergenerational dialogue between immediate and extended family members in the context of HIV/AIDS. The purpose of the intervention is to enhance resilience and nurture identity in OVC. Parents and caregivers are encouraged to share family stories with the children. A recording of the story and various objects evoking the memory of sick or deceased persons are put in a "memory box". Resilience can be defined as a child's ability and capacity to recover his/her well-being and life potential in spite of suffering through one or more life misfortunes. After completion of the modules each trainee has to complete supervised and mentored field work. The program is designed to equip "Memory Trainers (MT)" with the necessary skills and expertise to enable them to conduct memory awareness meetings, memory training workshops, plus supervise family visits, with a view to a multiplication of partner OVC organizations' in-house memory facilitators, and thereby, too, families/OVC reached. Following the training each certified MT is obligated to return to his/her home or workplace and within a one year period, conduct two memory workshops for staff and volunteers.

ACTIVITIES AND EXPECTED RESULTS:**ACTIVITY 1: Human Capacity Building**

Given the scaled-up training model of Memory Trainers (MTs), the Sinomlando staff have subsequently determined that vital to the success of the project proposal will be the initial Memory Awareness Meetings for prospective partners and their staff and volunteers. Meetings were conducted at eight institutions in the Eastern Cape in June and July 2008, resulting in successful partnership negotiations. This culminated with 15 people from areas covering the whole of the Eastern Cape being trained as MTs. Similar meetings were conducted in the Mpumalanga and Limpopo provinces in preparation for the second, third, and fourth CBP training blocks to be held in 2009. With the assistance of USAID/SA, other contacts are being pursued to maximize the coverage area through additional PEPFAR partners. At these meetings, the Sinomlando staff presents an introduction to the Memory-Box approach to psychosocial support of OVC and outlines the scaled-up memory work model.

For FY 2009 the plan is to train 45 memory work trainers through the three-month Capacity Building Project course and after conduct 30 supervised and co-facilitated (by Sinomlando staff) workshops with an average of 15 memory facilitators (that is, volunteers from partner organizations in direct contact with OVC) per workshop, which comes to a minimum total of 450 memory facilitators. In addition, nine Area Coordinators will be trained.

An annual conference on Memory Work will be held to draw together all those involved in the psychosocial work being carried out by the program. This will give an opportunity to expand the research component of the program, give further improvement on the training methodology and content as those who are using the training reflect and share their experience of the process.

ACTIVITY 2: Monitoring and Evaluation

M&E will continue to be incorporated through multiple layers of continuous quality improvement which will be tracked utilizing CERI's Social Solutions database. At a minimum the following will need measuring: training transfer retention of both the CBP and Regional Memory Workshops (curriculum content and presentation, as well as knowledge retention and skills transfer); number of family visits; number of memory boxes completed, number trained and number of OVC reached. A Skills Transfer Evaluation forms for CBP trainees will also be captured as part of M&E.

Funding Source: GHCS (State)

Budget Code: HKID

Activity ID: 2950.23102.09

Activity System ID: 23102

Mechanism: TASC2: Intergrated Primary Health Care Project

USG Agency: U.S. Agency for International Development

Program Area: Care: OVC

Program Budget Code: 13

Planned Funds: \$291,271

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Community Mobilization and Participation

Handing over (partnering with Department of Social Development): To ensure sustainability, the Integrated Primary Health Care Project (IPHC) shall collaborate with key stakeholders, mostly Department of Health (DOH), Department of Social Development (DOSD) and Child Care Forums (CCFs), to provide field technical support that includes on-site training and mentoring of Community-based Organizations (CBOs). The stakeholders shall be mentored in use of the revised data collection and reporting tools e.g. OVC register of services provided, child in-take form, monthly and quarterly data reports and targets. This is in anticipation of their taking over the responsibility of on-site mentoring of CBOs to sustain project activities in the long term.

IPHC shall also expand the role of its five provincial coordinators to include supervisory responsibilities to the 23 CBOs implementing the OVC program. This shall strengthen IPHC project support to Caregivers and help build sustainability.

Inclusion of disabled children: IPHC shall provide technical support to CBOs to identify marginalized groups in the community e.g. disabled children under fives, child-headed and youth-headed households, adolescent OVC. Currently some CBOs like Pholo Modi wa Sechaba in North West province are working with disabled children but need guidance on identification and documenting them. To facilitate this IPHC shall revise the data collection and reporting tools to include categories on disabled children. This shall ensure that the OVC data tools are sensitive to the needs of marginalized OVC groups.

Palliative care: IPHC shall also link the CBOs to palliative caregivers to enhance support to all groups of OVC, including the disabled, to ensure sustainable support.

ACTIVITY 2: Capacity Building/Technical Support

Fundraising: IPHC will build the capacity of CBOs through training, expanding networks and partnerships to identify opportunities for fund raising. This will enable organizations to effectively and efficiently implement integrated programs that are responsive to the needs of OVC at local level in a sustainable manner.

IPHC shall develop a fundraising strategy to assist CBOs raise funds to sustain their activities in support of OVC. This shall be done through identification of local private or business, and government and civil society organizations and engaging them. A draft fundraising plan has already been developed and some CBOs have already started fundraising initiatives. The CBOs shall first be involved in the Management and Organizational Sustainability Tool (MOST) training exercise to assess their current strengths and weaknesses.

Child Status Index: To improve on quality of care to OVC, IPHC shall introduce the Child Status Index (CSI), a tool that measures the quality and type of service provided to a child. IPHC is part of a country team working with DOSD, Save the Children UK, University Research Council (URC) and Pact to develop and pilot minimum standards tools for measuring the quality of service provided to OVC. A draft tool has already been developed.

Electronic OVC database: IPHC shall setup an electronic OVC database through technical support from partner NGOs and collaboration with the DOSD. IPHC shall assist CBOs to setup the same electronic database at project sites once it has been piloted and approved.

Depression and psychotherapy: To meet the physical, emotional, mental and spiritual needs of the child, IPHC shall prioritize training of Caregivers in child care and management, particularly focusing on psychosocial support and child participation. The main areas of focus in psychosocial care training shall be children's rights, succession planning (wills, memory boxes and memory books), stigma and discrimination, counselling, including bereavement counselling and play therapy, access to social grants and involvement of religious organizations in child care. The model of psychosocial care and support shall be through Child Care Forums (CCFs), Child Drop-In Centres, support to households including child-headed households and counselling and debriefing of caregivers to prevent burnout.

Caregiver retention strategy: To address the challenge of high attrition rates of Caregivers from the CBOs IPHC project shall offer incentives like training opportunities and skills development in income generating activities. Monitoring tools to track the number of Caregivers and type of training offered shall be introduced. A major strategy to be adopted is the recruitment of men to improve male participation in CBOs, especially as Caregivers. This shall help reduce the number of children per Caregiver/Volunteer and subsequently improve the quality of care. Assertiveness training in CBOs shall be introduced to reduce vulnerability of the orphaned girl child. The project shall facilitate this training and encourage CBOs to replicate the training among other CBOs.

ACTIVITY 3: Coordinated OVC Care

Child care committees: IPHC shall assist CBOs to identify key stakeholders like DOH, DOSD, and CCFs in the local catchment areas to act as child care coordination committees. These committees shall be replicated at district and provincial levels. CBOs shall be assisted to identify or set up CCFs in the local catchment areas. Some of the CBOs have already established links with CCFs in their local communities.

Inclusion of OVC in IDPs: IPHC-supported CBOs will advocate for the inclusion of OVC care and support service into the Local Government's Integrated Development Plans (IDPs). The 23 NGO sub-partners will be linked to the child survival activities through the Integrated Management of Childhood Infections (IMCI) portion of the IPHC project implemented in conjunction with the Department of Health and other partners. IPHC will ensure that OVC continue to be fully immunized through referrals by the 23 NGOs to nearby

Activity Narrative: clinics. The NGOs will also be encouraged to continue to monitor the weight of children, especially in the light of HIV/AIDS, to enable early detection of children failing to thrive. Access to ARVs will continue to be improved through facilitation of referrals of OVC to nearby health facilities that offer these services. In FY 2008 all 23 CBOs have reported successful referrals of OVC for ARV treatment.

SUMMARY:

Management Sciences for Health, Integrated Primary Health Care Project (IPHC), in collaboration with the National Department of Health (NDOH), will continue to support the expansion of the orphans and vulnerable children (OVC) program in 5 provinces of South Africa (Eastern Cape, Mpumalanga, KwaZulu-Natal, Limpopo and North West).

The OVC activities supported aim to strengthen communities to meet the needs of OVC and their families; supporting community-based responses, helping children and adolescents to meet their own needs and creating a supportive social environment. The activities under this program specifically aim to assist OVC with access to education, economic support, provision of food and or nutrition, legal assistance, healthcare, psychological support and protection from abuse. The target populations for the activity are OVC and their caregivers and people living with HIV. The major emphasis areas are in local organization capacity and wrap around activities with child survival interventions that link the IPHC partner organizations to their nearest clinics.

In FY 2007, IPHC increased the number of partner NGOs from 7 to 23 and they now include the following:
-Eastern Cape Province: Inkwanca Home-based Care, Ikhwezi Lomso Child & Family Welfare Society, House of Hope Hospice, Ncedisizwe Home-based Care, Bonukhanyo Youth Organization.
-KwaZulu-Natal Province: Khanyiselani Development Trust/National Peace Accord, Sibambisene Organization, Inkosinathi HIV/AIDS Project, Masakhane Women's Organization,
-Limpopo Province: Makotse Women's Club, Direlang Project, Makhuduthamaga Community Home-based Care Organization, Lafata Home-based Care, Mohlarekoma Home-based Care,
-Mpumalanga Province: Zimeleni Home-based Care, Thuthukani Home-based Care, Sizanani Home-based Care, Luncedo Lwesizwe Home-based Care,
-North West Province: Thibela Bolwetse Project, Botho Jwa Rona Home-based Care, Pholo Modi Wa Sechaba Home-based Care, Winterveldt HIV/ AIDS Project, Progressive AIDS Project.

BACKGROUND:

This activity is on-going and continuing from activities initiated in FY 2006 and FY 2007. IPHC will be working with NGOs and Community-Based Organizations (CBOs) that are implementing activities aimed at improving the lives of OVC. All NGO/CBO activities are integrated into the plans of the Departments of Health and Social Development. With FY 2008 PEPFAR funding, the IPHC will also establish and strengthen the referral system between the NGOs and CBOs and, local municipality and health facilities to increase access to health services e.g. provision of childhood immunization, pediatric HIV testing, clinical monitoring and management of ARV therapy when necessary. IPHC has a wrap around child survival activity at the health facilities surrounding these OVC organizations and will work to actively encourage and support referrals between the CBOs and the health facility. IPHC and its sub-partners will strengthen collaboration between the South African Police Services and Child Protection Units to report cases of abuse and rape especially in child-headed households. IPHC will engage traditional leaders to raise awareness and address the abuse of girl children in their communities.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Community Mobilization and Participation

Using FY 2007 funds, IPHC managed to increase the number of NGOs providing care and support to OVC from seven (7) to twenty-three (23) in the 5 provinces. As a result the number of OVC served surpassed the set target of 10,000 for FY 2007. In FY 2008 the aim is to continue to increase the number of caregivers, expand the services provided and increase the number of OVC that receive support. To achieve this IPHC will build the capacity of NGOs and CBOs through training, expanding networks and partnerships, and identifying opportunities for fund raising. This will enable organizations to effectively and efficiently implement integrated programs that are responsive to the needs of OVC at local level.

IPHC will also increase the number of caregivers trained in psychosocial aspects of working with OVC, including understanding their developmental needs and support requirements of children. IPHC will also assist with the identification of accredited service providers to provide training to the NGOs on technical aspects related to OVC care. Examples of such training include financial and project management, data management and reporting, financial proposal development and fundraising. IPHC will work with the NGOs that have crches and drop-in centers and raise their knowledge in relation to children's needs and rights, in line with the guidelines of the Department of Social Development on early childhood development. The trainings shall be at local district level in the five provinces.

It is expected that a total of 15,000 OVC shall be reached by end of FY 2008. This will be done through specific training that will be conducted on child rights, child participation and memory work' with children.

ACTIVITY 2: Capacity Building/Technical Support

With FY 2008 PEPFAR funding, IPHC will provide technical support to NGOs and CBOs to enable them to provide a comprehensive package of care and support to OVC. The package includes support to OVC to obtain birth certificates and identification documents; access social security grants; psychosocial support that includes trauma, bereavement and basic counseling; emotional and spiritual support; counseling and debriefing of caregivers to prevent burnout; referral to clinics and hospital for pediatric ARV treatment and adherence; immunization; age appropriate messages on prevention of HIV infection; support for child-

Activity Narrative: headed households and protection interventions to prevent sexual abuse, rape, land grabs and provide security of inheritance; access to life skills education; access to legal aid to prevent social neglect.

In FY 2008, IPHC will directly provide mentoring and technical support to NGOs in the areas of administration, financial management and reporting, data collection, monitoring, evaluation and report writing. A simple accounting and financial package, that is user friendly, will be provided to all NGOs trained so that they can apply it in their financial reporting. The newly designed data collection and reporting forms, registers and child in-take forms will be used in group trainings to build the skills of NGOs in data reporting. All 23 NGOs shall be supported to develop a monitoring and evaluation system that has activity plans, targets, simple indicators, outputs and outcomes and time-frames. This will be done through short-term one week training sessions that will be followed up with on-site field visits by the technical advisor and provincial coordinators.

ACTIVITY 3: Linkages and Networks

IPHC will facilitate partnerships between the 23 NGOs and other local organizations working with OVC in order to encourage shared knowledge and learning. IPHC will also ensure that NGOs participate in the local coordinating structures such as District AIDS Councils (DACs) to facilitate access to resources for OVC. IPHC will also form Child Care Forums to ensure that OVC receive appropriate services and encourage community protection of OVC. IPHC supported NGOs will also advocate for the inclusion of OVC care and support service into the Local Government's Integrated Development Plans (IDPs). The 23 NGO sub-partners will be linked to the child survival activities through the Integrated Management of Childhood Infections (IMCI) portion of the IPHC implemented in conjunction with the Department of Health and other partners. IPHC will ensure that OVC continue to be fully immunized through referrals by the 23 NGOs to nearby clinics. The NGOs will also be encouraged to monitor the weight of children, especially in the light of HIV/AIDS, to enable early detection of children failing to thrive. Access to ARVs will be improved through facilitation of referrals of OVC to nearby health facilities that offer these services.

Activity Narrative: SUMMARY:

McCord Zoe-Life (MZL) activities will strengthen the linkages between sites that offer care and treatment, and programs that offer traditional OVC services. The aim would be to integrate and streamline services, and ensure that orphans and vulnerable children are tested for HIV in a timely manner and receive quality care and treatment at the most appropriate facilities including the community. Emphasis areas include: development of referral systems between traditional clinic-based programs and OVC services and local organization capacity development.

BACKGROUND:

A major challenge in HIV care and treatment is the very specialized and vertical manner in which children and especially orphans and vulnerable children are managed. Organizations that predominantly support care and treatment are often not aware of organizations focusing on OVC programs and vice versa. OVC programs are often not aware of clinical and psychosocial best practice with regard to care and treatment, nor are they equipped to advocate for the best quality services for OVC. Caregivers are often not kept up to date with best practice and are often not emotionally or practically supported to provide the best quality care to the children they support. Facility-based services do not link with the community or OVC programs very effectively.

This is a new program area in which MZL will attempt to bridge services with an OVC focus to clinical and psychosocial care. MZL would like to start working with 3 models: one clinic linking with Big Shoes (children's home), one clinic or NGO linking with a curriculum-based OVC intervention (iThemba Lethu) and one NGO supported by this funding, linking with its community OVC activities.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Case Finding

As part of case finding to engage infected children with care and support services, ZL will partner with two local organizations that are involved with OVC activities. These are iThemba Lethu (iTL) and Big Shoes (BS). iTL is a local organization which offers a curriculum-based prevention program in several local schools. The focus is on HIV prevention, life choices, delay of sexual debut and community strengthening through support of teachers, economic empowerment of parents and strengthening parenting skills, particularly among men. ZL would seek to partner with iTL to provide testing to children within the school context, provide training to iTL Youth Workers to equip them to provide appropriate referrals for care and treatment, and to provide ongoing psychosocial support to children with HIV. BS operates within the context of children's homes. ZL will partner with them to assist with case finding. ZL will also engage with OVC programs which operate within close proximity to the NGOs and clinics which are supported by this funding in order to support testing through either training to test or through direct testing of children.

ACTIVITY 2: Psychosocial Support

ZL will offer an outcomes-based psychosocial support program for HIV-infected children and their caregivers at the clinics, children's home and community-based program. This will aim to link the clinic and community-based programs. Linkages with OVC organizations that operate near the clinics or NGOs supported by this grant will be created so that OVC facilitators and caregivers can be mentored to provide similar psychosocial support within their programs or communities. The support program will offer caregivers and volunteers quality updated information about the clinical care of HIV-infected children linked with CIMCI goals, as well as psychosocial care which would include assistance to help with disclosure and stigma, nutritional needs, understanding how to give medications, developmental screening and emotional needs.

ACTIVITY 3: Increasing Caregiver Capacity

Caregivers of OVC attending the outcomes-based psychosocial support programs who are not able to read will be linked with an adult literacy program (Operation Upgrade) which operates locally. This is essential as caregivers are often not able to read medication labels, nor are they able to access the resources which could assist them to provide quality care to the children. In addition, they are not able to read patient held clinic records. Linkages with literacy programs will assist to ensure a better quality care and more consistent clinical care from the caregivers. It will have a secondary effect on the cognitive development of the child as the caregiver may be able to engage more actively in the schooling of the child. In addition to this, literacy classes also address other issues such as clean water, starting small businesses, parenting, growing vegetables, and reading to children. These all contribute to strengthening community-based responses and leveraging additional resources to ensure that this happens.

ACTIVITY 4: Coordination of Care

ZL seeks to improve linkages, referral systems and case management of children between the clinics, NGOs, and OVC partners. To facilitate this, a multidisciplinary team meeting will be encouraged at each facility where a working partnership has been developed (clinic/NGO/OVC/Community) Infected children should each be assigned a case manager to encourage accountability and quality of services. Cases will be managed as a team, integrating facility-based recommendations with community-based recommendations. Monitoring and Evaluation (M&E) methods will be developed that ensure tracking and geographical mapping of children and their care pathways. Use of electronic hand-held devices to simplify M&E as well as to access information about medications, referral centers and Community-Based Integrated Management of Childhood Illness (CIMCI) goals will be explored as an integrated and simple way to achieve service tracking, quality services and program M&E.

ACTIVITY 5: Mobile Services

Activity Narrative: Where possible and needed, the mobile clinic used predominantly by the Workplace program funded in this grant may be used to provide clinical services to OVC in the community. This would be to optimize the use of the mobile vehicle and to address OVC needs in the short term.

ACTIVITY 6: Nutritional Support

A. ZL will develop and implement a nutrition screening tool for use within OVC settings (psychosocial support groups, school OVC programs and community OVC partners) to ensure anthropometric assessment and appropriate interventions.

B. ZL will provide technical support to access micronutrient supplementation for nutritionally compromised HIV-infected OVC patients where possible.

C. ZL will develop guidelines for OVC-based staff as well as training courses and resources to provide integrated nutritional assessments and counseling for OVC.

ACTIVITY 7: Gender

Gender will be addressed by providing a safe environment for vulnerable girls to be given access to accurate information and access to testing, care and PMTCT services where needed. Psychosocial support groups will provide an environment in which boys and girls will be able to receive counsel around sexual choices and to reinforce that girls have choices with regard to sexual coercion.

New/Continuing Activity: New Activity

Continuing Activity:

Emphasis Areas

Gender

- * Addressing male norms and behaviors
- * Reducing violence and coercion

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 10269.09	Mechanism: TBD Africare Follow On
Prime Partner: To Be Determined	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 23700.09	Planned Funds: ██████████

Activity Narrative: SUMMARY AND BACKGROUND:

The project's activities will emphasize the development of sound public sector and community responses to OVC needs. Public sector departments involved are the Department of Social Development (DOSD), Department of Health (DOH) and Department of Education (DOE). FY 2008 will include efforts to engage the Department of Labor (DOL) and the Department of Agriculture (DOA).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthen Communities to Meet the Needs of OVC Affected by HIV and AIDS

Service Corps Volunteers (SCVs) will be recruited to support OVC community-based activities. To support the identification and tracking of support to OVC, the project will support the Eastern Cape DOSD in designing and developing an OVC services tracking system and other tools for identifying vulnerable households, their needs, and tracking services delivered. SCVs, health sector community care-givers and the Child Protection Committees (CPCs) members will be trained to identify OVC and vulnerable households, and ongoing household needs assessments will be initiated and made routine. CPCs will continue to be developed for 15 wards (or clusters of wards) to provide a mechanism for coordinating resources to meet the children's needs. CPCs will also function as the accountability body for local OVC identification, monitoring and services coordination. Small grants will be provided to the CPCs to enable them to meet and coordinate activities for OVC. A memorandum of understanding will be signed with each CPC, each will be assessed for its development and resource needs; each forum will meet at least quarterly. The project support will be provided through a Service Corps Volunteer to establish patterns of OVC needs identification, work planning, and the development of an OVC community service plan. Kids' Clubs will be established with Africare support, designed in conjunction with the DOSD and their district committee for HIV and OVC ("DACCA"). Workshops will continue to be held to jointly establish roles, functions, and the service complement of CPCs and Kids' Clubs. CPCs, Kids Clubs, and community caregivers will link OVC and child heads of households to social services for necessary support in addition to providing direct support where they are capable.

ACTIVITY 2: Community-based Responses in Support of OVC and Their Households

The project will provide grants and technical assistance to selected community-based organization (CBO) members of CPCs. Two CBOs have been engaged and provided with initial grants. Orientation on financial management and monitoring and evaluation will be provided to CBOs and as well as those engaged in OVC activities. Grants will focus on enabling CBOs to provide care and support to OVC in their communities. Training of CBO caregivers will enable them to monitor, directly provide, and refer to specific services. Both service CBOs and public sector health volunteers will be provided with tools and training to monitor health status and to promote child utilization of well-child health services and to be cared for when sick. OVC households will be linked to ongoing and expanding food garden projects, soup kitchens and locally available food parcels distributed by the DOSD, churches and CBOs. A local legal aid service will be engaged to train child forums and volunteers in basic legal aid support for OVC and families, such as wills, succession planning, identity documents, deferment of school fees, etc. The project will facilitate the development of a referral system between the community, DOSD and legal aid for common legal needs. The South African Depression and Anxiety Group (SADAG) will continue to provide specific support in developing community-oriented psychosocial support training. They will initiate caregiver support groups, and train the support group leaders. The SADAG 'talking book' for OVC will be used by community and household caregivers for facilitating discussion and engaging children and youth. They will also establish a toll-free call line for support.

ACTIVITY 3: Direct Assistance to OVC

The project will facilitate establishing effective referral patterns and access to social services and various benefits. SCVs will be trained to assist CPCs and train child-headed households on home management, services and entitlements. To foster school compliance with the provincial no-fee policy in disadvantaged areas, minor repairs and rehabilitation or other school-wide benefits will be undertaken in exchange for waiving fees for OVC. Enrollment by OVC in school and routine attendance will be monitored. The project will capacitate the community volunteers and child care forums to ensure that OVC in need of shelter get referred. Monthly monitoring of access and utilization of a standardized package of services will continue in FY 2008. Children and youth attending Kids' Clubs will be trained in Life Skills. Kids' Clubs leaders will be trained in HIV prevention, AIDS care and support of OVC. The project will provide small grants to Kids' Clubs to organize recreational activities. The project will seek leveraged matching funds. Peer Educators (40) and Peer Counselors (40) will be trained to support children and youth attending Kids' Clubs and in the community. Children heading households and older OVC will be targeted for training in vocational and livelihood skills through vocational training centers and training organizations. Local organizations will be trained to support the development of income generating activities (IGA), and OVC and caregivers will be assisted in securing funding for IGA activities.

ACTIVITY 4: Access to Health Care

Home-based caregivers based at clinics will ensure that OVC under two years old encountered in the homes of their HIV clients are weighed, immunized, and those that are HIV-exposed are screened for infections, receive their follow-up HIV test, and access care and treatment, when required. OVC caregivers (OVCGs) deployed by the CBOs under each CPC will monitor clinic utilization for growth monitoring and immunizations and will support the clinics in direct weight monitoring for high-risk children. Older children encountered in the home will also be linked to clinic care and treatment services as needed. Schools and Kids' Clubs will be alert to children and youth, who need referrals for healthcare and HIV treatment, linking them through the structures above to ensure that clinic or hospital level care is provided.

CPC members will continue to be trained in FY 2008 to provide community-based support and advocacy,

Activity Narrative: e.g. prevention of exploitation and abuse, prevention of "land-grabbing", and identification of children and households in distress. CPC development will continue to be nurtured to provide a sustainable response to the need for OVC identification and service coordination.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 9225.09	Mechanism: Enhance SI
Prime Partner: John Snow, Inc.	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 21160.23629.09	Planned Funds: \$1,506,844
Activity System ID: 23629	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

This activity aims to improve OVC information gathering and reporting systems for both the Department of Social Development (DOSD) and PEPFAR OVC implementing partners. In addition, the activity aims to document OVC service delivery, assess program effectiveness by generating information about OVC programs through basic program evaluations and strengthen M&E capacity for OVC programming for both USG (IPs) implementing partners and the DOSD.

BACKGROUND:

This activity is a follow on to the MEASURE 2 TASC order that provided M&E technical support to the DOSD, South Africa. The Enhancing Strategic Information Project (ESI) managed by John Snow Inc. along with its partners Khulisa Management Services, Health Information Systems Program (HISP) and Tulane University aims to further strengthen M&E capacity of the DOSD and PEPFAR IPs in the area of OVC programming, monitoring and evaluation through sustained technical support by a Technical OVC M&E Lead, strengthened by partner support from Tulane, Khulisa, and HISP. The project also intends to conduct a series of capacity building activities to strengthen OVC M&E and program management at the strategic policy making level and implementation level.

ACTIVITIES AND EXPECTED RESULTS:

In addition to the proposed activities below, the project will aim to accomplish the following in FY 2009:

ACTIVITY 1: M&E Strategy for OVC

This activity will be led by a Resident Technical Advisor/Task Lead for South Africa Task 2 under the new ESI Project (Task Order No. GHS-I-03-07-00002-00).

The M&E OVC (Task 2) Lead under the new ESI Project will be responsible for provision of technical support to the DOSD. The support will include the following activities:

- Support a local consultant in developing the monitoring and evaluation operational plan and engage in the short term assignment write up and dissemination of the work.
- Assist the DOSD in providing support and coordination for the OVC Research Working Group at the DOSD and ensure collaboration of all key stakeholders in this participatory process. The ESI project will provide support to this Working Group at the DOSD.
- Provide technical support to a Tulane-based consultant responsible for conducting OVC case studies as a continuation of the previous work under MEASURE Evaluation.
- Explore providing support to the DOSD with regard to provision of M&E technical support in operationalizing a routine management information system for the collection of OVC community-based data for the National DOSD in addition to provide support for Routine Management Information Systems
- Explore whether DOSD would be open to integrating OVC community information reporting into the district health information system
- Partner strengthening in OVC M&E and OVC programming. ESI together with USAID will determine a methodology to identify partners who require supportive technical assistance. Provision of TA will be made available through the ESI Task 2 lead. It is envisaged that the ESI Task 2 lead will provide assistance in facilitating the OVC M&E portion of the PEPFAR Partner OVC meetings and identify, at these meetings (in addition to other consultative meetings), partners requiring supportive TA. This type of support can be further defined as:

1. Strengthening partner M&E plans and frameworks;
2. Strengthening partner monitoring and data management systems;
3. Being the focal point to partner OVC M&E queries (through the ESI Project); and,
4. Supporting USAID in activities relating to OVC M&E.

The project will also conduct, or support and oversee, a series of activities under the Tulane subcontract. The Tulane-based consultant will undertake a series of activities:

- Continuation of previous case studies. The number of case studies will be based on the funds available in the project and a work plan is to be determined to outline an exact number of studies based on available funds. Several synthesis reports based on existing case study information will be developed. This analysis will increase understanding of the services provided and identify trends in types of assistance and potential unmet needs. In addition, a Case Study Development manual will be generated to guide IPs with existing resources to independently replicate the approach.
- Develop a research protocol and data collection tools for basic program evaluations of two OVC initiatives implemented by USG IPs in South Africa.
- Develop a methodology and finalize protocol for the cost-effectiveness analyses undertaken with programs selected for evaluations.

Activity Narrative: It is expected that the activities carried out under the Tulane sub-contract will make use to its full extent and within the funding parameters, the use of Tulane graduate student interns for support of the OVC research component.

All studies that are planned will apply the most rigorous and cost effective methodologies as agreed by Project ESI and USAID. Local research partners will be selected through a competitive bid process and solicited for a detailed proposal. All studies will undergo the routine IRB and regulatory approval process as determined by South African and US Federal law.

The ESI project will make use of a local M&E consultant to continue the ongoing National and Strategic Policy level work at the Department of Social Development, initiated by MEASURE Evaluation.

This work will direct the DOSD in ensuring the effective implementation and capacity building strategy for M&E at the provincial and regional levels. The ESI project under the Task 2 and Task 1 leads and the direction of the local M&E consultant will provide strategic direction as to the most effective methodology for M&E capacity building of the national and provincial Departments of Social Development. The Task 2 lead will support the DOSD in its move to operationalize the National M&E OVC framework, to be finalized under the direction of the local M&E consultant mentioned in the above bullet.

ACTIVITY 2: M&E Capacity Development

This activity will be comprised of an integration of South Africa Tasks 1 and 2 under the ESI Project. South Africa Task 1 under ESI is designed to coordinate the M&E capacity building activities for USG partners in South Africa. The project Task 2 lead will lead the capacity building efforts for OVC partners and DOSD, South Africa, with a high level of effort and support from the Task 1 lead. It is envisioned that most of the trainings will occur at the project ESI offices training room as means to effectively use funds for program support. A curriculum on OVC M&E capacity building (for both partners and DOSD) will be developed following discussions and agreement between ESI and USAID. The focus for year 1 activities for OVC M&E capacity building will be to emphasize on basic M&E capacity building workshops and specialized courses on monitoring OVC community-based programs.

The ESI Project, through Task 1, will provide basic M&E training for OVC partners and also ensure that the Task 2 lead is a focal contact for PEPFAR partners for OVC M&E. ESI will also develop M&E specific curricula for PEPFAR partners and the content of this will be specific to monitoring of OVC Programming, in addition to conducting routine and basic M&E trainings. The project will focus, in year 1, on OVC evaluation techniques (as opposed to monitoring) and evaluation designs for partner support. Project ESI will together with USAID discuss a methodology for workshops designed for evaluation capacity building for partners for year 2 of the project. This will be done in collaboration with Tulane.

The ESI project will propose a series of training methodologies that will potentially encompass basic M&E, as well as strategies to train trainers at the level of implementation of DOSD activities (regional and site). Project ESI, through the outputs generated from the work of the local M&E consultant, will strategically position itself to provide M&E TA at the provincial level and/or program level. This will be done in an advisory capacity while further discussions with USAID and DOSD will be held to ensure resource mobilization at the field level to operationalize the DOSD OVC program.

SUMMARY:

This activity aims to improve OVC information gathering and reporting systems for both the Department of Social Development (DOSD) and PEPFAR OVC implementing partners. In addition, the activity aims to improve OVC service delivery and assess program effectiveness by generating information about OVC programs through a targeted evaluation.

BACKGROUND:

This activity was supported by MEASURE Evaluation in FY 2005 and FY 2006. The MEASURE activities will be recompleted in FY 2007 and it is anticipated that the same partner will continue these activities in FY 2008. PEPFAR funds have been used to work with the DOSD to support a resident advisor (RA) within the DOSD under the direction of Chief Director of the HIV and AIDS Unit. His role includes developing the M&E component of the National Plan of Action for OVC and the DOSD's policy framework for OVC made vulnerable by HIV and AIDS, as well as developing an operational plan. In FY 2006 the M&E Advisor provided program management support to the organization selected to develop a management information system (MIS) to track OVC. In addition, the RA works to build the capacity of DOSD staff in M&E to ensure sustainability of the M&E systems that will be developed.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: M&E Strategy

The PEPFAR funded M&E RA to the DOSD will assist them to implement the M&E strategy. A key component of the DOSD M&E system in South Africa will be the MIS for OVC co-funded by PEPFAR and the DOSD. The M&E RA will continue to serve as the liaison between DOSD, the MIS contractor, implementing partners and other donor agencies; oversee major time-lines for the MIS Contractor, and provide technical assistance to the MIS Contractor in the following areas: guidance on database design issues relevant to DOSD's M&E strategy and operational plan to ensure key objectives of DOSD are met with the system; oversight on functionality and user interface; ensure that data quality and integrity is maintained; and coordinate training needs of the users at local and provincial level once the MIS system is fully developed. The expected result of this activity is a functional national MIS system for OVC programs.

Activity Narrative: ACTIVITY 2: M&E Capacity Development

The M&E RA will continue to develop the M&E capacity of staff within the DOSD and local partners. The M&E RA will coordinate M&E training needs within the DOSD and of local implementing partners, conduct site visits to local and provincial sites in order to assess gaps in skills and knowledge in M&E and provide technical assistance to meet such needs. The M&E RA will evaluate and modify data utilization and flow within DOSD. The expected result of this activity is a sustainable M&E unit within the DOSD.

Funding Source: GHCS (State)

Program Area: Care: OVC

Budget Code: HKID

Program Budget Code: 13

Activity ID: 21254.23637.09

Planned Funds: \$1,650,538

Activity System ID: 23637

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

In partnership with the Department of Social Development (DOSD) PEPFAR funds will support the training of caregivers of orphans and vulnerable children (OVC) and child protection activities. Planned interventions include the development of the capacity of local community-based and faith-based organizations to provide support to OVC, thereby addressing the burden of care experienced in particular by elderly females, adolescents and male caregivers, each of whom has unique needs. As a result of training the quality of care provided to OVC will improve. In particular, household approaches that create linkages between OVC services and affected families will be prioritized.

BACKGROUND:

The project supports the PEPFAR goal of supporting care for 12 million people infected with and affected by HIV, including OVC. Among those most affected by the epidemic are children orphaned and made vulnerable by its impact. They experience heightened susceptibility to isolation, stigma, malnutrition, disrupted education, psychosocial issues and a generalized lack of physical and emotional care and support.

Over 3.3 million South African children have lost one or both parents. Over 250,000 have lost both parents and over 100,000 are estimated to be living in child-headed households. This translates into an increased burden of care experienced by family members, caregivers, volunteers and community and faith-based organizations. The personal needs of caregivers are often unmet. As a result their support to OVC is compromised, leading to an increased risk of neglect and abuse. This PEPFAR activity will focus on strengthening the capacity of caregivers by focusing on their own needs while simultaneously increasing the knowledge base and skills they require to support OVC.

Implementing organizations:

PATH has partnered with its AIDSTAR Sector I Consortium partners, Health and Development Africa (HDA) and The International HIV and AIDS Alliance (the Alliance) to deliver the Orphans and Vulnerable Children Caregiver Support and Child Protection Training in the nine provinces of South Africa.

In terms of the project management structure, PATH as prime contractor and recipient of the award, assumes accountability to USAID for project results, compliance and financial reporting. HDA takes the technical lead for project implementation and day-to-day management and will house the project. The Alliance leads the Caregiver support training component. Second tier partners will be added in FY 2008.

Gender:

The center of this activity will be child protection, and gender issues will be a major focus of this program. The three gender priorities that will be addressed are: increasing gender equity in HIV and AIDS programs; increasing women's legal rights; and reducing violence and coercion. All data will be segmented by gender. The importance of life skills and HIV prevention information for highly vulnerable girls will be built into the training program, thereby helping to educate youth and adults about the risks of cross-generational and informal transactional sex.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

Training will focus on the strengthening of the capacity of caregivers to provide adequate care to OVC. Caregiver capacity development will address personal health issues; family strengthening including relationship building, resource strengthening and resilience; psychosocial wellbeing; treatment literacy; knowledge of and ability to access resource networks; coping with bereavement and grief; parenting skills including household management, child nutrition, dealing with conflict, memory work, child development; and communication skills. Addressing the human resource inadequacies of caregivers and supporting organizations will enhance the quality of care provided to OVC.

The target of training is community-based caregivers active in the care and support of OVC. The caregiver support training curriculum will be supported by manuals and toolkits. Toolkits will provide resource information to raise awareness, build skills and strengthen problem-solving abilities. They will include a resource pack containing for example low-literacy information sheets and read aloud story books to facilitate child-caregiver communication about HIV/AIDS.

Training the Trainer (TOT) workshops will be offered to Master Trainers. Training of caregivers will take place over five-days divided into two- and three-day sessions to allow participants to assimilate learning over time.

Follow-up and support of trainees will take place through national and provincial convenings. Refresher trainings will be offered to trainees who have completed training. A quarterly newsletter will promote continuity of learning and enhanced networking between trainees. Training partners will conduct bi-annual site visits to monitor training implementation and assess further needs. A reporting form will facilitate collation of information. On-going training will be provided to trainee supervisors regarding their skills, roles and responsibilities and to discuss changes to reporting and monitoring data.

Sector Education and Training Authority (SETA) accreditation of training curricula will be finalized. 500 manuals will be printed and available on the project website. 2500 caregiver toolkits will be printed and disseminated.

Activity Narrative: Training sites will be identified in areas with highest prevalence of HIV and largest numbers of OVC in order to facilitate sustainable scale-up, with attention given to creating linkages with other HIV-related programs. Mapping processes will be employed to determine these greatest areas of need.

ACTIVITY 2: Improving collaboration and referral networks to promote sustainability

In order for caregivers to maintain a high standard of care, they must maintain their own health and psychosocial wellbeing. Referral networks will be established in the communities where South African PEPFAR OVC partners are working in to ensure that caregivers know where to access services for themselves. Specific focus will be put on psychosocial and health services, including ARV treatment.

Project activities will seek to embed the training into communities by creating child champions and strong referral and networking relationships between governmental and civil society organizations. In this way the project seeks to promote community responses to OVC and caregiver needs. Community participation will be encouraged in all project planning and implementation processes. For example caregiver and child participation will be built into conferences and evaluation processes.

Through its close collaboration with DOSD the project promotes long-term scale up in order to increase the number of OVC reached. The training program is replicable on a national level and takes into account the varying needs of different populations such as elderly and adolescent caregivers, under five year olds and persons with disabilities.

ACTIVITY 3: Dissemination of knowledge and better practices

This activity will focus on the identification and dissemination of better practices that strengthen households and improve child protection. In the process, promising practices will be benchmarked against criteria for "successful" practice. Ongoing discussions with PEPFAR partners and DOSD will provide information about as yet undocumented approaches. Local partner capacity to document case studies will be developed with a minimum of 30 individuals trained.

A targeted dissemination strategy will be developed. Promotional brochures will be distributed to 1000 organizations. Toolkits will be made available through public access networks and CD-Rom. Innovative ways to disseminate better practices dissemination will be facilitated by the quarterly newsletter and other ideas that will emerge in the strategy. At least three caregiver conferences will be held to share documentation of better practices, discuss innovative approaches and common challenges.

ACTIVITY 4: Child Protection

Training will focus on the early identification, prevention, treatment and follow up of child abuse and neglect. This continuum of care aims to create an effective and efficient response to high levels of child abuse prevalent in South Africa and to address the increased vulnerability of OVC. Training will be developed for NGOs, including FBOs, teachers, health professionals, mental health practitioners, social workers and caregivers. Efforts will be directed at the development of referral networks, quality assurance and supportive supervision to ensure follow up and mentoring of trained individuals.

Child champions will be identified in each geographical region where training takes place to provide mentoring to trained individuals, advocate for child protection and promote sustainability of the project. Meetings will be held locally and provincially to build awareness, increase networking and ensure implementation of training practices.

Training will be offered to PEPFAR partners and child forums as established partners involved in support to OVC. This will develop increased understanding of prevention, early intervention and treatment of child abuse and neglect and the appropriate institutional and legal responses to child abuse. An understanding of the roles, responsibilities and referral processes to and between child protection services, governmental and civil society will prevent children falling through the continuum of care. In addition the project will focus on the development of community-based safe spaces for children. This project will focus on introducing the special needs of OVC to the child protection professionals and also on introducing the child protection identification skills and support options for OVC caregivers. Both sides need to be sensitized.

SUMMARY:

In collaboration with the South African Department of Social Development (DOSD), PEPFAR funds will be used to support a caring for the caregivers intervention, with a major focus on the adolescent and female caregivers of OVC. These will include elderly female household heads with young children, large families with unrelated children (fostered or adopted), child-headed households, single parent/family member households, and formal or informal cluster foster care.

Funding will be used primarily in the emphasis area of training specifically in-service training with additional efforts in local organization capacity building. The primary target populations for the intervention is adults over 25 years, people living with HIV and AIDS and orphans and vulnerable children (OVC). A service provider to implement this activity will be selected in October 2007.

BACKGROUND:

Research has shown that families are absorbing the care of OVC but are doing so with great difficulty and at great cost to the caregiver. Adult caregivers of OVC have needs of their own that must be addressed in order to support and prolong their capacity to care for OVC. There are currently over 1 million OVC in South Africa, and the number continues to rise. Support structures need to be built to ensure the current model of community and family-based OVC care is able to be sustained. Issues and challenges that caregivers face

Activity Narrative: include burnout and personal health issues, depression, lack of adequate knowledge about HIV/AIDS, stigma, the lack of resources or the knowledge of how to access them, the lack of parenting skills and grief management. Trainings are needed that will increase the knowledge and skills of individuals providing care and support to children who have been orphaned or made vulnerable by HIV/AIDS.

The South Africa PEPFAR OVC Partners are trying to address this issue, but due to the large demand, have requested additional assistance in planning and implementing programs to address caring for the caregiver.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

This activity will focus on developing and sharing a caregiver support model for South Africa. Activities will address the critical health needs of adult caregivers, including guardians, (grandmothers or aunts) and adolescent heads of households. Activities will improve adult-to-child communication and provide counseling on difficult issues including parental illness, death, how to deal with bereavement and grief, sex education, parenting skills, gender sensitivity training and HIV prevention messages. These interventions will prioritize the needs of the caregivers and will strengthen the caregivers parenting skills set to ensure that they are able to keep the new family together as a family unit and support the OVC in a stable environment. Workshops will be held and mentoring and support provided for caregivers to improve their ability to care for vulnerable children and maintain the family unit.

ACTIVITY 2: Linkages and Referrals

In order for caregivers to maintain a high standard of care, they must maintain their own health. Referral networks will be established in the communities that the South African PEPFAR OVC partners are working in to ensure that caregivers know where to access services for themselves. Specific focus will be put on psychosocial and health services, including ARV treatment. Issues around accessing these services will also be examined including transportation costs and temporary child care to see how partners could best address these issues.

ACTIVITY 3: Sharing Good Practices and Knowledge

This activity will focus on dissemination of valued practices for caregivers. The intervention will focus on collection and sharing of information and best practices for caregiver support programs among OVC organizations. Other interventions to reduce the burden of childcare on stressed caregivers will also be explored. For example; aftercare programs offering sports and recreation, including weekends, holidays and holiday camps. Better practices will be documented and then caregivers will be invited to workshop what practices they could use in their communities, households and families. This intervention will focus on supporting activities that avoid further destruction and degradation of the family unit. A caregiver tool kit will be developed to provide organizations with sustained guidance for ongoing support of caregivers.

Development**Program Area:** Care: OVC**Program Budget Code:** 13**Planned Funds:** ██████████

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Salvation Army has declined future PEPFAR funding for FY 2009. The USG will recruit a new partner to provide services to ensure that there is continuity in this activity in FY 2009.

In collaboration with the South African Department of Social Development (DOSD), PEPFAR funds will be used to support the provision of OVC with access to a comprehensive coordinated range of services that meet their needs. The new partner will implement interventions that provide care and protection services to OVC and will work to ensure access to a comprehensive coordinated range of services that meet their needs. Services will include psychosocial support, access to government grants and school fee exemption. The Partner is expected to facilitate access to food nutrition and educational support (including assistance with food parcels, uniforms and school materials). An emphasis area will be training and building the capacity of volunteer caregivers to respond to the needs of OVC.

BACKGROUND:

The Partner that is currently providing services to OVC will no longer be doing so as of September 2009. This COP represents a follow-on activity to identify another implementing partner to provide services to OVC and ensure that services are continued.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training of volunteer caregivers and establishing quality training programs that will provide and enhance skills of those providing care to OVC

The programs will be designed with appropriate curriculum, qualified trainers and have a mechanism in which to measure the quality and impact of the training on promoting the well being of OVC. This partner will ensure that capacity building is integral in providing quality comprehensive services to OVC and their families. Training of primary and secondary caregivers in child and youth care work, ensuring linkages to social security and child protection interventions as well as in the establishment of income generating activities such as vegetable gardens, poultry farming and tailoring will all be part of the activities implemented by this new partner.

ACTIVITY 2: Comprehensive OVC services

The partner will establish a program to deliver comprehensive and holistic support services to OVC and provide focused bereavement counseling for OVC, specifically young people heading households who struggle to cope with their own intense grief as well as the responsibilities of dealing with the grief of their siblings which often manifests in different ways (bedwetting, depression). A further group that will be focused on is the grannies heading households who struggle with intense grief related to the multiple losses of their children, coupled with the stress of the responsibilities of raising many grandchildren of varying ages in the context of poverty. In addition the care workers themselves may struggle with unresolved personal grief and often have great difficulty providing good psychosocial support. The new partner will use some funds to contract specialists in the area of bereavement and grief to strengthen the capacity of carers at all levels.

ACTIVITY 3: Establishment of a referral process

The partner will establish a referral process for services that employs the "household-centered approach" that links OVC families with other critical services that include PMTCT, care and support, treatment, palliative care, etc.

ACTIVITY 4: Gender mainstreaming

The partner will implement gender interventions that address the priority gender issues affecting OVC care in the target area.

The major components of this program are: a) capacity building in OVC program design and implementation; b) collaboration and coordination with government and other services/programs for the provision of quality care and support to OVC; 3) effective monitoring and evaluation and 4) gender mainstreaming.

These activities are directly aligned to the South Africa Department of Social Development (DOSD) strategic priorities for OVC in its national plan of action for OVC. Strategy one seeks to strengthen the capacity of families to provide essential care and support for OVC. Strategy two seeks to mobilize communities to care for OVC.

Activities will be aligned with the Department of Social Development's Policy Framework on OVC and the OVC National Plan of Action and the SAG's HIV & AIDS and STI National Strategic Plan (NSP) 2007-2011 and other government responses related to meeting the needs of children affected by HIV and AIDS. The new partner will also explore co-funding opportunities with DOSD, other donors and the private sector where possible.

SUMMARY: The Salvation Army will provide OVC with a comprehensive range of services through the establishment of OVC Support Centers, which will offer psychosocial support, access to government grants for eligible OVC, school fee exemption, and referrals to other service providers such as social workers. Through leveraging community resources, trained community members will also facilitate access to feeding schemes and educational support (including assistance with uniforms and school materials). The major and minor emphasis area for this activity is training and building the capacity of the volunteer caregivers to respond more effectively to the needs of the OVC, community mobilization/participation and the

Activity Narrative: development of networks, linkages and referral systems. Key target populations are OVC, families affected by HIV and AIDS, caregivers and volunteers.

BACKGROUND:

The Salvation Army is an international Christian denomination with specific community programs to address all aspects of HIV and AIDS through community-based care and prevention programming including home-based care, psychosocial support for OVC, individualized pre- and post-test counseling, clinical care for opportunistic infections, community counseling, and youth mobilization. Salvation Army developed Matsoho A Thuso, a care and prevention model in November 2004 with PEPFAR funding. This model includes care and support activities for OVC in accordance with South African Government (SAG) OVC policy. Salvation Army works to capacitate communities to care for OVC through training volunteers, offering outreach services and mobilizing community resources. The project currently operates in 70 sites in eight of South Africa's nine provinces, many of which are in rural and underserved areas. In FY 2007 Salvation Army will intensify and enhance OVC care and support activities through training new caregivers as well as retraining existing caregivers on a range of care and support services for OVC and their families.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

To respond to the needs of OVC, The Salvation Army has developed a training course for its community networks to establish and strengthen services for OVC. Volunteers attend a 5-day training course based on a collection of resources used practically in the field to equip them with skills to employ child-friendly interactive methodologies to identify and support OVC and to set up OVC Support Centers in their communities, providing children with a range of support services. The collection of resources that will be used includes practical exercises which cover the following topics: defining and identifying OVC, practical skills for care and support, establishing and managing an OVC support center, understanding and accessing the SAG social support system, and basic monitoring and evaluation. Community volunteers are identified and profiled from local congregations and return to serve their communities after training increasing community support for OVC. Community volunteers will be provided with ongoing, on-site support and mentorship by skilled program staff. In the period ending June 2006, 85 volunteers were trained as OVC caregivers. In FY 2007 the Salvation Army will train additional caregivers to expand service delivery and enhance the quality of care provided through intensive supervision.

ACTIVITY 2: Establishment of OVC Support Centers

This activity involves the establishment of OVC Support Centers in communities where The Salvation Army already has a presence. Through extensive outreach to churches, community leaders and networks, community volunteers will inform the community of the establishment of the OVC Support Center and its services. As a result of this outreach, OVC will come to the OVC Support Center where their needs will be assessed and documented. OVC will then be provided with a comprehensive range of services based on each child's individual needs that include, but are not limited to, psychosocial support (primarily through child-friendly participatory approaches), building resilience, life skills and assistance in accessing SAG social support systems (including HIV prevention advocacy on behalf of OVC and their families). Volunteers will also negotiate with schools to help OVC obtain school-fee exemptions to ensure OVC have access to education. In addition, OVC will be linked to existing community resources for the provision of food, school uniforms and supplies. All outreach activities will be sensitive to gender and will address gender issues that arise in the equity of access to services through the routine monitoring of service data. Any imbalances detected will be addressed. In the period ending June 2006, Salvation Army provided services to just over 2000 OVC. FY 2007 funding will be used to intensify and enhance OVC services. Salvation Army will facilitate the referral system to ensure that the OVC have access to health and treatment services.

ACTIVITY 3: Establishment of referral networks and linkages

When volunteers identify cases they are not equipped to deal with, referrals will be made to relevant service providers such as child protection services, health care providers and social workers. The Salvation Army will form linkages and partnerships with existing specialized service providers such as social workers, police, child protection units and child health systems to improve and/or increase access to such services as well as to public and private institutions providing pediatric ARV treatment and services for HIV-infected children. Through utilizing established networks (such as women's groups, study groups, and Sunday School programs) and private and public sector partnerships, the Salvation Army will be able to access other community resources to further enhance OVC outreach initiatives. Reports on activities and data will be routinely forwarded to the local Departments of Social Development to share data and information contributing to national statistics of the OVC profiles the country and leveraging more support and resources for the OVC. This will improve the quality of service delivery and the services rendered and ensure that the program is in line with SAG policy, guidelines and priorities. With the incorporation of Abaqulusi child survival program and Community youth and OVC response into Matsoho A Thuso, attention will be given to documenting the best practices from their way of working and try and replicate them in other service hubs. Wherever feasible, The Salvation Army will retain the knowledge and services of the staff and volunteers associated with the Abaqulusi Child Survival program Northern KwaZulu-Natal and Western Cape Community Youth and OVC response program.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 10550.09	Mechanism: N/A
Prime Partner: Woz'obona	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 8256.23896.09	Planned Funds: \$266,999
Activity System ID: 23896	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1:

Woz'obona (formerly the Sekhukhune Educare Project) will strengthen the capacity of 933 family units to care for OVC through using household-centered approaches. This will be achieved through the introduction of Caregivers Support Groups (CGSG) in each village (1CGSG/Village) to reinforce the ability of families with OVC to improve, increase and enhance care provided by family members. This activity aims to further position the family as the unit of care for OVC, prioritizing its place within the continuum of care. Thus, Woz'obona will form support groups for carers that will serve as mechanisms to provide social support such as information, advice, material, and emotional support to carers. These support groups will also be a place where infected and affected parents and caregivers can be linked/referred to such services as palliative care, ART, PMTCT, and counseling and testing by child care workers. Emphasis will be placed on establishing a referral system, where referrals are tracked and monitored for completion.

Activity 1 will also be enhanced through strengthening existing child care forums (CCF) to improve the coordination of care among local HIV and AIDS-related service providers. To improve the functioning of these CCFs, Woz'obona will continue to provide administrative, logistical, program and technical support, to the CCFs. Woz'obona will encourage the CCF to identify and recruit more representatives of diverse community-based health and social services (family, community, schools, civil society, government and business sector) to participate in the CCF to improve formal referral networks within the Forum, promote coordination, and the provision of effective /comprehensive child centered services. Woz'obona will ensure that children are represented and actively participate in these CCFs.

ACTIVITY 4:

To improve the quality of psychosocial support services (PSS) provided to OVC, Woz'obona will receive training and support from the Sinomlando Centre for Oral History and Memory Work covering modules in memory work and psychosocial support for children, counseling, HIV and AIDS, Play Skills, Interview Skills and CBO Management.

The Sinomlando Memory Work model structures PSS provided to OVC in a systematic way. This evidence-based approach attempts to address the PSS needs of OVC thorough oral history. This will improve the participation of children in the decision making processes of households in relation to the children's care and inheritance.

Children residing in child and youth-headed households continue to be at a greater risk of HIV infection and negatively impacted by HIV and AIDS. Woz'obona will address this problem through the provision of PSS with a special focus on marginalized OVC sub-groups such as child and youth-headed households, and young girls vulnerable to early pregnancies and cross generational sex. Woz'obona will design and implement educational interventions specifically targeting this high-risk group. The ultimate goals are to empower young girls to delay sexual debut and reduce cross-generational sex, and positively influence male sexual behavior.

To further enhance this activity, referrals and linkages to other service providers will be promoted to afford young pregnant girls and their partners a comprehensive package of services. Woz'obona will focus on young pregnant girls who do not have support from their families and lack information on how to deal with unplanned/or unwanted pregnancies and absent or lack of support from their partner. To support these vulnerable children, Woz'obona will create an environment in which girls and boys will receive counseling, awareness and referral to various services available. The aim is to help these children cope with the prevailing situation.

ACTIVITY 6:

This activity will aim to reach disabled children who are marginalized due to their disabilities and often due to their vulnerability to HIV and AIDS as well. The goal is to address the material, emotional and social needs of disabled children and their caregivers residing in the program area. The use of Disability Resource Boxes is an innovative approach that has proved to be highly effective; this will be coupled with the provision of physiotherapy, by caregivers who have been trained by Woz'obona Child Care Workers, who will have received training from the National Alliance of Child Care Workers (NACCW).

SUMMARY:

Sekhukhune Educare Project (SEP), is a Limpopo-based non-governmental organization (NGO) that provides psychosocial, educational and nutritional support to orphaned and vulnerable children (OVC) and facilitates increased access to social security grants and other social services. SEP identifies and trains community members as child care volunteers, building their capacity to provide direct care and support to OVC. The primary emphasis area for these activities is human capacity development (training). Target populations include orphans and vulnerable children, caregivers, people living with HIV and AIDS. SEP integrates OVC and home-based care (HBC) work through a home visit system, where caregivers identify and supply services for both adults and children. Children then receive some additional services outside the home through Child Support Groups and Theatre. SEP does not provide food, except in emergency situations. SEP assists with food security through grant access, household budget training and follow-up, gardens and provides referrals for food parcels from the South African Government. Through an ongoing reflection/action process SEP asks questions about community ownership and sustainability. This process helps Sekhukhune to improve the safety nets for children model, which provides a range of services for vulnerable children and their families, including training, child support groups, grants access, etc.

BACKGROUND:

Activity Narrative: SEP works in Limpopo, one of the poorest provinces in South Africa with an HIV prevalence rate of 21.5 percent. In Makhuduthamaga Municipality, where SEP operates 52% of the population is unemployed (census 2001), 44% have not had schooling and only 11% have matriculated.

SEP will continue to work closely with Child Care Forums (CCFs), government departments, schools and the local municipalities to raise awareness about the impact of HIV and AIDS on children and their families and encourages communities to find their own solutions for OVC who need care. CCFs are community-based structures focusing on the needs of OVC. The role of the CCF is to ensure the identification of OVC, to be aware of initiatives involving child care and support, to create awareness of OVC issues, to assess OVC needs, to liaise with other community-driven initiatives focused on children and to perform advocacy for OVC in the community. CCFs are a vital component for sustainability of OVC programs and community involvement in ensuring that the needs of OVC are addressed. SEP will partner with the Local AIDS Council and encourages key local players to actively participate and support OVC in the Limpopo province. With PEPFAR funding through the Nelson Mandela Children's Fund, SEP has delivered care and support services to over 1,500 OVC in the past two years. SEP used to be a sub-partner under the Nelson Mandela Children's Fund program which ended in FY 2006. SEP has a cadre of 70 trained caregivers providing services to OVC in the Sekhukhune district.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: OVC Support

With FY 2008 PEPFAR funding, SEP will continue to provide intensive care and support services for OVC including individual needs assessments for each OVC, psychosocial and nutritional counseling, homework assistance, play group therapy at the resource centers, and training in home-based care, counseling, child development, community development, mapping, keyhole gardening and psychosocial support. During home visits, SEP child care volunteers conduct individual OVC needs assessment and provide counseling and guidance on nutrition, hygiene and appropriate child protection guidance. OVC support, referrals, and household and family support will be provided by the child care volunteers when they identify a household with an ill parent. SEP child care volunteers will also provide homework assistance and support to ensure that OVC stay in school. SEP child care volunteers will continue to provide support to obtain legal documentation such as birth and death certificates to assist OVC to access government social security grants. For OVC who cannot afford school fees and uniforms, SEP child care volunteers will assist with school fee exemption applications and will ensure that OVC have the necessary school uniforms, school shoes and stationery. SEP will strengthen its partnership with a local SCORE Supermarket, to provide food vouchers for OVC who need emergency food assistance.

One-day workshops will be held in villages to assist OVC households with budgeting skills to provide OVC households with the skills needed to efficiently utilize their social security income to meet long- and short-term needs of OVC. OVC households are also provided with training to establish and cultivate food gardens to improve the nutritional content of the meals for OVC and their families. SEP will provide training and will act as the secretariat for the CCFs and the local municipality in monitoring and reporting on OVC issues in the community. Feedback will be used to improve service delivery and strengthen coordination of services.

ACTIVITY 2: Human Capacity Development

SEP will provide training to its child care volunteers on counseling, needs assessment, referrals, child rights, child protection and the special needs of the girl and boy child. Child care volunteers are also trained as home-based care providers. In FY 2008, PEPFAR funds will be used to provide the Government's 49 days of training for home-based care (HBC) which is the South African Government standard HBC training program. These trainings are conducted by the Department of Social Development (DOSD) which has a tailor-made Home-Based Care (HBC) module. Training is also provided to SEP volunteers by another PEPFAR partner, the Hospice and Palliative Care Association. This training covers the topics of child care, child rights, and other useful modules that relate to palliative care.

SEP will provide HIV prevention messages to all primary schools in its district. The South African Police Service also conducts gender sensitivity training for SEP child care volunteers.

ACTIVITY 3: Home-Based Care (HBC) for OVC

HBC is provided for OVC who are ill and the affected household will be assisted in managing the child's illness. SEP will train home-based caregivers to provide these services. Households with OVC who are sick are visited once per week and more often if necessary. For OVC and the families that are terminally ill, visits are done on a daily basis. In order to sustain HBC for OVC, strong linkages have been established with the local hospitals and clinics. OVC are referred to SEP from the hospitals and vice versa.

ACTIVITY 4: Psychosocial Support

SEP child care volunteers will identify and provide OVC with psychosocial support and these children will receive advanced psychosocial support and follow-up. The SEP psychosocial support program will address coping skills, self-esteem issues, memory work, family trees, and spirituality. SEP will also establish child support groups which will provide among other things, healthy and appropriate recreation activities for OVC. This will be done in partnership with community groups, churches and schools. Safe spaces will be identified for these groups to meet on a biweekly basis. SEP will use community theatre techniques to increase the resilience and confidence of children. Children who have participated in the theatre activities have an opportunity to act out or dramatize their experiences, challenges, frustrations and angers and it also has provided OVC with an opportunity to search for solutions to the challenges they face. The plays focus on gender issues and provide an opportunity to sensitize the community and the children to gender-related problems and solutions. In FY 2008, PEPFAR funds will be used to facilitate theatre camps and expose children to visual art and dance. For those children who live too far from the Ikageng Dishaba Theatre, SEP partners with these select primary and secondary schools to arrange theatre activities at the

Activity Narrative: local school. During these theatre activities, participation of the child is encouraged and children are given the opportunity to lead activities.

ACTIVITY 5: Keyhole gardens

Sekhukhune is affected by drought and lack of water is a big issue. Shortage of water combined with challenges encountered with community gardens, has led SEP to use keyhole gardens within household premises. Keyhole gardens are small and use recycled waste water from the household. SEP will also investigate the use of drip irrigation. Keyhole gardening techniques will be facilitated by the child care volunteers who will receive training. Disused boreholes will be investigated, and made productive again through Play Pumps and other providers with necessary expertise to rehabilitate unused boreholes. The SEP partnership with the Department of Agriculture will be used to provide seeds and equipment, where necessary.

ACTIVITY 6: Children with disabilities

A community assessment/mapping exercise will assist us to identify disabled children. SEP will also map what services/resources already exist and develop relationships/partnerships with other institutions for referral and resources. Disabled children will receive both home and other community services, offered through child support groups.

ACTIVITY 7: Early Childhood Development (ECD) Teacher training for preschools

SEP offers ETDP-SETA accredited ECD training for preschool teachers. The training covers good health and safety practices, active learning for children, making equipment and learning resources and activities for children, working with families, and management of a preschool. One group of 25 practitioners will be trained.

Planned Funds: ██████████

Activity Narrative: SUMMARY:

This is a new activity in FY 2009. In collaboration with the South African Department of Social Development (DOSD), PEPFAR funds will be used to co-fund activities that support the protection and care of OVC. This activity will focus co-funding and supporting programs that the DOSD would like to scale up as well as activities that encourage and entrench collaboration between partners across the entire spectrum of service areas.

A service provider to implement this activity will be selected in October 2009. USAID will expand its collaboration and partnering with the South Africa Department of Social Development in areas that promote the well-being of OVC in the country and will seek to co-fund activities that support the protection and care of OVC, with the goal being a defined area of cooperation and co-funding scale up activities in the OVC arena.

BACKGROUND:

In 2008, the USG has collaborated with the DOSD in providing assistance in the development of an effective monitoring plan to develop indicators to measure progress being made under the National Action Plan and to identify opportunities for improvement particularly related to the Children's Act and objectives related to OVC.

ACTIVITIES AND EXPECTED RESULTS:

PEPFAR support to the DOSD will include:

- Technical Assistance to update the five-year National Action Plan which will need to be updated in 2009 for the next five year period. Once the 2009-2014 National Action Plan is developed PEPFAR will review the activities that would be most appropriate for co-funding to scale up successful models of care for OVC.

- Exploring opportunities for co-funding programs and technical activities. Specifically PEPFAR and DOSD co-funded and review models of care and best practice programs for lessons learned and national endorsement of effective models of care that can be replicated or scaled up.

- Continuation of technical, training and consultative support in the areas of Monitoring and Evaluation of OVC programs and assistance to the DOSD to strengthen the DOSD OVC Strategic Plan and Child Protection issues.

- Providing TA and consultation on increasing the number of OVC receiving grants, benefits and social services at the local areas.

- Assist with assuring that appropriate information is available for OVC policy makers (e.g. studies, assessments, and research).

- Continuation of efforts to develop an OVC Quality Improvement Program for OVC service in South Africa. This support may include funding for stakeholders forums, workshops, etc. in an effort to obtain broad based participation, input and feedback for identifying the most effective action steps and interventions to develop National Quality Standards for the protection, care and support of orphans and vulnerable children.

- Human capacity development in the area of monitoring and evaluation of the National Action Plan of OVC. This will include providing skilled technical assistance for short and long term time periods to provide mentoring and on the job skills sharing for DOSD staff. This may also include providing support to ensure that sex-disaggregated targets for all reporting indicators on the National Action Plan are available.

- Assist the DOSD to develop a gender strategic planning process to ensure that gender considerations are integral to the OVC National Action Plan. Likely support may include a gender assessment of the national DOSD OVC programs, workshops to share results and resulting recommendations.

- Gender Integration workshop to provide OVC program managers with tools to integrate gender into their programs.

The activities are aligned with the improvement of the quality of the OVC programs in South Africa. In addition, the goal will be to strengthen of capacity of the DOSD staff. The activities will be in line with the harmonizing of support to the Department's Policy Framework on OVC and the National Action Plan for OVC and the South Africa Government's HIV & AIDS and STI National Strategic Plan (NSP) 2007-2011 and other government guidelines related to meeting the needs of children affected by HIV and AIDS. The proposed activities also support government's efforts to develop policies, strategies and programs on integrating services for orphan and vulnerable children. PEPFAR will support the DOSD to ensure that gender integration is central to the support provided to DOSD. The gender priorities that will be addressed are: increasing gender equity in HIV and AIDS programs and increasing women's legal rights.

This support will be aligned to achieve the objective of several South African policy frameworks, including the HIV&AIDS and STI National Strategic Plan 2007-2011, the National Action Plan for OVC and Other Children Made Vulnerable by HIV and AIDS (NAPOVC), the National Guidelines for Social Services to Children Infected and Affected by HIV/AIDS and is rooted in conducting all activities in line with the new Children's Act (CA). This activity will contribute to the PEPFAR goal of providing care and support to 10 million HIV-affected individuals, including OVC. In addition it will contribute to the PEPFAR objective of strengthening local and national structures to provide long term responses to reaching the most vulnerable OVC with quality services and coordinated care.

Mechanism: Population Council

USG Agency: U.S. Agency for International Development

Program Area: Care: OVC

Program Budget Code: 13

Planned Funds: \$485,452

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Due to the lack of connectivity or access to internet it will be important to provide an alternative method of accessing the database for service providers who suffer such constraints. An SMS text service is proposed to enable specific choices to be identified for a specific area.

PC will continue to develop the database to its fullest extent and will work with key stakeholders such as the Department of Social Development (DOSD) and DOE to ensure that caregivers of OVC are informed about and given access to the database.

Monitoring and Evaluation:

The OVC policy and guidelines include indicators that should be collected to ensure that the implementation of relevant activities is effective. PC will review the project tools for monitoring the project indicators to ensure that the correct data is being captured and recorded correctly. Continued communication with key stakeholders will also ensure broader strategic use of the directory.

PC will conduct training to ensure the successful transfer of the database and its maintenance to a local partner. Documentation, models and manuals as well as appropriate instruction will be provided so that the partner is fully informed of regular input and maintenance activities and is aware of how to anticipate the scope of possible areas of concern. Specific areas of training would include, but not be limited to, the design of the database, physical data model, configuration management, database maintenance, and support utilities.

SUMMARY:

In collaboration with the South African government (SAG), FY 2008 PEPFAR funds will be used to support a service availability mapping exercise that will allow organizations to be able to locate all necessary HIV and AIDS related services they may need in order to strengthen their own care and treatment service delivery. This service availability mapping exercise of districts and sub-districts will assist home-based caregivers, volunteers, community-based organizations, faith-based organizations and public health facilities to provide referrals efficiently in order for clients to access services closest to their household. USAID/South Africa recognizes the need to be aware of available services and resources in order to identify gaps, avoid duplication and to maximize collaboration and linkages with other stakeholders and partners. This activity will include mapping of the essential services available from the South African Government, for example Home Affairs for birth certificates and identification documents, legal-aid centers for land disputes and inheritance issues, Social Development for access to grants, Rape Centers for access to post exposure prophylaxis (PEP), and ART treatment sites for access to pediatric and adult treatment, etc. Mapping provides a means of organizing local knowledge through the common language of geography and visual representation. Through a participatory process, local knowledge can be gathered, integrated, represented, and shared. Maps can then act as a basis for community discussion, empowerment, and decision-making. A service provider to implement this activity will be selected in October 2007.

Primary emphasis will be on local capacity building and the development of network referrals and Information, Education and Communication. The final product, a directory of services, will be used widely both by PEPFAR supported partners as well as the SAG and other organizations that provide HIV and AIDS services in South Africa. This booklet will be shared widely through the HIV and AIDS networks and forums in South Africa.

The primary target populations for the intervention include OVC, people living with HIV and AIDS and the general population aged over 25 years.

BACKGROUND:

The South Africa PEPFAR program embarked on a geographical information systems (GIS) mapping activity in FY 2005. These maps have proven a valuable tool for planning and coordinating activities within and across partners. However, to date, these maps only show PEPFAR supported services, as well as SAG ART services. The USG Team would like to take this mapping down to a community level to improve service delivery on the ground. This activity will strengthen referrals and linkages between government departments, NGOs, civil society groups and HIV and AIDS service providers through sharing and dissemination of information on the availability and location of essential services in South Africa.

ACTIVITIES AND EXPECTED RESULTS:

A directory of organizations providing HIV and AIDS related services in South Africa will provide a useful guide to the many agencies and organizations working to address the critical challenges faced by HIV and AIDS in South Africa. There is a need for a comprehensive database of organizations working with and for HIV-infected and affected individuals in South Africa. In 2001 a directory of Child HIV and AIDS services was published by the Department of Social Development in collaboration with Save UK and UNICEF. In addition, service availability mapping was completed in the Eastern Cape province during the former USAID equity project. These directories are now out of date, however they will be used as the starting point to establish a district map of the services and key service providers will be added. The availability mapping exercise will inform all those concerned about HIV and AIDS, especially the partners funded by PEPFAR, of the various services and initiatives available to assist them and to strengthen their efforts to support HIV-infected individuals and their families. This directory will be user-friendly and will facilitate smooth referrals and encourage linkages. The service directory will also enable organizations to better utilize services that are available, facilitate new partnerships to address the gaps in service delivery and encourage a multi-agency approach to assisting individual infected by HIV, their families and their communities. This activity would begin in three of the provinces and will then be replicated in all nine provinces of South Africa. In addition, this directory will be linked to GIS data points for more interactive usage of the directory and to

Activity Narrative: produce various maps.

This activity will contribute to the success of the following objectives of the SAG's National Strategic Plan; to develop and implement mechanisms to identify, track and link OVC and child-headed households to grants, benefits and social services at local levels and to increase the proportion of vulnerable children accessing social grants, benefits and services.

Activity System ID: 24489

Mechanism: NPI

USG Agency: U.S. Agency for International Development

Program Area: Care: OVC

Program Budget Code: 13

Planned Funds: \$0

Activity Narrative: SUMMARY:

Mfesane has a responding teams at two sites providing a comprehensive package of support and care for households with OVC and the children themselves. This has been in partnership with the nationally recognized National Association of Child Care Workers (NACCW) Isibindi program, which is PEPFAR South Africa-supported. This operates as a social franchise - NACCW trains, supports and monitors the childcare workers to receive an accredited national qualification; while Mfesane provides local coordination and management.

The child care workers each provide personal support to up to twenty specific children and their households, including counseling, life skills, guidance on household maintenance, assistance accessing social grants and acting as their advocate.

The delivery package of comprehensive services includes parenting and psychosocial care and support to guardians through counseling and bereavement, the social security needs of the children will be address, regarding their basic rights to be safe, assist in the applications of identity books and birth certificates and addressing their educational needs. Mfesane is currently caring for 250 OVC through the existing teams. According to NACCW guidelines, these teams should be able to increase the number of OVC they support to about 500. Together with the local authorities, Mfesane will establish an additional team in a different community at the start of the new programme. This will again be in partnership, with NACCW providing training, support and quality monitoring.

BACKGROUND:

Woord en Daad, a Dutch faith-based organization, will work through its long-standing South African partner organization, Mfesane, to provide quality prevention, counseling and testing, and care services to members of communities in two distinct municipalities: Saldanha Bay in the Western Cape, and Nelson Mandela Bay in the Eastern Cape. Mfesane will target informal settlements and other communities where people are at high risk of infection, socially dislocated and underserved by government services. The two programs will stand alone, but learn from each other, building upon Mfesane's engagement with communities and government, local structures including churches and schools and experience in responding to HIV/AIDS. In Saldanha Municipality Bay (SBM), Woord en Daad will support Mfesane to scale up the already existing programme through starting up additional programs - peer education in schools and mobilizing churches to complement its existing services providing counseling and testing, care for PLHIV, and care of OVC. In Nelson Mandela Bay (NMB), Mfesane has several years of experience. Previously Mfesane worked through coaching Thandi Youth Organisation for 3 years to consolidate its home-based care, and peer education. The Mfesane program will be set up to further scale up the response through directly providing services in Greenfield, a new informal settlement.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Recruit OVC Child and Youth Care Workers

There are 39 workers active and 13 others will be recruited. This will be done October - November 2009.

ACTIVITY 2: Human Capacity Development

The new Child and Youth Care Workers (CYCWs) will be trained by NACCW according to accredited course, in 14 modules over a period of 2 years. There are also specific courses e.g. on disability. Debriefing sessions are held every second month for the CYCWs, and there are 2 teambuilding sessions per year.

ACTIVITY 3: Implement Package of Comprehensive Care Services

When starting in the new area, Woord en Daad will have public meetings, distribute pamphlets, do radio talks etc. in order that the community may get to know them. It is particularly important that the schools, churches and other NGOs get to know them. The activity is done in addition to and cooperation with the local Government Social Services. Children are referred to the program by the Government Social Service and by other activities, e.g. HBC or schools. The child care workers also go into the communities, find the children on the streets or go door to door and identify the situation.

Woord en Daad's package consists of:

- psychosocial care and support (bereavement counseling, memory books)
- education support: (registering them in the schools, school uniforms, help them with grant, link to temporary nutrition program if needed, homework support)
- social security assistance: basic rights to be safe, assist with ID documents and birth certificates, immunization, link to clinics. Children who lost one or both parents are vulnerable, and also if parents abuse alcohol or if there is physical abuse.
- To decrease dependency, parenting and psychosocial care and support will be provided to guardians, single parents through counseling and bereavement support by a HIV trained counselor and or psychologist and or spiritual leaders. This will happen individually for the families who need this support and help. Sessions will be presented to parents/guardians to strengthen their parenting skills in rearing and supporting the children. This will take place in the community to groups of 15-20 parents times six sessions over a period of two months. St. John College is an existing service provider of Mfesane through them this service will be rendered.
- Referrals, networking and linkages: Training and monitoring is provided by NACCW. Department of Social Development will act as formal reference point for children who need this. There is a link with police stations because in case of abuse, Woord en Daad will report it to the police. Linkages will be there with churches to provide spiritual and deaconal support. If needed Woord en Daad will refer children to clinics for medical care. Link with local schools is important as they may refer to the partner and they may bring children to

Program Area: Care: OVC

Program Budget Code: 13

Planned Funds: \$776,724

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Child Welfare Tshwane (CWT) will be expanding their services to reach more OVC (400 new direct, 100 supplementary and 100 indirect services) and will be improving the quality of services. They will be increasing the quality of their service by introducing the issues discussed below.

Education: CWT will be introducing structured homework classes with the assistance of local schools. CWT has identified that OVC are not passing in the grade one and two levels. Care workers, students from University of Pretoria and teachers will be involved in these classes and sandwiches will be provided for the children. The classes will be held at three local schools. The progress of the children will be assessed through the school reports and educational assessments developed with the educators involved in the project.

Child Survival Activities: The health card system that has been implemented to monitor routine immunization in cooperation with the various medical clinics will be expanded to include the treatment of life threatening childhood illnesses as well as improved infant and young child feeding to those OVC identified by the care workers. During the information days for parents/caregivers representatives from the clinics will be requested to place emphasis on the importance of the usage of safe water and hygiene. This issue will also be addressed during the holiday projects with OVC.

CWT will assess whether a savings and loans program for the members in this project is feasible and can be implemented so as to increase the women's access to income and productive resources.

CWT's OVC program is currently focused on the primary school aged child. However, in FY 2009, CWT will be looking to identify more adolescents (in secondary school) who are orphaned and vulnerable. CWT will work with local high schools in the identification of OVC in this age group with specific attention to girls. The care workers are well known and easily recognized in the community due to the identifying T-shirts they wear, and many children respond to them by asking for help and this assists CWT to identify the OVC in the community.

Vegetable gardens are established in the homes of OVC. The families are selected by the land available for a garden, the quality of the soil and the motivation of the family to sustain the garden. CWT develops the garden and trains a family member to maintain the garden. The care worker then includes the monitoring of the garden as part of her service to the family. A separate measuring tool has been developed to monitor the progress of the garden. These gardens can provide food for the family at a very low cost if they can sustain the garden. If there are excess vegetables these can be sold for an income. However, CWT's experience in the urban area is that there are no excess vegetables and the gardens are not seen as an economic strengthening opportunity. These gardens are the backbone to provide fresh, healthy food for the families.

Economic strengthening is a focus for the service to many families, mainly women and girls, that are affected by HIV and AIDS as well those infected with AIDS to prevent them becoming dependent on social security. CWT has an established beading project that has a detailed marketing plan and has been identified as a supplier to 2010 Soccer World Cup. This marketing plan ensures the sustainability of the project for the beneficiaries and where possible they bead by orders. The beneficiaries are selected from the OVC program and are PLHIV. They are trained how to bead and are paid for each item they complete. The profits from the sale of the items are placed back into the project to ensure sustainability. This provides an income for these families, however it develops the self esteem of the beaders - many of them have gone on to establish their own small business or find work on the open labor market. CWT will assess whether a savings and loans program for the members in this project is feasible and can be implemented.

CWT has established a plant propagation nursery that provides seedlings to commercial farmers. Project members were selected from the OVC families and PLHIV. They were trained in plant propagation. A shade cloth nursery was erected in an area provided to the project by the City Council of Tshwane, who also provides water and electricity to the nursery. The goal of this project is that the nursery should become a fully functioning independent business. Farmers have visited the project and committed themselves to buying plants from this project.

These activities have a proven track record and are essential to the success of the families CWT serve.

CWT makes a special effort to train their care workers to recognize signs of gender-based violence as well as sexual exploitation of women and children and in unsafe housing conditions and appropriate counseling and referral services are rendered. Male OVC are encouraged to act responsibly and respect female OVC and women and are encouraged to play a positive role in their community.

SUMMARY:

CompreCare, through its partnership with Child Welfare Tshwane (CWT), will identify and provide a holistic package of services to orphans and vulnerable children and their families. Program activities include nutrition, shelter, psychosocial, educational, economic and health care support for OVC as well as outreach and HIV prevention education. Primary target populations are orphans and vulnerable children (OVC), their care workers, and people living with HIV and AIDS. The primary emphasis is human capacity development.

BACKGROUND:

CompreCare is a South African non-governmental organization (NGO) implementing HIV and AIDS prevention and care activities under a multi-partner initiative called CHAMPS. The CHAMPS Initiative aims to reduce the impact of HIV and AIDS on OVC and their families in the Tshwane metropolitan area, specifically Mamelodi and Olievenhoutbosch, by raising awareness about HIV/AIDS preventative practices and through strengthening care and response networks for OVC.

Activity Narrative: In partnership with Child Welfare Tshwane, the largest service provider addressing the needs of OVC in the Tshwane metropolitan area, CompreCare recruits, trains and mentors care workers and facilitates increased access to education and government services for OVC. To date, PEPFAR funding has enabled CompreCare to train 76 care workers and service 2601 children with care and support services. Child Welfare Tshwane is a member of the South African Government local Department of Social Development Forum. This forum was created to strengthen linkages and networks between local government officials and NGO, CBO and FBO members in order to improve coordination between public and private service provider's programs. Child Welfare Tshwane has established a partnership with the Ford Motor Company which donates a facility for their wellness center. The Wellness Center offers a range of services to OVC and their families including; psychosocial services, prevention education, nutritional counseling and support, and income generation activities.

ACTIVITIES AND EXPECTED RESULTS:

CompreCare's OVC care and support program will focus on the early identification of infected and affected children and families and ensure that their basic needs (food, health care and education) are met. The program will conduct household needs assessments and link OVC and their care workers to the appropriate government and community services. Trained community care workers residing in the target areas enable CompreCare and its implementing partner to provide comprehensive and holistic care for OVC.

ACTIVITY 1: Training

CompreCare, in collaboration with their implementing partner, Child Welfare Tshwane, will offer a standardized OVC training and service package/strategy to train and support community care workers. The training is based on the Iso labantwana ("eye on the children") model that was originally developed by Child Welfare Cape Town. Child Welfare Tshwane has adapted the model to address the needs of children infected and affected by HIV and AIDS and has produced a manual for trained volunteers. The training is a 10 module course that emphasizes community-based approaches for the early identification and care and protection of vulnerable children. Care workers are recruited from the communities, in which they reside and provided with training in the following; basic HIV and AIDS information and prevention, child abuse and neglect, assessment counseling and resources, parenting skills, child care act, domestic violence and maintenance act, substance abuse, management and administration skills. Care workers will also be exposed to a value-based prevention program (accredited) so as to enable them to render a more comprehensive prevention education to the OVC and their families. Care workers will also be given the opportunity to be trained in basic first aid (accredited) which will enable them to more accurately assess the clinical needs of the OVC. CompreCare and Child Welfare Tshwane provide on site follow-up training and mentoring for all care workers. In addition, Child Welfare social and auxiliary social workers and M&E staff provide group counseling sessions for care workers to provide additional mentorship and support and to share best practices and lessons learned.

ACTIVITY 2: Care and Support Services

The program recruits care workers from target communities to ensure that care and support services are readily available to OVC. As a result, the program, as a whole, benefits as the care workers are often well-known and respected by community leaders. The CWT OVC care program already has a cadre of trained, experienced and active care workers. The focus will be to recruit and train new care workers who can then slot straight into the work with mentoring in place. The transition will be smoother and more effective. Already trained and active care workers will be exposed to a continuous program of retraining and so expanding their capacity to render a more comprehensive service and also to improve the quality of the service rendered. Care workers are well positioned to easily access the services of other community groups and service providers including schools, churches, and community care forums. Each care worker reports to and receives ongoing support from a Child Welfare Tshwane social worker and M&E Officer. When a family is identified, the care workers complete an initial assessment and develop a plan of action in collaboration with the social worker for each child and their family. The plan of action details the type of assistance required by the OVC which includes obtaining identity documents and government social grants, household budgeting, and distribution of food parcels and establishment of food gardens (made possible through public and private donations). Care workers provide these services during weekly home visits. Additionally, care workers provide educational and psychosocial support including school fee exemptions, homework supervision, care for ill parents/caregiver, succession planning and bereavement counseling for OVC and their family members. When circumstances exist that require advanced or intensive support, such as health related issues and child abuse, care workers refer OVC to the appropriate service provider and follow-up to ensure that the relevant services are provided and that the continuum of care continues for each child. CWT already offers a comprehensive range of services that are based on the needs of the clients. More emphasis will be placed onto income generation opportunities and vocational guidance as OVC coming through the education system are struggling to find employment. The income generation opportunities will be made economically viable and sustainable.

ACTIVITY 3: Community Wellness Center

In addition to providing home-based support services, Child Welfare Tshwane also manages a community wellness center that provides care services, five days a week, for OVC and their families. The center operates a 12 -month intensive therapeutic program that includes individual and group support sessions to provide information on HIV and AIDS and build coping skills for OVC and their ill caregivers. A full-time social worker and community volunteers provide OVC with psychosocial support, referrals to social services and on going training and mentoring to start income generation activities e.g. beading. The program also offers life skills training for OVC, tailored to the specific needs of the child and includes HIV and AIDS prevention. Life skills courses are provided through after-school activities, school holiday programs and group play therapy.

Activity Narrative: ACTIVITY 4: Linkages

CompreCare and its implementing partner, HospiVision, train care workers in value-based HIV prevention emphasizing abstinence and fidelity. The program focuses on six central spiritual values (respect, responsibility, integrity, fairness, love and service) and enhancing the life skills of: decision-making, assertiveness and negotiation. The training also addresses issues of stigma and discrimination and gender through role play. Skills learned in the program empower care workers to further support OVC with knowledge, skills and attitudes to make informed decisions about living healthy, productive lives. As the CWT program is in an urban setting a comprehensive network of referrals is in place and CWT has a leading role in this network. CWT has a particularly strong relationship in the health sector and so are able to ensure that their clients receive the required care and treatment. These linkages will be further strengthened so as to improve care received by the OVC. USG's contact with the Department of Home Affairs who assist CompreCare with applications for birth certificates and identity documents is increasing and this will be further addressed. This will contribute a great deal to the economic strengthening of the OVC and their families as well as education.

Regarding expansion of FY 2008 COP activities, currently the OVC care program's main focus is on Mamelodi and Olievenhoutsbosch - based on the greatest needs and under resourced areas. However, the program will be expanded to other CWT sites in the Tshwane area. These sites are Sunnyside, Mid City, Atteridgeville, Eersterust and Centurion - these will become the focus for the expansion of CompreCare services.

Budget Code: HKID

Program Budget Code: 13

Activity ID: 12514.22882.09

Planned Funds: \$1,883,555

Activity System ID: 22882

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Human Capacity Development:

Pact's primary focus in implementing the Umbrella Grant Management Program (UGM) is the development of human capacity in South African NGOs and CBOs to promote the establishment and strengthening of viable and sustainable civil society organizations. However, the COP guidance is very specific in terms of what can be included in Human Capacity Development (HCD) and for this reason Pact will only address the Leadership and Management development aspects of the UGM HCD activities.

Prior to the signing of grant agreements, Pact provides extensive assistance to partner organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact emphasizes to management staff during this process the importance of ensuring that program and finance units work as a team rather than in isolation. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of management to diversify their funding base and ensure sustainability.

Pact conducts organizational capacity assessments in collaboration with each partner. The core methodologies used in all of Pact's capacity building activities are as follows: assessment of sub-recipient organizational and technical capacity, development of institutional strengthening plans, delivering capacity building services, reassessment and refinement of institutional strengthening plans (ISP). Several individuals from partner organizations participate in the assessments in order to ensure that feedback is obtained from staff at all levels. This process develops the skills of senior management to objectively assess organizational strengths and weaknesses and utilize the results to develop a realistic strategy that will ensure that organizational objectives are achieved (including retention strategies for staff) and identified gaps are addressed. The strategy also details what interventions and support will be provided, by whom, when and how organizational change will be measured.

Pact also conducts workshops that primarily target senior management and board members. A resource mobilization course is offered annually to provide information to partner organizations on sources and strategies for diversifying their funding base. One day of the three day-workshop is devoted to developing the skills of participants in writing proposals. Board training is also offered annually to address issues related to fiduciary, legal and ethical roles and responsibilities of board members. Although Pact's Monitoring and Evaluation course targets M&E and Program staff, senior management members of partners organizations are encouraged to attend in order to ensure that they understand how to utilize data to make organizational decisions.

Pact, in working with partner organizations over the course of the past four years has recognized that management skills among the leadership of many of the CSOs need to be further developed. For this reason, utilizing FY 2008 and 2009 funding, Pact will identify short term management courses in South Africa that will enhance leadership and management skills. Attendance to leadership courses will be made available to all partner organizations and their sub recipients but will primarily target the partners that have experienced great difficulty in transitioning to the increased funding levels or have new management staff and structures.

Alignment with South Africa's National Strategic Plan (NSP) or other SAG policies or plans:

In developing program descriptions with partners, Pact ensures that activities are aligned with District and Provincial business plans, the NSP and/or other SAG policies or plans.

Gender:

Pact ensures that gender-related activities are clearly articulated in partner's program descriptions and implementation plans. Programmatic and technical assistance provided to partners addresses gender issues as part of the assessments and recommendations for strengthening technical and organizational capacity.

SUMMARY:

Pact's Rapid Response for HIV/AIDS in South Africa is an umbrella grant mechanism for USAID PEPFAR grants identified through a USG interagency competitive process. Pact's primary goal is to build sustainable institutional capacity and increase the effectiveness of local partners to achieve expanded and quality services. Primary target populations include Non-Governmental Organizations (NGOs), Private Voluntary Organizations (PVOs), and Faith-Based Organizations (FBOs). Pact's major emphasis is the enhancement of local sub-partner capacity through the development and implementation of documented organizational systems and procedures and human capacity development at management and operational levels.

BACKGROUND:

Since 2004, Pact has facilitated the efficient flow of grant funds during the rapid scale-up of the PEPFAR South Africa program. Pact provides PEPFAR funding and assistance to over 30 total PEPFAR partners and sub partners in South Africa playing valuable roles in the fight against HIV/AIDS.

Grants to OVC partners support a range of best practices for orphan care using a variety of models of service delivery and working in coordination with the South African Government. During their partnership with PEPFAR, Pact OVC partners will significantly increase their reach. This scale up will require strong financial, monitoring & evaluation, and management systems to accommodate their growth and maximize sustainability. Pact conducts technical assessments of OVC partners and sources the assistance required to address any gaps in service delivery. In FY 2008, Pact will continue to provide capacity building support

Activity Narrative: to all OVC partners through training and mentoring. In addition, Pact will facilitate the sharing of established systems between emerging and well-established partners to further support enhanced and expanded networks of care.

Pact supports 11 PEPFAR partners providing care and support services to over 60,000 orphans and vulnerable children (OVC) in South Africa. Active in all nine provinces, these partners identify and train caregivers, establish community care centers and provide psychosocial and educational support. Ongoing efforts to secure identification documents, social grants, increased access to education and protection from abuse and exploitation have resulted in improved livelihoods for vulnerable children.

ACTIVITY 1: Grant Management

Pact conducts a participatory assessment of each partner organization and collaboratively develops an organizational capacity building strategy that details planned interventions. These assessment results also inform Pact of what type of assistance must be provided urgently in order to ensure that the organizations comply with USAID rules and regulations.

Prior to the signing of grant agreements, Pact provides extensive assistance to organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact assists partners in developing realistic cost share levels and emphasizes the sustainability aspect of this requirement. After the signing of the agreement, Pact works with each partner in developing a very detailed annual work plan that includes specific activities to be implemented, timelines, budgeted amounts, target beneficiaries and projected reach. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of partner organizations to diversify their funding base and ensure sustainability.

ACTIVITY 2: Human Capacity and NGO Development

Pact has developed a customized training series to orient new partners and their sub partners. The training series includes basic and advanced grants and sub grant management which addresses USAID rules and regulations, good governance and minimum financial management standards. Monitoring and evaluation courses cover basic principles of monitoring and evaluation and PEPFAR data requirements as well as internal data quality assurance. Refresher courses are also offered throughout program implementation. Pact also ensures that ongoing, intensive on-site training and mentoring is provided to partners and sub partners. On a quarterly basis, Pact assesses the level and type of assistance required by each organization and develops a site visit plan that ensures that the necessary support is delivered to each partner and sub partner. Pact organizes and supports technical consultation meetings for the sharing of best practices and lessons learned among PEPFAR and non-PEPFAR partners. As required, technical assistance from select regional and international providers is sourced to assist partners in improving their technical capacity.

ACTIVITY 3: Monitoring and Evaluation (M&E)

Pact SA assists each grantee in developing a results framework that tracks success against both PEPFAR program and organizational indicators. Pact further assists partners and sub partners in the development of monitoring, evaluation and reporting (MER) plans and systems. Participation in a five day M&E training is mandatory for all partners prior to full implementation. Pact provides additional M&E assistance to all partners in the following areas: review and development of effective data collection, analysis and reporting tools; setting realistic and achievable targets; establishing and strengthening data quality management systems, conducting internal data quality audits and verifying and validating partner and sub-partner data submissions.

ACTIVITY 4: Program and Financial Monitoring

Pact recognizes the importance of monitoring partner and sub partner program progress and early identification and resolution of implementation issues. Pact has frequent and regular contact with partners and if technical/programmatic gaps or problems are identified, ensures that issues are promptly addressed and resolved.

In addition to monitoring program progress, Pact closely monitors partner financial management and ensures that grants funds are utilized only for activities approved by USAID under PEPFAR funding. All partners submit monthly financial reports that detail and document expenditures. Once Pact has ascertained that the partner has implemented and/or strengthened financial management systems which fully comply with USAID regulations, the documentation requirement is removed and only the monthly reporting requirement remains in effect. Pact finance staff visit partners every quarter to audit program expenses and accompanying documentation, compliance with USAID rules (including branding requirements) and cost share.

ACTIVITY 5: Technical Assistance

Pact will provide and manage direct technical assistance in prevention, care and support strategies for all sub-grantees. Pact technical staff will conduct assessments and provide consultation and training on the development and implementation of programs and services (in line with best practice models, donor and SAG recommended methodologies and standards). In addition, sub-grantees will be supported with guidance and ongoing assistance on the design and delivery of partner HIV and AIDS curricula, training modules and publications. Pact will also work closely with partners to ensure the effective incorporation and strengthening of nutrition and food security, protection services, gender mainstreaming, and human capacity development in existing programs.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 504.09	Mechanism: N/A
Prime Partner: Nurturing Orphans of AIDS for Humanity, South Africa	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 3052.22879.09	Planned Funds: \$1,940,062
Activity System ID: 22879	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Noah (Nurturing Orphans of AIDS for Humanity) proposes to increase the number of funded Arks through PEPFAR from the original COP 08 number of 35 to 40 for FY 2009. An additional 28 Arks were incorporated into PEPFAR funding from May 2008 to September 2008 to boost their establishment process. These additional 28 sites offer basic activities to Orphans and Vulnerable Children (OVC), of which a large portion is nutritional support. Alternative donors able to support the full operating costs for the 28 Arks are being sourced.

Thus, in order to concentrate on delivery of quality care to OVC across the PEPFAR priority areas and in line with the Noah strategy of graduating Arks, the number of PEPFAR-funded Arks is proposed at 40 for October 2008-September 2009. These 40 Arks are selected based on major achievements, successes and challenges. In this way, PEPFAR funding will be matched with the Arks' operational capacity to more effectively mobilize and develop the Ark towards graduation.

ACTIVITY 1: Local Organization Capacity Building

While Noah will continue to support community mobilization in all 40 proposed PEPFAR-funded sites for FY 2009, primary emphasis will be placed on the quality of the service delivery at these Arks through effective implementation of the Noah model. This will enable Arks to become self-governing and to graduate into independent local CBOs. Thus, the activity will include more advanced capacity development activities to the Arks and their communities; to achieve compliance with government regulations and health and safety acts at Resource centers; securing local Non-Profit Organization (NPO) status as well as local fundraising and public-private partnerships (PPPs). These activities are deemed necessary to prepare the Arks to enter a graduation program to move towards independence as soon as measurable deliverables are attained.

ACTIVITY 2: Human Capacity Development

The changing demographic profile and needs of Noah volunteers has necessitated further training. So in addition to Bereavement Counseling and technical training in how to access social welfare benefits for the children, volunteers will be trained on how to establish and run peer support and debriefing groups to address secondary trauma and provide stress management skills.

In addition to the current volunteer training modules, volunteers will be trained on basic counseling and interviewing skills, parental guidance, identification of child protection issues and how to appropriately refer and follow up cases where children have been referred to relevant service providers as well as training on gender sensitization issues.

ACTIVITY 3: Care and Support

Noah believes that if children are provided with appropriate treatment, care and support, this can facilitate the process of reversing the effects of deprivation as well as supporting the development of the child's potential. An OVC Activities Department was established in January 2007 to implement a holistic age appropriate targeted program of care and support. Therefore, in addition to the current Early Childhood Development (ECD) training provided by external service providers, ECD training will now be rolled out through the OVC Activities Department as well as ECD curricula being integrated into the existing Clamber Club program for 2-6 year olds.

Furthermore, educational activities rolled out to the Arks will be expanded to include age appropriate life-skills programs and peer education. While gender equity is integrated across all Noah programs, children in this age group will be targeted to engage in gender equity promoting activities. Youth-headed households will also receive training in parental guidance in addition to basic life-skills training.

SUMMARY:

Nurturing Orphans of AIDS for Humanity (NOAH) mobilizes communities form networks of care called "Arks", which provide a range of services to orphans and vulnerable children (OVC) including: nutritious meals; educational activities including HIV prevention messages; regular home visits; assistance in birth registration and accessing government social security grants; psychosocial support and training in the establishment of food gardens. Through effective implementation of the NOAH model, with continued emphasis on sustainability and capacity building NOAH plans to capacitate community OVC programs (Arks) to become self-governing and to graduate into independent local CBOs. Emphasis areas for NOAH are Local Organization Capacity Building, and Human Capacity Development (Pre- and In-service training). The target populations for NOAH activities are orphans and vulnerable children.

BACKGROUND:

NOAH was established in 2000, and began receiving PEPFAR funding in 2004. With PEPFAR support, NOAH has registered over 20,000 children and provided over 10,000 children with direct comprehensive care throughout Gauteng, one community in the North West, and KwaZulu-Natal provinces. NOAH is currently active in 112 communities nationally, of which 35 are supported by PEPFAR. With FY 2008 funding, NOAH will strengthen the NOAH model through retraining committees, volunteers and resource center staff. Additional resources will be directed towards development and capacity building in order to capacitate communities to manage and sustain Arks as independent CBOs.

ACTIVITY 1: Local Organization Capacity Building

NOAH focuses on community mobilization and participation to develop community networks, or Arks, to support OVC affected by HIV and AIDS. Mobilization is initiated through an interactive process which allows communities to identify and evaluate themselves to determine whether the NOAH model will work for them.

Activity Narrative: Subsequently, through the establishment and training of NOAH committees (which target all major stakeholders in the community: private sector, community, religious and local government leaders) and a group of volunteers, OVC are identified and provided with services. The committee oversees the general activities of the volunteers and is involved in fundraising and building relationships with local government offices and surrounding schools to sustain the program. The staff of the Ark is accountable to the committee and to NOAH headquarters and manages the day to day running of the Ark, including caring for the OVC. In many Arks the committee has successfully secured material and monetary donations from local businesses through public-private partnerships (PPPs), in other Arks schools have donated classrooms, resources and teacher-time. All Arks are encouraged to build relationships with the local Department of Social Development (DOSD). With FY 2008 funding, NOAH will continue to support community mobilization in all 35 existing NOAH sites.

ACTIVITY 2: Human Capacity Development

NOAH training builds volunteers, Ark staff and committee members' skills to identify and register OVC and conduct home visits to monitor their progress and link them to appropriate government social services (e.g. Department of Home Affairs for issuing of birth certificates and Department of Social Development for child support grants). The training provided for volunteers includes Bereavement Counseling as well as technical training in how to access social welfare benefits for the children. For committee members, training includes Financial Management, governance, leadership, management and sustainability training. Nutritional counseling on how to provide healthy and balanced meals in a resource scarce environment, and accredited Early Childhood Development (ECD) training from Ntataise Trust (a partner NGO, registered on the National Qualifications Framework) for Ark staff members at resource centers is also provided. NOAH will continue to provide psychosocial support to OVC through training volunteers in Play Therapy and counseling techniques, and by partnering with organizations such as GoLD (another PEPFAR partner) in at least four PEPFAR Arks, two existing and two new ones in FY 2008, to provide peer counseling training on HIV and AIDS at secondary school level (over 13 years). Food security and nutritional support of OVC and volunteers is achieved through permaculture training and the subsequent establishment and maintenance of vegetable gardens.

Quality Assurance and supportive supervision is delivered through monthly meetings with NOAH staff in each region. This allows NOAH Ark Managers and community leaders to share successes and challenges and to come up with innovative solutions to solve the problems specific to their communities. Monitoring and evaluation (M&E) systems at community level are strengthened through ongoing training and data quality is improved through immediate verification of all numbers reported. Ark staff are trained in all of the skills they need for effective and cost efficient management of the Ark. Each Ark is responsible for its own budget and financial management and for reporting and its own Information Management System. All training is geared toward capacitating the Ark to be able to run independently and includes Financial Management, Computer Literacy, Fundraising, Project Management and Governance.

ACTIVITY 3: Care and Support

Through community, school and other donor-support, NOAH establishes, staffs and supports resource centers, satellite offices and satellite feeding schemes in 35 PEPFAR Arks. NOAH resource centers, apart from being safe havens where children can interact with each other and with adults in a supportive environment, also provide daily nutritious meals, access to educational support including ECD for young children and schoolwork support for older children, computer rooms and libraries, and opportunities to assess and monitor children's general health on a daily basis. Wherever children are identified as in need of healthcare they are referred to appropriate facilities and provided with ongoing follow-up and care. Parents, volunteers, children and teachers are actively involved in the maintenance and day to day activities of the center. All Resource Centers which operate daycare or crche facilities are manned by staff trained in Ntataise's intensive 3-week course on ECD. PEPFAR supports the day-to-day costs of the 35 centers such as staffing and materials and supplies (books, pencils, etc.). PEPFAR does not fund any construction of new Arks.

Outside of the Resource Center structures children's health and wellbeing is monitored through monthly home visits provided by Ark volunteers focusing on family-centered care. The home visit provides an opportunity for volunteers to work with parents to apply for birth certificates and social welfare grants for OVC as well as to assess the child's health, school performance and psychosocial wellbeing. All volunteers are trained in bereavement counseling and play therapy techniques to enable them to interact with the child and provide immediate psychosocial support wherever necessary. If the child is identified as being unwell they are referred to a nearby clinic.

In the interests of gender equality, NOAH actively monitors the number of girls and boys receiving services at Resource Centers. In most Arks there are an equal number of boys and girls attending the center and receiving services. Wherever discrepancies are noted Ark staff addresses imbalances through home visits and additional follow-ups. Two of the PEPFAR Arks (one in Gauteng and one in KZN) provide programs specifically for adolescent girls and in these cases there are usually more girl children attending centers than boy children, though there is no gender discrimination in service provision. In addition, NOAH volunteers and staff identify sick children and caregivers and facilitate referrals to the nearest hospital or clinic for health assessment and where necessary HIV counseling, testing and ARV treatment. These referrals are recorded, with an average of 75 children referred to clinics each month within PEPFAR Arks. HIV Prevention is provided through a partnership with GoLD Peer Education program which will be implementing programs in at least two additional PEPFAR Arks in FY 2008. NOAH has PPP with some companies that have provided material/resource support in the form of school uniforms and/or food; others offer the time of their employees to work with an Ark, its personnel and children.

Relationships with the South African Government (SAG) have been developed at the local, provincial and national levels. NOAH partners with the Department of Social Development (DOSD) and Education (DOE), to capacitate communities to access government funds and assistance. Local government representatives

Activity Narrative: are active members of Ark committees. Close relationships with local social workers are fostered and encouraged. Seven NOAH Arks of the total 112 active Noah Arks are currently funded by the Department of Social Development with further funding provisionally allocated to more Arks. NOAH has partnered with the DOE in KwaZulu-Natal to provide long term sustainable support by integrating the Ark model into schools. NOAH advocates for stipends for volunteers through the Department's Expanded Public Works Program which aims to advance rural communities both socially and economically by involving them in government-run programs. To date four PEPFAR Arks are accessing EPWP stipends for NOAH volunteers. NOAH is a founding member of the National Action Plan for Children Affected by HIV and AIDS and has been instrumental in policy development through this structure.

Activity System ID: 22918

Program Area: Care: OVC

Program Budget Code: 13

Planned Funds: \$242,726

Activity Narrative: SUMMARY:

Medical Care Development South Africa (MCDI-SA) will carry out OVC activities to support expansion of holistic, comprehensive community HIV and AIDS and TB care and support from Ndwedwe sub-district to the other sub-districts of iLembe District in KwaZulu-Natal province. FY 2007 and FY 2008 PEPFAR funding will be used to expand the primary activities of training, support and supervision of home-based care volunteers (HBCVs) and Directly Observed Treatment, Short-course (DOTS) providers, as well as the introduction of software to monitor home-based patient care. This will help to improve quality of care and treatment adherence for those on TB medication and/or ART; facilitate linkages between HIV and AIDS and TB-related community-based projects with the local health facilities; and build capacity among relevant community-based organizations (CBOs).

The emphasis areas include human capacity development (Pre- and In-service training, Retention strategy), local organization capacity building, and are extended through Child Survival and Safe Motherhood Wraparound Programs.

BACKGROUND:

MCDI-SA is a US-based private voluntary organization (PVO) that is registered as a Section 21 company (NGO) in South Africa. MCDI-SA has been successfully implementing community public health and social support projects in KwaZulu-Natal, South Africa, since 1995. Prior to PEPFAR funding, projects have incorporated activities focusing on traditional Child Survival (CS) interventions, reducing HIV/AIDS through prevention among youth and adolescents, assisting with CT/PMTCT site establishment, strengthening the government healthcare system's provision of services to and creating support groups for HIV-infected and TB-affected individuals, and supporting other health-supportive community-based initiatives.

The proposed OVC activities are part of the new and expanded activities from the previously implemented by MCDI-SA in Ndwedwe sub-district and are in line with the PEPFAR and SAG objective of providing quality care and support programs for children affected, orphaned and left in vulnerable situations. The key program partner is the South African National Department of Social Development (DOSD), whose current policies on HIV and TB care and gender equity inform all project objectives, and whose representatives are actively engaged in the design and implementation of activities to promote consistency and long-term sustainability. The DOSD has agreed to provide staff and financial support for project activities, as needed.

ACTIVITY 1: Expand Model Creche Framework

Based on the success of the Mavela Model Creche previously established by MCDI-SA in the Ndwedwe Sub-district of iLembe District, which has been functioning with very minimal support from MCDI funding for more than two years, MCDI-SA will use PEPFAR funds to expand this integrated approach to improve health, education and psychosocial well-being with input from the DOSD to four already identified creches (or day care centers) in iLembe District over a 2-year period. For the FY 2009 COP, MCDI will expand this activity to 2 creches in Maphumulo and Mandeni sub-districts. Working within this existing local capacity reduces initial investment and accelerates service delivery. To assure high quality and sustainable creches beyond the life of the project, minor improvements will be made to facilities, including minor upgrading of infrastructure and the planting of vegetable gardens as a food supply and an income-generating activity. Additionally, the model includes training creche teachers and principals to identify danger signs of need for urgent care per Community and Household Integrated Management of Childhood Illnesses (C/HH IMCI) guidelines, encourage parents to seek timely and appropriate care for their children, and use a health monitoring tool called the "Road to Health" card, which monitors growth and immunization status and ensures that any treatment regimens are adhered to. Support for good nutritional status will be provided through a balanced, calorie-dense lunch for each child using funds provided by the DOSD.

In addition, LifeStraw drinking water purifier units will be installed and creche staff trained on their use and maintenance. The majority of households in rural areas rely at least partially on local streams and rivers for drinking water, which are also used for sewage and other purposes that render them rich with disease-causing pathogens. Diarrhea remains one of the leading causes of illness and death among young children in iLembe, especially those who are HIV-infected.

As an additional public-private alliance, MCDI will partner with Vestergaard Frandsen, manufacturer of the innovative and inexpensive LifeStraw units, to place units in model creches and make additional LifeStraw units available to households of OVC as a means of reducing incidence of diarrhea and other life-threatening water-borne diseases. Creche staff will be trained on use and maintenance of the LifeStraw units so they in turn can train household caregivers. For the sustainability of the project, our strategy is to link the OVC sites with community, government, private and faith-based resources. MCDI-SA will also advocate with the Department of Health to purchase LifeStraw units for free or low-cost distribution to need-identified households.

ACTIVITY 2: Educational and Social Support for OVC

MCDI will partner with Training and Resources in Early Education (TREE) to provide children in model creche communities with educational and social supports through an established relationship with the network of Early Childhood Education (ECD) sites. Originally established by the KZN Department of Education, ECD sites are designed to support the needs of children in poverty and are currently active in most communities. Functioning ECD sites can become important resources for OVC and their caretakers by offering improved educational opportunities, an emotionally safe environment, and information and support for caretakers to access basic social services such as accessing social grant, and referrals to PMTCT and treatment sites as necessary.

ACTIVITY 3: Psychosocial Support for Caretakers and OVC

Activity Narrative: MCDI-SA will facilitate psychosocial support to OVC and their caretakers in collaboration with two partnership organizations using a variety of activities. While there are several programs addressing the material needs of OVC, there is less availability of psychosocial support services to help children cope with the trauma associated with the progressive deterioration and deaths of parents and other household members. The impact of this trauma begins even before children become orphans because of AIDS. MCDI-SA will partner with the KZN Interfaith Forum (eKhaya Project) and the Department of Psychology of University of KZN to provide support services to OVC and their caretakers under the direction of an MCDI-SA Social Worker and Social Work Assistant. Methods found to be successful include art, play, music therapy, narrative theatre, spiritual and psychosocial support groups, and individual counseling. The eKhaya Project provides age-appropriate support services to all household members. Successful activities have included after school groups and weekend activities for older siblings, including those who head child-headed households. MCDI will build on the experience of collaborating with the eKhaya Project on other projects to provide increased psychosocial support. Including caretakers in support activities helps ensure that vulnerable children maintain good mental health and are brought up in an emotionally safe home.

ACTIVITY 4: Legal Support for OVC and their Caretakers through Legal Desks

MCDI-SA will provide legal support to OVC and their caretakers, which will have a significant impact on their current and future economic well-being. Protecting and promoting the inheritance rights of OVC and fighting against disinheritance is crucial to comprehensive care and support of these children. MCDI-SA will partner with the Campus Law Clinic at the University of KwaZulu-Natal to provide legal/paralegal services for OVC and their caretakers to protect the legal rights of OVC. The most critical issues include property grabbing, inheritance rights, government social grants and the preparation of wills. Two types of activities are needed.

Orphaned children and their caretakers will be assisted to access educational and government childcare grants. HIV-infected parents will be assisted in making end of life plans to ensure that the child is cared in the event of their death, including instructions for legal guardianship or adoption. Parents and other caregivers will also be assisted in creating a file for their child consisting of essential legal documents and including birth certificates, instructions for acquiring death certificates, an appointed guardian, a will, and information on property and asset transfer.

Moreover, parents and caregivers will be advised on their legal rights to combat employment discrimination and the available adjudication channels should their rights be violated. Legal desks will be established in the Municipal Office or Traditional Courts in each sub-district, which are already being provided some legal support related to other legal aspects of HIV/AIDS.

Program Area: Care: OVC

Budget Code: HKID

Program Budget Code: 13

Activity ID: 16089.22954.09

Planned Funds: \$820,267

Activity System ID: 22954

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FHI will work with the OVC partners when developing their project description documents to ensure that they include some form of skills training for OVC, Early Childhood Development (ECD) Initiatives, and support of continued education, screening for abuse and referral for appropriate intervention.

FHI will review project descriptions to include a strong emphasis around Prevention with Positives (PwP) which will include Counseling and Testing, and Sexually Transmitted Infections (STI) diagnosis and treatment for OVC. As an approach for sustainable scale up, linkages with family planning services will be strengthened through age-appropriate referral for family planning. This will ensure that the needs of older children affected by HIV and AIDS are addressed and teen pregnancies are prevented.

FHI will also work with the partners to develop and/or strengthen referral networks to other services in the same locations. Strong and functional referral networks are essential for OVC to ensure that they receive comprehensive care and that their needs are addressed.

FHI will work with the sub-partners to encourage that they reduce the caregiver to child ratio as recommended by PEPFAR to ensure quality care and effective relationship building.

FHI will pay particular attention to partners' selection criteria when recruiting peer educators for their OVC programs. FHI will request to see and review the selection criteria to avoid the selection of non-dedicated or poor role models/peer educators, which can do more harm.

FHI will work with those partners providing training as a service, to get their training accredited.

SUMMARY:

Currently, USAID/South Africa (SA) supports institutional capacity-building of indigenous organizations that implement PEPFAR programs, including OVC focused care programs, through three competitively-selected Umbrella Grants Mechanism partners: Pact, the Academy for Educational Development (AED), and Family Health International (FHI). The main purposes of these UGM projects are to: (1) facilitate further scale-up of OVC services in the short term; and (2) develop indigenous capability thereby creating a more sustainable program. The emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs), and community-based organizations (CBOs). The current UGM with FHI will support five sub-partners who have transitioned over from Pact and five new sub-partners. The activity described below refers only to the USAID/SA UGM project managed by FHI.

BACKGROUND:

USAID's Health and HIV/AIDS strategy responds to the overwhelming challenges posed by the HIV and AIDS epidemic on individuals, communities and society in South Africa. In response, the Mission has obligated funds to many partners and sub-partners in South Africa playing valuable roles in the fight against HIV and AIDS, including organizations that are providing comprehensive services to OVC. Through this UGM, FHI is responsible for managing sub-grants to ten of USAID's partners (all of whom submit their own COPs directly to USAID). As USAID's prime partner and the managing umbrella organization, FHI will not directly implement program activities, but rather act as a grants management partner to manage and mentor sub-recipients who, in turn, carry out the assistance programs. Thus, FHI functions primarily as a sub-grant making entity, and a relatively small percentage of overall funds is used for administrative purposes. Given that grant recipients require significant technical assistance and management support to grant recipients, FHI will devote a reasonable percentage of overall funding to provide this support.

USAID closely collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grant mechanism. Although some of the partners work closely with various SAG Departments at national and/or local (i.e., provincial and district) levels, the umbrella grant's primary interface with the SAG is through the Senior Management Team (SMT), which includes key staff from USAID, National Departments of Health and Social Development (NDOH, DOSD), and representatives from the provincial departments.

Under this UGM with FHI USAID is supporting six indigenous and international NGOs providing care and support services to OVC in South Africa. Active in all provinces except Eastern Cape, these partners identify and train caregivers, establish community care centers, and provide psychosocial support. These are: Mpilonhle, NOAH, PSA-SA, Starfish, Hands at Work, and Heartbeat. Grants to OVC partners support a range of locally-driven best practices for orphan care using a variety of models of service delivery and working in collaboration with the South African Government's Department of Social Development. During their partnership with PEPFAR, OVC partners will increase their reach two to three-fold. This scale-up will require adequate financial, monitoring and evaluation, and management systems to accommodate growth and maximize sustainability.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008, USAID will continue to support current OVC partners through this UGM with FHI. Funds budgeted under this narrative will support costs for administering and managing these OVC sub-partners of FHI. Separate COP entries describe the OVC activities implemented by each sub-partner under FHI. Institutional capacity building of indigenous organizations is a key feature of the umbrella grant mechanism and an important strategy for achieving prevention, care and treatment goals of PEPFAR to ensure long-term sustainability of programs and organizations.

ACTIVITY 1: Grants Management

Activity Narrative: The umbrella mechanism will award and administer grants to partners selected through the PEPFAR APS competitive process to implement OVC activities. These are: Mpilonhle; NOAH; PSA-SA; Starfish; Hands at Work; and Heartbeat. This involves an array of related activities including award and administration of grants, monitoring of grant progress, meeting reporting requirements, and grant closeout. The umbrella mechanisms will monitor OVC partners' program implementation and adherence to financial regulations. This involves provision of extensive technical assistance to partners on project development and implementation, financial management, monitoring and evaluation, and reporting.

ACTIVITY 2: Capacity Building

The new umbrella mechanism will support institutional capacity building of indigenous organizations, defined as activities that strengthen the skills of indigenous organizations to implement HIV and AIDS programs efficiently, with diminishing reliance on internationally-based technical assistance and support. The umbrella partners will support activities to improve the financial management, program management, quality assurance, strategic information (M&E) and reporting, and leadership and coordination of partner organizations implementing OVC activities.

ACTIVITY 3: Monitoring and Evaluation (& Reporting)

The umbrella mechanisms will provide support to OVC partners on monitoring and evaluation, in order to strengthen measurement of the implementation and impact of program activities, an eventual achievement of PEPFAR goals. M&E support of OVC partners includes: measurement of program progress; provision of feedback for accountability and quality; surveillance; and implementation of information management systems. In addition, the umbrella mechanism will provide supportive supervision to provide guidance, monitoring, mentoring and oversight through site visits, technical assistance, and performance evaluation.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 218.09

Mechanism: Track 1

Prime Partner: Family Health International

USG Agency: U.S. Agency for International Development

Funding Source: Central GHCS (State)

Program Area: Care: OVC

Budget Code: HKID

Program Budget Code: 13

Activity ID: 2922.22946.09

Planned Funds: \$906,970

Activity System ID: 22946

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The bicycle project was not implemented in FY 2008 due to the high cost of procurement of bicycles.

Child care forums (CCFs): In collaboration with the Department of Social Development (DOSD), CCFs will be established in three provinces. The forums will support the program in identification of children in need, coordination of care and support for children and families affected by HIV/AIDS. They will also support the program's sustainability efforts by ensuring that community level structures are in place and functioning by the end of this program.

Peer education: In partnership with the Centre for Support of Peer Education (CSPE), the Vhutshilo peer education program will be piloted by the FABRIC program in North West and Gauteng. This program, piloted by other PEPFAR partners in FY 2008, has been found to be effective as a structured and rigorous peer education model. Peer educators will be trained to integrate and lead prevention education and psycho-social support activities. This activity will strengthen links between OVC programs and ART through linkages with RHRU's Echo program to encourage pediatric HIV testing and treatment in the North West province.

Household economic strengthening: The program will support group loan schemes, train youth-headed households in savings and budgeting and provide business skills training and support for older youth and their families. The Department of Labour will provide skills development training for children above the age of 16. Other networks will support job-creation, skills development and small business training and support.

CSI and OVC database: Child Status Index (CSI) tools will be implemented to identify care, support and prevention needs of families, refer them to other service providers as appropriate and track their progress. The program will also implement an electronic OVC database that will be linked to the CSI tools. The CSI and database initiative will strengthen quality assurance by providing a means of tracking services to each child against the identified needs.

Close-out Plan: In FY 2009, a close-out plan will be developed that will document strategies to build capacity of sub-recipients to implement and manage sustainable OVC programs after the end of the FABRIC program. Each sub-recipient will be assessed to identify any new areas for capacity building. Suitable service providers will provide customized training on resource mobilization, proposal writing and fund-raising. The close-out preparation and support will be done with all sub-recipients under FABRIC. Each sub-partner will be required to document exit plans for children above the age of 15. The plan will document past and current needs and services provided and develop a plan for tertiary education, skills development training or small business support. These children will be encouraged to get involved in the program activities as peer educators, secondary caregivers or after-school care facilitators.

Meeting the needs of OVC with Disabilities: In response to PEPFAR SA technical considerations and the National Strategic Plan's objective to increase proportion of people with disabilities in care, treatment and support programs, FABRIC will support OVC with disabilities in two sites in the Free State and Gauteng provinces. These projects have identified children with physical, intellectual and sensory impairments who are also orphaned or made vulnerable by HIV and AIDS due to chronic illness or loss of a parent/s. The program will support the current number of children with disabilities identified at the above mentioned two sites (approximately 40) and will ensure that these children have access to program site facilities such as drop-in centres, early childhood centres and after care facilities and also access to essential services. Special developmental and therapeutic programs to support these children will be initiated in collaboration with local experts in this field as well as civil society groups including Disabled Children Action Group South Africa. The program will facilitate identification and assessments of disabilities and will identify local resources for continued support and follow-up. Caregivers in these sites will be trained to identify and care for disabled children, to support applications for disability grants and to respond to cases of abuse.

Child Protection: The program will continue efforts to protect all children from abuse, stigma, discrimination and neglect. In collaboration with the DOSD, training will be provided to caregivers in identifying, reporting and preventing child abuse. Sub-partners will be linked to provincial Childline offices for support in handling of reported child abuse cases. Caregivers will also be trained on the provisions of the Child Care Act on Child Protection and Child Abuse. The program will continue to provide legal support including access to birth and ID documents and to support women and children on issues of inheritance.

SUMMARY:

Family Health International (FHI) will continue to support the Southern African Catholic Bishops Conference (SACBC) and its sub-recipients (SRs) in orphans and vulnerable children (OVC) program design, implementation and direct OVC service provision through ongoing training, mentoring and support. FHI will continue to strengthen the monitoring and evaluation (M&E) system through quality assurance and improvement procedures and regular data verification checks. The emphasis areas for this program are local organization capacity building and gender. The primary target populations are OVC and caregivers.

BACKGROUND:

FHI, together with SACBC, began implementing the Track 1 FABRIC program across 11 sites in South Africa in February 2006. In FY 2008, the SRs will reach OVC and their families with psychosocial, educational, nutritional, and economic support, health care, palliative care, legal support, pediatric treatment referrals and child protection services. The program will seek formal partnerships with SACBC's home and community-based care program and other partners to strengthen the integration of home and community-based care so as to ensure that OVC and family members receive comprehensive care and to scale up pediatric treatment for children. The program will integrate age-appropriate HIV prevention messages in its key activities and will use the FHI Family Life Education curriculum to train youth and adults in reproductive health and HIV prevention from a Christian perspective. The major components of this program are: 1)

Activity Narrative: capacity building in OVC program design and implementation; 2) collaboration and coordination with government and other services/programs for the provision of quality care and support to OVC; 3) effective M&E; and 4) gender mainstreaming. These activities are directly aligned to the South Africa Department of Social Development (DOSD) strategic priorities for OVC in its national plan of action for OVC for 2006 to 2008. Strategy one seeks to strengthen the capacity of families to provide essential care and support for OVC. Strategy two seeks to mobilize communities to care for OVC. The remaining DOSD strategies focus on creating an enabling environment in terms of policy, legislation, advocacy and coordination. FABRIC will ensure that at least 50% of all OVC served receive 3 or more services, per the South Africa PEPFAR guidance.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Capacity building

FHI will provide further technical assistance to SACBC to strengthen their organizational capacity to support SRs using capacity assessment and improvement tools and quality assurance checklists. Both FHI and SACBC will continue to provide assistance in project and financial management and OVC technical areas to SRs to improve the quality of their OVC programs. This support will include training and ongoing supervision and mentoring. FHI will ensure that SACBC together with each SR have clear sustainability plans and will provide training and links to other providers for the establishment of creative income-generating activities (IGAs) to support OVC and their families. Public-private partnerships will be encouraged at the local level, for example soliciting support from local businesses such as bakeries.

ACTIVITY 2: Collaboration and coordination

In line with the DOSD policy framework for OVC, FHI and SACBC will jointly boost networks developed with government and with other USG partners. FHI and SACBC will work closely with DOSD through forums such as the National Action Committee for Children Affected by AIDS (NACCA) and the provincial and district committees to strengthen networks and linkages to improve care and support for OVC and also to link caregivers to other government programs. FHI will ensure that strong referral systems are in place at local level for the provision of essential services such as health care, educational support, food security and nutrition and legal assistance. FHI will continue to support community mobilization and coordination. SRs will be encouraged to liaise with community leaders and community members to target the most vulnerable, identify local resources and develop linkages with other services. In FY 2008, FHI will continue to emphasize pediatric treatment. SRs will be supported in conducting mapping exercises to identify the nearest treatment sites for pediatric referrals. SRs will be trained in basic pediatric HIV testing, treatment and care in order to provide essential information and support for pediatric treatment to OVC and their families. All referrals will be tracked closely to ensure the referral service has been provided and the feedback form has been completed and returned to the SR by the referral site. Age-appropriate prevention messages and life skills programs will be integrated into the after-school care program.

ACTIVITY 3: M&E

FHI will strengthen technical skills around M&E for SACBC and the SRs through ongoing training and mentoring. FHI will participate and provide ongoing comments in the development of the national DOSD M&E system and will ensure that the indicators required for the national database are included and collected by the SRs. FHI and SACBC will implement information verification procedures as part of regular site visits and will ensure that the M&E forms are translated into local languages in low-literacy areas. FHI will pilot an OVC database in collaboration with the USG technical working group that is developing an OVC database.

ACTIVITY 4: Mainstreaming gender

In FY 2008 gender will form an integral part of the FABRIC program's activities. FHI will ensure that girls and boys are receiving equitable support and access to essential OVC services, especially education. Partners will work with male groups in their dioceses to mobilize the involvement of men as caregivers. Female child-headed households will receive special attention to ensure that the burden of care on them is decreased and that they continue to access education and to receive adequate mentoring and support. Communities will be mobilized to enforce OVC protection from exploitation, violence and abuse and to mitigate against stigma and discrimination. Advocacy initiatives will also be conducted at the congregational level to ensure that the church is supportive and promotes the same messages to address gender inequities. FHI will link gender to sustainability efforts by improving access to training and resources for female primary and secondary caregivers. FHI will set-up a tracking system to ensure that equitable access to care and support is enhanced and that activities addressing gender inequities and child protection are recorded and reported.

NEW ACTIVITIES

ACTIVITY 5: Reaching Disabled OVC

This activity will be implemented in three sites in Free State and Gauteng that have identified children with disabilities. Special programs to support these children will be initiated in collaboration with medical practitioners, academics and local experts in this field. The program will facilitate identification and assessments of disabilities and will identify local resources for continued support and follow-up. Caregivers in each site will be trained to identify and care for disabled children and to support applications for disability grants.

ACTIVITY 6: Bicycle Project

In FY 2008, the bicycle project in collaboration with the Institute for Transportation and Development Policy

Activity Narrative: (ITDP) will be introduced and piloted in 3 sites where access to public transport is poor and where children have to travel long distances to school. The bicycles will be given to older OVC living in remote areas to assist them to reach school and to attend the after-school care activities at the selected project sites. A feasibility assessment will be done in advance to identify opportunities and challenges of introducing this project in the selected sites.

ACTIVITY 7: Exit strategies for older OVC

The sites will be assisted in developing exit plans for children above 15 years. This is to ensure that when children leave the program there are plans in place for them to further their education, access vocational training, establish income generating activities or gain employment.

ACTIVITY 8: Research

In FY 2007, FHI and SACBC submitted a concept note to the Joint Learning Initiative for Children and HIV/AIDS (JLICA) to conduct a study on lessons learned in implementing family centered approaches to OVC service provision. The concept note was accepted and the Rockefeller Brothers Foundation has granted SACBC \$25000 for the study upon approval of the full proposal to be submitted in October 2007.

EXPECTED RESULTS:

Improve reach (# of OVC) and coverage (# of geographic regions) in 10 sites across 7 provinces; Strengthen the capacity of SACBC and its SRs to effectively coordinate and sustain programs at the local level; Enhance skills and knowledge of caregivers through training in OVC technical areas; Improve the FABRIC M&E system and align with the DOSD national system and indicators through quality assessment and improvement; Equitable access to care and support and resources for male and female OVC; Increase in the number of male caregivers trained and mentored to care for OVC; Establish linkages to income generation service providers and training opportunities for SRs and families caring for OVC; and Increased awareness and community mobilization against gender-based violence and child abuse. By the end of FY 2007 semi-annual reporting period, FABRIC had met the annual target of 7000 OVC and of these, more than half (57%) received primary direct support (3 or more services).

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 7296.09	Mechanism: N/A
Prime Partner: Hands at Work in Africa	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 15934.22970.09	Planned Funds: \$1,019,450
Activity System ID: 22970	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 2: Human Capacity Development

Seventeen OVC Coordinators and 14 Youth Coordinators will be sponsored in the PEPFAR budget and identified through the CBOs with a guideline on qualities and skill required for that position. They will meet monthly for workshops to learn skills on dealing with children, in order to empower other care workers in their different areas.

ACTIVITY 3: Psychosocial Support

The OVC Coordinators and Youth Coordinators in the CBOs will be trained by Hands at Work to provide the psychosocial training for primary caregivers and child-headed households and in the development of support groups. There will be a larger focus on the training of child-headed households in the primary caregiver training.

This training was previously done by a training team within Hands at Work, but in line with sustainability and community ownership this will now be done by the CBOs themselves.

Hands at Work was identified by the South African government (SAG) to be fast tracked in the registration as an accredited training organization - however a breakdown between the SAG and the consultant has stopped the process at a national level. Hands at Work will still be handing in accreditation documentation for HBC training this year and will then work to extend this to other training areas.

ACTIVITY 4: Educational Support

Hands at Work will provide school stationary or school uniform packs to each of the schools serving OVC through PEPFAR funding.

SUMMARY:

Hands at Work in Africa (hereafter Hands at Work) will use FY 2008 PEPFAR funds to provide a holistic package of basic services to OVC, including increased access to educational support and social services through community-based programs in four provinces. The specific target population is orphans and vulnerable children and the major emphasis area is local organization capacity building.

BACKGROUND:

Established in 2002, Hands At Work (HAW) is a South African NGO that provides comprehensive care and support services to OVC and their families through a network of associated community-based organizations (CBOs). Hands at Work has a vision to reach 100,000 OVC by 2010 in sub-Saharan Africa. The Hands at Work model, and in particular, the Masoyi project, (described by various independent organizations as a best practice model) lends itself towards mobilizing new community initiatives in resource-poor settings. Its model builds on the foundation of home-based care and local community ownership by mobilizing the local church to accept the biblical mandate to look after the sick and the dying in their communities and to care for the orphans. Hands at Work helps to establish, encourage and build capacity in CBOs that are formed out of local churches that agree to implement the Masoyi Community Intervention Model. With PEPFAR funding Hands at Work has reached 6500 OVC and over 1200 caregivers with an integrated service package that includes education, psychosocial and nutrition assistance. With FY 2008 funding, Hands At Work will continue to increase the program's reach and extend additional support to established care centers to provide support groups for young mothers, facilitate reintegration of young mothers into schools; ensure OVC access to counseling and testing and ARV treatment, when needed; train and mentor Community Child Care Forums (CCCFs) and provide life skills and prevention education for all beneficiaries. In addition, Hands At Work will also continue to implement income-generating initiatives, home-based care and resilience-building programs to further support improved security and livelihoods for children. The Hands at Work program is aligned with the South African National Action Plan for Orphans and Other Children made vulnerable by HIV and AIDS and the Department of Social Development (DOSD) Policy Framework and has a good relationship with both the national and provincial DOSDs.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Local Organization Capacity Development

Local organization capacity will be developed through a CBO training and mentoring program. Partner CBOs are trained and mentored for an 18 month period in OVC care and support, and the provision of direct services to OVC; also developing and improving organizational capacity. Organizations are taught how to access and implement services within the frameworks provided by the departments of education, home affairs and DOSD. E.g., they are taught how to secure school fee exemption, rather than trying to raise funds for fees; how to apply for and access legal documents and secure grants; rather than directly paying monthly household expenses/needs. Hands at Work in Africa assists organizations with the development and use of data collection tools, methods and processes; implementation plans and subsequent monitoring, evaluation and reporting obligations. In the Training and Mentoring program, CBOs will be trained in organizational matters such as bookkeeping, proposal and report writing, conflict mediation, forming linkages and partnerships and establishing relationships with local government departments and local service providers (treatment sites etc.). Local organization capacity will be developed further with the training and mentoring of lead Child Care Workers in various organizations.

ACTIVITY 2: Human Capacity Development

Hands At Work will partner with 45 local CBOs to identify, train and mentor caregivers providing direct care

Activity Narrative: and support services to OVC and their families. Training topics will include basic child care, the role of the childcare worker, OVC selection criteria and community care forums; minimizing discrimination and stigma, HIV prevention, children issues, promoting gender equality, child rights and protection; and caregiver participation in service delivery. Caregivers will also be trained to identify cases of vulnerability, abuse, ill health and HIV and AIDS infection and referral mechanisms. In addition, caregivers will receive training and support on family-centered care including basic parenting skills, nutrition counseling and food gardening and health. Hands At Work will support local CBOs to develop caregiver support groups, led by senior caregivers, to facilitate peer-to-peer support and information dissemination. Child care workers will also be the first link to ensure M&E data capturing and integrity. Each child care workers will be mentored on appropriate case management including documentation.

ACTIVITY 3: Psychosocial Support

Hands At Work will provide training and support to local CBO partners to provide a targeted psychosocial support to OVC and their families. Psychosocial support activities will include the provision of one-on-one counseling, group counseling (support groups), play therapy at care centers, and age-appropriate development programs such as youth camps (based on Survive Your Life and Better Choice curricula) and life-skills training. In addition, child-headed households (CHH) will receive training in grief management, sexuality and HIV prevention. Support groups will also be formed for members of these households to provide ongoing counseling and support.

ACTIVITY 4: Educational Support

Hands At Work's community care centers are multi-purpose centers based in the community and used for pre-school training for OVC and HIV-infected infants (0-5yrs), after-school care and homework tutoring, and nutritional support for CHH. All the centers follow a set, pre-school curriculum to ensure that OVC are adequately prepared for entry into primary school. Hands at Work works closely with the Department of Education to ensure every OVC is enrolled in school and exempted from school fees. Academic assistance and homework support will be facilitated at care centers by qualified teachers and volunteers, with a focus on English and mathematics. Care centers are also places of safety for OVC. All school going CHH OVC within the area of a care center will also receive nutritional counseling and a cooked meal (provided with non-PEPFAR funding) at the care centers. Food parcels (sourced through public-private partnerships) will also be provided to those children in need.

ACTIVITY 5: Health

Workshops on HIV and AIDS information and education will be held with all the OVC above 10 years. All the OVC will be de-wormed at least once with assistance from the local health clinic. Health Care and home visits are provided to the OVC by the Home-based Care staff funded by other Hands at Work donors. The CBOs link OVC with health services including screening, immunizations and where needed home-based care services (varying from adherence monitoring, basic wound care to cleaning) as well as pediatric testing for infants and VCT for older OVC.

ACTIVITY 6: Legal Assistance and Economic Support

A birth certificate and identity document drive will enable social workers (who are employed to facilitate this intervention) to apply for government social grants for OVC who qualify for them. This intervention will assist government to fulfill their mandate as stipulated in the Department of Social Development's Strategic Framework. Blankets will be distributed to all the new OVC registered after October 2008. Hands at Work will support skills training for older OVC and income generating activities for caregivers, to bring revenue and new skills that contribute to reducing the susceptibility of OVC and their caregivers to HIV infection.

ACTIVITY 7: Nutritional Support

Active support will be given to ensure that food gardens provide fresh produce to supplement monthly food parcels, and supply soup kitchens for daily meals provided to pre- and school going OVC at care centers. Provision of monthly food parcels is a wrap around activity funded through national and local business partnerships. Soya porridge is distributed to severely malnourished OVC as part of an emergency feeding scheme funded from non-PEPFAR sources. Nutritional education training will be given to OVC-headed households and caregivers to assist in improving OVC nutritional status by covering topics such as healthy food choices, food preparation and storage.

ACTIVITY 8: Prevention Education

HIV Prevention and protection training will be provided to child-headed households, primary caregivers (PCG), and OVC. The training will focus on core themes such as life skills, gender equality, child protection with the view to reduce violence and coercion, sexuality, HIV and AIDS and reproductive health. The youth development programs, Survive Your Life, Better Choices and young moms focuses particularly on abstinence and faithfulness. The young mom program is focused on integrating the girls back into the education system while supporting them in caring for their babies.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 513.09	Mechanism: N/A
Prime Partner: Starfish	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 3061.22815.09	Planned Funds: \$970,905
Activity System ID: 22815	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Local Organizational Capacity Development

1.1 Improving Performance of CBOs and Expanding Their Reach: A total of 45 CBOs have been enrolled in the 18 month training program, with training on OVC care and organizational development (OD), supplemented with mentoring. There remains a high staff turn over in CBOs. To address this Starfish will provide a better environment for the care-givers. Starfish will provide recognition for all caregivers. After training, Starfish will provide a grant to each CBO in the range of US\$14,500 to US\$ 43,000 as support for OVC care. Starfish will become a resource provider and monitor the number of OVC reached and the number of services.

1.2 Reduce the Ratio of Caregiver to Children: The current ratio is an average of 25 per caregiver. Starfish is working to reduce this ratio to 10 to 1 by recruiting and training. This requires more funds and given the limitations of PEPFAR funding, Starfish will source the funds from alternative donors.

1.3 Increase Access to ART Services: One of the essential 47 services provided by Starfish supported CBOs to OVC and their extended families include access to ART and PMTCT. Many of the PEPFAR funded CBOs provide this essential service. Starfish will now require that all selected CBOs prioritize and include them among the list of services. Starfish Regional Program Managers (RPM) will assist CBOs to form linkages with local public hospitals and clinics to ensure that orphans and families living with HIV receive proper counseling and treatment. The RPMs will facilitate the assignment of a professional nurse from nearby clinics to each CBO in order to train caregivers on ART administration and to monitor adherence.

1.4 Strengthen the Consistency and Effectiveness of Services Provided to OVC: The CBOs submit a monthly report to Starfish on the number of services provided to each child. The names of children are also listed in the report form and thus it is possible to track from month to month the consistency and range of services received by each child. With this system of monitoring, CBO managers and Starfish RPMs will be able to identify gaps for each child and address the shortfall. The quality of services received by the OVC is not yet systematically monitored and is conducted on an ad-hoc basis through site visits.

ACTIVITY 2: Human Capacity Development

2.1 Address Human Resource Inadequacies: All CBOs under the PEPFAR funded M&T Program receive 18 months of mentoring. Mentors provide on-the-job training, technical support and advice to the management and staff of the CBOs through regular visits, residential workshops and onsite training. The mentoring serves effectively to reduce staff burn-out and ensures better service delivery for OVC. An external evaluation of the mentoring program will be conducted during 2008/09 with PEPFAR funding. Outcomes of this evaluation will determine the future direction of the mentoring program. Recognizing the limitations of a CBO in terms of the availability of qualified human resources and staff turn-over, Starfish RPMs will actively support CBOs to establish links with co-existing systems and structures. Once CBOs have established links with neighborhood schools and churches it will be easier to enroll the OVC into schools and ensure that they stay enrolled and attend classes regularly. Starfish will ensure that RPMs become members of CASNET a PEPFAR-funded initiative. This membership will enable Starfish to access schools that have special care and support programs for OVC.

2.2 Strengthen Adequate Supportive Supervision of Caregivers-Each CBO has a supervisor assigned to each of the programs they implement. The supervisors are trained in OVC care and are continuously exposed to symposia and forums for sharing of information. This enables the supervisor to provide on-going guidance to the caregivers to improve service delivery. To institutionalize effective supervision, Starfish will encourage all CBOs to have quality process management systems. A system of mapping and monitoring the providing services to OVC will clarify management systems. Starfish will seek technical assistance from University Research Council to guide the process. This initiative will be included in a series of regional and provincial workshops for the PEPFAR-funded CBOs as refresher training on OVC care.

2.3 Train Caregivers to Improve Service Delivery-The OVC care training is conducted by experienced training organizations specializing in OVC care. The topics are comprehensive includes essential support services areas that are critical to the wellbeing of OVC. The training is interactive with many sessions on role-play. For the PEPFAR-funded projects, Starfish currently partners with Heartbeat to provide the OVC care training. For future training requirements, Starfish will contract National Association for Child Care Workers (NACCW) an accredited trainer to provide this training.

SUMMARY:

Starfish will use PEPFAR funds to provide a holistic package of basic services to orphans and vulnerable children (OVC), including increased access to educational support and social services through community-based programs in six provinces. Major emphasis areas for the program are human capacity development (training) and local organizational capacity building. The program's specific target population is OVC.

BACKGROUND:

Starfish Greathearts Foundation (Starfish), a South African NGO, uses a multi-tiered capacity building model that focuses on partnerships, the ability to replicate or scale-up programs and sustainability to ensure necessary care and support services reach as many OVC as possible. Starfish acknowledges the invaluable role that community-based organizations (CBOs) and caregivers play in the care of OVC, and supports and capacitates Non Governmental Organizations (NGOs) and CBOs through training and mentorship to provide direct OVC services to OVC. The Starfish program is aligned with the South African National Plan of Action for Orphans and Other Children made vulnerable by HIV and AIDS and the Department of Social Development's (DOSD) Policy Framework.

Activity Narrative: With FY 2008 funding, Starfish will increase and expand its range of services and reach to OVC following a three-pronged strategy: (i) qualitatively improved programming for improved training to CBOs; (ii) quality care and services to OVC and; (iii) organizational, managerial and technical competence to support improved programming and service delivery. This strategy will continue to strengthen Starfish's Mentoring and Training Program (M&TP) which builds capacity of CBOs providing direct services to OVC. PEPFAR funds will train, mentor and support 48 CBO and their caregivers and workers in the following provinces: Eastern Cape, Gauteng, KwaZulu-Natal, Limpopo, North West and the Western Cape. The program will continue to partner with a number of preferred Service Providers, especially Heartbeat. In particular, Heartbeat's child protection training modules are widely used. Starfish will also continue to work with other Mentoring Service Providers (MSP) in the following provinces: Unsung Heroes (Gauteng Province), Barnabas Trust (Eastern Cape), CHOICE (Limpopo), Seboka and Ragoga (North West) and Narcosa (Western Cape).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Local Organization Capacity Development

Central to Starfish's scale-up strategy is a sustainable CBO training and mentoring program. Partner CBOs are trained and mentored for an 18-month period in OVC care and support as well as in developing and improving their organizational capacity. As the number of trained and strengthened CBOs increases nationally, more OVC can be reached more cost effectively and brought into a safety net of care in a sustainable manner. CBOs are provided with the skills to access and implement services provided by the Departments of Education, Home Affairs, Department of Labor (learner ships for 18 year old OVC and those graduating from OVC categorization due to age including those OVC who are heads of households) and the Department of Social Development (DOSD). Starfish also assists CBOs with the development and implementation of work plans, their monitoring, and use of data collection tools, methods of good quality data collection and overall monitoring and evaluation of their programs. Skills, methods, tools and strategies acquired during these workshops combine to add value to the work of CBOs in their OVC Care programs. In addition, good quality programs allow CBOs to solicit additional funding from other sources. The value added to the work of these CBOs is achieved with PEPFAR funding.

ACTIVITY 2: Human Capacity Development (HCD)

The HCD program provides skills in practical management and organizational governance which would include topics such as: vision-building, planning and evaluation which covers following eight steps of planning: delegation and participation, problem solving, planning and implementation, strategic planning, administration, personnel, leadership, legal registration, managing money and fund raising. Fund raising includes: financial systems, bookkeeping, developing a finance policy, budget reporting, conflict mediation, linkages and partnerships and establishing relationships with local government departments and local service providers.

OVC care and support topics covered in the CBO training include; identification of OVC, establishing OVC selection criteria, children's rights, models of care for children, parenting skills, minimizing discrimination and stigma, HIV prevention education; The training will also cover; promoting gender equality and child protection, the roles of community development facilitators and child care workers. Caregivers will receive training on identification of OVC who are particularly vulnerable, abused, sick and HIV-infected. The latter are linked to CBO networks of trained caregivers who regularly visit OVC in their homes. Special care programs and mechanisms for referral are then put into place. The caregivers also serve as points of contact for OVC and ensure that linkages and referrals are made to provide OVC with the necessary services. Training in OVC care will also be provided to Granny support groups who create a network of caregivers supporting each other, reducing the individual burden of care and providing a forum for sharing information.

ACTIVITY 3: Psychosocial Support (PSS)

Age-appropriate PSS programs will be provided by CBOs and caregivers working with them. These PSS programs will include, play therapy and youth support groups, The focus will be on core themes such as life skills, establishing and balancing gender equity by addressing cultural stereotypes held particularly by boys, child protection with the view of reducing violence and sexual coercion. Sexual and reproductive health especially for adolescent OVC forms part of the PSS program and it is aimed at preventing HIV infections and providing reproductive health information. PSS programs will link OVC to psychological and emotional care. A network of care workers will regularly visit OVC at their homes to provide follow up care at the household level.

ACTIVITY 4: Educational Support

The Heartbeat training module will be used to train CBOs to address educational support topics. Starfish will train and support its partner CBOs to ensure OVC are able to access to primary and secondary school education. For example: In various participatory workshops, CBOs and their caregivers/workers contingent are trained on how to secure school fee exemptions, how to apply for and access legal documents and secure social grants etc. Caregivers will work with local schools to facilitate school fees exemption. Caregivers will be assisted to form partnerships with local educators to assist OVC with their homework and monitor on-going school progress. Starfish will also develop local partnerships to secure bursaries for older OVC. Caregivers will provide advice on and enroll older OVC on learner ship programs offered by the Department of Labor. Academic assistance and homework support will be facilitated at care centers and, where possible, qualified teachers will be engaged to work alongside volunteers. Particular attention will be given to English and Mathematics as these subjects are traditionally the most difficult. Starfish will identify, via CBO partners, tutoring and homework after school centers where work can be conducted simultaneously whilst providing a places of safety for OVC. Linkages to programs and services providing school uniforms and stationary will continue to be made. This is an important intervention as it is known to

Activity Narrative: reduce stigma and discrimination and encourages school attendance.

ACTIVITY 5: Legal Assistance

Heartbeat's training module will be used in training CBOs to address topics in this area. The training module covers: Children's Protection; Children's Rights and Child Protection Policy; Assessing and Minimizing Risks; Prevention and Management of Abuse. CBOs will be empowered to ensure that OVC legal status including their possession of birth certificates and identity documents are in place. This will ensure that children are able to access social grants and other economic support services they are entitled to and will assist government to fulfill its mandate as stipulated in the DSOD's Strategic Framework. Post-training activities by caregivers will include ensuring that all topics covered in the training sessions are implemented.

ACTIVITY 6: Nutritional Support

CBO OVC care training will include modules that will focus on nutritional training courses. Trained caregivers will be placed in areas within specified communities to ensure that nutritional education is spread as widely as possible. Nutritional education training given to OVC-headed households and caregivers will assist in improving OVC nutritional status. Training programs in this regard will include topics on healthy food choices, food preparation and storage. The training will focus on CBOs who provide food parcels, manage food gardens, run soup kitchens or assist grandmothers who receive social grants on behalf of OVC. Provision of monthly food parcels is a wrap around activity funded through national and local business partnerships. Soya porridge is distributed to severely malnourished OVC as part of an emergency feeding scheme using non-PEPFAR funding.

Starfish donors e.g. Coca-Cola, Virgin Unite, Cell C etc. provide basic services to over 12,000 OVC through PPPs.

Activity ID: 3128.22993.09	Planned Funds: \$4,293,826
Activity System ID: 22993	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

With the increasing number of Isibindi Projects particularly in KwaZulu-Natal with children in granny-headed households direct support to these aged and burdened caregivers is required to be strengthened in various ways. Beginning in FY 2008 COP, the National Association of Childcare Workers (NACCW) the program will be expanded to reach more grannies in FY 2009. There is a need for talking circles (a form of skills building through facilitated dialogue) to promote positive parenting skills especially related to work with teenagers and support for the active transfer of family and cultural tradition and rituals. A bereavement counseling and support program will support grandmothers in overcoming personal grief and coping with the grief of grandchildren.

This program will also provide OVC with bereavement support and counseling. A creative training/social program will be developed to respond to this need and include access to a micro-finance/economic empowerment programs designed especially for grannies. In addition the successful Isibindi Safe Park will design specific activities and programs to involve grannies in the safe park - to relax, engage in story telling activities and support the recreational activities of their grandchildren and other children (such as supporting sports tournaments). The NACCW will also partner with schools - linking child and youth care workers to support educators in work with OVC.

The program will include the establishment of the NACCW Safe Parks in schools where psychosocial services will be offered at the 'Safe School Parks' with child and youth care workers deployed after school hours in integrated multidisciplinary teams along with educators. In addition, in FY 2009 COP a partnership with the Early Childhood Development (ECD) sector will ensure the Safe Park is used creatively to provide easy access to ECD services - for all Isibindi and community children, but particularly for those from child-headed households. Safe parks will also be made available to disabled children who will be transported to the parks on a regular basis, increasing the social contact of disabled children, and destigmatizing disability in communities. Disabled children included in Safe Park activities will be those provided with services in the disability program as well as others in HIV/AIDS-affected communities where Isibindi projects are situated. Participation of this group of children will increase the spread of preventative work. The disabled children at the Safe Parks will have access to all the activities that occur at the Safe Park e.g. when there are talks/sessions of sex and sexuality, ARVs, HIV/AIDS, etc. They will be a part of these activities and thus a wider number of OVC will be reached with prevention messages.

The Women's Empowerment Program and Young Women's Empowerment Program will be enhanced to focus on more economic empowerment activities and relevant microfinance programs for the young women. This program will be documented in COP 08. It will also be reviewed and enhanced on recommendations made by the researcher in COP 09. Young women will be awarded scholarships to study further after completing school. Microfinance and income generation programs that were piloted in COP 08 will also be implemented in COP 09. In addition, a Life Center Model will be initiated and remain an ongoing program for young people (male and female) heading households where they will meet to discuss their challenges and coping strategies, as well have space and fun away from the daily parental responsibilities of associated with their roles as children heading households. This enhancement responds to the critical need for localized, regular social networking was expressed by the young women in the pilot Young Women's Empowerment Program. According to the Children's Act the development of cluster foster care programs is one way of responding to the needs of OVC. The NACCW will design and pilot three different cluster foster care models specifically responding to the needs of OVC in response to the expectations of the Children's Act. One model will target children 16 years and over who are heading households and can, according to the Act, live on their own without an adult. The second is a model for children under 16 years who are currently living on their own in child-headed households but should, according to the Children's Act, not be living in these circumstances - where a method of structuring adult supervision of such households will be piloted. The third model will focus on children living in child-headed families who have added difficulties, such as living with disability, and substance addiction. Other areas of services within the Isibindi Model that will be strengthened (some with the inclusion of other expert consultants) include grief work, succession planning, food security, Developmental Quality Assurance, planned Safe Park activities, and the Isibindi Partners Network.

SUMMARY:

The National Association of Childcare Workers (NACCW) provides accredited child and youth care training to community members in order to provide holistic services to OVC. Funding will be used in the emphasis area of training and community mobilization, developing referrals and linkages, and conducting needs assessments. Primary target populations are OVC, HIV-infected families and their caregivers, and community organizations.

BACKGROUND:

NACCW is the only South African NGO focusing on provision of specialized, professional training in child and youth care. NACCW has developed a unique community-based child and youth care response to the HIV and AIDS crisis called the Isibindi Model. This program trains unemployed community members in an accredited child and youth care course and provides an integrated child and youth care service to child-headed households and vulnerable families through partnerships between NACCW and community-based organizations. This project is part of a larger initiative of the NACCW to replicate the Isibindi Model nationally in partnership with the Department of Social Development (DOSD). Since 2004, PEPFAR has supported 24 of NACCW's 40 Isibindi projects, providing direct services to 10 891 OVC and training for 430 child and youth care workers in 7 provinces in South Africa. The NACCW also offers this accredited training to other PEPFAR funded projects.

To promote the sustainability of the NACCW Isibindi childcare model, public-private partnerships will support the program in selected provinces. Partners include De Beers Fund, Anglo America Chairman's Fund, AngloGold, Royal Netherlands Embassy, UNICEF, ABSA Bank and the Impumelelo Innovations

Activity Narrative: Award Trust. The NACCW has a program called Masihlangane Ngezingane Zetu: Make a Difference which focuses on securing funding for food parcels for the Isibindi projects from various other donors and private enterprises like Old Mutual, Independent Newspapers and Private Sponsorships.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training and Mentorship

Accredited child and youth care training at South Africa's National Qualification Framework (NQF) level will be provided to child and youth care workers and selected volunteers in all sites. This training is the only accredited basic child and youth care course in the country in the profession of Child Care Work. This accredited training will allow workers to be registered as Auxiliary Child and Youth Care Workers with the South African Professional Board for Child and Youth Care Work. This registration promotes professional practice and ensures that workers function within a professional code of ethics. In FY 2008 expert consultants and mentors will be provided to all 50 Isibindi Projects to ensure development of the project staff and thus ensure provision of quality services.

ACTIVITY 2: OVC Outreach Services

NACCW will ensure that all OVC are visited regularly and provided with services within a child rights framework. These services will include education on children's rights and assistance with access to education, facilitating access to legal documents, food parcels, social security grants, ARV treatment for children and health care, child protection, services for recreation and play, educational support and bereavement and grief work. Health Care services will include general health care, health care for HIV-infected OVC and preventive health care services. NACCW will ensure that OVC also receive child care services including counseling, grief-work, age-appropriate developmental programs and assessment in the context of ordinary daily events like bath-times, mealtimes, study times and playtimes. Lifespace work (using daily events and routines like meal preparation, meal times, study times, play times etc developmentally and therapeutically) will be offered in the community in homes, schools and drop-in centers to build resilience and empower OVC to take charge of their lives. To respond to large numbers of children requiring after school care services and less intensive support, the NACCW Isibindi projects will create safe parks - safe places where children can play with access to child and youth care workers. The safe park will provide homework supervision, health care assessments and HIV prevention and psychosocial discussions, organized sports fixtures, free play, group discussions by age group and gender as appropriate, cultural activities and the opportunity for children to connect with adults in a safe environment. This intervention will be replicated in the communities and in the established Isibindi Projects; the additional components serviced will be added.

ACTIVITY 3: Child Protection and Gender Equity

The NACCW program will focus on the identification, care, management and referral of children who are abused and neglected. This will be a focus area of the NACCW project in FY 2008. Expert training and support from other specialist organizations will ensure effective service from the child and youth care workers according to minimum standards and practice procedure. Caregivers will be sensitized and trained to actively identify and address gender-based violence in vulnerable households, particularly households-headed by young females. Children with disabilities will benefit from focused developmental and support programs by trained child care workers including referrals and physical therapy. In addition, a gender program for the protection and promotion of the girl child will be developed in the 50 PEPFAR supported NACCW sites. This gender program will include women's development/leadership skills workshops for the child and youth workers so that gender sensitivity, women's rights and protection will be integrated into the ethos of daily activities and programs of the Isibindi project. A specific girl child program will be in place in all Isibindi sites including career camps and bursaries for girl children who have passed their final exams (grade 12) and are heading households; this will increase the economic security for the girl child and siblings in the home.

In addition to NACCW's child protection and gender equity activities, NACCW will also implement interventions designed to meet the needs of adolescent OVC girls and boys. CYCW will be trained on the needs of adolescent girls and boys and activities will be mainstreamed into all household visits and at Safe Parks. Activities will include information and education on reproductive health and teenage pregnancy, prevention of gender-based violence and gender roles and role models. This gender program initiated in FY 2007 will be ongoing in the sites that it was piloted in and new additional projects will be provided with the program needs assessment. Ongoing follow up and support will be provided to sites that have already started this program.

ACTIVITY 4: Advocacy

The Isibindi Model translates SAG policy for OVC into practice. By sharing better practices from the Isibindi model with national and provincial government departments, NACCW will help inform national policy on OVC. NACCW promotes the UN Children's Rights Charter, the South African National OVC policy and the South African Draft Children's Bill as well as other national policy and legislation for the protection and promotion of children rights and interests in the context of HIV and AIDS. The focused advocacy from the NACCW in the consultations on the Draft Children's Bill has resulted in amendments for the inclusion of child and youth care workers in the Bill in communities as a cadre of caregivers providing social services. This will have significant impact on future of the Isibindi Model and the future security of the child and youth care workers being developed. In FY 2008 NACCW will continue to target key stakeholders such as magistrates, social workers, and officials in SAG departments such as Home Affairs (responsible for birth certificates) and Education, at provincial local level through meetings and other forums to ensure that government policy and legislation are implemented in the best interests of the child. In all Isibindi projects, children who have been refused admission to school (for lack of school uniforms or nonpayment of school fees) have all been successfully readmitted.

Activity Narrative: ACTIVITY 5: Care and Support for Disabled Orphans and Vulnerable Children

NACCW will conduct a needs assessment of each Isibindi site to identify OVC requiring care and support. CYCW will network with health care facilities and service providers in each site to foster access to specialized and disability services. A report for each site will document the number of children with special needs, describe the identified needs (both in individual children and as a group), outline existing local health/social service facilities, and articulate an action plan. NACCW mentors will meet with appropriate rehabilitation departments at local hospitals or clinics. CYCW will refer OVC for services and follow up to ensure services are received.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 2802.09	Mechanism: Track 1
Prime Partner: Olive Leaf Foundation	USG Agency: U.S. Agency for International Development
Funding Source: Central GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 3301.23149.09	Planned Funds: \$342,977
Activity System ID: 23149	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

HOPE worldwide has been working on the Child Protection Policy (CPP) since last year. It has gone through five drafts and has had inputs throughout the process from two different legal advisors who have approved same. The board has also finally approved the policy and it is currently in the processes of being launched to all our sites.

Challenges and proposals to mitigate: Although the policy has been written in very user-friendly English it is an incredibly comprehensive policy and currently stands at approximately 80 pages. This means that it needs to be condensed in order for it to appeal to a broader scope of people. An organization has been identified to carry out this task.

Although the board and senior management have bought into the need for the policy there is a need to get buy-in from all levels which will require training and sensitization workshops. There is concern among staff that all staff including management and anyone who is working with children will need to now get police clearances. The sensitization workshops will give the staff a clearer idea as to the need for the clearances and the need for the policy.

A clause in the policy states that HOPE worldwide can only work with other organizations that have CPP policies. If they do not, then the organization will need to adopt the HOPE worldwide policy. This may initially be hard for organizations to accept as they may feel that they are being judged and may not understand the need for the policy. It would be highly beneficial for all partner organizations to undergo sensitization training as well as child protection policy training.

Proposed activities:

HOPE worldwide will hire an agency that specializes in reference checks to check every employee's criminal record in case they have committed a crime related to children. Sensitization training will be followed by policy training. HOPE worldwide will appoint Regional as well as a National Child Protection Officer. Translating the policy into different languages as well as condensing it. A law firm needs to be appointed to act a legal advisor in the event that legal advice is sought. The policy needs to be translated into a taking book in order to appeal to a wider market as well as to include people who are illiterate.

SUMMARY:

The Africa Network for Children Orphaned and at Risk (ANCHOR) partnership will continue to strengthen and develop community support groups for orphans and vulnerable children (OVC), facilitate kids clubs, strengthen Child Care Forums (CCF), train partner organizations and provide one sub-grant to a Community-Based Organization (CBO). ANCHOR partners will continue to build relationships with local Rotary Clubs, local and provincial government departments, health facilities and local NGOs and CBOs. The primary target populations include orphans and vulnerable children and their families, youth, people living with HIV and AIDS. The program has reached over 3,600 OVC in 2006. The major emphasis areas are training and local organization capacity building.

BACKGROUND:

ANCHOR is a regional OVC partnership initiative operating in six African countries (South Africa, Cote d'Ivoire, Kenya, Nigeria, Botswana and Zambia). ANCHOR comprises four organizations: HOPE worldwide, Rotarians For Fighting AIDS (RFFA), Coca-Cola/Africa (CC), and the Schools of Public Health and Nursing at Emory University. ANCHOR will contribute to the PEPFAR vision in South Africa as outlined in the Five Year Strategy by providing care for OVC through the expansion of local community capacity to deliver quality care for orphans and vulnerable children and their families. ANCHOR will strengthen community capacity to scale-up OVC efforts at the community level. Through ANCHOR participation in the National Action Committee for Children Affected by AIDS (NACCA) at the national Department of Social Development (DOSD) level, ANCHOR SA is making a contribution to achieving these goals.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Care and support

ANCHOR will continue to provide comprehensive integrated care and support to OVC, their caregivers and families. ANCHOR activities will include providing services such as assisting OVC to access education (waivers for school fees, school supplies and uniforms), assistance in securing government social security grants for OVC, access to health care, and legal aid on issues of inheritance, nutritional and psychosocial support. In addition, as part of its wrap around activities, ANCHOR will continue to work with Tiger Brands, a major food producer, which provides OVC with food support. Nestle will provide training to OVC and their families on how to prepare meals with high content nutritional meals. ANCHOR will continue to build linkages and support with local schools and clinics as key partners in providing educational and health services to OVC.

ACTIVITY 2: Training and capacity building

In 2006, 200 participants from Gauteng and Port Elizabeth were trained in psychosocial support (PSS) for OVC. In FY 2008 ANCHOR will continue to train community members in PSS skills to support OVC. ANCHOR will develop user-friendly and outcome-based psychosocial support and basic counseling training manuals to be used by community workers. ANCHOR will continue to be supported by Hope worldwide (HWSA) Regional OVC Organization Support Initiative (ROSI) to provide training to partner organizations, SA-based volunteers, caregivers, and Hope staff use a 'Training of Trainers' (TOT) approach to scale up efforts and increase the number of OVC service providers that have been trained in PSS skills. HWSA's Abstinence focused (AB) team in partnership with ANCHOR will continue to train the caregivers/families on

Activity Narrative: parenting and leadership skills. The involvement of caregivers and community groups will ensure that ANCHOR strategies remain relevant to the community and that they meet the best interests of the children and families. ANCHOR will provide training for caregivers and family members to address strategies on child protection, psychosocial support of OVC and strategies to reduce the abuse of women and children especially girls. Workshops and family interventions will be facilitated on topics such as succession planning, stigma and discrimination, children's rights, gender equality and HIV prevention for OVC, community members and caregivers.

ACTIVITY 3: Support Groups and Kids Clubs

ANCHOR will establish new OVC support groups and strengthen community OVC support groups and Kids Clubs which will be school and community-based, to address the psychosocial needs of all vulnerable children. Psychosocial support (to build resilience and empowerment), educational support (including homework supervision), nutritional support and comprehensive referrals to other care and support services are key components of the support groups and Kids Clubs. The Kids Clubs have a strong emphasis on youth involvement and leadership, as well as child participation at all levels. Children with strong leadership potential have been identified in different Kids clubs. These children will be trained as facilitators, will be consulted in needs assessment, planning and implementation of activities and finally in the monitoring of activities. Local Rotary Clubs will strengthen the kids clubs by providing educational and age appropriate life skill materials, school supplies and refurbished containers in areas where there are no centers to house Kids Clubs.

ACTIVITY 4: Child Care Forums

Child Care Forums (CCF) will be established in ANCHOR sites in the two provinces. One CCF was established in 2006 and ANCHOR plans to establish four more in Gauteng and Port Elizabeth. These forums will consist of key stakeholders in local communities, including health workers, the police, government departments, and CBOs, FBO, caregivers and child/youth representatives. In addition, educators will be represented on each CCF to ensure children's educational issues are addressed. The functions of the CCF are to ensure that the needs of OVC are met in a sustainable local structure and to be advocates for children within their community. The Journey of Life (JOL) manual will be used to train CCF members and caregivers.

ACTIVITY 5: Sub-grantees

Boitshoko, an OVC-focused organization, has been identified as a sub-grantee for the ANCHOR Track 1 program. Boitshoko, located in Soweto, Gauteng, will provide OVC support in education, nutrition, developing and supporting Kids Clubs, support groups and providing psychosocial support. ANCHOR will provide technical assistance to Boitshoko which has a focus on organizational capacity development, to improve implementation of Boathook's OVC program. Regular mentoring and feedback sessions will be held to review progress. Funds will be used to support staff, training, community mobilization and other program support needs. Coca Cola Africa Foundation and other donors have been approached to fund organizational capacity development and staff development for all ANCHOR community partners. If this request for funding is successful it will strengthen sub-grantees and OVC serving NGOs.

Prime Partner: Olive Leaf Foundation

USG Agency: U.S. Agency for International
Development

Funding Source: GHCS (State)

Program Area: Care: OVC

Budget Code: HKID

Program Budget Code: 13

Activity ID: 3304.23153.09

Planned Funds: \$2,071,910

Activity System ID: 23153

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: The curricula on the Peer Education and Structured Group Therapy will include an Adolescent Sexual Reproductive Health component, which will address prevention messages, education on rights to access healthcare, and contraception options for the 14-18 year olds. HwwSA will review the best models of youth-friendly clinics and implement lessons learned at five pilot government clinics. HwwSA will facilitate training, work with clinics to strengthen the implementation of Youth Friendly Services guidelines and continued monitoring to ensure quality services.

ACTIVITY 2: HwwSA will pay attention to Food and Nutrition Policy informed by the Hearth Model and guidelines derived from the quality assurance program for child care centers. Upon the completion of the internal policy, HwwSA will engage communities to draw up guidelines which will inform the training curriculum. A toolkit will be developed in partnership with Save the Children who has implemented this model in reducing malnutrition in Asia. HwwSA aims to train 400 people on the implementation of Food & Nutrition guidelines.

ACTIVITY 3: HwwSA will change focus from sub-grant support to focus on capacity building, training and mentoring of other NGOs, and Community Child Care Forums (CCCCF). One of the tools that will be used in providing capacity building targeting these groups is the Community Capacity Enhancement Program (CCEP). The aim of the CCEP is to ensure that ownership is successfully transferred from the implementing partner to the community. HwwSA will implement this by enhancing existing CCCC to be equipped to form new CCCC in the community through training in governance, fundraising, event organizing and mapping to examine areas of need. This will ensure sustainability by capacitating the communities to replicate the CCCC models without external support. The goal is to train 649 people from the above mentioned groups.

ACTIVITY 4: HwwSA will link older OVC (15-18yrs) to vocational skills training programs and gender sensitization. Activities will include:

(A) Introduction of the 'Umzi Wethu' Model, which links OVC to industry specific vocational skills training and mentoring. The program is sponsored by the Department of Tourism and has links to other PEPFAR partners. Corporate partnerships will be pursued to ensure sustainability. The pilot program will be duplicated in all 5 provinces to benefit an estimated 200 OVC.

(B) Refinement of the current strategy to include an exit plan for older OVC by replicating the Youth Empowerment Project (YEP), which was initiated by an 18-year old OVC who exited the program in the KwaZulu-Natal province. HwwSA will strengthen networks with other NGOs that have young adult specific interventions. These OVC will be linked to career guidance/counseling, training on grant/loan applications for tertiary education, how to access services for grants and housing, political involvement and community leadership.

HwwSA plans to integrate training on Youth Adult Partnership, which encourages greater involvement of OVC in decision making. 400 OVC will benefit from this activity.

ACTIVITY 5: Introduction of training sessions targeting pregnant OVC in: the Prevention of Mother to Child Transmission, parenting, health, food/nutrition education. Findings from the field indicated that pregnancy among OVC is escalating and this necessitates a need to encourage behavior change which can be facilitated by using tools such as the Hearth Model for the OVC "mothers" and mentors. The synergy between OVC and Abalingani Gender Program focuses on addressing the harmful impact of gender imbalance on the implementation of OVC-centered interventions. Enhancements to the secondary cross-cutting budget attributions are as follows: HwwSA will develop human capacity through 3 levels (child, family and community) that will ensure quality service delivery through training and mentoring. Food and nutrition policy tools and delivery will be addressed through the development of an internal food security policy, a consultative process with all stakeholders to develop guidelines that will inform the training curricula. For Food and Nutrition commodities, HwwSA will establish food gardens to augment food items handed out at Kids Clubs to assist OVC and their families with nutritional supplements. This will be done in partnership with the Rock Angel foundation, Nestle and Tiger Brands.

SUMMARY:

Hope worldwide South Africa (HWSA) will continue to strengthen and develop community orphans and vulnerable Children (OVC) support groups, facilitate kids clubs, strengthen community child care forums, train partner organizations and provide small sub-grants to community-based organizations (CBOs). Primary target populations reached include OVC, youth, and people living with HIV and AIDS. The major emphasis area for the program is training. There will also be a strong focus on educating boys and girls on gender issues. HWSA will also embark on a strong prevention program for older OVC. Older OVC and their families will also be assisted with income generating activities development through public-private partnerships (PPPs).

BACKGROUND:

The OVC program is one of the five focus areas funded by PEPFAR since 2004. The program's main objective is to strengthen and scale-up community-based interventions to provide comprehensive care and improve the quality of life of OVC in areas where HWSA operates. The three activities described below began in 2004 and will be strengthened and scaled-up in FY 2008. HWSA has a PPP with Coca Cola which started in the Western Cape. HWSA will increase care and support of OVC and their families as outlined in the South African Government (SAG) OVC National Plan of Action and National Strategic Plan. HWSA is an active member of the National Action Committee for Children affected by Aids (NACCA) implemented through Department of Social Development (DOSD) in collaboration with other departments to address the OVC National Plan of Action. In FY 2006, HWSA reached almost 14,000 OVC across 4 provinces.

ACTIVITY 1: Training and Capacity Building

Activity Narrative: HWSA in partnership with ROSI (Regional OVC Support initiative), will continue to provide training to NGOs, CBOs and FBOs in working with children and Psychosocial Support, Kids Clubs, Community Child Care Forums, Basic Play skills, Basic Counseling for Children and support groups to partner organizations. This partnership will enhance HWSA's capacity to offer quality training, enhance capacity of communities to provide comprehensive care and support to orphans and help scale up the OVC reach across the country. In FY 2008 ROSI will train HWSA site coordinators and fieldworkers who will then conduct training of other organizations, Caregivers, Community Child Care Forums and Kids Club Leaders. ROSI trainers will follow up on trained organizations and staff to observe implementation. HWSA continues to emphasize the importance of youth participation in all its activities, and a key component of the Kids Clubs is that the children themselves lead the discussions. To encourage child and youth participation, Kids Club leaders will be trained on Basic HIV/AIDS and knowledge on how to run Kids Clubs (e.g. facilitation skills, lesson plans, games etc.). During Kids Club Activities the HWSA fieldworkers observe, and then organize workshops to help Kids Club Leaders improve their skills.

ROSI's expert on Child protection has sensitized HWSA managers on the need for the organization to adhere to Child Protection. HWSA is drafting a Child Protection Policy which will ensure that all staff and Caregivers working with OVC have been checked and qualify to work with OVC.

Caregivers and family members will be trained on succession planning, children's rights, child participation and child protection. The Children Commission, in collaboration with HWSA and local police, conduct annual campaigns on Children's Rights and Child Protection. These campaigns will be held in schools and community centers and will educate OVC on their rights and responsibilities and help them identify and address physical and sexual abuse issues.

ACTIVITY 2: Comprehensive OVC support

The OVC program will continue to provide comprehensive care and support to OVC and their families. OVC are identified by the program through schools, referrals from Community Child Care Forums, Adults from HWSA's Care and Support program. All OVC referred are assessed and registered on HWSA's database, HWSA conducts baseline surveys when entering communities and establishes networks of service providers and NGOs to facilitate referrals. Services such as access to education, social security grants, health care, legal aid, targeted food, nutrition and psychosocial support will be provided to OVC through activities Kids Clubs lead by trained OVC, Home Visits will be done by Caregivers to ensure OVC receive comprehensive care. OVC will be counseled will be done by trained HWSA field workers, coordinators and trained caregivers either one on one in groups. HWSA field workers, coordinators and caregivers will educate OVC and refer others for services not provided directly by HWSA. OVC will receive ART treatment and adherence support at the closest SAG accredited treatment site. In the Soweto area abused children will be supported and referred for special treatment to Harriet Shezi Clinic in Soweto, where they will receive psychosocial support and ART treatment. In addition, through HWSA's partnership with Tiger Brands (the largest cereal producer in South Africa), local markets, churches and schools. With non-PEPFAR funds, OVC will receive food parcels at least once a month; others may receive more regular food parcels depending on the need. HWSA will provide a meal to every OVC during activities like Kids Clubs and Support groups on a weekly basis. Various other services will be provided in partnership with the local schools, women's groups, community and youth centers, clinics and government departments. For example, ABSA a major South African banking group, is supporting Kids Clubs with educational and life skills material with funding raised from the public through Special Campaigns for the purpose of assisting OVC educational needs. HWSA's caregivers who do home visits then identify educational needs and provide educational material to OVC identified as in need. This is supervised by coordinators and tracked through HWSA's procurement procedures. Through the Kids Clubs and support groups, HWSA conducts life skill activities, organize leadership camps, and provides one-on-one and group counseling to children with special needs.

ACTIVITY 3: Sub-grants

NGOs such as VUKA and Emthonjeni will assist in scaling-up OVC activities in the areas where they operate. The objective is to expand programs in rural areas of Eastern and Western Cape provinces. Sub-grants will be awarded for OVC support to provide nutritional, psychosocial and material support. Technical assistance will be provided on organizational capacity development where necessary to improve the care and support of OVC. In addition, regular mentoring and feedback sessions will be held to review progress.

ACTIVITY 4: Public-Private Partnership with Coca Cola

HWSA will pioneer a Vendor Employment Model for orphans and vulnerable children in South Africa. Through a public-private partnership with Coca Cola, HWSA will explore a vendor economic support activity for OVC/child-headed families and granny support groups. HWSA has recruited 20 OVC and this number will be increased in FY 2008. The children will be provided training in small business management, money management and how to save and reinvest in their business. OVC will also be trained on basic business skills, marketing and budgeting. In addition, psychosocial training, support and supervision will be provided by HWSA. The necessary trolleys, uniforms, umbrellas and the first inventory of Coca-Cola will be provided to the children. The Coca-Cola management assigned the children in the most appropriate areas where they can sell Coca-Cola. This income generating activity will bring revenue autonomy and new skills into the lives and homes of the OVC which will contribute to reducing the susceptibility of the OVC to HIV.

ACTIVITY 5: HIV Prevention and Gender Socialization

HWSA will use the funds as follows: a) To strengthen adolescent OVC program to focus on HIV Prevention including reproductive health education. OVC face pressures to engage in risky sexual behavior like any other adolescents, but their situation is magnified due to their increased vulnerability because of lack adequate parental guidance. HWSA has undergone training on conducting prevention activities for adolescent OVC to enhance their knowledge, skills and capacity to prevent HIV infection. HIV prevention

Activity Narrative: messages will be incorporated into Kids Clubs and Support group activities. Kids Club leaders, HWSA field workers and coordinators who conduct Kids Clubs and support groups will all be trained on HIV prevention messages for OVC. b) To integrate gender issues within the OVC program: While caregivers and adolescent OVC (especially child-headed households) face serious challenges due to illnesses and bereavement, the realities of gender inequalities and social norms contributes to their vulnerability. HWSA Coordinators and fieldworkers, as well as Caregivers and members of CCFs will undergo training and mentoring support on how to conducting gender socialization messages for adolescent OVC to enhance their knowledge, skills and capacity and to build resilience to face gender related issues. Gender socialization messages will be incorporated into Kids Clubs and Support group activities.

Planned Funds: \$485,452

Activity System ID: 23079

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Direct Support to OVC

The Turntable Trust (TTT), based in KwaZulu-Natal province in the Sisonke District, works with clinical staff, peer educators and community outreach workers to reach community members in schools, at workplaces, including farms, at the TTT youth drop-in center, at health facilities and at community gatherings. TTT will work with OVC to provide direct support to OVC identified through the schooling system and other community structures. TTT will train caregivers who will provide a package of direct support, including psychosocial support, to identified OVC in the Sisonke District.

The Lighthouse Foundation (LF), working in the rural, underserved area of Jericho, North West province, will work with community facilitators to provide a package of care to identified OVC in the area. LF will train community-based caregivers to provide a package of care to addressing the needs of identified OVC in the area.

DramAidE will no longer provide direct OVC services, but will focus on building the capacity of identified PEPFAR partners to deliver psychosocial support to OVC serviced by their programs. DramAidE will also continue to work with community facilitators in KwaZulu-Natal province who will be trained to work in communities to assist OVC to gain access to basic material needs and ongoing psychosocial support activities.

The OVC program of the Anglican Church is being managed by another PEPFAR implementing partner.

SUMMARY:

The Johns Hopkins University/Center for Communication Programs (JHU/CCP) will implement an orphans and vulnerable children (OVC) intervention that builds networks of support around OVC, their caregivers and educators. OVC will be assisted in accessing basic needs and psychosocial support. Proven psychosocial models for supporting OVC will be used to build the capacity of organizations working with OVC. The target populations for this program are OVC, people living with HIV, religious leaders, and teachers and existing PEPFAR partners. The major emphasis area for the activity is local organization capacity building.

BACKGROUND:

This program is now in its third year and focuses on using tools developed in past years to work with communities, caregivers and OVC to implement appropriate responses which address a range of OVC needs, including physical, social and emotional issues. DramAidE, The Valley Trust and the Anglican church have worked with schools, FBOs and CBOs to identify OVC, who have received needed services. This partner's activities to date include community mobilization for the provision of psychosocial and direct support for OVC in communities. Direct support includes; home visits to OVC to monitor their progress, referrals to social workers, tribal authorities, assisting in applying for the waiving of school fees for OVC through the Department of Education, referrals to the Department of Social Development and the Department of Home affairs for Child Support, Foster Care and Child Dependency grants. Support has also focused on collaboration with local police and other community organizations to promote child protection.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Direct Support to OVC

The Valley Trust (TVT) works in the rural areas of KwaZulu-Natal and identifies and trains caregivers within local communities to provide direct care and support to OVC. This includes protection from abuse and exploitation and working with school officials to identify and work with OVC who are trained as Peer educators within the school settings. Peer Educators identify and work with other OVC on creating safe spaces and providing psychosocial support that uses group recreational activities including music, drama and sports to decrease social isolation. Peer Educators also provide support to OVC for bereavement and compiling and maintaining memory boxes.

DramAidE Community facilitators (CFs) are trained to work in communities to assist OVC to gain access to basic material needs and ongoing psychosocial support activities. In addition to providing direct assistance to OVC, CFs work with communities, FBOs, NGOs, educators and caregivers to lay the foundation for community action in support of these OVC.

Through these activities DramAidE and TVT strengthen the capacity of the communities to be able to respond to the needs of and to develop a culture of care, nurture and support for OVC.

ACTIVITY 2: Technical Assistance (TA) for PEPFAR OVC Partners on Psychosocial Support

DramAidE provides training and technical assistance on psychosocial support to other PEPFAR OVC partners. Creative, interactive and culturally appropriate activities to reach OVC, such as drama, storytelling and workshops are used to equip and enhance existing PEPFAR OVC programs in responding to the psychosocial needs of OVC and include HIV prevention interventions for OVC which are age appropriate. Educators and caregivers are trained and provided with on-going support in implementing these programs. The meaningful participation of affected children, OVC and youth is critical to the success and sustainability of any effective intervention targeting OVC. To this end, OVC are consulted regarding their needs and are involved in developing local support networks.

ACTIVITY 3: Communication Training

Activity Narrative: JHU/CCP and PEPFAR partner Soul City work together to provide communication training to assist caregivers in developing tools and skills which will enhance their ability to provide more effective and efficient services. Interpersonal communication skills training will be conducted, and a core set of materials adapted from media programs, along with facilitator guides, will also be produced and distributed as part of this activity.

These activities will contribute towards meeting the vision outlined in the USG Five Year Strategy for South Africa, by providing care for children made vulnerable by HIV and AIDS through the expansion of community capacity to deliver good quality care. In addition they increase OVC access to government support systems, and strengthen linkages and referral systems to other social services such as health, education and social welfare. The latter will be achieved through the establishment of child care forums with all relevant stakeholders, including government departments that provide services to OVC; compilation of directory of government and civil society services available for children and also through facilitation of community conversations for OVC, pre-school practitioners, school governing bodies, community policing forums, other stakeholders and youth caregivers to address stigma directed at OVC

JHU/CCP and its partners contribute towards the attainment of the National Strategic Plan target of ensuring that 80% of people living with HIV and their families are provided with an appropriate package of treatment, care and support through ensuring the effective implementation of policies and strategies that mitigate the impact of HIV on orphans, vulnerable children and youth-headed households.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 7298.09	Mechanism: N/A
Prime Partner: Heartbeat	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 15936.23068.09	Planned Funds: \$800,996
Activity System ID: 23068	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

BACKGROUND:

Heartbeat has set a strategic objective in 2007 to reach 50,000 children by end of 2010. In addition to the number of children Heartbeat would like to reach, the organization will also expand geographically to include all nine provinces of South Africa. The targets set for PEPFAR COP 2008 and COP 2009 have this expansion in mind. Heartbeat will establish a Learning Centre in each province to implement the following four major strategies:

1. Mentoring and training of other NGOs, CBOs and FBOs to implement Heartbeat's model of care.
2. Training of primary caregivers and heads of households on relevant topics.
3. The expansion and enhancement of Heartbeat's current projects to offer better quality of service.
4. Securing grants for eligible OVC and their households.

These strategies speak to the technical considerations provided by USAID. Heartbeat will scale-up by improving performance and the expansion of current programs. With the expansion of Heartbeat into all provinces of South Africa, special care will be taken to identify communities with the greatest prevalence. The scale-up will assist Heartbeat in reaching more children as will be reflected by the targets that are set.

ACTIVITY 2: Human Capacity Development

In addition to childcare workers and children, Heartbeat will also reach primary caregivers of orphaned and vulnerable children through training. Training will include topics like succession planning, discipline, access of basic services and care for the carers.

SUMMARY:

Heartbeat will use PEPFAR funds to assist in providing a holistic package of basic services to orphans and vulnerable children (OVC), including increased access to educational support and psychosocial support services through community-based programs in eight provinces. Specific target populations include OVC, their families and caregivers. The major emphasis areas for the program are human capacity development and local organization capacity building.

BACKGROUND:

In the seven years since its inception, Heartbeat has successfully worked with partners to implement projects in seven provinces, meeting the needs of 11,000 orphaned and vulnerable children and approximately 1,100 primary caregivers. Heartbeat is reaching these children through two priorities: (1) their own direct project initiatives and (2) their training and mentorship initiative.

Heartbeat projects are physical communities and sites from which the organization runs its services. Heartbeat reaches three specific categories of children in their projects, namely: (1) Children living in child-headed households (CHH), approximately 10% of the children; (2) Children living in relative - (mostly grannies / aunts)-headed households (RHH), approximately 60% of the children; and (3) Children living with a primary caretaker that is terminally ill (PO). Heartbeat programs contribute to the positive transformation of the whole child. These programs are sustainable and focused and are delivered through project sites called After School Centers. These programs include: material provision, education, children's empowerment, rights and access to basic services, capacity building and a sponsorship program through Sponsor a Child in Need (SACIN).

The services that Heartbeat provides are provided in partnership with other stakeholders in a supply-chain, for example Heartbeat partners with stakeholders that assist with Early Childhood Development Services (e.g. Project Head start); Tertiary Education Support especially for older OVC and as part of an exit strategy for OVC that reach 18 years (e.g. Tomorrow Trust; CIDA City University Campus); Sports and Recreation and Health care training and support (Big Shoes Foundation which provides medical care to OVC especially those affected by HIV and AIDS). Through this chain of service providers, Heartbeat has a continuous and close collaboration with other NGOs, the South Africa Government, Public-Private Partnerships (PPP), Community-based Organizations (CBOs) and individuals.

Apart from implementing the recognized Heartbeat Model of Care for OVC, Heartbeat has also developed a Mentorship Program to extend their reach to more children by empowering existing organizations (e.g. CBOs and FBOs), to implement the Heartbeat model of care. Heartbeat's program is aligned with the South African National Strategic Plan for Orphans & Other Children made vulnerable by HIV/AIDS and the Department of Social Development's (DOSD) Policy Framework. Heartbeat is also part of the National Action Committee for Children affected and infected by HIV and AIDS.

Heartbeat services and program are supported by partnerships with the South African Government, international funding and with business, including more than 30 business contributing small and large amounts of money to support services such as food parcels, seedlings for food gardens, home visits, toiletries, psychosocial support and educational support. Heartbeat's largest donor through a PPP is Tiger Brands, which has supported Heartbeat with food parcels since 2002.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Local Organization Capacity Development

Activity Narrative: Core to Heartbeat's scale-up strategy is a sustainable training and mentoring program. Partner organizations are trained and mentored for a 24 month period in OVC care and support and direct service provision to OVC; as well as developing and improving organizational capacity. As the number of capacitated organizations increase nationally, more OVC can be cost effectively reached and brought into a safety net of care in a way that ensures sustainable service delivery. Heartbeat will work to access and implement services within the frameworks provided by the Departments of Education, Home Affairs and Social Development. Partner organizations will be trained and mentored to secure school fee exemption, rather than trying to raise funds for fees and to apply for and access legal documents and secure social grants; rather than directly paying monthly household expenses and needs. Heartbeat delivers other services such as psychosocial support and legal aid services in partnership with these organizations in eight provinces in South Africa.

ACTIVITY 2: Human Capacity Development

As part of the Heartbeat's "Tswelopele" Training and Mentoring program, Heartbeat and other partners' care workers will be trained in organizational matters such as OVC care and support topics that include basic child care, the role of the childcare worker, establishing OVC selection criteria and community child care forums; minimizing discrimination and stigma, HIV/AIDS and children issues; and promoting gender equality, child protection and participation and psychosocial support services in service delivery. Organizations with care workers should proof potential to be sustainable, i.e. have the ability to attract donors to support the implementation of the Heartbeat model of care. Basic parenting skills, nutrition and food gardening form part of the curriculum. Orphaned and vulnerable children will in addition receive training in child protection and child participation, gender equality, sexuality and HIV prevention and AIDS information.

ACTIVITY 3: Psychosocial Support

The psychosocial support programs link OVC to psychological and emotional care and leads to the empowerment of children and improvement of their well-being. A network of care workers regularly visit OVC at their homes to offer emotional support and practical support, i.e. household chores, cooking, cleaning and some homework assistance. These care workers are recruited from advertisements in communities. PEPFAR funds will be used to provide training, ongoing supportive supervision and mentoring to care workers as well as stipends. Psychosocial support services to children will include support groups, individual counseling, bereavement support, memory work, children's workshops, puppet shows, and youth camps.

ACTIVITY 4: Prevention and Protection

Heartbeat will provide age-appropriate developmental programs will include children's workshops, puppet shows, and youth camps in FY 2008. The youth camps (for older OVC) will focus on core themes such as life skills, gender equality, child protection (including issues around alcohol and drug abuse) with the view to reduce violence and coercion, sexuality education, HIV and AIDS prevention information and reproductive health. The youth camps will also train and mentor young peer educators through a partnership with Harvard School of Public Health. The children workshops will enforce prevention messages regarding HIV and AIDS and will focus on child protection and gender equality information and tools. The puppet shows will have a specific focus on values and child protection and will be done among other with Heartbeat's Early Childhood Development partners and projects.

ACTIVITY 5: Educational Support

School uniforms and stationery are supplied to OVC as part of Heartbeat's educational program with funding from Heartbeat's other corporate and international donors. This is a very important intervention as it is known to reduce stigma and discrimination and thereby encourage school attendance. PEPFAR funding will be used to fund academic assistance and homework support facilitated at After School Centers by qualified teachers and volunteers or in partnership with Tomorrow Trust, with a focus on English and Mathematics during school holidays. Heartbeat's After School Centers are also places of safety and support for OVC and provide a hub from which Heartbeat delivers other necessary services to OVC.

ACTIVITY 6: Legal Assistance and Economic Support

PEPFAR funding will support a birth certificate and identity document drive that will enable social workers (who are, and will be, employed by Heartbeat to facilitate this intervention) to apply for government social grants for OVC who qualify for them. This intervention will assist government to fulfill their mandate as stipulated in the DOSD's Strategic Framework. PEPFAR funding will also ensure that blankets be distributed as one intervention that will provide a safe and secure environment for OVC. Other services that will also contribute to the safety and security of children include child protection workshops, abuse interventions from social workers, mobilization of the Community Child Care Forum that consists of concerned community members, access to the After School Centers and visits from the care workers.

ACTIVITY 7: Nutritional Support

Food gardens provide fresh produce to supplement monthly food parcels, and meet the needs for daily meals provided to pre- and school going OVC at Heartbeat's After School Center and the Heartbeat supported pre-schools where OVC are integrated. PEPFAR has supported the establishment and maintenance of these food gardens in the past and will continue to support this initiative in FY 2008. Furthermore, nutritional education training will be given to OVC, caregivers and pre-school teachers, to assist in improving OVC nutritional status by covering topics such as healthy food choices, food preparation and storage. Provision of monthly food parcels is a wrap around activity funded through national and local business partnerships (e.g. Tiger Brands a local food producer). Food parcels with non-perishable food products are provided to families without any government economic support (grants) from non-PEPFAR

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 7297.09	Mechanism: N/A
Prime Partner: Health and Development Africa	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 15935.23061.09	Planned Funds: \$679,633
Activity System ID: 23061	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

FY 2009 activities will have a greater focus on reaching out-of-school youth, and encouraging these children back to school. Emphasis will be placed on reaching the siblings of the in-school OVC that might be too old or young to be in school. This group will include, for example, children under five years old and those who have completed Matric (12th grade) and are neither pursuing further education nor employed.

Youth participation will also be an enhancement to the 2009 activities, as children who have been supported through the project are now able to support younger children themselves, and have the confidence and self-esteem to offer their own opinions on project activities - so enhancing the project model itself. The quality of the project model will be further enhanced as constant monitoring and evaluation during 2008 will expose any project challenges and gaps. Internal evaluation will allow Health and Development Africa (HDA) to implement project improvements to overcome challenges faced in FY 2008, as well as build on those activities that are proving successful. The refresher trainings that will take place in 2009 will strengthen the knowledge and skills of the twelve facilitators, 18 Child Care Forums (CCFs) and 90 School-based support Teams (SBSTs), which will ultimately improve the quality of service delivery.

HDA will conduct three types of training in FY 2009, which will be to refresh the knowledge and skills transfer that took place during 2008 and highlight main issues that will be addressed in 2009, such as gender equity and reaching out-of-school youth. The first training is for the project's six Circles of Support Facilitators (COS) and Learner Facilitators, who are Lejweleputswa community members capacitated and employed to train and guide the CCF members and SBSTs on how to identify and support OVC and ensure they access quality health and social services. Training will also focus on improving the COS Facilitators and Learner Facilitators' growing management and future leadership skills. All six COS Facilitators are paid by the project and Learner Facilitators are Department of Education employees and are paid by the department.

CCFs and SBSTs (18 and 90, respectively) will receive their own set of trainings. Their training will focus on identifying OVC, developing an action plan to address the needs identified, establishing networks with relevant stakeholders and monitoring and reporting. These will address their specific area of focus and skills needs to support OVC, to establish links to health and social wraparound services, and to sustain this support even once the project has exited the area.

A district workshop will be held with relevant stakeholders, who will include government departments, local businesses, local NGOs and community stakeholders. The workshop participants will receive basic project-based skills training to build up their capacity to also support the OVC beneficiaries in their own initiatives and to network these initiatives. The objectives of the Circles of Support project are closely aligned to that of South Africa's National Strategic Plan (NSP) 2007-2011. The project works towards all four Key Priority Areas of the NSP.

The project will work with the South African Department of Health's Training Manual (Operational Plan for comprehensive HIV and AIDS care, management and treatment for South Africa) and the OVC National Plan of Action to adapt the COS training material to suit the South African and Free State contexts. Project staff will work closely with the district Department of Social Development (DOSD), which will allow the project to be closely aligned to the DOSD's Policy Framework on Orphans and Vulnerable Children and its six key strategies.

A Gender Analysis Tool will be adapted at the start of the project from existing tools developed by other OVC organizations. This adaptation also will be based heavily upon the gender issues identified by the beneficiary communities. This tool will guide gender issues of the project. It will be managed by the M&E officer. The M&E tools and procedures also will disaggregate data and M&E information according to all four gender groups (men, women, girls, and boys).

Monitoring and Evaluation: The project's M&E officer and technical support will create and manage relevant M&E tools and procedures whereby project staff record relevant information on how current OVC support in the Free State district stands and how it is developing. The project's M&E system will add to South Africa's collection of valid OVC data as well as build M&E skills and understanding of the local project staff.

SUMMARY:

This project is being initiated by the Department of Education in the Free State province, managed and supported by Health and Development Africa. The project will support Orphans and Vulnerable Children (OVC) through a school-based intervention in 90 schools in the Free State province, and the development of 18 community Child Care Forums. Community Facilitators will work with structures at a school and district level to identify OVC and support them. The emphasis areas are human capacity development and local organizational capacity development. The specific target population is orphans and vulnerable children.

BACKGROUND:

HDA is a South African health consulting company, which has been working in the field of HIV for the past 7 years. Between 2000 and 2003 HDA staff led and participated in a number of HIV Impact Studies for Ministries of Education across Southern Africa. As a result HDA developed the Circles Of Support (COS) model to provide education ministries with a model they could use to develop ways to support OVC within the education system. This model trains educators and community members to work together to identify vulnerable children. These children are then assisted with their basic needs, and also the project also ensures that they stay in school and continue with their education. By using schools, which are present in all communities, the COS model becomes a sustainable way to support vulnerable children, and make sure that they do not get trapped in a cycle of poverty, which also makes them more vulnerable to HIV infection. This project will build on existing initiatives to support OVC by the Department of Education that are already underway in the Free State province. It will also build on the Circles of Support (COS) project developed by

Activity Narrative: HDA, and implemented in Swaziland, Botswana and Namibia between 2003 and 2005. While the project aims to target all OVC in the project schools, there will be particular focus on the vulnerable girls, and will aim to ensure that these girls continue with their schooling. Activities and expected results: We will carry out 5 main activities in FY 2008.

ACTIVITY 1: Training & Assessment

The first activity will be to review and adapt the materials that have previously been used for similar projects in Botswana, Namibia, Swaziland and the Eastern Cape. The DOE will assist HDA decide the most important content for the facilitation materials including but not limited to: Understanding children's lives, talking and listening to children, setting up a circle of support group at school, setting up a neighborhood circle of support group, basic HIV and AIDS knowledge, know the community your school serves, know who to ask for help and support, find ways to get financial or other material support for children, decide what action to take to help children, how to use the circles of support diary. After this HDA will train at least 6 Circles of Support (COS) facilitators (dedicated project staff) and at least 6 learning support facilitators (DOE staff) the above topics. We will recruit the 6 facilitators in this period, and conduct training workshops that will HDA will also coordinate a capacity audit in a sample of project schools. The capacity assessment processes will ensure that any significant policy or institutional issues that may impede the implementation of the project are identified at the beginning and discussed with the DoE and key stakeholders. Also it will ensure that the facilitation manuals and awareness materials are sensitive to the school environment and address key capacity gaps.

ACTIVITY 2:

The second activity will be the facilitation and development of 18 community forums. These structures are being set at the request of the Department of Education in the Free State. They are multi-sectoral bodies that can overcome some of the common obstacles that OVC face. For example, it is not possible for OVC to access child support grants without identify documents, but often this requires the Department of Home Affairs, as well as the police and other stakeholders to assist OVC to get all of the necessary documents in order. Each local COS facilitator will be responsible for the development of 3 Child Care Forums (CCF). This will involve identification of stakeholders, community mapping, introductory workshops, monthly meetings and oversight of a program of activities. It is expected that the CCFs will be operational within the first six months of project implementation. These forums will typically be made up of community members, as well as representatives from the Departments of Education, Health and Social Development. HDA will orient and train the CCF members, using a similar curriculum to that used for the School-based Support Teams (SBSTs) (see above). After this the COS facilitators will ensure that these community forums meet at least monthly, and also that any problems that are being experienced by the SBSTs are being raised and solutions discussed at these meetings.

ACTIVITY 3: Strengthening School-based Support

HDA will partner with 90 schools in the Lejweleputswa district to establish Schools-based Support Teams (SBSTs). SBSTs will include teachers, concerned parents and community members who can play an active role in supporting children. In schools where the Department of Education has established Health Advisory Communities (HACs), the HAC will serve as the SBST. These SBSTs will be supported by a local COS facilitator and learning support facilitator/s. The local COS facilitator will lead the process of introducing the COS project to SBSTs and will, through a program of half day workshops train SBST members on the needs of vulnerable children, how to identify children, community mapping, networking with government and other resources, action planning and monitoring and reporting. Once members of the SBST have been trained they will start to actively identify vulnerable children in the school. All teachers will be asked to be involved in a process of identifying these children, many of whom are already known. Although the initial process will prioritize children in school, it is expected to extend to siblings who are not in school, and also children who have dropped out of school. The children that are supported at school will not be identified as "AIDS orphans", and the HDA will train the teachers to approach all vulnerable children in a sensitive manner.

ACTIVITY 4:

Care and Support HDA and the Department of Education will ensure that all children who are identified through this project are provided with a package of services to ensure that the child's needs are met as comprehensively as possible. The SBST will meet monthly, and discuss and assess the children who are being supported. After a child has been identified, members of the SBST will conduct interviews with the child and caregivers to determine the child's needs, and to discuss priority interventions. If necessary home visits will be organized to establish the circumstances under which the child is living. Once the needs assessment is completed the SBST will provide the child with support to meet their needs. This support is likely to include the following: provision of school equipment and uniform, assistance to ensure exemption of school fees, working with local clinics to get access to health care, assistance with ensuring the child receives a social grant and nutritional support. This is usually delivered by referring the child to NGOs working in the community, or through helping the school set up a feeding program. Children will also receive assistance with home care and home work. Often these children are looking after ill adults, and younger children. The SBST works with neighbors and community organizations to make sure that these children get support in these tasks, while at the same time get help with their own school work. There may be extreme cases where children are in severe need, either because they do not have housing, or food, or are being abused in some way. In this case the SBST will work closely with the Department of Social Development, and the South African Police, to ensure the safety of that child. If the SBST is unable to find a way to provide for child's needs, they will then consult the COS facilitator and the Community Forum. The COS facilitator will also help to share experiences between SBSTs, and highlight solutions that can then be used in other areas. The COS facilitator will also help to monitor the progress that the SBSTs are making. The COS Project will ensure the following is monitored in terms of gender: the gender of OVC receiving direct support, the involvement of women in all COS structures (particularly at the local level where there can be

Activity Narrative: over representation of women), adequate involvement of men in COS structures. This means all monitoring data will be disaggregated by gender, including all workshop data. Additional exercises specifically addressing gender issues will be integrated into set-up training. For example, the training will focus on the increased vulnerability of girls, and ways to ensure that girls are kept safe, both in and out of school. Training will also discuss critical child safety and protection issues such as sexual abuse. SBSTs will be encouraged to introduce child participation activities designed to build self esteem of vulnerable children, particularly girls where this may be necessary to build resilience.

By the end of FY 2008 all 90 schools will be actively implementing COS support activities. While the main focus of the SBSTs is to keep OVC in school, other services will be to ensure that OVC get social grants, to provide psychosocial support, and to provide for material needs where this is a problem for that child. The schools will get some funds for emergency support for OVC. This may include the purchase of food, transport of children and carers to places of safety etc.

Activity ID: 12479.23157.09

Planned Funds: \$1,334,994

Activity System ID: 23157

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

After the success of the pilot project, with increased funding the program will be expanded to forty sites, within all provinces, with a long term view to having a children's hospice program within each health district and sub-district which make up the district.

A National OVC Officer will be appointed to assist in the support of the forty sites and other development sites, as well as with training.

For the St. Nicholas Bana Pele Children's Network, specific staff will be appointed to develop and manage the network and provide training and mentorship to other network partners and to ensure effective liaison with government departments regarding children.

SUMMARY:

The Hospice Palliative Care Association of South Africa (HPCA), founded in 1988, currently has 75 member hospices throughout South Africa (SA), each an independent legal entity. The HPCA Mission is to provide and enhance the provision of sustainable, accessible, quality palliative care. The target population is orphans and vulnerable children (OVC). The emphasis areas are human capacity development (training) and local organizational capacity building. PEPFAR funding used to strengthen the capacity of HPCA member hospices to provide pediatric palliative care to vulnerable children through identifying hospices that provide care for OVC. The Bana Pele project, in partnership with St Nicholas Children's Hospice (St Nicolas) in Bloemfontein, a sub-partner will improve the quality of life of OVC in the Motheo and Xhariep Districts of the Free State, and increase identification of HIV positive children and improve access to antiretroviral therapy for them.

BACKGROUND:

HPCA strengthens existing services and develops new services through direct funding to member hospices to promote accessibility and availability of palliative care in SA. HPCA personnel at national, provincial and district levels continue to provide the infrastructure and coordination to develop and strengthen palliative care programs within member hospices, and government and non-government organizations. FY 2006 PEPFAR funding has allowed the Palliative Care training of 7,108 trainees from October 2006 to July 2007. These trainees include Doctors, Social Workers, Trainers, Professional Nurses, Enrolled Nurses, Home-based Caregivers and Managers. The major focus of PEPFAR funding in FY 2008 is to provide direct palliative care to patients and their families, to assess quality of palliative care, assist in the development of new services, provide support to the care providers, and provide training in palliative care. In FY 2008 an OVC funding component has been added to the HPCA program, to ensure that children infected and affected by HIV and any other life-limiting conditions will be identified, supported, receive pediatric palliative care and antiretroviral therapy and, where necessary, referred for further support.

ACTIVITY 1: Bana Pele Project

In FY 2008 HPCA will be managing the Bana Pele Partnership grant. HPCA will provide mentorship to St Nicholas to build capacity within that hospice. Capacity Building for the Bana Pele project will also include the appointment of new staff in the Free State to coordinate the project and expand services to new regions and into more rural areas. Capacity building in the communities will take place to identify and care for HIV-infected and affected children through education and training from the wellness centers. The wellness centers are health drop-in facilities to promote and monitor health. Holistic services are provided, including weighing of babies, nutritional advice, and immunization. Education in the homes and in community groups will also be provided in order that communities can develop the capacity to provide care for these vulnerable children and use community resources including local primary health care clinics. PEPFAR funding for the Bana Pele Project, will be used to improve the quality of life of OVC in the Motheo and Xhariep Districts of the Free State, increase identification of HIV positive children and improve access to antiretroviral therapy through a strengthened referral system and the establishment of a cooperative network consisting of relevant government departments, the antiretroviral program, faith-based organizations and other non-profit organizations. OVC will receive direct support and family members will receive psychosocial, emotional and spiritual care into the bereavement period.

Training for the Bana Pele Project: A Pediatric Palliative Care Training and Resource Center will be established in collaboration with all project partners and the Department of Pediatrics of the University of the Free State. The objective is to promote palliative care for children and provide a resource for the Free State Province for expert advice and support. Materials on palliative care for children will be developed and used for training. Community capacity will be improved through training and services from eight community Wellness Centers in impoverished areas linked to the development of a Pediatric Palliative Care Training and Resource Center, together with the Department of Pediatrics and Family Medicine. Prevention education will be provided with the faith-based organizations to reach young people and training in palliative care for children will be given to individuals. This activity will be supported by an array of monitoring and evaluation activities to assist in monitoring the progress and measuring the results.

ACTIVITY 2: Capacity Building

HPCA will provide capacity building expertise to the member hospices selected to participate in the OVC program. The selection of participating hospices is based on the following criteria: 1. Those hospices which currently have an established children's program included in the palliative care services they offer were considered. 2. The numbers of OVC patients reported in their statistics. 3. A representative spread of the difference models of OVC service provision e.g. day care, home-based care and in patient units. 4. The community need in the region and availability of OVC services within each region. PEPFAR support will be provided to these hospice sites to enable them to equip the hospice for this role. This funding will also be used for the salary of an OVC coordinator at each OVC site, plus partial funded posts. In FY 2007 20

Activity Narrative: hospices were supported by this project and in FY 2008 this will increase to 29.

ACTIVITY 3: OVC Care Services

The pediatric care services will be provided as follows: identification of OVC, accessing grants, assistance with foster care placements, assisting with access to education, HIV prevention information, education and counseling, health care including pain and symptom management, Anti Retroviral Therapy (ARV) and TB Medication supervision, day care, support to Child and Youth-Headed Households, bereavement support, resilience and memory training, spiritual, emotional and psychosocial care, and support for elderly caregivers, home-based care, in-patient care and early childhood development programs. HPCA will provide the following OVC services: psychosocial, emotional and spiritual support will be provided to family members with identification of very vulnerable households such as those-headed by children and young people, or the elderly. This activity will be supported by appropriate Monitoring, Evaluation and Reporting (M&E) activities and tools to measure progress. Other support activities are improving access to ARVs, monitoring and adherence of ARVs, nutritional interventions and facilitating access to social grants. Funds will be used for direct funding for nurses, social workers, and social auxiliary workers and for transport and admin costs of these human resources. Focus will be on the girl-child and the role of the female caregiver, including the role of the grandmothers in support of OVC. This program will be for five specific pediatric services and seven integrated pediatric services, with at least one per province. This program will also focus on strengthening of existing comprehensive and or extensive pediatric programs through direct funding. Linkages to other services such as TB treatment, ARV treatment and support will be integrated into the OVC services.

ACTIVITY 4: Advocacy and Liaison

HPCA will liaise with corporate social investment programs and Government to strengthen and increase funding for the care and protection of OVC. Where OVC support services are required which are outside the scope of hospice expertise, e.g. child protection and nutrition, HPCA will identify suitable partners with the technical expertise and resources to provide these services and to strengthen HPCA OVC programs. The Bana Pele project will promote palliative care for children and raise public awareness. Links through existing Child Care Forums will be strengthened through liaison with the Department of Social Development.

ACTIVITY 5: OVC and Pediatric Palliative Care Training

The Pediatric Palliative Care training will be strengthened to include the South Africa PEPFAR OVC indicators, gender issues etc. Existing Pediatric Training curricula will be revised and expanded. Pediatric palliative care training courses will include the following: Definitions of pediatric palliative care, Conditions requiring pediatric palliative care, Models of pediatric palliative care, The Rights of the Child, Palliative care within the context of childhood development, Pain management in children, Symptom management, Nutrition, young person's understanding of death, Communication with children, Emotions of the child and family members, Spiritual care and support of the child, young person and family, Bereavement support including resilience and memory approaches, Social and legal issues relating to children and young people. Ethical issues Core competencies and practical experience, and the mapping of family members (similar to a family tree), to determine the support structure which each child has in their home environment.

Activity ID: 8245.23170.09	Planned Funds: \$582,543
Activity System ID: 23170	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1:

In addition to the continuation of all of the activities listed above for FY 2008, in FY 2009 Ingwavuma Orphan Care (IOC) will be improving the quality of its services through further staff training, developing and documenting training material with clear learning outcomes for staff, volunteers and caregivers. It will strengthen the monitoring and evaluation of its programs. It will consult the community on what services they require through focus group discussion and this information will feedback into strategic plans. Having excellent community links, the strategy is highly community and beneficiary directed and at this stage. IOC's strategy involves working closely with local churches so that the congregations are actively involved with caring for their own community and that pastors are working together providing education and support for 4000 OVC. Although the particular ways that this will happen depend upon the community. IOC has 120 churches that are on board and are willing to participate in OVC support. A church liaison officer will be appointed to work with these churches. This is in addition to the orphan coordinators who work directly with about 20 volunteers each, supporting them with training and referral pathways.

ACTIVITY 2:

The database will be used by all sub-grantees for data collection. Sub-grantees will be mentored and training needs identified and met where possible. Training curricula developed for caregivers will be shared and disseminated.

ACTIVITY 3:

A foster care supervisor (a trained auxiliary social worker) will provide follow-up supervision of families receiving foster care grants. She will hold support groups for foster parents where she can provide additional information e.g. on money management as well as facilitating sharing between the foster parents. She will also do home visits and spot checks to make sure that the children are being cared for adequately. Families are encouraged to aim for self-sustainability rather than becoming dependent on the foster care grants, which will in any case cease when the children reach 18. They are taught about income generating projects as well as how to save money.

ACTIVITIES 4-6:

These activities will continue with a focus on improving the quality of services through better monitoring and evaluation, implementing quality improvement systems, further training of caregivers and staff and improving support for primary caregivers. Coordination of care with other service providers will be improved through the local Child Care Forum.

SUMMARY:

Ingwavuma Orphan Care (IOC), in partnership with Lulisandla Kumntwana (LK), provides psychosocial, educational and nutritional support to OVC and facilitates access to government social grants and other social services. Activities aim to extend the reach of OVC projects in Ingwavuma and Mseleni areas of Northern KwaZulu-Natal. FY 2008 funding will be used to double the numbers of OVC reached. The primary emphasis area for this project is human capacity development with additional emphasis on local organization capacity development, development of network/linkages/referral systems and training. The primary target populations are OVC, HIV-infected children, and caregivers of OVC.

BACKGROUND:

This project is part of the work of two organizations, Ingwavuma Orphan Care (IOC) and their partner Lulisandla Kumntwana (LK), which began their work in 2000 and 2002, respectively. The organizations work in adjacent districts in Northern KwaZulu-Natal, covering an area of around 4,000 square kilometers between them. There are thought to be about 10,000 orphans (both parents deceased) in this area. Most of the other 100,000 children under 18 in the region could be said to be vulnerable due to poverty and the severe impact of HIV and AIDS in the community. The organizations have been networking with each other since 2002 and benefit from this partnership through sharing ideas, information and resources, and occasionally loaning each other staff with particular expertise. Both organizations were new to PEPFAR in 2007, and are registered as Welfare Organizations with the South African Department of Social Development (DOSD). Three of their social workers are funded by the DOSD. IOC also has strong links with the Department of Home Affairs and its paralegal officers assist clients with getting their applications in order to secure birth certificates, death certificates and identity documents from this department. IOC's OVC services are closely linked to its palliative care services, ensuring that children of terminally ill clients are referred early for support. LK works closely with the Department of Health, which refers OVC to LK and helps facilitate psychosocial workshops that train boys and girls in life skills, gender issues, and sexual education. LK also has an MOU with the KwaZulu-Natal Department of Welfare to ensure that there is no duplication of services and to facilitate sharing of information, skills, and resources.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Service Delivery Improvement and Expansion

In FY 2008 with PEPFAR support, IOC and its partner LK will continue to expand their current OVC services by establishing more staff and family support teams in areas that are currently not being served. Infrastructure will be improved with the establishment of further satellite resource centers and upgrading the central offices and care center. The orphan coordinators will continue to mobilize, train and support teams of people from local churches who will regularly visit OVC and their caregivers and assist them practically, spiritually, emotionally and socially. This will lessen the burden of OVC care on women and girls, as many

Activity Narrative: of the caregivers for OVC are elderly grandmothers and female OVC. Training of the team members includes child abuse awareness, how to refer children to other services, and addresses the area of reducing violence and coercion. The coordinators will continue to distribute food and clothes to those in need from the resource centers, refer families to the social worker to access foster care grants and deal with cases of child abuse, and refer children in need of health care to the home-based care teams, HIV support groups or local clinics. The paralegal officers will assist families in getting the documents they need to apply for the grants. School support officers, memory box workers and a youth pastor, who are funded by other grants, provide psychosocial, bereavement and spiritual support to the children. The team will ensure that OVC are attending school and will provide uniforms if needed. A housing project is also ongoing, funded by other grants such as Greater Good South Africa and school groups, which rebuilds houses for some orphan families whose houses have collapsed.

ACTIVITY 2: Capacity Building

The organizational capacity of both IOC and LK will continue to be enhanced. This will include in-service training of existing staff and employing and training new staff to improve sustainability. Training provided to the IOC and LK staff includes driving lessons, computer literacy, project management skills and advocacy skills. Another key feature is the implementation of a database to provide clear information on the work done by the field staff and volunteers and show how many children are receiving at least three of the nine key OVC interventions. This will allow managers to monitor activities and develop quality improvement plans.

ACTIVITY 3: Foster Care Facilitation

With FY 2008 PEPFAR funding, LK will continue to run a fostering agency to identify children in need of care and place them with qualified community families. LK employs two social workers to facilitate this process. LK recruits foster parents, who attend parenting workshops run by the organizations. IOC will duplicate this service. The social workers investigate home circumstances, screen the foster parent, and assist the children in accessing birth and death certificates. The social workers take the family to the Children's Court at Ubombo and Ingwavuma where the children are officially placed in foster care. The family is then able to apply for the government foster care grant. The social workers continue to supervise the placement to ensure quality of care and timely application for foster care renewal. IOC and LK address gender by reducing the burden on girls and women of caring for OVC and reducing the need for teenage girls and young women to use sex to get food.

ACTIVITY 4: Memory Boxes

IOC and LK will continue to help HIV-affected families create Memory Boxes for OVC. Memory boxes are created by the family, and consist of a collection of important documents, photos, meaningful items, and stories about themselves. This then serves as a memento for the children once the parent has died and the documents make it easier to sort out a government foster care grant for the children. This is a valuable psychosocial intervention which helps the OVC to cope with what is happening in their lives. IOC and LK each employ a Memory Box worker. Community team members are also trained in Memory Box work. Support groups for HIV-affected and infected children are established which will provide psychosocial support and information for the caregivers and the children.

ACTIVITY 5: Youth Clubs

FY 2008 PEPFAR funding will support 25 after-school youth clubs in 25 primary schools, in addition to youth clubs that both IOC and LK will establish and run at their centers. These youth clubs will develop the life skills and spiritual growth of youth in general (aged 5 to 24 years), and orphans and vulnerable children in particular. The life skills program in the youth clubs and the psychosocial support workshops will include training for youth on male norms and behaviors and violence avoidance. The support offered to OVC through these clubs also enables young girls, who are especially vulnerable to abuse, teenage pregnancy, and HIV infection, to develop self-respect and self-esteem and to develop strategies to protect themselves. Training for both girls and boys will include discussion on the challenges of early sexual activity, the benefits of abstinence, and the importance of faithfulness for life with one partner. Youth clubs and workshops encourage OVC to remain in school and offer help with homework supervision and support. The youth clubs and psychosocial workshops described below provide a forum for young people to discuss gender issues and for young girls to boost self-esteem and build self-confidence.

ACTIVITY 6: Renovation of Training Center and Expanded Office Facility

IOC will renovate a building at a new office complex which will allow for the integration of all IOC activities at the geographical center of the area in which it works. A run-down building requires extensive renovation to convert it into some offices and storage area for PEPFAR-funded staff. Current offices were built to accommodate 7 staff while by 2008 there will be around 30. The current offices will be converted to a full time training center, providing much needed infrastructure and services in the area. The training center will be used by the organization to train staff, volunteers and community members for many of the PEPFAR related activities. PEPFAR funding will be used to do the landscaping of the grounds and equipment and furniture purchases.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 4755.09	Mechanism: N/A
Prime Partner: Mpilonhle	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 8246.22987.09	Planned Funds: \$524,289
Activity System ID: 22987	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: School-based health screening

This activity now assures that all HIV-infected learners get CD4 counts, which allows Mpilonhle to screen them to see if they require ART. This is done as follows. Persons tested for HIV by Mpilonhle staff who are HIV-positive are offered the opportunity for having blood taken by Mpilonhle staff if they desire to know their CD4 count and need it for ART therapy. For those persons who agree and desire CD4 counts, the Mpilonhle nurse obtains a blood sample. This blood sample is then taken to the appropriate (by geographic region) KwaZulu-Natal Department of Health (KZN-DOH) clinic. From there it is sent by KZN-DOH staff to the KZN-DOH district hospital where the CD4 test is performed. Mpilonhle staff follow up to assure that the specimen makes it to the District Hospital, and then assure that the result is available to Mpilonhle staff. Mpilonhle staff then arrange for the client to be seen in the Mpilonhle mobile clinic and the results of the test result is communicated to the client. If need be, Mpilonhle staff visit the home of the client to provide the result. They also involve family members in this process if required. At this time Mpilonhle staff discuss with the client the management of their HIV infection, including the need, if required, for ART. Currently, Mpilonhle staff does not provide the same service for community members determined to be HIV-infected. With the PEPFAR-funded units now deployed, we are exploring having the units return to communities on a regular basis. If this is successful Mpilonhle would be able to provide community members with the same service described above for school learners.

Mpilonhle continues providing referral services for all PLHIV to KZN-DOH community-based health facilities for further management. This includes referral for ART services, TB services, STI services, pregnancy services, services for diarrhea and skin problems, and for a variety of other problems. Mpilonhle has an established referral system for this process.

Mpilonhle shall increase its efforts in the following areas:

1. During Mpilonhle's Health Screening and Health Education activities described, its health counselors and health educators will emphasize the value of reducing multiple and concurrent partnerships, as well as cross-generational and transactional sex. These issues are already addressed in Mpilonhle's current activities, but it shall be emphasized more strongly in line with the FY 2009 COP Technical considerations.
2. Mpilonhle shall encourage the participation of school governing boards and parents in its training sessions on HIV prevention, promotion of reproductive and general health, and care and support for PLHIV and OVC. Mpilonhle shall also encourage the participation of members of other CBOs and FBOs in its training activities.
3. Mpilonhle shall improve its referral systems for linking up participants in its programs with community-based health facilities, support services, and support groups, particularly to access reproductive health services including family planning, and services for substance abuse issues. Mpilonhle shall also strengthen its relationships with other CBOs and FBOs in the community involved in care activities for PLHIV and OVC.

Mpilonhle clarifies that its Health Screening activity promotes HIV preventive behaviors among young boys and men; that its Health Education sessions promote positive roles for members of both genders; and that its Health Screening activity by a Primary Health Care Nurse involves treatments for symptomatic STIs, for pains, and for simple skin conditions. Its Health Screening service also involves referrals to an on-site staff social worker who helps OVC and PLHIV access grants, and obtain legal and social support for issues of sexual violence and abuse. All these services are offered to all program participants, including all PLHIV and OVC.

SUMMARY:

Mpilonhle is a new South African community-based organization registered in 2007 with the South African Directorate of NGOs. It is dedicated to improving the health and well-being of adolescents in high schools in Umkhanyakude District Municipality, KwaZulu-Natal (KZN) through its "Mpilonhle Mobile Health and Education Project. It will begin operations in late 2007 with a single mobile unit funded with support from Oprah's Angel Network, and expand with two further mobile units funded by PEPFAR funds. It is currently building up its staff, which is expected to be 40, and is based in the Mpilonhle office in Mtubatuba, KZN. The Mpilonhle program will provide orphans and vulnerable children (OVC) with support to access education, economic support, psychosocial support, legal assistance. Mpilonhle will reach the OVC through the implementation of three schools-based activities (1) health screening, (2) health education and (3) computer-assisted learning. These services will be delivered through mobile clinic and computer laboratory facilities to OVC in 12 secondary schools in rural KwaZulu-Natal, South Africa. The emphasis areas for the Mpilonhle program will be on gender and local organization capacity building. The targeted populations are adolescents aged between 10 and 24 years and OVC among secondary school students.

BACKGROUND:

This is a new activity to be implemented by a local NGO, Mpilonhle, with support from the South African Government leadership at the district and provincial level in KwaZulu-Natal. Activities will be implemented in the Umkhanyakude District, the poorest and most rural district in KwaZulu-Natal province, with one of highest HIV prevalence. Mpilonhle will implement activities in 12 rural secondary schools that have inadequate resources in the Umkhanyakude District Municipality. Approximately 33% of secondary school students have lost at least one parent. Partners consist of the Department of Education, the South African Democratic Teachers' Union, District Health Services, and District and Municipal leadership.

ACTIVITIES AND EXPECTED RESULTS:

Mpilonhle will conduct three schools-based activities for OVC: health screening, health education, and

Activity Narrative: computer-assisted learning. These count as OVC support since they provide supportive health care services, increasing access to education, economic support, and supportive social services including legal aid. These activities will be provided through mobile facilities. Each mobile facility consists of a paired-up mobile clinic and mobile computer lab, staffed by 1 primary care nurse, 4 health counselors, 1 health educator, and 1 computer educator. Each mobile facility will visit a participating secondary school one week per month for eight months per year. This allows each mobile facility to serve 4 secondary schools per school year. The project will have three mobile facilities, allowing them to serve 12 secondary schools in total. Six of the 12 schools have been pre-selected. The remaining six schools and the 24 community sites will be determined with the Mayors of Umkhanyakude District, Mtubatuba Municipality, and Hlabisa Municipality and with local officers of the DOE.

ACTIVITY 1: Health screening

A health counselor will provide students with an annual individualized health screening that includes VCT; individualized AB-counseling for HIV prevention and behavior change; counseling or referral to further services for PMTCT, ART, TB and psychosocial support; and referral to a staff social worker for assistance with accessing government grants and assistance with legal matters. School principals, local Department of Education officials, District and Municipal mayors, and focus groups of teachers and students have expressed the community acceptability of schools-based VCT. This activity provides support for OVC in the form of improving their access to health care.

ACTIVITY 2: Health education

A Mphilohle health educator will provide students with four 90 minute small-group HIV, health and life-skills education sessions per year that will discuss the basic facts about HIV, VCT, STIs, TB, ART, PMTCT; reducing stigma and discrimination against PLHIV; and promoting respect between men and women. An age-appropriate curriculum on these topics will be developed by the Educational Development Center (EDC) and the South African Democratic Teacher's Union (SADTU), drawing on material developed by the EDC in collaboration with SADTU, and the World Health Organization (WHO). This curriculum emphasizes the tradition of improving Knowledge, Attitudes, and Practice (KAP), skill-building methods in topics such as risk reduction, being faithful, decision making, and social responsibility, as a way of preventing HIV infection, providing support to those infected and affected by HIV, respect for women, fighting stigma and discrimination, and dealing effectively with the challenges of everyday life. Group health education provides supportive social care in the form of efforts to reduce stigma and efforts to increase community awareness of care, prevention, and treatment. This activity will provide support to OVC in the form of psychosocial support and HIV prevention messages.

ACTIVITY 3: Computer-assisted learning

An Mphilohle computer educator will provide students in participating schools with four 90 minute small-group computer education sessions per year that will provide training on how to use computers, basic software, and the internet; and computer-assisted learning for improved school performance, HIV prevention, and general health promotion. This activity is expected to improve student learning, raise graduation rates, self-confidence and employability. This in turn increases self-reliance, self-confidence and self-sufficiency and the socio-economic status of the females, thus reduces their vulnerability to coercive, cross-generational, and transactional sex. This activity will improve educational development of OVC through computer-assisted learning and will encourage OVC to stay in school and complete their education. In addition, having computer skills will improve the market skills and employability of OVC that head households.

Sustainability of activities is facilitated by building human capacity in remote rural areas. Mphilohle maximize the capacities and skills of relatively abundant lay health workers to enable them to perform critical yet currently scarce services such as VCT, health screening and personalized risk assessment, and health education, shifting the burden of these activities away from relatively scarce professional health workers like nurses and doctors. Mphilohle will build the technical expertise and capacities of lay health workers through rigorous training and regular refresher courses. Sustainability is also facilitated by political commitment from District and Municipal governments and the local Department of Education to scale-up and fund-raise for this activity.

Gender issues will be addressed in the provision of care and support to in-school OVC with special emphasis on the girl child. The emphasis areas for this program are Human Resources in the form of salaries for health counselors, health educators, and computer educators, Information, Education and Communication in the form of resources for health education and computer education, Infrastructure in the form of deployment of mobile clinics and computer laboratories and Development of Network/Linkages/Referral Systems through the referral of OVC to the staff social worker.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 4745.09	Mechanism: N/A
Prime Partner: Anglican Church of the Province of Southern Africa	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 8182.22598.09	Planned Funds: \$1,048,577
Activity System ID: 22598	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Building community capacity to care for OVC

Recognizing community structures and resources, the men and women that volunteer their time to support fellow members is an underpinning factor of the support that protects and promotes healthy child development and creates an enabling environment where OVC can thrive and grow. This activity is a capacity building initiative that will strengthen these structures, in order to better reach and support its children. Training of community Child Care Workers (CCWs) will be increased to improve quality. The program will invest more on the CCWs by training them to improve service and to build their capacity to respond to OVC needs. Additional training will be done to build the capacity of child care workers to systematically integrate gender into all their services. Specifically, a total of 336 CCWs and 12 Diocesan OVC Coordinators (DOVC) will be trained in gender and gender-related issues, in gender mainstreaming and trained in abstinence and behavior change interventions, reproductive, sexual health and life skills.

ACTIVITY 2: Community engagement workshops

This will be enhanced to reflect its purpose more specifically as an activity that is aimed at a coordinating effort at community level to promote "non-exploitive community norms that value the child as a contributing member of society". Workshop approaches will be used that create opportunities for Anglican AIDS Healthcare Trust (AAHT) partners and for other organizations with similar interests including local municipalities to share relevant information and seek to influence policies and norms that engender disempowering practice among communities and within households.

ACTIVITY 3: Partnerships

This will be modified to take out the training of CCWs in Prevention strategies - which is now reflected under Activity 1. Activity 3 remains with the life skills and sexuality, HIV and AIDS education and awareness component, which targets school children 12-18 years old, with special attention given to adolescent OVC, who may fall victim to early sex including cross-generational sex. Support groups as part of psychosocial support groups will be used to reach these children as well as workshops in the 12 Anglican Church dioceses.

ACTIVITY 4: Care and counseling of children, caregivers and parents

Sustainability strategies will be initiated through building the capacity of dioceses and assisting them to register as NPOs with the Department of Social Development. Registration as not-for-profit organizations will afford them the status of being fully fledged organizations that can raise funds and become prime partners for funding and service delivery.

Also, the inclusion of schools into the coordinated effort to bring care and support services to OVC is at the center of this activity. Because children spend a considerable amount of time in school, this avenue provides a prime opportunity to reach and support them.

ACTIVITY 5: Linkages with Faith-based Organizations (FBOs) and Community-based Organizations (CBOs):

AAHT will undertake a profile study of organizations implementing OVC projects, in order to better coordinate care and support services to OVC. This feasibility study in the new dioceses will determine what the programmatic gaps are to avoid a duplication of services and to work towards effective collaboration to strengthen service delivery. The sustainability of the program will be ensured by empowering local communities with the knowledge and experience of working with OVC, partner organizations and the Anglican Church. Continued technical support and mentoring at parish level will ensure the long-term viability of the project. AAHT is in the process of sourcing funding to commission the research.

In addition, supporting the greater involvement of FBOs into the mix of OVC service providers widens the network of care and support that children and young people so desperately need, as they grow into adulthood--the need for spiritual and psychosocial support. There is no better resource that communities can tap into to provide such support than from the faith-based community, as they are uniquely positioned to offer this type of support. This activity will strengthen their involvement and better position them to play a greater service delivery role.

ACTIVITY 6: Advocacy

This activity will focus on building caregiver capacity (within AAHT and externally) to advocate on behalf of OVC. This activity focuses on building of OVC skills and on actual implementation of advocacy on behalf of OVC. Building of local partnerships with FBOs and CBOs and with government departments will be focused on advocacy within this activity.

SUMMARY:

The Anglican Church of Southern Africa (ACSA) program aims to support orphans and vulnerable children (OVC) by meeting basic and immediate needs while simultaneously building capacity in families, leaders and communities to develop local sustainable solutions to meet the long term needs identified by children and their caregivers in their communities. The primary emphasis area for this activity is in-service training of caregivers. Specific target populations are OVC (boys and girls ages 0-18 years), people living with HIV and AIDS, religious leaders and teachers.

BACKGROUND:

Activity Narrative: The ACSA Care for Orphaned and Vulnerable Children (OVC) program builds on a successful OVC model piloted under ACSA's "Isiseko Sokomeleza" which means Building a Foundation, program in partnership with Heartbeat Center for Community Development, the Barnabas Trust and the Anglican Mothers Union (MU), in the four Eastern Cape Dioceses of Grahamstown, Port Elizabeth, Umzimvubu and Mthatha. All activities will be implemented directly by the Anglican Mothers Unions, an important women's group within the Anglican Church. Partner organizations provide mentoring and technical assistance to groups of trained caregivers. This model encourages community participation and supports traditional community life while strengthening mutual assistance and social responsibility. This ACSA model ensures that communities understand the needs and rights of the children in their community and protects them from abuse. The ACSA model will be scaled-up and expanded in all nine provinces. A preliminary needs analysis of the 20 dioceses in South Africa showed that all 20 dioceses would benefit from coordinated support in implementing programs that care for OVC. The ACSA's approach to caring for children builds on the 6 strategies in the policy framework of National Plan of Action of the South African Government's Department of Social Development (DOSD). The South African constitution guarantees all children the right to comprehensive healthcare and basic health services. In addition, ACSA will give special consideration to HIV-infected OVC to ensure that they are referred to HIV pediatric treatment. ACSA also plans to develop activities to focus on vocational training for older OVC and caregivers.

To assist girls to understand the risk of early sexual activity, the ACSA program will provide age-appropriate, culturally sensitive educational interventions for comprehensive HIV and AIDS knowledge, reproductive and sexual health and life skills at kids clubs, schools and in communities. Gender inequalities affect girls' access to and interaction with health services, including those for HIV prevention and AIDS care. The ACSA program will emphasize keeping girls in schools and promoting girls' access to health services. Teachers are ideally placed to track the wellbeing and change in children and identify OVC. Age-appropriate life skills and sex education including HIV prevention messages and empowerment activities combined with caregiver training will help mitigate this trend and protect young girls.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Building community capacity to care for OVC

Volunteers will be trained to provide care and support of OVC. The trained volunteers will recruit and train community caregivers to increase the local capacity of their communities. The training will focus on the process of planning and implementing OVC projects in community parishes. Upon completion volunteers will have a better understanding of how to deal with OVC in order to provide comprehensive, integrated and quality responses such as psychosocial support, accessing child support grants, healthcare, nutrition and other life sustaining services. The training will be provided through a partnership comprised of Barnabas Trust, Care for Kids and staff from the Anglican Church. Each partner will have its own curriculum but in essence focus on enabling community organizations (parish-based projects) to have an integrated approach to delivery of services to orphans and vulnerable children. The partner organizations will provide mentoring to all trained caregivers, after the training. The mentors will provide technical assistance and retraining to groups of caregivers in each diocese as the need arises. The Project officer will assist the Diocesan OVC Coordinators and will also provide technical assistance to the caregivers. They will receive all the necessary forms to assist with the assessment process of children and households. The principals and teachers at schools within the Diocese will complete a survey to assist the caregivers to identify the children who will be provided assistance through the "Back to school" support intervention. In addition ACSA will locate a new partner to provide vocational training for older OVC and caregivers.

ACTIVITY 2: Community engagement workshops

These workshops will serve to influence norms on acceptable treatment of OVC thus confronting stigma and discrimination. The workshops will provide platforms for ACSA partners to network and share lessons learned on how to best intervene on behalf of OVC, create gender awareness and eliminate stigma and denial. Joint action and initiatives will be implemented at annual mass events such as International Children's Day, Child Protection Day, Women's Day, 16 Day of No Violence Against Women and Children, the Special Day of Prayer for Orphans and "The School is Cool" Campaign with special emphasis on involving meaningful participation of young people in the planning and delivery of these events.

ACTIVITY 3: Partnerships

Partnerships with organizations and institutions (Barnabas Trust, Heartbeat, etc.) that have developed programs and material on abstinence, sexuality, life choices, etc. will be strengthened. The content of these programs will be discussed with Parish coordinators and communities. New partnerships will be developed and child care workers will be trained in abstinence and behavior change interventions, reproductive, sexual health and life skills. HIV education and awareness will be facilitated at the schools with special emphasis on supporting OVC in schools; this will support the children who attend the psychosocial support groups. Four workshops will be held in the 20 Anglican Church dioceses.

ACTIVITY 4: Care and counseling of children, caregivers and parents

Care and counseling will be provided to meet the bereavement needs of OVC and to facilitate the mourning processes for adults who care for OVC. Bereavement workshops will be held quarterly to assist parents and caregivers. Four retreats will be held semi-annually for caregivers to facilitate debriefing and sharing experiences. Follow-up home visits will be conducted to ensure that, in child-headed households are provided with support and they know how to access the necessary services. Follow-up and monitoring to track the progress of children who receive school uniforms and other school supplies through the Back to School intervention is vital for the program. This will also ensure that ACSA track children who drop-out of school for specific reasons and to offer support through the after school activities. The OVC will receive assistance with homework and assignments. This will happen at parish level and retired teachers and older learners are recruited. Donations from non-PEPFAR sources will be delivered to households and families,

Activity Narrative: i.e. blankets, food parcels, toys, etc.

ACTIVITY 5: Linkages with Faith-based Organizations (FBOs) and Community-based Organizations (CBOs)

This activity will develop effective linkages with FBOs and CBOs to share resources, information on best practices and increase capacity of FBOs and CBOs to support OVC in their communities. These Child Care Community Forums, comprising, FBOs, CBOs, the South African Police Service (SAPS), schools and community leaders will ensure that all stakeholders develop a common vision in dealing effectively with the challenges that children face in their communities. ACSA will provide advice and training to other faith leaders, traditional leaders, NGOs and community leaders on how to effectively collaborate, in order to appropriately respond to OVC needs. Consultations will be held at parish level to get the support of the leadership and clergy as well as other religious leaders of various faiths in the communities to address the plight of orphans and other vulnerable children.

ACTIVITY 6: Advocacy

This activity will focus on building caregiver capacity (within ACSA and externally) to advocate on behalf of OVC. This will be done by establishing linkages with government departments, municipalities and other service providers to facilitate the provision of wrap-around services and support such as accessing government social grants, health services, registration of birth certificates, legal aid, advice and support to establish food gardens, etc. ACSA will explore ways to introduce tools to avoid and reduce the issue of gender-based violence into their activities, in order to strengthen social cohesion in communities. Assistance will be given to families and households by providing information on the rights of women regarding inheritance, developing legal wills and other legal advice. The sustainability of the project will be ensured by empowering local communities with the knowledge and experience of working with OVC. Continued support from the church and expanded linkages will ensure the long-term viability of the project. ACSA will focus on expanding partnerships with governmental agencies, FBOs, and the private sector to increase its funding base. Local partnerships will be expanded to other FBOs, CBOs and NGOs in an effort to expand the network of care and resources. The development of relationships with corporate and private partners who can contribute funding and in-kind resources to the project will also be initiated.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 274.09	Mechanism: Masibambisane 1
Prime Partner: South African Military Health Service	USG Agency: Department of Defense
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 2980.22786.09	Planned Funds: \$145,636
Activity System ID: 22786	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

It is unfortunate that the OVC program was not implemented as planned due to human resource shortage and other reasons. However the OVC program remains a priority and the new Director of HIV at the South African Department of Defense (SADOD) has planned to address this with particular focus.

When a Defense Force member is deceased in the SADOD, the Human Resource Office through a process identifies the Orphans and then hand over these cases to the Chaplains and Social Workers who will identify needs and provide the necessary support to this identified group. While this is a current practice it is not as structured and organized as the DoD would like to be. Once these identification mechanisms have been strengthened it is envisaged that these children will be taken care of for an interim period within the SADOD before referral to appropriate community structures. The interim care will include support for schooling, clothing, nutrition and recreation.

In order to ensure that all vulnerable children are efficiently identified, a coordinated approach will be taken to link all programs where infected parents/guardians are receiving treatment e.g. hospice, roll-out sites, infectious diseases clinics and the PMTCT sites.

A pilot project on care and support for vulnerable children is being explored. The idea is to adopt a school which caters for predominantly military children so that programs on substance abuse, sexual health education and first aid are conducted in the school. Teachers and identified learners will be trained and supported to conduct these programs. Nutritional support in the form of a soup kitchen will also be explored.

SUMMARY:

The SA DOD Orphans and Vulnerable Children (OVC) program is a relatively new development in the Masibambisane program with a focus on establishing a data base and referral system for OVC of military members. A needs assessment and pilot projects in four sites during FY 2006 will provide the direction for the future focus and strategy of this program to include support services for HIV-infected infants, children and caregivers in the military communities and capacity building of these services within the military through the assistance of NGOs near these communities. The major emphasis area is linkages with other sectors and initiatives and minor emphasis areas are infrastructure and community mobilization and participation. The target populations are OVC and their caregivers, HIV-infected infants and children, military personnel, volunteers and community leaders.

BACKGROUND:

The Masibambisane program initiated the OVC program in FY 2005 with an institutional focus in terms of establishing a database on military OVC and the initiation of projects at four sites as a pilot to determine the need and direction in terms of services to OVC. The underlying principle was to establish networks within communities to address the needs of OVC in general, address stigma and discrimination through access to comprehensive services and military OVC specifically through collaborative partnerships. Due to the extensive community involvement and leadership by the communities themselves, the four pilot projects have had varying levels of success during implementation in FY 2006. This has provided valuable information that will guide future strategies in this regard. Lessons learned at the pilot sites confirmed that the approach towards the management of OVC will differ from site to site and need to address activities that include training caregivers, increasing access to education, economic support, targeted food and nutrition support, legal aid, as well as psychosocial support and palliative care. Collaboration with local NGOs will be encouraged in all communities.

The OVC project is coordinated by the Directorate Social Work in the SA DOD as a sub-program of Masibambisane and has been initiated at the four sites through a local coordinator and collaborative workgroups from the communities. The projects at the four sites will be expanded to other appropriate regions and integrated with terminal care activities where appropriate. The program will support the activities of a military site in Phalaborwa (Limpopo province) while local NGOs will be targeted for funding through USAID in the other three sites (KwaZulu-Natal, Eastern Cape and North West provinces). This program will address beliefs and myths about HIV infection, prevention and treatment versus "cures". Self-help resources that include books about military separation and its affect on families will be provided.

ACTIVITIES AND EXPECTED RESULTS:

The implementation of activities that were planned for FY 2007 was delayed due to the staff restructuring in the SA DOD. These activities will therefore be continued in the FY 2008.

ACTIVITY 1: OVC Tracking System

The SA DOD will develop a tracking system to identify and monitor orphans of military members in order to provide these orphans with the healthcare services and support to which they are entitled.

ACTIVITY 2: OVC Service Site

The SA DOD will renovate a library at the Ba-Phalaborwa military site in Limpopo province to provide a place for children to learn and foster their education after school. This library will provide an educational atmosphere that emphasizes learning and a healthy lifestyle for OVC. References will address beliefs and myths about HIV infection, prevention, and treatment and will include myths about "cures". In addition information will be provided that deals with family separations and the stress that places on the family including age-appropriate strategies to address these concerns.

ACTIVITY 3: Sharing Information

Activity Narrative: The SA DOD will sharing information and experiences through attendance of PEPFAR OVC partner meetings, publications in military and peer reviewed magazines and journals and oral and poster presentations on effective and innovative programs at conferences and seminars. The SA DOD and other African countries will benefit from the information presented in peer-reviewed journal and at professional conferences.

All these activities will be monitored and evaluated with close supervision and support for quality assurance and the identification of best practices in this program area. Technical assistance will be provided to SA DOD by the US DOD in order to continue the participatory project begun in 2004, to assist with selection of additional province to begin OVC military community mobilization and participatory action and to support the participatory process as it evolves.

Budget Code: HKID

Program Budget Code: 13

Activity ID: 2933.22601.09

Planned Funds: \$0

Activity System ID: 22601

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. PEPFAR funds were allocated to the Association of Schools of Public Health (ASPH) and sub-contracted to the Harvard School of Public Health and the Centre for the Support of Peer Education to support a coherent national inter-sectoral system of rigorous peer education. Funding for ASPH will not continue under its current agreement in FY 2009 because the contract ends in September 2009. Instead, the agreement will be re-competed through a Funding Opportunity Announcement. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Program Area: Care: OVC

Budget Code: HKID

Program Budget Code: 13

Activity ID: 22742.09

Planned Funds: \$194,181

Activity System ID: 22742

Activity Narrative: SUMMARY AND BACKGROUND:

Re-Action! Consulting will work in partnership with the District Management Teams (DMTs) in the provinces of Mpumalanga, Limpopo, North West and Northern Cape to develop and establish a task mix for Pediatric Treatment service delivery.

In partnership with the DMTs Re-Action! will support the DoH with the sourcing, recruitment, training and supervision of critical health care professionals. Re-Action! will also focus on the re-training of existing personnel, not only in HIV concerns, but also on-the-job training such as the collection of treatment data and reporting, advanced counseling and program management skills.

At a strategic level the Re-Action! program team will undertake a joint assessment for each service provider site/group of competencies development needs (behavioral, skills, systems). Re-Action! will establish these partnerships with the aim of strengthening existing HIV treatment programs in these provinces, training of and providing supportive supervision to health care professionals and facilitating behavior change interventions focused on individual households and OVC households in the community.

In partnership with the DoH the Re-Action! program team will identify and engage available service sites and providers (public sector and non-state, including private GPs, CBOs, Traditional Healers). Re-Action! facilitated the accreditation of the Bernice Sameul site as a ART initiation site and another 3 sites have been established as down-referral sites from the Witbank Hospital Wellness Clinic. As part of Health Systems Strengthening (HSS) relating to Adult Treatment Re-Action! will facilitate the accreditation of the existing down-referral sites to initiation sites for HIV treatment, as well as facilitate the process of three new sites being developed as either down-referral or initiation sites for HIV treatment, as per the national accreditation guidelines and the National Strategic Plan (NSP).

ACTIVITIES AND EXPECTED RESULTS:

Based on the district-based health service/ response improvements plans and Re-Action!'s experience in five existing sites, the model of door-to-door VCT, OVC and pediatric identification and referral will be rolled out into three additional sites. This community-based approach focuses on the family and the early identification of and enrollment of children into treatment programmes. Re-Action! aims to increase the number of children identified and enrolled on treatment. At all of the eight clinics, emphasis will be placed on the integration of TB/HIV services and Re-Action! will ensure that all services are implemented as per the relevant guidelines.

The OVC program is a direct entry point for HIV-infected children to access home-based care, referral, treatment and support groups. This is initiated by the "I know! the way to live" campaign whereby individuals have the opportunity to test for HIV at home. In addition, the Outreach Workers (OWs) conduct follow-up visits identifying potential health risks in the households, as well as the tracking and tracing of defaulters.

Re-Action! will source, recruit and train an additional 40 OWs, as they are regarded as an important link between the community and district health facilities and are directly involved in developing OVC intervention strategies.

The quality and clinical management of OVC underscores the Re-Action! program and the OWs are thereby supervised by a professional nurse, thus ensuring the quality and clinical accuracy of palliative care services rendered at household level. The expansion of the program into three additional sites in Mpumalanga will require the recruitment of two professional nurses and one social worker as shared program resources.

Nutritional assessments are key to the clinical management of HIV-infected individuals and especially OVC. Re-Action! will recruit a dietician as a shared program resource across all program areas.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 7313.09

Mechanism: N/A

Prime Partner: Childline Mpumalanga

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Care: OVC

Budget Code: HKID

Program Budget Code: 13

Activity ID: 16016.22744.09

Planned Funds: \$592,252

Activity System ID: 22744

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 4: Specialized psychosocial support for children, ACTIVITY 5: Psychosocial support to caregivers, ACTIVITY 6: Life Skills development

All the activities outlined in activity 1-6 are in line with the NSP and SAG policies.

- Priority area 1 of the NSP: Prevention will be emphasized in Activity 1 (Strengthening of community care for OVC) and Activity 2 (Human Capacity Development).
- Priority area 2: treatment care and support will be done through Activity 3 (Facilitating access to social security grants and OVC services), Activity 4 (Specialized psychosocial supports for children) and Activity 5 (psychosocial supports to caregivers).
- Priority area 4 human rights and access to justice will be aligned though Activity 3 (Facilitating access to social security grants and OVC services) and Activity 6 (Life Skills development).

These activities will be enhanced by Childline Mpumalanga signing a sub-partner agreement with Childline SA. Childline SA manages the national Childline toll-free line to which children can call in should they experience abuse or seek guidance on children issues.

The occurrence of sexual abuse of the boy child has in recent studies been identified to be as high as sexual abuse of the girl child. Through the psychosocial support to OVC and caregivers, the program will address violence and coercion, enabling vulnerable girl and boy children to have access to counseling, legal resource and refer these children to services in their vicinity. Vulnerable children will also be referred to the well established Crisis line referral system of Childline SA which has a network of service providers focusing on child protection and safety, at its disposal.

The life skills program as presented in schools by all provincial Childline offices in South Africa will raise awareness on children's safety and will facilitate the development of a balanced self image and healthy role modeling for both the boy and girl child and women in the community. Involving boys and girls in inclusive activities where the girls can be involved in sports such as soccer and boys playing handball will deal with stereotyping and create a safe environment for the children to express their views on gender roles. Celebration of national days will include cultural and traditional activities linked to gender and addressing stereotyping. There will be a focus on children rights and reducing violence, specifically child abuse. This will reaffirm the children belonging to their roots and also the respect for the community in its unique differentiation of roles and responsibilities to different genders.

Engaging Childline SA will ensure that children across all nine provinces can be provided with immediate assistance by Crisis line counselors, and assure referral of vulnerable children to services close to them. Psychosocial support to caregivers is already an activity that is currently operating in the National network of Childline and would ensure that care workers of children do not burn out. Life skills development is an activity that is incorporated in the Childline SA activities through the school awareness program, and focus on empowering vulnerable children to be safe, and get help when in danger. Through expanding the activities to the national network of Childline SA, OVC will be able to receive specific services from Childline staff. Often children are removed from their home and placed with relatives in another province, and through the services and network within Childline, these children can be included into programs aimed at children by Childline Social workers. Prevention and early intervention in child abuse issues is one of the core functions of this program and will benefit all children and adults with concerns about children who call the toll free number in South Africa.

Focus on building human capacity to enable implementation of these activities will include specific training on the counseling of children, a ten-day child counseling training that Childline South Africa is currently in process to have accredited through the Health and Welfare Setas and also limited training in economic strengthening. Since this is a new program CL Mpumalanga needs to strengthen the M&E systems by ensuring that staff is trained on data collection/ tools for M&E and collation of data. Childline Mpumalanga staff will attend Pact training offerings on M&E, financial management and grant management throughout the year. These trainings will have high priority with staff of Childline Mpumalanga as well as in the National Network of Childline SA.

SUMMARY:

Childline Mpumalanga provides care and support services to orphaned and vulnerable Children (OVC) in five underserved and rural areas in Mpumalanga Province. The main emphasis areas of activities are training, reducing violence and coercion and local organization capacity building. Primary target populations are OVC, adolescents 10 to 24 years and people living with HIV and AIDS.

BACKGROUND:

Childline South Africa is a national non-governmental organization with eight affiliate offices providing services in all of the nine provinces of South Africa. The Mpumalanga office was established three years ago by Childline SA and Mpumalanga Department of Social Services to provide services to children in the province. Statistics South Africa estimates that approximately 18 percent of the children living in Mpumalanga province are OVC. Childline Mpumalanga aims to help restore and transform communities, facilitate the development of strong, community-based support systems for children affected by HIV and AIDS with the hope of assuring a secure and healthy future for the OVC living in Mpumalanga. The programs that Childline Mpumalanga offers are in line with the service specifications of the Department of Social Development as published in 2005, and included in the business plan of Childline Mpumalanga and partially subsidized by the Department of Health and Social Services of Mpumalanga.

Childline Mpumalanga is well known for its telephone helpline 'Crisis line' and offers therapeutic and face-to-face counseling services for children who have undergone serious trauma, including as a result of AIDS. In response to the increasing numbers of OVC, Childline has also developed a comprehensive outreach

Activity Narrative: model that will help extend services to the most rural parts of the Mpumalanga province. Childline works closely with the Department of Education and implements HIV prevention and awareness programs and children's rights and child abuse programs in schools in Mpumalanga. Childline Mpumalanga also has a strong working agreement with the Office on the Rights of the Child from the Office of the Premier of Mpumalanga in their combined efforts to make the voices of children heard in the services delivered to children in the province.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthening community care for OVC

Childline has conducted baseline research to identify five sites for service delivery. Childline has identified five projects with partners in rural under serviced areas with high numbers of vulnerable children, where community infrastructure will be developed to establish and deliver interventions for vulnerable children and their families. Each site will be managed by a dedicated social worker. This will include conducting the baseline needs assessment, drawing up a memorandum of understanding with the community, identifying role players and stakeholders, the recruitment of volunteers and setting up infrastructure for the project. This will ensure that OVC and people living with HIV in the community are aware of and able to access assistance for dealing with the needs of children who are orphaned, affected by child abuse or domestic violence, poverty, substance abuse and neglect. Each project site will be developed through networking with local tribal chiefs, municipal managers, community structures and members.

ACTIVITY 2: Human capacity development

This project will offer various trainings developed by Childline and available from the Department of Health and other sectors on children, on communicating/counseling children, dealing with children's rights, child abuse and the basic needs of vulnerable and orphaned children to community volunteers, parents, teachers, children and youth in order to set up networks and systems and to capacitate role players within communities to offer referral opportunities. Each site will advertise for volunteer counselors. Candidates will be interviewed and selected in conjunction with each site's governing body. Selected counselors will be trained on personal growth; communicating with children; and counseling skills. Trained caregivers will also be capacitated to provide case management to OVC to ensure comprehensive support and services are provided. Networking with schools, clinics, early childhood development centers and churches in the community will be facilitated to help in identifying vulnerable children in the community and implement service delivery to these children by volunteers that are trained in the community. In addition, each site's governing body and other community role players involved in service provision to OVC will also be trained using Childline's courses on organizational management and capacity building. The social worker will work with trained counselors to develop schedules and work hours for volunteer counselors. Monthly supervisory sessions will be set up with volunteer caregivers to share their trauma and provide debriefing session from their experiences in the field and to deal with stress coping strategies.

ACTIVITY 3: Facilitating access to social security grants and OVC services

Childline will introduce counselors to the community through holding awareness campaigns at local schools, at mass meetings and through posters advertising Childline's services. Children identified as in need of services will be visited at home by trained volunteers who will conduct an assessment to identify the services each child needs. Childline will also organize 'Access Jamborees' with the Departments of Home Affairs, Social Services, Social Development, local government and tribal authorities. These Jamborees will enable not only vulnerable children but also other marginalized members from the community to access necessary legal documents; apply for social security grants and access information on services. Caregivers will follow up on all cases identified to ensure that OVC access services. Caregivers will also train household/family members on budgeting to ensure that OVC are cared for and maximizing the resources available. Caregivers will also provide households with information on other social, economic and health services available in each community such as health, education and social service provided by government as well as civil society.

ACTIVITY 4: Specialized psychosocial support for children

Counseling and therapy that is appropriate for their age, development stage and context, will be provided to OVC by social workers on a weekly basis. 24-hour Crisis line counseling will be available to all children and adults with concerns about children at the Childline office. This will serve as an access point to services close to the child, and children calling the Crisis line will be referred to service providers in the geographical area where the child concerned resides. Trained counselors will follow up with children individually during home visits and provide referrals to child protection services available as necessary. A needs assessment will be done with volunteer counselors to develop a year plan for monthly continuous training. Continuous training will be according to standardized SETA accredited training modules developed by Childline SA. Trends and new policy relating to child protection and the management of child abuse will also be covered during these trainings. Training with parties like South African Police Service, Department of Health, other government stakeholders and civil society organizations will also be facilitated to ensure collaborative service delivery to vulnerable children in the community. Service providers will be trained on communicating with children and on the emotional needs of children to ensure services are delivered with sensitivity to children needs.

ACTIVITY 5: Psychosocial support to caregivers

Social workers will supervise volunteer counselors from the community to ensure that children are provided with the care and support they need to cope with the situations they are facing as a result of the effect of HIV and AIDS on their lives. With PEPFAR support, children will be able to access services to obtain legal documents, cope with grief and loss, and deal with abuse and violence related issues. Children will be able to talk and think about relationships with parents, peers, siblings, opposite sex, step- and extended families.

Activity Narrative: Quality of services rendered by volunteer counselors will be monitored through statistics, reviewing process reports, and holding monthly sessions for debriefing and in-service training.

ACTIVITY 6: Life Skills development

Social workers, in cooperation with local schools, will develop youth groups/clubs to actualize the youth potential to act as agents of change in their own communities. Focus group discussion will be conducted on a weekly basis dealing with various topics identified by the youth. Gender specific program for boys and girls will be offered. Trained counselors will facilitate youth groups providing educational support, recreation opportunities and life skills training focusing on HIV prevention, reproductive health and gender-based violence. A community event will also be identified, planned and executed with the support of the social worker by the youth to have a mass impact of the community e.g. National Aids day / Youth day to develop skills and create potential for young people to participate in organizing community care and support events.

Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 7958.22745.09	Planned Funds: \$970,905

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Community Care Project Trust (CCPT) will replace Project Gateway (PG). CCPT was the implementing agency within PG and is now autonomous. Activities in schools will be carried out by all four sub-partners. In FY 2008, three partners worked directly with the schools. LifeLine received children for CT through referrals from the other partners, by actively motivating for CT in schools and organizing transport to bring them in groups to the CT site on Saturdays. Children 12 years or older are legally allowed to consent for CT. Younger children are accompanied by their parent/guardian who sign consent. To reach the numbers requiring CT in FY 2009 & 2010 a mobile unit will be used. This will make CT available during the week at a location close to where the children live. Life skills training and psychosocial support services will also be offered by means of the mobile service unit, thus avoiding stigmatization.

Sinani will add a module on age appropriate HIV prevention education for older learners in primary schools, as requested by schools.

CCPT & Youth for Christ (YFC) will scale up to reach more children in schools and will extend the services offered to OVC and caregivers in households, and the siblings of school children, including access to social grants, food gardens, school fee exemption and assistance in obtaining birth certificates and ID documents. LifeLine will run a support group for children who are HIV-infected.

Psychosocial support in the form of gender-sensitive life skills training, counseling and support groups will also be offered by CCPT, YFC and LL (in addition to Sinani).

ALIGNMENT WITH NSP & OTHER SAG POLICIES:

Children in Distress (CINDI) is on the advisory committee of the children's sector representative group to the South African National AIDS Council. CINDI has aligned its program activities in accordance with the priorities identified at the sector's national summit in June 2008. In particular, the sub-partners prioritize: food security and access to grants; CT for children and parents; human resource development including stipends, training and increased competency of caregivers; psychosocial support (community and OVC); implementation of comprehensive M&E systems; information dissemination; human and children's rights-information, dissemination and access. The director of CINDI is a member of the Provincial AIDS Council.

GENDER RELATED ACTIVITIES:

Gender considerations are integrated throughout all services to increase gender equity, address male norms and behaviors, increase girl's legal rights, access to education and social grants and reduce violence and coercion, including:

- Age appropriate school-based HIV prevention education that encourages boys to be responsible in their sexual behavior and to respect women - including the reduction of sexual violence and coercion, number of sexual partners, and cross-generational and transactional sex;
- Project database and M&E tools collect sex-disaggregated service delivery data which is used to improve the quality of program services;
- Ongoing evaluation of marginalized and missing gender balance, and strategizing to redress the balance;
- Sponsorship of transport to increase access of girls to treatment and testing;
- Life skills programs target young men and boys and encourage their participation and responsibility in caregiving and household functions, their support for female caregivers and their recognition of the burden of care and reduction of gender-based violence in the household;
- Individual counseling, group work and structured group therapy sessions focus on the unique needs of girls including sexual abuse, assault, rape and the empowering of girls in interpersonal situations;
- Encouraging young men and boys to access CT and other health services;
- Adopting a family-centered approach to care and treatment services;
- Programs to ensure that girls are given equal opportunity to attend school and increase access to education by supporting school fee exemptions and school uniforms as identified per OVC in need;
- Caregiver training to recognize signs of gender-based violence and to provide appropriate counseling and referral services to social, legal, and community-based support groups;
- Programs address societal and community norms to reduce stigma, protect women from violence, promote gender equality, and build conflict resolution skills; and
- Survivors of sexual violence are linked to the provision of post-exposure prophylaxis.

SUMMARY:

Activities are carried out by Children in Distress (CINDI) in KwaZulu-Natal (KZN), to support the expansion of services aimed at improving the lives of orphans and vulnerable children (OVC) and families affected by AIDS through providing comprehensive services and to strengthen communities and ensure that the needs of OVC are met. The emphasis areas of the project include local organization capacity-building, gender and wrap-around program (education). Primary target populations include orphans and vulnerable children, children 5-9 years, adolescents 10-14 years and 15-24 years, and people living with HIV.

BACKGROUND:

CINDI, founded in July 1996, consists of over 100 member organizations (NGOs, CBOs, FBOs) that collaborate to reduce the impact of HIV and AIDS on children in KZN. This project is part of a larger initiative implemented by CINDI members. The project was implemented in FY 2007 with PEPFAR support. The activity is supported by the Department of Education in KZN with whom CINDI liaises in selecting the targeted schools. Four member organizations are implementing the project for CINDI - Project Gateway, Sinani, LifeLine and Youth for Christ/ KZN (YFC). Both LifeLine and YFC receive PEPFAR funds in other program areas and have no OVC activities that overlap under this CINDI project. LifeLine and Project Gateway have both received accreditations from the provincial Department of Health as counseling and testing (CT) sites. CINDI will address gender issues through increasing access to services for girls/women;

Activity Narrative: encouraging the participation of males as facilitators and caregivers wherever possible (since they are mostly female); prioritizes gender issues within targeted schools; and provides training addressing male norms and behaviors.

ACTIVITIES & EXPECTED RESULTS:

ACTIVITY 1: Life skills training for OVC

CINDI, in partnership with 4 sub-partners, will provide life skills, peer education training and promote learner access to CT (and encourage access to pediatric ARV therapy) in 14 new targeted primary and high schools in FY 2008 and will provide follow-up in the 14 schools from FY 2007. Lifeline and Project Gateway have both been accredited as CT sites and have mechanisms in place for formal referral systems for children identified. Children identified will be followed up with care and support activities aimed at orphans and vulnerable children and their families. The 14 targeted primary and high schools are provided with training for learner peer educators and selected teachers. All learners participate in a creatively-designed school-based presentation which will increase their knowledge and information on HIV and AIDS and related issues such as stigmatization and discrimination, gender issues, CT and age appropriate sexuality training to motivate for abstinence and encourage behavior change. Learners also participate in a 4-day HIV and AIDS intensive workshop which will increase their knowledge on safe healthy sexual behavior, HIV messages, personal development and gender issues and skills in accessing grants, fees exemption from schools, skills in heading up child-headed households, which will facilitate positive behavior change. In addition, all learners voluntarily participating in CT will be able to communicate what they have learned about voluntary testing in their communities and be encouraged to live their lives responsibly. Learners participating in CT will be assisted in dealing with previous and/or current sexual abuse and serious sexual offences will be taken up through the legal system. Life skills in accessing grants, etc. will assist the learners in schools to be aware of their rights, build resilience and individual empowerment. Youth workers in schools will assist, provide support, and refer the child to the necessary sub-partner who will ensure that their needs are met. FY 2008 funding will support staff and youth workers to provide these services in the targeted schools. Sustainability of these activities is built in through the training of interested and committed teachers within each school who will support the activities into the future, and the trained learner peer educators will be enabled to continue with the activities. Youth workers and peer educators will have first contact with OVC and provide necessary support and care before referring. Schools will also be linked directly with organizations and government departments who can provide ongoing services. CINDI supports all 4 sub-partners with project supervision and management, financial management, monitoring and evaluation of this activity and ensures quality assurance of record-keeping and data-capturing.

ACTIVITY 2: OVC and Family Support

CINDI, in partnership with Project Gateway, identifies OVC in the 14 new target schools and provides services to improve the quality of life of vulnerable children, and HIV-infected individuals and their families. The families and caregivers will be supported through capacity-building activities to provide better care for their households; the stability and sustainability of families will be increased through access to shelter, food (in conjunction with the DOSD), economic support, education, psychosocial support and health care. Identified families will have at least one child who attends one of the 14 target schools. FY 2008 funding will support CINDI staff and trained volunteers working with the families to deliver the required services. Sustainability of these activities and services is provided through training of caregivers, linking families with relevant government departments and organizations who provide ongoing services, and through capacity-building provided to household providers/caregivers. CINDI supports Project Gateway with project supervision and management, financial management, monitoring and evaluation of this activity and ensures quality assurance of record-keeping and data-capturing.

ACTIVITY 3: Psychosocial Support for OVC

CINDI, in partnership with Sinani, will provide good quality comprehensive and compassionate care for children orphaned by AIDS and other vulnerable children to help ensure they grow up to be healthy, educated and socially well-adjusted adults, through all CINDI sub-partners. The identified children will come from targeted primary schools. OVC will participate in a Structured Group Therapy Program which effectively reduces distress and builds resilience, with the aim of decreasing depression while increasing children's access to social support. The duration of therapeutic sessions will vary according to the child's or group's needs. Youth and adult community leaders and members will be sensitized to the needs of OVC which will result in an increase in community- awareness of the needs of OVC in communities. This activity is facilitated by Sinani, one of the CINDI members specializing on psychosocial support with a counseling psychologist to transfer skills to trained facilitators and volunteers. CINDI supports Sinani with project supervision and management, financial management, monitoring and evaluation of this activity and ensures quality assurance of record-keeping and data-capturing.

ACTIVITY 4: Providing care and supervision for providers/caretakers

In FY 2008 caregivers will be given on-site and group training by CINDI, in partnership with Project Gateway, to be able to identify and manage stress and burn-out. Regular supervision will be given to enable caregivers to be efficient in their work while debriefing sessions will take place for caregivers to discuss problems associated with their work. All the four CINDI members will ensure that each OVC counted is provided with at least a minimum of three services which include access to education, health care, psychosocial support, nutrition support, protection from abuse, economic support, pediatric HIV and AIDS treatment, legal assistance and mobilizing and building capacity of communities to respond to OVC needs.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 519.09	Mechanism: N/A
Prime Partner: University of KwaZulu-Natal, Nelson Mandela School of Medicine	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 6421.22737.09	Planned Funds: \$29,127
Activity System ID: 22737	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Nelson Mandela School of Medicine will monitor the following parameters to measure the impact of traditional healer involvement in improving the health and wellbeing of OVC:

1. Numbers of OVC and household in the care of traditional healers;
2. Description of the psychosocial context and needs of OVC and their extended families;
3. Changes in utilization public sector services;
4. Changes in school attendance;
5. Access to social and welfare grants; and,
6. Access to preventative and curative health care services, including antiretrovirals, immunization, growth and nutrition monitoring.

SUMMARY:

The Nelson Mandela School of Medicine will introduce additional training modules to explore developmental disability prevalence and interventions for orphans and vulnerable children (OVC) seeing Traditional Health Practitioners (THPs), either directly as patients or as family members of patients. The primary emphasis area will be training, with minor emphases in information, education and communication and needs assessment. The target populations are OVC, their caregivers and traditional healers.

BACKGROUND:

It is estimated that 6 to 11 percent of South African children under 15 years of age are orphaned due to loss of one or both parents due to HIV and AIDS. These children are particularly vulnerable to neglect within households, marginalization within communities, and are less likely to receive adequate, education, growth and nutrition, regular healthcare and social services. Many of these children may be infected with HIV themselves. This emphasizes the need to address the bio-psychosocial problems facing this group of children in addition to access to antiretroviral drugs. Traditional healers may facilitate preventive care in these households and children.

ACTIVITIES AND EXPECTED RESULTS:

This traditional healer and the biomedical collaboration will facilitate the following specific activities:

ACTIVITY 1: VCT

Provide support for voluntary counseling and testing (VCT) of OVC, families and child caregivers, including HIV prevention and treatment education.

ACTIVITY 2: Psychosocial Support

Provide psychosocial support to OVC, their caregivers and families by introducing coping strategies, mental health assistance, counseling and referral for problems that can be dealt with on the biomedical side.

ACTIVITY 3: Training

Activities 1 and 2 will be included in one-day training modules for THPs (entire FY 2006 cohort) on a ten-question screen for pediatric developmental disabilities as well as for HIV that lay counselors can also use. This will be introduced and adapted to THP practice. OVC are especially at risk for developmental disabilities, delayed school entry, etc. Field evaluation will follow to validate negative or positive screens of OVC. Workers from the Department of Community Health at the Nelson Mandela School of Medicine (NMSM) will apply an inter-rater reliability test for sample THP groups.

ACTIVITY 4: Stigma and Discrimination

A pilot workshop will be held with smaller group of THPs from FY 2006 cohort to explore assistance and biomedical-traditional healing collaboration on managing stigma and discrimination problems for OVC. Advice will be provided on treatment availability and confidentiality. In addition, the NMSM will explore joint strategies with THPs on disclosure of child's status and daily drug regimens.

ACTIVITY 5: HBC

Integrating child health and wellbeing into home-based care (HBC) for the sick will be done in collaboration with current HBC training modules. THPs visiting patients and patient families can do rapid checks on kids when visiting homes or dealing with parents and determine if OVC are receiving government grants. This will be added to the monitoring and evaluation practices.

ACTIVITY 6: Public Sector Services

NMSM will work to improve utilization of public sector services - such as social welfare and health, including facilitating access to antiretrovirals. They will ensure that all THPs in the program are fully aware of social security grants available and special facilities for kids, people in communities who receive special training to engage children in early education activities, before pre-school. The same is true for care dependency grants, foster care grants, disability grants. This training and collaboration will form part of training sessions

Activity Narrative: discussed in item 3 above. THPs could help direct children and their caregivers to social workers at community level instead of patients only meeting a social worker at the tertiary level and having to be referred back to the community level social worker (a common situation currently). NMSM will conduct training and interact with THPs to include discussion of advocacy on behalf of children on issues of guardianship, school attendance, and legal issues.

ACTIVITY 7: M&E

NMSM will carry out follow-up sessions with THPs on these issues during the course of the year to explore implementation successes and failures and needs for modification of training.

The following parameters will be monitored to measure the impact of traditional healer involvement in improving the health and wellbeing of OVC:

1. Numbers of OVC and households in the care of traditional healers;
2. Description of the psychosocial context and needs of OVC and their extended families;
3. Changes in utilization public sector services;
4. Changes in school attendance;
5. Access to social and welfare grants;
6. Access to preventative and curative healthcare services, including antiretrovirals, immunization, growth and nutrition monitoring.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 3462.09	Mechanism: DoE
Prime Partner: National Department of Education	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 14042.23011.09	Planned Funds: \$282,533
Activity System ID: 23011	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activities in targeted schools located in KwaZulu-Natal (KZN) will support orphans and vulnerable children (OVC) and provide training for their caregivers to improve the lives of the OVC. Support will extend to primary schools which serve as feeder schools for the high schools in the peer education program. Activities will offer services to OVC in schools and train caregivers to mentor and support OVC. Primary areas of emphasis will be human capacity development, psychosocial support, education and training to support OVC. The program will support the Department of Education (DOE) strategy to use schools as full service centers for learning, teaching, prevention care and support. The target population will be OVC ages 5 - 17 in grades 0-12, and caregivers servicing the focus schools. Program focus will be on strengthening families, households and communities to meet the needs of orphans and other vulnerable children affected by HIV and AIDS. The program will also support community-based activities that offer responses to help children and adolescents to meet their own needs through meaningful youth participation, and create a supportive environment where children can grow and develop into productive members of society.

Support for OVC will be linked with other DOE programs to ensure that the students can gain access to available services such as "no fee schools", school nutritional programs, life skills and peer education programs and link OVC programs with other USG programs to access full scale services and sustain the support. The USAID-supported OVC program in KZN schools will also support full service schools to strengthen and sustain the continuity of care and support through the training of the district and school level officials. USAID will support the establishment of at least six full service schools in the Umzimkulu area.

Full service schools will be structured to provide psychosocial support to students and teachers by making available qualified social workers and psychologists (linking with the social welfare services); professional nurses and medical services (linking with health); protection services for OVC cases that need (linking with police and legal services) interventions and support; and educational and vocational training services (linking with education) for OVC that need mentoring, scholarships and career guidance.

The KZN provincial DOE has established full service schools in some of the districts and there are none in the Umzimkulu area due to the recent provincial border demarcations that led to Umzimkulu being moved from the Eastern Cape to KZN.

SUMMARY:

Support for orphans and vulnerable children (OVC) and training for their caregivers in targeted schools will be carried out by a local NGO to support the Department of Education (DOE), to improve the lives of the OVC. Activities will provide services to OVC in schools and will train caregivers to mentor and support OVC. Primary areas of emphasis will be gender, human capacity development, psychosocial support, education and training to support OVC. The program will support the DOE strategy to use schools as full service centers for learning, teaching, prevention care and support. The target population will be OVC and children ages 5 - 17 in Grades 0 - 12, and caregivers servicing the focus schools.

BACKGROUND:

The DOE is committed to increasing access to quality education for all students including students with special needs. Policies are in place to address student retention rates at schools through the expansion of the feeding scheme program which provides access to nutritious food. DOE is focusing on improving access for children in rural areas and exemption and elimination of school fees for children whose parents cannot afford the cost of education. The no fee paying schools offer access to five million children. The DOE's inclusive education policies are aimed at creating an education environment where there is no discrimination. The DOE uses a district-based approach to support a cluster of schools with special needs. Some of these schools have been earmarked as full service schools where therapy, counseling, assessment, treatment, care and support will be provided to students who require these services.

Many children in rural areas do not have access to any of the services discussed above. Girls still suffer from various forms of discrimination. Children have to travel long unsafe distances to school and in some instances they experience abuse and rape along the way. Other children are abused in their homes, maltreated their peers, and live without adequate adult support and supervision. In some cases children are absent from school due to ill health or psychosocial factors. Children are marginalized and stigmatized due to their disability, ill-health or when parents are terminally ill or have died of AIDS. In rural areas children with disabilities do not have easy access to schools due to lack of transport. They are sometimes hidden by families or mainstreamed without recognition of their disabilities.

ACTIVITY 1: Caregiver Training

This program will provide training for caregivers to support children and teachers to address disability and vulnerability issues. The education system is not equipped with qualified caregivers, social workers, psychologist, and therapists to assess, and provide support to children with disabilities, children traumatized due to death of a parent, or children infected with AIDS. Teachers do not have adequate skills and the capacity to serve as counselors and caregivers. Human and physical resources are limited to urban areas and economically affluent schools. While the DOE has set aside finances to support children with disabilities, this plan has not yet started to yield the desired results due to lack of capacity. Support will include training for 30 caregivers from school governing body members to increase capacity to offer quality education to OVC and disabled children. Support will increase measures to protect OVC from violence, exploitation, discrimination, abuse and obviate any secondary trauma that may result from their orphanhood and/or vulnerability. Training for caregivers will impart skills to mitigate the impact of HIV and AIDS, address disabilities and fight discrimination. Caregivers will receive training to identify OVC, access for referrals for the identified children to appropriate service providers, establishment and support of child care forums and monitoring and evaluation systems to ensure that there is accurate data to respond to emerging problems. The skills acquired through the training will also assist members of the local community especially women to

Activity Narrative: access income.

Other education funds will be leveraged to provide a comprehensive integrated wraparound OVC program. Support will include conducting a baseline study in target schools to determine the specific needs of the students. The targeted schools will receive support for abstinence and be faithful activities.

ACTIVITY 2: OVC with Disabilities

PEPFAR funds will assist 2000 OVC to fight the impact of HIV and AIDS and address disabilities. USG funds will be used to strengthen mentoring training programs for OVC and more vulnerable disabled children and increase access to social services, health, nutrition, and education. Activities will support prevention against HIV and AIDS, equip children with skills to counter abuse, teach children about gender-based violence prevention, offer OVC career guidance opportunities, tertiary education and training programs, child protection services and legal aid. Training and workshops will address psychosocial issues for OVC in schools, integrate HIV and AIDS and gender into the curriculum, addressing sexual harassment, sexual abuse and unwanted pregnancies to reduce abuse and cohesion.

Support will be linked to the schools that are currently receiving peer education assistance and special schools identified by DOE as full service schools. This link is aimed at consolidating USG education support to ensure comprehensive programming in the area.

The OVC program will support children in a cluster of 200 rural KZN schools. The program will focus at the Kokstad, Mzimkulu schools in the Sisonke District with high poverty levels and HIV prevalence rates. OVC include children with mental, physical and learning disabilities, and children orphaned by AIDS. The support to OVC is in line with the DOE's objectives on inclusive education, and uses schools as supportive centers of learning.

In KZN the provincial education department is working with other donors and local NGOs to strengthen school structures to provide care and support for children and teachers. This program will be implemented in collaboration with other ongoing DOE activities. Other partnerships will include establishing links with local health, social, law enforcement and legal aid services. This is to ensure that the activity is integrated with existing service institutions in the area to sustain the collaboration between education, health, social services and police. A local service provider will be identified competitively through an Annual Program Statement to implement this program.

Program Area: Care: OVC

Budget Code: HKID

Program Budget Code: 13

Activity ID: 8251.23042.09

Planned Funds: \$339,817

Activity System ID: 23042

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Project Support Association - Southern Africa (PSASA) will fully integrate OVC programs into existing HBC programs. Once trained, the child care workers (CCWs) will be working with the 14 existing PSASA HBC programs.

PSASA will provide support to establish food gardens with child carers at the homes of children by obtaining assistance from farmers and the Department of Agriculture.

Training on fruit tree planting by local farmers for children at their homes. (PSASA will obtain fruit trees from farmers for this purpose.)

Community child care forums have been implemented by Government. They need to be followed up and training will be done for these forums so that they contribute to the safety and security of children, and child rights. PSASA will continue to support OVC in the following services - assistance with access to health care, education, economic support, food and nutrition support, legal assistance, psychosocial support, palliative care, and training related to OVC.

SUMMARY:

Project Support Association - Southern Africa (PSASA) is a community-based HIV and AIDS prevention and care organization based in Mpumalanga. With FY 2008 PEPFAR funding, PSASA will increase the scope of services provided by integrating orphans and vulnerable Children (OVC) care, adult palliative care and community-based HIV counseling and testing. PSASA will also improve the quality of these programs. The major emphasis areas are training and local organization capacity development. Target groups are OVC, people living with HIV (PLHIV), and their families. With FY 2008 funding PSASA will expand the number of OVC programs. These new PSASA OVC projects will target poorer rural communities of Mpumalanga, Limpopo and KwaZulu-Natal provinces where health services are limited.

BACKGROUND:

PSASA is a non-profit organization, which was established in 1998 in HIV prevention, care and support, and mitigation. Its mission is to create community partnerships that enhance their ability to prevent, mitigate and alleviate the impact of HIV and AIDS of which home-based care (HBC) programs are an integral component. Care in the home at community level is a strategy within the South African Government Strategic Plan. PSASA has established and continues to support over 60 home care programs. Many of these were established in partnership with the Mpumalanga Department of Health from 1998 onwards. In 2004, 127,614 clients received direct support from a PSASA project and over 32,000 household members received training from a community caregiver. Currently, PSASA works with OVC programs in three municipalities of Mpumalanga province; Thaba Cheuw, Emalahlene, and Steve Tswete. These projects will be expanded and integrated into their home-based care programs with FY 2008 funding. PSASA will continue to work closely with Departments of Health, Welfare and Population Development. In recent years closer relationships have been formed with the provincial Department of Home Affairs, Agriculture Development, Provincial Premier's Office (Gender), Department of Education and Department of Labor (specifically for income generation activities). The Mpumalanga provincial Department of Health & Social Services (DOH&SS) provided R800, 000 to conduct training in HIV and AIDS in 2005-2007. The DOH&SS also provides PSASA with HIV test kits and home-based care kits, as well as assistance with establishing referral networks for family planning, antiretroviral (ARV) and tuberculosis (TB) programs. Social grants, food packages and child assessments are undertaken closely with Department of Social Development (DOSD) with funding from the Dutch. Each of the PSASA projects are encouraged to work closely with local AIDS Councils, churches, government departments and municipalities, schools and businesses that are able to provide "in kind" support. PSASA worked with its partners to provide social grants, food packages, child assessments and psychosocial training to OVC, teachers and foster parents in 2007 to strengthen the resilience of OVC. These activities will continue in FY 2008.

ACTIVITIES AND EXPECTED RESULTS:

PSASA will conduct two key activities for OVC: 1) Train child care workers, teachers and foster parents and OVC on psychosocial support; and 2) Ensure that OVC services are fully integrated into the home-based care programs.

ACTIVITY 1: Training on psychosocial support

In FY 2008, PEPFAR funding will be used to train child care workers (CCWs), teachers, foster parents on OVC psychosocial support. These CCWs will be recruited from and work within PSASA's HBC programs. Training will include: how to identify and assess OVC, how to plan for various needs of OVC and how to provide psychosocial support. Additional training will be provided on communication skills, referral and follow-up. HBC workers will receive training on how to identify OVC and will refer to the CCWs for follow-up. A social worker will assist in building the capacity of the CCW through training and mentoring.

ACTIVITY 2: Integration of OVC Programs into Existing HBC Programs

PSASA will fully integrating OVC programs into existing HBC programs. Once trained, the CCWs will be working with the 77 existing PSASA HBC programs. Referral to CCWs for the identification of OVC will come through the HBC workers. CCWs will provide or ensure that spiritual support is provided. CCWs will provide psychosocial support, referral for medical issues as observed and nutritional and material assistance including birth certificates, social grants or educational assistance. Emphasis will be placed on keeping school-aged children within the educational system. This may include, after-school homework supervision, provision of school uniforms or assistance with school fee waivers. PSASA will work closely with DOSD and with the drop in centers to assist with homework support and nutritional support and feeding

Activity Narrative: OVC. PSASA, through funding from the Dutch, will provide targeted nutritional support and supplemental food provisions to selected OVC and their families. PSASA will ensure that where appropriate guardian consents can be obtained, OVC will be referred for HIV counseling and testing. The ability of OVC to access existing grants from the South African Government is vital to the survival of each individual OVC. With the support of the PSASA home caregiver, OVC will be able to draw on local, community and other more sustainable funding sources. PSASA is well known to the provincial Department of Health & Social Services. The DHSS has requested PSASA to support some of the home care projects in the province and it is likely that Government will provide some cost sharing. The OVC projects link closely with community and church groups who regularly supply "in kind" support (usually 10% of project budget). Certain components of the home care program have become fully sustainable. Income generation activities for care workers such as food gardens have become sustainable with care workers receiving R1000 per annum through the selling of vegetables and fruit. These activities are extended to OVC especially those in child or orphan-headed households.

Activity System ID: 22564

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Umbrella Grants Management partner, Academy for Education Development (AED-UGM) will continue providing TA and capacity building to new and ongoing sub-partners using the same strategy as FY 2008.

OVC constitutes the largest program area for the AED-UGM, with 6 sub-partners working in this area: 1) Anglican AIDS and Healthcare Trust (AAHT), 2) Hospice and Palliative Care Association of South Africa (HPCA), 3) Ingwavuma Orphan Care (IOC), 4) Senzakwenzeke, 5) Woz'obona, and 6) Care. Core group training and follow-on technical support will primarily focus on organizational development and institutional strengthening, whereas customized training, TA and twinning activities will build technical capacity in OVC programming. Yearly capacity building plans for each sub-partner will be developed, building on prior year's plans and will articulate the individual CB needs of each sub-partner. Where possible, cohort/cluster trainings will be organized for sub-partners, to maximum resources and facilitate cross-sharing of best practices.

The AED-UGM has established an Educational Training Fund (ETF) to support the HCD needs of sub-partners through the provision of resources that include: funding for such things as the development of job aides, handbooks and educational materials; and sponsorship for attending courses, technical meetings, etc. The ETF is a mechanism whereby the staff and volunteers working for sub-partners can apply for, and receive, funding to improve skills and enhance service delivery. Sub-partners engaged in OVC programs will tap the ETF for sponsorship to attend short courses and technical meetings in such areas as: financial management, computer training, and report writing; and technical OVC subjects including memory box, child abuse case management, child and youth care development, etc. Additionally, the AED-UGM will adapt/develop and disseminate standard tools, protocols and manuals for use by sub-partners to improve operational systems and expand service delivery. Examples from year one CB plans illustrate the types of training, TA and twinning activities that OVC sub-partners will participate in:

- 1) Woz'obona and Senzakwenzeke exchange visit/twinning on Household Gardening
- 2) Senzakwenzeke and AAHT exchange visit/twinning on Child Care Forums
- 3) Woz'obona and Senzakwenzeke exchange visit/twinning on CINDI Database
- 4) Sponsorship for IOC staff to participate in paralegal, child abuse case management, and child and youth care development courses
- 5) Training of trainers for Woz'obona staff in facilitation and training skills

AED-UGM is a capacity building program which ensures that sub-partner organizations collaborate and coordinate with SAG. AED-UGM seeks to ensure that all sub-partner service delivery strategies are aligned with the four priority areas in the NSP, namely: (i) Prevention; (ii) Treatment, Care and Support; (iii) Research, Monitoring and Surveillance; and (iv) Human Rights and Access to Justice.

AED-UGM is committed to gender equality and has established systems, procedures and monitoring and evaluation instruments to ensure sub-partners are sensitive to this issue. Since gender equality and gender equity are concerned with ensuring that the needs of women, men, girls and boys are addressed in all phases of program planning, AED-UGM monitors the integration of gender concerns in situation analyses, the formulation of objectives, program activities and MER plans. Thus, AED-UGM goes beyond the mere counting of the number of females and males attending training courses by actively promoting gender equality and gender equity, and providing support to sub-partners to enable them to address this issue effectively. As part of this process, sub-partners are required to report on gender-related activities in their quarterly monitoring reports. Gender equality consultants will also be engaged to strengthen the expertise of AED-UGM in this area.

Sub-partner organizations sign MOUs with provincial and district departments. Details concerning the status of MOUs in different provinces will be provided in sub-partner COPs. AED-UGM ensures that sub-partners report progress on SAG collaboration efforts and MOU status on a quarterly basis.

SUMMARY:

As an Umbrella Grants Management (UGM) partner, Academy for Education Development (AED) supports institutional capacity building, technical assistance and grants administration for indigenous organizations that implement PEPFAR programs. These partners and sub-partners consist of indigenous NGOs, FBOs, and CBOs that were selected through the Inter-Agency PEPFAR Annual Program Statement (APS) and have met the criteria for full and open competition. The main functions of the UGM program are: 1) to facilitate further scale-up of HIV and AIDS care services and (2) to develop indigenous capability, thus creating a more sustainable program. The emphasis area is Local Organization Capacity Development and the primary target population is indigenous organizations.

BACKGROUND:

AED has extensive experience managing grants programs on behalf of USAID with PEPFAR funds. Prior to award of the UGM under the South Africa APS, AED was already managing grant programs funded with PEPFAR dollars in Ghana and Honduras, and providing TA and capacity building to PEPFAR partners on palliative care and OVC work in Mozambique and Kenya. In addition, AED has been sourced as USAID's exclusive partner for capacity building to the 23 NGOs funded under the PEPFAR Round One New Partners Initiative. As such, AED is well experienced in providing TA and capacity building on the broad array of technical areas related to PEPFAR programs, monitoring and evaluation, organizational development and finance management. In addition, AED has also been a key PEPFAR implementing partner in South Africa

Activity Narrative: and is thoroughly familiar with working on HIV/AIDS programs within that context. As a UGM partner, AED will not directly implement program activities, but rather act as a grants administrator, technical assistance provider, and mentor for sub-recipients, who in turn carry out the assistance programs. AED collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grant mechanism. Although some of the partners work closely with various SAG Departments, AED's primary interface with the SAG is through the Senior Management Team (SMT), which includes key staff from USAID, National Departments of Health and Social Development, and representatives from the provincial departments. Under AED, between 6 and 11 indigenous partners will be supported via sup-grants and technical assistance. Partners are active in many provinces across South Africa and provide support for OVC by identifying and training caregivers, establishing community care centers, and providing psychosocial support. Grants to OVC partners support a range of locally-driven best practices for orphan care using a variety of models of service delivery and working in collaboration with the South African Government's Department of Social Development. During their partnership with PEPFAR, OVC partners will increase their reach while also building their own capacity towards long-term sustainability. This scale-up will require adequate financial, monitoring and evaluation, and management systems to accommodate growth and maximize sustainability.

ACTIVITIES AND EXPECTED RESULTS:

Funds budgeted under this narrative will support costs for administering and managing these OVC partners. Separate COP entries describe the OVC activities implemented by each partner. Institutional capacity building of indigenous organizations is a key feature of umbrella grant mechanism and is designed to promote sustainability of care programs and organizations.

ACTIVITY 1: Grants Management

AED will award and administer grants to partners selected through the PEPFAR APS competitive process to implement OVC activities. This involves an array of related activities including award and administration of grants, monitoring of grant progress, meeting reporting requirements, financial oversight, ensuring compliance with USG regulations, and grant closeout. AED will monitor OVC partners' program implementation and adherence to financial regulations. This involves provision of extensive technical assistance to partners on project development and implementation, financial management, monitoring and evaluation, and reporting.

ACTIVITY 2: Capacity Building

AED will support institutional capacity building of indigenous organizations. (Capacity building activities are defined as activities that strengthen the skills of indigenous organizations to implement HIV and AIDS programs efficiently, with diminishing reliance on internationally-based technical assistance and support.) AED will support activities to improve the financial management, program management, quality assurance, strategic information (M&E) and reporting, and leadership and coordination of partner organizations implementing OVC activities.

ACTIVITY 3: Monitoring and Evaluation (& Reporting)

AED will provide support to OVC partners on monitoring and evaluation, in order to strengthen measurement of the implementation and impact of program activities, an eventual achievement of PEPFAR goals. M&E support of OVC partners includes: measurement of program progress; provision of feedback for accountability and quality; surveillance; and implementation of information management systems. In addition, AED will provide supportive supervision to provide guidance, monitoring, mentoring and oversight through site visits, technical assistance, and performance evaluation.

USG Agency: U.S. Agency for International
Development

Program Area: Care: OVC

Program Budget Code: 13

Planned Funds: \$1,941,809

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Gender Programming:

The program will seek to increase women's access to income and productive resources through the formation of women's associations. Women from the project areas will group themselves and be advanced a loan that will belong to the group. Each group will develop a code of conduct on how the group will function including the interest that will be charged on borrowed funds and defaulters. Individual members from the group will then borrow from the group at a nominal interest. At the year end profits are shared among the group members with the initial seed money being returned to the pot for use again the following year. It is envisaged that these associations will present opportunities for income generation for community health workers and children from disadvantaged families. These income generating activities will be developed following locally focused operational research on niches in the local market conditions that could be exploited. Also leveraged will be the experience generated by other PEPFAR partners. The African Medical and Research Foundation (AMREF) will seek to replicate the voluntary savings and loan scheme being implemented by Care.

Economic Strengthening:

In addition, AMREF will pilot an income generating initiative for OVC, partnering with Project Concern International; a US-based NGO with experience in the implementation of income generating activities. The primary aim is to develop agricultural income generating activities including food production and animal husbandry. Children who have graduated will form associations who will then be provided entrepreneurial training and skills on how to implement and manage an income generation activity. Each group will then be asked to develop a proposal and then access funds from the project. It is anticipated that such initiatives would lead to economic development of the area as it creates employment opportunities for children and their families. It is planned that the income generation is targeted at OVC who have graduated. The initial pilot seeks to benefit 50 children (25 per district).

Human Capacity Development:

Human capacity development activities will focus on training of community health workers (CHWs), and project and management staff. For CHWs training will aim at equipping them with skills to enhance service delivery. CHWs will be trained on how to identify, refer, support and monitor children. The scope of training includes basic home-based care, counseling, support to home-based care, tuberculosis and ART clients, as well as provision of nutritional support.

AMREF will focus on training of CHWs to improve service delivery. The use of job aids in rural communities will be promoted. Job aids are materials that help a CHW perform the required tasks while providing a sense of affiliation and enhancing the CHW's authority. Appropriate job aids also strengthen skills and are invaluable in increasing confidence. Job aids that AMREF will pilot among community health workers are on health education for children and community members:

Alignment with the NSP or other SAG policies:

AMREF's OVC project seeks to improve children's access to comprehensive services being provided by civil society and government through the identification of children at the local level and referring them to the relevant service providers that include Health, Education, Department of Social Development (DOSD) and the South African Social Security Agency (SASSA). In situations where services cannot be obtained from government, children are referred to other CBOs and NGOs for the relevant service. This is in line with the National Strategic Plans (NSP) goal of developing and operationalizing mechanisms to identify, track and link child-headed households to grants and other social services.

The project promotes the development of community structures that enhance the communities' response to the plight of OVC. This is done through the creation of child care forums at the district and ward levels to ensure that each ward in which the project is being implemented has a platform to identify children and address their needs.

The project also seeks to increase the number of children accessing services from government departments. Through activities with the different agencies above, the project is working towards the NSP's objectives of increasing the number of children accessing grants and essential registration. Referrals by service providers will also increase children's access.

In addition, the program's reliance on community home-based care workers also ensures that capacity at the local level is developed and community care workers develop career paths. This program approach is aligned to the NSP's goal of expanding community home-based care as part of the expanded public works program.

SUMMARY:

The African Medical and Research Foundation (AMREF) will strengthen capacity of South African district government departments, Child Care Forums (CCFs), NGOs and CBOs, and service providers to provide quality and accessible care and support for OVC, through training, mentoring, awareness-raising and advocacy for children's rights. Emphasis areas for this program are training, gender (addressing male norms and behaviors and reducing violence and coercion) and local organization capacity development. Target groups include OVC (0-18yrs) and their caregivers.

BACKGROUND:

AMREF is an international health and development NGO working in East and Southern Africa. In South Africa Page 1318

Activity Narrative: Africa, AMREF previously worked in Mpumalanga (from 2001 to 2004) strengthening community care-giving infrastructure for OVC, including the improvement of capacity and integration of service providers and government departments. Building on this initiative, AMREF has formed partnerships with key government and civil society stakeholders in both Limpopo province (Sekhukhune district) and KwaZulu-Natal (KZN) province (Umkhanyakude district). In these two particular districts, in which 55% and 57% respectively of the population are under the age of 18, AMREF has identified the need to develop a comprehensive program to address the needs of OVC by strengthening collaboration between, and capacity of, local service providers, governmental and civil society groups. The districts are presidential rural nodal points recognized by the SAG as the poorest and most under-resourced districts in South Africa. The NDOH (2006) survey reported that KZN and Limpopo have high HIV prevalence rates (20.6% and 11.7%, respectively) and a high number of OVC (57% and 55% respectively). Currently, AMREF has seven local partners providing services to OVC located in sites in Sekhukhune and Umkhanyakude districts of KwaZulu-Natal and Limpopo provinces, respectively where intervention will continue with FY 2007 PEPFAR funding. Each of these partners, in turn, work with an average of three second line partners who spearhead identification of children and servicing of these children within their locality. In FY 2008, AMREF is proposing to add a new partner (Ndumo Drop-In Center) to be contracted as one of AMREF's first line partners to increase reach and improve access to services in Umkhanyakude. AMREF work is closely aligned to the aims of the Department of Social Development's (DOSD) National Action Plan for OVC as well as the National HIV and AIDS Strategic Plan (2007-2011).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

With FY 2008 PEPFAR funding AMREF will provide training, mentoring and on-site support to its eight established CBO partners (first line partners) and their individual networks of emerging community groups (second line partners) to strengthen care and support systems for OVC in the two districts. AMREF's first line partners are those partners who have signed contracts with AMREF and receive sub grants from AMREF and have been registered as community-based organizations (CBOs). Second line partners on the other hand are community groups that have been formed to address needs that will have been identified in their communities such as home-based care and orphans and vulnerable children. AMREF will focus on system development at community level for first line level and service delivery at second line partner level. For AMREF's first-line partners, capacity development activities will include training in financial, project, organizational and human resource management. In addition, they will be trained in supportive supervision to ensure that volunteers do the work they are supposed to do and that the quality is of a high standard. AMREF will also provide capacity building support for second line partners from where most of the children are identified and serviced. Particular attention will be on the identification, referral and support mechanisms to ensure that children who will have been identified receive a comprehensive package of services. Second line partners will receive essential training in the identification, servicing and referral system that has been developed.

ACTIVITY 2: Care and Support Services

AMREF-trained community care workers and service providers will provide a comprehensive care and support package for children requiring psychosocial, nutritional, educational and health care support. Trained service providers will identify OVC and conduct needs assessments, home-visits, and psychosocial support, provide nutritional support and counseling, and life skills training and homework supervision. In addition, AMREF and its partners will also provide assistance with SAG social security grant applications, succession planning and birth registration as well as on-going monitoring and follow-up for other essential services including access to primary health care protection services, and information on HIV prevention and interventions to reduce gender-based violence (GBV). AMREF will also continue to ensure that OVC under five years access health care through integrated management of childhood infections (IMCI) and the expanded immunization program (EIP) supported by UNICEF. This service package is provided directly to OVC by the Children's Drop in Centers, CCFs, CBOs and NGOs including home-based care organizations. Health practitioner capacity has often been cited as presenting a barrier for children and adolescents to access health services. AMREF will strengthen the skills base of health care professionals in the delivery of child friendly health services. AMREF also will work with the local clinics and health service providers to promote provision of reproductive health service, counseling and testing, management of sexual violence as well as information and counseling on development including nutrition, hygiene, and substance abuse. This will be a major focus aimed at reducing death and disease, deliver on the rights of the children and adolescents to health care

ACTIVITY 3: Strengthening district and civil society capacity and coordination

To ensure sustainability of support for OVC, AMREF will provide training in program design, planning and implementation, monitoring and evaluation as well as technical support for government at district and municipality levels (including District AIDS Council). AMREF will facilitate improved collaboration between departments and integration of services by organizing and facilitating regular inter-agency/ departmental meetings and forums. AMREF will provide organizational strengthening training and systems development, support and follow-up for CBOs/NGOs engaged in OVC service delivery, including financial and program management skills, leadership and resource mobilization training. AMREF will train selected NGO workers and community care workers in psychosocial support and counseling for OVC. To cope with the number of children in need of care, the establishment of community care structures is essential. AMREF will build on the childcare forums that will have been established and strengthen these structures. CCFs will be key in the identification and support of orphans through community-based care and support program. CCFs will continue to be established in every ward and strengthened.

ACTIVITY 4: Community-level Advocacy

In FY 2008 AMREF will conduct consultations with civil society and government stakeholders to determine

Activity Narrative: community level advocacy issues. In response, AMREF will train youth, caregivers, service providers on advocacy skills and planning and assist to develop strategies to advocate for changes to SAG policy and practice concerning OVC, identify and work to eliminate bottlenecks in service provision and mobilize resources. AMREF will facilitate and support advocacy meetings with traditional leaders, local and district government. AMREF will also continue to support CCFs in their advocacy role at community level on behalf of OVC. Specifically, AMREF will provide CCF members with training to support advocacy against GBV, especially against female OVC. Some of the major challenges that orphans face include lack of access to adequate treatment and care services, loss of property and lack of protection from abuse and exploitation. AMREF will partner with organizations such as Legal AID, mobile clinical service providers as well as other civil society and community-based organizations to ensure that there is synergy in the implementation of program and that children get a comprehensive package of services.

ACTIVITY 5: Gender Mainstreaming

This component will build on the peer education initiative pilot that was started in 2007. Male OVC will be a key group of focus under this initiative. The gender-mainstreaming component seeks to increase the participation of male OVC in the provision of care to other children as well as address the gender stereotypes that tend to predispose female OVC to abuse. Male OVC will be educated on the norms and behaviors that promote equality of the sexes. AMREF will use PEPFAR funds to continue training and supporting community care workers, partners and other stakeholders (e.g. traditional leaders, teachers, health workers, social workers) to mainstream gender into the delivery of a comprehensive service package for OVC. AMREF will work with OVC service providers and stakeholders to develop and implement gender-based violence awareness campaigns with specific focus on vulnerable populations such as female OVC and the disabled. In addition, AMREF will work to sensitize parents and teachers to mainstream gender issues in life skills training. Gender mainstreaming will include training on gender roles, gender-based violence recognition and prevention, male/female norms and behaviors in OVC identification, referral, care and support.

Activity System ID: 22641	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

CARE South Africa's Deepening and Expanding Local Links Project (DELL) is a follow-on activity to CARE's Local Links Project funded through Track 1. The two projects will be implemented concurrently in FY 2009 with funding separately managed. In FY 2010 Local Links programming will be integrated into DELL, thus the implementation and funding will operate as one project, through DELL. In Limpopo, DELL will be implemented in Mopani and Sekhukuneland districts and expand to Vhembe district. In the Free State, implementation in Motheo district will be discontinued, and scaled up in Thabo Mofutsyane District. The proposed expansion into Ehlanzeni Region of Mpumalanga will not be affected. DELL will also work in tandem with CARE's LETSEMA program funded through the Centers of Disease Control. DELL's goal is for OVC and their caregivers to access and use a wide range of high-quality, comprehensive services from government and civil society institutions.

BACKGROUND:

DELL will be implemented through 9 new sub-partners and 4 district or local municipalities. Two sub-categories of implementing partners will be contracted. Technical Partners (totaling 5) - who are able to scale up their reach directly and /or mentor smaller community-based organizations (CBO) will be supported to recruit professionally qualified nurses and a social worker to ensure sustainable access to skilled staff. The technical partners will also provide services to OVC in their operational areas. 4 New CBOs (referred to as Implementing Partners) will be contracted to only provide services to OVC and their caregivers. Proposed technical partners are: CHOICE Health Care Trust, Bethlehem Child Welfare; Civil Society Development Initiative and Dihlabeng Development Initiative; a fifth technical partner is yet to be identified. OVC focal posts will be funded and supported to develop 4 district or local municipalities' capacity to coordinate services, ensure OVC needs are integrated into local plans and budgets, provide further support and access to training and funding opportunities to CSO and improve the coordination function of relevant government -civil society structures.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Package of Services

Community-based organizations provide access to a core package of services to meet the needs and rights of OVC. Three outputs are envisaged:

- a) a minimum package of core services will be agreed upon with sub-grantees which will be developed through building their own capacity or building linkages to ensure effective referrals. CBOs will develop these plans and the monitoring tools collaboratively within a municipality or district;
- b) CBOs deliver high quality services through ensuring OVC access comprehensive coordinated services through placing critical technical capacity like social workers, nurses in the Technical Partners to provide skilled and consistent outreach to Implementing Partners; and
- c) Referral Systems are established and tracked. A local municipal and district-based multi- sectoral mapping of services will be undertaken with Government Departments and CSOs. Implementing partners will develop reliable referral protocols with at least one local service provider to extend the range and effectiveness of services to OVC.

CARE's economic work with the OVC caregivers is well established, its adaptation to reach adolescents and youth will be strengthened through ensuring that the head office-based Economic Support Coordinator is experienced in working with youth and in establishing linkages with government and the private sector to ensure work opportunities. Older OVC access to HIV/AIDS related services will be strengthened through placing 3 youth counselors in strategic clinics (to be funded through Track 1).

ACTIVITY 2: Economic Security of OVC

- Households with OVC will have more diversified and sustainable livelihoods through
- a) using their income grants productively through engaging in the CARE's savings and lending model (VSL), and supported to develop income generating activities (IGA);
 - b) developing the regulatory mechanism to ensure compliance with the South African Financial Service Act and provide beneficiaries with other means to grow their savings;
 - c) the social support function of the VSL groups is strengthened by CBO and other stakeholders through making technical input into the groups in areas of health care, parenting skills, sexuality and reproductive health care for adolescents and youth; and
 - d) the adaptation of VSL and IGA for older OVC. 400 Caregivers will be trained and supported to save; 100 youth will engage in viable income security activities.

ACTIVITY 3: Policy

Local government policy and implementation environment is enhanced to further benefit of OVC and their caregivers. CARE will place 4 OVC Focal persons in 4 District or Local Municipalities to develop government's capacity to respond to OVC needs and develop policy and program decision that support OVC and their caregivers. The OVC Focal persons will coordinate OVC services and data, participate in and strengthen Child Care Forums and AIDS council to build effective referral and support networks; provide hands on support to CBOs and develop district database to inform Integrated Development Plans and Budgets; and address bottlenecks in government service delivery. CARE will document at least one promising practice.

ACTIVITY 4: Organizational Capacity

Organizational capacity of Implementing partners is strengthened, to ensure long term sustainability, self

Activity Narrative: reliance and maximize project impact. CARE will contract 9 new partners (5 large and 4 smaller NGOs). DELL will focus on institutional strengthening of implementing partners to ensure a) enhanced strategic leadership; b) improved institutional planning and monitoring thereof ;c) stronger governance and human resource management capacity; and d) increased resource mobilization and financial management capacities. The overall organizational framework for ensuring the long term sustainability of implementing partners recognizes the value of small CBO to reach marginalized farming communities. These groups will be supported to provide peer learning and coordinated into a network. The network functions like financial management, fund raising, monitoring etc will be undertaken by the established CBOs. These established CBO's are usually larger or medium sized non-governmental organizations that will be supported to improve their own internal functioning and to better serve the institutional and service delivery needs of CBOs in the network.

Partners will participate in a national Project Steering Committee and capacity development initiatives as required. The Project Steering Committee of 9-12 people will be drawn from a mix of Implementing and Technical Partners, government officials and other related stakeholders to increasingly take strategic oversight of the project.

ACTIVITY 5: Cross Cutting Issues

CARE will undertake a baseline study of OVC needs and service satisfaction. CARE will migrate to using an electronic data base system. To reduce CARE and partner staff and volunteer caregiver turnover, CARE will build in incentives for staff development like access to accredited training, provide protective clothing and build in a systematic approach to care for the caregiver and access to services for themselves and their family members. CARE recognizes that the volunteer caregivers, predominantly women, are themselves infected or at risk for HIV /AIDS infection because of their economic vulnerability.

SUMMARY:

This follow-on activity will provide support to orphans and vulnerable children (OVC) and strengthen families affected by HIV and AIDS. The follow-on activity will work through South African locally-based sub-partners to stimulate and support the use of local resources (human, economic and knowledge systems) to promote the wellbeing and protection of OVC. The emphasis is on building the capacity of local organizations to strengthen direct service delivery to OVC and their caregivers. The targeted populations are OVC and people living with HIV and AIDS (PLHIV).

BACKGROUND:

This activity was supported by CARE USA in FY 2006 and FY 2007. The CARE Track One activities will be recompeted in FY 2007 and it is anticipated that the same partner will continue these activities in FY 2008. The follow-on activities will include: strengthening economic coping mechanisms of households caring for OVC; strengthening the capacity of sub-partners to provide a range of innovative services to OVC and their families; and promotion of advocacy efforts sensitive to the needs and rights of OVC and PLHIV.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Economic Strengthening

The follow-on will continue to focus on women's (caregivers) access to income and productive resources through Voluntary Savings and Loan (VSL). VSL is a group savings and internal lending model that creates a base for economic security for vulnerable families. The loans are circulated among group members based on individual emergency needs, which are usually medication, transport to health service, school fees and uniforms for children, food, etc. VSL members use the saving group as a social safety net to help them cope with family stresses including death and other related stresses, and to set up Income Generating Activities (IGA). The follow-on will focus on improving the qualitative aspect of the economic empowerment component of the female caregivers. VSL activities seem to induce a demand by the caregivers for IGA training. The follow-on activity will enhance the capacity of sub-partners to scale-up IGA training and support, tracking the qualitative relationship between the economic activities and the well being of OVC and their households and documenting the VSL model and lessons learned.

Small qualitative studies will be done to assess the impact of the economic component in improving the wellbeing of Caregivers and OVC. These studies will be done in different in areas in order to compare the impacts of the VSL and IGA activities on OVC and their households.

The follow-on activity will scale up the usage of VSL groups as one of the entry points to reach caregivers and OVC with other services such as psychosocial support, education and assistance in accessing birth certificates. Lessons learned will be documented that link VSL with the provision of other services to caregivers and OVC. The lessons will be replicated and used as models on how to use economic activities to enhance care and support of OVC.

ACTIVITY 2: Local Capacity Building

The follow-on activity will strengthen and improve the quality of services offered to OVC and their caregivers by focusing on institutional capacity building and program support to strengthen the partnership model. The follow-on will continue to support and build the capacity of sub-partners to provide a range of services; this will include strengthening home-based care support services offered to OVC and their caregivers. Activities with the support groups for OVC and caregivers who are both infected and affected by HIV and AIDS will continue. Activities will focus on reaching the most vulnerable children especially the under-five age group, the disabled and young girls.

In order to improve capacity of sub-partners to provide better services, the follow-on activity will appoint

Activity Narrative: Social Workers to work closely with sub-partners to use the training modules adapted from Hands at Work to train caregivers, especially grandmothers who are having difficulties of raising OVC, particularly adolescent OVC. Training will also focus on caregivers' communication skills with OVC will be integrated within sub-partners programs. The social worker will train, support and disseminate information on how sub-partners could improve OVC access to legal documentation, state social grants, and educational support to ensure that OVC stay in school and to assist in finding ways for volunteers to get regular stipends.

Sub-partners will be trained using the Sexual Health Reproduction manual to enhance the capacity of caregivers to communicate with OVC about issues of sexual health and reproduction.

The follow-on will focus on enhancing the capacity of sub-partners to provide support to caregivers to build coping mechanisms to deal with stresses raising OVC through a caregiver program that is based on group debriefing and sharing. This model will also be used to educate infected and affected people to form support groups.

The follow-on will develop an organizational development (OD) process with sub-partners. The OD processes will focus on enhancing the programmatic capacity of sub-partners to ensure organizational sustainability and to improve the quality of services delivered to OVC and their caregivers.

ACTIVITY 3: Advocacy

The follow-on sub-partners will be trained and supported to identify advocacy issues using the advocacy strategy developed in years three and four. This activity will strengthen sub-partners ability to advocate on and behalf of OVC and to enhance their ability to provide better quality services to OVC and their caregivers with improved to access government services and the creation of linkages with the private sector for economic support activities. Participatory Educational Theatre (PET) will continue to be used to deal with issues of stigma and discrimination and other rights-based issues, for preventative messaging and training of youth counselors. Cooperation with other PEFAR partners will be explored to strengthen and broaden this theatre activity to include storytelling. The CARE follow-on will work with sub-partners to introduce trained youth counselors to increase the reach of young people with services targeted at the youth.

The follow-on will continue to participate in the Government's National Plan of Action through the National Action Committee for Children affected by HIV and AIDS (NACCA) and on the NACCA sub-committee for food security. This program is consistent with the Department of Social Development (DOSD) Plan of Action for OVC. In addition, other relevant Departments will be supported to influence the improvement of OVC services, especially the Departments of Health, Agriculture and Education and participation in the police forum to assist the police with appropriate responses to issues of child and women abuse.

The CARE follow-on activities will contribute to PEPFAR 2-7-10 goals by improving access to quality care for 10 million people, including OVC.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

(a) The FY 2008 COP original targets were based on the last 9 months of the project, until 31 May 2009. Since Local Links programming has been extended to September 2009, all orphaned and vulnerable children targets have been maintained at 100%. Training targets have been reduced to 500 as the focus will be on supporting partners to implement all the training provided in the previous years.

(b) Voluntary Saving and Loans (VSL) Qualitative and Quantitative studies have been added in order to measure impact of VSL using one new village in Limpopo and one village/urban setting in the Free State province. This will track the impact of VSL and how the economic interventions directly contribute to the improvement of the lives of OVC.

(c) In response to VSL studies findings, regulation of VSL groups will be explored in the coming year so that the groups collectively are enabled to benefit from other private and government financial or health services targeting the poor.

(d) Local Links will work closely with Letsema project and Local Links follow-on (DELL) in strengthening partners' health component such as referral systems for positive children, pediatric care, etc.

(e) 3 Youth counselors post to be based at the local clinics will be created and supported in order to increase the use of related HIV/AIDS services by youth OVC.

SUMMARY:

CARE USA Local Links Project (CARE) provides support to orphans and vulnerable Children (OVC) and strengthens families affected by HIV and AIDS. CARE works through South African locally-based sub-partners to stimulate and support the use of local resources (human, economic and knowledge systems) to promote the wellbeing and protection of OVC. Local Links will expand its technical support for OVC services to implementing partners working through CARE's LETSEMA project. This will also entail expansion into Mpumalanga. Emphasis will be on building the capacity of local organizations to strengthen direct service delivery to OVC and their caregivers and developing networks for linkages and referrals. Targeted populations are OVC, people living with HIV and AIDS (PLHIV) and religious leaders.

BACKGROUND:

Local Links is part of the CARE USA OVC-focused Track 1 project implemented in South Africa and Kenya. This is the fourth year of Local Links Project, ending in March 2009 funded through Track One. CARE Local Links activities are: strengthening economic coping mechanisms of households caring for OVC; strengthening the capacity of sub-partners to provide a range of innovative services to OVC and their families; and promotion of advocacy efforts sensitive to the needs and rights of OVC and PLHIV. CARE implements activities in Motheo and Thabo Mofutsanyane Districts in the Free State province, as well as Mopane and Sekhukhune in the Limpopo province. CARE works in partnership with eleven sub-partners. Due to increased funding from the local mission and the redirection of OVC program funding for LETSEMA, new partners be added to scale up and reach more OVC. Scale-up will be done in consultation with the provincial Departments of Social Development (DOSD) and Health.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Economic Strengthening - Voluntary Saving and Loans (VSL).

CARE will continue to focus on women's (caregivers) access to income and productive resources through VSL (VSL is a group savings and internal lending model that creates a base for economic security for vulnerable families. The loans are circulated among group members based on individual emergency needs, which are usually medication, transport to health service, school fees and uniforms for children, food, etc. VSL members use groups as social safety net to help them cope with family stresses including death and others related stresses) and Income Generating Activities (IGA). In addition CARE will focus on improving the qualitative aspect of the economic empowerment component. Usually, a VSL group has at least six members who meet monthly for saving and internal lending. VSL induces demand for IGA training, CARE will continue to provide training and support to caregivers needing IGA training. Economic security activities are contributing to improved wellbeing of OVC and caregivers; feedback indicates that VSL members have increased ability to buy food, pay school fees, pay for health services etc. VSL groups serve as one of the entry points to reach caregivers and OVC with other services. CARE will strengthen the social support function of VSL and will facilitate training for grandmothers with a particular focus on communicating and caring for adolescent OVC. CARE will expand the baseline and impact study two additional villages. In addition, CARE USA will facilitate an evaluation across Local Links in Kenya and South Africa.

ACTIVITY 2: Capacity Building for Sub-Partners

CARE will continue to strengthen and improve the quality of services offered to OVC and their caregivers by focusing on in-depth institutional and programmatic support. CARE will continue to support and build the capacity of sub-partners to provide a range of services; this will include strengthening home-based care support services offered to OVC and their caregivers and work on the support groups for OVC and caregivers who are both infected and affected by HIV and AIDS. In order to improve capacity of sub-partners to provide better services, in FY 2007, CARE appointed a Social Worker to work with sub-partners across Limpopo Province. CARE will adapt the Hands at Work curriculum for use in training caregivers, especially grandmother to improve their communication with adolescent OVC. Elderly caregivers experience great difficulty in raising OVC, particularly adolescent OVC. CARE also attended the International Child Development Program (ICDP) focusing on caregivers' communication skills with OVC. The social worker will support partners in improving OVC access to legal documentation, state income grants, support for staying in school, and volunteer stipends CARE with the help from an intern from CARE

Activity Narrative: USA has developed a Sexual Health Reproduction manual targeted at caregivers and OVC with one of the sub-partners in the Free State Province (Mosamaria). This manual will be used to enhance the capacity of caregivers in communicating with OVC about issues of sexual health and reproduction, and issues related to HIV and AIDS prevention. CARE will also focus on enhancing the capacity of sub-partners to provide support to caregivers to cope with stresses of home-based care through care of caregivers program that is based on group debriefing, the model will also be used to strengthen support groups of the infected and affected. Through the appointment of the Professional Nurse, CARE will strengthen the health component within sub-partners to work with government departments at district and provincial level to ensure access to basic health care, ART, training and mentoring of volunteers and staff to improve the clinical component of home-based care. The nurse will also work with Early Childhood Development and Drop-in-centers in strengthening teachers and caregivers' capacity to access basic health services, improve on nutrition, and early identification of positive children and referral for pediatric treatment. CARE will also explore partnerships with PEPFAR partners who have a strong focus on ECD in order to strengthen the capacity of ECD teachers to deal with children who infected and affected by HIV and AIDS. A special focus will be on youth programs within sub-partners to improve HIV prevention messages and peer-led youth education and counseling using the Harvard OVC Peer-led Education intervention program. In addition, CARE will explore Youth Vocational Training to strengthen the livelihood and economic security of the vulnerable and orphaned youth. In order to do this, CARE will link with partners and private sector that have strong Vocational Training focus. CARE will use the organizational development (OD) experience and lessons learned to replicate to sub-partners to strengthen their OD capacity. The OD support is aimed at organizational sustainability and improved quality of services delivered to OVC and their caregivers

ACTIVITY 3: Advocacy

CARE will continue to use Participatory Educational Theatre (PET) to deal with issues of stigma and discrimination and other OVC rights-based issues, for preventative messaging and training of youth counselors. Cooperation with DramAidE (PEPFAR partner) will be explored to strengthen this activity. CARE will continue to work with the mainstream and traditional church leaders to use sermons to address issues of stigma and discrimination in their congregations and enlisting their support for HIV and AIDS affected households. Training manual for use by the church leaders has been developed; CARE will disseminate the manual and lessons learned about this activity to sub-partners for their adoption. In FY 2007 CARE developed an advocacy strategy that will help sub-partners identify advocacy issues as they relate to OVC, for example, one of the partners in Free State trained caregivers on starting food gardens in order to improve the nutrition of OVC; lack of water facilities in the area made it difficult for the caregivers to implement the training. The strategy will help sub-partners undertake appropriate actions in order to improve OVC services. CARE will continue to participate in the National Plan of Action through the National Action Committee for Children affected by HIV and AIDS (NACCA) and on the NACCA sub-committee on food security. This activity will continue through FY 2008. The CARE program is consistent with the Department of Social Development's Plan of Action for OVC. In addition, CARE will continue liaising with other relevant Departments in as far as influencing the improvement of OVC services, namely the Department of Health, Agriculture and Education and participation in the police forum in Tzaneen to ensure that the police have the appropriate response to issues of child and women abuse.

In Limpopo, CARE will contribute to the development of appropriate policies for OVC within the Provincial Department of Social Development.

Prime Partner: US Department of State	USG Agency: Department of State / African Affairs
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 3118.22668.09	Planned Funds: \$1,100,000
Activity System ID: 22668	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Community Grants will continue to support South Africa's most promising small community and faith-based organizations making significant contributions to the fight against HIV and AIDS. Major emphasis areas for this activity are training, procurement of basic equipment, and local organization capacity development.

The strategic direction of Community Grants is evolving with an increasing focus on economic strengthening. Community Grant Coordinators will help facilitate economic strengthening by continuing to link community and faith-based organizations funded through Community Grants with larger PEPFAR partners and South African government departments to build capacity and ensure project sustainability.

As the Community Grants strategy evolves, a significant emphasis will also be placed on income generation activities, such as training Grantees on grant writing and fund raising, thus enabling the programs to benefit from multiple sponsors. Another focus area for funding will be program-sponsored, self-sustainable income generation businesses, such as bakeries, sewing projects, gardens, brick and bead making. This advancement will allow Coordinators to remain responsive in the ever-changing nature of the HIV/AIDS pandemic and encourage the projects to become self-sufficient.

SUMMARY:

The Small Grants program aims to support OVC in South Africa to have equal access to basic essential services. The USG acknowledges the invaluable role that small community-based organizations and caregivers play in caring for OVC, and therefore funds, supports and capacitates small NGOs and small CBOs through the provision of funding for direct services and training to enable better community responses in caring for OVC within their care and reach. The Ambassador's HIV and AIDS Small Grants Program will use FY 2008 PEPFAR funds to continue to support South Africa's most promising small community and faith-based organizations making significant contributions to the fight against HIV and AIDS. Major emphasis areas for this activity are training, procurement of basic equipment, and local organization capacity development. The target population for these activities is OVC, HIV-infected infants and children, their families and caregivers, community volunteers, community-based organizations (CBOs), faith-based organizations (FBOs) and non-governmental organizations (NGOs).

BACKGROUND:

The Ambassador's HIV and AIDS Small Grants Program in South Africa (Small Grants) has had three tremendously successful years. Out of over 1,000 applications, the South Africa Mission has entered into agreement with 237 small community-based organizations (FY 2005, FY 2006, & FY 2007) in the areas of prevention, hospice care, home-based care, treatment support, and care for orphans and vulnerable children. Funded projects are located in nine provinces, primarily in disadvantaged rural areas. The average funding amount is approximately \$10,000. Programs supported with Small Grants funds provide service delivery that directly impacts communities and people affected by HIV and AIDS. The USG PEPFAR Task Force is increasingly linking community and faith-based organizations funded through Small Grants with larger PEPFAR partners and South African Government departments to build capacity and ensure project sustainability. Small grants projects generate positive publicity for PEPFAR and goodwill in communities. The Mission has established guidelines and review procedures to ensure that strong applications are considered for funding through a fair, transparent process. Criteria for selection include: improvement of basic conditions at the community level; benefit a substantial number of people in the community; be within the means of the local community to operate and maintain; and quick implementation of grant within one-year agreement period. Grants must conform to the PEPFAR Small Grants Guidelines. Projects are reviewed by a technical Mission Health Committee and supervised through the Embassy and each Consulate General by State Department Small Grants Coordinators. Based on experience in FY 2005, FY 2006 and FY 2007, the USG PEPFAR Task Force anticipates the strongest applications for FY 2008 will be in the areas of (1) care, particularly hospice and community-based care, and (2) orphans and vulnerable children.

ACTIVITIES AND EXPECTED RESULTS:

The next round of applications and approvals for Small Grants has begun (with anticipated FY 2008 funding). Given three successful years of the program, the USG PEPFAR Task Force expects to fund approximately 95 community and faith-based organizations assisting OVC in FY 2008. These organizations are expected to reach 17,000 OVC with the following services: nutritious meals; educational activities including HIV prevention messages; regular home visits; assistance in birth registration and accessing government social security grants; psychosocial support and training in the establishment of food gardens. Anticipated activities include training for caregivers, stipends for caregivers, basic equipment for orphanages such as bedding and kitchen equipment, transportation costs for OVC, educational materials, and nursing supplies.

Examples of programs funded in FY 2007 include: St. Anna and Joachim Roman Catholic Organization, a faith-based organization in King Dinizulu Township, KwaZulu-Natal that provides care to more than 476 OVC. Members of the local Catholic church started the organization when they saw a growing number of orphans in the community who needed care, but were receiving little or no support. Volunteers from St. Anna and Joachim visit child-headed households provide food, help OVC gain access to government grants and services, assist with school uniforms, provide psychological support, and encourage community involvement with OVC. A small grant of \$10,000 will help train the caregivers and fund small stipends to support the St. Anna and Joachim caregivers. Caregivers training typically include identification training for cases of vulnerability, abuse, ill health and HIV/AIDS infection and information and mechanisms for referral to access other Government services. Basic parenting skills, nutrition and food gardening, health and hygiene normally form part of the training.

Diabashe Day Care Center and Orphanage, a small CBO located in Mdantsane township outside East

South Africa Page 1330

Activity Narrative: London, Eastern Cape, shelters 15 HIV positive orphans. It also provides care to 183 OVC through its day care center. The center, apart from being a safe haven where children can interact with each other and with adults in a supportive environment, may also provide daily nutritious meals, access to educational support, and other support to OVC. Diabashe works closely with government social services, which place orphans at their Center. A small grant of \$10,000 will provide training to Diabashe staff on pediatric AIDS care, as well as provide the Orphanage with beds, bedding, towels, heaters, and fans. Caregivers will also receive gloves, first aid kits, nursing supplies, and small stipends.

These activities support the South Africa Mission's Five Year Strategy by providing support to and building capacity in small local organizations working at the community level.

Program Area: Care: OVC

Budget Code: HKID

Program Budget Code: 13

Activity ID: 3060.22651.09

Planned Funds: \$1,697,141

Activity System ID: 22651

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 2: Human Capacity Development

In FY 2009, ten new sites will be developed. Focus will be placed on improved performance, expansion of service delivery and enhanced capacity development of communities to intervene and assist vulnerable children. Focus will be placed on training in two key areas; PMTCT and Psychosocial Care and Support. Child Welfare South Africa (CWSA) has an established partnership with the Regional Psychosocial Support Initiative (REPSSI) who will provide training to CWSA personnel and volunteers in the field of psychosocial care and support. Improved training for volunteers will enhance service delivery to children.

ACTIVITY 2: Human Capacity Development and ACTIVITY 6: Referrals and Linkages

To enhance the prevention program additional training of volunteers in PMTCT and treatment options will be conducted. Training will be undertaken at community level and partners within each individual community served will be sort. This will also guarantee effective networking ensuring families are linked with the most appropriate care options at community level.

ACTIVITY 3: Community Campaign

Awareness raising activities taking special cognizance of gender inequalities and the need to promote abstinence particularly among adolescents will be developed. Community volunteers will impart information through talks at community centers, clinics and school and distribute pamphlets. Partnerships with relevant service providers will be established to obtain awareness raising materials focusing on this specific group. CWSA will consult PEPFAR partners including Love Life and Soul Buddies in developing these campaigns.

ACTIVITY 4: Outreach Services

Scale-up of service delivery will be improved through the aforementioned trainings as volunteers will have the necessary knowledge to broaden the services provided to a larger group. They will be able to assist pregnant women deal with the issues of HIV transmission to children in a more sensitive and informative manner. Quality of care will be enhanced by reducing the volunteer to child ratio, from one volunteer to 12 children to one to ten, by training at least 30 volunteers per site. Volunteers will provide additional assistance to caregivers through basic counseling and by providing inputs and guidance on caring for children. Support groups will be run for caregivers. M&E systems will be updated to ensure that services rendered to adults and caregivers are also recorded. A volunteer nurturing program will be developed and implemented to address volunteer retention. This will include training of social workers and other volunteer supervision staff to address the emotional needs of community volunteers, reflect empathy and aid them in coping with stress and burnout related to their activities. In FY 2009, CWSA will carry out a community-based situational analysis with the purpose of identifying especially vulnerable children, marginalised communities and specific difficulties facing each community. This will provide insight into the most pressing concerns facing communities and mark the foundation upon which interventions can be developed. Findings will be site-specific. Specific needs of disabled children, children under the age of five, gender inequalities, adolescence as well as food security and income generation will be some of the issues raised.

Human Capacity Building:

Training focuses on pre-service training for CWSA personnel and social workers who are to implement the program at site level, and train volunteers. Volunteers at the onset of the program attend a 10-day training workshop. The training focuses on key support services areas needed by OVC e.g. social grants, bereavement, rights, community awareness, child protection, resilience, and HIV/AIDS. The training is in the process of being accredited with the assistance of Department of Social Development. Once volunteers are deployed they will continue to receive training bi-monthly. These one day sessions focus on key area of need identified by the volunteers. In addition, volunteers will attend bi-weekly group supervision sessions with social workers to assist them in service provision to children and families.

Economic Strengthening:

Community-based situational analyses will be conducted at all sites to identify the most pressing difficulties. When needs relating to material difficulties are identified sites will be assisted to design economic strengthening activities, including microfinance and microenterprise. Volunteers and identified families will participate in the development of business plan and budget, including profit sharing agreements. CWSA will work with vendors in linking them to relevant markets.

Gender Issues:

CWSA will recruit more men to the program by drawing in the participation of community leaders and local chiefs so to encourage and motivate men to participate, in order to challenge gender norms and beliefs. CWSA interventions have resulted in men attending anger management counseling and redressing past behaviors. Best practices in addressing violence against children will be shared among sites.

SUMMARY:

The Child Welfare South Africa (CWSA) Asibavikele (Let's Protect Them) program facilitates the recruitment and training of community volunteers who work in teams to identify and meet the needs of Orphans and Vulnerable Children (OVC) and AIDS affected households and to uphold children's rights. The program emphasis is human capacity development. Primary target populations are OVC and people living with HIV and AIDS.

BACKGROUND:

Activity Narrative: CWSA is the umbrella, development, capacity building and coordinating body for 170 member organizations and 49 developing child welfare organizations. It is a not-for-profit organization that works closely with the South African Government (SAG) Department of Social Development (DOSD) in advocating for the rights of children and addressing children needs. In dealing with the HIV and AIDS pandemic, CWSA with PEPFAR assistance, has developed a national program, Asibavikele, implemented by Child Welfare member organizations. The Asibavikele program now in its fourth year, was initially implemented in 21 pilot sites in 2005 trained more than 600 community volunteers and reached over 7000 children within its first year. By FY 2008 the program will be implemented in a total of 40 sites. Asibavikele is a nationally coordinated program facilitating community-based care and support for OVC in disadvantaged communities. The program involves communities in the identification and care of OVC, sensitizes communities to the rights of children and establishes foster care and safe homes. CWSA has succeeded in leveraging support for these safe homes through a public-private partnership with Thokomala Orphan Care.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Community Consultation and Mobilization of Child Welfare Affiliate members

CWSA personnel together with member organizations will identify communities where there are high numbers of OVC as a result of HIV and AIDS. Project staff will consult with local leaders and other key role players to ensure buy-in and support for the program. Baseline studies and community profiles will be conducted to gain a deeper understanding of the community, its needs and resources. This activity lays the foundation for strong working relationships, fosters community participation and sets in motion M&E processes.

ACTIVITY 2: Human Capacity Development

i) Employing Additional Staff

Building human resource capacity at national, provincial and site level has been identified as a priority. CWSA will therefore ensure the employment of additional staff at national level for program and financial management, M&E, and administrative support. Provincial program coordinators, bookkeepers, administrative and M & E support will be employed in each province to ensure decentralization of activities. The employment of Asibavikele dedicated social workers at site level will ensure that children needs are met and targets achieved.

ii) Training Activities and Training Strategy

The focus in FY 2008 will be to sustain the existing 40 sites. CWSA will train all employees on the Asibavikele program, not only those directly implementing the program at site level. This will ensure that trained staff is always available to implement the program even during times of staff turnover. Training of Project Teams will be conducted at provincial. This will allow for training in smaller teams, providing more time to workshop issues specific to each of the provinces. All staff will attend a training workshop to equip them with knowledge and skills to implement the program as well as to train and support community volunteers. These trainers will constitute the Project Teams at site level, and will recruit screen and train community volunteers. Screening of volunteers is key to motivation, skills and ability of prospective volunteers to achieve the goals of Asibavikele. Structured training sessions in accordance with the volunteer training manual will be conducted at each site, preparing volunteers to provide services to OVC.

iii) Mentoring and Support

Set procedures and policies to guide project teams and community volunteers in implementing the Asibavikele program have been developed and will continue to be used together with a structured M&E plan. Provincial coordinators, bookkeepers and administrative staff will provide ongoing training, mentoring and support to project teams collectively and individually through monthly meetings and regular site visits. Program reviews and exchange visits will be conducted within provinces and nationally to share best practices. On-going support will focus on strengthening project teams, developing work plans and administrative procedures to ensure efficient rollout and implementation. Member organizations will be assessed in each province to identify roll-out sites in FY 2009. This strategy will contribute toward ensuring sustainability of the program at all levels in the long term. The National Steering Committee will meet quarterly to oversee the full implementation of the program and to focus on the CWSA national goals and targets. These mechanisms ensure that the program is implemented in a standardized manner and quality controls are in place.

ACTIVITY 3: Outreach Services

Volunteers will conduct door-to-door visits, introducing the program, identifying OVC and providing prevention messages to the community. Together with social workers, volunteers will draw up care plans for each OVC and their family within the context of their families thus promoting family centered care. Volunteers will provide a range of assistance including: applications for birth certificates, other legal documents, SAG child support grants, school fee exemptions; provision of targeted short term emergency food, shelter and clothing; emotional support to children and their caregivers; referrals to relevant medical services, primary health care clinics, pediatric ART programs and linking OVC with social workers when foster care is needed. In addition, partnerships with other organizations to strengthen psychosocial service delivery and memory work will be sustained. Focus will also be placed on aiding communities in developing food gardens to enhance food security. Volunteers will provide a comprehensive care package addressing the physical, educational and emotional needs of OVC. Social workers will primarily focus on protection of OVC through statutory child placements and supervision of care.

ACTIVITY 4: Community Campaigns

Volunteers will develop and present bi-monthly HIV and AIDS prevention and awareness campaigns for their communities as a means to provide information and make them aware of the Asibavikele program,

Activity Narrative: children rights, and gender issues. These campaigns will be aimed at OVC and their families. CWSA will ensure that through such campaigns affected households are aware of pertinent issues affecting OVC, including the rights of the girl child as well as changes to South African legislation regarding children and OVC. The knowledge and information provided through these targeted awareness- raising activities will empower households affected by the epidemic to make informed life choices and to plan for the future.

ACTIVITY 5: Volunteer support and sustainability

Volunteers are central to the program and aid social workers in reaching OVC. Emphasis will be placed on sustaining volunteers with the support and guidance provided by social workers. Bi-weekly volunteer group supervision as well as monthly volunteer training sessions will be held to aid volunteers in their interventions with children and to enhance their skills. Social workers will also be available for individual consultations with volunteers as a means to mentor and support them. These mechanisms are aimed at ensuring a quality service to OVC as well as to prevent burnout and loss of volunteers. From focus group discussions with volunteers and evaluations, CWSA has established that this support plays an important role in sustaining the volunteer commitment to the program. This activity will require the employment of professional social workers or social auxiliary workers at each site dedicated to the Asibavikele program. Additional support for volunteers in the form of specialized training to enhance volunteer skills and knowledge will be used to further sustain these valued caregivers. A dedicated caring for caregiver's component will be added to the program to enhance volunteer debriefing and prevent burnout. Volunteer support "clubs" will be encouraged so to provide assistance to each other in times of personal need, e.g. burial funds.

ACTIVITY 6: Referrals and Linkages

The Asibavikele program is a community-based response to OVC and requires strong networks within the community to ensure the needs of children are met. The CWSA program is consistent with the Department of Social Development's strategic framework on OVC. CWSA has developed a strong relationship with the Department of Social Development, which provides funding as well as support services to CWSA organizations on the ground. Further, at the onset of the program community profiles are developed highlighting role players within the community who will aid CWSA in providing a comprehensive service to children and their families. These will include hospice care, pediatric treatment programs, psychological counseling and material aid. Volunteers track referrals and make follow-ups to establish whether OVC received services.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 1071.09

Prime Partner: US Peace Corps

Funding Source: GHCS (State)

Budget Code: HKID

Activity ID: 3107.22662.09

Activity System ID: 22662

Mechanism: N/A

USG Agency: Peace Corps

Program Area: Care: OVC

Program Budget Code: 13

Planned Funds: \$265,000

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Under BACKGROUND, added: In FY 2009 Peace Corps will contract with individuals and organizations with specialization in delivering training and conducting outreach in OVC activities. Priority will be given to contracting with those individuals and organizations that have already received PEPFAR capacity development support. This will (a) strengthen and build upon previous PEPFAR investment and (b) provide training and outreach in the communities where Peace Corps Volunteers (PCVs) live and work, allowing the Volunteers to provide follow-up and document results.

Changes in ACTIVITY 1: In FY 2009, approximately 30 PCVs and 30 counterparts will receive training in meeting the physical and psychosocial needs of OVC, using internationally and locally produced materials.

Changes in ACTIVITY 2: Approximately 30 PCVs and 30 counterparts will train 50 service providers (e.g. teachers, OVC peer educators, CSO employees, HBC volunteer workers and OVC caretakers) in topics addressed in Activity 1. This will result in improved care provided to 3,000 OVC. PCVs and counterparts will also directly provide outreach to OVC.

SUMMARY:

Thirty Community HIV/AIDS Outreach Project (CHOP) Peace Corps Volunteers (PCVs) and twenty Schools and Community Resources Project (SCRP) PCVs will be involved in this program area. PEPFAR funds will be used to train the CHOP PCVs and their counterparts in organizational capacity building-that is the strengthening of organizational and human capacity. Both CHOP and SCRП PCVs will receive PEPFAR-funded training in OVC caretaker support-that is enabling PCVs and their counterparts to develop the skills and knowledge needed to meet the physical, psychosocial and financial needs of OVC and OVC caretakers. Using the PEPFAR VAST mechanism, these PCVs and their counterparts will train OVC caretakers, CSO employees and OVC volunteer workers. SCRП PCVs will specialize in training teachers and OVC peer support groups in the schools while CHOP PCVs will focus more on the training CSO counterparts and OVC volunteer works, and out-of-school OVC peer support groups and mobilizing traditional, business and religious leaders in supporting community- and school-based OVC support activities. CHOP and SCRП PCVs and their counterparts will be encouraged to work together in designing and delivering comprehensive OVC and OVC caretaker training and outreach programs in their rural communities. OVC training and outreach activities will be conducted in the KwaZulu-Natal, Limpopo, North West, Northern Cape and Mpumalanga provinces.

BACKGROUND:

To date, the program in South Africa has relied primarily on PEPFAR-funded PCVs assigned to the (previous) NGO Capacity Building Project. Although the FY 2007 program still utilizes PEPFAR-funded PCVs, in FY 2008 there will be no PEPFAR-funded PCVs and instead all CHOP and SCRП PCVs will be encouraged to be involved in training and outreach activities that will enable OVC caretakers, community outreach volunteers and CSO employees to better meet the needs of OVC.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

In FY 2008, approximately 50 PCVs and 50 counterparts will receive training in meeting the physical and psychosocial needs of OVC, using internationally and locally produced materials. The training will provide skills and knowledge in counseling (e.g. dealing with feelings of isolation, stigma and discrimination and the negative attitudes of others, production of memory books/boxes), physical care (e.g. helping OVC and caretakers establish trench and raised gardens, nutrition education, training in sewing clothes), and legal and financial assistance (e.g. helping OVC and caretakers access South African Government social grants e.g. child-support grants and care-dependency grants).

ACTIVITY 2:

Approximately 50 PCV and 50 counterparts will train 50 teachers, OVC peer educators, CSO employees, HBC volunteer workers and OVC caretakers in topics addressed in Activity 1, using the PEPFAR VAST mechanism to fund the training. This will result in improved care provided to 3000 OVC. PCVs and counterparts will also directly provide outreach to OVC. The CHOP and SCRП PCVs will contribute to this program area of the U.S. Mission by uniquely providing American citizen assistance in rural communities. Their activities are also closely aligned to the South African government strategies in each of the provinces in which PCVs work.

NOTE: PCVs involved in this program area are part of the population of PCVs who are required to participate in Activities 2 and 4 described under the prevention program area. CHOP PCVs in this program area are part of the population of PCVs who may participate in Activity 3 described under the prevention program area.

Activity ID: 6563.22868.09	Planned Funds: \$2,451,534
Activity System ID: 22868	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Linking with the Southern African Catholic Bishops' Conference AIDS Office (SACBC)/Catholic Relief Services (CRS) treatment program will mean that the OVC program will benefit from the experience, M&E expertise and good practices in this program. These treatment sites will focus on identifying HIV-exposed children in the communities they serve. Early identification, screening and referral will be emphasized. Every community health care worker will identify vulnerable children in the households they visit. Children will be identified and registered. Parents will be counseled and motivated to have children tested. PCR testing will be offered from 6 weeks of the infant's life for the first year. Thereafter rapid testing will be used.

The SACBC will continue with the FY 2008 activities and emphasis will be put on the following:

ACTIVITY 1: Support to Parents

SACBC will increase the number of surviving parents and guardians receiving care. Surviving parents and guardians will be equipped with relevant training to enhance their economic opportunities. Advocacy on prevention and VCT will be conducted at site level. Surviving parents and guardians will be trained in linking nutrition with treatment, with an emphasis on healthy living.

ACTIVITY 2: Community Mobilization

SACBC will continue to give the sites relevant support to create new links and networks and strengthen existing ones. The sites will be given training on formation of child care forums to enhance them with the capacity to deal with the needs of OVC. Awareness campaigns will be conducted to promote responsibility shifting within the communities. Communities will be educated on treatment literacy and the importance of adherence.

ACTIVITY 3: Access to Services

The Education for Life program will continue at the site level, with emphasis on sexuality, morality, psychosocial support, and spirituality. OVC will be educated on life skills training to help them make decisive choices and not fall prey to situations. This will also reduce teenage pregnancy, street children, drug and alcohol abuse and prostitution. Further, there will be scaling up of children accessing ARV. This will require the improvement of transport services, and ART sites improved to be more child-friendly. More referrals will be made on children with serious social problems as to reduce the rate of OVC dropouts from school.

ACTIVITY 4: Gender, Stigma and HIV Prevention

Programs will be implemented to target cultural issues, especially the role of women in society. Advocacy on behavior change and positive living will be at the core of gender mainstreaming program. Within the OVC sites attention will be paid to addressing the needs of girl children and boys independently. The sites will continue to provide HIV and AIDS education to combat stigma and encourage voluntary counseling and testing. Activities and approaches to address gender issues will include involvement of men in the program as decision-makers, family-centered care, couple counseling and testing links with treatment programs. The program will involve partners (through increased partner testing, male support, prevention and interventions with regard to gender-based violence), including support groups for HIV-infected patients, more so, the OVC.

Partners of pregnant women will also be targeted and providing information to men on PMTCT, CT, prevention and other health issues and encouraging couples counseling and testing in an attempt to increase men's involvement in HIV and AIDS treatment and care programs and to reduce stigma and violence against women. The approaches will include couple counseling and testing at CT and PMTCT sites with the view of promoting testing of men as well as building their support for their female partners, where possible. Efforts will be made to include health worker trainings to recognize signs of gender-based violence, to provide appropriate counseling and referral services to social, legal, and community-based support groups, as well as training and employment of women as health care providers to increase the confidentiality and comfort of women and girls seeking treatment for HIV.

ACTIVITY 5: Exit Strategies for OVC

Through the assistance of the Department of Labour, with which the SACBC has working relationship, the OVC will be equipped with skills development training that will assist them to fend for themselves when they can no longer benefit from the project. The OVC would be assisted through career camps on the availability of funding opportunities for their further studies and vocational training.

ACTIVITY 6: Training Secondary Caregivers

Surviving parents and guardians of caregivers would be trained in parenting skills, where they would be assisted to deal with teenagers' development and how to handle their behavior. The guardians would also be advised and trained on how to deal with children with disabilities and addressing their needs.

The goal is to mitigate the impact of HIV and AIDS and create an enabling social environment for care, treatment and support. The objective is to strengthen the implementation of OVC policy and programs. Another is to increase the proportion of children obtaining vital documents such as birth and death registration to 90%.

SUMMARY:

The Southern African Catholic Bishops' Conference AIDS Office (SACBC) provides comprehensive care for South Africa Page 1338

Activity Narrative: orphans and vulnerable children (OVC) to help them grow to be healthy, educated, and socially well-adjusted adults. SACBC supports community programs and projects, linking them to various sources of financial assistance, healthcare, legal aid and nutritional support. OVC services will be provided in 23 sites in all eight provinces of rural South Africa within 18 dioceses of the SACBC Region. SACBC is a sub-partner through Catholic Relief Services for its HIV care and treatment programs.

BACKGROUND:

The SACBC launched this PEPFAR-funded OVC program in September 2007. Over the last eleven months the SACBC AIDS Office supported 21 sites in eight provinces with funding provided directly to sub-recipients. Through this program about 6,700 OVC were reached with psychosocial, educational, nutritional, economic support, health care, pediatric treatment referrals and child protection. In FY 2008, the sub-recipients will continue to use PEPFAR funds to expand and scale up existing services to meet the increasing needs of OVC in South Africa. The SACBC coordinates OVC services at 23 sites. Identification of the OVC sites was based on evaluations of previous programs. Six of the 23 OVC sites also provide antiretroviral (ARV) treatment to people living with HIV (PLHIV), including OVC. Many SACBC sites have a network of trained volunteers. Mostly these are unemployed women, who volunteer in return for training and a monthly stipend. These volunteers become auxiliary community home-based caregivers and continue to develop into specialized OVC caregivers. Some of the volunteer caregivers are so well-trained that they are able to move on to more sustainable jobs in other healthcare sectors. This creates a need for ongoing recruitment of new volunteers and training. OVC at schools are highly stigmatized, and therefore the SACBC response includes stigma mitigation. OVC face many forms of differential treatment and human rights abuses, being denied access to schools and health care facilities. The OVC program will target gender sensitivity and awareness training at schools, and will focus on advocating for the rights of the girl-child, especially adolescent girls. One of the key partners in this program is the Catholic Institute of Education, which focuses on the Education Access Project (EAP). The EAP aims to enable OVC in Catholic schools to continue their education and remain healthy. EAP's strategy is to provide resources to poor schools to assist selected learners orphaned by HIV and AIDS and made vulnerable by poverty with education expenses, including fees, uniforms, transport, sport, outings and a daily ration of food (depending on individual needs) and to motivate school communities to contribute to the care of those affected by HIV and AIDS. SACBC is in partnership with the National Department of Social Development's (DOSD) National Action Committee for Children Affected by HIV and AIDS (NACCA). The mandate for NACCA at national level is to coordinate action for children affected by HIV and AIDS. SACBC adheres to the DOSD Policy Framework on Orphans and other Children made Vulnerable by HIV and AIDS. SACBC is also an active member of the various NACCA tasks teams, including Food and Nutrition, and Care and Support. SACBC will encourage their sites to become active members of the provincial structures of NACCA as well as local districts structures. Most of the selected OVC sites provide community care; only one provides residential care. The family-centered developmental approach of the SACBC OVC program ensures that OVC are placed in families and communities of care. The community mobilization program ensures that members of the local community are in the best position to know which households need assistance and what assistance is required for OVC care.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Support to parents

SACBC will strengthen the capacity of families to protect and care for OVC by prolonging the lives of parents and providing economic, psychosocial and other support. This is currently carried out at some of centers and will be expanded to other sites with PEPFAR funds. Economic strengthening, such as income-generating activities play a key role in maintaining the livelihoods of OVC and their families. These income-generating activities include food gardens, sewing school uniforms, and brick making training.

ACTIVITY 2: Community mobilization

SACBC will mobilize and support FBO/CBO community-based responses to OVC care by building community responses through local networks and advocacy initiatives. This includes establishing Child Care Forums at local level to reinforce the capacity of communities to respond to the needs of OVC. SACBC will also increase the capacity of FBOs/CBOs with training programs for OVC care and support, utilizing lessons learned and best practices from 'Choose to Care' to enhance training skills. SACBC will provide technical assistance to FBO/CBO projects as they respond to the needs of OVC and their families, including skills training and development and assistance to access the funding necessary to provide needed services.

ACTIVITY 3: Access to services

SACBC will ensure that OVC and their families access essential services including education, healthcare and other support. Existing services will be improved and expanded, including psychosocial counseling. Coping strategies will include life skills training to reduce vulnerability, as well as assistance for education costs (school uniforms and stationery) in line with South African Government policies and programs. The SACBC project will also scale up educational, nutritional, social, medical assistance and psychosocial support for OVC at new sites within 18 dioceses. The components of the program will feature cross-cutting issues, child participation, gender issues and will address stigma and HIV prevention.

ACTIVITY 4: Gender, Stigma and HIV Prevention

The Education for Life Program, is a behavior change skills building program geared towards young people, targeting OVC aged 10 -15. It is divided into 3 stages, whereby the participants are led through a process of self-introspection on their present reality to name and own behaviors that are life threatening and harmful to their dignity. Through ongoing questioning and various participative activities youth are led to choose and commit themselves to possible new behaviors that promote a positive and healthy lifestyle. The process will

Activity Narrative: provide positive engagement and open discussion around sexuality, sexual behavior, teenage pregnancies and the role of women. It also addresses gender mainstreaming, and the SACBC will continue to develop sites on the promotion of the needs of the girl child, especially from age 10-16.

NEW ACTIVITIES

ACTIVITY 5: Bicycle Project

In FY 2008, the bicycle project through collaboration with the Institute for Transport and Development Policy (ITDP) will be introduced and piloted in 10 sites. A feasibility assessment will be done in advance to identify opportunities and challenges of introducing this project in the selected sites. The pilot will include the bicycles for OVC who have to travel long distances to attend school and the secondary caregivers to reach OVC.

ACTIVITY 6: Exit strategies for OVC

23 sites will be assisted in developing exit plans for children above 15. This is to ensure that when children leave the program there are plans in place to further their education, access vocational training, establish income generating activities or gain employment. The SACBC will develop wrap-around programs with other partners (e.g.DOSD) for food supplements and nutrition assistance to ensure effective implementation of OVC interventions.

ACTIVITY 7: Training

Secondary caregivers: Training to be provided in FY 2008 will focus on child and youth care, psychosocial support and caring for children with disabilities, equipping participants with an understanding of the fundamentals of child and youth care work and developing basic caring skills for children and youth. Training of primary caregivers: Families of OVC will be trained by secondary caregivers in identifying and establishing viable income-generating activities for household economic strengthening. Training will also focus on basic nutrition, HIV awareness and prevention, basic hygiene and treatment literacy, particularly for families of PLHIV. Training of trainers: This program will target a few secondary caregivers from each sub-recipient to be trained as trainers in child and youth care work, psychosocial support and M&E. Training of OVC: A series of formal and informal training sessions will be conducted with OVC across the program, including child-headed households, focusing on life skills training (provided by two PEPFAR partners - Soul City and FHI), reproductive health and HIV and AIDS. Informal training sessions will be held during career camps and the after school programs, covering various topics, including child rights, basic saving and budgeting as well as career guidance for older youth. Training of sub-recipients: In FY 2008, training will focus on proposal writing and financial management.

Family Health International (FHI) is also funding SACBC as a sub-partner but these are different sites. Once the agreement with FHI ends, these sites will be transitioned all to the SACBC (as a prime partner) program.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 4761.09	Mechanism: N/A
Prime Partner: Training Institute for Primary Health Care	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 8269.22832.09	Planned Funds: \$155,345
Activity System ID: 22832	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

OVC identification, registration, needs assessments, information and referral for services will be incorporated in the AB Prevention program. OVC requiring medical attention, psychosocial counseling, access to economic support services like social grants, legal services like birth certificates and assistance with school needs will be referred to the Government clinic and social worker. However, the AB facilitator will have a follow-up check list to ensure that the OVC needs identified are met. A tool for reporting the achievement of results will be developed and used to feed information to the OVC program coordinator.

Subpartners will be a key role player since they are assigned more than two-thirds of the targets. The involvement of AB facilitators will help to increase the numbers of OVC that will be receiving PEPFAR supplementary direct services. It is anticipated that the integrated approach will increase the OVC target by 20%.

Human Capacity Development Activities:

TIPHC intends to consolidate the quality of its services by ensuring that the knowledge and skills of caregivers are standardized to ensure quality improvement. Sustainability will be achieved through imparting the knowledge and skills in care giving to OVC caregivers, families of OVC and community members through home visits and local ward and information sharing meetings.

Management and leadership development: OVC Project staff will be capacitated on project management and supervision which will include data collection system for tracking caregivers training, managing caregivers deployment, performance and attrition information for planning and modeling long-term caregiver needs.

Retention strategies for OVC Caregivers: OVC Caregivers will be retained through incentives, training, respite care and psychosocial support such as counseling and bereavement care for caregivers as well as adequate supervision by professional Social Workers.

Five caregivers with suitable qualifications will be identified and selected to attend a twelve months training as Auxiliary Social Workers. This will be an incentive for career pathing and will cost US\$ 125.00 per caregiver. This amount will cover tuition fee, books, uniform and per diem.

An independent psychologist will be identified to attend to caregivers' needs in counseling and debriefing.

Economic Strengthening Activities:

Family strengthening is a key component to the OVC program. Households with OVC will be targeted with income generating activities like the Coca Cola Shanduka new movable Tuckshops initiative which is being discussed with the Coca Cola company which will supply initial stock. Child-headed households above the age of 18 or elderly guardians will qualify to operate Tuckshops and earn an income from the profits. This is an income generating project that has potential to benefit OVC and care clients in a family. This project is aimed at 18 years olds or elder guardians in order to let the school-going children attend school without interruptions.

Alignment with NSP and SAG policies:

The OVC program is aligned with National Department of Health HIV & AIDS and STI National Strategic Plan (NSP) for South Africa 2008 -2011. Priority Area 2 of the Strategic Plan which covers Treatment, Care and Support target is to "provide an appropriate package of treatment, care and support services to 80% of people living with HIV and their families by 2011 in order to reduce morbidity and mortality as well as other impacts of HIV and AIDS". Goal 8 under Priority Area 2 is to "mitigate the impact of HIV and AIDS and create an enabling social environment for care treatment and support". Objective 8.1 is to "strengthen the implementation of OVC policy and programs. TIPHC program is contributing to this objective by implementing activities which enable access to social grants (child support, foster care and care dependency), exemption from school and health service fees and obtaining of vital documents such as birth and death registration in collaboration with Departments of Social Development, Education, Local Government, Home Affairs, and NGOs/CBOs in the area and communities.

The Local Economic Development (LED) Plan for Nkangala District Municipality of December 2004 highlights Human Resources and Community Development as one of its seven pillars for LED with HIV and AIDS caregiver training as one of its priority activities. The plan is to construct a facility for training "personnel providing care for HIV and AIDS sufferers". Human capacity development is one of the emphasis areas for PEPFAR. Therefore, TIPHC caregiver training is aligned with the LED Plan in that its goal is to enhance the skills and expertise of caregivers in an effort to improve the quality of service delivery.

Gender Programming:

The OVC program will endeavor to strengthen links with the palliative care program through a family-centered approach. Child-headed households and households where the adult is sick and incapacitated will be prioritized to ensure that the conditions of the girl-child in terms of household responsibility are assessed for appropriate intervention. The burden of providing for the home and caring for sick members of the family is mostly on the girl child.

Both girl and boy child-headed household will be empowered with life skills, income generating means and information on prevention of teenage pregnancy, alcohol and substance abuse, education on HIV and parenting skills. But the main focus will be on the girl-headed household due to the fact that they are most vulnerable.

Activity Narrative: The OVC program will also have strong links with the AB prevention program. The schools to which the OVC on the register go to will be on the database. The schools will all be included on the school-based AB program to ensure that the OVC have access to the curriculum-based information and education on HIV and AIDS, risky sexual behavior, life skills, male norms and sexual behavior and peer-outreach that motivates for delayed sexual debut.

Follow-up to OVC especially referrals to other service providers will be a mandatory. A check-list system will be put in place which will enable a follow-up to ensure provision of referral services to OVC. This is critical especially for OVC reporting cases of sexual abuse and domestic violence which require decisive intervention by the child protection unit of the SAPS. Reports from schools in the current AB program indicate increasing numbers of young girls that are sexually abused in the home. Hence, schools and drop-in centers are an important focal point for targeting OVC and linking them to the home where a comprehensive and coordinated support service system for the OVC can be devised.

SUMMARY:

The Training Institute for Primary Health Care (TIPHC) has implemented OVC-related support activities as part of its Basic Health Care and Support Services to HIV and AIDS infected and affected people. With increased PEPFAR funding, TIPHC will expand their orphans and vulnerable children (OVC) program and provide OVC-specific services focusing on support with educational, psychosocial and nutritional needs of OVC. Selected members of the community will be trained as caregivers and young counselors (OVC volunteer buddies) The emphasis areas for the program are human capacity development, training, community mobilization and the strengthening of partnerships and linkages with the Departments of Social Development, Health, Education and Home Affairs. The target populations are the OVC, HIV and AIDS-affected families, caregivers and youth OVC "buddies".

BACKGROUND:

TIPHC is a South African registered non-profit organization established in April 1994 working in the Emalaheni Municipality, of Mpumalanga province. Its OVC program is in line with the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment Plan for South Africa. TIPHC is a key partner to South Africa's National and Provincial Government HIV and AIDS Prevention and Control Program. The program aim is to enable equitable access to HIV and AIDS health care and social services and protect this most vulnerable group from abuse. With FY 2008 PEPFAR funding, TIPHC intends to intensify its activities and provide effective and coordinated OVC care and support services to ensure that OVC receive a minimum of three services in line with PEPFAR South Africa OVC support requirements. TIPHC's main activities will include facilitating access to clinical health care services through referrals, enabling receipt of social security grants, processing of legal documentation, provision of psychological counseling, support with schooling requirements and promoting good nutrition. Capacity building interventions will involve conducting training workshops, home visits and family information, education and counseling to de-stigmatize HIV and AIDS.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: OVC care and support

OVC care will involve allocating a number of OVC to a caregiver and a "buddy". The caregiver will visit the OVC at home to assess the child's health and home environment. During the visit, the caregiver will provide information on where to go for help, offer psychosocial counseling and give guidance on nutrition, hygiene and protection from abuse. Where a child is sick and in need of medical care, the caregiver will obtain a referral letter from the nurse and arrange to take the child to the clinic. Palliative care for OVC will be provided through the home-based care system. Home-based caregivers will be assigned sick OVC to make sure that they receive the necessary care with feeding, cleaning, medication and counseling. The OVC buddy will also visit and assist with school work and available to talk to the child.

ACTIVITY 2: Facilitating OVC Access to Basic Services

Enabling access to basic services will involve meeting OVC educational needs like waiving school fees, providing school uniforms and tuition, ensuring economic support through social grants, assistance with obtaining legal aid and birth certificates as well as provision of food and nutrition needs with other donor support. TIPHC will identify selected preschools, drop-in centers and primary schools in the target communities where TIPHC is implementing the home-based care program. With assistance from school principals and community leaders, TIPHC will develop a data base of OVC and assess their needs. Based on the needs identified, referral and support services will be provided.

ACTIVITY 3: Training of caregivers and youth

Effective support and care for OVC will be achieved through the work of caregivers and youth OVC buddies. These facilitators will go through a two-week skills training on HIV and AIDS, lay counseling, children's rights and protection, nutrition, hygiene and child development. The training will not include palliative care since sick children will be put into the care of home-based caregivers. The training courses will be provided by the Department of Social Development. Other modules like First Aid will be provided by the Red Cross.

ACTIVITY 4: Community Information, Education and Communication

The information and education messages about the needs of OVC and the role of the community as caregivers and supporters will be included in the HIV and AIDS awareness and prevention program. Meetings will be held with for community leaders (church pastors, union leaders, ward councilors, business owners, teachers and traditional healers) where they will be informed about the program their accountability role and expectations explained. Reporting meetings will also take place to ensure adequate

Activity Narrative: communication with all stakeholders.

ACTIVITY 5: Strengthening networks and linkages with partners

A situational analysis that will be done at the beginning of the program will include the identification of other health and social development initiatives in the area. TIPHC will maintain a comprehensive database of the organizations and service providers. Furthermore, it will establish a forum that will bring key role players to support the OVC program. TIPHC will arrange regular information sharing meetings.

Budget Code: HKID	Program Budget Code: 13
Activity ID: 19452.22841.09	Planned Funds: \$288,844
Activity System ID: 22841	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The OVC school committee will be elected to give better insight into identifying and meeting the needs of OVC.

Two caregivers will be trained per school since there are 50 OVC to be cared for in each.

On school wellness days, parents, teachers and learners will provide health assessments and counseling including VCT and HIV Prevention knowledge sharing.

Infected guardians will be referred to health services (PMTCT, treatment including TB), social support services and Peer education support groups in the area.

Lastly, debriefing sessions will be held for caregivers. The partner will carry out mentoring, support and monitoring of project implementation and review of OVC policy and implementation in OVC schools.

SUMMARY:

The South African Democratic Teachers Union (SADTU) workplace program aims to provide support to 50 eligible orphans and vulnerable children in two schools per SADTU region out 17 regions in the three provinces, NW, FS, GP.

BACKGROUND:

The HIV and AIDS pandemic has created workplace environments that are not conducive to quality teaching and learning for both educators and learners alike. The SADTU project aims to reduce the impact of HIV and AIDS by focusing on preventing transmission of HIV for teachers and caring for orphans and vulnerable children (OVC) in the workplace.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Establish school-based care and support for OVC

In collaboration with the Department of Social Development (DOSD), the South African Social Security Agency and the Department of Education, SADTU will work with schools to identify OVC and establish school-based care and support centers to support these children. School-based interventions will be established in two schools in each of the seventeen regions with FY 2007 funds. SADTU will ensure that OVC are registered with the DOSD. SADTU will work with each school to identify and prioritize the needs of OVC. This could include, but is not limited to, paying school fees in schools that require this, supplying them with school uniforms, educational necessities not provided for, community gardens, and ensuring OVC have access to social services through the DOSD. They will also build upon existing life skills programs to ensure that HIV prevention messages are integrated into the OVC program.

ACTIVITY 2:

SADTU will train 1 caregiver per school in the 34 identified OVC schools. Children's rights, first aid including universal precautions, HIV Transmission & prevention; positive living; life skills; substance abuse, violence including sexual abuse, sexuality, study skills. Entrepreneurship skills, health and hygiene.

ACTIVITY 3:

SADTU will establish a further 10 peer education support groups in regions to bring the number to 20. These will be organized for PLWA and/affected individuals to promote positive living, care and treatment access thus further reducing HIV transmission. Monthly meetings will be facilitated by the PE facilitators and AIDS ambassadors.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 4762.09	Mechanism: N/A
Prime Partner: Ubuntu Education Fund	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 8272.22807.09	Planned Funds: \$242,726
Activity System ID: 22807	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Ubuntu provides orphans and vulnerable children (OVC) and their caretakers with comprehensive services firmly rooted in the Department of Social Development's Policy Framework for Orphans and Other Children Made Vulnerable by HIV and AIDS, and the Department of Health's HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011. Ubuntu will continue to provide services described in COP 2008, but several enhancements have been made.

Ubuntu will train community members in caregiving skills and on HIV and AIDS. A group of 12 community members, the OVC Volunteer Core, will be trained continuously in caregiving, food preparation and hygiene. These volunteers will cook for the daily school feeding program, and will serve as the childcare forum, which identifies vulnerable children who need additional assistance and oversight. They will be established as leaders and known as "people who can help" in their communities.

School-based day camps will be enhanced by leadership training, and by using leaders to assist at camps. In addition, career guidance and counseling sessions will be offered, and more community leaders will be used as role models. In FY 2009, Ubuntu will reduce the staff to participant ratio to 1 adult per 10 children. This will allow individualized attention that builds the quality of care. Ubuntu's camps will also continue to address gender inequities through small group discussions. Ubuntu staff will facilitate age-appropriate dialogues with boys and girls on gender inequality, stereotyping, and gender-based violence, girl-headed households, HIV, teenage pregnancy, and rape.

After-school programs offering care for 100 OVC in grades seven and eight will be established. Ubuntu will link this program with the abstinence and being faithful program by offering life skills education. Some OVC will be enrolled in a four-year academic track to equip them with essential skills so that they can benefit from Ubuntu bursaries. An academic specialist will work with a psychologist and a care worker to ensure comprehensive services.

Ubuntu's nurse will initiate a growth monitoring strategy for OVC to ensure that all children are immunized, that those needing essential services are referred to the clinic. Ubuntu's nurse has developed strong relationships with local clinics to ensure that malnourished or children with other health issues are assisted by the clinic.

Ubuntu will continue to facilitate weekly support groups for OVC. Ubuntu's OVC program will wrap around with prevention programs. Ubuntu will collaborate with Men as Partners (MAP) to include elements of their program in the training and support groups. All support groups will be linked to Ubuntu's career and higher education program that builds skills and facilitates access to tertiary education.

Ubuntu OVC program will use a "memory box" therapy approach to support the OVC. This therapy will enable children and their families to work through the issues they have faced with loss, bereavement, stigma, denial and trauma.

Ubuntu will address domestic violence and coercion of women through the family-centered OVC program. OVC and their families will be screened for violence in the home. Vulnerable children will be enrolled in ongoing psychosocial support sessions. A suitably qualified staff member works on these cases. Ubuntu staff will work closely with the Department of Social Development to ensure that social workers are assigned to domestic violence cases. In addition, staff will accompany OVC and their family court and assist them in court preparation. Ubuntu will remove children and women from unsafe home environments and will provide them with safe havens. MAP trainers will also assist these families, as they provide a level of confidence in the children and their mothers, and help children regain trust in male role models.

The program will continue feeding disadvantaged children. Ubuntu will not scale up the number of recipients, but instead, will scale up the quality of the feeding program. The enhancements will focus on the meal's nutritional value and growth monitoring. Ubuntu will source vegetables from the feeding program through Ubuntu's six school gardens. Ubuntu will integrate the gardens into programming for OVC through using the gardens for environmental education and skill building.

Ubuntu will continue to identify child-headed households (CHH) affected by HIV and AIDS. Ubuntu will continue providing safety and security measures and basic household essentials to CHH in need. A team leader will be dedicated to identifying and developing interventions for CHH. Each household will be assessed provided with ongoing psychosocial, social and nutritional support. CHH that do not qualify for social grants will be provided with monthly nutritional food parcels.

Ubuntu's OVC program will link directly with Ubuntu's adult care and support program. The Ubuntu Centre, due to be completed in 2010 will ensure comprehensive services under one roof.

SUMMARY:

Ubuntu Education Fund (Ubuntu) offers counseling, access to health services, nutritional support, assistance with obtaining child support and foster care grants, assistance with obtaining birth certificates, school kits, internship/scholarship opportunities, holiday camps and support groups for orphans and vulnerable children (OVC) living in resource-constrained townships of Port Elizabeth, a city in the province of the Eastern Cape. The emphasis areas are community mobilization/participation, food and nutritional support, development of network/linkages/referrals, and linkages with other sectors and initiatives. Specific target populations include OVC, HIV-infected infants, HIV-infected children and caregivers of OVC.

BACKGROUND:

Ubuntu began working with OVC in 2003 with school-based psychosocial support, which has evolved over the past three years into a comprehensive OVC care program. There are an estimated 50,000 OVC in the

Activity Narrative: townships of Port Elizabeth. The rapidly increasing number of OVC in the target area is an immediate measure of the impact of HIV and AIDS on local communities. In a recent intake of a general population of schoolchildren into an Ubuntu activity, 40 percent were OVC. Child-headed households in South Africa are rapidly increasing, as are the number of elderly grandparents caring for orphaned grandchildren. The burden of responsibility for care giving and coping with a family member who is suffering from AIDS-related illnesses invariably falls on women, particularly girls and grandmothers. Children are experiencing "repeat orphaning" - where they are taken in by a close relative who then also becomes sick and dies. OVC are also particularly at-risk for sexual abuse, economic exploitation and HIV infection.

Ubuntu uses a community-based approach to mobilize community members to recognize and care for OVC. The program targets children who are orphaned, or those whose parents or caregiver are living with HIV to ensure they access treatment when appropriate, and child-headed households. Ubuntu also provides services to a significant number of children living with HIV who are in need of coordinated services from providers that are family-centered and integrate child and parent services. Ubuntu became a PEPFAR partner in FY 2007 and has only recently received funds so does not yet have PEPFAR-funded results to report. FY 2008 PEPFAR support will allow Ubuntu to scale up the OVC program to provide comprehensive services to an increased number of OVC.

ACTIVITIES AND EXPECTED RESULTS:

The OVC program targets high-poverty, high-risk schools as evidenced by intakes into Ubuntu's counseling program. Ubuntu places full-time OVC specialists on site at the school to identify OVC for intake into their psychosocial support services. Ubuntu ascribes to the school as a "center of care, support and prevention" model (SCCSP) and proactively engages school governing boards, administrators, teachers and parents to establish a caring, supportive school environment. Ubuntu is an active participant in the training and best-practice sharing of the Caring Schools Network (CASNET) of OVC service providers organized by Save the Children UK. Ubuntu's OVC services are in close alignment with the Department of Social Development's Policy Framework and National Action Plan for Orphans and Other Children Made Vulnerable by HIV and AIDS, 2006 - 2008. In alignment with these policies, Ubuntu aims to strengthen family and community-based care for OVC. Ubuntu works closely with social workers to coordinate services for families. Staff are engaged in ongoing policy meetings with the Department of Social Development regarding income grants, nutrition assistance and efficient and effective service delivery. Ubuntu participates in a local network of corporate organizations, NGOs and CBOs which work with the Department of Social Development and the Department of Home Affairs to coordinate income grant and identity document events in local community settings. Ubuntu provides comprehensive psychosocial services to 11 OVC as an implementing partner in the Umzi Wethu project coordinated by the Wilderness Foundation which provides skills training and learner ships for OVC in the ecotourism industry. Ubuntu has strong referral partnerships with the Child Protection Units of the South African Police, Childline and the Rape Crisis Center at Dora Nginza Hospital. Other Ubuntu programs provide wrap-around services to OVC including a school gardening/lunch program, improved educational facilities and life skills education.

ACTIVITY 1: Comprehensive Care Services for OVC

Through case management and school-based counseling services Ubuntu provides comprehensive care for OVC. Ubuntu uses a family-centered approach to address the needs of OVC and work with their caregivers to stabilize the household and to provide a supportive, caring environment for the child. Each OVC and their household's needs are assessed and an individualized action plan is developed. Service plans include the following as needed: counseling, access to health services including voluntary counseling and testing (VCT) and antiretroviral treatment (ART), protection from abuse, assistance with obtaining South African government (SAG) grants including disability, child support and foster care grants; legal documents such as identity documents and birth certificates; assistance with food security including food parcels are provided with support from other funding partners, daily school lunches, or backyard garden support; and assistance with access to education such as school kits, tutoring, waiving school fees, internship/scholarship opportunities, referrals to other service providers, support groups and school holiday camps. Community partners are encouraged to refer child-headed households to ensure that they receive comprehensive care services.

Support groups for OVC girls who have survived sexual abuse, OVC who are teenage mothers, and OVC living with HIV are provided on a weekly basis. OVC Specialists assist OVC girls and adolescents to avoid transactional sexual relationships with older men by providing emotional, economic, nutritional and educational support as well as sexual and reproductive health education and access to services. Group therapy is provided to OVC boys who are acting out aggressively in home or school settings. These support groups meet weekly and focus on addressing male norms and behavior. All support groups are linked to Ubuntu's career and higher education program that builds skills and facilitates access to ongoing education for these particularly vulnerable groups.

Through Ubuntu's VCT and Care services, children at higher risk of HIV exposure are proactively identified to ensure they receive access to VCT as well as providing access to treatment services for children living with HIV and AIDS and their caregivers. Ubuntu case managers work with Dora Nginza's Pediatric ARV Unit and its sub-clinics to provide ongoing monitoring and support to children on ART.

ACTIVITY 2: Developing Schools as Centers of Care, Support and Prevention

Ubuntu uses a model of "schools as centers of care, support and prevention" based on the school playing a central role in the caring and safety of OVC. Ubuntu works closely with school communities to create a caring and safe school environment both during and outside of school hours. The school management, staff and Ubuntu sign a Memorandum of Understanding (MOU) that lays out the model including the roles and responsibilities of the school and Ubuntu. Ubuntu works with the school to develop a garden on-site and ensures that all school children receive a daily hot meal. Ubuntu OVC specialists provide life skills classes, case management services to OVC and their families, and facilitate support groups. Each Ubuntu OVC

Activity Narrative: Specialist has a dedicated counseling room to provide on-site confidential counseling services to OVC. Committees are created at each school comprised of staff, parents, community members and the OVC Specialist. Committees discuss the needs of OVC in the community, coordinate government services events and mobilize community members to care for OVC and child-headed households. Ubuntu works with mobile units from the Department of Social Development, Department of Home Affairs, and the Police to hold government service events that bring relevant government agencies together at the school to enable the greater school community to access vital services such as affidavits, identity documents and income grants in community settings. During school holidays, Ubuntu holds school-based day camps for OVC staffed by OVC specialists, parents, teachers and volunteers. The school holiday program targets 200 OVC in Grades 4-12 and consists of life skills, tutoring and technology workshops, activity clubs, mentoring and peer support, and arts and sports activities with partnering organizations. The camp takes place during the school holidays in July and December for a two-week period. During the week-long school holidays in September and April, Ubuntu holds more focused intensive interventions with OVC including retreats and intensive tutoring programs. Ubuntu provides two nutritious meals per day during the camp sourced from the school garden Ubuntu has developed. In 2009, Ubuntu will expand to two additional schools to provide comprehensive SCCSP services.

Table 3.3.13: Activities by Funding Mechanism

Mechanism ID: 509.09	Mechanism: N/A
Prime Partner: Save the Children UK	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 3054.22903.09	Planned Funds: \$3,296,221
Activity System ID: 22903	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

This program was designed to support implementation of the National Strategic Plan (NSP), National Action Plan for OVC and Department of Education (DOE) policies - implementing Child Care Forums (CCFs), local coordination and caring schools.

ACTIVITY 1: Establishing and strengthening community structures

Save the Children UK (SC), in partnership with The Center for Positive Care (CPC), will develop CCFs in farms, work with DOSD and other government departments to develop a referral system for OVC from CCFs and schools, and ensure that CCF members receive supportive supervision as an extension of the social development system. SC and the DOE will develop training for School-based Support Teams (SBSTs) including the role of the SBST in supportive supervision for Youth Facilitators (YF).

ACTIVITY 2: Human Capacity Development

Emphasize child protection and participation in all training; develop materials and training of teachers and school management to ensure sustainability of caring schools and support for YFs; develop materials, training and mentoring of local government (LG) officials for LG to play the key coordination role in local responses to OVC including data collection and analysis; training for CASNET (Caring Schools Network) to increase the number of organizations providing quality support to schools that care for OVC.

ACTIVITY 3: Care Services

SC and CPC will emphasize after school and holiday activities including sports, arts, games; opportunities to learn practical skills such as sewing, budgeting and caring for ill people and children. Some groups will provide play skills support to encourage children to communicate about difficult subjects such as grief and loss.

SC will introduce programming for very young children including support groups for primary caregivers who will bring the young children with them for stimulation, a nutritious meal and play while caregivers interact; the establishment of community-based toy libraries where children can play and caregivers borrow toys to take home and encouraging groups of school age children to play with small numbers of young children at or close to their homes. Selected CCF members will be trained in the care and development of very young children to incorporate a focus on young children into their home visits

The peer educator program will be extended to three further schools. Recommendations of the action research on the situation of adolescents will inform the establishment of programs to work with youth.

The Child Wellbeing assessment will be rolled out to CCFs and schools to track the wellbeing of children and inform implementers of cases that require attention before they become urgent.

SC and CPC will use cost share funding to support schools and resource centres to establish gardens to enhance school feeding programs. Feeding will be extended to younger children with a particular emphasis on 0 to 2 year olds.

With cost share funding SC is establishing vocational training opportunities. This will include training in welding, carpentry and catering to establish a small business in the local community. FY 2009 funds will extend this program to additional schools, mentor the schools and liaise with organizations such as Umsobomvu to provide additional support including credit to young people to establish their own enterprises.

SC and CPC counter the stereotype that only women care for children by appointing male staff and ensure that there are equal numbers of male and female YFs. To counter the impoverishment of women that results from volunteering, SC and CPC are advocating with the DOSD about stipends and provide some stipends for CCFs. Male and female children are included in all program elements and data for different services will be disaggregated by gender.

Training for the YFs, FBOs and CBOs will have an explicit gender focus.

ACTIVITY 4: Advocacy

Training and mentoring municipalities to use data collected at ward level to advocate with line ministries for effective service delivery to OVC. SC and CPC will advocate for improved coordination of action for children at all levels. SC will advocate for provision of feeding in high schools. Results of the program components to focus on young children, children on farms and migrant children will be shared with partners to inform their programs to provide more comprehensive service.

ACTIVITY 5: Improved Coordination

SC and CPC will promote and support coordination of action for children at provincial level. SC and CPC will mentor local government officials that are trained in coordination. SC will share the results of efforts to improve coordination with other partners. CASNET will encourage its members to coordinate with government and others at local and provincial level and will promote coordination through provincial chapters.

SUMMARY:

Save the Children UK (SC), in partnership with The Center for Positive Care (CPC), supports the South African local government (LG), Departments of Social Development (DOSD), Education (DOE) and Health

Activity Narrative: (DOH) and other NGOs in the Free State (FS) and Limpopo provinces to provide comprehensive care for OVC. Activities include building community capacity by establishing, training and mentoring Child Care Forums (CCFs), training home-based care (HBC) givers, helping schools to plan and implement care for OVC and improving local, district, provincial and national coordination of OVC programming.

BACKGROUND:

SC's OVC program in SA began in 2003 and has been supported by PEPFAR since 2004. SC works with LG to rapidly roll out CCFs at ward level. In FY 2006 SC and CPC assisted 40,381 OVC. FY 2008 funding will continue to strengthen the reach, quality and long term sustainability of care provided to OVC by expanding ward level networks of support and extending these to additional municipalities. SC actively seeks support of government, local business and FBOs for network activities. SC activities will be implemented in underserved areas in the FS in Thabo Mofutsanyana District, a SA presidential poverty area, and selected rural and underserved municipalities in Fezile Dabi and Lejweleputswa Districts. In Limpopo, SC in partnership with CPC, will provide services in Vhembe district, a designated homeland during Apartheid. In FY 2008 services will be expanded to incorporate the needs of very young OVC, OVC with disabilities and OVC in farming communities.

The project is in line with SA's National HIV/AIDS and STI Strategic Plan, Policy Framework for OVC, National Action Plan for OVC and SAG policies. SC is a member of the National Action Committee for Children affected by HIV/AIDS steering committee and participates in the development of national policy and guidelines. SC coordinates the national Caring Schools Network of organizations establishing OVC care through schools in South Africa.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Establishing and strengthening community structures

SC and CPC, with partner NGOs, establish and strengthen ward level networks comprising of a CCF, HBC groups, schools, local business, faith-based and other groups, which are led by the ward councilor and the Community Development Worker (CDW) in each province. SC establishes and strengthens CCFs, which identify OVC, ensure OVC and their caregivers access services, mobilize community support for OVC and their caregivers, actively support community initiatives for OVC, and keep records of OVC. CCFs monitor the well-being of OVC (taking account of needs according to age and gender) and their caregivers, and raise issues related to service delivery for OVC with relevant local authorities through the OVC Task Team or other coordinating structures. SC will enable schools to plan and implement programs to care for OVC and to establish children's groups to ensure that children are actively involved in all aspects of support. In FY 2008 SC will extend community-based care for OVC to selected, underserved municipalities of in the FS and to additional wards in Limpopo. SC and CPC will extend the caring schools component of the program, including support for adolescent OVC, to additional schools in all districts in which the program is implemented.

ACTIVITY 2: Human Capacity Development

SC supports human capacity development by training CCF members, school-based youth facilitators (YF) and community stakeholders in children's rights including child participation, HIV and AIDS, identifying OVC, supporting access to essential services, psychosocial support and home visits and child protection. HBC groups will be trained in health care for children in AIDS-affected households, with an emphasis on very young and adolescent OVC, and support to children that are caring for ill adults. Organizational development and OVC program training will be given to CBOs, FBOs and partner NGOs. All ward-based CDWs will be trained in comprehensive child wellbeing and mentored to assume leadership of a ward network to achieve child wellbeing. Additional training for YFs, CCF and HBC members on understanding adolescents will be incorporated into the program. This will include; how to talk to and listen to adolescents to help them to understand the changes in their bodies and how to initiate groups and activities that they will participate in. YFs will be trained to initiate and support peer education activities for adolescent in school OVC. All activities will include a focus on gender and gender roles in adolescent sexuality. Clinic staff will be offered training and support by SC in working with adolescents and responding to their health needs.

ACTIVITY 3: Care Services

With SC support, CCF members will identify OVC; facilitate access to birth registration, health care (including pediatric treatment) and HIV counseling and testing, social security grants and protection: monitor that services are delivered; make home visits and initiate children's and caregiver's activities to enhance psychosocial well-being and provide or arrange for food assistance, school fee waivers, uniforms and transport to government services. Schools are capacitated to support OVC improving access to nutritional support, recreation, play and psychosocial support for children and their caregivers (both teachers and family caregivers); extracurricular activities that encourage children to excel in different fields and that teach children relevant skills; clothes and uniform banks; improved safety and protection for children; the provision of other government services at schools; and linkages with community programs that support OVC. SC will explore the role of gender and activities will respond to the needs of young girls and boys and caregivers, including older women. Women will actively participate in decision-making while men and youth will play an active role in community care and support activities. SC data for specific indicators will be recorded and analyzed by gender and monitored to ensure gender-balanced outcomes.

Adolescent OVC will be referred to clinics for sexual and reproductive health services and SC with the DOH will ensure that the clinics are responsive to adolescent OVC needs. SC will start support groups for adolescent OVC, in conjunction with resource centers in Vhembe district. Services will include support for peer-led activities and services from trained adult caregivers. OVC will be supported to discuss and find solutions to their problems, access information and services, and interact socially with each other in a safe space supervised by trained adult caregivers. SC will expand the in-school youth peer education program

Activity Narrative: using existing best practice models, such as the RADS (Radically Different Species) life skills program developed with Rutanang, in the Free State and Vhembe. Teenage mothers will be included in support groups for positive mothers. (May be obvious but a word on the rationale may be useful)

In addition, in FY 2008, SC will utilize PEPFAR support to respond to gaps identified through SC's internal impact monitoring process. Support for OVC under-five years will be introduced to respond to recommendations from research into the strengths of different programs of home and community care for young children that SC is currently conducting. This will include support for caregivers to stimulate OVC and ensure health and nutritional support. In addition, approaches to supporting OVC in the sparsely populated farming communities will be initiated and piloted. SC and partners will build on existing infrastructure, such as farm schools and mobile health services for the development of support networks for OVC. SC will work in partnership with farmers and farm worker unions to reach OVC currently not receiving services on farms. Services for OVC with disabilities will be a focus area in all districts. Members of all CCF groups and YFs will be trained in community-based rehabilitation for OVC with disabilities to ensure inclusion in all OVC programs. SC will provide support to schools to enroll children with disabilities in schools where possible in accordance with SAG policy.

ACTIVITY 4: Advocacy

SC will continue to advocate for improved service delivery to OVC. A key element will be the collation and sharing of data on service delivery with SAG. SC will refine its database and decentralize data collection to ward level to generate reports on the status of service provision. These will be analyzed collaboratively with LG and Home Affairs, DOSD, DOE, and DOH to design more responsive services including child-oriented CT. OVC Task Teams will be capacitated to monitor OVC service provision. LG will be encouraged to include children's issues in their integrated development plans. For long term sustainability SC will lobby DOSD to ensure that all CCF members are provided with stipends and with DOE to include YFs in programs that receive stipends. SC will extend the reach of the CASNET program through training and active engagement of DOE at provincial level to expand OVC care through schools in all provinces. SC will continue to actively support the national rollout of CCFs by NACCA.

ACTIVITY 5: Improved Coordination

SC will support OVC Task Teams to coordinate services for OVC including hosting meetings between service providers and strengthening links with CCFs, other ward structures and the district level. SC will support exchange visits and promote participation of OVC in ward and local level decision making. Stakeholders at district and provincial levels will be encouraged and supported to form appropriate coordination mechanisms. SC will also support NACCA to engage with the SAG's National AIDS Council, and local government bodies.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP for Salvation Army (SA). No FY 2009 COP funding is requested. Salvation Army (SA) withdrew from continuing activities of its FY 2008 COP for FY 2009 therefore no FY 2009 funding is needed for SA. The OVC activity was approved in SA's FY 2008 COP and funded with FY 2008 PEPFAR funds. FY 2008 funds were allocated to provide OVC with a comprehensive range of support services. Continued PEPFAR support for OVC activities in FY 2009 will be done through a new partner that will be determined in FY 2008. For FY 2008 SA will implement and complete the activities according to the schedule outlined in the FY 2008 COP.

Mechanism ID: 4759.09	Mechanism: N/A
Prime Partner: Senzakwenzeke	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Care: OVC
Budget Code: HKID	Program Budget Code: 13
Activity ID: 8259.22899.09	Planned Funds: \$242,726
Activity System ID: 22899	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1:

Senzakwenzeke (SEKA) will provide support and monitor the already established Child Care Forums (CCFs). CCFs are community-based structures focusing on meeting the needs of OVC. Through collaboration with the Department of Social Development (DOSD) at the District level, SEKA will identify one care worker to undergo Training (Master Trainer in the CCFs) by the DOSD. The Trainer will come and do the train the trainee session in the organization, and at the municipality level SEKA will have 12 CCFs each led by a Supervisor.

The Guidelines for mentoring are in line with the DOSD Policy Framework and National Plan of Action. The role of the CCF is to ensure the identification of OVC, to be aware of the initiatives involving child care and support, to create awareness of OVC issues, to assess OVC needs and ensure that the needs of OVC are holistically addressed.

ACTIVITY 2:

In terms of workforce planning SEKA is planning to increase the numbers of care workers by adding 16 care workers to the 63 to total at 79 Child Care Workers (CCWs) and 5 supervisors to the 12 for SEKA to reach a total of 17 supervisors. This will help the organization to render a quality service to children. All Care workers will be trained on how to address the special needs of the girl and boy child.

Promotion and retention strategy - SEKA selects supervisors from existing CCWs creating opportunities for upward movement from within. Although SEKA is facing negative competition from local organizations that offer better incentives in the form of stipends and attract most of the organization's trained care workers. For example, the KwaZulu-Natal (KZN) Department of Health is paying the Community Health workers not less than \$142.90 compared to SEKA care workers who earn \$114.3. To address this challenge, SEKA will increase stipends by 10%.

Mentorship - SEKA will utilize induction activities to orientate new CCWs on job expectations and procedures to ensure easy integration into the communities. Existing CCWs and Supervisors will assist new ones. A refresher course for existing care workers will be focused on psycho-social support and counseling using Regional Psychosocial Support Initiative (REPPSI) curriculum. New care workers will also be trained with the REPPSI psycho-social support and counseling modules. Already trained SEKA in-house facilitators will conduct the training.

Support of Caregivers: attention will be given to caring for care workers- an approach which also contributes to the SEKA retention strategies. The University of KZN (Psychology and Humanities) will provide debriefing sessions for 15 care workers per session, after an initial assessment by the University. This will be both one-on-one and a group intervention.

ACTIVITY 3

This activity will reach especially vulnerable children - disabled children. CCWs will pay special attention to identifying disabled children. SEKA will strengthen activities that meet the needs of OVC with disabilities and their caregivers, providing special training to care workers to work with disabled children. The training will be undertaken by CREATE.

ACTIVITY 6:

This activity utilizes a household-centered approach and prioritizes family and household care and reaches especially vulnerable children aimed at making a measurable difference in their lives. SEKA care workers will provide support to 105 OVC, from 15 child-headed households, teaching food gardening skills to generate food for subsistence purposes. The food gardens are established at their homes and on protected allocated community land. A once-off donation of seedlings is received from the Department of Agriculture. SEKA has to supplement the donation with its own seedlings putting emphasis on producing a variety of vegetables to provide for OVC nutritional needs. Food gardening is one of core activities that largely contributes to OVC care and support; to enable scale up and create sustainable food gardening, care workers who have undergone vegetable production training will transfer their skills to the OVC, especially those from child-headed households. Using this approach, SEKA equips OVC with necessary skills to enable them to sustain their lives after graduating from the PEPFAR program (above 18 years). This also increases meaningful participation and ownership of the gardens among of the children; they are involved in looking after the crops. Additionally, post-harvest food processing and storage activities will be included in FY 2009. This will improve food security and equip caregiver with skills to store enough food.

SUMMARY:

Senzakwenzeke (SEKA), a South African non-governmental organization (NGO) based in KwaZulu-Natal, provides psychosocial support, nutrition, counseling, homework assistance and social grant application assistance to orphans and vulnerable children (OVC). SEKA conducts training programs for Child Care Forums (CCFs) and caregivers on children's rights, child protection, and care and support for OVC. The main emphasis areas of Senzakwenzeke activities are community mobilization and participation, the development of networks, linkages, and referral systems, and training. The target beneficiaries are orphans and vulnerable children, caregivers of OVC, community leaders, SA-based volunteers, and people living with HIV and AIDS.

BACKGROUND:

Senzakwenzeke (SEKA) is a community-based organization operating in Nkandla Local Municipality, in the South Africa Page 1356

Activity Narrative: Uthungulu District 28 in KwaZulu-Natal province (KZN). KwaZulu-Natal is the South African province with the highest HIV prevalence rate (39 percent). The Nkandla District, one of the largest districts in KZN is characterized by high unemployment, lack of resources and a very poor infrastructure. This affects service delivery to children and the community. Within their population radius, Senzakwenzeke has identified 924 OVC, and this number is likely to increase during the next few years.

SEKA is a partnership between the local community and local health professionals. The Nkandla Hospital had identified the need for a community-based care program to provide services to OVC. SEKA provides services that are relevant to the development and well-being of OVC, such as assistance in getting social security grants, health promotion, HIV prevention messages and reproductive health education, assistance in waiving school fees for OVC to access education, and access to legal documents for succession planning. SEKA was a sub-partner under the Nelson Mandela Children's Fund program which ended in FY 2006.

With PEPFAR support since 2006, SEKA has expanded their OVC activities to three wards in the Nkandla District. As of March 2006, SEKA has been able to provide services to 924 OVC. SEKA has established strong links with the traditional leadership, the local government of Nkandla, the Nardini Sisters (a faith-based organization providing shelter and food to OVC), and the Nkandla Hospital (for OVC ART referral), in an effort to provide a strong community response to care for OVC. These and other partners work with SEKA to provide food aid, scholarships for tertiary education and skills training for OVC.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthening Community Care Forums (CCFs)

SEKA will provide support in the establishment and training of Child Care Forums (CCFs). CCFs are community-based structures focusing on meeting the needs of OVC. The role of the CCF is to ensure the identification of OVC, to be aware of initiatives involving child care and support, to create awareness of OVC issues, to assess OVC needs, to liaise with other community-driven initiatives focused on children, and to perform advocacy for OVC in the community. CCFs are vital for sustainability of OVC programs and community involvement in ensuring that the needs of OVC are addressed. SEKA partners with the Department of Social Development (DOSD) to train the CCFs, which is composed of representatives from the community. The training follows the DOSD Guidelines for establishing CCFs. SEKA implements all its OVC activities in line with the DOSD OVC Policy Framework and the National Plan of Action. Topics covered in the CCF training include, the role of the CCFs, drawing up a community profile, costing and fundraising, monitoring and evaluation, and understanding the needs and rights of children.

SEKA will expand the program by mobilizing and training 25 new caregivers in the CCFs. They will be linked to the 35 existing caregivers. These 35 caregivers will receive refresher training through a direct Train the Trainers course. SEKA will ensure close monitoring and tracking of trained caregivers and their CCFs.

ACTIVITY 2: Human Capacity Development

SEKA will provide monthly training and mentoring for their thirty-five caregivers (recruited from the community) on counseling, psychosocial support, OVC needs assessments, children's rights, special needs of the girl and boy child, referrals for ART, nutrition, child protection and gardening. In FY 2008 SEKA will recruit and train an additional twenty five OVC caregivers. During these training sessions Supervisors will provide psychosocial support or debriefing sessions for the SEKA caregivers to share their concerns and provide a forum to openly discuss what they see and experience in caring and supporting OVC.

ACTIVITY 3: OVC Care and Support

Through using the Sinomlando and REPPSI models, SEKA trains OVC on how to create memory boxes to capture family memories, deal with grief, and build resilience in OVC. Periodic home visits to the OVC, provide an opportunity for follow-up and monitoring to see if the OVC are coping with the difficult situation in their home environment. SEKA works with a number of partners in the Nkandla area, to assist with OVC follow-up by observing resilience in the families that have benefited from memory boxes.

ACTIVITY 4: Improving OVC access to Social Security Grants

During home visits, SEKA caregivers will assess whether OVC are in possession of legal documents such as birth certificates and identity documents. These documents are required in order for OVC to access government social security grants. Once the OVC is in possession of the required documents, the caregiver will assist the household with the application process to access the government social security grants and the caregivers will also provide training in budgeting skills so the OVC are able to manage this new source of household income. OVC and their households will also receive information and counseling on other available government social and health related services such as child protection and pediatric ART. The SEKA caregiver will act as a point of linkage, referral and follow-up for the OVC to access these services.

SEKA will continue to coordinate community-based outreach by Home Affairs to assist in fast tracking legal documents for succession planning of the OVC (using mobile vans).

ACTIVITY 5: Strengthening Gender-Based Activities

SEKA caregivers work in and out of schools which run specific gender programs for girls and boys. Special sessions are held for girls and boys separately and cover issues such as sexual reproductive health, sexuality and abuse. South African Government training materials are used for the training. Additionally, SEKA caregivers will host sessions where boys and girls interact together, to share their experiences and learn from each other. Caregivers also ensure that during the OVC home visits they spend time with each individual child to give them an opportunity to ask questions or share concerns around these topics.

Activity Narrative: ACTIVITY 6: Food Gardens for Child-Headed Households

SEKA caregivers will provide training to OVC, especially child-headed households, on the skills required to create survival food gardens. The food gardens are at the homes of the children and on community land provided by the municipality. This is a wrap around activity where other stakeholders in the community provide the seeds and fertilizers for the gardens. The survival food gardens will provide vegetables which enable the children to have better nutrition. A SEKA two-week training module on food gardening includes a nutrition component encouraging the use of local plants and high nutrition vegetables to supplement the OVC nutritional needs.

Additionally, post-harvest food processing and storage activities will be included with help from the AED Umbrella Grant Management Program.

USG Agency: U.S. Agency for International
Development

Program Area: Care: OVC

Program Budget Code: 13

Planned Funds: \$3,824,393

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Expanded community-led response to provide care and support for OVC:

World Vision's (WV) Community Care Coalitions (CCC) model is similar to the Department of Social Development's (DOSD) Child Care Forum structure and is based on global best practice. In line with the goals of multi-sectoral and holistic support for children, CCCs draw their membership from an array of stakeholders at local level to include churches and other FBOs, CBOs, local government, traditional leaders, associations of PLHIV and OVC. The CCC is responsible for coordinating OVC activities in the community, and for recruiting and supervising Home Visitors (HVs) who are then trained by WV to visit OVC and PLHIV.

The identification of OVC will take place at the same time, to link support provided to individuals in the same household.

The project will work with existing CCCs in the eight Area Development Programs (ADP); a new intake of 600 HVs will be needed to reach the additional 10,000 OVC that the project will target. HVs will be trained on the full range of child care and support topics.

The menu of services include the following: child monitoring, HIV prevention education, psychological support, succession planning, health care support (referrals, transport), nutrition support (in the form of food, e-pap, chickens), education assistance (uniforms, materials, vocational training), child protection (birth registration), economic strengthening, agricultural support and shelter support.

Additional Activity: Mobilized and strengthened community-led response to care for PLHIV and their families

Networks of Hope (NoH) will work through the same CCC structure to introduce home-based care into project areas, by training HVs in the DoH proposed new 72-credit minimum skill set (MSS), to become accredited Community Care Supporters (CCS). These CCSs with stipends will expand their duties to provide a comprehensive and quality package of essential services to a total 9,915 PLHIV/chronically ill.

Using the Health and Welfare Sector Education and Training Authority (HWSETA) Accreditation Toolkit, WV will pursue accreditation as a provider of the MSS. WV will employ its own accredited trainers. WV will receive guidance from the DoH regarding the finalization of the approved unit standard-based skills programs that will form the MSS, and will use this accredited program in its trainings.

The eight CCC Coordinators will be trained to accreditation in the MSS and will, in turn, train the 600 existing HVs to accreditation as CCSs in line with DoH requirements. CCSs may begin visiting PLHIV in their homes and providing basic care and support as part of the practical component of the training, prior to receiving full accreditation.

Human Capacity Development:

WV will continue to mainstream Channels of Hope training for faith-based organizations through a two-day workshop. WV will work with each local FBO to develop action plans to address congregational and community, as well as confront gender discrimination, promoting gender equity in communities. Trained congregation and FBO members will form Hope Teams which WV will support with ongoing training and mentorship. In turn, these Hope teams will develop and carry out action plans relating to the protection and care of OVC working closely with CCCs.

WV through its Organizational Capacity Building (OCB) process will work with community care groups and community care coalitions in high prevalence regions to provide care and support to orphans and other vulnerable children, home-based and palliative care, prevention activities, care and support.

WV will strengthen the already established resource centers in each ADP. Each ADP will be trained on how to source and utilize resources. The resource centers will be used by the CCCs and community assisting them in the development of an adequate response to the OVC issues.

The South African government's (SAG)'s HIV & AIDS and STI National Strategic Plan for South Africa 2007-2011 (NSP) calls for: 1) reduction of HIV incidence by 50%; and 2) expanding access to appropriate treatment, care and support to 80% of all HIV-infected people and their families by 2011. Through its NoH project, WV fully endorses these objectives in collaboration with the SAG at various district levels is essential for an active, effective and sustainable response.

Gender:

Peer support groups and Youth AIDS clubs will be targeted toward adolescents through schools and churches. Training in Youth prevention strategies will target boys and girls. OVC will identify role models to serve as the peer support leaders. The anticipated outcome of this process is a re-emergence of AB as a community norm and a reduction in the practice of cross-generational sex, transactional sex and multiple casual sex partnerships, etc.

Holistic Soul Body Institute will be responsible for delivering gender-related trainings for home visitors, adolescents and relevant community members and key stakeholders.

SUMMARY:

World Vision (WV), together with the Christian AIDS Bureau of South Africa (CABSA), will mobilize and strengthen a community led response to protect and care for orphans and vulnerable children (OVC) and their families. The program is active in the Free State, Limpopo and the Eastern Cape provinces and will expand to the KwaZulu-Natal province. The major emphasis area is human capacity development

Activity Narrative: (training). The target population is OVC.

BACKGROUND:

WV works in six provinces in South Africa (SA) in collaboration with CBOs, FBOs and government entities to support over 42,000 sponsored children including 4,439 OVC registered at present. Currently, PEPFAR supports Area Development Programs (ADPs in three and this will be expanded to four additional sites within KwaZulu-Natal province. WV partners with CABSA to empower faith communities to develop projects addressing HIV and AIDS. WV will use the CABSA curriculum (Channels of Hope (CoH)) to address churches and FBOs to deal effectively with HIV and AIDS. The South African Government (SAG) Policy Framework for OVC asserts that NGOs should assist in rolling out innovative and tested models to mobilize, strengthen and support community led OVC efforts. With FY 2008 funding, WV will continue to assist targeted communities to establish structures through which the community can care for and support OVC. One element of an enabling environment for OVC support is the sustainability of community-based organizations (CBO) such as Community Care Coalitions (CCC) which are equivalent to Child Care Forums. WV will implement an organizational capacity building guide that includes self-assessment, training based on the assessment and the follow-up support. WV will facilitate a process of sustainable community involvement through this training to enable communities to develop and support their OVC. The WV program will continue to work toward gender equity in service delivery by offering short gender courses to NGOs and CBOs to improve their knowledge about child protection and how to address the factors that keep girls out of school.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

WV will conduct workshops, utilizing the CABSA CoH curriculum. A two-day Leaders Workshop will be held with interested religious leaders. The workshop will help religious leaders understand the urgency of the HIV and AIDS crisis, to address negative and discriminatory attitudes and to work towards compassionate and effective responses in congregations and communities. These leaders return to their congregations and to FBOs to identify interested members who will in turn attend a four day workshop, which give attention to best practice models for prevention, care for OVC, home-based care, voluntary counseling and testing and advocacy. As a result of the four-day workshop, WV will work with each FBO to develop action plans to address congregational and community, as well as confront gender discrimination, promoting gender equity in communities. Trained congregation and FBO members will form Hope Teams which WV will support with ongoing training and mentorship. In turn, these Hope teams will develop and carry out action plans relating to the protection and care of OVC. The Hope Teams will work closely with the CCCs. 111 Hope Teams have already been formed, training at this level will continue in FY 2008.

ACTIVITY 2: Community Mobilization

Through CCCs, WV will mobilize community stakeholders, including FBOs, CBOs, local government, traditional leaders, school committees, health representatives, women groups, associations of people living with HIV (PLHIV) and OVC. A two day stakeholder workshop will be held to identify gaps, and select the CCC structure most appropriate to the local context. WV and CCCs will recruit new Home visitors (HV) to visit OVC in their homes. CCCs will be encouraged to link and play an active role within the District Action Committee for Children affected by HIV and AIDS (DACCA). Together with the CCC the HV will receive training on Child Rights and Protection, access to education, health and nutrition, HIV prevention, Life Skills, psychosocial support (PSS) and succession planning over five days. As a result, each identified OVC will receive support from HV ranging from direct material provision to greater livelihood security.

ACTIVITY 3: Care and Support

After the workshops for CCCs and HVs, each OVC will receive a basic minimum package of services and support. The services will include child monitoring and protection, PSS, agricultural inputs, facilitating access to education, health care, basic nutrition training, HIV prevention, home-based care for chronically ill adults and children, succession planning and supervised recreation. Direct support will include school fees, vocational training, school uniforms, books and supplies, facilitation with transport for primary health care checkups, improved diets/livelihoods through, clothing shoes, bedding and blankets.

ACTIVITY 4: Local Organizational Capacity Development

WV developed an Organizational Capacity Building (OCB) guide to build organizational capacity. The OCB process begins with an organizational self-assessment, training based on the result of the assessment and follow-up support. The training may include Organizational Purpose, Planning, Procedures, Group dynamics, Monitoring, Evaluation and Reporting, Finance, Resource Mobilization and external relations. Through this activity WV will build the capacity of local organizations to operate effectively in providing adequate protection and care to OVC and their families. WV will partner with CABSA to establish resource centers in each ADP; stocked with relevant HIV and AIDS materials. The resource centers will be used by the CCCs and community assisting them in the development of an adequate response to the OVC issues facing their community.

ACTIVITY 5: Referrals and linkages

WV works in collaboration with the DOSD, the Departments of Health, Education, Agriculture, private companies, FBOs and CBOs. These partnerships will be expanded to ensure that all OVC are provided with a full package of care and referred for appropriate treatment and care services. In addition to establishing a program of 'community conversations', the project will integrate a gender component and advocacy into all activities. The aim of these activities is to build stronger, more gender-equitable relationships with better communication between partners utilizing participatory learning to improve the health, well-being and

Activity Narrative: resilience of adolescent OVC (Boys and Girls). Emphasis is place on options to delay sexual activity.

In FY 2008 the following activities will be added:

ACTIVITY 6: Community conversations

Facilitated community conversations will focus on raising awareness of social-economic and cultural inequalities that put women at a disadvantage and how this contributes to the spread of HIV and AIDS. Specifically, discussions will focus on how to strengthen the negotiating powers of women and girls in sexual relationships and on raising the awareness of men about the role they play in sexual relationships. This gender equality dialogue will emphasize the positive aspects of changing the behaviors that increase the risk of becoming HIV-infected and using best practices. WV will benefit from participatory research conducted demonstrating that these open and frank but sensitive "community conversations" help cement new positive attitudes among youth and reduce gender-biased stereotypes. The majority of care workers (Home visitors/HV) in OVC programs are women (over 70%). WV will work to increase the involvement of men in care-giving of OVC. As part of the CCC (Community Care Coalition) trainings, HV's will engage men by focusing on such topics as family violence, anger management, fathering and parenting skills. Training materials will include discussion of power relations between girls and boys, women and men, and will give girls skills in refusal and negotiation. CoH training will also emphasize addressing gender from a standpoint of context and attitudes. WV will focus on men and boys as agents of change in this process of awareness building, mobilizing and spreading HIV prevention messages.

ACTIVITY 7: Peer-support groups and Youth AIDS clubs

Peer support groups and Youth AIDS clubs will be targeted toward adolescents. WV will connect with these adolescent OVC through schools and churches. Training in Youth prevention strategies will target boys and girls. Using a participatory process, OVC will identify role models (including positive deviants) to serve as the peer support leaders. The adolescents will form peer-education groups and these groups will form the critical catalysts for the community social discourse on healthy norms and avoidance of risk behavior. The anticipated outcome of this process is a re-emergence of AB as a community norm and a reduction in the practice of cross-generational sex, transactional sex and multiple casual sex partnerships, etc.

In all WVSA ADP PEPFAR-funded sites there are sponsored children, funded by donors from different countries, many of whom are OVC. WV requires at least quarterly visits to each of these children by Development Workers. Through this process WVSA identifies the education, health, spiritual and other needs of the children and their families. WV field staff provides a proactive role in identifying the needs of OVC and the subsequent delivery of services, justifying the allocation of WV Matching funding to the budget allocated by PEPFAR.

counselors and professional nurses and provision of technical assistance and mentoring. The SA USG team conducted an internal paper-based partner evaluation with all partners this year. Partners submitted an early modified COP, which probed in areas that needed clarification in various aspects such as improved service delivery and gaps for each program area. The data from the partner evaluation provided a broad review of the PEPFAR CT partners, which is outlined below. The South African USG/CT team is actively responding to the need for improvements in areas such as TB screening for all CT partners and utilization of multiple CT models per partner and site.

Models

Partners utilize a wide variety of CT models across the country, and all are in line with NDOH guidance. An increasing number of partners are offering mobile, stand-alone, and traditional VCT services. In addition, there has been evidence of a steady increase of partners providing ROTC, known as provider-initiated testing and counselling. A considerable number of partners have started providing home-based CT, a new model in South Africa, but one that South African partners have embraced. In all nine provinces, there is at least one partner proposing to implement home-based CT. Home based CT is mainly proposed in rural areas where services are not easily accessible. Workplace CT is another important model that is being implemented by several partners in South Africa. Finally, couple HIV counseling and testing is being implemented on a large scale in the country. The biggest challenge in South Africa, however, is attracting clients to come as couples for CT. Partners have therefore proposed interesting and innovative ways of attracting couples, such as opening for longer hours and partnering with churches and other organizations where people go as couples. Partners aim to attract both married and cohabitating couples.

Geographic coverage

The 2008 COP indicated that there was a large gap in geographical distribution of services, particularly in the provinces of Free State, Northern Cape and the North West. This year, however, partners are distributed more evenly, and all the provinces have some coverage, with a variety of models. Each province has more than five partners providing CT services. Provinces such as KwaZulu-Natal and the Eastern Cape, which have a higher disease burden, have more partners working in the area. Models such as home-based and mobile CT are largely used to serve the rural populations.

Targets

The FY 2007 CT target was estimated by reviewing the antiretroviral treatment (ART) targets for each year over a five-year period in order to reach 500,000 persons on ART by September 2009. Over the past three years, approximately 19 people were tested for HIV per every one person placed on ART. The September 2008 and 2009 CT targets are estimated at 2,036,000 for each year.

About 80% of public health facilities offer VCT nationwide through 4,000 public VCT service points. Though this may seem adequate, recent data show that only 2% of persons who need to be tested undergo testing. This means that while testing services are accessible in most parts of the country, only a few people in the target population utilize the services. One of the target populations for CT services is men and partners have proposed methods of attracting men to test for HIV. The NSP sets new targets for CT to ensure that all persons at risk get tested, especially those at highest risk who present at clinics for family planning, sexually transmitted infections, antenatal, and TB services and those in high transmission areas. The NSP recommends provision of ROTC in health facilities. It sets a target of 75% of all public health facilities using this model by 2011. The ROTC model is used in addition to the standard VCT and other CT models.

Cost per target

The South African government provides test kits to public health facilities as well as to selected stand-alone and mobile CT facilities. Independent CT services, however, need to purchase their own supplies. This makes it difficult to calculate average cost per target, and in an attempt to remedy this, partners have been asked to provide an explanatory narrative in their COP entries to explain costs related to CT services. Given all the different circumstances, the average cost per target for South Africa in the 2009 COP is \$22.50 USD.

Training

All partners described their training activities in COP FY 2009. This year's PEPFAR guidance discouraged training on traditional VCT. Instead, partners were encouraged to identify gaps and provide more training on ROTC, couple counseling, and quality assurance. The South Africa USG team will review partner training activities in 2009 to ensure that multiple aspects of training and evaluation are taking place.

Challenges

As more people become willing to undergo HIV testing and counseling, the need for quality assurance increases. In addition to increased demand for CT services, the NDOH approved five test kits to be used on tender last year. This meant that each province was assigned different combinations of test kits, which may have led to a lack of standardized procedures and thus decreased quality of testing. The USG is currently working with the NDOH and the National Institute for Communicable Diseases to strengthen quality management systems and particularly, quality assurance and quality improvement.

The amended Children's Act that allows children aged 12 and upwards to consent to HIV testing, has also affected CT service providers. Many counselors are not comfortable discussing sexual issues with children and adolescents as they have not received any training on these target populations as yet. There is an urgent need for more training on counseling children and adolescents.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 4746.09

Prime Partner: University of Stellenbosch,
South Africa

Funding Source: GHCS (State)

Budget Code: HVCT

Activity ID: 13866.22711.09

Activity System ID: 22711

Mechanism: Desmond Tutu TB Centre

USG Agency: HHS/Centers for Disease
Control & Prevention

Program Area: Prevention: Counseling and
Testing

Program Budget Code: 14

Planned Funds: \$858,811

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In response to the slow start of activities set out in FY 2007, a budget redirect was requested and approved to enable the two community voluntary counseling and testing (VCT) centers planned for FY 2008 to be initiated with FY 2007 funds. Eight community VCT centers are now fully operational and these will continue in FY 2009.

All centers will be closely monitored to ensure that quality standards are maintained and that targets are achieved. Although the activities described will broadly remain unchanged, activities have been modified as detailed below.

Special attention will be paid to problems currently experienced at community VCT centers, including:

1. Improved tuberculosis (TB) screening of clients, especially during outreach VCT activities when sputum collection poses a challenge.
2. Improved systems to follow-up clients diagnosed HIV-infected or those diagnosed with TB both at clinics to which clients have been referred and in the community for clients who fail to access care.
3. Infection control plans will be implemented in all community VCT sites to protect both staff and clients in the facility.

The support provided to health facilities has been substantially increased for a wide range of activities, with a total of 24 facilities receiving support. An estimated 44,550 clients will receive counseling and testing and receive their results at these facilities. Facilities will be supported to make VCT services more accessible to clients attending the clinic with a targeted increase in the number of clients accessing services by 5% above the previous years figures and to increase acceptance rates by 1% (to 92%).

SUMMARY:

The Desmond Tutu TB Center has developed a project in the Western Cape (WC) focused on improving the integration of TB and HIV services by increasing access to counseling and testing (CT) services, intensifying case finding for TB among those who are HIV-infected and expanding access to HIV-care for those diagnosed positive. The major emphasis area is human capacity development through training of staff and managers, developing the capacity of local organizations to implement and manage community CT sites; development of networks, linkages and appropriate referral systems and increasing gender equity through improving male access to CT. The target populations include policy makers, program managers and the general population with a specific focus on couples, men and youth. The project addresses the dual challenges of reducing HIV transmission in communities and minimizing the impact of HIV on individuals and of reducing the TB burden by increasing TB case-finding and ensuring appropriate TB care.

BACKGROUND:

The extremely high TB rates in the WC and the increasing prevalence of HIV have led to the health system being placed under extreme pressure resulting in a failure to cope with the dual epidemics. Therefore, it is necessary to develop effective and feasible strategies that can be adopted by health services and supporting community organizations to increase access to services and improve the quality of care for people with HIV and TB. This project is closely aligned with existing health services and aims to complement, enhance and support these services. It will be nested in six Western Cape communities that form part of the Zamstar project. The Zamstar project is part of the CREATE consortium and is funded by the Bill and Melinda Gates Foundation through a grant to the Johns Hopkins University. Zamstar works to reduce the prevalence of TB by improving integration of HIV and TB services, and through these efforts, have established community advisory boards and stakeholder support. The PEPFAR funded project will benefit the Zamstar project by establishing Community Flexi Hour CT Centers, and improving access to and utilization of CT services through social mobilization and existing household and community activities. It will implement routine screening for TB at CT at the Community Flexi Hour CT Centers and improved access to TB and HIV care through strong referral networks. The project scope has been revised from that submitted in COP FY 2007 to address evolving community and health service needs. All Desmond Tutu TB Centre's projects are implemented in close collaboration with the Western Cape Department of Health, Cape Town City Health Department and non-governmental organizations (NGOs).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Establish Six Community Flexi-Hour CT Centers

Approximately 8% of the adult population of the WC access CT through existing healthcare services annually. The majority of people accessing CT are women who are exposed to CT through prevention of mother-to-child transmission (PMTCT) programs, and clients who are tested in health centers for medical reasons. Only about 30% of people undergo CT through self-referral. Community Flexi-hour CT Centers aim to expand the reach of CT to settings outside health facilities, making CT more accessible to those who do not access routine health facility-based CT services. The target groups include youth, couples, working people and males and this activity will therefore address the gender inequality in access to CT.

The Community Flexi-hour CT Centers focus on outreach activities in the community (sports clubs, youth clubs, church organizations, local small businesses) and individual households. The Centers aim to raise awareness about HIV and to promote CT. Six Community Flexi-hour CT Centers will be established through contracts with existing NGOs already

Activity Narrative: employing CT counselors deployed to health facilities. NGOs should have the capacity to manage the service and to sustain the initiative in the long term. Project staff will be employed to run the CT centers in partnership with the NGO. Each center will be staffed by (a) a professional nurse who will manage the center, oversee HIV testing and test if required; (b) an enrolled nurse who will do HIV and TB testing; and (c) three to four CT counselors who will provide pre- and post-test counseling, symptomatic screening for TB and be responsible for health promotion in the community and at the center. Staff will be responsible for mobilizing the community to utilize the service, for provision of the service at the site and on an outreach basis and for routine data collation.

A database will be established at each site to collect and collate routine client information, including demographics, referral source to the center (from community drama events, school initiatives, household interventions etc), HIV test results, TB screening and referral to clinics. The Monitoring and Evaluation (M&E) manager will undertake data validation, quality control, data collation across sites and evaluation of data. A mentor will provide support to staff at these sites through case discussions, debriefing, stress management and team building. The mentor will visit sites every two weeks.

Symptomatic screening for TB will be undertaken during CT at the Community Flexi-hour CT Centers. Counselors will be trained to implement a simple screening tool that is used in health facilities in the Western Cape. Symptomatic clients will have sputa collected and the nurses at centers will use standard national diagnostic algorithms to diagnose TB. Those diagnosed positive will be referred to local clinics to commence TB treatment. Feedback loops from clinics will be used to minimize primary TB treatment default rates. Project staff will monitor the referral process to ensure timely visits and back-referral. Approximately 15% of clients with newly detected HIV infection will have active TB disease. Community Flexi-hour CT Centers will be regarded as a ward of the established health facility. Although Community Flexi-hour CT Centers will not be situated on the grounds of a health facility, they will be linked to formal structures, ensuring appropriate patient referrals to treatment, care and support, and ultimately, helping to ensure sustainability. Close links will be maintained between the Community Flexi-hour CT Centers and the Sub-District Management Team to ensure good communication and feedback and to address referral issues.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 257.09	Mechanism: N/A
Prime Partner: Medical Research Council of South Africa	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 3141.22924.09	Planned Funds: \$1,695,200
Activity System ID: 22924	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Drugs and HIV

The Medical Research Council (MRC) will continue to work with the existing non-governmental organizations (NGOs) to ensure voluntary counseling and testing (VCT) services are implemented for high risk groups. Challenges identified in the midterm evaluation report will be addressed in FY 2009 to ensure improved implementation. NGOs will continue to implement activities in accordance with FY 2008 funds. In November 2008, MRC will conduct a stakeholders consultation to review methods used to achieve project targets in FY 2007. Where modifications can be made to practices in FY 2008, they will be implemented. For those that cannot be implemented in FY 2008, modifications will be considered in the methodology to be applied in FY 2009. In addition FY 2009 funds will be used to expand services geographically to other parts of the Western Cape, Gauteng, KwaZulu-Natal and Mpumalanga by moving into other areas not covered in FY20 07 and FY 2008. In addition services will be expanded to Limpopo province.

SUMMARY:

The Medical Research Council's (MRC) findings from the International Rapid Assessment Response and Evaluation (I-RARE) of drug use and HIV risk behaviors among vulnerable drug using populations, including injection drug users (IDUs), sex workers and men who have sex with men (MSM), in Cape Town, Durban, and Pretoria point to: (1) high prevalence of overlapping drug and sexual risk behaviors; (2) high prevalence of HIV in these populations; and (3) barriers to access and utilization of risk reduction, substance abuse and HIV services. Activities of this project build upon FY 2005 and 2006 PEPFAR investments to strengthen programs serving IDUs, sex workers, and MSM by developing the capacity of organizations in Cape Town, Durban, and Pretoria to deliver services that enable these populations to reduce their risk of HIV infection. Activities will focus on creating multi-sectoral and multi-disciplinary consortia of substance abuse and HIV organizations and developing organizational capacity to implement targeted community-based outreach interventions, and linking outreach efforts to risk reduction counseling related to drugs and HIV, and access and referral to substance abuse, HIV care, treatment, and support services. The major emphasis area for these activities is the development of networks, linkages, and referral systems between outreach workers, NGO/CBOs, and healthcare service providers. Minor emphasis areas include community mobilization/participation; information, education, and communication; linkages with other sectors and initiatives; local organization capacity development; policy and guidance; quality assurance, quality improvement, and supportive supervision; strategic information; and training. Primary target populations are high-risk vulnerable populations, (including IDUs, sex workers, and MSM), and organizations that provide service to these populations. This project is consistent with the revised South African National Drug Master Plan and will provide guidance on how the South African Government can translate strategies into action. Across all activities, sustainability is addressed by linking HIV counseling and testing, care and support services for vulnerable populations, developing the capacity of existing programs, creating synergy across organization and service provider networks, providing quality assurance and refresher trainings, and enhancing data management systems. Legislative interests include: (1) gender, by increasing gender equity in HIV and AIDS program; reducing violence, increasing women's access to income and productive resources; and (2) reducing stigma and discrimination associated with HIV status and vulnerable populations.

BACKGROUND:

In FY 2005, PEPFAR supported the MRC to conduct a rapid assessment of drug use and HIV risk among IDUs, sex workers, and MSM in Cape Town, Durban, and Pretoria. In FY 2006, PEPFAR supported the convening of public and private partners, stakeholders, and organizations serving the target populations to develop recommendations, based on the findings of the rapid assessment. In FY 2007, the MRC, in collaboration with a consortium of organizations and provincial governments, is well positioned to implement interventions to reduce high-risk drug use and sexual behaviors and increase access to and utilization of services.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Linking Community-based Outreach to HIV Services among Injecting and Non-Injecting Drug Users, Drug Using MSM, and Drug Using Women Engaged in Sex Work Three separate activities focusing on the target groups (IDUs, CSWs, and MSM) are consolidated into one activity description as they share similar components. A major finding of the rapid assessment indicates a lack of linkages and coordination of drug abuse treatment and HIV services. The focus of this activity is developing the capacity of NGO/CBOs and other HIV and drug service organizations serving IDUs, sex workers, and MSM to implement interventions targeting high-risk drug use and sexual behaviors and to increase their access to and utilization of services. Specifically, this activity will support the formalization of consortia linking drug abuse treatment and HIV service delivery organizations in Cape Town, Durban, and Pretoria/Johannesburg. This activity will develop the capacity and skills among the consortia for the provision of comprehensive HIV and AIDS programs tailored for drug users and adapted to the local epidemic. Components will include community-based outreach, risk reduction counseling, and access and referral to HIV counseling and testing, substance abuse, and other HIV care and treatment services. Individuals reached by outreach efforts will be linked with tailored HIV counseling, testing, treatment, and other support services. Service providers will be cross-trained to respond to issues of violence, drug abuse and HIV, including issues of sensitivity, confidentiality and stigma related to vulnerable populations. To facilitate integration among drug and HIV services, a system for referrals from counseling and testing to other services will be established in the consortia to ensure HIV-infected and HIV-negative clients are linked to appropriate prevention, care, and treatment services (e.g., antiretroviral treatment, PMTCT, palliative care, STI and tuberculosis treatment, substance

Activity Narrative: abuse treatment, and transitional services including job skills and income generation activities).

ACTIVITY 2:

Managing, Monitoring and Rapidly Evaluating Links and Coordination of Drug Treatment and HIV Services for Drug Using Populations In preparation for activities in FY 2007, the MRC will conduct formative key informant and focus group interviews to ensure interventions are aligned with the current local epidemic and adapt existing training manuals for community-based outreach. This activity will support the MRC in the management, oversight, monitoring, and evaluation of the three activities summarized under Activity 1. The MRC will regularly monitor all aspects of the activities, including ensuring that sub-partners coordinate provision of trainings by local AIDS Training Centres. The MRC will establish a system for collecting data on targets on an on-going basis. The MRC will rapidly evaluate Activity 1 to determine the relative effectiveness of the interventions to reduce high-risk drug use and sexual behaviors and increase access and utilization of services among the three target populations. Future plans for this project will build upon FY 2005 and 2006 PEPFAR investments and lessons learned from the implementation of the interventions in FY 2007. In FY 2008, the MRC will continue to refine the interventions and rapidly scale them up to reach other provinces and underserved populations. Results contribute to PEPFAR 2-7-10 goals by preventing infections and increasing uptake of voluntary counseling and testing (VCT) among vulnerable drug using populations to know their status and be appropriately referred to treatment services. Also, results are aligned with South Africa goals to scale-up programs that serve IDUs, MSM, and sex workers; integrate VCT into other healthcare delivery and by decreasing stigma and discrimination; and increase VCT services links with referrals to health systems networks.

Planned Funds: \$2,046,401

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY: Right to Care (RTC) is one of the most successful counseling and testing (CT) partners of the South African PEPFAR program, using leveraged funds to provide access to the Proudly Tested program. In FY 2009, PEPFAR funds will emphasize provider initiated HIV testing at all antiretroviral treatment (ART) sites, and, through direct community-based access to CT in all nine provinces of South Africa.

BACKGROUND: RTCs CT services are a continuation of ongoing activities. The point of care testing is conducted using an opt-in policy of the Department of Health (DOH) and is provided with streamlined post-test counseling for risk reduction. Couples CT and improving the testing of males and home-based HIV testing have been successfully implemented by RTC. Sexually transmitted infection (STI) assessments and tuberculosis (TB) symptom screenings are included in CT activities. The CT activities of RTC now exceed 100,000 clients annually from predominantly vulnerable populations.

RTC implements workplace programs and collaborates with employers to extend the HIV testing funded by the employer to the temporary or contractors workers and/or community. This workplace program is currently contracted to 130,000 employees of 38 companies. After three years of the program, >80% of employees volunteer to go for CT. All RTC CT initiatives are coordinated through the Proudly Tested campaign. This campaign, a registered trademark under RTC, is intended to create a brand that promotes regular CT for individuals and groups in all social levels. RTC has implemented a unique mobile data system, encompassing biometric consent, to enable both the collection of data and improved transition to care through reporting and referral. The data systems have been developed on an open-source code platform and can be made available to other CT partners.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Scaling of access to CT through provider initiated CT

FY 2009 funds will support the continuation of assistance to government sites, non-governmental and faith-based organization (NGO), and faith-based organization (FBO) clinics, as well as to private practitioners to ensure the widespread availability of CT services. PEPFAR funds will largely be used for human capacity development including: (a) salaries for consultants and part-time healthcare workers at all CT providers, (b) sub-grants for NGO and FBO clinics and organizations that are partially earmarked for nurses and lay counselors, (c) direct salary support for lay counselors and nurses at government sites, (d) providing direct CT support to all TB sites supported by RTC to ensure that all TB patients are tested for HIV, and (e) scaling up the PMTCT testing of pregnant women, their partners through the use of rapid testing methods for point of care diagnosis of HIV, and infant PCR diagnosis for children born of HIV-infected mothers. PEPFAR funds will also be utilized to address minor infrastructure needs such as for the delivery of CT services at NGO, FBO and government sites.

ACTIVITY 2: Support for CT Providers

RTC will support all its CT providers by disseminating guidelines on CT, by providing quality assurance through sharing best practices and supportive supervision, and by offering guidance on monitoring and reporting of results. RTC and several of its sub-partners will also provide ongoing training in CT services for lay counselors and nurses (either employed by RTC or its partners, or external health workers) to ensure strict adherence to CT protocols and high quality counseling. RTC will also support healthcare providers in public health facilities to implement provider-initiated counseling and testing (PICT) as recommended in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011.

ACTIVITY 3: Community-based CT

The strategic mix of clinic-based and community-based CT will see further expansion of activities which will bring CT services to the doorstep of impoverished populations and high-risk, male dominated groups such as truck drivers, farm workers, small and medium enterprise (SME) employees, Direct AIDS Intervention (DAI) contract/temporary workers, tertiary students, rural communities and residents of informal settlements. Mobile and rural clinics, home-based CT in partnership with the Home Loan Guarantee Company, and clinic-linked units will be established in vulnerable communities.

ACTIVITY 4: Prevention and Behavior Change

In FY 2009, RTC will support a partnership with Cell-life to develop a cell phone program focused on the provision of prevention education messaging using mobile technologies. This program will be a public private partnership with the Vodacom Foundation (committed to providing 1:1 funding to Cell-life) for the expansion of the use of mobile platforms for HIV prevention and transition to care. Content for messaging has already been developed. This same platform will be used to manage all appointments scheduling for patients who are found to be HIV-infected at the time of CT, and through TxtAlert provide patient reminders for medical appointments.

ACTIVITY 5: Strengthening Expansion of Referral Networks and Increasing Initiation to Treatment

Linkages with community mobilization and outreach activities will be continued to promote the uptake of CT services and to normalize CT-seeking behavior using community lay counselors and educators. These linkages and capacity building with indigenous organizations will affect long-term sustainability. Prior to all CT activities, referral linkages will be established for direct referral at the time of CT.

ACTIVITY 6: Large Scale Mass Media CT Promotion

In collaboration with other CT providers, RTC is participating in the annual national HIV testing week promoted through Khomanani and will include enhanced testing at mobile and facility-based sites and other

Activity Narrative: non-traditional testing sites. The entire network of RTC nurses will be available at treatment sites.

INTEGRATED ACTIVITY FLAG:

SUMMARY: Right to Care's PEPFAR program will be recompeted through an Annual Program Statement (APS) in 2008. Right to Care (RTC) will use FY 2008 PEPFAR funds to identify HIV-infected individuals by supporting selected antiretroviral treatment (ART) sites and through direct community-based access to counseling and testing (CT) in seven provinces, namely KwaZulu-Natal, Free State, Eastern Cape, Limpopo, Mpumalanga, Western Cape and Northern Cape. CT is used as a prevention mechanism to promote abstinence, be faithful and condoms, as well as an entry-point into care, support and ART. It is also an essential tool for fighting stigma and discrimination. The major area of emphasis is human resources. Minor areas of emphasis include community mobilization/participation, training and workplace program. Specific target populations include university students, adults, pregnant women, HIV-infected infants, truckers, and public and private sector healthcare providers.

BACKGROUND: RTC's CT services are a continuation of ongoing activities. CT was originally part of RTC's holistic education, testing, care and treatment program for the employed sector, known as the Direct AIDS Intervention (DAI) program. RTC's CT activities have since expanded their reach through a range of partnerships with government sites, private sector providers and non-governmental and faith-based clinics and organizations, and are now reaching substantial numbers of clients from predominantly vulnerable populations, through clinic-based and mobile CT services.

RTC is currently implementing a program of CT for vulnerable populations. Testing is conducted by nurse networks, General Practitioner (GP) networks, mobile CT clinics or by sub-partner non-governmental organizations (NGOs). RTC implements workplace programs and often collaborates with a private sector partner, Alexander Forbes' Comprehensive Health and Wellness Solutions.

Uptake of on-site CT is reaching high proportions. Almost 90% of employees volunteer to go for CT. RTC supports the Access CT activities of treatment partners, including the Thusong network of private practitioners, several government sites, and non-governmental and faith-based organization sites. CT training is conducted by RTC's Training Unit as well as by several of RTC's sub-partners.

All RTC CT initiatives are coordinated through the Proudly Tested campaign. This campaign, a registered trade mark under RTC, is intended to create a brand that promotes regular CT for individuals and groups in all social levels. High-profile leaders within communities will promote this brand and strategy to create increased social acceptance of CT. The Proudly Tested activities will also include commercial CT, which will receive technical support through PEPFAR funds.

ACTIVITIES AND EXPECTED RESULTS:

RTC used FY 2008 funds to consolidate and expand its existing activities; building on past successes. RTC tested more than 52,000 clients, and trained 180 healthcare workers and lay counselors in the first three quarters of FY 2007.

ACTIVITY 1: Assistance to South African Government Sites

FY 2008 funds will support the continuation of assistance to government sites, NGO, and FBO clinics as well as to private practitioners to ensure the widespread availability of CT services. PEPFAR funds will largely be used for human capacity development including (a) salaries for consultants and part-time healthcare workers at all CT providers; (b) sub-grants for NGO and FBO clinics and organizations that are partially earmarked for nurses and lay counselors; (c) direct salary support for lay counselors and nurses at government sites; and (d) support for a fee-for-service arrangement with private contractors such as the private and Access CT programs and a network of private practitioners for the Thusong program. PEPFAR funds will also be utilized to address minor infrastructure needs such as for the delivery of CT services at NGO, FBO and government sites, for the maintenance of RTC's mobile clinics, and for the procurement and distribution of HIV test kits for NGO and FBO clinics.

ACTIVITY 2: Support for CT Providers

RTC will support all its CT providers by disseminating guidelines on CT, by providing quality assurance through sharing best practices and supportive supervision, and by offering guidance on monitoring and reporting of results. RTC and several of its sub-partners will also provide ongoing training in CT services for lay counselors and nurses (either employed by RTC or its partners, or external health workers) to ensure strict adherence to CT protocols and high quality counseling. RTC will also support healthcare providers in public health facilities to implement provider-initiated testing and counseling (PITC) as recommended in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011. Providers will be trained on PITC as well as on conducting HIV rapid tests. This activity will include internal and external quality assurance around rapid testing.

ACTIVITY 3: Prevention and Behavior Change

The success of CT as a prevention activity should include promoting prevention and behavior change including "abstinence, be faithful and condom use", reducing stigma, encouraging disclosure and couple counseling. HIV-infected individuals are referred from CT to care services. RTC's counselors are trained to provide counseling services in all prevention areas. In FY 2007 RTC will maintain models of increasing transition to care including the use of CD4 count testing at the time of CT to encourage early patient staging for referral. Access to a 24-hour call center for post-test counseling has also proven to be beneficial.

Activity Narrative: ACTIVITY 4: Strengthening Expansion of Referral Networks and Increasing Initiation to Treatment

The strengthening and expansion of referral networks and linkages with care and treatment services for clients identified as HIV-infected remains one of the central focus areas of RTC's CT activities. Linkages with community mobilization and outreach activities will be continued to promote the uptake of CT services and to normalize CT-seeking behavior using community lay counselors and educators. These linkages and capacity building with indigenous organizations will affect long-term sustainability. Prior to all CT activities, referral linkages will be established for direct referral at the time of CT. A CT module through Therapy Edge, an electronic patient database system, is being developed to track all positive CT clients, for call center counselors to follow-up and direct referral and regular CD4 test.

ACTIVITY 5: Community-based CT

The strategic mix of clinic-based and community-based CT will see further expansion of activities which will bring CT services to the doorstep of impoverished populations and high-risk, male dominated groups such as truck drivers, farm workers, small and medium enterprise (SME) employees, DAI contract/temporary workers, tertiary students, rural communities and residents of informal settlements. Mobile and rural clinics, home-based CT in partnership with the Home Loan Guarantee Company, and clinic-linked units will be established in vulnerable communities. Through a public-private partnership, RTC will increase CT uptake in a cost-sharing model with commercial companies. PEPFAR funds will be used for technical support, training and CT kits, while the commercial partner will cover the substantial direct cost of nurses, facilities and other direct activities. This cost-sharing model will enable CT of contract workers, employees and unemployed persons.

Emphasis will be placed on consolidating and expanding CT services for couples, infants and children, and cross-testing (testing STI and TB patients for HIV and vice versa, and testing of pregnant women).

FY 2008 funds for counseling and testing will be used by Right to Care to expand services in government sites, NGO and FBO clinics as well as to private practitioners to ensure the widespread availability of CT services. The organization will assist the National Department of Health and the provincial Departments of Health in Gauteng, Northern Cape, and Mpumalanga with activities for National Testing Week. The South African National Testing Week will include enhanced testing at mobile and facility-based sites and other non-traditional testing sites. Right to Care will also focus on improving provider-initiated testing and counseling.

Activity System ID: 22808

Mechanism: N/A

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Prevention: Counseling and Testing

Program Budget Code: 14

Planned Funds: \$72,818

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Ubuntu Education Fund will hire a nurse and utilize a recently purchased a mobile testing van. With these resources, Ubuntu will scale up community members reached with voluntary counseling and testing (VCT) as the offices are in the middle of the township and testing hours will be scheduled to offer various testing opportunities to the community.

To reduce potential stigma Ubuntu will strategically place the mobile VCT van behind its offices to create a private space and enhance confidentiality.

Ubuntu will further link its counseling and testing services to antiretroviral treatment (ART) provided at Kwazakhele Day Hospital (KDH). With PEPFAR support, Ubuntu will be fully supporting ART provision at KDH. This linkage will allow for a more efficient flow of clients that test positive to be entered into the system for ART provision. When Ubuntu opens the Ubuntu Center in 2010, the two facilities will refer patients and become a strong part of the Port Elizabeth health system.

Previously, Ubuntu has hired nurses from within community institutions to assist with VCT drives. By hiring a full time VCT specialist, management and organization will be improved. Further improvements will be made by training additional members of our staff on family and child counseling. Our care workers already have this training; however, the demand is so great that additional training is necessary. This will create a more effective referral system to our orphan and vulnerable children (OVC) program. The staff that is on site at VCT drives will be able to better identify OVC issues before referring into Ubuntu's OVC program.

Clients accessing counseling and testing services will be referred to on-site care services if they test seropositive. As mentioned above, by providing on site VCT, Ubuntu will improve its ability to provide a holistic service to community members.

SUMMARY:

Ubuntu Education Fund (Ubuntu) will expand and improve comprehensive counseling and testing (CT) linked to prevention, care and treatment services at two clinic sites and a freestanding site, which will be a part of Ubuntu's multi-purpose community center in Port Elizabeth, Eastern Cape. Emphasis areas include increasing gender equity in HIV and AIDS programs. Target populations include children under 5, children 5 -9, adolescents 10-14, adolescents 15-24, adults 25 and over, persons who engage in transactional sex, but who do not identify as persons in sex work, street youth, discordant couples, people living with HIV, pregnant women, and orphans and vulnerable children (OVC).

In order to target high-risk groups that are statistically less likely to visit clinicmobile CT will be done in every quarter. Target populations include out-of-school youth and men, For the past six years, Ubuntu has provided targeted HIV prevention community outreach activities in the townships of Port Elizabeth. Ubuntu has a comparative advantage in the community with its great capacity to gather large groups of community members and then provide testing in the community

BACKGROUND:

In 2005, Ubuntu began providing comprehensive CT and access to care and treatment services at KwaZakhele Day Hospital, a large outpatient public healthcare center located in the middle of an informal settlement. Counseling and testing (CT) services are linked to community outreach in and around the clinic, and focus on CT uptake and treatment availability. CT counselors are trained to provide family and couple counseling, and risk reduction counseling to clients who test HIV-infected. Counselors assist with partner referrals to reduce onward HIV transmission and ensure access to prevention of mother-to-child transmission (PMTCT) services. Clients who test negative, but who display high-risk behavior, also receive risk reduction counseling. CT counselors ensure that clients testing seropositive receive CD4 testing and obtain their results. Counselors enroll HIV-infected clients into Ubuntu's comprehensive family case management program providing care and support services. The district and provincial health departments support Ubuntu's strategy to work with and capacitate public clinics and hospitals to support CT uptake. CT counselors received a 10-day training from Hope Worldwide that meets national and international standards.

Ubuntu became a PEPFAR partner in FY 2007 and has only recently received funds so does not yet have PEPFAR-funded results to report.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Expansion of CT

This activity builds on existing services at KwaZakhele Day Hospital and serves as an entry point to comprehensive HIV and AIDS care services at public clinics. In FY 2008 Ubuntu will expand CT services to Zwide Clinic. There will be three CT staff at each of the two sites; staff will consist of a professional nurse skilled in HIV management and two CT counselors on site. Mobile CT will be done every quarter targeting youth during school holidays. All sites feed into Dora Nginza Hospital. The CT teams will be deployed full-time at the sites and their mandate will include in-service training, quality assurance and provision of technical support to ensure that patients receiving antenatal or family planning services, or presenting with AIDS-related opportunistic infections, are offered CT and integrated HIV management, particularly in antenatal and tuberculosis (TB) services. The professional nurse will provide technical support to nursing staff and clinic lay counselors.

Activity Narrative: In order to target high-risk groups which are statistically less likely to visit clinics, such as out of school youth and men, mobile CT will be done every quarter. For the past six years, Ubuntu has provided targeted HIV prevention community outreach activities in the townships of Port Elizabeth. Ubuntu has a comparative advantage in the community with its great capacity to gather large groups of community members and then provide testing in the community.

ACTIVITY 2: Expansion of Couple and Family Counseling

The Zwide Clinic team will build on their success in providing couple and family counseling, and in FY 2008 the team will focus on increasing male uptake of CT. Ubuntu reaches couples in two ways: (1) by conducting outreach to encourage couples to access CT; and (2) by requesting people testing seropositive to refer and accompany their partner(s) for CT. Ubuntu provides couple counseling sessions based on safer sex, family planning and supporting a partner living with HIV to discordant couples. Parents testing seropositive are asked to bring their children for CT, and OVC and children with parents who are enrolled in our HIV care services are routinely offered counseling and testing. Children are counseled and tested with their guardian's consent and in their presence. The CT program is fully integrated with treatment services at the clinic sites; CT counselors also provide treatment readiness and adherence counseling. These sites also manage pediatric HIV patients after they are referred back from the Paediatric ARV Unit at Dora Nginza Hospital. Children living with HIV are highly underserved in target areas and Ubuntu is pursuing every opportunity to identify them.

ACTIVITY 3: Counseling and Testing for Pregnant Women and Infants

Services also focus on uptake of PMTCT services by pregnant women. Pregnant women and infants must to be identified earlier for more timely enrolment into treatment. Women and infants enrolled in PMTCT programs are monitored to ensure compliance with PMTCT program that has been adapted by the National Department of Health. All babies born by HIV-infected mothers will get a routine polymerase chain reaction (PCR) test starting from six weeks after birth. CT staff develop risk reduction plans with the client as part of ongoing counseling, and this also serves to reduce onward HIV transmission and prevent HIV infection in individuals identified with as practicing higher risk behavior. Clients with symptomatic sexually transmitted infections (STIs) are referred to on-site treatment. Male and female condoms are available to all clients accessing CT. All clients testing seropositive are referred for CD4 testing, and referred for enrolment in treatment readiness if indicated. They are enrolled in Ubuntu's on-site care services including a support group, food garden and family case management services. Clinic sites maintain a daily registry of all clients accessing pre- and post-test counseling disaggregated by gender, age, and test results. Results are collated monthly and submitted in standardized reports to the National Department of Health (NDOH).

ACTIVITY 4: Free-standing CT Site

In 2009 Ubuntu will open a free-standing CT center at the organization's offices in Zwide. Non-medical sites provide access to higher risk populations, particularly youth and men. The provincial and district health departments strongly support Ubuntu's initiation of non-clinic based CT provision. There is significant unmet demand for CT services especially in a non-specialized site that reduces stigma by providing other services and that ensures confidentiality and a youth-friendly approach. The CT center will be part of a community center providing an array of other programs including a health resource library, career center and computer laboratory. The CT center will be staffed by three full-time counselors and a professional nurse. The center will be open five days a week on a walk-in basis. The SAG has agreed to provide rapid test kits.

ACTIVITY 5: Referrals to On-site Care Services

Clients accessing CT services will be referred to on-site care services if they test seropositive. Ubuntu's care program is integrated with clinical services in HIV management including CD4 testing, ART readiness and adherence, ongoing psychosocial support and counseling, risk reduction and couple counseling, referrals to PMTCT, access to income grants, home-based care, nutritional support, support groups and referrals to other service providers. Ubuntu has developed strong referral partnerships to help establish a continuum of care for PLHIV and their families, and to coordinate access to service providers including clinics and hospitals, the Department of Social Development, the Department of Home Affairs, Childline, the Rape Crisis Centre at Dora Nginza Hospital, the National Institute for Crime Prevention and the Reintegration of Offenders (NICRO), Family and Marriage Society of South Africa (FAMSA), community-based organizations, non-governmental organizations, community home-based care providers and hospice services.

Ubuntu's services will contribute to the PEPFAR 2-7-10 goals by improving access to and quality of CT services for highly vulnerable populations to identify HIV-infected persons, reduce onward transmission of HIV between serodiscordant partners and from mother-to-child, and improve health and timely entry to ART through early diagnosis of HIV infection.

Activity ID: 19515.22821.09	Planned Funds: \$161,044
Activity System ID: 22821	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

This is a follow-on activity to year one of the Workplace Intervention Program.

BACKGROUND:

The Tshepang Trust (Tshepang), a non-profit organisation, is the South African Medical Association (SAMA)'s HIV/AIDS program. Its mission is to utilize private general practitioners (GPs) to increase HIV testing and treatment access to individuals dependent on the public health care system in a public private partnership model with the SA government. It focuses on providing doctor human resource by mobilizing HIV clinical management trained GPs using two models of care, a sessional model where GPs are placed on a sessional basis in public antiretroviral treatment (ART) clinics and a private GP model where (ideally) the same GPs are utilized to test and treat patients in their rooms in order to alleviate the burden of care and treatment associated with shortage of infra structure e.g. consulting rooms, long cues and stigma currently experienced in public healthcare facilities.

The GP model was formulated out of a need by individuals to access treatment services in areas of close proximity to their places of abode for several important reasons:

Patients can access their treatment and medical care outside of working hours without having to miss work because they have had to stand in cues for long periods of time in a crowded healthcare setting. Patients do not have to worry about stigma, e.g. being seen by people they know queuing at an HIV clinic.

The GP model is simply a means to complement government services because it addresses two fundamental challenges that currently face the Department of Health, infrastructure and medical human resources which are currently lacking in public health facilities. Both the sessional and GP models are an effective short and immediate way for South Africa to reach its HIV & AIDS and STI National Strategic Plan, 2007-2011 targets. This is because 70% of the medical resources including HIV Clinical Management skills are in the private sector in the form of GPs versus 80% of South Africa's population that is dependent on the poorly resourced public health care system.

Long term sustainability depends on all HIV/AIDS patients being cared for by the state and when the public health care system is stronger and stable enough with systems in place to take on the challenges of care and treatment, Tshepang will in cooperation with government find ways of returning the patients currently seen at GPs rooms back to state facilities. Looking at the already mentioned challenges, this can realistically take place in another three to four years. To take patients back to state facilities now would create more of a burden for the public health system rather than assist in ensuring that the country reaches its NPS treatment goals of ensuring that 80% of all individuals needing ART receive it by 2011.

All Tshepang contracted GPs are skilled professionals who have been trained in HIV clinical management that acknowledges SA government standards and procedures for HIV care and management. Further more Tshepang protocols on HIV disease management are based on the SA national guidelines and the Tshepang model ideally (although not always possible) has been to utilise GPs who would also assist at local public sites in order to ensure that they understand clinic procedures and work according to national guidelines.

Tshepang started off as a sub-grantee of American Center for International Labor Solidarity (Solidarity Center) commissioned as a treatment partner in the Prevention Care and Treatment Access to South African Teachers (PCTA) program. The partners within the PCTA consisted of four South African teacher unions, the United States-based Academy for Educational Development (AED), the Federation of American Teachers (AFT) and the Solidarity Center being the prime recipient of funding from PEPFAR for all these partners. Within this partnership teacher unions would refer their colleagues for HIV/AIDS treatment to Tshepang and later as the program evolved also referred them for testing. The funding cycle for the Solidarity Center grant came to and end in March 2007 but the Center gave Tshepang a no cost extension to continue with testing and treatment services until December 2007.

In the meantime a request for proposals was issued by PEPFAR via the Centers for Disease Control and Prevention (CDC) for a five-year cooperative agreement for a workplace intervention program (WIP) to run from FY 2007 until FY 2012 and Tshepang applied. The organization was awarded the grant and can now receive direct funding from PEPFAR through CDC to provide counseling, care and ART treatment to individuals in the workplace in order to continue with the treatment of teachers from the PCTA program but also extend the program to include healthcare workers and workers from the Small Medium Micro Enterprises (SMMEs), their spouses and immediate family dependents. WIP is based on the GP model.

The funding cycle for WIP started in October 2007 but because Tshepang had been given a no cost extension, as mentioned earlier, the organization only started using its grant funds with effect from January 2008.

In the past when Tshepang conducted counseling and testing services for teachers through the PCTA program under the Solidarity Center, Enzyme-Linked Immunosorbent Assay (ELISA) tests were used because people receiving results in an environment where their colleagues are would have been counterproductive. However this model did not work because even though the people that had gone forward for testing had given their contact details for follow-up and referral where they could receive their results in GP rooms and then get enrolled into HIV care, most of them never got their results. There were various factors why this was the case: cell phone numbers were wrong or not working, those that were reached and asked to go and get their results refused and did not want to be contacted again or said they would go but never went etc.

SUMMARY:

Activity Narrative: Tshepang recognises the need for a holistic approach to HIV management and the need to work in collaboration with other partners to ensure the delivery of a comprehensive healthcare package to HIV-infected individuals. To this effect the Tshepang has had a long standing relationship with the Treatment Action Campaign (TAC) utilising its counselors at grassroots level to bring the required psychosocial care and adherence support in some areas of operation within the program. In other areas the Trust has trained nurses for voluntary counseling testing (VCT) and adherence counseling with the purpose of aligning them with the GPs to further take care of the psychosocial needs of patients and their loved ones within the program. It has been Tshepang's experience that some patients, (particularly the relatively elite ones) like teachers and nurses might not want to be assigned counselors due to fear of stigma, however these services will continue to be made available to them as well as the telephone line counseling offered by Tshepang patient managers on a monthly basis.

Tshepang acknowledges that the program has been heavily treatment focused up to now, but it is progressing to be more comprehensive. With effect from October 1, 2008, all HIV infected patients enrolled for HIV palliative care but not eligible for ART will be seen by GPs more regularly. This will involve patient monthly visits for cotrimoxazole prophylaxis to restore and maintain the individuals' immune system and delay the need for ART, TB screening and TB prophylaxis, cervical cancer screening and general patient clinical assessment. Tshepang's approach has also evolved to include prevention and in depth adherence counseling for patients on treatment. Currently Tshepang is doing VCT for early detection and positive prevention, encouraging routine family counseling including couples and children, prevention education that incorporates abstinence, being faithful and condom use (ABC) messages i.e. abstinence including delaying sexual debut, being faithful, female empowerment, male reaffirmation and condomising (as a last resort) through the "stick to one partner" campaign to be launched at the beginning of 2009.

Tshepang has done well in providing CT services even in the light of a late start and the initial start up challenges, because GPs rose to the occasion and encouraged routine testing in their rooms. The partnership with Eskom, South Africa's energy supplier, has also done very well now that it is building up power stations to increase the nations' electricity capacity and there are a lot of sub-contractors that are receiving counseling and testing services through Tshepang.

The need for CT services is huge and Tshepang realizes that CT cannot only be limited to GPs rooms and a couple of workplace events here and there, particularly because South Africa is a vast country with vast needs in the remotest of areas where sometimes GPs cannot reach. As an enhancement to FY 2008 and an ongoing activity in FY 2009, Tshepang has forged partnerships with various VCT organizations and pathology laboratories as sub-contractors who are assisting Tshepang to increase counseling and testing access. The main emphasis in these partnerships is that HIV infected individuals must translate to HIV care enrollments through Tshepang GPs. All HIV-infected individuals from campaigns are immediately contacted and referred to GPs in areas where they live and enrolled into the workplace intervention program (WIP). The Trust has maintained its partnership with the PCTA Education Labour Relations Council teacher union group. It is important to note that the numbers of testing done for this group are part of Tshepang's overall testing figures although the unions may have them as targets for their CT program area.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008 a revision of testing target was made where 10,000 individuals will be tested versus the 15,000 that was originally targeted, the numbers will be maintained at 10,000 in the FY 2009 COP. The reason for decreasing the target is for the Trust to be able to effectively cater for care and treatment services. If targets were kept at 15,000, presumably 1,500 individuals who need to be enrolled for care if one considers that 10% of all individuals tested are likely to be HIV infected, however the target for new HIV enrollments is a 1,000. If the target was not reduced to 10,000, the funds allocated for care and treatment would not be able to cater for the 500 extra individuals that would need it.

GPs will be trained and equipped through the Foundation for Professional Development (FPD) on routine counseling and testing in order for them to make this activity an integral part of routine medical care.

INTEGRATED ACTIVITY FLAG:

Activities are linked to others described in ARV Drugs, ARV Services, and Other Prevention. This is a follow-on activity to the American Center for International Labor Solidarity.

BACKGROUND:

the FY 2007 PEPFAR funding corporative agreement has enabled the Tshepang Trust to start testing workplace employees together with their immediate dependents. In the FY 2007 period and going into the FY 2008, the Trust is focusing on utilizing general practitioners (GPs) to do routine counseling and testing in their consulting rooms. The Trust although it had a slow start for the FY 2007 period, is gaining momentum with testing both in GPs rooms and in workplaces through partnerships with other VCT entities, is currently testing on average 500 individuals per month and the number is rising as the program becomes known with the assistance of the SA Medical Association in alerting its members on the program.

The emphasis area for this workplace activity is testing for early detection. The target population for this initiative is men and women of reproductive age working in SMEs, the healthcare and education sector including their partners and dependents. This includes managers, worker representatives and workers, educators and other individuals working in the education sector and healthcare workers working in the public healthcare sector particularly in areas where Tshepang currently has public private partnerships with some of Gauteng's public ARV sites.

With funding from PEPFAR, these workplace programs will conduct HIV awareness and testing sessions for

Activity Narrative: both employers and employees on the basic facts of HIV transmission, prevention, and impact of HIV and AIDS on the industry.

This activity will directly contribute to PEPFAR's goal of preventing 7 million new infections and treating more than 10 million infected persons. These activities support the USG Five-Year Strategy for South Africa by expanding and improving quality workplace HIV and AIDS prevention programs and are also in line with the SA National Strategic Plan.

ACTIVITIES AND EXPECTED RESULTS:

This activity will provide access to VCT services for employees, their partners and their dependents through referrals to general practitioner (GP) sites and aso workplace wellness facilities. These GPs will provide counseling and testing and initiation into treatment. These accomplishments will directly contribute to the realization of PEPFAR's goal to prevent 7 million new infections and provide care for 10 million people infected with HIV. These accomplishments also support the prevention, care and treatment goals laid out in the USG Five-Year Strategy for South Africa.

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

Xstrata is a new PEPFAR partner, which received funding in FY 2007 for a public-private partnership with the Mpumalanga Department of Health (MPDOH). The implementing partner for this activity is Re-Action! Consulting (RAC). RAC will facilitate a co-investment partnership with Xstrata to provide support for strengthening targeted government clinic sites, continuing to improve access to basic preventive, clinical care and psychosocial support services in one district of Mpumalanga, extending into a second district during FY 2008. The project will build on a public-private mix model for strengthening HIV and TB service delivery that Xstrata and RAC has already begun to implement in the province with funding from Xstrata (dollar for dollar match with PEPFAR).

Xstrata and RAC will work through established partnerships with local government, MPDOH, community groups and private providers. Project deliverables have been defined in response to specific requests for assistance from the MPDOH. Major emphasis will be given to development of health workforce capacity, with minor focus on community mobilization/participation, building linkages with other sectors, local organization capacity development and strategic information. The target populations are underserved communities of men, women and children and people living with HIV and AIDS in Nkangala District, extending to a second district during FY 2008, where Xstrata Alloys has its operations.

BACKGROUND:

Xstrata Coal is a subsidiary of a multi-national mining group committed to practical ways of achieving sustainable development and contributing to the health and social welfare of employees and their communities. The company employs 4,000 people at 11 mines (collieries) located within the socio-economically deprived Coal Powerbelt region of Mpumalanga. Xstrata Alloys has more than 10,000 employees with operations in 3 provinces (Mpumalanga, Limpopo, and North West) and Swaziland. This funding partnership enables scaling up the community extension component of Xstrata's comprehensive workplace HIV and AIDS program managed by RAC. The project is focused on implementing a public-private mix service-strengthening model of capacitating government providers within primary care clinic sites to deliver HIV-related preventive, clinical and psychosocial care services. FY 2008 funding will allow continued support to sites established in FY 2007 (working towards full site accreditation) and to expand the number of sites within two target districts. The scope of assistance is defined within a Memorandum of Understanding between Xstrata and the Mpumalanga Department of Health and Social Services, and responds to specific requests for support by the provincial department's HIV and AIDS Unit, as well as the district management teams. This fits within a broader range of interlinked corporate social investments being made by the Xstrata Group to support sustainable local development in these communities.

The project will provide technical assistance, health workforce capacity development, clinic infrastructure improvements, strengthening of pharmaceutical supply management systems and service monitoring for public sector primary care clinics to deliver quality HIV-related preventive and clinical care services. This will contribute to strengthening district-level primary health care service networks and district service management, with a strong focus on improving human resource capacity, including through training and deploying community outreach workers to deliver household-level services. The project works in partnership with other PEPFAR contractors in the province to achieve synergies and avoid duplicating activities.

ACTIVITIES AND EXPECTED RESULTS:

Three activities will be implemented to strengthen the provider-initiated testing and counseling (PITC) services in two districts in Mpumalanga, in collaboration with the Mpumalanga Department of Health.

ACTIVITY 1: Strengthen Primary Health Care sites to deliver Counseling and Testing Services

Technical assistance and training will be provided to improve public sector human resource management capacity so that critical staff positions will be filled to strengthen counseling and testing services. Physical upgrades to clinic infrastructure (undertaken by Xstrata) will accommodate additional counseling space and essential equipment will be procured. Health information management systems and patient monitoring systems will be strengthened through in-service training, technical assistance and procurement of equipment where necessary. Service delivery will be improved overall to ensure that HIV-infected adults and children testing positive are referred to the essential package of HIV-related, treatment, care and support interventions at designated clinic sites.

ACTIVITY 2: Public Health Sector Workplace HIV Response at the Identified Sites

Retention of health workforce capacity and health worker performance through strengthening public health sector workplace HIV response at the identified sites will be undertaken. A workplace HIV intervention for health and allied workers will be implemented to build 'AIDS competence' in the health workforce at the selected sites, to encourage uptake of HIV testing and counseling and to promote appropriate health action (including care-seeking) and improved attitudes towards patients.

ACTIVITY 3: Community Mapping, Mobilization, Health Promotion, Treatment Preparedness and Support, Referral to Appropriate Health and Social Services

Community outreach workers will be trained to provide basic household health risk assessments and health promotion under supportive supervision. They will mobilize the community for HIV testing and counseling (through the 'I know!' campaign developed by RAC) and will direct community nurses to deliver provider-initiated HIV testing and counseling within households (door-to-door campaign). Individuals with social and health risks will be referred for appropriate services and appropriate follow-up arranged. This will result in risk mapping of all households within targeted communities and systematic follow-up, linked to facility-based

Activity Narrative: services. The community program will be monitored and improved using normative standards and tools developed by WHO (IMAI). Community Health Workers will receive close supportive supervision by professional nurses. A regular learning review will be undertaken, based on an established improvement methodology and ongoing in-service training will be provided from both 'in-house' and external sources. Periodic review of strategic information and performance indicators will support monitoring the quality of service delivery. Each community health worker will undergo routine performance appraisal based on Re-Action's established Human Resource management procedures.

ACTIVITY 4: Community Support and Psychosocial Care

Linkages with community-based service organizations (including faith-based organizations and non-governmental organizations) will be strengthened and all providers will be encouraged to participate in delivering their service tasks in more coordinated ways through the 'public-private mix' approach (which RAC will support district management teams to oversee). Peer support groups will be established at all sites and linkages to the community will be strengthened through Community Outreach Services. Traditional healers will be engaged and trained in partnership with the MPDOH and supported to provide appropriate referrals to the clinic sites, to provide chronic care support and health promotion. Attention will be given to gender equity, increasing male involvement in the program, addressing stigma and discrimination

Sustainability of this program is assured through the public-private partnership between Xstrata and the MPDOH. By providing support for counseling and testing in underserved communities, Xstrata is contributing to the 2-7-10 PEPFAR goals.

Activity ID: 13834.22800.09

Planned Funds: \$145,636

Activity System ID: 22800

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Modification Plans to Activity One in FY 2009:

In FY 2009 it will be emphasized to all healthcare workers that at any interaction with patients at all levels of care, counseling and testing (CT) will be initiated by the healthcare worker and offered to the patient in the consultation room. The hospital will work towards ensuring that healthcare workers strive to make HIV testing an essential component of the diagnostic process, rather than a separate event which occurs in a different location. The tuberculosis (TB) service delivery site will be a focus for FY 2009. HIV-negative patients will be briefly counseled on preventative measures and additional in-depth counseling will be provided by lay counselors as well as referral to the care and treatment within the Hospital to HIV-infected patients. In depth preventative counseling remains a concern and the referral of HIV-negative patients to counselors and therapeutic counselors (TCs) post testing will be addressed.

Couple CT will be a focus at the prevention of mother-to-child (PMTCT), antenatal care (ANC) settings and within the home if possible. Training in couple counseling and testing will be provided to health care workers, therapeutic counselors (TCs) and counselors.

Disclosure of HIV status to sexual partners will be stressed and encouraged, if the couple is not tested together and various approaches will be explored that will address partner notification.

Modification Plans to Activity 2 in FY 2009:

There will be an increased focus on CT using mobile clinics to support designated down-referral clinics by not only being used as a point for care and treatment but also offering PICT at these clinics and in the communities. There will be a link with the local schools and community outreach programs to intensify HIV testing. An increased focus will be on the referral of HIV-infected patients to the clinics, and hospital for follow-up services. Once CD4 counts are provided to the patient the need for additional support via support groups or treatment facilities will be advised. Follow-up on patients receiving CT will be a key element to ensuring that patients receive antiretroviral (ARV) treatment when required. Patient tracking systems will be implemented at the clinic level, within St. Mary's Hospital and within the mobile clinics. Referral to support groups with a similar tracking system will be key to ensuring that patients who require future treatment are not lost to follow-up.

Rapid tests will be used as a diagnostic tool and will be used in parallel to minimize the time in CT settings.

The quality assurance (QA) or rapid testing services are as follows:

- i) Regular on-site audits conducted by the senior counselors, which includes record-keeping, and observation of staff performance.
- ii) Blinded re-checking will also be implemented where a selected sample of specimens will be retested in a laboratory using patient samples. St Mary's has a high volume through put, so this is a good measure for quality
- iii) Once the National Health Laboratory Services have a QA standard operating procedure (SOP) approved, St. Mary's Hospital will adhere to the policy.

Modification Plans to Activity 2 in FY 2009:

Ongoing training is being provided to new TCs, counselors and health care workers, but any new training will focus on supervision and the management of CT services, as well as couple, child and family counseling as the CT services are being extended rapidly into the community via the mobile clinics as well as through the community clinics.

SUMMARY:

St. Mary's Hospital in Durban, KwaZulu-Natal will implement extensive counseling and testing services in the hospital as well as in the community to encourage patients' referral to the hospital for antiretroviral treatment (ART). The activities will encompass human resources, consumables and asset procurement. The emphasis area of this activity is to provide counseling and testing to the family unit and communities and in particular, there will be a focus on couple counseling at the prevention of mother-to-child transmission (PMTCT) program. This is in line with the goals of the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 to reduce the impact of HIV and AIDS on individuals, families, communities and society and with the ultimate aim to reduce the number of new infections. The target group for this activity is the general population and pregnant mothers; partners of pregnant mothers, children from prior pregnancies and extended families of HIV infected individuals. There is also a focus on men in the workplace as counseling and testing and referral to St. Mary's Hospital for treatment has been offered to industries surrounding St. Mary's Hospital.

BACKGROUND:

This is a new program activity funded in FY 2008, although St. Mary's has received previous PEPFAR funding as a sub-partner to another PEPFAR partner, Catholic Relief Services. This activity will enhance the PMTCT, palliative, treatment and care programs that were funded by PEPFAR in FY 2007. The program is supported by the South African government as St. Mary's Hospital has a service level agreement with the provincial Department of Health and the Hospital is in partnership with the District Office of the Department of Health to provide HIV and AIDS training to all clinical staff over the next two years.

Activity Narrative: ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Dedicated Counselors in the Hospital Setting Providing HIV Testing and Counseling

The overall objective of this activity is to routinely counsel and test as many patients as possible in the hospital setting. Patients and extended family members will be encouraged to be tested and continuously be re-tested in order to refer to the care and treatment programs if appropriate. The goal will be to counsel and test all patients attending the facility whether or not the patient has symptoms of HIV and regardless of the patient's reason for attending the facility. In addition, the focus will also be on encouraging those that are negative to remain negative. This will be addressed through extensive counseling and the need for a change in behavior if necessary. All areas of the hospital will be targeted both inpatient and outpatient areas. In particular, the PMTCT program will encourage the counseling and testing of couples and members of the family unit. A provider-initiated testing and counseling (PITC) approach has been adopted as the preferred method of counseling and testing throughout the facility. There is an integrated approach to the treatment of TB and HIV at the facility. This will ensure that all TB patients will be routinely tested for HIV, and all newly diagnosed HIV-infected clients at the facility will be screened for TB (via the Catholic Relief Service funding).

A group of thirteen counselors will be in the wards, outpatient section and the primary healthcare clinic, which is an integrated clinic setting that addresses TB, hypertension, diabetes, antenatal services, primary health services and PMTCT. Approximately 2 000 patients make use of this facility on a monthly basis. In order to maximize the goals of this activity it is important to have counselors spread throughout the facility. The counselors will be trained and continuously updated through the treatment program activity area to ensure that patients will make informed decisions. Government counseling and testing protocols will be adhered to. The expected results of this activity is to (a) create a culture in which all people regularly seek counseling and testing and re-counseling and testing on an ongoing basis for HIV; (b) provide HIV and AIDS care and treatment to those who require this treatment, and particularly addressing the referral and access to treatment programs; and (c) provide accurate clinical information to health care workers when treating patients.

ACTIVITY 2: Community Mobilization/Outreach

A vehicle will be purchased and a team of two counselors and a nurse will be tasked to work with the 19 referral clinics to St. Mary's Hospital and the primary healthcare clinic to provide mobile HIV counseling and testing. The primary goal of the activity is to encourage regular counseling and testing in the clinics; and counseling and testing for family members in a home setting. This activity will be an extension of the PMTCT program. The community mobilization of testing and counseling will extend to a large industrial community that surrounds St. Mary's Hospital. A team of counselors will primarily target men in the workplace and offer testing and counseling to all, and treatment to those who require treatment.

Currently a local radio media campaign exists (not a St. Mary's Hospital funded activity) that encourages industry to establish a culture of ongoing testing and counseling in the workplace; and support and referral to treatment sites for those that require treatment. St. Mary's activities will support this initiative. The outreach counseling team will also address loss to follow-up and counseling and testing of partners of pregnant mothers and extended family members of the pregnant mother. The expected results of this activity is to (a) address couple counseling and testing but in a home-based program which has shown to reduce HIV transmission in sero-discordant couples; (b) address referral links for care and treatment to St. Mary's Hospital from referral clinics and home-based settings; and (c) address the culture of counseling and testing in the community.

These activities contribute directly to the overall PEPFAR objectives of 2-7-10 as HIV-infected people will be identified, appropriately treated, cared for and supported. Family members affected will benefit directly from counseling and support within the hospital environment as well as within the community setting during home visits.

Testing**Budget Code:** HVCT**Program Budget Code:** 14**Activity ID:** 19517.22842.09**Planned Funds:** \$436,907**Activity System ID:** 22842

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

- Couple counseling and testing at community support group family wellness days will be organized to encourage knowledge of spouse and children status, as the first step in HIV prevention and treatment.
- School-based family wellness days will be carried out to provide health assessments of a range of diseases including blood sugar levels and HIV testing for learners, parents, guardians and educators.

SUMMARY:

South African Democratic Teachers Union (SADTU) will expand counseling and testing services for teachers, learners and their workplace community in three provinces and refer them for care and treatments services.

BACKGROUND:

The HIV and AIDS pandemic has created workplace environments that are not conducive to quality teaching and learning for both educators and learners alike. The school as a workplace is plagued by high levels of stigma. This often results in educators suffering silently and becoming victims of the pandemic despite high perceptions of knowledge of HIV and AIDS. As a result many educators do not have the courage and support in the workplace to go for voluntary counseling and testing, since knowing your status is not publicly encouraged. Consequently most educators discover they are HIV-infected when they start showing symptomatic illnesses that do not respond to medications. By this time their CD4 counts are usually low and they can no longer function optimally at their schools with compromised health. The SADTU project aims to reduce the impact of HIV and AIDS by focusing on preventing transmission of HIV for teachers and caring for orphans and vulnerable children in the workplace. The SADTU will implement routine access to VCT services in its events making it possible for union members to participate in VCT without having to go to clinics or health centers. Partnerships are already in place with local public clinics and mobile clinics. Any union member testing positive will be referred to the partner health facility for treatment, care and support services. At each of the health facilities the SADTU project will support 2 additional community health workers trained in local languages to assist in fast tracking union members who have been identified as HIV-infected at union events.

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Training of community health workers

17 community health care workers will be trained as lay counselors for VCT. They will be placed at partner clinics in each of the three provinces. They will also offer VCT at union events and those who test positive will be referred to treatment, care and support services at the referral clinics. Pregnant women will be referred for PMTCT.

Activity 2: Workplace counseling and testing

At any SADTU event taking place, union members will have the opportunity to access VCT. VCT will be conducted using the national protocol for testing. Community health care workers will be trained to conduct VCT, and make appropriate referrals to treatment, care and support services. In order to ensure that referrals are made, SADTU has established partnerships with health facilities in each of the districts/regions where SADTU activities will take place.

Activity 3: AIDS Ambassadors

The SADTU project subscribes to the "greater involvement of people with AIDS" principle. As a result the project supports people living with HIV to engage in project planning of union events and the participation in HIV testing campaigns. These AIDS Ambassadors have a great impact on union events, including on workshops aimed at encouraging union members to participate in VCT.

The SADTU project contributes to the PEPFAR 2-7-10 goals and objectives by encouraging educators and union members to participate in VCT activities being conducted at union events. This ensures that more union members are aware of their HIV status early, and can be referred to treatment, care and support services timely.

Activity System ID: 22826

Mechanism: N/A

USG Agency: HHS/Centers for Disease
Control & Prevention

Program Area: Prevention: Counseling and
Testing

Program Budget Code: 14

Planned Funds: \$397,585

Activity Narrative: SUMMARY:

The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will make concerted efforts to improve counseling and testing (CT) uptake and ensure good quality CT services at all possible entry points i.e. prevention of mother to child (PMTCT), integrated management of childhood illnesses (IMCI), expanded program of immunization (EPI), tuberculosis (TB), out-patients department (OPD) and in the wards. EGPAF will use FY 2009 PEPFAR funds to support its existing CT activities and programs which include National Department of Health (NDOH) and provincial DOHs in Kwazulu-Natal (KZN), Free State, North West and Gauteng provinces, as well as McCord Hospital and the AIDS Healthcare Foundation (AHF) in KZN. The primary emphasis area is human capacity development and expansion of services through training and provision of additional staff. EGPAF will train and provide supportive supervision to counselors thus ensuring good quality CT services.

BACKGROUND:

The long-term goal of the EGPAF Project HEART CT program in South Africa is to ensure that CT is offered at all possible entry points, including medical settings and non-medical CT service points. All CT methods will be explored i.e. provider initiated testing and counseling (PITC), couple CT, home-based CT and prevention CT. Support for disclosure will be strengthened through support groups and the family centered approach will be used. EGPAF will continue to support national and provincial DOHs by providing CT technical assistance and human capacity development.

Priority areas include: (a) PITC will be encouraged at all entry points; (b) couples CT; (c) home-based CT; (d) psychological, social, spiritual and prevention services provision; (e) ongoing supportive supervision and mentoring of counselors; (f) developing advanced CT skills i.e. couple, family and child counseling; (g) strengthening referral systems to ensure HIV infected patients are linked to care and treatment services as well as other prevention services; (h) ensuring adequate support for disclosure; and (i) ensuring that DOH supported sites have adequate systems in place for quality assurance of testing services.

ACTIVITIES AND EXPECTED RESULTS:

EGPAF will carry out the following five activities in this program area.

ACTIVITY 1: Human Capacity Development

CT is an entry point into the continuum of care. Therefore, EGPAF will prioritize human capacity building to improve CT uptake. EGPAF will train various categories of staff on CT and continue promote PITC at all possible entry points. Where required, EGPAF will provide additional counselors and provide ongoing supportive supervision, mentoring and coaching at sites.

EGPAF will continue to train staff on CT policies and protocols, provide onsite mentoring and coaching to ensure didactic training translates to good quality CT practices. EGPAF will second staff to various service points in-order to strengthen CT capacity. Non-medical CT e.g. home-based CT, voluntary counseling and testing (VCT) campaigns with community-based organizations (CBOs) and faith-based organizations (FBOs) will be implemented by capacitating CBOs and FBOs to offer CT in homes and communities, and refer HIV infected patients to care and treatment services. Advanced CT skills i.e. couple, family and child counseling training will be conducted.

ACTIVITY 2: Community Linkages

EGPAF will establish linkages and provide technical assistance to CBOs, in an effort to scale-up CT. Community-based CT services will be linked to care and treatment sites and effective referral systems will be implemented. Ongoing supportive supervision, mentoring and coaching will be provided to CBOs to ensure good quality CT services. CT integration into other programs e.g. community integrated management of childhood illnesses (IMCI), TB and directly observed therapy short-course (DOTS), TB/HIV and functional referrals will be strengthened.

ACTIVITY 3: Quality Improvement

Facility and community-based multidisciplinary improvement teams will be established for ongoing CT quality improvement activities. QI activities will assist in integrating CT in the medical and non-medical settings. Compliance with CT policies will be monitored to ensure quality CT services.

ACTIVITY 4: Monitoring and Evaluation

EGPAF will assist facilities and districts in setting up CT targets in line with the HIV & AIDS and STI Strategic Plan for South Africa 2007-2011 goal of increasing CT coverage. Staff will be trained on data collection tools, indicators and reporting to ensure good quality data. Program sustainability; based on programs staffing needs and funding availability, DOH seconded staff will be absorbed into the DOH payroll system. Training, mentoring and coaching will result in the much needed skills transfer. Community awareness, buy-in and ownership of CT services will be promoted in an effort to reduce stigma and ensure sustainability of community-based CT services.

ACTIVITY 5: Couple Counseling and Testing

Couple CT will be promoted to reduce HIV transmission in discordant couples, and may encourage faithfulness in concordant negative couples. Couple CT will be implemented through VCT, PMTCT, family planning and home-based CT and active male participation will be promoted. Programs that reduce gender-based violence and promote human rights will be implemented. In light of women vulnerability and financial dependency on men, disclosure counseling should be routine part of CT services. Different approaches to

Activity Narrative: support partner disclosure e.g. couple CT, partner referrals will be encouraged. Specific needs of women will be addressed.

EGPAF overall CT support is in line with NDOH CT policies and guidelines as well as the HIV & AIDS and STI Strategic Plan for South Africa 2007-2011 Priority Area 1, Prevention, goals 1, 2, 3, and 4, aimed at reducing new HIV new infections by 50% by 2011. EGPAF support to DOH CT program aims to increase testing uptake by ensuring CT services are offered at all possible medical and non-medical entry points. Effective referral to care and treatment and other prevention services will be of priority.

Funding Source: GHCS (State)

Program Area: Prevention: Counseling and Testing

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 19514.22875.09

Planned Funds: \$357,293

Activity System ID: 22875

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

SABCOHA program PEPFAR funds will be used to identify HIV-infected individuals as noted in the Vendor Chain and BizAIDS programs below. VCT is used as a prevention mechanism to promote abstinence, be faithful and to use condoms, as well as an entry-point in to ARV treatment. It is also an essential tool for fighting stigma and discrimination. The major area of emphasis is Workplace Programs. Minor areas of emphasis include Community Mobilization/Participation, and Information, Education and communication.. Specific target populations include Male and Female adults, Truckers, and the Business Community.

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Vendor Chain

Vendor Chain Management - the businesses that have been offered capacity building through the development of a workplace - will be offered VCT during the second phase of the programme. VCT will be offered to all employees of participating businesses.

Activity 2: BizAIDS

BizAIDS activities will ensure that VCT is provided in a training workshop setting.

Activity 3: SABCOHA will use the contracted Disease Management service provider for the provision of counseling and testing.

Linkages with other services providers and public hospitals will be explored to maximize the manner in which the intervention can reach the target group effectively and efficiently, as need arises.

The counseling and testing interventions will be conducted by a sub-partner and that will facilitate the implementation of VCT services to communities that would not otherwise be able to access testing. The FY 2008 funding will ensure that employed populations have access to counseling and testing services in the workplace. SABCOHA will primarily use On-site VCT and provide counseling and testing at the site of the SME. All sites will be inspected for suitability for testing: e.g. privacy for employees, accessibility, hygiene. A communication campaign informing employees about the testing date is undertaken before the testing dates. Such communication is linked into the prevention ABC education. Prior and on the date of testing, the eligible individuals undergo an education session which includes motivational messaging on the benefits and procedures of HIV testing.

Information on organizations which provide support will be given to the employees. Referrals for HIV-infected individuals will be done for PreHAART and treatment related services, which will be offered by an contracted Treatment service provider.

SABCOHA's VCT activities will contribute to the PEPFAR 2-7-10 goals by identifying HIV-infected individuals for care, treatment and preventing infection in those who are HIV-negative. This will contribute to the PEPFAR vision outlined in the Five-Year Strategy for South Africa by expanding access to, and availability and quality of VCT services.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

University Research Co., LLC (URC) is currently in discussions to expand its support to Northern Cape, if they are invited to do so by the province's Department of Health. This may result in URC supporting up to six provinces. URC will focus on enhancing the quality of support provided and as a result the accelerated growth of the project will be slower in FY 2009, with a maximum number of sites supported being 130. Facilities will be assisted to improve their referrals to tuberculosis (TB) screening of clients who are HIV-infected. URC will assist this process by ensuring that job aids are available to health care providers. In FY 2009, URC will focus on increasing social mobilisation with a focus on men to promote counseling and testing. This will be done in collaboration with non-governmental and community-based organisations in order to create the demand for counseling and testing services in health facilities. URC will also place emphasis on development of information, education and communications materials for clients.

SUMMARY:

University Research Co., LLC (URC) works with the national and provincial Departments of Health in South Africa to expand access to and uptake of HIV testing and counseling. URC's major strategy is to assist NDOH/PDOHs in implementing provider-initiated HIV testing, with the option to opt-out, to reduce missed opportunities for HIV identification and further spread of HIV in the country. URC will use a collaborative approach for rapidly expanding the HIV testing services. The approach will include integrating HIV testing with antenatal care, sexually transmitted infections (STI), tuberculosis (TB), family planning (FP) and general clinical service areas. Training of program managers and healthcare providers in strategies to expand uptake of HIV testing and counseling rapidly will be a focus. URC will place temporary clinical staff to provide HIV testing in high volume facilities where current staff are unable to meet the demand for testing, thus ensuring that HIV clients are referred for onward treatment and support services. Finally URC will strength supervision and monitoring systems to ensure provision of high quality HIV testing. Support will also be provided to improve recording and reporting systems for HIV testing at all levels. The major emphasis area is local organization capacity development, with minor emphasis on quality assurance and supportive supervision, network/linkages/referral systems, and training. The activity targets public health workers, community-based organizations (CBOs) and faith-based organizations (FBOs), program managers and community volunteers, youth and adults, and STI, TB, and general clinic attendees.

BACKGROUND:

Uptake of HIV testing remains low due to limited provision of this service at most facilities, staff shortages as well as stigma and perceptions about poor follow-up and treatment options available for people with HIV and AIDS. Since 2006, URC has been working through a CDC-funded program to expand uptake of HIV testing at healthcare facilities in five provinces (Mpumalanga, KwaZulu-Natal, Limpopo, North West, and Eastern Cape) to increase uptake of HIV testing. The basic strategy is to help healthcare facilities introduce provider-initiated HIV testing and counseling as referred to in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011. This is being achieved by integrating provider-initiated HIV testing, with the option to opt-out, with TB, STI, FP, antenatal care and other general clinical services targeting both adults and youth. In FY 2008, URC will continue using the district-based HIV testing expansion model whereby public healthcare facilities will be assisted to increase uptake of HIV testing through direct provision of high quality provider-initiated services as well as through referrals to CT where direct HIV testing provision is not possible. In clinics that lack the requisite number of staff or the existing staff do not have the appropriate skills for initiating HIV testing; URC will place temporary staff (counselors and testers) to roll out the HIV testing services. The maximum duration of temporary staff assignments to a facility will not exceed six months. URC will develop the capacity of healthcare workers in their ability to provide high quality provider-initiated CT services, including post-test counseling for HIV-infected and uninfected persons.

ACTIVITIES AND EXPECTED RESULTS:

URC will carry out eight separate activities in FY 2008.

ACTIVITY 1: Assist NDOH to Streamline Policies and Develop Guidelines on Provider-initiated HIV Testing and Counseling

URC will work with the National Department of Health (NDOH) to develop a policy framework to streamline the integration of provider-initiated HIV testing in clinical settings. URC will support policy dialogue workshops at national and provincial levels to expedite the development of the policy framework as well as operational plans.

ACTIVITY 2: Develop District-based HIV Testing Expansion Strategy

URC, in consultation with provincial health offices, will identify target districts for HIV testing rollout. All facilities in a district will be covered under URC's HIV testing expansion program. URC will assist each focus district in developing a strategy for increasing uptake of provider-initiated HIV testing services. A typical strategy will include the following elements: (a) training facility staff in provision of HIV testing services; (b) monitoring key performance indicators (number of people trained; number of people who receive the HIV testing services, number of HIV-infected people referred for onward treatment and support services percent of providers who follow national guidelines for HIV testing and counseling; quality of testing services); (c) maintaining a training schedule (who will be trained, when will they be trained); and (d) supervising and mentoring (who will be responsible for providing supervision and mentoring to facilities to ensure the HIV testing is being integrated and the quality of services are per national standards, etc.). Each district will establish a HIV testing expansion team representing HIV, maternal and child health, TB, and STI directorates. These teams will be responsible for reviewing results every three months to determine if HIV expansion strategies are producing desired results.

Activity Narrative: ACTIVITY 3: Establish Baseline HIV Testing and Counseling Uptake Levels in Each New Facility

URC staff will review clinic logs and patient records to establish baseline HIV testing uptake, and referrals for antiretroviral treatment (ART) in various clinical settings (TB, STI, antenatal health clinic, etc.). These assessments will help the facility teams identify clinical services that are offering CT as well as the levels of uptake. The rapid assessments will also examine the quality of services that may be affecting the CT uptake. The assessments will target both service providers and CT clients (those who accept and those who opt-out). Observations, chart and record reviews, and interviews are some of the approaches that will be used for data collection.

ACTIVITY 4: Training

URC will work with the departments of health to train clinic staff (doctors, nurses, midwives, counselors, and testers) in provider-initiated HIV testing and counseling. Training will focus on how to provide basic pre-test information and how to provide post-test counseling to HIV-infected and uninfected persons. The training will also include a module on the management of provider-initiated HIV testing, which covers logistics, recording and reporting, referral systems for HIV testing (for sites that are unable to provide testing within their sites) and ART. Specific case studies will be presented and participants will work in groups to identify gaps in CT services and suggest possible solutions. URC will provide job-aids, wall charts, and other needed materials to improve compliance with clinical and counseling guidelines.

ACTIVITY 5: Referrals and Linkages

Not all service providers or facilities will be able to offer HIV testing within their facilities. In such instances, URC will work with provincial and district departments of health to develop referral linkages to ensure that clients have easy access to services. URC will also develop linkages between CT sites and sites offering ARV treatment.

ACTIVITY 6: Community Linkages

URC will assist each participating healthcare facility to develop community linkages to increase awareness as well as uptake of HIV testing services. This will be done through building partnerships with local community- and faith-based organizations working in the catchments areas of clinics.

ACTIVITY 7: Compliance Audits

URC will conduct annual compliance assessments in a sample of participating facilities to assess whether the staff complies with the national HIV testing and counseling guidelines. These assessments will also examine the quality of performance data reported to the program.

ACTIVITY 8: Strengthening Quality Assurance and Supervision System

URC will train district and facility-level supervisors in quality assurance and quality improvement methods and facilitative supervision techniques for improving the quality of CT services. These activities are expected to increase uptake of HIV CT in 150 healthcare facilities (100 current and 50 new facilities) by assisting them to rapidly expand CT services. Facilities receiving URC assistance will provide HIV testing results to 100,000 men and women as a result of the integration of HIV CT with other high volume health services. URC will train 1,400 healthcare workers in CT integrated with antenatal care, TB, STI and general health services. By focusing on promoting the uptake of counseling and testing through community structures and increasing local capacity, URC will contribute to the PEPFAR goals of 10 million people in care and 7 million infections averted.

Control & Prevention**Program Area:** Prevention: Counseling and
Testing**Program Budget Code:** 14**Planned Funds:** \$1,522,692

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2008, the South African Parliament enacted the some sections on the new Children's Act. This included bringing down the age of consent to an HIV test to 12 years. The challenge is that most health providers in public health facilities are not trained in discussing HIV issues with children as young as 12 years and so although the Act stipulates that children should be allowed to consent for an HIV test on their own without parental consent, in reality they are not offered the service due to lack of training on the side of health workers. The Centers for Disease Control and Prevention (CDC) will work closely with National Department of Health and the provincial departments of health to train health workers in HIV counseling and testing services for children and adolescents.

SUMMARY:

The aim of this project is to provide technical assistance to the National Department of Health (NDOH) and provincial health departments to ensure expansion and strengthening of CT services in all nine provinces. Target populations for these activities include host country government, healthcare workers, and community healthcare workers. PEPFAR funds will be used to employ two full-time CT technical advisors to be placed at NDOH. The technical advisors will assist with the coordination of CT activities, enhance capacity of NDOH CT staff by providing support for the NDOH annual CT technical meeting, and to support the implementation of provider-initiated testing and counseling (PITC) in five public facilities sites per province.

BACKGROUND:

The goal of the National CT program is to ensure the universal access to HIV counseling and testing. The purpose of this project is to provide technical assistance to NDOH by funding two CT technical advisors to work within the NDOH on all aspects of the program. Responsibilities of the technical advisors include focusing particularly on development of national guidelines on PITC and the training of healthcare providers. The technical advisors will also monitor the implementation of PITC in all provinces. They will also assist in the development and implementation of quality assurance guidelines around HIV testing.

The project will also support capacity building of healthcare workers and community healthcare workers, development and implementation of provincial CT specific operational plans, strengthening of national and provincial reporting systems, coordination of the national CT steering committee meeting, development of a monitoring and evaluation system for early infant diagnosis and strengthening service delivery through the implementation of systems strengthening activities.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Technical Assistance to NDOH

Technical assistance to NDOH will be conducted by two technical advisors. Although both will engage with NDOH regularly, one of the advisors, who will be a locally employed staff person, will work at the National program. Specific technical assistance to the national CT program will be around capacity building for all cadres of healthcare workers, monitoring and evaluation, the development of protocols and guidelines, and the implementation of PITC in all nine provinces.

The responsibility of the technical advisors will include support for the provision of quality HIV testing which will require (a) the development and implementation of quality assurance guidelines on HIV testing; (b) standardization of national quality assurance guidelines; and (c) supervision of quality training for all CT coordinators, laboratory technicians and nurses who conduct HIV testing.

Support will also be provided for the accreditation of non-medical CT facilities according to the NDOH requirements as well as the revision of all current training materials relating to CT.

In addition, PEPFAR funds will support skills enhancement of current NDOH and provincial staff by providing support for the national CT technical meeting and attendance of NDOH CT staff at the International HIV and AIDS meeting.

This program will contribute to 2-7-10 goals by ensuring the implementation of quality CT services and increasing access to CT services.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 1071.09	Mechanism: N/A
Prime Partner: US Peace Corps	USG Agency: Peace Corps
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 3798.22663.09	Planned Funds: \$20,000
Activity System ID: 22663	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009 Peace Corps will contract with individuals and organizations with specialization in delivering training and conducting outreach in counseling and testing (CT) activities. Priority will be given to contracting with those individuals and organizations that have already received PEPFAR-capacity development support. This will strengthen and build upon previous PEPFAR investment and provide training and outreach in the communities where volunteers live and work, allowing them to provide follow-up and document results.

In FY 2009 approximately 80 Peace Corps Volunteers and 80 counterparts will receive training in HIV/AIDS prevention and will deliver life skills sessions in schools and the community, using and developing peer educators in the process.

SUMMARY:

Peace Corps Volunteers (PCVs), who work in civil society organizations (CSOs) that focus on counseling and testing services, are assigned to the Community HIV/AIDS Outreach Project (CHOP). PEPFAR funds will be used to train these CHOP PCVs and their counterparts in (a) organizational capacity building, i.e. strengthening organizational and human capacity; and (b) promoting counseling and testing, particularly among youth. PCVs in this program area do not provide pre- and post-counseling service but are involved mainly in local organization capacity development, helping their host CSOs improve their systems and practices to motivate youth to use counseling and testing services. The primary target populations for these interventions are CSO employees, community citizens, volunteers, and traditional, religious and business leaders. PCVs will be placed in the rural areas of North West, Limpopo, Mpumalanga and KwaZulu-Natal provinces. Funds requested in FY 2008 will cover the costs of training PCVs and their counterparts and, through the Volunteer Activity Support and Training (VAST) mechanism, the training of CSO employees and community volunteers involved in promoting counseling and testing.

BACKGROUND:

To date, the program in South Africa has relied primarily on PEPFAR-funded PCVs assigned to the (previous) non-governmental (NGO) capacity-building project. Although the FY 2007 program still utilizes PEPFAR-funded PCVs, beginning in FY 2008 there will be no PEPFAR-funded PCVs and instead it is anticipated that one to four CHOP PCVs will assist CSOs with a significant need to improve their CT capacity in reaching out to youth.

ACTIVITY 1:

As noted in the prevention program area, approximately 100 PCVs and 100 counterparts will receive training in HIV prevention in FY 2008. They will deliver life skills sessions in schools and the community, using and developing peer educators in the process. One to four CHOP PCVs will respond to their host CSO wishes to strengthen their CT capacity. Through the PEPFAR VAST mechanism, these PCVs will be able to pilot activities that will increase the number of youth who will avail themselves of counseling and testing services. The CHOP PCVs will contribute to this program area by uniquely providing American citizen assistance in rural communities. Their activities are also closely aligned to the South African government strategies in each of the provinces in which PCVs work.

NOTE: PCVs involved in this program area are part of the population of PCVs who are required to participate in Activities 2, 3, and 4 described in the Prevention program area.

Human Capacity Development**Public Health Evaluation****Food and Nutrition: Policy, Tools, and Service Delivery****Food and Nutrition: Commodities****Economic Strengthening****Education****Water****Table 3.3.14: Activities by Funding Mechanism****Mechanism ID:** 9630.09**Prime Partner:** Catholic Medical Mission Board**Funding Source:** GHCS (State)**Budget Code:** HVCT**Activity ID:** 22317.22643.09**Activity System ID:** 22643**Mechanism:** N/A**USG Agency:** HHS/Centers for Disease Control & Prevention**Program Area:** Prevention: Counseling and Testing**Program Budget Code:** 14**Planned Funds:** \$485,452

Activity Narrative: SUMMARY:

This activity was awarded funding in September 2008 as part of the August 2008 reprogramming.

During year two of Men Taking Action (FY 2009), Catholic Medical Mission Board (CMMB) will introduce its male-focused program in the communities surrounding three main sites of the Diocese of Port Elizabeth (Eastern Cape Province) currently providing home-based care (HBC) services. The project will offer counseling and testing services in a two-pronged approach to over 10,040 men-of whom 2,040 men will be offered testing and counseling through the home and 8,000 men from parish-based networks will be offered testing and counseling. Of the total number of men offered counseling and testing or pre-test counseled, 4,840 men minimum will be fully counseled and tested with their results delivered, and confirmation testing and referrals carried out, as necessary.

BACKGROUND:

This project focuses on testing men, a vulnerable part of the population that has been underserved, or has not been reached, through traditional CT services. However, as a core function of its programs, it aims to reach a sizeable number from the community who will benefit from the CT services through raising the awareness and eliminating destigmatization in the community, using "knowing one's status" as a vehicle.

The Men Taking Action utilizes lay community workers who will be trained in counseling and nurses will be employed to perform the HIV testing. At a secondary and related level, men will be trained to be engaged as: i.) leaders of the household (linking families to care & prevention services), ii.) vehicles of their own health future (repeated counseling & testing and prevention behavior-change messages), and iii.) community leaders in the mitigation of HIV/AIDS. Because Men Taking Action is fundamentally a community-based activity, we expect that testing men through this program will increase overall uptake of services for counseling and testing in families and communities.

Prevention and awareness education will be integrated into sensitization around counseling and testing and continued "talking-up" of knowing one's status, which would be routinized in the home-based care visits conducted by the home-based care worker to the families of the men and the community. The injection of counseling and testing in the already established system of HBC is what makes this model unique in getting the men in the community to gradually get tested and keep them informed about how to use their status to remain healthy. The men will also be educated on disclosure and encouraged to take up voluntary disclosure with their partners.

ACTIVITIES AND EXPECTED RESULTS:

CMMB will carry out five separate activities in this program area.

ACTIVITY 1:

For the home-based counseling and testing of men, CMMB will roll out the program through its established partner home-based care services in the Eastern Cape Province in the following dioceses: Port Elizabeth (Care Ministries), Grahamstown (Assumptions Sisters), and King Williams Town and its surrounding villages (King Williams Town AIDS Office). The home-based care worker, who already enjoys an established relationship with the household, will recruit (at a minimum) four men from each household (and their extended families) over the first year of the program and administer pre-test counseling to them. In modification to the protocols discussed in the previous narrative, a nurse will accompany the home-based care worker (or parish leader, as discussed in the next paragraph) to conduct the actual testing, using a "finger-prick" rapid test method, as well as draw blood for confirmation testing, as necessary.

Similarly, CMMB will work with local parishes and parish mobilizer networks "Ududana" to incorporate male testing and counseling and HIV and AIDS education surrounding testing and counseling into parish meetings. The parish meetings that are referred to in the program are the regular weekly meetings of the community members of the parishes (all men) that are conducted by the Ududana parish leaders (all men), which mainly concern issues of faith, responsibility of the parish, and involvement in the community. They are usually attended by anywhere between 20-40 men (at least) and last a couple of hours on a Sunday afternoon. Traditionally, it will be followed-up by other parish activities or community activities in the community, hence giving the opportunity to make the testing and counseling a part of a holistic community awareness program (at no extra cost) around HIV and AIDS and importance of knowing one's status and keeping health.

Due to start-up logistical and acceptance challenges, CMMB expects to test only 2,040 men from 1,020 households targeted. Similarly, it is expected that 35% of the men offered testing in the parish-based testing will accept testing, thereby testing 2,800 men out of 8,000 men reached through parish-based events. Therefore, the number of men tested and counseled will be 4,840. A total of six (6) nurses minimum and thirty (30) home-based care workers and Ududana men will be trained and working with the program.

ACTIVITY 2:

CMMB, in partnership with the Diocesan HIV/AIDS Offices, has already established strong formal linkages between the home-based care worker networks and the District Health Clinics. These linkages and referral systems ensure proper referral mechanisms within the community, enrollment, and monitoring and adherence for all HIV-infected persons to get treatment through the Ministry of Health programs. Other Dioceses or areas that may not have as strong a link will be assisted in establishing referral protocols with the District Health Clinics as a part of the program. The Men Taking Action program will also work with established local community-based organizations and parish-based systems and Ududana networks to introduce men on treatment to care and support and adherence groups. Through the home-based care worker, the program will also create new groups and follow-up with monitoring and targeted messages and

Activity Narrative: training. Similarly, Men Taking Action will create support groups amongst the rest of the communities' men to bolster empowerment around HIV and AIDS prevention and regular counseling and testing (themselves and family members).

ACTIVITY 3:

A core characteristic of the program is that it will link negative clients to prevention services in the community that will be assessed and interlinked with our program. Similarly, through the strong relationship and referral network structures of the Diocesan AIDS Offices and the District of Health Clinics, all those who test (confirmed) positive for HIV/AIDS will be referred to care and treatment and support groups. Those who are tested will also be educated in risk assessment around counseling and testing (i.e. continued primary prevention and appropriate timeline for re-testing, or uptake and adherence to secondary prevention and treatment and monitoring of immune system strength).

ACTIVITY 4:

Per Ministry of Health/South Africa guidelines, all men and affiliate family members will be offered an 'individual information session' before being tested. All persons testing positive will have their status confirmed with a second rapid finger prick with a different test kit. Post-test counseling will be offered to both positive and negative tested individuals emphasizing modes of transmission and the availability of specific care, treatment and support services specific to their community/parish.

ACTIVITY 5:

Quality prevention and requisite counseling and testing messages will be developed based on baseline, mid-term and final evaluation surveys. Mid-term and final evaluations will also include questions of clients related to the accuracy and thoroughness of HIV-related information and related psychosocial support provided by counseling staff and care providers.

MTA will abide by all standard universal precautions in management of any and all blood products.

Scale-up phase for FY2010 - FY2013 (pending continued and scaled-up support from PEPFAR):

During year three of the program (FY 2010), with satisfactory progress from the program and pending an increased PEPFAR support for the scale-up efforts, CMMB will transition its direct implementation support programs in the Eastern Cape Province to a sub-granting program, as well as expand implementation to two other dioceses: Diocese of Ingwavuma (KwaZulu-Natal) and Diocese of Tzaneen (Limpopo). Given the increased funding, as proposed, to supplement the scale-up efforts, the program intends to train an additional 100 home-based care workers and nurses in counseling and testing, as well as reach 22,110 men with pre-test counseling, of whom 12,360 men minimum will be fully counseled and tested with their results delivered and confirmation testing and referrals carried out, as necessary. The percentage of men taking up testing and counseling (out of all who are offered testing and counseling and pre-test counseled at the home or parishes) is expected to rise to over 50% for years two and beyond, which is in line with Government of South Africa targets.

Similarly, in the following years, with continued and increased program funding from PEPFAR, the project proposes to transition previous Diocese home- and parish-based testing and counseling to a local sub-granting mechanism and scale-up throughout South Africa as follows:

It is worth noting, that given the current funding streams for the following years (\$500K per year), only a limited continuation of services and minimal scale-up throughout the five provinces can be achieved. However, with continued and increased support from PEPFAR, given satisfactory achievement of targets, CMMB can continue the Men Taking Action program in a sustainable manner and scale-up operations to counsel and test over 125,661 men over five years.

Testing**Budget Code:** HVCT**Program Budget Code:** 14**Activity ID:** 3308.22648.09**Planned Funds:** \$85,286**Activity System ID:** 22648

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

There will be an increased emphasis on monitoring and evaluation (M&E) to keep track of all patients tested. HIV-infected patient should be offered care at diagnosis and followed up, regardless of their CD4 count. Household dependants should be identified and screened after help with disclosure.

Field-based medical nurses will be specifically trained in community-based counseling and testing (CT) identification of household dependants and encouraging family-centered support, including pre- and post-test counseling, as well the clinical aspects of testing. Adherence monitors across the program will be trained (or re-trained) in CT, including pre- and post-test counseling, as well the application of rapid tests on adults and children, of a non blood nature, such as oral rapid testing which has been used across the country, and has proven to be extremely cost-efficient and effective in conducting rapid tests. Other support includes salaries for implementing staff at the sites, such as salaries and benefits.

A family centered testing and care approach will be used where possible. Couples counseling and testing at CT and prevention of mother-to-child transmission (PMTCT) sites will be used to promote testing of men and to build their support for their female partners. It is also hoped that, through a community-based testing, increased outreach will be made to women and children in villages. Where possible, training and employment of women as health care workers to increase the confidentiality and comfort of women and girls seeking treatment will be emphasized.

Different models of counseling and testing are used, among which are voluntary counseling and testing (VCT) and provider-initiated counseling and testing (PICT). Counseling and testing algorithms used at AIDSRelief sites involve rapid HIV test (finger prick and oral) which is used in both facility-level and community settings in patients older than 12 months. Patients who test negative are counseled and asked to return after three months for retesting. Patients who test positive receive a confirmation test with another rapid test of a different type. In a tie-breaker situation, an Enzyme-Linked Immunosorbent Assay (ELISA) serum test is performed. ELISA tests are also done for every 10th positive test as a quality assurance measure. Polymerase chain reaction (PCR) serum tests are performed for children between 6 weeks and 12 months of age.

SUMMARY:

Catholic Relief Services (CRS) activities are implemented to support provision of counseling and testing (CT) under the comprehensive antiretroviral treatment (ART) program carried out by Catholic Relief Services (CRS) in 25 field sites in 8 provinces in South Africa. The program aims to establish the HIV status of as many residents of the catchments area of each site as possible, with a view to determine their CD4 counts, so that they can be placed on ART as soon as necessary. Major emphasis is placed on community mobilization/participation, with minor emphasis given to the development of network/linkages/referral systems, development of human resources and training. Specific target populations include the general population, people affected by HIV and AIDS, nurses and other healthcare workers.

BACKGROUND:

AIDS Relief (the Consortium led by Catholic Relief Services) received Track 1 funding in 2004 to rapidly scale-up ART in nine countries, including South Africa. In FY 2005, FY 2006 and FY 2007, PEPFAR funding was received to support central funding, with continued funding applied for under COP 2008. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and the Institute for Youth Development South Africa (IYD-SA).

All sites operate under the terms of a Memorandum of Understanding (MOU) with the provincial Department of Health (DOH) in which they operate, observing the national and provincial protocols. Many patients present themselves for CD4 tests and/or ART after having undergone CT at the South African Government (SAG) clinic.

Contrary to initial expectations, the most difficult issue has been ensuring that men benefit from the CT activities offered. It is mostly women who undergo CT at the field sites. At each field site, home-based caregivers, who are based in their communities, are vigorously recruiting men to undergo CT. A problem experienced by all treatment programs in South Africa is the reluctance of males to present themselves for treatment. CRS sites attempt to overcome this by encouraging females to attend adherence sessions with their partners. Once the participation of males has been secured in this way, they are encouraged to undergo CT and/or CD4 testing.

ACTIVITIES AND EXPECTED RESULTS:

With funding provided in FY 2008 AIDSRelief will continue implementing the activities in support of South African national ARV rollout. Of the 25 existing field sites, activated in program year 1 (March 2004 - March 2005), two have transferred all their ART patients into the SAG rollout, and have ceased providing treatment, and two new field sites have been activated in the same period of FY 2007 to replace them..

ACTIVITY 1: Support for SAG Rollout

Two new field sites have been activated in FY 2007 period to enroll additional ART patients in support of the SAG rollout plan. Utilizing technical assistance from AIDSRelief staff members and South African experts, ongoing support and guidance will be provided to sites in the form of appropriate refresher medical training courses, patient tracking and reporting, monitoring and evaluation mechanisms and other necessary support.

Activity Narrative: At each field site, staff are trained in counseling techniques, including the provider-initiated testing and counseling (PITC) in support of the HIV & AIDS and STI National Strategic Plan, 2007-2011. Trained nurses are employed at each site, and they are able to perform rapid tests. Those patients who are identified as HIV-infected undergo CD4 and viral load tests. If their CD4 count is below 200, they commence with ART. The home-based caregivers provide care to large numbers of patients, many of them not necessarily people living with HIV. The caregivers are trained to be aware of possible symptoms that might be AIDS-related (for example, weight loss or persistent diarrhea). Where a caregiver suspects that illness might be AIDS-related they give the patients appropriate counseling and advise them to be tested.

In sites with onsite medical services, counseling and testing will be provided by trained nurses and counselors, though the majority of patients in the AIDSRelief program receive free counseling and testing in public sector facilities. Commodity procurement (test kits) is provided for by Department of Health.

All activities will continue to be implemented in close collaboration with the South African Government's HIV and AIDS Unit and the respective provincial authorities to ensure coordination and information sharing, thus directly contributing to the success of the South African Government's own rollout and the goals of PEPFAR. These activities are also aimed at successful integration of AIDSRelief activities into those implemented by the South African Government, thus ensuring long-term sustainability.

FY 2008 COP activities include the provision of PITC for all patients visiting the partner treatment sites, as well as family-oriented CT which will try to include all members of a family of the person currently on ART. These activities are in line with the efforts to encourage testing for HIV for increased number of people, while leaving them the option of refusing the testing if they feel they should not have it. Application of rapid tests of a non-blood nature, are being considered as one of the tools in the implementation of the program, along with PCR testing for children younger than 12 months. It is hoped that the increased rate of voluntary testing for HIV and AIDS will assist additional people who are in need of treatment across the program.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 9227.09	Mechanism: N/A
Prime Partner: AgriAIDS	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 21169.22584.09	Planned Funds: \$155,038
Activity System ID: 22584	

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

AgriAIDS will work in FY 2008 to raise awareness of HIV/AIDS and implement strategies to combat the disease among the following target groups: 1) farm workers; 2) farm owners; and 3) commercial agriculture businesses. Working with other non-governmental organizations (NGOs), as well as the Department of Health and Agriculture, AgriAIDS will work to prevent new infections among farm workers. This project will work to ensure that farm workers and, to the extent feasible, their families access counseling, testing, care, treatment, and prevention messages and services.

BACKGROUND:

AgriAIDS was established to address the devastation of the impact of HIV/AIDS on farms and therefore reducing the direct effects of HIV/AIDS on farm workers. This requires intervention on two levels:
-Direct: facilitating rapid access to information, VCT, medical care - and ART for farm workers; and
-Indirect: lobbying the commercial agricultural sector to start viewing HIV/AIDS as an "occupational health threat" and encourage spending on care and treatment programs at the farm level.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

In FY 2008, AgriAIDS will organize large-scale voluntary counseling and testing (VCT) days on farms in conjunction with PEPFAR service partners. These VCT activities will use mobile providers as necessary. Results will include increased access to testing services, as well as to referral for patients in need of HIV care and treatment services.

ACTIVITY 2:

AgriAIDS will work with our treatments partners to develop and monitor systems to ensure workers who test positive enroll into care and treatment (when necessary) services. Results will include: 1) increased access to HIV /STI care and treatment services, as well as TB services; 2) minimizing "lost to initiation" in farming communities among farm workers who test HIV positive; and 3) an increase in female farm workers accessing reproductive health services and/or PMTCT via links to HIV care and treatment services.

ACTIVITY 3:

In FY 2008, AgriAIDS will ensure that adherence and counseling support services are available at the farm level for those individuals in need of such services. AgriAIDS will ensure that referral networks are developed and that tracking and tracing of clients is achieved and addresses issues related to loss to follow-up and loss to initiation of ART services.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 7279.09	Mechanism: CDC CT FOA
Prime Partner: African Medical and Research Foundation	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 15872.22572.09	Planned Funds: \$853,716
Activity System ID: 22572	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The African Medical Research Foundation (AMREF) will continue with the above activities. However, in line with the external Comprehensive HIV/AIDS Quality Assurance (CHAQA) review, and FY 2009 recommendations by the Centers for Disease Control and Prevention (CDC), AMREF will not implement Activity 2 (Community Mobilization and Sensitization). Thus, the key strategies to be employed will include 1) health system strengthening through human capacity development (training and mentoring), 2) strengthening referral systems for HIV and tuberculosis (TB), and (3) assessment of HIV-TB integration.

ACTIVITY 1: Health Systems Strengthening (training and mentoring)

AMREF will largely restrict its activities to supporting 180 public health care facilities to deliver quality voluntary counseling and testing (VCT) TB services and will support health providers to apply policy guidelines around provider initiated counseling and testing (CT).

The project will tap into previously developed and tested training curricula (from AMREF, the Department of Health and CDC/World Health Organization) on CT. Activities will focus on building the capacity of VCT services to improve quality, confidentiality, equity, access and demand for services and strengthen coordination between VCT and TB services.

AMREF will train mentors on mentoring and coaching of VCT staff and will develop a mentoring system and to support TB and HIV service management for clinic staff. AMREF will strengthen the district health information systems (DHIS) and improve health providers' ability to collect and analyze data, document results, and use data effectively in health service planning and management. AMREF will train government HIV/AIDS STI and TB (HAST) committee members in monitoring and evaluation (M&E) for comprehensive care.

AMREF strengthen and support HAST committees to encourage networking and collaborative service provision between TB and HIV/AIDS services in the supported local service areas (LSAs). AMREF will also document the model of VCT-TB integration in the supported LSAs.

AMREF will also use FY 2009 funds to care for health providers through counselors support systems aimed at reducing burn-out of counselors and help improve the quality of counseling services offered to clients;

ACTIVITY 2: Health Systems Strengthening (Referral Systems for HIV and TB)

With FY 2007 and FY 2008 funds, AMREF refined the Eastern Cape Department of Health's referral protocol for VCT and TB. FY 2009 funds will be used to scale-up and institutionalize the use of this referral system (and tools) for cross referrals from VCT and TB services in Eastern Cape, Limpopo and KZN provinces. AMREF will work in collaboration with service providers to monitor implementation of the referral system. In line with the mentoring strategy, monitoring of the referral system will involve checking the usage of the referral tools and tracking access to services for referred clients. This will enable accurate data and monitoring of the number of HIV infected clients that are undergoing screening for TB. AMREF will also expand referral systems from to include expansion sites.

The program will also strengthen the capacity of health service staff at VCT and TB clinics to monitor and evaluate and keep accurate records of patients and services.

ACTIVITY 3: HIV-TB Assessment

AMREF will largely restrict its activities to supporting health care facilities to deliver quality VCT-TB services and will support health providers to apply policy guidelines around provider initiated CT.

However, in line with external programme evaluation and recommendations (CHAQA), and as recommended by CDC under the FY 2009 COP review process, AMREF will redirect FY 2008 funding for sub-granting community-based organizations (CBOs) to increase 1) human resources support for mentoring of facilities, 2) M&E for an expanded programme (from one to three provinces, or 71 to 180 facilities), and 3) documentation of best practices which can be used in collaborating and working with CBOs in increasing access to HIV-TB.

Taking lessons from AMREF's FY2007 challenges in identifying and recruiting suitably established CBOs to conduct community mobilization and testing for VCT, AMREF plans to assess and document best practices for partnering with CBOs within a VCT-TB integration model. Thus, the above assessment will include documentation of constrains, opportunities and gaps in partnering with community-based organizations. AMREF will map CBOs and non-governmental organizations (NGOs) in supported sites to determine the service in terms of confidentiality practices, compliance with quality assurance methods for rapid testing, accessibility, quality, utilization of VCT services, data management; and client awareness/perceptions of local communities of VCT services and facilities. With the aim of expanding access to VCT services, AMREF will review the relationship between NGOs offering (or seeking to offer) VCT and the Department of Health, specifically to understand what role CBOs/NGOs can play in expansion of VCT services.

AMREF will assess clients' referral sources, perceptions, opening hours of and waiting times at the VCT service; application of existing policies and guidelines on VCT related services; and audit the structural conditions of VCT facilities. AMREF will assess the extent to which TB staff from health facilities are testing TB patients for HIV and monitoring the CD4 count of TB patients.

SUMMARY:

Activity Narrative: African Medical Research Foundation (AMREF) will employ three key strategies: 1) Implement social marketing and stigma reduction strategies; 2) Health system strengthening (training and mentoring including sub-granting and support); and 3) Community partnerships. The project will tap into previously developed and tested AMREF training curricula, partnerships with government and community counseling and testing (CT) providers. The project will expand CT coverage by both improving and ensuring quality, accessibility, appropriateness and convenience of services and developing targeted social marketing campaigns to improve CT uptake.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: NGO VCT Assessment

AMREF will map NGO VCT sites surrounding selected facilities; assess the service in terms of confidentiality practices, compliance with quality assurance methods for rapid testing, accessibility, quality, utilization of VCT services, data management; and client awareness/perceptions of local communities of VCT services and facilities. AMREF will assess clients' referral sources, perceptions, opening hours of and waiting times at the VCT service; application of existing policies and guidelines on VCT related services; and audit the structural conditions of VCT facilities. AMREF will assess the extent to which TB staff from health facilities are testing TB patients for HIV and monitoring the CD4 count of TB patients. With the aim of expanding access to VCT services, AMREF will review the relationship between NGOs offering (or seeking to offer) VCT and the Department of Health, specifically to understand the role that NGOs can play in expansion of VCT services.

ACTIVITY 2: Social Marketing and Stigma Reduction

Key activities include: 1) Desktop review of VCT social marketing activities (Government, CBOs, etc); consultation at all levels (national to district); assessment of knowledge, attitudes and perceptions (KAP) about HIV/AIDS and VCT within local targeted communities; 2) Design and develop information, education, and communication materials; (3) Build capacity of local stakeholders in order to fight stigma; 4) Social marketing campaign and facilitation of access to wider sources of care and support for people living with HIV; and 5) Conduct monitoring and evaluation (M&E) and documentation of best practices.

ACTIVITY 3. Health Systems Strengthening

Activities will focus on building the capacity of VCT services through training and mentoring to improve quality, confidentiality, equity, access and demand for services and strengthen coordination between VCT and TB services. The program will also strengthen the capacity of health service staff at VCT and TB clinics to monitor and evaluate and keep accurate records of patients and services.

AMREF will train and mentor 30 VCT staff at selected VCT centers in HIV counseling and testing according to national and/or international standards; support TB and HIV linkages, TB symptoms and referral to TB testing; improve VCT service management and mentoring for clinic staff. To strengthen quality assurance AMREF will train 60 mentors in mentoring and coaching VCT staff and will develop a mentoring system to ensure that VCT testing staff are mobilising and referring. AMREF will strengthen the district health information systems (DHIS) and improve providers' ability to collect and analyze data, document results, and use data effectively in health service planning and management. AMREF will train 60 government HIV/AIDS STI and TB (HAST) committee members in M&E for comprehensive care.

AMREF will train 30 CBO carers, managers and nurses in ARV literacy; strengthen and support HAST committees to encourage networking and collaborative service provision between TB and HIV/AIDS services; mobilise and motivate TB patients for HIV testing and vice versa. AMREF will develop a referral system, tools and guidelines for health professionals, local NGOs/CBOS, primary health care and community service providers, in collaboration with VCT and TB nurses; and will monitor the implementation of the referral system.

Testing

Program Budget Code: 14

Planned Funds: \$1,165,086

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In partnership with the Department of Health, and as part of increasing counseling and rapid testing accessibility to the Hlabisa sub-district, and thereby increasing access to HIV treatment, the ART program has initiated two additional strategies. Two voluntary counseling and testing (VCT) models are going to be introduced in the communities, mobile VCT and home-based VCT.

Mobile VCT

This strategy involves partnership with the sub-district's traditional and political leadership in which the main purpose is to gain permission to deliver the service in the various communities. Various parking spots will be identified such as market places, schools, pension points, recreational facilities, in addition the counseling and testing trailer will also be part of the continuous road shows around the sub-district to encourage people to test. Various mobilization strategies will be used to invite the community to get tested for HIV near their homes. The trailer will comprise of confidential counseling and testing space and will be complemented with extra tents which will be used as additional counseling spaces as well as education area.

Home-based VCT

A portion of the sub-district will be allocated to deliver counseling and testing in homes. A group of trained counselors will work on a schedule to approach various households where they will offer counseling and testing to all family members. Since there is not much data on the effectiveness of home-based VCT, the cost-effectiveness of the component will be evaluated through administering a basic questionnaire to those visited in their homes.

Counselors have been trained in couple counseling and at the clinic level people living with HIV and AIDS (PLHIV) are encouraged to bring their partners to the clinics. Strategies will be developed to make services more male friendly in an effort to reach couples. Also, rapid tests are offered in all the clinics. Training will focus on advanced skills (family, couples children counseling) and healthcare providers will be trained on routine offer CT. Training will be a major focus in the activities around CT and will be held in all the rural clinics. CT will be linked to the wellness program and will include STI screening.

Funding from CT will be needed for the HIV awareness campaign and for community mobilization.

SUMMARY:

The Hlabisa antiretroviral treatment (ART) program aims to deliver comprehensive, integrated, safe, effective, efficient, equitable and sustainable ART and related services to all who need it in the community. Counseling and testing (CT) is part of this program in the Hlabisa District set in rural KwaZulu-Natal, South Africa. The target population for the program is adults and people affected by HIV and their families. The major emphasis area of this program is community mobilization/participation. Minor emphasis areas include information, education and communication (IEC), local organization capacity development, and quality assurance and supportive supervision.

BACKGROUND:

The Africa Centre for Health and Population Studies' Hlabisa ART program is a partnership between the KwaZulu-Natal Department of Health (KZNDOH) and the Africa Centre, a population research department of the University of KwaZulu-Natal. The Hlabisa ART program is comprehensive and integrated. CT-related activities fall within this program. The program is based in Hlabisa District, a rural health district in northern KwaZulu-Natal, and provides health care to 220,000 people at one government district hospital and 13 fixed peripheral clinics. The ART program is embedded in the Department of Health's antiretroviral therapy rollout where the Africa Centre and KZNDOH work to complement each other's abilities and resources in providing ART. The Africa Centre has expertise in infectious diseases and management that are not available at the district Department of Health (DOH). In addition to clinical staff and infrastructure, the district DOH provides the necessary drugs, laboratory tests, and rapid test kits for effective rollout.

With FY 2008 funds, the Africa Centre will continue to improve and expand CT services by providing additional human resources and training. Africa Centre will link CT services to prevention of mother-to-child transmission (PMTCT) services, TB/HIV, palliative care, and treatment programs. Increased attention will be given to addressing gender inequality (including increasing male involvement in CT and care) and to promoting ART services among men and children.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Partnership with South African Government

Africa Centre will expand CT and provider-initiated testing and counseling (PITC) in collaboration with DOH. The Africa Centre will work closely with the DOH to ensure that all patients who enter the 14 clinics will be offered an HIV test.

ACTIVITY 2: Counseling

Counseling centers were established in partnership with another of Africa Centre's donors, the Wellcome Trust-UK. PEPFAR funds will be used to expand and promote the center at Mtubatuba. Another testing center will be established at Hlabisa. A mobile testing center will be used during road shows and other public events. The traditional leaders will be approached for testing in their Isigodi. (Isigodi is the

Activity Narrative: geographical area where a traditional Zulu authority called the Induna is in charge.)

The Africa Centre covers a research area of approximately 90,000 people in 11,000 households. Funded by the Wellcome Trust UK, all inhabitants older than 15 years are offered an HIV test annually. Approximately 10,000 people are participating in that study each year. This study is one of the most reliable sources for incidence data in Africa. The method used for HIV testing is a dried blood sample on filter paper analyzed in the Africa Centre Virology Lab in Durban. The Africa Centre will return the test result within three weeks of testing; clients will be provided with post-test counseling together with their test results at one of the Africa Centre centers. PEPFAR funds will be used to fund HIV counselors accompanying the study team. Counselors will offer rapid tests for HIV. A small study suggested that 20% of the participants of the study are interested in a rapid test.

Moving away from clinics and offering the CT in a broader range of settings (e.g. close to a supermarket, in town), Africa Centre hopes to attract hard-to-reach people to CT. Further, it is hoped that CT centers in non-clinical settings will help to minimize the stigma attached to taking up HIV testing and counseling. The counseling centers will offer rapid testing with pre- and post-test counseling. CT services will follow South African government protocols. CT counselors will refer clients to appropriate further services, including the ART programs, TB programs and government support services (disability grant, food help). CT counselors will encourage clients to disclose their status to partners. Prevention counseling will be specifically aimed at people who are at increased risk for HIV and will be tailored to the individual needs of the patient. Clients will be counseled on personal risk reduction including messages about partner reduction and behavioral changes to achieve healthy life styles. Counseling and testing takes place in separate closed rooms in order to ensure confidentiality. All clients will receive their test results during the post-test counseling session.

ACTIVITY 3: Community Mobilization

For several years, the Africa Centre has been conducting road shows to provide information, education and communication (IEC) services to rural Zulu communities. These road shows and other community events will be used to promote CT. Specifically, the community will be informed that rapid testing will be offered at the CT sites. The road shows will also be a forum to reduce the stigma around visiting a CT center. Appropriate materials will be developed for informing the community about CT and other services offered through the Africa Centre. All possible efforts will be made to encourage couples and youth to receive counseling and testing. PLHIV have to play a major role in the community mobilization. Africa Centre will involve PLHIV in educating the community about HIV, sharing their experiences with the people, and through that getting more people tested. A behavior change communication specialist will be employed to develop an appropriate strategy (such as the Stepping Stones strategy).

ACTIVITY 4: Referral and Linkages

Africa Centre will strengthen the referral system from the Department of Health's TB program to CT by providing training to direct observation treatment supporters (DOTS) on the need for HIV testing for patients who receive TB treatment. HIV-infected people will be referred for CD4 testing and treatment where applicable. The counselors will inform clients on where to enroll in the ART program and on how to access government support programs, such as disability grants and food aid.

ACTIVITY 5: Human Capacity Development

PEPFAR funding will be used to provide CT centers with additional CT counselors. As part of capacity building, counselors are recruited from the local area, and trained and provided with mentoring and supervision on a regular basis by Africa Centre. In addition, Africa Centre will conduct counselor-debriefing sessions to discuss their work with their peers and support staff. Counselors will participate in short courses to refresh their counseling skills. These courses will incorporate education on new initiatives that had not been a part of their initial training. In addition, Africa Centre will provide training and mentorship to medical staff in order to strengthen their knowledge about CT and to introduce provider-initiated testing and counseling into the clinics.

Funding will also be used for additional staffing in clinics and hospital.

These activities will contribute to the PEPFAR goals of 2-7-10 by contributing to the 10 million people who will receive care through PEPFAR assistance by providing counseling and testing to many individuals in Hlabisa district.

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 19513.22562.09

Planned Funds: \$506,812

Activity System ID: 22562

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

The program will be implemented in at least eight provinces in South Africa. The program will be expanded to South African Council on Alcoholism and Drug Dependence (SANCA) and LifeLine Southern Africa centres on a national basis who have the capacity and agreed to provide voluntary counseling and testing (VCT) services and also include non-governmental organization (NGO) partners who operate government approved medical and non-medical sites. This VCT project is unique in the sense that it will focus its training and activities to reach hard-to-reach populations, like couples, substance abuse persons, children, adolescents and families. The selection of such partners will be coordinated with the provincial VCT coordinators who do not receive other PEPFAR funding for VCT services.

Activity 2, Training, has been modified as follows:

Counselors will be trained on counseling couples, as well as counseling substance abusers, children, adolescents and families. AED will sub-contract an accredited Health and Welfare Sector Education and Training Authority (HWSETA) training provider to train counselors on accredited HIV training courses and also submit a new developed training curriculum, together with the sub-contractor, to HWSETA for pre- and post-test counseling, as per South African Qualifications Authority (SAQA) unit standard 252533. AED will approach SANCA to share existing training material for substance abuse counseling and include it in the new curriculum for refresher trainings. AED will arrange trainee assessments by the sub-contractor and coordinate certification of successful candidates. During 2009/10, the project team will focus its activities on technical assistance and partner support through on-site visits. Partners will be monitored and guided following the VCT training workshops in 2008/09.

The AED training curriculum addresses sero conversion and the effect it has on test results. This aspect is discussed in detail and forms part of the protocol when a negative client is counseled. Based on the client's risk, the client will be requested to return for VCT again.

Negative clients will also be referred to support them in maintaining their HIV negative statuses. This can be done by referring them to organizations that support a positive lifestyle like churches, sport facilities, etc. to follow the ABC principle (Abstinence, Be-faithful and Condomize). Prevention of new HIV infections and the identification of HIV negative clients remains as important as the referral and treatment of the already infected clients. These clients will be requested to tests regularly and collect condoms as necessary.

Outreach to these specific populations through test events will become an important part of the project to increase VCT access and to make communities aware of partner organisations' existence within their communities who provide VCT and other essential community services and support.

AED will provide HIV rapid testing quality management systems training to professional nurses employed at partner sites to ensure general quality control including quality assurance of testing services, through coordination with the National Institute for Communicable Diseases (NICD).

Activity 3: Technical Assistance (TA)

Referrals, data management, procurement systems and VCT services will be strengthened through on-site technical assistance and support by the project team. AED will develop and strengthen partnerships between health-care facilities, district VCT coordinators and its NGO partner sites and the establishment of effective links for referral. AED will further promote the usage of NDOH approved kits on tender and will coordinate with provincial and district representatives on the supply of rapid test kits and possibly other VCT commodities.

Based on a flat-line budget approval, each partner site will be visited on average 1.8 times in the year. All 40 partner sites will be visited during the first four months and at least 32 will receive second visits between the sixth and eighth months of the financial year. These on-site visits will be doubled in the event of a 10% increase in funding and an additional technical support person will be employed to assist the project team.

In addition, or as an alternative to TA visits, the project team will also provide telephonic assistance and support by means of regular follow-up calls, as well as through e-mail communication. Monthly data reporting will be evaluated to monitor on-site progress.

AED will focus on establishing non-medical sites at participating SANCA centres and promote VCT in addition to their existing services. AED will promote and support outreach to communities through test events, but also put emphasis on door-to-door visits and offering VCT to existing and new SANCA clients.

AED will link up with VCT activities of the Medical Research Council (MRC) especially SANCA sites in KwaZulu-Natal.

Specific strategies will be developed and discussed with partner organizations to reach more men with VCT services. Outreach events to workplaces and schools can ensure that more men are reached, or by offering after hour VCT services and deploying more men counselors. More men will also be reached through provisioning and promoting couple and family counseling on and off site. Outreach test events at malls and pay points can play an important role in reaching men as a specific target.

As part of the technical assistance visits from year two onwards, a certain set of operational questions will be developed as an on-site checklist in collaboration with the Centers for Disease Control and Prevention (CDC) to monitor the impact of program implementation during the full period of the project. This data will be processed after each visit.

Activity Narrative: The initial assessment data, which will serve as baseline data, will be compared to the technical assistance data which will be collected during each on-site visit. The program impact will be evaluated as the project continuous.

AED will support outreach events in collaboration with partner organizations based on planned activities and through on-site technical assistance and possible attendance of the events where possible.

SUMMARY:

The Academy for Educational Development (AED) in partnership with South African Council on Alcoholism and Drug Dependence (SANCA) and Lifeline along with a host of collaborators, seek to build on its success under the community voluntary counseling and testing program previous funded by PEPFAR. AED will collaborate with some of the same organizations and networks providing a mix of training along with several strategic testing events seeking to capture clients who may visit service outlets. The program will be implemented in four provinces.

BACKGROUND:

AED proposes to build upon a previous program to expand counseling and testing (CT) in South Africa that was funded by PEPFAR until FY 2006.

ACTIVITIES AND EXPECTED RESULTS:

Activity 1: Outreach and HIV testing

This activity will be implemented through enhancing current CT sites and creating selected new sites, especially in organizations with proven outreach to at-risk and underserved populations. AED will work with Lifeline and align its activities with the its workplace prevention program to hold testing days at selected worksites. AED will also support linkages to SANCA' s home visiting counselors with CT counselors to support family testing. SANCA clients who have alcohol and drug dependency problem will all be offered HIV testing by their counselors and this will be extended to their family members.

AED will hold testing events at locations frequented by youth and adolescents. Prior these events AED will conduct community campaigns targeting youth and adolescents.

Activity 2: Training

AED will train staff from SANCA who work with high risk populations on HIV counseling and testing. Refresher courses will be held for all other counselors. Counselors will be trained on couple HIV counseling and testing.

All of the above activities will contribute towards meeting PEPFAR's 2-7-10 goals.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 2787.09	Mechanism: N/A
Prime Partner: Absolute Return for Kids	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 7883.22557.09	Planned Funds: \$363,214
Activity System ID: 22557	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

BACKGROUND

FY 2009 funding will allow Absolute Return for Kids (ARK) to provide CT support within the prevention of mother-to-child transmission (PMTCT) program to 13 sites in the Amajuba District of KwaZulu-Natal and to a further three sites in the Eastern Cape. The Nelson Mandela Metropole in the Eastern Cape will be a focus area for ARK with FY 2009 funding.

Activity three, referrals and linkages, will be modified in that all HIV-infected individuals will be referred for tuberculosis (TB) screening and treatment as appropriate.

Alignment with HIV & AIDS and STI Strategic Plan for South Africa 2007-2011 and other South African Government policies

CT activities align with the HIV & AIDS and STI Strategic Plan for South Africa 2007-2011 Key Priority Areas 1 and 2, Prevention, Care and Treatment. Counseling is the doorway to knowing your status, which, if negative, will encourage clients to remain so, thus assisting to achieve the goal of reduction in new infections by 50%. It also opens the door to care and treatment in that, once found to be HIV-infected, patients will be counseled to access care and treatment, thus ensuring access to care for 80% of those in need.

Gender Related Activities

While ARK CT activities are not couple-focused, through our Community Access and Adherence (CAA) programs, ARK patient advocates will assist the partners of HIV-infected women during home visits to be tested, as well as facilitate this testing in any of the sites providing care for women including the family planning clinics. The ARK patient advocate will offer support to all pregnant women for safe disclosure and will also facilitate partner testing and male partner support for the pregnant women. The regular home visits undertaken by ARK's patient advocates ensure that the entire family receives palliative care and male partners are educated on prevention, testing, treatment and care.

SUMMARY:

ARK's focus is to provide antiretroviral treatment (ART) and accompanying support to primary HIV-infected caregivers with children. This includes the encouragement and support for the voluntary counseling and testing (VCT) of partners and children, to ensure complete family coverage and earlier access to ongoing treatment, care and support. Although the primary focus of ARK is on the caregivers of children, ARK offers its services to the entire population in all of its service areas. CT services will be delivered in all of ARK's supported communities.

The primary emphasis areas for these activities are community mobilization, local organization capacity development, human resources, and training. Primary target populations include adult women and men and their families.

BACKGROUND:

ARK is a charity organization whose mission is to facilitate and support delivery of accessible and sustainable comprehensive treatment, care and support services to children and their caregivers in communities affected by HIV and AIDS and poverty.

In partnership with the KwaZulu-Natal (KZN) provincial government, ARK has established a comprehensive ART program in government primary health centers and hospitals. ARK works with the provincial government to identify sites and areas for capacity building in areas such as human resources, human capacity development, modest infrastructure improvements and service delivery. ARK's activities enable the provincial government to increase the number of patients counseled, tested, and provided ART and related services.

To date, PEPFAR funding has enabled ARK to provide over 15,000 patients with ART in KZN through the sustained development of primary care facilities and their down referral sites in five districts, in primarily peri-urban and rural communities.

With FY 2008 funding, ARK will focus on provider driven opt-out testing to all pregnant mothers entering the antenatal clinics, and CT services to children and spouses/partners of caregivers and other household members. This activity will be linked to home visits undertaken by ARK's community adherence workers. Home visits serve to evaluate the psychosocial situation of patients, the degree of family support, and issues related to disclosure. Although ARK's treatment target population is predominantly mothers, caregivers, and their spouses/partners and children, increased attention is given to encourage men, single women and children to come forward for testing and treatment.

ACTIVITIES AND EXPECTED RESULTS:

ARK's primary objective is to keep mothers alive to continue caring for their children and to reduce the incidence of orphans and vulnerable children (OVC). Early, widespread testing and access to ART reduces the likelihood of morbidity and mortality from HIV. This, in turn, increases the likelihood of survival of family units, which guard income security and ongoing nurturing required by children in these households. Furthermore, the psychosocial component of counseling and testing forms a vital component for behavior change.

Activity Narrative: ACTIVITY 1: Support to Provincial Government for CT Services

ARK works with the KZN provincial government to develop the necessary processes and systems to manage a comprehensive HIV and AIDS treatment program, and to ensure that the model created is scalable, sustainable, and replicable elsewhere. ARK, in partnership with KZN provincial government, will provide training and mentoring for government employed lay counselors and community adherence workers working at these primary sites where ARK's ART program exists. ARK will ensure that management systems are in place to support the work of the counselors and the delivery of CT.

ARK will strengthen or initiate CT services at all sites identified by the provincial health department and assigned to ARK for support. To ensure sustainability, where possible, ARK will use the counselors available through the district HIV program. ARK will also employ counselors and train existing employed community care workers to provide counseling for CT services. Where infrastructure support is required, ARK will, in consultation with the facility managers and district managers, decide on the most cost-effective infrastructure support (prefab or modest renovations). ARK's OVC program, through the social workers and community workers placed at schools, will establish links with clinic services to ensure better and more efficient referral of children in need of testing and care, including their caregivers and immediate family.

ACTIVITY 2: Human Capacity Development

Formal and informal training and on-site mentorship will be provided to all lay counselors in the program. ARK, in partnership with the Centre for Social Science Research at the University of Cape Town, will continue to develop and improve training modules for lay counselors. The areas covered in training include basic and advanced counseling skills, positive living, disease progression, opportunistic infections, risk reduction for HIV transmission, and safer sex. Counseling and ongoing training will be in line with the National Department of Health's (NDOH) guidelines. ARK will provide mentorship and supportive supervision to lay counselors in the program to ensure high-quality standards for CT. Nurses conduct testing, in accordance with NDOH standards, at the CT sites. Support in terms of systems management and coordination of lay counseling will be provided to CT sites.

ACTIVITY 3: Referrals and Linkages

Community care workers and social workers will be recruited to assist OVC and their caregivers in accessing ARK-assisted primary health facilities for CT. They will coordinate the referral system between caregivers, children and CT services. ARK will inform and coordinate activities with local NGOs, CBOs, and FBOs to establish effective referral networks for CT services. Lay counselors will refer HIV-infected individuals to ARK's ART sites.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 4094.09	Mechanism: N/A
Prime Partner: Research Triangle Institute	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 21158.23051.09	Planned Funds: \$506,205
Activity System ID: 23051	

Activity Narrative: SUMMARY:

USAID, through Research Triangle Institute (RTI), will provide support to strengthen the HIV-related clinical, psychological and social care services for the Thuthuzela Care Centers (TCCs) for rape victims in all provinces.

BACKGROUND:

This is the third year of support to the TCCs. Thuthuzela means "to comfort" in isiXhosa; TCCs are multi-disciplinary centers that provide comprehensive care for rape survivors with an emphasis on women and children.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

RTI will help the South Africa National Prosecuting Authority's (NPA) Sexual Offenses and Community Affairs (SOCA) Unit to establish eight new TCCs in FY 2009, eight in 2010 and seven in 2011, making a total of 23 TCCs. It will fund three core staff in each TCC. The program focuses on refurbishment of TCCs in order to meet health and TCC blueprint standards. RTI understands that it cannot use the funds for new construction without special waivers. RTI will orient and train TCC staff, doctors and forensic nurses; provide both core multi-disciplinary training and on-site training; and support all TCC staff by conducting training focusing on the delivery of post-exposure prophylaxis (PEP), HIV counseling and testing (CT), protocols for care and treatment of victims and follow-on psycho-social counseling for TB, PEP, ARV and secondary prevention adherence.

ACTIVITY 2:

Through the grants component, RTI will support referral systems for treatment and care and follow-on psycho-social counseling for children who tested positive by providing assistance to non-governmental organizations (NGOs) and working closely with them. With additional funding from the PEPFAR Special Initiative on Sexual and Gender-based violence, RTI will pilot improved models of care at selected TCCs to inform SOCA's national "blueprint" for TCC care services and future Women's Justice and Empowerment Initiative (WJEI) program implementation.

ACTIVITY 3:

RTI will also develop pilot models based on existing best practices in rape care currently offered through the SAG's Department of Health and NGO-supported services. RTI will strengthen health care services at TCCs, with special attention to improving PEP adherence, health care follow-up and referrals and will explore strategies for explicitly raising community awareness of TCC services and for strengthening TCC linkages with community networks to help facilitate victims' access to services.

Testing

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 8254.23043.09

Planned Funds: \$145,636

Activity System ID: 23043

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Project Support Association of Southern Africa (PSASA) will strengthen links between the specific home-based care (HBC) programs and the household counseling and testing (CT) program in 40 different sites within five municipalities.

NEW AREAS:

Lay counselors will be motivated to mobilize more men when mobilizing their communities to have them tested. Further, counselors will be encouraged to mobilize couples to come for testing. Specific training will be included in the curriculum on couples CT. Training will also include CT of family members including children

Referral skills for staff will be included in the training to ensure that people tested positive are effectively referred to health facilities. Staff will need to provide feedback on successful referrals made by visiting health facilities situated within the sites where testing was done. Professional nurses will attend sexual and reproductive health training by Family Health International master trainers in order to obtain knowledge on family planning and referral information thereof.

Tuberculosis (TB) screening and referral will be done to identify possible TB clients that need to be referred to health facilities for further attention.

The number of clients tested and referred will be communicated to the health facility within the site where testing took place.

SUMMARY:

The Project Support Association of Southern Africa (PSASA) will use FY 2007 funding to expand access to integrated services for HIV-infected and affected individuals in home-based care (HBC) programs by strengthening the linkages between HBC and voluntary counseling and testing (CT). This will be done by establishing referral mechanism with Family Health International's Mobile Support Units (MSU) and through strengthening referral systems with provincial Department of Health clinics. PSASA will refer HBC clients and community members to CT from underserved areas in Mpumalanga and KwaZulu-Natal provinces. The emphasis areas for the following activities are the development of network/linkages/referral systems, training and local capacity development. Target populations addressed are people living with HIV (PLHIV) and their families, health professionals, volunteers, and caregivers.

BACKGROUND:

PSASA is a non-profit organization who aims to create community partnerships prevent, mitigate, and alleviate the impact of HIV and AIDS. Home-based care programs are an integral component of this activity. Care at the home and community level is a strategy within the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011. PSASA has established, and continues to support over 60 HBC programs. Many of these programs were established in partnership with the Mpumalanga Department of Health from 1998 onwards. In 2004, 127,614 clients received direct support from a PSASA project and more than 32,000 household members received training from community caregivers. Currently, PSASA will refer HBC clients to CT when a government clinic is nearby; however, much of the population lives in areas where access to CT is limited. These projects will be expanded under PEPFAR as part of PSASA's ongoing core activities. Tighter links between HBC and CT and antiretroviral treatment (ART) services will afford men and women the opportunity to improve their overall quality of life through integrated services. This project addresses the need to establish formal referral and follow-up mechanisms for CT and ART and other essential healthcare services in HBC programs. Through the use of MSUs, PSASA's referred clients will have better access to CT, diagnosis and treatment of sexually transmitted infections (STIs), ARV services, and family planning (FP). These integrated mobile services target HIV-infected individuals and their families, orphans and vulnerable children (OVC) and their families, HBC caregivers, as well as the surrounding communities.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Counseling and Testing Referral

In close collaboration with the Mpumalanga Department of Health, PSASA will, through referral, expand access to quality, integrated services for infected and affected individuals. Services that will be targeted for referral to MSUs will include CT, ARV services, and STI screening in rural and underserved areas. These projects in Mpumalanga, where existing home-based care programs are operating, will have limited associations with existing referral facilities such as private or government CT providers. A Testing Coordinator will provide training in CT referral, follow-up, and communication skills to each of the HBC Coordinators. Mentoring and didactic case scenarios will also be used. The HBC Coordinators will assist the HBC worker to counsel one person or family per week and encourage or refer them for CT. The testing will be conducted by FHI but the home-based care workers will provide follow-up counseling. PSASA will strengthen links between the HBC program and the CT facility in 37 municipalities where PSASA-run HBC programs will not be reached by the MSU and where government or private access to CT is available. A tracking system will be formalized to track CT referrals. HBC workers, of which many are traditional healers, will receive additional training in CT referral and follow-up. This will be augmented through CT mentorship and follow-up by project coordinators. PSASA will continue to provide ongoing basic care and support services for its clients and refer clients and their family members, OVC and their family members and community members for CT. In many cases, PSASA's home-based care workers will accompany individuals (with consent) for CT. Working with the Testing Coordinator, the PSASA home-based care workers conduct

Activity Narrative: community outreach to promote CT.

These activities will contribute to the PEPFAR 2-7-10 goals by increasing the number of people receiving counseling and testing and by increasing the number of people receiving ARV treatment.

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 9445.23047.09

Planned Funds: \$881,581

Activity System ID: 23047

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

All program areas described in the FY 2008 COP will continue in FY 2009, including counseling and testing (CT) tailored to underserved groups such as adolescents, men, couples and women at risk. Through the further implementation of the Reproductive Health Research Unit's (RHRU's) HIV standards materials at RHRU-supported sites, routine testing offers will be emphasized at all primary health care (PHC) sites, and bedside testing services will be increased at RHRU supported hospital sites. Where PHCs do not have space to offer CT, RHRU will provide mobile testing units to render this service. At all sites, patients who test positive will be given CD4 test results. Patients not collecting these tests will be followed up by clinic staff to ensure maximum referral into care and treatment. Those referred for care and treatment will also be followed up as necessary. In addition, RHRU will continue to hold CT "events" at selected sites in order to increase the numbers of those tested and referred. RHRU plans to build on the recent piloting of "health days" that provide a holistic, approach to testing, by offering it as part of a package of health tests and demonstrations, in order to reduce stigma and increase HIV testing uptake. These events will be targeted at different groups, and in particular young people and men, in underserved communities. Psychosocial support will be provided within an enabling environment in collaboration with our sub-partner ECHO.

Increased attention will be directed at family-centered testing at the PHC level. Furthermore, RHRU will pilot a case-finding/family testing program at Selby Hospital, Johannesburg. Active case finding will be coupled with testing of families during hospital visiting times, and follow up for those who require further referral.

RHRU will explore opportunities to develop a youth center with other non-governmental organization (NGO) partners within the Hillbrow Health Precinct, where, together with a package of health- and social-related services, counseling and testing will be offered in a youth friendly manner.

RHRU will pilot a telecommunication system based on "short message services (SMS)" to increase repeat CD4 measurements across selected sites in KwaZulu-Natal, Gauteng and the North West province. Mobile CT vehicles will be used to provide services in areas where site-based CT services are hard to access. These vehicles will be equipped with CD4 measuring machines for rapid provision of results with defined linkages to treatment and care services.

RHRU will provide additional training in counseling and testing to existing teams of nurses and counselors at supported sites. This training is given in the context of an expanding antiretroviral (ARV) treatment and down referral program, and is tailored at capacitating staff to effectively deal with the challenges this presents.

SUMMARY:

The Reproductive Health and HIV Research Unit's (RHRU) PEPFAR-funded program, subsequently referred to as the "Follow-on to the RHRU Program" (FRP), was re-competed through an Annual Program Statement (APS) in 2007, and awarded to the RHRU. PEPFAR funds will support the FRP to continue to provide counseling and testing (CT) services, and to expand services tailored to target groups such as couples, pregnant women, young people, children, and families, as part of an integrated prevention, care and treatment program. FRP will also provide training and mentoring in voluntary counseling and testing to Department of Health (DOH) staff, to ensure the implementation of provider-initiated testing and counseling (PITC) in TB, STI, antenatal/postnatal and contraceptive services at all levels. Major emphasis in this program area is on quality assurance and supportive supervision, with additional emphasis on the development of network/linkages/referral systems, human resources, and training. These activities target HIV-affected families (children, youth, and adults), sex workers, men, pregnant women, discordant couples, and public health workers.

BACKGROUND:

RHRU, a unit of the University of the Witwatersrand in Johannesburg, currently provides technical support to the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa, which includes the national antiretroviral (ARV) roll-out strategy. Under PEPFAR funding since FY 2004, RHRU has provided regular on-site support, direct treatment, training, and quality improvement to DOH sites in three provinces (Gauteng, KwaZulu-Natal and North West). The FRP will continue these activities, which include inner city, district wide and rural programs focusing on providing support to a complete up and down treatment referral network. In addition, FRP will continue the provision of counseling and testing (CT), palliative care, and prevention services. FRP will seek to develop models of service delivery that can be replicated and expanded, and produces findings from lessons learned and targeted evaluations to disseminate and share with others. It should be noted that the success of ARV treatment scale-up depends on the comprehensive approach detailed in other program areas. In particular, the strengthening of referral from other primary healthcare programs such as TB, family planning, antenatal/postnatal and STI services is critical.

In FY 2007, FRP will continue to focus on further strengthening DOH adult and pediatric treatment, and on continuing the development of a family-based approach to HIV care and treatment in the public sector. Furthermore, FRP will continue to develop strategies to address underserved communities affected by HIV, such as couples, high-risk groups such as adolescents, and gender-based interventions with women at risk, including pregnant women and sex workers, and men. FRP places strong emphasis on quality assurance for all interventions supporting CT and will draw on the tools that have a proven track record in terms of improving quality of care, such as pocket reminders for counselors, wall charts with trigger messages for clients and counselors, and routine performance assessments.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Counseling and Testing

Activity Narrative: PEPFAR funds will support FRP to continue to directly provide CT services at multiple sites, and to expand services tailored to target groups such as couples, family planning clients, children, families, men, pregnant women, and sex workers as part of an integrated prevention, care and treatment program. Discordant couples will be targeted for prevention education, and concordant couples can benefit from referral to a wellness program. Both groups will benefit from fertility and family planning advice. FRP will work closely with the national DOH and will ensure that CT is integrated into other health programs at all levels. In addition, FRP will focus on integrating provider-initiated testing and counseling (PITC) into TB, STI, antenatal/postnatal and family planning services as recommended in the HIV & AIDS and STI Strategic Plan for South Africa, 2007 - 2011.

ACTIVITY 1.1: Gender-based Voluntary Counseling and Testing

Approximately 70% of individuals currently accessing antiretroviral treatment (ART) are women. FRP will continue to develop services that aim to address this gender inequality, and to increase the number of men who obtain HIV care. This will be done through the development of male-friendly CT methods, such as family-centered counseling and testing, and interventions to encourage health-seeking behaviors. This program will contribute towards increasing gender equity in HIV and AIDS programs.

ACTIVITY 1.2: Family-Centered Testing

Children and families have special needs that will be addressed in the program. Previous work in antenatal clinics and in pediatric treatment will have given FRP the opportunity to promote family testing to DOH staff and community social workers, and to develop approaches to this activity. A youth-friendly CT model will continue to be developed and implemented in the inner city of Johannesburg and Durban. Mobile CT units will be utilized to increase access to CT for families at weekends and to other hard-to-reach groups. Age-appropriate counseling and testing techniques will be developed, and opportunities to scale-up counseling and testing of this group will be identified and interventions implemented accordingly.

ACTIVITY 2: Human Capacity Development

FRP will train counselors, doctors, nurses, and other healthcare workers to provide comprehensive and appropriate CT services, in line with South African guidelines. This includes appropriate referral, and updates on new practices and current debates in an evolving field. In addition, FRP staff will provide mentoring to local NGOs, lay counselors, and DOH staff in the public sector facilities in which they work, through weekly supportive supervision sessions with all counselors and regular meetings to discuss the development and application of new practices.

In FY 2008, RHRU will continue to undertake monitoring and evaluation activities to inform and develop quality HIV care. RHRU will be in a position to conduct targeted evaluations (TE) and Public Health Evaluations (PHEs) of some of its counseling and testing projects in FY 2008 and FY 2009. For each PHE, a detailed proposal will be developed and submitted to PEPFAR for review and funding approval.

These activities expand CT services to important high-risk populations, and serve as a critical entry point into HIV care and treatment programs, thus contributing to the 2-7-10 goals by enabling access to treatment and prevention for those who test.

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. University of KwaZulu-Natal (UKZN), Nelson Mandela School of Medicine is funded to empower Traditional Healers Practitioners (THPs) and strengthen their work in the prevention of HIV and AIDS. One of the aims of the project was to train THPs to counsel and test their clients for HIV, however, the project has since been informed that although THPs handle blood on a daily basis in their practice during scarification practice, they are not by law permitted to perform HIV tests. THPs are now referring their clients for and HIV test to the nearest clinic. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Program Area: Prevention: Counseling and Testing

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 3032.22999.09

Planned Funds: \$971

Activity System ID: 22999

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The National Department of Correctional Services (NDCS) will procure counseling and testing (CT) services in six regions (one drive per region).

The plan is to outsource CT services for employees and inmates to external service providers. The CT drives are planned to take place in the six regions, namely one per region, and to test at least 3,000 inmates and personnel. Sexual activity in prisons is rated as high risk due to the issue of men having sex with men (MSM), anal intercourse and coercive intercourse which may exacerbate sexually transmitted infections (STIs) including HIV.

One important aspect of HIV prevention and HIV/AIDS management is knowledge of one's HIV status which can be promoted through CT drives.

For those who test negative, the counseling is aimed at helping them ensure that they maintain this status. For those who test positive, it is intended to assist them to cope with the disease in the best way possible, to ensure that the effect on their quality of life is minimized and to discuss the available treatment and management options.

SUMMARY:

PEPFAR funds will be used by the Department of Correctional Services (DCS) to increase the uptake of members in HIV counseling and testing (CT) services in correctional centers as well as in other places of work. The major emphasis area for this program will be awareness raising and accessing CT services, with minor emphasis placed on mobilizing the incarcerated community and encouraging their participation; information, education and communication; logistics; and strategic information. Target populations will include offenders and DCS members (men and women of reproductive age, including people living with HIV (PLHIV)), and most at-risk populations (e.g., men who have sex with men, injecting drug users). To increase capacity, DCS will train nurses, social workers, psychologists, and spiritual care workers in counseling and testing.

BACKGROUND:

This is an ongoing activity intended to initiate the establishment of voluntary counseling and testing (VCT) in correctional centers. According to the National Department of Health protocols, only nurses can be trained to give the rapid test. Social workers, psychologists, spiritual care workers and nurses, will be trained in pre- and post-test counseling. Other professionals will play a role in the delivery of pre-, post-, and ongoing counseling, which nursing personnel will be unable to do because of time constraints.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Counseling and Testing DCS members

Voluntary counseling and testing services will be made accessible to all DCS staff members at each correctional center and where possible at other places of work (e.g., offices, etc). Employee Assistance Practitioners (EAPs) will run campaigns in correctional facilities focusing on staff members and encouraging them to be tested for HIV. In facilities where the correctional center clinics are not suitable to offer the testing service, the EAP will collaborate with local NGOs to provide the CT services. Couple counseling will also be strongly encouraged and the service will be made available to all DCS staff.

In order to ensure that CT services are enhanced and encouraged among members, a number of 24 regional CT roll-out campaigns will be held (at least four per region). The number of members who have undergone CT is not known at this point in time as members are making use of external healthcare providers (private doctors or health facilities) if they want to test for HIV.

ACTIVITY 2: CT Services for Offenders

With FY 2006 funds, nurses, social workers and psychologists working in prisons were trained in CT. Each correctional facility will have confidential CT services. Peer educators will be used to encourage offenders to use CT, as well as conduct other health campaigns in prisons. One-hundred and twenty CT roll-out campaigns will be held in 120 correctional centers, especially targeting those centers where CT sites have not yet been established.

These activities will contribute to both 7 million infections averted and 10 million people in care by promoting and providing testing and counseling as an entry point for prevention, care, support and management of HIV and AIDS.

Activity System ID: 22908

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

Salesian Missions will conduct a voluntary counseling and testing (VCT) Life Choices project serving youth and adults in the Western Cape.

BACKGROUND:

In 2004, the Salesians were granted support from the U.S. Government to start an HIV/AIDS outreach project - Life Choices.

In the end of 2005, Life Choices South Africa began its work with children and youth in the Western Cape. The vision of this project is to contribute to a South Africa with empowered and passionate youth equipped to make informed and healthy life choices. Life Choices achieves this by partnering with the Western Cape Department of Education and Health in order to deliver holistic approach to public schools. Life Choices bases its methodology in the fact that schools present the perfect opportunity for accessing young people from all walks of life as well as sustained and positive behaviour change requires significant investment of time, one-on-one support and resources. For these reasons, Life Choices runs different programs in each of the target schools that complement each other in order to create a supportive environment for healthy behaviours. This model calls for working on the same school for a period no shorter than four years. Running programs directly targeting young people (life skills, peer-education, VCT, welfare, career guidance, behaviour change communication and health promotion programs) as well as running programs targeting stakeholders in the lives of youth (parents and teachers programs).

As part of the successful education and peer training programs, the belief of normalization and importance of testing has been made a norm with all the youth, thereby creating an unprecedented demand. For this reason, Life Choices approached the U.S. Government once again to get support to expand the VCT component. In 2007, Life Choices was granted that support in order that VCT activities can be expanded in order to meet the demand created within youth to know their status. Life Choices also intends to take advantage of Life Choices' vast network within the Western Cape area and implement VCT with youth in the Western Cape area (rural and urban) via a mobile VCT unit going in this way beyond their initial targeted schools.

Outcome Objectives (5 Years):

- 1)100 different sites provided with mobile flexi-hour VCT services;
- 2)30,000 Youth & Adults know their HIV status;
- 3)30,000 Youth & Adults are screened for TB;
- 4)30,000 clients have access to care, treatment and prevention interventions;
- 5)90,000 people are reached with HIV/AIDS awareness and VCT mobilization campaigns;
- 6)300 clinic staff are trained and mentored in how their services can become friendlier to different targeted groups (youth, males, couples, etc).

ACTIVITIES AND EXPECTED RESULTS:

Life Choices will carry out eight separate activities in this program area.

ACTIVITY 1: Mobile youth friendly VCT in high schools

In FY 2009, 8,000 youth in high schools will be tested using youth friendly VCT services through a mobile unit. All youth will be invited to participate in group information sessions (30 - 40 minutes) where HIV/AIDS basic facts are discussed and after they are invited to the pre-counseling session. During this session, youth explores risk factors in their lives, support structures and they are also screened for tuberculosis (TB) and sexually transmitted infections (STIs), following the SA Government guidelines. After the pre-counseling session, a Life Choices lab technician conducts the test using a serial algorithm (First Response, Sensa and SD Bioline, as a tiebreaker). Results are given during a post-counseling session where a plan is made with the individual about how to maintain their negative status or how to manage his/her positive diagnosed. During all the procedure, all youth will receive strong messages about the benefits of abstaining, being faithful to one negative partner and information about the consistent use as well as the limitations of condoms. In the end of the procedure, all youth is referred to prevention, care and treatment programs in accordance with their particular situation. Clients who are diagnosed as HIV-infected will also be offered on-going psychosocial support given by a professional psychologist.

ACTIVITY 2 - Mobile VCT services in churches, community groups and workplaces

In FY 2009, 2,000 adults, couples and young people in churches, workplaces and community structures will be tested using VCT services through a mobile unit. The VCT services in church settings and community groups will be provided mainly after regular work hours and during the weekends. VCT services at the workplace will be provided during business hours. With this activity, Life Choices intends to continue reaching and testing people during school holidays and school exam time. In this activity, different methodologies will be used in accordance with the specificity of the campaign. In some campaigns, Life Choices uses the same methodology like in high schools (campaigns with colleges, community youth groups, church youth groups among others) and in other campaigns (church general population, shopping centres, workplaces among others) Life Choices does not conduct information sessions but pre-counseling

Activity Narrative: sessions touch briefly in the basics in order to minimize the time that the client goes through the procedure.

ACTIVITY 3 - Awareness and VCT mobilization campaigns

During FY 2009, the project will organize awareness and mobilization campaigns prior to the roll-out of the mobile VCT services. The project will also seek to promote sexual and reproductive health (SRH) discourse among in school youth and religious leaders to address cultural practices that discourage abstinence and faithfulness. These campaigns will incorporate culturally and age-appropriate HIV/AIDS prevention communication and will reach 35,000 people.

ACTIVITY 4 - Enhance youth's life skills

The adoption of healthy behaviors is not a simple process of providing information to people and then watching them change. Years of research have proven that knowledge alone will not assist young people in adopting the behaviors needed to prevent the spread of HIV/AIDS and that many more factors play a role. According to the United Nations Children's Fund (UNICEF) some of the components that young people need to adopt healthy behaviors are information about the need to be healthy, motivation to be healthy skills to initiate and sustain behavior, belief that the change is possible and positive, community norms that support the behavior, supportive environment to enable behavior and policy structures that support behavior. Life Choices South Africa aims, with the Life Skills Program, to address the first five of these components. This activity will aim to support youth by mobilising youth to know their HIV status as well as to give youth skills to initiate and sustain healthy behaviors. With this activity, Life Choices will reach 2,500 youth with life skills sessions (seven sessions per class) given during Life Orientation (LO) periods. These sessions are designed in order to be interactive, experimental, and to learn while having fun. At the same time, 60 youth will be trained as peer-educators in order to work as health promoting agents among their group of peers. These groups of peer-educators will run awareness campaigns, one-on-one conversations as well as they will serve as a support structure to their peers in case they have been diagnosed as infected or they have any other problem.

ACTIVITY 5 - Referral and Support of mobile VCT clinic clients

Life Choices South Africa will develop referral networks for the mobile VCT clients. Project counselors and health professionals will be trained to refer all clients (7,250 people) to additional prevention, care and treatment programs. Life Choices will also provide each client diagnosed as HIV with five psychological support sessions (one-on-one). In addition to these sessions, youth needing further support will be linked with the Life Choices social worker to obtain further support and to access additional services.

ACTIVITY 6 - Life Choices Staff Training

Life Choices South Africa will engage in a full range of capacity building activities focused on organizational management, resources, and monitoring and evaluation. In FY 2009, the Life Choices-VCT Project will provide two main trainings to the 20 staff members.

ACTIVITY 7- TB Screening

In FY 2009, 10,000 youth and adults in schools, churches and workplaces will be screened for TB during the pre-counseling sessions. Clients presenting with two or more TB symptoms will be referred to TB diagnose in their nearest health clinic. All clients reached through the mobile unit will receive information about TB.

ACTIVITY 8- Quality Assurance

In FY 2009, Life Choices will continue with activities to ensure that processes are adequate in order to achieve quality services. Standards procedures (protocols & quality control) will continue being followed during each of the steps of the procedure (information session, clients intake, pre-counseling, testing and post-counseling). On-going direct observation of each of the steps will take place by the Life Choices VCT coordinator and HIV/AIDS government coordinator in order to secure that good standards are followed. This direct observation will also guide the development of the on-going training of staff. Clients' feedback (survey) will also be considered in guiding further changes. Data for each activity will be collected, records will be kept (paper and electronic) and they will inform the monthly reports submitted to the government, as well as the semi-annual reports submitted to the Centers for Disease Control and Prevention.

Expanding CT services contribute towards the PEPFAR 2-7-10 goals.

SUMMARY:

Salesian Missions will conduct a voluntary counseling and testing (VCT) Life Choices project serving youth and adults in the Western Cape.

BACKGROUND:

The vision of Life Choices is to reach youth with a culturally accepted abstinence and be faithful (AB) message early in their lives and to support the maintenance of positive behavior changes during adolescence and adulthood through the involvement of community mentors, informed parents, and organized peer groups. Life Choices has also networked with an established organization in order to use their mobile VCT in the project's targeted High Schools. However, Life Choices' capacity to carry out VCT services is much higher than the numbers its' partner organization has been able to meet. As a part of the successful education and peer training programs, the belief of normalization and importance of testing has

Activity Narrative: been made a norm with all the youth, thereby creating an unprecedented demand. This program hopes to meet the demand created within youth to know their status, and to take advantage of Life Choices' vast network within the Western Cape area and implement VCT with youth in the Western Cape area (rural and urban) via a mobile VCT unit.

ACTIVITIES AND EXPECTED RESULTS:

The main goals of this project are to: 1) increase access to youth friendly VCT by youths and young couples 15-24 years in high schools; 2) increase access to mobile VCT during the weekend in churches and; 3) build an indigenous, sustainable response to the national HIV epidemic in South Africa through a rapid expansion of innovative, culturally appropriate, high-quality, youth friendly HIV/AIDS VCT services.

Salesian Missions will expand VCT services to youth by: 1) integrating VCT into Life Choices; 2) offering high schools and churches in the Western Cape Province with access to mobile VCT services; 3) improving the quality of youth friendly VCT services at existing VCT sites through training and mentoring of service providers and other clinic staff; 4) increase community mobilization within schools and churches via peer educators, educators, parents and community leaders; and 5) offering psychological support and counseling for onward care and support services to clients diagnosed as HIV infected.

Expanding CT services contribute towards the PEPFAR 2-7-10 goals.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

BACKGROUND AND SUMMARY:

In FY 2009 BroadReach Healthcare (BRHC) will significantly expand counseling and testing (CT) accessibility by supporting CT across an increased number of sites. In addition to activities of FY 2008, specific focus will be placed on ensuring quality of testing, targeting of specific groups and testing facilities, referrals and prevention education. BRHC will work with government facilities to expand and enhance CT services within hospital systems and will aim to mobilize communities by driving large scale CT campaigns, in addition to implementing or expanding home-based testing initiatives. BRHC will partner with community groups and CT partners in order to obtain the necessary reach. To meet these objectives, BRHC, in conjunction with key personnel of partner sites, will design and develop programs, processes and operating procedures, source and develop education materials, design and implement data collection and monitoring tools, align resourcing needs and assist with implementation.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Quality Assurance/Quality Improvement

BRHC will promote the use of rapid tests as a diagnostic tool in both clinical and community settings. Partner sites will be assisted in creating, formalizing and standardizing standard operating procedures and quality assurance programs to ensure quality around testing. This program will include proficiency testing for those conducting rapid tests and on-site monitoring. BRHC will assist sites in taking ownership of the program and will provide support in extending quality assurance programs from medical facilities to home-based CT. BRHC will focus training efforts on the management of CT services aligned to the quality program.

ACTIVITY 2: Targeted Groups and Testing Facilities

BRHC will work with government sites to ensure that HIV CT is routinely provided at the hospital level and extended to linked community health centres (CHCs) and primary health centres (PHCs) where counselors are trained to provide CT. Per a government request, BRHC will also be pioneering a program to train traditional healers to perform rapid tests. Specific focus will be placed on tuberculosis (TB), sexually transmitted infection (STI), family planning and out-patient clinics, as well as pediatrics. BRHC will work with sites to implement policies whereby providers initiate and offer HIV testing to all patients and ensure CT services (including pre-test information and post-test counseling) are available on site. BRHC will promote utilization of counselors as opposed to clinical staff in performing counseling duties to avoid diverting clinical staff from their medical duties. In addition, BRHC will target specific audiences that engage in high risk behavior such as sex workers through dedicated campaigns. Increased CT initiatives (campaigns and increased facility CT services) will be planned and co-ordinated with district and hospital management to ensure facilities are able to cope with demand for care and treatment services. Family members will be targeted through the home-based program focusing on family members of patients receiving HIV care and treatment. Counselors will receive advanced CT training focusing on family and child counseling. Grassroots (including door-to-door and engagement of local leaders) campaigns will be used to mobilise community members en masse for testing.

ACTIVITY 3: Referrals and Linkages

Underpinning all BRHC work is the concept of developing scalable solutions which can help to bolster THE South African Government's (SAGs) HIV/AIDS efforts across the country. To do this, BRHC breaks down the problem into demand-side and supply-side. Demand-side addresses the patients and communities to ensure that solutions are in place to mobilize, generate demand for testing, provide education including treatment literacy, provide ongoing adherence and psychosocial support to PLHIV and the affected/unaffected community members. BRHC generally does this by training and capacitating community organizations such as people living with HIV and AIDS (PLWHA) support groups, faith-based organizations (FBOs), non-governmental organizations (NGOs) and SAG facilities to carry out these activities. The supply-side addresses the providers of services such as hospitals, clinics, healthcare workers, labs, pharmacies, etc. and focuses on solutions such as training, service delivery integration and re-engineering, operations improvement, equipment and infrastructure upgrade, etc.

BRHC will work with partner sites to ensure all TB patients and (and those suspected of having TB) are routinely tested for HIV, and all newly diagnosed HIV-infected people are referred for TB testing. BRHC will specifically focus on referral of patients from testing to care and treatment. Processes and systems are put in place to prevent lost to initiation with registers and monitoring mechanisms to ensure patients are monitored within the system. HIV negative clients are registered for ongoing prevention education.

ACTIVITY 4: Prevention

BRHC recognizes that CT is an important HIV prevention opportunity. Prevention messaging is therefore a key component of post-test counseling, providing in-depth individualized counseling tailored to the client's needs (positive or negative). Prevention messaging is incorporated into mobilization and VCT campaigns. BRHC will promote disclosure of HIV status to sexual partners and family members as a routine part of CT services and will work with sites to implement processes that encourage partner referrals and partner notification. BRHC has also developed a series of patient education videos that are to be shown in various settings and takes a family approach to encouraging testing (including partner testing), disclosure, the importance of TB screening, positive living and wellness, how to manage HIV in children, antiretroviral therapy and importance of adherence. The videos also demonstrate the appropriate use of male and female condoms (BRHC's experience to date is that shockingly large numbers of adults have never seen these demonstrated or handled them).

Activity Narrative: -----

SUMMARY:

The primary goal of BroadReach Healthcare's (BRHC) counseling and testing (CT) is to ensure that those testing positive for HIV are started on antiretroviral treatment (ART) when clinically qualified and enrolled patients continue to receive outstanding care and support. CT is the entry point for this goal. BRHC also supports activities that include test-kit procurement, meeting infrastructure and human resource demands, increasing testing uptake, prevention, patient counseling, referral systems, and training. Primary target populations include children, adolescents, adults, pregnant women, and people living with HIV (PLHIV).

BACKGROUND:

PEPFAR funds support BRHC initiatives that provide HIV and AIDS clinical management, care and support services to HIV-infected individuals in areas where the South African Government (SAG) rollout has not yet been implemented and assists ART rollout in the public sector. The BRHC PEPFAR program began in May 2005 and now operates across five provinces. BRHC is supporting approximately 5,000 people directly with care and treatment and 15,000 indirectly. BRHC taps private sector health professionals to provide comprehensive care and treatment, fostering capacity-building initiatives within the public health system, and supporting community-based programs. BRHC leverages PLHIV support programs to identify and assist with treatment literacy, adherence support and ongoing community mobilization, prevention education activities, and positive living initiatives. BRHC also works to build capacity in public health facilities, focusing efforts on human capacity development (HCD) activities, including clinical didactic training, clinical mentorships, patient training, and operational assistance training. BRHC is expanding its provision of staff and infrastructure support to SAG facilities. Finally, BRHC is expanding its involvement in the design of scaleable down referral models in partnership with faith-based organizations (FBOs), community-based organizations (CBOs), and public-private partnerships (PPPs).

ACTIVITIES AND EXPECTED RESULTS:

The primary goal of the program is to ensure that those testing positive for HIV are started on ART when clinically qualified and enrolled patients continue to receive outstanding care and support. CT is the entry point for this goal.

ACTIVITY 1: Voluntary Counseling and Testing

BRHC will provide access to rapid voluntary counseling and testing (CT) at enrollment sessions and, where available, CD4 testing services for patients who test positive to determine eligibility for treatment. In accordance with SAG guidelines, BRHC patients will be properly counseled (pre- and post-test), tested, and referred as appropriate to a BRHC network doctor or to an accredited SAG facility.

ACTIVITY 2: Support to South African Government

BRHC will expand access and availability of CT by (1) procuring testing materials (rapid test kits when unavailable through the government system); (2) improving operational efficiency through needs assessment, identification of operational bottlenecks, implementing solutions to address bottlenecks; (3) assisting with refurbishing physical space at government clinics/hospitals; and (4) advising SAG partner clinics on increasing CT uptake and improving the percentage of results received. BRHC will further support SAG efforts in meeting the increased demand created by testing. This will range from providing salary support for counselors to improved processes and systems for enrolling and following up greater numbers of new patients.

ACTIVITY 3: Outreach

Using a family-centered approach to care and treatment, BRHC will encourage the testing of families and households, utilizing patients already enrolled in the BRHC program as a point of entry. BRHC will also promote community-based programs such as support groups, CBOs, and churches as entry points for CT services.

ACTIVITY 4: Referrals and Linkages

All HIV-infected patients identified through BRHC-supported CT efforts, will be linked (via BRHC network doctors, home-based care (HBC) and support groups) to other services such as TB care, nutrition and wellness, and psychosocial support.

ACTIVITY 5: Human Capacity Development

BRHC may enhance the quality of CT services at selected sites (assigned by the relevant district authorities) through training and mentoring for counselors, health professional staff, outreach workers and support group facilitators. In addition to training, BRHC will assist CT programs at sites by providing salary support to counselors as sites expand access to CT services.

BRHC's CT activities directly contribute to the 2-7-10 objectives by identifying infected individuals who are unaware of their HIV status and who may be eligible for treatment. Greater numbers of people tested means meeting the treatment and care and support objectives. Moreover, prevention messages given to both infected and uninfected individuals during post-test counseling will contribute to the goal of averting 7 million infections.

All BRHC activities articulated in the FY07 COP will be scaled up significantly in FY 2008 through its partnerships with 15 SAG hospital systems, which include hospitals and affiliated community and primary

Activity Narrative: health centers.

The FY 2007 activities will be expanded and enhanced in FY 2008 as follows:

BRHC will support quality assurance at each of its public sector partner hospitals through quality assurance assessments, systems re-engineering, and the development of reporting systems that provide program management feedback that is used to improve program performance and more closely monitor patient care. This includes monitoring, tracking and reporting on CT activities at partner sites.

As part of systems re-engineering BRHC will focus on improving CT referrals at sites to boost the number of patients tested, and the numbers that receive their results and ultimately enroll in treatment. A special effort will be made to test family members of patients in an effort to boost family-centered care initiatives at sites through partnerships with CBOs and home-based care organizations.

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 24971.09

Planned Funds: \$0

Activity System ID: 24971

Activity Narrative: SUMMARY AND BACKGROUND:

The counseling and testing program plan was modified after consultation with the South Africa PEPFAR team prior to approval in the FY 2008 New Partners Initiative (NPI) workplan and budget. The voluntary counseling and testing (VCT) program was redesigned to be a joint Genesis Trust and Positive Ray project. The two new Positive Ray professional nurses will perform all the actual HIV testing and reporting of results to clients. Testing will occur at multiple sites but will not be a truly mobile VCT program and the request for a vehicle for the CT program was eliminated. Genesis will add an additional (third) counselor to support the CT program. Testing will take place at the Genesis Care Centre (testing family members of patients in the care centre), at workplaces (testing workers at their worksites) and in communities (testing clients in their homes or at local churches and community centres). Approval for the VCT program has been received by the local Ugu district Department of Health. The program will effectively function three days per week as each of the two professional nurses will spend 30% of their time doing VCT (the remaining 70% of their time will be spent doing home-based care). The target for individuals being tested has been increased to 1,200 for the year which averages eight clients per full time equivalent day.

ACTIVITIES AND EXPECTED RESULTS:

Genesis Trust will carry out three separate activities in this program area.

ACTIVITY 1: Identification and Referral of Clients for CT

The project's prevention education program as described in the prevention section of the COP reaches people in factories, clinics and homes in communities with the message of the importance of knowing one's status. The prevention activities currently generate more than 130 VCT referrals per month. In addition, many factory workers express a desire to be tested but desire testing in the workplace rather than leaving work to be tested. Finally the counselors at the Genesis Care Centre work with family members of patients many of whom need HIV testing. Clients from all of these current activities will have access to the alliance VCT program.

ACTIVITY 2: Provision of VCT

The counselors at Genesis Care Centre or the Positive Ray Community workers will provide education and pretest counseling and schedule clients for VCT. Testing will be done at several locations including the Genesis Care Centre, factories and in communities (in home or at community centers). The Positive Ray professional nurses will perform the HIV testing and provide the clients with their results. The nurses and/or counselors will provide post-test counseling focusing on negatives staying negative and positive living and prevention for positives. Counselors at Genesis Care Centre provide counseling for discordant couples and family centered counseling as do the Positive Ray Community Workers in the communities.

ACTIVITY 3: Referrals and Follow-up Care

All clients testing positive will be referred by the professional nurse for further evaluation and treatment at a government clinic. They will be instructed on the importance of CD4 testing and regular follow-up care. They will also be offered referral or linkage with home-based care services (with Positive Ray or with South Coast Hospice if in a community not served by Positive Ray). Support groups will be offered by the counselors at the Genesis Care Centre as well as in communities by Positive Ray community workers. All clients testing negative will be given additional education and counseling on staying negative and the need for periodic repeat testing depending on their exposure risks.

Control & Prevention

Program Area: Prevention: Counseling and
Testing

Program Budget Code: 14

Planned Funds: \$194,181

Activity Narrative: SUMMARY:

The Solidarity Center, in cooperation with a consortium of partners, proposes to implement a five-year HIV prevention initiative in South Africa called "Be Faithful, Be Tested, Be Union." The Solidarity Center's project partners are EngenderHealth and four of South Africa's largest and most influential unions. These unions are the National Union of Metalworkers of South Africa (NUMSA), the Police and Prisons Civil Rights Union (POPCRU), Health and Other Service Personnel Trade Union of South Africa (HOSPERSA), and the Congress of South African Trade Unions--Western Cape (COSATU-Western Cape). Over five years, activities will be implemented in five provinces-Gauteng, Limpopo, and KwaZulu-Natal, Western Cape and Eastern Cape.

BACKGROUND:

The project will directly expand access to HIV-related services to one million South Africans, with a focus on prevention through promoting safe and healthy sexual behavior in HIV-infected and uninfected individuals and improving access to HIV counseling and testing. Union members, their families, and communities are the target audiences. The "Be Faithful, Be Tested, Be Union" project strategy focuses on prevention, concentrates on workplaces, and enlists unions, businesses, and communities to dramatically increase HIV prevention within these critical economic groups. The project will address three key HIV-related areas: counseling and testing, behavior change through gender norm transformation, and HIV-related institutional capacity building among the union partners.

The South African labor force, and thereby, businesses and the public sector, have been particularly hard hit by HIV/AIDS, with a negative impact on productivity and business profits. Historically, South African unions have been at the forefront of improving work and social conditions, not only for their members, but for their communities as well. However, most trade unions and employers lack the capacity and direct encouragement and support to create workplaces that offer HIV education, promote counseling and testing, reduce stigma, and provide benefits and access to services for workers and their families living with HIV/AIDS. This project will fill that gap in key workplaces.

ACTIVITIES AND EXPECTED RESULTS:

Solidarity Center will carry out two separate activities in this program area.

ACTIVITY 1: Be Faithful, Be Tested, Be Union

The "Be Faithful, Be Tested, Be Union" project will address the high rate of HIV/AIDS among South Africans through a strategy that focuses on prevention, concentrates on workplaces, and enlists unions, businesses, and communities. The project will assist four large and influential South African unions, and the workplaces and communities in which their members labor and live, to achieve wide-reaching HIV prevention outcomes. The project will address four critical HIV-related areas: counseling and testing, gender norm transformation, workplace policy development and implementation, and increased institutional HIV-related capacity through targeted technical assistance. Over the life of the five-year project, activities will be implemented in five provinces. FY 2009 funding will ensure that activities reach Limpopo and Eastern Cape provinces. All are areas of the country in which either the Solidarity Center or EngenderHealth have previous program experience and/or in which the project's union partners have large memberships, extensive field operations, and substantial employer contacts.

The project will benefit from the strength of project partners with proven South African experience in critical areas, such as HIV/AIDS programming, gender norm transformation, social mobilization skills for worker and community outreach, and workplace advocacy and policy negotiation. The Solidarity Center and EngenderHealth have offices and ongoing HIV/AIDS programs in South Africa, as well as significant experience managing PEPFAR and other U.S. Government-funded programs. As a result, these organizations are very familiar with HIV/AIDS technical areas and interventions, program implementation and management of large-scale projects, reporting, grant regulations, and related issues. The "Be Faithful, Be Tested, Be Union" project will harness the trade unions' highly developed and effective organizing and mobilization skills to address key elements of HIV prevention, as well as make use of union infrastructure and networks at the local, provincial and national levels. The project will contribute to all four key priority areas identified within the South African Government's HIV & AIDS and STI Strategic Plan for South Africa 2007-2011. These are: 1) Prevention; 2) Treatment, Care and Support; 3) Research, Monitoring and Surveillance, and; 4) Human Rights and Access to Justice.

ACTIVITY 2: Expansion of Counseling and Testing Services

The Union-Branded Counseling and Testing (CT) Promotion initiative will be implemented through a combination of regular onsite testing at workplaces, CT campaigns, union public events, and the production of union-branded information, education and communication (IEC) materials. The project will increase access for union families to CT, provide quality HIV treatment and care referrals, encourage union leaders and employers to reduce HIV and AIDS-related stigma and discrimination in the workplace and strengthen overall union and business partnerships in response to the epidemic. Campaign canvassing teams, largely comprised of recently laid-off workers, will be hired to implement grassroots outreach. The Solidarity Center team will collaborate with both mobile and fixed CT service providers, including New Start to provide CT referrals and onsite testing, as well as treatment and care referral services to workers and their families who test positive. The project will develop a strong referral network and sign memoranda of understanding (MOUs) with agencies providing assistance for people living with HIV and AIDS and their families.

These activities will involve implementing workplace programs centered around HIV counseling and testing. By ensuring access to CT services for union members and their families, more union members will know their HIV status and can be referred to treatment programs if positive. For those union members who are negative, this activity will ensure that they are provided with enough information around staying negative. In

Activity Narrative: addition, by focusing on men and gender norm transformation this activity will address gender imbalances that affect sexual decision making and ensure that men and women are equipped with knowledge on how to protect themselves from contracting HIV/AIDS.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 190.09	Mechanism: N/A
Prime Partner: Aurum Health Research	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 2915.22609.09	Planned Funds: \$1,301,012
Activity System ID: 22609	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activities started in FY 2008 will continue in FY 2009, with the modifications detailed below.

The program will focus on couple counseling and accessing youth and men. All the PEPFAR-supported sites will be supported to improve access. Other activities will be performed to provide access to those healthy people for early diagnosis and to keep the negative population as such.

The Small and Medium Enterprises (SME) project will not provide counseling and testing (CT) training to persons not eligible to provide this service. Instead, the project has been approached by a number of nursing colleges to provide nursing students with training on CT.

CT sessions will be linked to tuberculosis (TB) symptom screening and this will be incorporated into routine CT assessments.

The CT support will be provided to eight primary health care down referral sites in the Ekurhuleni district (Gauteng province) that provide HIV/AIDS, TB and HIV services, the general practitioner (GP) project, the currently supported public sector sites including Orkney clinic in the North West, Tembisa hospital, Tembisa main and Winnie Mandela clinics in Gauteng and Madwaleni hospital in the Eastern Cape. The PEPFAR supported CT sites will be provided with a nurse and/or lay counselor as required from individual sites, with training to be conducted for each of the geographical areas.

The program will also link up with the integrated management of childhood illnesses (IMCI), TB, and family planning programs and the general outpatient clinic and the staff members will be included in the trainings for better access for patients, increasing the numbers counseled and those tested, and those enrolled in care and treatment programs.

Emphasis will also be on the early screening of HIV-exposed babies by an Enzyme-Linked Immunosorbent Assay (ELISA) rapid testing for those children above 18 months and provision of cotrimoxazole for both adults and children. All Aurum staff that provide CT services receive in-house training on the basics of CT as well as specialized training on couple counseling, post-rape counseling and post exposure counseling. The City of Johannesburg staff at Metro Transport Company (MTC), lay counselors and SME managers receives training and mentoring on aspects of HIV including prevention, referral for treatment and other issues related to HIV/AIDS. In addition market traders in Johannesburg receive training and capacity building on HIV/AIDS issues.

The counseling training will include and encourage men to assume a positive in health and well-being of their partners, families and communities in order to increase HIV preventive behaviors, with a focus on:

- a) Behavior change programs that promote the positive role men can play in the health and well-being of their partners, families and their communities to increase HIV preventive behaviors.
- b) Programs targeting partners of pregnant women and providing information to men on prevention of mother-to-child transmission (PMTCT), CT, prevention and other health issues and encouraging couples counseling and testing in an attempt to increase men's involvement in HIV/AIDS treatment and care programs and to reduce stigma and violence against women.
- c) Couple counseling and testing at CT and PMTCT sites to promote testing of men and to build support for their female partners.

Couples counseling will continue to be provided at the mobile and fixed service delivery sites. The SME project targets males, both in SMEs and at taxi ranks, and provides them with easy access to CT which they currently are reluctant or unable to access through the formal health care delivery points. The majority of market traders within the taxi rank are women. Provision of free CT services within their workplace overcomes barriers such as cost of transport and the presence of female health care workers.

A gender module for training will be operationalized in CT to better address gender issues and provide targeted and appropriate services to both genders. Formative work on male norms will be done to inform the interventions. All data collected will be gender disaggregated to better inform program deliverables around gender.

SUMMARY:

The Aurum program provides HIV counseling and testing (CT) for patients in private general practitioner (GP) practices and non-governmental sites. Where Aurum provides support in the public sector, the voluntary counseling and testing (CT) human resources and commodities are provided by the South African government. Emphasis areas include human resources, commodity procurement and quality assurance. The primary target populations are people living with HIV (PLHIV), HIV-infected children, prisoners, homeless people and street youth. The SME Project will continue and expand counseling and testing services offered to SME employees, their partners and dependents through fixed and mobile sites located within targeted workplaces, mobile clinics and sites located within taxi ranks.

BACKGROUND:

Aurum Institute for Health Research (Aurum) is a not-for-profit, public benefit organization that is committed to improving the health of disadvantaged individuals and communities through transformational research (the research programs are not PEPFAR-funded), management of TB and HIV programs and provision of HIV testing, treatment and care. The main focus of the Aurum program in the public, private and non-governmental sector is to provide HIV care and treatment to a large number of persons in a cost-effective standardized manner ensuring a high quality of counseling, patient care and patient monitoring. The model

Activity Narrative: is centrally coordinated and designed to be implemented on a large scale in peripheral sites that are resource-constrained and lacking basic resources such as HIV specialists, information technology (IT) infrastructure, and laboratory and pharmacy capacity. Aurum has established a centralized system of support which includes (1) training of all levels of healthcare workers to ensure capacity building of clinicians to manage patients in resource limited settings with remote HIV specialist support; (2) providing and maintaining guidelines for HIV preventive therapy (including INH and cotrimoxazole), treatment of adults and children, prevention of mother-to-child transmission and CT; (3) providing clinical and administrative support through site visits by staff involved in psychological support, training, clinical support and monitoring data management systems; and (4) maintaining a centralized distribution of medication and laboratory testing. This program will supplement the South African government's antiretroviral rollout and therefore the program adheres to national guidelines and protocols. This is an ongoing program funded by PEPFAR since October 2004. It is a facility-based program in which Aurum works with general practitioners, a faith-based organization (FBO) and within the public sector. In addition the SME Project will expand its services to three additional fixed sites and two additional mobile clinics within Gauteng, Mpumalanga and Limpopo.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Establishing Capacity for CT

This activity will take place in two primary health clinics and two prison clinics. This activity will include the provision of and training of staff in these clinics as well as provision of running expenses for these clinics.

ACTIVITY 2: Counseling and Testing

HIV counseling and testing is conducted at selected GP sites, primary health centers and mobile units. The counseling and testing includes pre- and post -test counseling and rapid finger prick testing with a screening and a confirmatory test. Provision has been made for the mobile units.

ACTIVITY 3: Quality Control of HIV Testing

External Quality control is done at Aurum CT sites. Specimens are supplied on a monthly basis to the CT sites and each staff member on site tests these. This is reported to Aurum by Thistle. Feedback on these results is given at the quarterly refresher training.

ACTIVITY 4: Training on Voluntary Counseling and Testing

A five-day course is given to all new personnel involved in CT. In addition, an annual meeting is held and new findings, discussions on counseling, running of support groups are covered. Training includes a focus on stigma and discrimination.

ACTIVITY 5: Data Management

All encounters are recorded on a standardized form and then captured onto a centralized database that is used for reporting.

ACTIVITY 6: Supply and Distribution of Testing Kits

Kits are ordered using a form that is faxed to, and authorized at, Aurum. The supplier then delivers the kits to the sites.

ACTIVITY 7: Marketing and Promotion

Educational pamphlets and campaigns are provided. Various methods are being used to market and encourage counseling and testing. Some sites (MES and Aurum Klerksdorp) run CT campaigns over short periods of time. Other sites run activities on commemorative days such as Valentine's Day and World AIDS Day. Marketing material is developed locally by the site according to their needs.

ACTIVITY 8: Expansion of Counseling and Testing in SME Sector

Activities in FY 2008 will include the expansion of counseling and testing services to additional sites in SMES in Witbank Central Business District and Polokwane Central Business District. In addition an additional fixed site will be established in partnership with the City of Johannesburg. This will enable market traders, taxi drivers, commuters and SME employees and their dependents to access counseling and testing. Partnerships will continue to be developed with individual SMEs to provide counseling and testing onsite, within occupational health clinics where they exist or within Aurum's mobile vehicles. Additional staff will be hired and trained to provide these services. In addition, occupational health staff will also be trained and supplied with testing kits. As yet there remain restrictions of the use of rapid test kits by persons not registered with the Health Professions Council but in the event of a change in the regulations, Aurum will be in apposition to test and equip a number of lay counselors to also perform rapid testing.

Aurum will contribute to the PEPFAR 2-7-10 goals by promoting and providing counseling and testing services to allow for entry into HIV care and treatment programs.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 274.09	Mechanism: Masibambisane 1
Prime Partner: South African Military Health Service	USG Agency: Department of Defense
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 2982.22787.09	Planned Funds: \$48,545
Activity System ID: 22787	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

There will be a new focus on training healthcare providers on routinely offering HIV tests, child testing and couple counseling and testing. A "know your status" campaign will be launched that encourages members and their families to test.

Counseling and testing is done on all new recruits, in the CHA's for deployment, promotion, and fitness tests. VCT is conducted at all rollout sites and sick bays.

Construction and renovation of a counseling and testing center is planned for the Eastern Cape Province (particularly Mthatha).

SUMMARY:

Counseling and testing is a critical point of entry to care and treatment services, supports HIV prevention, and is a pivotal component in the South African Department of Defense (SADOD) plan for the Comprehensive Care, Management and Treatment of HIV and AIDS. The South African Military Health Service has a scheduled health-monitoring program that includes HIV testing with pre- and post-test counseling. Many of the regions have opted for the establishment of a centralized health assessment and counseling and testing center. Routine counseling and testing (RCT) will be offered as an expansion to counseling and testing (CT) for individuals as part of sexually transmitted infection (STI) consultations, pregnant women and couples who plan a family, and CT performed as part of differential and TB diagnoses. Individuals themselves will make voluntary counseling and testing (VCT) requests.

CT has a positive impact on HIV prevention, and the advantages of early identification and management of HIV-infected individuals has been shown. This program area is supported through the development and sourcing of media items, pamphlets and posters to encourage members and dependants to request or accept an HIV test if they do not know their status or if they have been exposed to an activity with a high risk of HIV transmission.

One of the major obstacles to requests for and acceptance of CT is stigma and discrimination, and further support towards this program area is provided through the development and sourcing of media items, pamphlets, and posters towards the establishment of a non-discriminatory organizational environment. This includes media products aimed at informing members of the SADOD on the organizational HIV and AIDS policy and strategy, as well as the management of HIV and AIDS in the SADOD.

The primary emphasis area of this activity is infrastructure development, and minor emphasis is given to human resources, strategic information and training. Specific target populations include military personnel, children and youth (non-OVC), men and women of reproductive age, doctors, nurses and healthcare workers.

BACKGROUND:

The military community is considered a high risk group due to various factors that include foreign deployments and high mobility. CT provides an opportunity for prevention to both infected and uninfected individuals. This activity is ongoing. FY 2006 PEPFAR funds were used for renovations and upgrade of three centralized counseling and testing centers, and for training of healthcare workers. These activities will continue during FY 2007 and FY 2008. Counseling and testing takes place at all military health care facilities and therefore it is essential that all healthcare workers are trained in CT.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Offering of Routine Counseling and Testing/ Provider-initiated Testing and Counseling (PITC)

SADOD will upgrade healthcare facilities that will be used to provide confidential and effective HIV counseling and testing in highly populated military areas. Healthcare workers will be trained on PITC and RCT which will be supported by the development and printing of training material. SA DOD will develop information education and communication materials, which will be used to encourage members to accept an HIV test if they do not know their status, or, if they have been exposed to an activity with a high risk of HIV transmission. Best practices will be shared through attending PEPFAR CT partner meetings, publications in military and peer reviewed magazines and journals, and oral and poster presentations on effective and innovative programs at conferences and seminars.

Counseling and testing centers will be established using PEPFAR funding. These centers will enable confidential and effective CT for HIV, and in addition, will provide venues for the training of healthcare professionals in CT. Training will continue during FY 2007 and FY 2008. Supportive media campaigns will be established, and these campaigns will encourage voluntary requests for, and uptake of HIV testing. Uptake of counseling and testing services will be monitored and evaluated through the HIV Monitoring and Evaluation (M&E) plan of the SADOD HIV and AIDS program. The impact of media on the reduction of stigma and discrimination is monitored through the annual Knowledge, Attitudes, and Practices (KAP) survey that is a sub-component of the M&E plan.

Mechanism: RESPOND

USG Agency: U.S. Agency for International Development

Program Area: Prevention: Counseling and Testing

Program Budget Code: 14

Planned Funds: \$253,406

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY/BACKGROUND:

To enhance its reach in FY 2009 EngenderHealth South Africa (EHSA) will use creative methods to maximize output and integrate cost reductions by further integrating its counseling and testing (CT) program with abstinence, being faithful (AB) and other sexual prevention (OSP) activities. Specially, by activity, the following modifications will occur:

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: University-Based CT

This activity will essentially remain the same, however efforts will be maximized through integrating CT into AB/OSP prevention partners efforts at tertiary institutions.

ACTIVITY 2: Community-Based CT

This activity will be slightly modified. Although all EHSA partners will be offered CT services, greater emphasis being placed on conducting community-based CT drives with community partners associated with EHSA's Police as Partners (PAP) project. Thus, as AB and/or OP community mobilization events are being planned by Men as Partners (MAP) network community-based partners or EHSA itself, CT will be an integral component in these events. In terms of budget reductions, EHSA will scale back the reach of the project, focusing more on Gauteng, Mpumalanga and Limpopo provinces, based on increasing in these provinces as well depth of the EHSA prevention programs.

ACTIVITY 3: Health Service Provider Training

This activity will remain the same as in FY 2008.

ACTIVITY 4: Private/Government Sector Partnership

This activity will be modified to focus more on conducting CT drives in partnership with the private sector and government agencies. EHSA will work to secure financial support from various private sector partners, offering CT at a subsidized rate as a part of MAP community mobilization effort conducted close to workplaces. Based on recommendations from a strategic planning session (September 2008), EHSA will embark on securing support from various corporate entities with large male employee-bases (e.g. automotive and/or mining and construction sector). EHSA will work with these entities to secure funding from them to subsidize CT services to their employees (and families), with strong linkages to care and treatment services for those employees testing positive for HIV. Strong community education programming will be linked to such efforts, working to transform gender norms through a community and encourage additional men (and women) to test. EHSA is confident that such an approach will not only create opportunities to reach additional men with quality CT services, but also assist EHSA in creating a more sustainable program for the future.

ACTIVITY 5: Monitoring and Evaluation

This activity will remain the same.

SUMMARY:

EngenderHealth's Men as Partners (MAP) program works to reduce the spread and impact of HIV and gender-based violence by challenging unhealthy gender-related beliefs and attitudes, such as equating masculinity with dominance over women, pursuing multiple sexual partners, and participating in other HIV risk behaviors. The MAP program utilizes a range of strategies including skills-building workshops, community mobilization, health service provider training, media advocacy and public policy advocacy efforts to achieve its major goal of gender norm transformation to reduce the spread and impact of HIV and gender-based violence. MAP recognizes that this transformation will assist men and women in achieving low-risk behavior such as sexual abstinence, being faithful to one partner, using condoms consistently and correctly, reducing the numbers of sexual partners, and treating women as equals. MAP works with individual men and boys, their romantic partners, as well as community structures to influence culture and transform lives. In addition, MAP targets in and out-of-school youth, university students, adults, people living with HIV, caregivers, community and religious leaders, program managers, public healthcare providers, and community-based, faith-based and non-governmental organizations (CBOs, FBOs, NGOs).

BACKGROUND:

Since 1998, EngenderHealth has received USG funding to support CBOs, FBOs and the South African government to implement MAP programming. EngenderHealth's core strategy is conducting skills-building workshops on gender norm transformation. Through these workshops, MAP develops "transformation agents" (peer educators) who then spread MAP messages and skills from the workshops to others in their communities. These workshops are tailor-made for various communities, integrating abstinence/be faithful messages and/or condoms and other prevention messages, as well motivating men to know their HIV status and to take action if they test positive for HIV. MAP encourages men to take action in their communities, challenging other men who are practicing high-risk behaviors and gender-based violence. Working through various community-based partners, MAP also mobilizes communities to take action via community education events and the formation of "community action teams" (CATs). EngenderHealth/MAP also produces behavior change communication materials that are used to motivate men and boys to

Activity Narrative: address these harmful gender norms and transform themselves. Currently, EngenderHealth is running the "I am a Partner" campaign; focusing on defining what men can do to take action and be more gender equitable to reduce the spread and impact of HIV. (See www.iamapartner.org). Working through national campaigns, such as the annual Men as Partners (MAP) Week, EngenderHealth engages national, private sector, media, and government partners to increase the effectiveness of MAP. Finally, EngenderHealth staff coordinate provincial MAP Networks, creating a space for gender activists to share lessons learned, and formulating a platform for national advocacy efforts, such as participating in the development and adoption of the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011.

Recently, EngenderHealth developed additional programming linked to voluntary counseling and testing and palliative care. In 2006, EngenderHealth carried out research to investigate why men were not testing for HIV. In response to the findings of this research, EngenderHealth created a counseling and testing (CT) program consisting of a mobile vehicle that focuses on getting men to test. In addition, it has become apparent that more men need palliative care. Thus, EngenderHealth has recently launched a program to meet the specific needs of men dealing with the stigma and stress of living with HIV, as well as other issues related to gender norm transformation.

ACTIVITY 1: University-based Counseling and Testing

EngenderHealth will continue to support CT that has been provided on five government-supported university campuses to increase access to young men and women. Using PEPFAR funds, EngenderHealth will expand these services to three additional universities outside the Western Cape. Transformation Agents (peer educators) will be trained, according to South African Government (SAG) guidelines, to promote CT through workshops and community mobilization on campuses. It is estimated that EngenderHealth will reach more than 100 students per month per campus with these activities. EngenderHealth will also use a mobile CT unit, staffed with professional nurses and counselors as per SAG guidelines, to provide CT services on campuses. Education materials, which will also comply with SAG policies, will be designed, developed, and tested to spread the message. A monitoring and evaluation system will be developed and utilized to track the effectiveness of the activities on campuses.

Students will be referred for TB screening and for CD4 count and ARV services when necessary. This activity consists of three components: (a) provide support to CT sites at eight tertiary institutions through sub-agreements; (b) develop referral systems to CT sites; and promote CT among students. Activities will also include training of counselors, with a focus on gender counseling, couple counseling, and stigma reduction. Additionally, CT outreach days will be organized to introduce CT to the wider campus population, reaching those who do not use the university health clinic. During these outreach days, testing booths and the mobile CT unit will be placed at strategic points throughout the campuses and CT services offered to all. These booths will be designed to ensure confidentiality. Posters, campus radio, and other media will be used to attract students. Referral systems for HIV-infected students to existing support groups and media services will be established, and those students testing negative will receive reinforced prevention messages. EngenderHealth will collaborate with the universities' health services to help build sustainable programming.

ACTIVITY 2: Community-Based Counseling and Testing

EngenderHealth will expand their reach of CT services through additional mobile testing drives. Special community CT drives promote CT services to men in the community. EngenderHealth will team up with its MAP partners in Gauteng, Limpopo, KwaZulu-Natal, North West, and Western Cape to sponsor community CT drives. EngenderHealth's mobile clinic is designed to ensure confidentiality. Experience has shown that mobile testing will attract a large number of people who would not usually visit clinics. This activity will improve and expand on the work already conducted in the inner-city area of Johannesburg. In addition to the nurses, male Transformation Agents (peer educators) have been trained on gender-specific counseling, couple counseling, and stigma reduction. All training has been approved by the South African government. Referral systems for HIV-infected people to existing support and medical groups will be established, and those testing negative will receive reinforced prevention messages. A follow up system will be established to ensure that those referred to get the necessary services. EngenderHealth will also sub-contract the Township AIDS Project to provide additional confidential male-friendly mobile CT testing throughout Gauteng.

ACTIVITY 3: Health Service Provider Training

EngenderHealth will train public sector healthcare providers in Gauteng and Western Cape. Training will adhere to South African government policies, and will aim to improve CT services, taking into account male-specific needs. By linking with the public sector, EngenderHealth intends to build more sustainable programs. The improvement of services will, in turn, increase men's utilization of HIV services, CT, TB screening, antiretroviral treatment uptake and adherence, and their support for their partners' participation in these services, especially prevention of mother-to-child transmission (PMTCT). EngenderHealth's programs will also improve the quality and availability of male-friendly HIV services. Staff will focus on key target areas, linking its prevention and palliative care programs to these CT efforts. Staff expect to conduct quarterly training, reaching at least 30-40 providers per training.

ACTIVITY 4: National and Local Government Key Stakeholder Program

Using the CT mobile unit, EngenderHealth will provide CT services to outlets at public sector institutions, such as the South African Police Services. Working through these government offices and linkages with communities, CT services will be provided to encourage more men to know their status. The CT mobile unit will be available at community events, government workplace HIV and AIDS awareness days, and other important events. Employees and community members will be encouraged to test. EngenderHealth recognizes the importance of public sector partnerships on the sustainability of such programming. On a monthly basis, CT drives will be take place in various parts of Gauteng, Limpopo, Northwest and KZN

Activity Narrative: provinces.

ACTIVITY 5: Monitoring and Evaluation

EngenderHealth staff will continue to monitor and evaluate the project through various process and impact assessments. Specific monitoring plans have been developed to assess CT programs. Each training session and community event is documented, and knowledge and attitudinal shifts among participants is examined.

Program Area: Prevention: Counseling and Testing

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 3321.22750.09

Planned Funds: \$396,129

Activity System ID: 22750

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009, all 2008 activities will be continued, and new interventions will be added, as detailed below.

- The mobile counseling and testing (CT) project described in the FY 2008 COP will be conducted in FY 2009.
- Supervision of field caregivers (FCGs) and lay counselors will be systematized via development and implementation of assessment tools (competency checklists).
- Monitoring systems for the multidisciplinary team (MDT) and interdepartmental transfer system, such as back referral forms, systematic reporting of referrals during MDT meetings, and use of escort systems, will be developed and implemented.
- Documentation of voluntary counseling and testing (VCT) registers will be enhanced.
- Data analysis and regular feedback on the yield of expanding VCT services to other departments beyond the traditional ART site will be planned and conducted.
- Exposure of peer educators to infectious diseases will be minimized.
- Infection control training will be provided to peers in the following areas: hand-washing, cough hygiene and disposal of body fluids.
- Home-based care (HBC) kits, with minimum infection control (IC) equipment (gloves/masks), will be provided.
- A focus on stigma as an obstacle to VCT will be primary.
- The International Center for AIDS Care and Treatment Programs (ICAP) regional psychosocial staff, in conjunction with peer educators, will focus on linkages with key informants in the community, and conduct community outreach activities and community mapping, with an emphasis on identifying most at risk individuals within communities. The ICAP gender-based programming will support these activities as well (see below).

Space: ICAP will prioritize meeting space requirements for the expanding CT needs during infrastructural developments and modifications (see under health systems strengthening interventions).

Partner disclosure and couple counseling: All antenatal care (ANC) clients identified to be HIV infected will be supported to disclose their status to partners in the following ways through invitation letters for partners to come to the health facility, home visits, men's HIV testing days, and making clinics male friendly. This process will be monitored using standards of care (SOCs). ICAP's gender-based programming will support these activities.

Home-based counseling: Provided by FCG's initiative, to be expanded in FY 2009.

Rapid testing: Efforts will be continued in FY 2009 to standardize quality of rapid testing and perform quality assurance.

Acute infection and window period: ICAP will develop and implement a systematic approach to encouraging and educating patients, and tracking repeat testing for at-risk clients.

Prevention counseling: All elements of prevention with positives are in place at facilities supported, primarily through peer educators and FCGs. Tools will be developed in order to standardize approaches used, focusing on routine counseling and testing of sexual partners, children; couples counseling for discordant couples; condom promotion and distribution; assistance with disclosure; provider-initiated behavioral risk reduction interventions; assessment, diagnosis and management of STIs; adherence to prophylaxis and treatment; referrals to family planning; alcohol assessment; counseling and referrals for needed professional services.

SUMMARY:

Columbia University (Columbia) and its identified partners in the Eastern Cape have been supporting the care and treatment of patients dually infected by HIV and tuberculosis (TB) since FY 2006. This activity focuses on HIV counseling and testing (CT) for TB patients and will be an ongoing activity for Columbia in FY 2008. The major emphasis area for this program will be human resources, with minor emphasis on development of network/linkages/referral systems, linkages with other sectors, quality assurance and supportive supervision, strategic information and training. The target population will include people infected and affected by TB and HIV including infants, children and youth (non-OVC), men and women (including pregnant women and family planning clients).

BACKGROUND:

Columbia will use FY 2008 funds to continue strengthening the Eastern Cape Department of Health's capacity to provide routine HIV counseling and testing (RCT) services to tuberculosis patients. In the latter part of FY 2006, Columbia began RCT activities in three TB hospitals: Empilweni, Nkqubela and Fort Grey. In FY 2008, PEPFAR funds will be used to continue to screen TB inpatients for HIV, implement TB/HIV patient prevention education and to ensure that TB and HIV co-infected patients are referred for appropriate HIV care and treatment services. Referral mechanisms with adjacent health facilities (including hospitals and primary health clinics) have already been identified and established. Ongoing program emphasis area will be on the development of network/linkage/referral systems that will eventually result in retention into HIV treatment services for the TB and HIV co-infected after completing of TB treatment and improved adherence to TB and HIV therapies.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008 Columbia University will continue to implement four activities in three TB hospitals: Fort Grey,

Activity Narrative: Nkqubela and Empilweni.

ACTIVITY 1: Support Routine HIV Counseling and Testing for TB patients

Columbia will provide assistance through hiring and training of additional clinical staff (nurses and peer educators) to increase the uptake of HIV testing among TB patients. Columbia will actively promote provider-initiated testing and counseling for HIV (PITC) for TB patients. Registered nurses at each hospital will be responsible for performing the HIV tests and post-test counseling, and trained peer educators will provide pre-test counseling.

ACTIVITY 2: Provide Patient HIV Prevention Education

This activity will consist of collaboration with the Eastern Cape Department of Health, community-based organizations and other local non-governmental organizations to provide information and education on TB/HIV. In addition, trained peer educators will be actively involved in one-to-one patient education.

ACTIVITY 3: Referrals for TB Patients

Practitioners will continue to take advantage of and support the existing referral systems for TB patients into HIV care and treatment activities, and where feasible, develop and promote more efficient referral linkages.

ACTIVITY 4: Monitoring and Evaluation

Data collection and reporting will be strengthened by training and hiring data staff, as needed, to collect accurate counseling and testing patient information and to provide monitoring and evaluation technical support for data interpretation and dissemination that will result in program improvement.

In FY 2008, Columbia proposes the following additional activities:

ACTIVITY 5: Strengthen Provider-Initiated HIV Counseling

Columbia will expand provider-initiated testing and counseling services to all the 36 antiretroviral treatment (ART) sites that will be supported in FY 2008. With this approach, people attending the health care services or those seeking specific medical attention can also receive CT. Pre-test counseling will be conducted by peer educators and reinforced by the health unit staff or by HIV and AIDS counselors during post-test counseling.

ACTIVITY 6: Provision of Mobile Counseling and Testing Services in KwaZulu-Natal

In order to make HIV and AIDS care and treatment more widely available to inaccessible populations, a mobile clinic is being procured for the Kokstad area, in KwaZulu-Natal. A mobile CT team will be integrated with the care and treatment team to provide services at fixed times at a variety of outreach sites in Kokstad. Pre-advertising will be conducted (via fliers and public announcements), to provide potential clients with information, maps and schedules for the mobile service. Rapid tests will be used to ensure immediate results for clients within the same day and session.

Activity 7: Provision of Group Counseling at 36 ART sites

In the facilities supported by Columbia, the patients wait for some period of time after checking into the clinics and before seeing the healthcare providers. Through peer educators, Columbia will motivate and support this opportunity to tell the patients that it is recommended that all patients are tested for HIV and to provide them with information about HIV and TB (group pre-test counseling). Brochures will be developed in liaison with the Department of Health and will be given to patients when they check in to read in the waiting room. Posters will also be placed in waiting rooms and throughout the clinic, noting the importance of knowing one's HIV status to facilitate the pre-test counseling sessions. Those who opt for the test will then be privately counseled post-test.

ACTIVITY 8: Creation of a Functioning Referral System for Counseled and Tested Patients

Functional links will be established between the different departments at the health facilities including the ART clinics to facilitate cross-referral. Mechanisms for referral to post-test diagnostic and care services will be established including regular clinical meetings.

ACTIVITY 9: Establishment of Quality Assurance Systems for Testing and Counseling Services

Columbia will support two overarching principles of quality assurance: (a) supporting clients' rights, and, (b) addressing providers' needs. To meet the clients rights, Columbia will refurbish the facilities to ensure private and confidential space (aural and visual privacy) at each of the facilities providing CT services. The sites will be supported to undertake rapid counseling and testing. Mechanisms will be instituted for sample referral for quality assurance testing (10% of samples to be confirmed centrally) in an external facility/laboratory.

To support the work of providers, Columbia will guarantee accurate documentation and information management procedures to ensure accuracy and confidentiality of all patient test and diagnostic information. Adequate supply of simple/rapid tests, condoms and client information materials from the DOH will also be ensured. In addition good quality management and supervisory support including information, training and skills development will be supported by Columbia.

Activity 10: Engaging Stakeholders

Activity Narrative: Columbia will engage stakeholders in the planning and management of the program through meetings, sensitization workshops and feedback reports. The stakeholders include Department of Health officials, district managers, health facility managers, clinic supervisors, laboratory personnel, and staff representatives, including doctors and nurses.

By providing HIV counseling and testing to patients on TB treatment, Columbia's activities will contribute to the realization of the PEPFAR goal of providing care to 10 million people. These activities will also support efforts to meet HIV and AIDS care and support objectives outlined in the USG Five-Year Plan for South Africa.

Activity ID: 19516.22760.09	Planned Funds: \$371,371
Activity System ID: 22760	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAY:

ACTIVITY 1: Training master trainers and lay counselors

In FY 2008, the Academy for Educational Development (AED) will design and introduce a training module on tuberculosis (TB) testing to supplement the existing training materials to ensure that master trainers and lay counselors are skilled in the screening procedures for tuberculosis. In FY 2009, the scope of lay counselor training will be expanded to provide accredited training on couple counseling. The purpose of this voluntary counseling and testing (VCT) training will be to prevent transmission in serodiscordant couples and promote fidelity among concordant negative couples. Potential lay counselors will also be identified and recruited from experienced peer educators.

ACTIVITY 2: VCT services

Educator-specific incentives will be developed and distributed to encourage more testing at outreach events. For example, pencil boxes featuring the Education Labour Relations Council Prevention, Care and Treatment Access (ELRC-PCTA) logo and displaying, "I know my HIV status," will be available at peer education workshops and union meetings.

ACTIVITY 3: Fostering linkages with treatment, care and support

Referral systems will be improved by monitoring and coordination of VCT services through the ELRC-PCTA secretariat. The ELRC-PCTA will strengthen its relationship with its national treatment partner Tshepang Trust, but also encourage unions to develop relationships with local VCT providers. Tshepang Trust will also add TB screening to its menu of services and provide data regarding the number of educators screened for TB.

ACTIVITY 4: Addressing stigma and discrimination

Union leaders will be trained in treatment literacy, stigma and discrimination towards educators and learners. These union leaders will then be responsible for distributing information, education and communications (IEC) materials focused on treatment literacy, stigma and discrimination as well as conducting workshops to address these issues. The Department of Education national and provincial teams will also receive induction training workshops in treatment literacy, stigma and discrimination.

SUMMARY:

The voluntary counseling and testing (VCT) activity is a component of integrated service delivery activities through the training of peer education and lay counselors in the workplace; and relates to activities in prevention/abstinence and being faithful as well as condom distribution and sexually transmitted infection program. This activity is a component of a comprehensive prevention education, care and treatment program and activities are described in AB, Policy Analysis and Systems Strengthening, and Condoms and Other Prevention. With an estimate of 12.3 million learners in South Africa, served by 386,600 teachers and more than 26,000 schools managing a response to HIV and AIDS across the education sector requires a comprehensive and substantial effort. Efforts must include a focus on both learners and educators if the impact of HIV is to be mitigated; and it must be recognized that any efforts focused on learners via the education sector cannot succeed without educators also being addressed. The Education Labour Relations Council (ELRC) will implement a comprehensive HIV and AIDS workplace program for the education sector of South Africa.

BACKGROUND:

ELRC is a statutory council which serves the South African education sector nationwide and is comprised of the public sector, the national and provincial departments of education, the private sector and teacher unions representing all primary and secondary public school educators. The ELRC works as an interface between the Department of Education (DOE) and labor organizations for labor peace and a vision of contributing towards the transformation and development of a quality South African public education system. A 2005 Health of Our Educators Report found that 50% of all teacher attrition is linked to complications of HIV and AIDS, resulting in 4000 teachers being lost each year due to AIDS. The general prevalence rate among educators was found to closely parallel that of the national population with an estimate of 12.7% of all DOE employed educators living with HIV. Based on the findings of this report and with FY 2007 and FY 2008 PEPFAR funding ELRC will implement a country-wide project in all 9 South African provinces to educators living with and affected by HIV and AIDS. The target group for this project is teachers, including those living with HIV or those who have family members living with HIV. This is a workplace intervention with minor emphasis areas in information, education and communication, community mobilization, and the development of linkages and networks. A particular focus of this project is the greater involvement of people with AIDS. ELRC will work with HIV-infected teachers to ensure they can serve as role models to fellow teachers and to learners.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training Master Trainers and Lay Counselors

Master trainers and lay counselors will receive training on rapid test protocols and VCT. The Master trainers will be responsible for training lay counselors within their educational sector unions as well as increasing the demand for and acceptance of VCT services.

ACTIVITY 2: VCT Services

Activity Narrative: This activity will provide access to VCT services for teachers and their families. Services will include training, support and supervision of counselors. Peer educators within the education sector will promote HIV counseling and testing as a strategy to prevent HIV. The peer educator will also raise awareness about local community VCT Centers to increase the uptake and accessibility of counseling and testing. For those who test positive, trained lay counselors will offer counseling on how to live with HIV, as well as strategies to mitigate stigma and discrimination in the workplace and education sector.

ACTIVITY 3: Fostering linkages to treatment, care and support

ELRC will work with the implementing education sector unions providing VCT to ensure that linkages with treatment, care and support services are established. ELRC will ensure, via the implementation of a tracking system that all educators testing positive will be provided with referrals as needed. In addition, lay counselors will work with the union to track educators who have been referred and to ensure that they receive the services that they have been referred for. ELRC will develop a comprehensive provincial-based directory of services. This directory will be geared towards educators and their families and will be distributed via the union structures.

These accomplishments will directly contribute to the realization of PEPFAR's goal to prevent 7 million new infections and provide care for 10 million people infected with HIV. These accomplishments also support the prevention, care and treatment goals laid out in the USG Five-Year Strategy for South Africa.

Testing

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 8247.22988.09

Planned Funds: \$242,726

Activity System ID: 22988

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Activity 1, schools-based health screening, now assures that all HIV-infected learners get CD4 counts that allow us to screen them to see if they require antiretroviral treatment (ART). Persons tested for HIV by Mpilonhle staff who are HIV-infected are offered the opportunity for having blood taken by Mpilonhle staff if they desire to know their CD4 count and need for ART therapy. For those persons who agree and desire CD4 counts, the Mpilonhle nurse obtains a blood sample. This blood sample is then taken to the appropriate (by geographic region) KwaZulu-Natal (KZN) Department of Health (DOH) clinic. From there it is sent by KZN-DOH staff to the KZN-DOH district hospital where the CD4 test is performed. Mpilonhle staff follow up to assure that the specimen makes it to the district hospital, and then assure that the result is available to Mpilonhle staff. Mpilonhle staff then arrange for the client to be seen in the Mpilonhle mobile clinic and the results of the test result is communicated to the client. If need be, Mpilonhle staff visit the home of the client to provide the result. They also involve family members in this process if required. At this time Mpilonhle staff discuss with the client the management of their HIV infection, including the need, if required, for ART. Currently, Mpilonhle staff do not provide the same service for community members determined to be HIV-infected. With the PEPFAR-funded units now deployed, we are exploring having the units return to communities on a regular basis. If this is successful we would be able to provide community members with the same service described above for school learners.

Mpilonhle continues providing referral services for all people living with HIV and AIDS (PLWHA) to KZN-DOH community-based health facilities for further management. This includes referral for ART services, tuberculosis (TB) services, sexually transmitted infection (STI) services, pregnancy services, services for diarrhea and skin problems, and for a variety of other problems. Mpilonhle has an established referral system for this process.

Mpilonhle shall increase its efforts in the following areas:

1. During Mpilonhle's health screening and health education activities, Mpilonhle's health counselors and health educators will emphasize the value of reducing multiple and concurrent partnerships, as well as cross-generational and transactional sex. Mpilonhle shall also emphasize issues of positive roles for men, dispelling HIV/AIDS myths, disclosure support, and more frequent VCT. These issues are already addressed in Mpilonhle's current activities, as can be seen in the last paragraph of the FY 2008 activity narrative, but they shall be emphasized more strongly in line with the FY 2009 COP technical considerations.
2. Mpilonhle shall encourage the participation of school governing boards and parents in its training sessions on HIV prevention, the promotion of reproductive and general health, and care and support for PLWHA and orphans and vulnerable children (OVCs). Mpilonhle shall also encourage the participation of members of other community-based organizations (CBOs) and faith-based organizations (FBOs) in its training activities.
3. Mpilonhle shall improve its referral systems for linking up participants in its programs with community-based health facilities, support services, and support groups, particularly to access reproductive health services including family planning, and services for substance abuse issues. Mpilonhle shall also strengthen its relationships with other CBOs and FBOs in the community involved in Care activities for PLWHA and OVCs.

Mpilonhle clarifies that its health screening activity promotes HIV preventive behaviors among young boys and men; that its health education sessions promote positive roles for members of both genders; and that its health screening activity involves treatments for symptomatic sexually transmitted infections, for pain, and for simple skin conditions offered by a primary health care nurse. Mpilonhle's health screening already involves screening and referrals for TB. Mpilonhle's health screening service also involves referrals to an on-site staff social worker who helps OVCs and PLWHA access grants, and obtain legal and social support for issues of sexual violence and abuse. All these services are offered to all program participants, including all PLWHA and OVCs.

SUMMARY:

Mpilonhle is a new South African community-based organization (CBO). It was registered in 2007 with the South African Directorate Non-Profit Organisations. Mpilonhle is dedicated to improving the health and well-being of adolescents in high schools in Umkhanyakude District Municipality, KwaZulu-Natal through its "Mpilonhle Mobile Health and Education Project". Operations will begin in late 2007 with a single counseling and testing (CT) mobile unit funded by Oprah's Angel Network, and later, will expand with two further mobile units funded by PEPFAR. The organization is currently recruiting and employing staff, which is expected to grow to 40. Staff will be based in the Mpilonhle office in Mtubatuba in KwaZulu-Natal.

Mpilonhle's counseling and testing (CT) activities include (1) schools-based health screening, and (2) community-based health screening. These services will be delivered through mobile clinics and mobile computer laboratory facilities to 12 secondary schools and 24 community (non-school) sites at Umkhanyakude District in rural KwaZulu-Natal province.

Emphasis areas include gender, human capacity development, and strategic information. Target populations include adolescents aged 10-24 years and adults.

BACKGROUND:

This is a new activity that will be implemented by the prime partner, Mpilonhle, a newly established non-governmental organization (NGO). The program has broad support from district and provincial South

Activity Narrative: African government leadership. PEPFAR funds will be used to establish the infrastructure, to purchase mobile vans, equipment and operational costs to run the program. Mpilonhle will implement activities in Umkhanyakude District, the poorest and most rural district in KwaZulu-Natal province, and one with high HIV prevalence. Activities will take place in 12 representative rural secondary schools that are affected by physical remoteness, poor health conditions, and inadequate resources, and in 24 community (non-school) sites. Partners include the Department of Education, the South African Democratic Teachers' Union, district health services, and district and municipal leadership.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Schools-based Health Screening

A health counselor will provide secondary school students with (a) an annual individualized health screening that includes CT, screening and referral for common health problems; (b) counseling or referral to further services for prevention of mother-to-child transmission (PMTCT), antiretroviral treatment (ART), TB and psychosocial support; and (c) referral to a social worker for assistance with accessing government grants and support for people living with HIV (PLHIV). School principals, local Department of Education officials, district and municipal mayors and focus groups of teachers and students have expressed the community's acceptance of schools-based CT.

ACTIVITY 2: Community-Based Health Screenings

This activity will be conducted by health counselors at 24 community-based sites outside schools. Community-based health screenings will consist of a core of HIV preventive services including individualized CT; personalized ABC counseling, and condom provision to sexually active individuals; referrals to other community-based services for PMTCT, ART, TB and psychosocial support; referrals to a social worker for assistance with accessing government grants and support for orphans and vulnerable children (OVC) or PLHIV; general health screening and referral for care and other services as required; basic computer training to community members; and group HIV and health education sessions.

ACTIVITY 3: Mobile Facilities

These counseling activities will be provided through mobile facilities. Each mobile facility will consist of a paired-up mobile clinic and mobile computer laboratory, staffed by one primary care nurse, four health counselors, one health educator, and one computer educator. Each mobile facility will visit a participating secondary school one week per month for eight months per year. This will allow each mobile facility to serve four secondary schools per school year. The project will have three mobile facilities, allowing Mpilonhle to serve 12 secondary schools in total. Each participating secondary school has an average of 800 students, and will offer the first three activities described above. Six of the 12 schools have been pre-selected.

ACTIVITY 4: Counseling and Testing

CT will be conducted using South African Government (SAG) approved algorithms, test kits and guidelines and procedures. Health counselors will be trained in SAG-approved CT programs and will use SAG-approved HIV CT protocols. External Quality Assurance methods will be used to check the service quality. Health screening will use an Electronic Medical Record (EMR) system implemented on handheld computers, programmed with health screening guidelines, algorithms, and series of questions that must be followed by the counselors. These will save individual screening results into a medical record. EMRs facilitate collection of timely, high quality and easily analyzable data. EMRs also contribute to quality control by minimizing missing data, and by enforcing and monitoring conformity to protocols and guidelines. The data collected by the EMR system will include indicators of acceptance of pre-test counseling, testing, results, post-test counseling, data on HIV status, and on sexual behavior.

Persons who are HIV-infected will be referred to the program nurse for further evaluation, including CD4 testing, which will be done at Department of Health laboratories. People who meet initial screening criteria for antiretroviral treatment (ART) will be referred to the Hlabisa Health sub-district ART program at one of the DOH clinics. Persons screened for TB will also be referred for TB management at district clinics.

ACTIVITY 5: Human Capacity Development

Sustainability of activities is facilitated by building human capacity in remote rural areas. Mpilonhle will maximize the capacities and skills of relatively abundant lay health workers to enable them to perform critical yet currently scarce services such as HIV counseling, health screening and personalized risk assessment, and health education. This skills development in lay health workers will shift the burden of these activities away from relatively scarce professional health workers like nurses and doctors. Mpilonhle will build the technical expertise and capacities of lay health workers through rigorous training and regular refresher courses and through the technological support provided by the information technology components of the program. Sustainability is facilitated by political commitment from district and municipal governments, and the local Department of Education to scaling-up and to fund-raising in support of such scaling-up.

These activities will contribute to PEPFAR 2-7-10 goals of promoting counseling and testing for HIV among secondary school students and adults in the general population.

Activity ID: 21176.23175.09	Planned Funds: \$436,907
Activity System ID: 23175	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

This new partner won the FY 2008 annual program statement competition. The overall objective of the Ripfumelo project is to reduce HIV vulnerability of farm workers in identified districts of South Africa by implementing a coordinated, evidenced-based and focused HIV/AIDS prevention and care program. Building on experiences and lessons learned from International Organization Migration (IOM) pilot projects in the Southern Africa, the Ripfumelo project aims to provide sustainable prevention and care services to farm workers by building the technical capacity of local implementing partners (IPs); strengthening partnerships among and with local, provincial, and national governmental agencies; promoting public/private partnerships; and developing a network of stakeholders working specifically on HIV-related issues within the commercial agriculture sector.

The overall anticipated results of the project are a reduction in the HIV incidence in the targeted areas and a mitigation of the impact of AIDS on farm workers and their families and communities. The project will build particularly on experiences and lessons learned from the ongoing IOM prevention and care project which has been implemented in Hoedspruit, Mopani District, Limpopo province since 2005. The Ripfumelo project will strengthen the existing intervention in Hoedspruit and target additional seasonal, temporary, and permanent farm workers, whether South African or foreign, documented or undocumented, in the commercial agricultural areas of Hectorspruit/Malelane (Lowveld, Mpumalanga), Makhado/Musina (Vhembe, Limpopo), and Tzaneen (Mopani, Limpopo). The project will initially target approximately 20,000 farm workers on about 120 commercial farms and will run for three years, from September 2008 until August 2011. Once this initial expansion phase has been consolidated in these geographical areas, it is proposed that opportunities be reviewed in other provinces with large commercial farming sectors, such as KwaZulu Natal, Free State, Western Cape and Eastern Cape.

BACKGROUND:

The IOM will execute the Ripfumelo project and assume overall responsibility for the coordination and management of all project activities. Ripfumelo will fall under IOM's regional Partnership on HIV and Mobility in Southern Africa (PHAMSA) program, which targets economic sectors characterized by high levels of labor mobility, and which aims to reduce the HIV incidence and mitigate the impact of AIDS among migrant and mobile workers and their families. Counseling and testing (CT) is an important aspect of prevention and for those identified as HIV-infected, to refer them for treatment and support. The Ripfumelo project will actively promote the use of existing CT services and work with the services to ensure that they are more accessible to the migrant farm populations.

ACTIVITIES AND EXPECTED RESULTS:

The partner will carry out four separate activities in this program area.

ACTIVITY 1: HIV in the Workplace

Approximately 120 farm owners and managers will be encouraged to include information on CT sites and offer programs to promote CT and the benefits of knowing one's status.

ACTIVITY 2: Social Change Communication

An evidenced-based communication campaign will be developed and implemented to support all other components of the project. In addition to behavior change messages, the campaign will also promote knowing one's status and encouraging individuals to visit CT centers.

ACTIVITY 3: Peer Education

Approximately 650 farm workers will be trained as peer educators who will provide information and support to their colleagues. Specifically, their role will be to facilitate better access for farm workers to local primary health care services, especially CT, and to de-stigmatize HIV.

ACTIVITY 4: House-to-House CT

Through the network of caregivers, the project beneficiaries will be encouraged to access CT services.

SUMMARY:

The overall objective of the Ripfumelo project is to reduce HIV vulnerability of farm workers in various districts of South Africa by implementing a coordinated, evidenced-based and focused HIV and AIDS prevention and care program. Building on experiences and lessons learnt from IOM pilot projects in the southern Africa, the Ripfumelo project aims to provide sustainable prevention and care services to farm workers by building the technical capacity of local implementing partners (IPs); strengthening partnerships among and with local, provincial, and national governmental agencies; promoting public/private partnerships; and developing a network of stakeholders working specifically on HIV-related issues within the commercial agriculture sector.

The overall anticipated results of the project are a reduction in the HIV incidence in the targeted areas, and a mitigation of the impact of AIDS on farm workers and their families and communities. The project will build particularly on experiences and lessons learned from the ongoing IOM prevention and care project which has been implemented in Hoedspruit, Mopani District, Limpopo Province since 2005. The Ripfumelo project will strengthen the existing intervention in Hoedspruit and target additional seasonal, temporary, and permanent farm workers, whether South African or foreign, documented or undocumented, in the commercial agricultural areas of Hectorspruit/Malelane (Lowveld, Mpumalanga), Makhado/Musina

Activity Narrative: (Vhembe, Limpopo), and Tzaneen (Mopani, Limpopo). The project will initially target approximately 20,000 farm workers on about 120 commercial farms.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 4749.09

Mechanism: N/A

Prime Partner: Ingwavuma Orphan Care

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Prevention: Counseling and Testing

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 13988.23171.09

Planned Funds: \$97,090

Activity System ID: 23171

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 2: A greater emphasis will be placed on tuberculosis (TB) education and screening. A local drama group will be hired to provide entertainment and education at the testing site. One play will be about HIV and the other about TB. Anyone who tests positive for HIV will be screened for TB. Those who are suspected of having TB will be referred to government clinics for follow-up. A quality assurance program will include site inspections by the supervisor and batches of blood will be sent to a reference laboratory for cross-checking of results. Counselors will receive debriefing and support one day a week.

SUMMARY:

Expansion of Ingwavuma Orphan Care's current counseling and testing (CT) project consists of recruiting and training a dedicated mobile team to provide counseling and testing, specifically targeting youth. The home-based care staff will continue to provide CT to their clients and clients' families, with task shifting from nursing staff to lay counselors.

BACKGROUND:

Ingwavuma Orphan Care (IOC) started to offer counseling and testing to its palliative care clients and their families in April 2007. The National Department of Health and nursing staff train lay caregivers to provide pre- and post-test counseling to their clients in their homes, while the nurses and doctors carry out the test at the clients' homes when they next visit. The project has found that many male clients are reluctant to go to local clinics or the hospital for HIV testing, but are willing to be tested in their own home, so this program helps to address gender equality in HIV programs. Home testing also increases the uptake of couple testing and testing children of HIV-infected clients.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Home-based Counseling and Testing Services for Home-Based Care Clients

Counseling and testing services will be integrated with the home-based care project. The lay caregivers will counsel clients and their families and recommend testing for anyone who has not yet been tested. They will then offer testing and post-test counseling at the clients' homes. The IOC will train caregivers to administer the HIV tests as part of a task-shifting strategy. Nurses will supervise and monitor their activities. HIV-infected clients can immediately be referred into IOC's home care service and support groups that are run by the organization. The nurses can then take blood to check CD4 counts, which will be transported to the local hospital. The nurses will undertake quality assurance monitoring. High-risk negative clients will be referred to existing programs such as loveLife. This activity also works to increase the local organization capacity through training of staff and employment of skilled personnel.

ACTIVITY 2: Mobile Counseling and Testing Unit Targeting Youth

IOC will set up a CT mobile team consisting of two trained HIV counselors and an assistant. The team will work from a vehicle with a trailer. The counselors will provide CT, and the IOC medical staff will monitor their work. These services will be publicized through the extensive existing community links IOC has with high schools and areas where youth congregate, such as near water points and outside informal drinking dens. Many of the targeted girls are involved in transactional sex for food or other favors. The emphasis is on targeting adolescents in a youth-friendly way. However, anyone who wishes to be tested will be welcome to use the service.

The team will set up three tents with chairs and tables at a selected site such as a high school. The team is equipped with a music system and DVD projector with which to play music and show DVDs relating to HIV and abstinence. One tent will house leaflets, information about HIV and other youth-relevant material. The HIV counselors will work in the other two tents.

Once a group has gathered, people will be encouraged to go for free testing to know their status. In the tents the counselors will perform confidential pre-test counseling, testing and post-test counseling. Finger prick tests are used. As per government protocol, the serial testing algorithm should be used, as opposed to parallel testing. Those who test positive are encouraged to go to the clinic or hospital for CD4 counts. Those who test negative are provided post-test counseling and referred to youth programs such as loveLife.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 479.09

Prime Partner: Humana People to People in South Africa

Funding Source: GHCS (State)

Budget Code: HVCT

Activity ID: 3021.23167.09

Activity System ID: 23167

Mechanism: N/A

USG Agency: U.S. Agency for International Development

Program Area: Prevention: Counseling and Testing

Program Budget Code: 14

Planned Funds: \$565,066

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Human Capacity Development

During FY 2007 Humana People to People's Total Control of the Epidemic (TCE) program increased the number of counselors from six to eight per site, making 16 trained lay counselors in total. A new element in the training of Hope counselors and field officers will be referrals to family planning during counseling of people who are HIV-infected where Humana finds it appropriate.

ACTIVITY 2: Counseling and Testing (CT) Promotion and Support

In FY 2009 the Hope activists will take over from TCE to mobilize people to test in areas where TCE has finished. By this time the HOPE activists (volunteers trained under HOPE Humana), many of them Passionates, will be well established in the community. Both in TCE and in Hope, special actions will be conducted to target men to be tested for HIV. This includes person-to-person (door-to-door) campaigns, outreach to workplaces and shebeens, and campaigns among taxi and truck drivers.

ACTIVITY 3: CT Services

As of the middle of FY 2007, HOPE Humana Bushbuckridge gained permission from the Department of Health to run its own CT site. Humana had expected to obtain permission to carry out CT in Mopani already in July 2008. However, a series of new demands were put forward and they are still in the process of seeking permission and hope to receive this permission in August 2008.

Also, more emphasis will be put on encouraging people to disclose to their partners and/or family members in order to be able to receive support e.g. from the TRIO programme, which TCE implements under palliative care. TCE will also facilitate an increase in uptake of CT of males, youth and adults, MARPS (most at risk populations) and persons in the 15 - 24 year age group. More information will also be given to clients about family planning and referral to these services.

Additionally TCE field officers will be trained to screen clients for symptoms of TB by identifying people who have been coughing for more than 3 weeks, having night sweats and losing weight. Clients showing these symptoms will be referred to public health facilities for testing and treatment if necessary.

ACTIVITY 4: Mobile Testing

Humana now has permission to carry out mobile testing in Bushbuckridge. The mobile testing is performed by nurses inside tents that are erected in the morning before the testing starts in whatever village the testing is taking place that day. HOPE Humana sets up four tents, two for counseling and one for testing and one as a waiting room. The set up has been approved by the Department of Health in the District. The concept has been very well received by the communities, and the number of people tested increases significantly with this campaign.

ACTIVITY 5: Linkages with Sectors and Initiatives

An additional and important linkage has been established with the PEPFAR-funded Bhubezi Health Centre in training of nurses and caregivers and in provision of test kits. TCE field officers and HOPE counselors are also referring to their services. Humana also is part of networking forums, where Bhubezi staff are active.

SUMMARY:

Humana People to People (Humana) implements an HIV prevention program called Total Control of the Epidemic (TCE). TCE's voluntary counseling and testing (CT) program focuses on (a) providing counseling and testing (CT) to household members during home visits; (b) training lay counselors; (c) supporting South African Government (SAG) services through human resources; (d) piloting mobile testing; and (e) following up with household members to ensure that counseling and testing took place. The major emphasis area of the CT program is community mobilization/participation, while minor emphasis areas are development of network/linkages/referral systems and training. Key target populations are men, women, pregnant women, discordant couples, migrants, community leaders, and traditional healers.

BACKGROUND:

Humana first launched TCE in Zimbabwe in 2000, and since then, TCE has been implemented in eight countries in southern Africa reaching a population of five million people. This program trains community members as Field Officers (FOs) to utilize a person-to-person campaign methodology to reach every single household within the project target area with a comprehensive HIV and AIDS program that includes prevention, CT, and palliative care. Humana received its first PEPFAR funding in July 2005. By FY 2007 Humana was managing five PEPFAR-funded TCE areas in the province of Mpumalanga and one TCE area in Limpopo province. With FY 2007 funding, Humana will add palliative care activities to its program. Humana has previously implemented care programs with TCE and other community programs in South Africa. Furthermore, Humana is, at present, implementing the TRIO program, a public-private partnership with Johnson & Johnson that provides support for people on antiretroviral treatment in Limpopo and Gauteng. Lessons learned from this program and from similar activities in Botswana will be applied to activities. Humana works in partnership with the SAG, and the Ehlanzeni and Mopani District Municipalities are major partners of the program contributing with significant counterpart support. Humana's program has received a number of awards, including the 2003 Stars of Africa Award (in partnership with Johnson & Johnson) for best Corporate Social Investment Program within Health/HIV/AIDS in South Africa. In 2008, TCE will expand its outreach activities with funds from the Global Fund through the South African National

Activity Narrative: Council on AIDS (SANAC).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

TCE will increase the capacity of services for CT in the target areas by establishing two CT sites. TCE will train two nurses and six counselors for each site. The nurses and counselors will all receive a once-off training on CT and thereafter they provided with quarterly training on data management, referrals and linkages and other refresher courses. Counselors will be trained in accordance with SAG policy and guidelines. In addition, TCE will support the salaries of retired private sector nurses to provide testing services.

ACTIVITY 2: CT Promotion and Support

CT sites will actively target couples and encourage them to go for counseling and testing as a strategy for reaching both women and men. The sites will also actively seek to test children of HIV-infected people. The TCE Field Officers will mobilize and refer clients to the CT sites. In addition, TCE encourages the FOs and community volunteers (Passionates) to know their own status and thereby become good role models to other members of their community. The FOs are trained as lay-counselors and will follow-up with people after testing and offer them the necessary ongoing support, either through referral to existing services or by establishing their own support systems, e.g. Positive Living Clubs and support groups.

ACTIVITY 3: CT Services

Based on previous experience, TCE has identified a need for increased access to CT in the areas where TCE operates. Since 2005, Humana collaborated with loveLife, a South African NGO, to run a CT center from the TCE offices at Bushbuckridge in Limpopo province. Negotiations are taking place with the District Department of Health for TCE to start its own site and to work at public CT sites. In July 2007 Humana obtained permission to start CT in Mopani District. Humana will have established two CT sites in FY 2007, and these will be maintained in FY 2008. The CT sites together with the home-based care program will be administered under a sub-program called Hope, which will continue to service each area after the three-year TCE campaign ends.

ACTIVITY 4: Mobile Testing

Experience in the field has shown that many people cannot spare the time or money to visit their local CT site. Experience in other TCE programs has demonstrated that mobile testing in communities has increased the number of people tested. TCE is at present in negotiation with the District Department of Health about mobile testing. Humana will carry out mobile testing from the two sites, both designed to ensure confidentiality, at places in the communities to increase the accessibility to testing. These sites could be established at a school, youth club, church or any other public site. In FY 2007, Humana will explore possibilities of doing home-based testing. TCE is already carrying out home-based testing in Zambia and Mozambique, where FOs are legally permitted to test.

ACTIVITY 5: Linkages with Sectors and Initiatives

In addition to running its own sites, TCE mobilizes community members to go for testing at public CT sites, educates pregnant women about PMTCT, and makes referrals to antenatal clinics. Other TCE collaborative activities include:

- (a) working with PEPFAR partners and SAG hospitals to facilitate access to antiretroviral treatment and related services such as support groups;
- (b) conducting TCE-run activities for palliative care, which may absorb some of the needs identified by the FOs during their door-to-door-campaign or at TCE's CT sites;
- (c) Strengthening a partnership with the TB sub-directorate in the Ehlanzeni and Mopani districts, as FOs are trained to raise awareness about TB, make referrals to clinics and collect sputum;
- (d) cooperating with SAG departments including the Department of Social Development to ensure that orphans and vulnerable children (OVC) and people living with HIV who are identified through household visits are able to access social grants;and
- (e) working with the Department of Education to ensure children and youth access education and receive information and education on HIV and AIDS.

These activities will contribute to the PEPFAR goal of providing care to 10 million HIV-affected individuals through an increased number of people being tested and knowing their status resulting in fewer infections; reduction of stigma as a result of more people knowing their status; higher gender equity through counseling (individuals/couples); increased lifespan due to timely treatment of opportunistic infections, positive living, monitoring of CD4 counts and entry to treatment programs before developing AIDS; and strengthened linkages between services offered by government and other organizations.

Activity System ID: 23158

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The activities described in the FY 2008 narrative are about to commence. The Hospice Palliative Care Association (HPCA) will monitor the standards of service delivery at the counseling and testing (CT) sites and implement a quality assurance policy and procedure for hospice CT activities.

SUMMARY:

The Hospice and Palliative Care Association of South Africa (HPCA) currently has 75 member hospices throughout South Africa (SA), each an independent legal entity. The Mission of HPCA is to provide and enhance the provision of sustainable, accessible, quality palliative care. PEPFAR funds will strengthen the capacity of member hospices and other governmental and non-governmental organizations to provide quality services to HIV-infected persons. **BACKGROUND:** HPCA strengthens existing services and develops new services through direct funding to member hospices to promote accessibility and availability of palliative care in SA, including work with religious leaders and member hospices that are faith-based organizations. HPCA personnel at national, provincial and district levels continue to provide the infrastructure and coordination to develop and strengthen palliative care programs within member hospices, the formal healthcare sector, and NGOs. Improved collaboration between HPCA and National Department of Health (NDOH) is a key objective, aimed at optimum utilization of scarce palliative care resources. FY 2006 funding has allowed the training of 7,108 trainees from October 2006 to July 2007. The major focus of FY 2008 funding will be to train and support staff from identified hospices to integrate counseling and testing (CT) into their services as a pilot program. The program will focus on training and supporting hospice staff to provide CT services to patients and their families.

ACTIVITY 1:

Pilot Site Project PEPFAR funding in FY 2008 will enable HPCA to select four pilot sites in four provinces to integrate CT into their patient services. The funds will be used to employ a professional nurse at each of these four sites, to pay related overheads and to provide the necessary equipment and rapid test kits. Information brochures will be produced for distribution at these four hospice sites and wherever else appropriate. After completing the pilot project, HPCA will extend these CT services to all member hospices and sites. Within these four hospice sites, CT will also be provided to families in homes as part of the home-based care program.

ACTIVITY 2:

CT Training Specific counseling and rapid testing training will be provided to these four, and other hospice professional nurses, who will be certified after having received the required training. If necessary, lay counselors will also receive specialized training to alleviate the burden on the clinical staff. Additional training will be provided on couple counseling and testing. Home-based caregivers (HBCs) will be trained to identify potential HIV patients in the community or family members and neighbors of patients. Those identified will be encouraged and referred to the hospice for CT. The HBCs will also receive training on antiretroviral treatment support and the importance of treatment adherence. The four professional nurses will also be trained in supervision skills, as they will be supervising the HBCs involved in supporting this pilot project.

ACTIVITY 3:

Client Services The target population for CT will be patients, their families, and neighbors. The objective is to identify those in most need of HIV treatment at the earliest opportunity. Confidentiality will be maintained through a professional approach. The pilot hospices will have stocks of high quality CT rapid test kits and external quality control measures around rapid testing will be implemented. Free tests will be offered, in a medical setting at these sites, by trained and certified staff to all patients and their families or neighbors who present with conditions that might suggest underlying HIV disease. Specially trained personnel will provide appropriate pre- and post-test counseling in all cases. HIV-infected patients will be routinely referred for TB testing, and to antiretroviral (ARV) clinics for CD4 counts and ARV treatment. Ongoing counseling and referrals for medical care will be available to those who test HIV-infected. HPCA personnel will facilitate ARV treatment support for enhanced adherence to antiretroviral drugs. Trained home-based caregivers will provide enhanced treatment support and patients will be referred to support groups. Those who test HIV negative will be encouraged to maintain their negative status though educating them about prevention, and how to protect themselves and their partners. It has been shown that CT reduces the transmission of HIV from infected individuals to their partners. Hospice site staff will be trained in the importance of targeting men, and on couple counseling and testing. Disclosure remains voluntary, but HIV-infected patients will be encouraged to disclose their HIV status to their partners and families when they feel safe to do so. Couple counseling will help to address this issue. The four professional nurses at each site will supervise home-based caregivers who will be providing information and support on CT in the communities.

ACTIVITY 4:

Liaison with ARV Clinics and the Department of Health The four pilot sites will improve liaison with local ARV clinics and the Department of Health to optimize CT in that region. Patients will be referred to HIV support and advocacy groups.

Activity ID: 2991.23080.09

Planned Funds: \$1,572,866

Activity System ID: 23080

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Interpersonal Communication:

Turntable Trust works in rural areas of KwaZulu-Natal with youth 15–24 and young people 18-32 and will promote the uptake of counseling and testing (CT) services within workplaces and the local community. Owing to changes at the Department of Correctional Services (DCS), as well as a change in emphasis in programming by the John's Hopkins University Center for Communications Programs (JHU-CCP), it is not foreseen that any activities will take place with the DCS in FY 2009.

Mass Media:

JHU has initiated the Scrutinize Campaign together with Matchboxology, its new partners Mediology and CellLife, that aims to encourage young South Africans 18 -32 to assess their risk of HIV infection and to encourage counseling and testing as part of a broader message promoting delaying sexual debut and partner reduction through use of the mass media including the outdoor media and cellular technology. CellLife will support the mass media outreach of all communication partners in South Africa with free short message service technology to promote consistent and correct condom usage, increase risk perceptions in relation to transactional intergenerational sex and the linkages between alcohol consumption and HIV infection. JHU will in FY 2009 scale up a new campaign to be initiated in FY 2008 targeting adult men on CT using male celebrities, including footballers, capitalizing on the 2010 Football World Cup. Trailblazers, which was co-produced with the South African Broadcast Corporation (SABC), has been fully absorbed into the programming of SABC Education, which will enable these resources to be directed to the further development of the Circles Drama Series, the Scrutinize Campaign and a new campaign to be initiated in FY 2008 targeting adult men.

Training activities on voluntary counseling and testing are based on national guidelines by the Department of Health, national, regional and international best practices on counseling and testing.

CT training will focus on routine CT offers and advanced CT skills such as couples, family and child counseling.

SUMMARY:

Johns Hopkins University Center for Communication Programs (JHU/CCP) coordinates the work of 20 South African partners and provides technical assistance and capacity building to provide counseling and testing (CT) using both mobile and fixed services through local NGOs and tertiary institutions. These services will be promoted through the Mindset Health channel to both healthcare workers and patients. Key areas of male norms and behaviors, partner limitation, correct and consistent condom usage, substance and alcohol abuse, reducing violence and coercion and stigma and discrimination, form an integral part of the CT interventions. The target populations for this activity are secondary school learners, university students, patients in health care centers, celebrities and their fans, people living with HIV (PLHIV), out-of-school youth, men who have sex with men (MSM), community leaders and healthcare providers. The major emphasis areas are community mobilization and participation, and information, education and communication, with additional emphasis on local capacity building across all activities. Findings from a qualitative study on multiple concurrent partnerships and the National HIV and AIDS Communication Survey, carried out in early 2006, will help focus on community perceptions of CT and help to determine perceived needs in respect to CT communication interventions.

BACKGROUND:

This is the fourth year that JHU/CCP has undertaken counseling and testing activities. Eighteen of the 20 partner organizations work across all nine provinces of South Africa utilizing mass media and interpersonal communication strategies in a variety of social settings aimed at creating a broad national social movement that promotes counseling and testing as part of the broader national HIV prevention, treatment and care strategy. Testing is promoted through mobile clinics and fixed sites operated by four partners and in partnership with the public health system and other partners such as New Start. Counseling addresses issues related to male norms and behaviors, violence and coercion, stigma and discrimination, alcohol and substance abuse, and correct and consistent condom usage. All organizations carry out prevention with positive living activities as part of their post-test counseling with HIV-infected individuals.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Social Mobilization for Testing

DramAidE, The Valley Trust, Lesedi Lechabile, Mothusimpilo, and Matchboxology support and promote CT services targeting men, women, youth and the broader community at 85 mobile and fixed testing sites. DramAidE's HIV-infected Health Promoters (HPs) mobilizes tertiary students in 23 tertiary institutions across South Africa to undergo CT. The Valley Trust (TVT), based in KwaZulu-Natal (KZN), promotes CT through community outreach and mobilization activities targeting adult men and women in the rural areas of KwaZulu-Natal at its 15 mobile and one fixed CT site. TVT promotes CT with youth aged 14 years and older through its school Anti-AIDS clubs, and among adult men and women through community events and traditional ceremonies, workplaces, taverns and faith-based organizations.

Dance4Life promotes CT among youth older than 14 using dance, drama and drumming as part of their prevention activities covering schools in the Eastern Cape, Western Cape, KwaZulu-Natal and Free State provinces. Lesedi Lechabile and Mothusimpilo promote CT through activities undertaken at their mobile and fixed sites to vulnerable women, youth and men in the mining areas of the Free State and the North West.

LifeLine promotes CT with workers in small and medium enterprises and farm workers in informal

Activity Narrative: settlements/rural areas in Gauteng, Free State, Northern Cape, Limpopo and Mpumalanga. This activity is undertaken in partnership with the Small Business Association, farm owners and farm workers' unions.

Lighthouse, working in 13 informal settlements in the Madibeng District of the North West province, promotes CT through its school Anti-AIDS club activities. The project encourages adult men, women and out-of-school youth to undergo CT through their door-to-door campaigns and at community events, traditional ceremonies, and gathering places like taverns and taxi ranks.

Matchboxology (MB) in partnership with the South African Professional Footballers Union (SAPFU) and the Premier Soccer League (PSL) places 16 wellness coaches in 16 Premier Soccer League Clubs to mobilize professional footballers and their fans to undergo CT. MB is a private sector firm that is responsible for the Levis Red for Life Campaign that mobilizes celebrities around HIV.

Sonke Gender Justice (SGJ) will expand the number of men's clubs in Mpumalanga, North West and Northern Cape to mobilize men participating in their male clubs to undergo CT. SGJ receives funding from the Western Cape provincial government, the National Office on the Status of Women, a independent foundations and United Nations agencies.

The PEPFAR partner, Department of Correctional Services (DCS), will expand their program from the Limpopo and North West provinces to include Gauteng and the Northern Cape. The program with DCS uses the TshaTsha TV drama series, to train their peer educators (PEs) to promote CT.

A "to be determined" (TBD) faith-based organization (FBO) will work with faith-based leaders to promote CT to their communities.

A TBD partner will work with the indigenous communities living in the Northern Cape (the San and the Khoi) to to promote CT as part of a broader effort to promote HIV prevention amongst this community.

A TBD partner will work with men who have sex with men (MSM), including male sex workers, to mobilize this community to increase HIV prevention efforts including CT as part of a broader HIV prevention effort targeting MSM in South Africa.

A TBD partner will work with cellular telephone providers in South Africa to utilize cellular technology to encourage celebrities and other key personalities, through SMS technology, to participate in cellular and on-line chat forums to promote CT.

ACTIVITY 2: Promoting CT in Health Centers

The Mindset Health Channel (MHC) broadcasts information to 400 health clinics. Patients in waiting rooms are targeted with information on CT and HIV. The channel provides training and technical information to healthcare workers (HCWs) using a multimedia approach that combines video, print and computer-based interactive multimedia. Training on current CT guidelines (including strong linkages to HIV care and services) are included. Mindset will also develop a video on provider-initiated testing and counseling (PITC). The video will inform patients that the facility has a PITC policy and that the provider will test them for HIV unless the patient refuses.

Community Health Media Trust (CHMT) works with MHC and with other community-based organizations through its 92 Treatment Literacy and Prevention Practitioners (TLPPs). Seventy-two TLPPs are funded by PEPFAR and 20 by the National Department of Health (NDOH). All TLPPs encourage CT in health centers as an entry point into treatment while reinforcing HIV prevention to those who test negative.

ACTIVITY 3: Mass Media in Support of Community Mobilization

ABC Ulwazi produces a radio talk show series tailored to 60 different community radio stations with a special emphasis on voluntary counseling and testing. Listeners' Associations formed by local citizens have facilitators' guides to carry out community outreach interventions that mobilize local communities around voluntary counseling and testing and encourage them to know their HIV status.

The South African Broadcasting Corporation plays a key support role by co-funding two TV programs with radio (nine local language stations) and by providing web support. Trailblazers, a community health show, will air 13 episodes highlighting individuals that provide models of positive behaviors for others to emulate. A second season of a 26-episode TV drama deals with contextual issues relating to social and cultural norms that inhibit and/or support positive male norms and behaviors, including positive examples that promote counseling and testing and living positively. Radio talk shows follow both programs, providing additional information and stimulating community participation.

MB and the South African Football Players' Union (SAFPU) and the Premier Soccer League (PSL) will mobilize South African football players to be positive role models and to undergo public counseling and HIV testing. Players will be encourage to promote messages relating to counseling and testing through in the build up to the 2010 Football World Cup in South Africa.

JHU/CCP's work supports the vision outlined in the USG Five-Year Strategy for South Africa for expanding CT services. CT is a critical entry point into an entire range of HIV services, including identifying HIV-infected individuals for ART. These activities substantially contribute to the PEPFAR goal of providing 2 million people with treatment and averting 7 million new HIV infections. It also supports the HIV & AIDS and STI Strategic Plan for South Africa's priority of establishing a national culture in which all people in South Africa regularly seek voluntary counseling and testing. Establishing regular CT as a norm will contribute towards reducing the number of HIV infections by 50% by 2011 and ensure that 80% of people living with and affected by HIV have access to appropriate care and support and treatment.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 2801.09	Mechanism: N/A
Prime Partner: HIVCARE	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 7988.23071.09	Planned Funds: \$254,280

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

A. Promotion of voluntary counseling and testing (VCT) through the youth clinic, the antiretroviral treatment (ART) sites and the testing of the youth.

- 1) Bringing the whole family into care: A family centered approach is followed with patients encouraged to bring their partners and children in and to have them tested for HIV and screened for tuberculosis (TB).
- 2) Considerable attention is given to prevention among those already HIV infected, including regular assessment for sexually transmitted infections (STI), condom promotion and contraception.
- 3) A VCT coordinator based in the head office will coordinate the numbers of tests performed throughout the 18 sites. In addition, this nurse coordinator will arrange counseling and testing (CT) events in the clinics' immediate area that cannot be arranged through local medical staff.
- 4) The offer of home-based CT will be made available to those patients who have disclosed their status to their partners/families and where they are reluctant/unable to attend at the clinic. This is especially true at the Tsogang site where space constraints prevent staff from isolating persons wishing merely to test from those undergoing treatment. Further to the problem of space constraints, child testing takes place over designated weekends when the clinic is empty.

B. The implementation and management of routine offer of HIV testing at all supported sites

- 1) All patients attending primary health clinics will have access to HIV counseling and testing through the intervention of the general practitioner. This will ensure that the VCT process is part of the basic diagnostic assessment and that as many individuals as possible are tested. This is at all times accompanied by a signed consent document and following pre-test counseling.
- 2) All persons testing positive are staged and where necessary enrolled into the ART program. Where ART is not then required the persons will be entered into the pre-ART register for follow-up. The clinic has been established specifically to provide ART to patients so very few pre-ART patients are referred to us. The existing pre-ART patients are mainly family members of program patients. The demand for ARV amongst patients is still so large that ART remains the primary focus of the clinics.
- 3) Training for health providers including doctors and nurses will be conducted on the promotion of a routine offer of counseling & testing. This has been lacking in previous programs and has been identified as a need in smaller primary health practices.

Rapid testing is used for adults as it is minimally invasive. In the event of a positive result, a second rapid test is used as a confirmatory test using a different type of testing kit. In children, the same procedure is used but using saliva tests. All tests used are recommended by the World Health Organization and have had their sensitivity and specificity tested by the South Africa National Institute of Communicable Diseases. Where there is discord between the initial and confirmatory tests, an Enzyme-Linked Immunosorbent Assay (ELISA) test is performed. Persons testing negative are counseled on the window period and encouraged to return for a later test in three months time.

As an additional quality control measure all batch data is recorded for all tests performed.

SUMMARY:

HIVCare will use FY 2008 funds to work with the Free State Department of Health (FSDOH) to provide antiretroviral treatment in private health facilities to patients who do not have medical insurance (either through referrals from the public sector, or self-referral). The Free State has mainly a rural population, with only two major metropolitan areas (Bloemfontein and Welkom). In addition, the government rollout of HIV care and treatment has been geographically limited with only one treatment site in each of the five districts.

The Medicross Medical Centre, a well-equipped private primary health center, provides the main resource base in conjunction with three other sites in Bloemfontein, another two in Welkom and nine other centers located in rural towns within the province. The centers will provide an effective means of providing HIV care and treatment to patients who are either referred from state facilities or who access the sites by word of mouth. The major emphasis area for this program will be commodity procurement, with minor emphasis given to logistics and the development of networks, linkages and referral systems, quality assurance and supportive supervision. The target population already includes men and women; families (including infants and children) of those infected and affected factory workers and other employed persons, and government employees - specifically teachers, nurses and other health workers. A further specific population that will be targeted will be secondary school children as HIVCare has determined that a definite need exists. Activities will include active prevention campaigns, HIV counseling and testing (CT) and treatment for those diagnosed. The most significant target group is those persons in the economically active age group of the population that cannot access services in the public health system. Additional attention is to be given to the screening and treatment of TB amongst the patients attending the program. The linkage with the youth centre will ensure that the program will have a larger proportion of younger persons being attended to, specifically adolescents aged 10-14 and 15-24. This focus on youth should further encourage involvement with the street youth and it is anticipated that the program will be marketed among those NGOs working with the street youth as a testing and treatment site.

BACKGROUND:

The HIVCare project began in June 2005 with PEPFAR funding. The main aim of the program was to match

Activity Narrative: the FSDOH with partners from the private sector (in this case Netcare, the largest private sector health provider in South Africa, through their primary health centers) in order to build private sector capacity and absorb some of the burden from state facilities. Many FSDOH centers have waiting lists of people for ARV treatment and given that CT is the mainstay of the National Strategic Plan, these waiting lists are likely to continue to grow. Prevalence amongst children in the 9 to 15 year age group in the Free State province is among the highest in the country. The HIVCare site is the only child-friendly site in the area. Patients from these waiting lists, who meet the eligibility criteria for treatment, are referred from those public sector clinics to one of the HIVCare primary health centers. The FSDOH is a collaborating partner in this public-private partnership.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Provision of Medical Services

The HIVCare treatment sites will provide all medical services related to the delivery of HIV care and treatment. In addition they will provide counseling and testing services. Management and coordination activities will be provided by HIVCare. Active marketing of CT service will only be done within local secondary schools as part of an HIV awareness and prevention strategy although it is expected that word of mouth and the central location of the sites will provide the desired accessibility for the public and will furthermore ensure that the required patient numbers are achieved. Consideration will be given to the principle of opt out testing embodied in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011. This principle will be applied with due regard to the sensitivities involved with dealing with the youth. In addition to clinic referrals, Free State government employees will be encouraged to make use of the HIVCare services. The HIVCare centers are promoted among government employees (who do not have medical insurance) in the Bloemfontein area as independent testing and treatment sites where confidentiality can be ensured.

ACTIVITY 2: Counseling and Testing

Patients attending the center for testing receive comprehensive counseling and testing. Persons testing positive, with their consent, are screened for treatment and care options including staging tests (e.g. CD4) to determine the level of disease progression. Those that meet the clinical criteria will be referred to the treatment program. Persons participating in CT will be provided with a call center number, which they will be able to use to access further advice and /or information. Literature on HIV and related matters will also be provided. All persons testing negative receive post test counseling and are encouraged to test again within three months, receive information as to where they can access condoms and are provided with the phone number of the 24-hour assistance line. Those persons testing positive receive the same information and are staged. On returning for their results are asked to return after six months to check the progression of the disease should they not need to initiate antiretroviral treatment (ART).

ACTIVITY 3: Public Private Partnership

This program area will promote the public-private partnership between HIVCare/Medicross and the FSDOH. This partnership strengthens the system of both parties and allows for the sharing of knowledge and skills. This public-private partnership has been ongoing for a number of years and includes the greater Netcare Group in the Free State. In addition, HIVCare will expand its existing project to target children as part of its continuum of care. This activity targets girls and boys of mainly secondary school age through messages of awareness of HIV care and treatment. A teen center catering for the specific needs of this age group has been established and PEPFAR funding will be used to continue the treatment services already started. CT that takes place at this center will be provided in an environment that is sensitive to the special needs of this group and in line with the South African laws and regulations pertaining to children and HIV.

By providing comprehensive CT services to patients and promoting ARV services for a significant population (people without private insurance and school age children) HIVCare is contributing to the PEPFAR goals of placing 2 million people on ARV treatment and providing care for 10 million others who are infected with HIV. These activities also support care and treatment objectives outlined in the USG Five-Year Strategy for South Africa by expanding public-private partnerships and expanding care to an underserved population.

Program Area: Prevention: Counseling and Testing

Program Budget Code: 14

Planned Funds: \$468,723

Activity Narrative: SUMMARY:

USAID/South Africa (SA) supports institutional capacity building of indigenous organizations that implement President's Emergency Plan for AIDS Relief (PEPFAR) programs, including abstinence and fidelity focused prevention programs, through three competitively-selected umbrella grants mechanism (UGM) partners: Pact, the Academy for Educational Development (AED) and Family Health International (FHI). The main purposes of these UGM projects are to: (1) facilitate further scale-up of HIV/AIDS prevention services through local and international implementing partners in the short term; and (2) develop indigenous capability thus creating a more sustainable program. The major emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs) and community-based organizations (CBOs). The current UGM with FHI will support ten sub-partners. The activity described below refers only to the USAID/SA UGM project managed by FHI.

BACKGROUND:

Currently, USAID/SA's Health and HIV/AIDS Strategy responds to the overwhelming challenges posed by the HIV/AIDS epidemic on individuals, families, communities and society in South Africa. Through this UGM, FHI is responsible for managing sub-grants to ten of USAID's partners (all of whom submit their own COPs directly to USAID). As USAID's prime partner and the managing umbrella organization, FHI will not directly implement program activities, but rather act as a grants management partner to manage and mentor its ten sub-recipients who, in turn, will carry out the assistance programs. Thus, FHI functions primarily as a sub-grant making entity and a relatively small percentage of overall funds are used for administrative purposes. Given that grant recipients require significant technical assistance and management support, FHI will devote a reasonable percentage of overall funding to providing this support.

USAID closely collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grants mechanism. Although some of the partners work closely with various SAG departments at national and/or local (i.e. provincial and district) levels, the umbrella grants mechanism's primary interface with the SAG is through the senior management team (SMT), which includes key staff from USAID, the National Departments of Health and Social Development (NDOH, DOSD), and representatives from the provincial departments.

Under this UGM with FHI, USAID is supporting six indigenous and international NGOs providing counseling and testing (CT) services to communities in South Africa. Active in Gauteng, Mpumalanga, KwaZulu-Natal and North West provinces, these partners improve the capacity of local health workers to provide quality CT services and educate the community on the importance of CT in preventing HIV transmission and as an entry point for treatment and care. These are: Humana, Lifeline, MCDI-SA, Mpilonhle and PSA-SA.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008, USAID will continue to support current CT partners through this UGM with FHI. Funds budgeted under this narrative will support costs for administering and managing these CT sub-partners of FHI. Separate COP entries describe the CT activities implemented by each sub-partner under FHI. Institutional capacity building of indigenous organizations is a key feature of the umbrella grant mechanism and is an important strategy for achieving prevention, care and treatment goals of PEPFAR to ensure long-term sustainability of programs and organizations.

ACTIVITY 1: Grants Management

The umbrella mechanism will award and administer grants to partners selected through the PEPFAR annual program statement (APS) competitive process to implement CT activities. These are: Humana, Lifeline, Medical Care Development International South Africa (MCDI-SA), Mpilonhle and the Project Support Association of Southern Africa (PSA-SA). This involves an array of related activities including the awarding and administration of grants, monitoring of grant progress, meeting reporting requirements, and grant closeout. The umbrella mechanisms will monitor CT partners' program implementation and adherence to financial regulations. This involves provision of extensive technical assistance to partners on project development and implementation, financial management, monitoring, evaluation, and reporting.

ACTIVITY 2: Capacity Building

The new umbrella mechanism will support institutional capacity building of indigenous organizations, defined as activities that strengthen the skills of indigenous organizations to implement HIV/AIDS programs efficiently, with diminishing reliance on internationally-based technical assistance and support. The umbrella partners will support activities to improve the financial management, program management, quality assurance, strategic information, reporting, leadership and coordination of partner organizations implementing CT activities.

FHI will work with sub-partners to develop and strengthen referral networks to ensure availability of comprehensive health care services with special emphasis on quality sexually transmitted infection (STI) and family planning (FP) services and provision of linkages to care and treatment for HIV-infected patients and clients. FHI will also work with sub-partners to ensure that HIV-negative clients are linked to prevention services. FHI will work with those sub-partners that are providing training as a service to get their training accredited.

ACTIVITY 3: Monitoring, Evaluation and Reporting

The umbrella mechanisms will provide support to CT partners on monitoring and evaluation (M&E), in order to strengthen measurement of the implementation and impact of program activities, an eventual achievement of PEPFAR goals. M&E support of CT partners includes: measurement of program progress;

Activity Narrative: provision of feedback for accountability and quality; surveillance; and implementation of information management systems. In addition, the umbrella mechanism will provide supportive supervision to provide guidance, monitoring, mentoring and oversight through site visits, technical assistance, and performance evaluation.

Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 3095.23038.09	Planned Funds: \$8,475,997
Activity System ID: 23038	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The program is essentially the same with updated targets. The program will continue to focus on expanding the counseling and testing (CT) models available in South Africa and on increasing male and couple CT. The program also will focus on strengthening tuberculosis (TB)/HIV management by screening all clients for TB, referring clients for TB treatment, providing CT at TB facilities and offering routine offer CT training to TB facilities. The program was developed in cooperation with the South African Government and the leveraging of Global Fund support through the South African National AIDS Committee further strengthens the alignment of the program with government's policies, priorities and strategic plan. Through Global Fund support the program is developing activities in new provinces in cooperation with provincial departments of health. New Start is a member of the National VCT Steering Committee and all relevant provincial VCT committees. The program has been modified for FY 2009 in the following ways:

The Society for Family Health (SFH) is currently in negotiation with Dischem, South Africa's second largest retail pharmacy chain, to provide New Start CT services within up to 33 Dischem retail pharmacies. This partnership will be similar to New Start's franchise partnerships, with the exception that Dischem will not require a sub-award. The costs of this partnership are clearly identified in our FY 2008 continuation application budget. Through this partnership, Dischem in-store clinic staff will be trained and supported by New Start. Dischem will promote and advertise CT services. Dischem has agreed to charge a standard R25 fee for service. This partnership, which will bring high quality CT services to for-profit retail pharmacies, will expand the range of models of CT in an innovative, low-cost and sustainable manner.

Because of an inability to get national level buy-in to our national testing week plans, SFH, Right to Care and Leonie Selvan Communications currently are developing provincial-level testing week campaigns to take place in late 2008. These campaigns will bring together New Start and other CT service providers in a week of intensive testing, preceded by a mass media education and promotion campaign. The campaign will also focus on the provision of quality CT services and provide support to participating CT service providers. There currently is no day or week reserved for the promotion of CT in South Africa. This campaign will take place in three provinces and hopefully expand nationally in future years.

SFH proposes adding an additional sub-awardee, Shout-it-Now. Shout-it-Now is a non-profit organization established in 2007 which aims to eliminate the spread of HIV amongst adolescents. The organization works in schools, in partnership with provincial government, health experts and corporate sponsors to deliver MTV-style HIV prevention training and information to teenagers. Cutting-edge interactive video programmes aim to help young people to protect themselves from HIV infection, unwanted pregnancy and STI's. Shout-it-Now's message, coupled with innovative technology and HIV testing, aims to change teen behaviours and reduce the rate of new HIV infections. New Start currently works with Shout-it-Now in Western Cape, providing CT services to students after they complete the program. The program also will add an additional four franchise partner NGOs.

Based on a plan approved by the Centers for Disease Control and Prevention (CDC) South Africa and in cooperation with provincial departments of health, New Start will begin a home-based door to door CT pilot project.

The program will aim to increase its percentage of couple clients. Although the New Start program probably sees more couples than any other CT program in the country, our proportion of clients who come for CT as a couple is currently only 6%. Mass media and/or promotional activities will promote couples CT, as will door to door CT.

SUMMARY:

This project promotes a mix of community-based and clinical counseling and testing (CT) models. The Society for Family Health and the Population Services International (SFH/PSI) will manage a franchise network (under the brand name, New Start) of 12 stand-alone CT sites, each with a mobile CT program. From these CT sites, SFH will provide training and support to at least six healthcare facilities to increase the number of tuberculosis (TB) patients who receive HIV CT in clinical settings, and to private healthcare workers to enable them to make CT a routine part of medical care. Emphasis areas include community mobilization/participation, development of network/linkages/referral systems, local organization capacity development, quality assurance/quality improvement/supportive supervision and training. Primary target populations include men and couples for CT in non-medical settings, and TB patients for CT in medical settings. Higher risk populations such as prisoners, sex workers, and men who have sex with men are targeted when possible.

BACKGROUND:

Activities are ongoing. New Start opened in December 2004. At this time, 83% of FY 2006 has elapsed and New Start has achieved 76% of its FY 2006 client flow goal and exceeded its training target. The program addresses gender issues primarily by targeting men and couples for CT. To date, 52% of clients are male and 11% are couples. Although funding for the TB/HIV project only arrived in July 2006, one medical facility in Durban was able to begin working with New Start in August, 2006. SFH works closely with and has strong support from the South African government at national and provincial levels. The program started off with PEPFAR funding and today is co-funded by the South African government.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

SFH will manage a network of 12 stand-alone CT sites, each operating a mobile and workplace CT

Activity Narrative: program. SFH will manage three sites, and partner NGOs will manage the remaining nine sites. SFH will provide technical, financial, management, marketing, and quality assurance support to the nine sites. The nine partner-managed "franchise" New Start sites will open in late 2006 and early 2007. Non-profit CT franchising has proven effective at building the capacity of local NGOs to provide CT services and increase client flow. New Start franchising is based on standardized systems for management, training, supervision, quality assurance and referrals and linkages to other services. SFH, the South African government and the National Institute for Communicable Diseases (NICD) will train New Start counselors and testing staff. SFH and NICD will carry out quality assurance. Marketing activities will use radio, public relations, print media and community mobilization to reach men and couples. Beginning in late 2006, Levi's will promote New Start services through Levi's stores, Levi's sponsored mobile CT and Levi's media activities. Mobile CT and below-the-line marketing will continue to target prisoners, men who have sex with men, and commercial sex workers when possible. Mobile CT activities will expand and work with a variety of hosts – including workplaces, NGOs, communities, churches, and government agencies such as the prison system and the commuter rail system. New Start has an agreement with the Anglican church to provide CT services through its parishes. New Start CT protocols include non-medical TB and STI screening. Each New Start site has a site-specific referral guide to allow counselors to refer clients to an array of post-test care and support services. Each New Start site also has a Referral Coordinator to maintain linkages with referral points. From New Start sites, SFH will provide training and support to NGOs not part of the New Start network in CT service provision and to private doctors in routine offer CT using rapid test kits. These training and quality assurance activities will be carried out in partnership with NICD and the FPD, the training arm of the South African Medical Association.

ACTIVITY 2:

SFH will increase the number of TB patients who are tested and referred for HIV treatment. The project will partner with and mentor NGO, private sector and/or government facilities, strengthen already existing systems and work to fill important gaps where the testing and referral of TB patients can be improved. The support provided to these TB healthcare providers will depend on the needs of the facilities. Support will include some or all elements of the following assistance models: (a) SFH will provide training and support to partner organizations in routine provider-initiated CT, so that partner organizations can introduce routine testing for TB patients. (b) SFH will provide training and support to partner organizations in client-initiated CT, so that partner organizations can introduce and manage their own CT operations in TB facilities. (c) SFH will create New Start satellite operations at TB facilities. Partner organizations will provide space and support to New Start to provide CT from TB facilities on a daily basis. (d) SFH will provide training and support to partner organizations who wish to open New Start franchises within TB facilities.

Franchise partners will be fully integrated into the New Start network. Gender issues will be addressed through targeting men and couples for CT services, including testing targeting male construction workers. Testing rates among men are low. Encouraging couple CT allows women a structured environment to address HIV issues with their male partners. Diminishing HIV stigma is best achieved by increasing the number of people who learn their HIV status and disclose to family and friends. The proposed activities encourage sustainability by focusing on human capacity and organizational development. Franchising develops the capacity of a network of NGOs to provide high quality services, including the development of workplace programs that bring in revenue to partner NGOs. The proposed activities also encourage a sustainable response to the need to test large numbers by providing training and support to private doctors to make CT a routine part of medical care. Mobile CT activities bring together non-health sectors of society such as churches or workplaces in the fight against HIV.

ACTIVITY 3:

PSI/SFH will develop and carry out a mass media campaign to encourage HIV counseling and testing. PSI/SFH will work in partnership with at least one private sector partner. The campaign will be national and will culminate in a one week testing drive. This testing week will bring together PSI/SFH's New Start static site and mobile testing services, the testing services of other service providers, including other NGO and Government of South Africa testing services. The campaign's private sector partner will associate its brand with the campaign and spend its own funds on the campaign. Media used will include television or radio and public relations. The campaign and one-week testing drive will take place in late 2007 or early 2008. SFH is developing the campaign, selecting campaign target groups, determining private sector partners and developing testing targets. SFH will work closely with the government of South Africa to ensure that the campaign has government support and buy-in at all levels.

ACTIVITY 4:

SFH will partner with Careworks, a private organization which provides healthcare services. Careworks will provide mobile CT services to men in construction works and in mining throughout the country. This activity is aimed at reaching men who would otherwise not access testing services at public healthcare facilities.

Activity System ID: 23034

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. During the PEPFAR South Africa Interagency Partner Evaluation, it was decided that Population Council should reconfigure its program areas to focus its strategy as an organization, as well as to optimize its areas of expertise. A decision was made to streamline its activities, removing counseling and testing activities and expanding Other Prevention services. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Activity ID: 3305.23154.09

Planned Funds: \$235,444

Activity System ID: 23154

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Abalingani Gender Program (AGP) within HOPE worldwide South Africa (HwwSA) will be incorporated into counseling and testing (CT) activities to achieve the specific objective of increasing the uptake of voluntary counseling and testing (VCT) among men. The AGP focuses on achieving gender equality and preventing HIV infections by increasing men's involvement in health seeking behaviour. Anecdotal evidence suggests that a significant number of men report that they perceive clinics as unfriendly and claim that they are told their (STI) results in a manner that does not respect confidentiality and is perceived as being derogatory. Men are also perceived by female nurses as naughty and the cause of spreading HIV infection to women. The results from the survey will be utilised to develop and conduct a three-day workshop targeting men utilizing a curriculum developed in 2007 in partnership with the Department of Health (DOH), which addresses broad topics related to the HIV/AIDS epidemic such as gender-based violence, violence in general, and alcohol abuse. HwwSA will utilize street campaigns and soccer tournaments to attract more men to take up VCT services. The findings of the survey will be used formally to advocate for more male friendly clinics. HwwSA will reach 3,000 men through this activity.

HwwSA will offer CT services at the AGP workshops for men and provides information and referrals to appropriate HIV/AIDS services. Men will also be encouraged to accompany their partners in attending prevention of mother-to-child transmission (PMTCT) classes, to gain better understanding on feeding options and providing support to their partners. CT counselors will assist participants of AGP workshops through discussions addressing the benefits of supporting PMTCT and VCT along with the dangers of activities related to risky sexual behaviour. Topics related to the spread of HIV infections are dealt with in order to encourage people to get tested and know their status. Pre- and post-workshop assessments will be conducted and willing participants will be encouraged to enroll as community action teams (CATS). CATS are groups that have attended an AGP workshop and, from lessons learnt, are willing to change their behaviour and help other people as well. They volunteer their time and resources to communicate what they have learnt to their peers and the community at large. The CATS will become the custodian of ongoing discussions and will be provided with skills and a toolkit by HwwSA.

Activity two has been modified as follows: The lack of male counselors in the program has impacted CT negatively. It has been recognised that more males were tested at the HwwSA supported "Male Clinic" in Khayelitsha township Cape Town in 2008 than any other site. Only male counselors are employed in this clinic. 1,500 men were tested at the clinic compared with 590 women. This result is the opposite of what is found at other clinics where HwwSA is providing services. These other clinics utilize primarily female counselors. This suggests that men are more at ease with being counseled by other men. HwwSA will select and train 60 additional male counselor volunteers from AGP workshop / CATs on the VCT Protocol.

In order to refine HwwSA's strategy to increase participation and buy-in of clinics and hospitals in the communities targeted, HwwSA introduced the Community Capacity Enhancement Program (CCEP). HwwSA will conduct community conversations with clinics and hospitals to bring out burning issues and concerns about HIV/AIDS. This approach will help in formulating strategies that will address the underlying concerns about the epidemic in public health sectors. The CCEP is an integral part of the United Nations Development Program's Leadership for Results Program, and is based on a methodology known as Community Conversations. CCEP deals with the underlying causes of HIV including power relations, gender issues, stigma and discrimination. Most community methodologies focus on awareness-raising and discussion, however, the CCEP focuses heavily on interactive dialogue on the epidemic's deeper causes through a facilitated process which results in community decision-making and action.

Alignment with South African Government (SAG) Policies or Plans: The HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP) seeks to establish a national culture in which all people in South Africa regularly seek VCT. HwwSA will promote CT activities in communities and increase visibility through community meetings, community gatherings and community campaigns. HwwSA aligns with the NSP by educating communities on CT services, to increase accessibility of CT services to communities, engage communities in reducing stigma and to promote individuals to know their status, access treatment and other social services. Counselors have been placed in the public health centres in the four provinces serviced by HwwSA..

Another NSP goal is strengthening the health and other systems to create the conditions for universal access to a comprehensive package of treatment for HIV, including ART and the integration of HIV and TB care. HwwSA aligns with the National Strategic Plan by providing pre-test counseling sessions, referring clients for testing, providing results, and providing post-test counseling sessions. HwwSA will refer clients to CD4 count testing and treatment.

SUMMARY:

HOPE worldwide SA (HWWSA) will use FY 2008 PEPFAR funds to continue its work in partnership with local Departments of Health (DOH) to increase access to quality counseling and testing (CT) services at public sites in the Eastern Cape, Gauteng, KwaZulu-Natal, and Western Cape provinces. Counseling and testing targets adolescents from 15-24 years both in and out-of-school through the abstinence and being faithful (AB) program, adults from 25 years and over and nurses in the public sector. The main emphasis areas for this CT activity are to increase gender equity in HIV and AIDS programs and to build capacity at local organizations.

BACKGROUND:

CT is acknowledged within the international arena as an entry point to HIV prevention and AIDS care. HWSA's CT strategies strengthen provincial government's capacity to manage counseling and testing centers and so to create demand for the services. In addition, HWSA has developed 35 CT partner sites

Activity Narrative: around South Africa. HWSA plans to use FY 2008 funds to continue existing activities, but focusing on increasing the uptake of CT services. Currently the uptake of CT services in South Africa is still predominantly by women and HWSA will attempt to increase the number of males being tested and to promote couple and family counseling. HWSA, in conjunction with Engender Health, developed the Men As Partners (MAP) program to increase male involvement. HWSA's FY 2008 CT strategy is to educate and sensitize men, women, and youth (in- and out-of-school) about HIV and AIDS to increase CT uptakes. HWSA undertakes to train of male counselors. The continued mentoring of counselors to ensure a high level of competency will remain imperative. HWSA, through PEPFAR-funded counseling activities, will, in FY 2008, build on successes achieved in FY 2006. HWSA provided CT services to 12,000 people in FY 2006, and CT is integrally linked with all other programs at HWSA. If a client has tested HIV-infected, the client is referred to care and support and the children are referred to the orphans and vulnerable children (OVC) program. If the client has tested negative the risk reduction plan is repeated to the client to encourage him/her to maintain their negative status. The following factors will be considered and addressed to counter low male uptakes at CT sites: proxy testing (using partner status as theirs); gender socialization; an unfriendly health care system; fear of dying; and stigma. The partnership between HWSA and the departments of health has ensured the establishment of a male clinic and a CT/MAP program to ensure education and sensitization on these factors. Although uptakes of men are steadily rising, they still show a resistance to HIV testing. HWSA found that its male-targeted campaigns tended to increase demand for testing by men.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

Provision of CT pre- and post-test counseling will continue to be rendered at 30 existing DOH CT sites as a strategy for preventing the further spread of HIV infection. Part of the HWSA FY2007 strategy will be to increase the number of CT visits by men. Strategies to promote couple-oriented CT will be enhanced and referrals to antiretroviral treatment centers increased to encourage the CT demand. HWSA CT continues to be implemented as part of integrated healthcare services, directly linked to existing HIV care and treatment services. HWSA will continue to support referrals from OVC and prevention activities and will continue to refer clients testing positive to HWSA's support groups. FY 2008 PEPFAR funding will be used to conduct workshops and campaigns addressing constructive male involvement in CT, gender-based violence and HIV and AIDS. Reduction of HIV and AIDS stigmatization, staffing of new sites, and outreach to workplaces will be a focus of this activity.

ACTIVITY 2:

Training CT Counselors Ongoing emphasis will be laid on training more male counselors, to further capacitate CT counselors on MAP methodologies and to equip the latter with skills to pre- and post- test counsel men. This supports HWSA's strategy to reach more men. There will be a two-week CT training and orientation session to capacitate counselors to run CT/MAP workshops. For newly appointed peer educators and CT counselors there will be a 5-day Peer Education training course and a 10-day counseling course on CT protocols. In addition, a MAP facilitator/trainer will be hired to engage CT counselors on how to involve men on HIV and AIDS issues. HWSA also aims to capacitate counselors with adherence and couple counseling. Regular assessments and mentoring of participants will take place during and after training. The latter group's reach will be tracked. HWSA will examine the CT protocol and solicit feedback from the trainer/learner assessor after each training session. HWSA activities in FY 2008 will include further training of existing and new CT counselors with an emphasis on couple counseling, CT protocol, and CT training and technical support of other CT organizations. In FY 2006, HWSA capacitated 100 CT counselors. HWSA CT trainers will continue to provide their services to partner organizations while the use of international CT protocols to ensure standardization of services will be ensured.

ACTIVITY 3:

Expansion of CT Provision HWSA will conduct community campaigns to promote the uptake of CT services and to reduce the stigma associated with HIV testing. Trained community volunteers will conduct activities in workplaces, at community meetings, and through door-to-door visits. Strategies to promote the uptake of CT services will include providing information on CT, awareness-raising on the benefits of HIV testing, promoting couple counseling, and marketing CT as an entry point for ARV treatment. HWSA will use a mobile CT truck to provide CT services at educational campaigns and to provide CT services in areas and/or sites that lack CT provision. HWSA will also ensure that two-way referral systems between their OVC, prevention, care and treatment support programs are strengthened to ensure that clients receive appropriate services as determined by their HIV status. HWSA will also advocate for the provision of confidential and voluntary CT in the public sector. HWSA has learnt that that counseling and testing works best if you take the services to - and involve the communities. Activities like campaigns within the communities have been one of the successful methods used to reach more community members, especially men who feel that clinics are unfriendly and impersonal. HWSA will maintain the 35 public and private sites from which HWSA CT program has been operating. Introducing the MAP program at these sites will enhance the quality of the CT services provided, and consequently, HWSA will reach more men. Efforts to engage private doctors as partners in the CT will continue. HWSA will identify areas without CT service and attempt to extend HWSA coverage to these areas by establishing new partnerships. The PEPFAR program contributed, through these partner sites, to reach over 11,000 people through the CT services. HWSA will also work very closely with South African prisons to increase the uptake of males who are accessing CT services. HWSA will initially start work with the Johannesburg prison, which has given approval for the provision of CT and training (protocol). This activity will (a) promote the benefits of CT during peer education in all the medium security centers within the prison, and (b) promote referral of inmates to counseling and testing. If tested positive the client will be referred to support groups. Inmates will be identified and screened for training. The counseling and testing protocol will be used for counseling. Inmates from Johannesburg prison will be trained to become counselors and a refresher course will be done for those who were trained by other organizations. Existing HWSA staff members will be trained on couple counseling and further

Activity Narrative: training will be extended to organizations that have already been trained by HWSA on counseling and testing. These activities contribute to the PEPFAR goal of providing care and support to 10 million HIV-affected individuals. Consistent with the USG Five Year Strategy for South Africa, these activities also strengthen community demand for CT services; engaged communities on reducing the stigma associated with low CT uptakes; strengthen partner capacities through training. Therefore, through these interventions HWSA CT will strengthen community resolves on knowing their sero-status, promote and engage communities on reducing the stigma associated with low uptakes at CT sites, promote and expand the partner network with the goal of identifying additional resources for the sustainability of the program and identify and strengthen partner capacities through training.

Planned Funds: \$557,493

Activity System ID: 22974

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Growth and Expansion of Testing Venues:

The primary goal of the Assess, Consent, Test and Support (ACTS) initiative is to increase by 20,000 each year the numbers of youth who learn their HIV status through youth-serving health clinics and community and faith-based organizations in the Western Cape and at least one other province. The strategy for reaching this number of youth is to first routinize provider-delivered HIV testing in clinical settings—particularly among young sexually transmitted infection (STI) and family planning clients, and then engage, train and support other youth-serving clinics and community organizations/non-governmental organizations (NGOs) in efforts to institute or improve existing HIV testing services.

In year two, the ACTS team will expand by at least 15 sites the number of testing venues offering provider-delivered, streamlined counseling and testing (CT). We will also strengthen our relationships with the existing 14 ACTS clinics in the Western Cape to ensure that opportunities to test youth are maximized. As a third arm of our expansion strategy, outreach will be made to community-based organizations (CBOs) and faith-based organizations (FBOs) in the communities where we are working to offer HIV testing to youth who do not access health care at our partner clinics.

A major focus of work in year two will be to continue working with the South African National Department of Health (NDOH) and other partners to select ACTS implementation clinics in a minimal of an additional province (P2). Once sites in P2 are located, we will complete site-specific needs assessments, implementation plans and staff training sessions, with a goal of officially launching routine testing at P2 sites in year two. This effort will be aided by working with high risk youth-serving NGOs as mentioned in our other sexual prevention sections.

Improving Linkages to Care:

In addition to the scale-up of routine HIV testing at additional sites, the program will continue to focus efforts on linking newly diagnosed HIV-infected youth to reorganized care and prevention services. In year two, we propose to implement a support group curriculum concentrating on newly diagnosed HIV-infected youth derived from evidence-based cognitive behavioral interventions for HIV-infected adolescents and families that were demonstrated as efficacious in the United States and adapted for prevention of mother-to-child transmission (PMTCT) programs in South Africa. The adapted curriculum will address common issues that challenge the health of HIV-infected youth in South Africa including engaging in appropriate care consistently; understanding the personal significance of HIV disease staging and progression; improving adherence to HIV medications; coping with an HIV diagnosis; disclosing HIV status to family, friends and partners; choosing and negotiating abstinence, being faithful and condom use (ABC) prevention; and preparing for the future.

Prevention for Uninfected Youth:

For youth who are HIV-negative, the ACTS program will provide culturally appropriate information, education and communications materials based on ABC. Additionally, a video loop comprising culturally appropriate HIV prevention and care content will be developed with social marketing partners in Cape Town. This video content will be utilized in the waiting rooms of the youth clinics in Khayelitsha to improve HIV testing uptake, HIV knowledge and prevention/risk reduction behavior.

Monitoring and Evaluation:

The ACTS program will be monitored to collect requested PEPFAR indicators (numbers of newly established testing venues, numbers of youth tested, numbers of HIV youth identified, numbers of providers trained in ACTS). We will also measure progress toward several public health and quality improvement goals with a particular focus on linkage to care for HIV youth and linkage to antiretrovirals (ARVs) for youth with CD4 counts <200.

SUMMARY:

The Montefiore Medical Center aims to eliminate missed opportunities to test youth by building the capacity of youth-serving clinics and STI clinics to more routinely provide CT using the ACTS model. ACTS (Assess, Consent, Test and Support) is a program of rapid, simplified counseling and testing (CT) that effectively scales up provider-initiated counseling and testing (PICT).

BACKGROUND:

Engaging young people in HIV counseling and testing, prevention and care is one of the most important strategies for reducing the burden of HIV and AIDS in South Africa. Unfortunately, thousands of opportunities to achieve these goals are missed every day when vulnerable South African youth seek a variety of health care services but are not offered HIV counseling and testing (CT). By reducing pre-test counseling sessions to five minutes or less, ACTS allows nurses to incorporate CT into the other clinical services they provide, such as sexually transmitted infection (STI) care and family planning and promotes immediate follow-up and linkage to care. This frees up lay counselors via task shifting to provide more intensive counseling and support services to HIV-infected youth.

ACTIVITIES AND EXPECTED RESULTS:

Activity Narrative: Using ACTS, this program will focus initially on maximizing CT services in high-prevalence youth clinics, starting with STI clients and expanding to family planning clients. TB screening will also be introduced. The ACTS program will then broaden its activities to other health care facilities and community organizations. The ACTS team will engage each new site, develop an implementation and monitoring plan and train all relevant health care providers in CT, collect PEPFAR indicators, provide quality assurance monitoring and initial HIV care. During the five year cooperative agreement, this model will be continuously refined and successively implemented in high prevalence communities and sites throughout South Africa starting in the Western Cape and Mpumalanga.

In FY20 08, the team will continue to refine the ACTS services in two youth clinics in Khayelitsha . A monitoring and evaluation plan will be developed that includes PEPFAR indicators. A quality assurance plan will evaluate linkage to care among newly diagnosed HI-infected youth. A Project Director will be hired and trained and locations in Mpumalanga or other Province will be chosen as well as additional clinical and community sites in the Western Cape. The goal is for this partner to test 20,000 youth for HIV and link them to prevention, link 2000-4000 HIV-infected youth to improved care, screen at least 100 youth for TB,

train 180 nurses, lay counselors and peer educators to implement the ACTS CT protocol, and establish 15 new CT outlets. The integration of local staff and partners in the operation and monitoring of this program to scale-up routine testing will ensure local ownership and sustainability.

These activities will contribute towards meeting PEPFAR's 2-7-10 goals.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 7311.09

Mechanism: N/A

Prime Partner: GRIP Intervention

USG Agency: U.S. Agency for International Development

Funding Source: GHCS (State)

Program Area: Prevention: Counseling and Testing

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 16012.22969.09

Planned Funds: \$97,090

Activity System ID: 22969

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The activities and results remains the same for FY 2009. Modifications can be made at a later stage when clear results will be obtained from our monitoring and evaluation systems.

The chief executive officer (CEO), accountant and assistant accountant will be directly involved in this program due to the need for supervision, monitoring and accountability of finances.

ENHANCEMENTS:

The main aim of the counseling and testing (CT) activities is to increase access to HIV counseling and testing by advancing innovative approaches and strategies for reaching the general population, as well as high-risk target groups who are especially vulnerable to contracting HIV, and survivors of sexual assault, rape and domestic abuse. All CT sites, be they at the Greater Nelspruit Rape Intervention Project (GRIP) program office, in homes, or at locations within the community, will offer CT using rapid testing algorithms that are in line with the National Department of Health framework and guidelines. This is a client-centered approach whereby CT is based on self-initiated HIV testing and prevention counseling, offered in free-standing sites (offices, homes and workplaces). Pre- and post-test counseling, followed by referrals, for those testing both negative and positive, are integral components of the approach. GRIP staff are already trained and accredited to provide CT services, but refresher training and technical support will be provided, through the Academy for Educational Development (AED) Umbrella Grants Mechanism (UGM). Quality assurance tools and the risk reduction protocol (mainly those from the Centers for Disease Control), along with AED referral system protocols will be used to improve the quality of services and strengthen overall service provision.

Home-based counseling and testing (for survivors) is an evidence-based approach that has yielded good results in other African settings. This activity will add to the body of knowledge, for scale-up and advocacy purposes, and routine (opt-out) testing offers will be a standard practice.

Two professional nurses will receive ongoing training, support and guidance from the Department of Health and GRIP, in order to perform duties that are in line with CT legislation and national policies.

The CEO, accountant and assistant accountant will receive ongoing training, supervision and guidance from the board of trustees and all finances and activities will be audited in order to ensure that financial and business legislation requirements are met at all times. The AED-UGM is also very much involved in staff capacity building and education and regular workshops are attended by various staff members.

The amount will also include human resource functions such as policies, formulation of job profiles, performance evaluations, bonuses and salary scales.

GRIP service delivery is in line with the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 Priority Area 2 Treatment, Care and Support; and 4 Human Rights and Access to Justice.

Within these priority areas, GRIP is working with victims of sexual assault, rape, domestic violence and those infected or affected by HIV as a result of sexual assault. GRIP is helping the government in making sure that everyone in South Africa can get all the necessary services from government, from non-governmental organizations (NGOs) and from private practitioners. GRIP ensures that people know about all medicines used in the management of HIV/AIDS, including antiretrovirals (ARVs). GRIP supports survivors in taking these medications. GRIP ensures that clinics provide support to people living with AIDS and help with community outreach so that people living with HIV/AIDS and their families are getting the support and treatment that they need. GRIP ensures care, love and non-discrimination for our survivors and those who are HIV-positive. GRIP assists the government in making sure that the health care system is strong enough to support people who are living with HIV or are affected by sexual assault. It also increases the amount of people working within the criminal justice system.

By ensuring that the rights of people who are exposed to sexual assault and living with HIV are legally protected, and that these people are treated with dignity and respect, falls in line HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 Priority Area 4: Human Rights and Access to Justice. GRIP is ensuring that people who are sexually or physically assaulted get justice, counseling and treatment and understands why people may have problems getting services. GRIP also ensures that the rights of women and girls are understood and respected so that secondary trauma can be reduced when they need to enter the criminal justice system. GRIP lobbies that all existing laws to ensure the safety of women and children are carried out and focus on the needs of people in abusive relationships, and making sure they get the help they need.

GRIP also addresses male norms and behaviors:

GRIP's school-based youth and teacher programs will encourage men to be responsible in their sexual behavior and child rearing, and to respect women, including the reduction of sexual violence and coercion, number of sexual partners and cross-generational and transactional sex. GRIP will also focus on behavioral change programs for boys that promote the positive role men can play in order to increase their HIV preventative behavior.

GRIP also works toward increasing gender equity in HIV/AIDS programs:

GRIP's teacher and peer-group programs will address the obstacles that women and girls face in accessing health care, ranging from cost of treatment, transportation, and child care, to appropriate appointment schedules, and guarantees of privacy and confidentiality. GRIP's programs do meet the unique needs of women, including the empowerment of women in interpersonal situations, young people and children and those who are victims of sex trade, rape, sexual abuse, assault and exploitation.

Activity Narrative: GRIP increases women's legal rights:

GRIP advocates for the inheritance rights of women, particularly women in rural communities. GRIP's interventions review, revise and encourage enforcement of laws relating to sexual violence against minors, including strategies to more effectively protect young victims and punish perpetrators. GRIP supports institutional capacity building of government departments within the criminal justice system, and intervenes with lawyers, prosecutors, law enforcement and service providers on the legal rights of women and children and their access to justice. GRIP also works with governments and other civil society groups to eliminate gender inequalities in civil and criminal code.

GRIP reduces violence and coercion:

Counseling, referrals and follow-up treatment and prevention programs about the risk of disclosing status, including links to shelters for women, support groups in the community and referrals to professional or legal services are provided to the survivors. GRIP ensures that health workers recognize signs of gender-based violence and to provide appropriate counseling and referral services to social, legal and community-based groups. GRIP trains unemployed women from rural areas to become trained counselors in order to increase the confidentiality and comfort of women and girls seeking treatment for sexual assault. GRIP also addresses societal and community norms to reduce stigma, protect women from violence, promote gender quality, and build conflict resolution skills. All services for survivors of sexual assault/violence should link to the provision of post-exposure prophylaxis.

SUMMARY:

In March 2007, the Greater Nelspruit Rape Intervention Project (GRIP) established a walk-in HIV voluntary counseling and testing site at its headquarters in Nelspruit, Mpumalanga. A professional nurse was appointed to offer free HIV counseling and testing (CT) and awareness to any community member who visits the site. The nurse is also involved in creating awareness on HIV and AIDS throughout the business community in Nelspruit. Individuals who test negative are given guidance and information on how to prevent the transmission of HIV. Through this CT site, GRIP promotes CT through advertising and community mobilization campaigns. The professional nurse follows up and links clients into referral systems to ensure they receive appropriate and timely care and treatment services. GRIP will use FY 2008 funds to appoint a second nurse who will offer CT to the community. This will involve counseling and testing of survivors and vulnerable children in their homes, and will include providing guidance, advice and assistance, where necessary. The community nurse will work with a team of counselors to provide in-depth individualized counseling tailored to survivors' needs. The team will reach out to survivors in areas where there is inadequate numbers of healthcare workers and poor transportation infrastructure. The emphasis areas are gender and workplace programs.

BACKGROUND:

GRIP was initiated by volunteers and established in 2000. GRIP started by offering services to all rape and sexually assaulted survivors. GRIP seeks to empower all women, men and children through the process of preventative education, counseling and testing, post traumatic care, advocacy and lobbying. Due to the link between rape and HIV/AIDS, GRIP is now also focusing on HIV prevention and Voluntary counseling and testing.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: HIV Counseling and Testing at the Walk-in Facility

The GRIP non-medical walk -in site offers CT, information on HIV and AIDS, and HIV-related referral services. The referral system focuses on active follow-up, tracking of clients, and linking HIV-infected clients with prevention, care and treatment services. Clients who test negative for HIV are linked to other prevention services. The walk-in facility operates from the GRIP Head Office. The professional nurse conducts voluntary testing on any community member that wishes to know his/her status in a private and confidential yet comfortable and friendly room. The rapid finger prick test is used and test results are immediate. A follow-up test is done to confirm the original results. People who receive HIV testing in this site will receive pre-test counseling to prepare for the implications of the test, and post-test counseling in order to deal with the emotions regarding the result.

ACTIVITY 2: Community-based Counseling and Testing

The community nurse will be responsible for HIV counseling and testing to survivors of rape or sexually assault, and who may be at risk for being infected with HIV. The community nurse's duties are distinct from those of the Walk-in-Facility nurse's duties. The community nurse will travel to survivors' homes in rural areas where there is limited infrastructure and no public transport. Testing and counseling will be conducted in the familiarity and safety of the survivors' own homes. The rapid finger prick test will be used and if a survivor tests positive, a follow-up blood test and CD4 count will be taken. Each survivor has individual needs and each survivor who tests positive will be monitored while the professional nurse will ensure follow-up tests and medication.

The community nurse will be accompanied by the survivor's counselor on home visits. The counselor will be there to provide additional support and guidance if the test is positive. The community nurse will conduct home visits to all survivors and offer HIV counseling and testing, whenever it is needed. GRIP will also assist those infected with HIV to adopt positive lifestyles and offer entry into treatment programs, when needed. Through this intervention, GRIP aims at empowering the community with information on HIV and

Activity Narrative: AIDS and the opportunity to know their status.

ACTIVITY 3: Corporate Testing and Awareness Raising

GRIP also assists in debunking myths and "instant cures" by providing correct and factual information on appropriate lifestyle changes. This activity is supported by language-relevant booklets and facilitating access to relevant treatment programs. Beyond the suffering HIV imposes on individuals and their families, the epidemic is profoundly affecting the social and economic fabric of societies and is affecting the most productive segment of the labor force. Therefore, GRIP would like to reach out to the corporate sector that includes businesses and the farming community. GRIP will offer employees HIV testing, information, preventative talks and referral to immediate counseling if tested positive. The methods to be used in this activity will be very interactive and participatory, and attendance of participants should be seen as part of work obligations. Some of the activities will include assessments of high-risk behaviors, information about transmission, support to vulnerable young women, information on the effects of the virus and emotions thereof and information on prevention and management of HIV infection.

Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 7987.22959.09	Planned Funds: \$1,448,066

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY/BACKGROUND:

Private medical practices, private pharmacies, and tertiary educational facilities, as described in the FY 2008 COP, were not developed. This was due to financial constraints and the success achieved with the mobile units to gain access in communities and the workplace environment. In FY 2008, the mobile units will service the tertiary education facilities to perform CT. The mobile units will be increased from two to a total of six, to accommodate the expansion of services in Gauteng, North West and Mpumalanga, and new satellite sites will be established in KZN and the Eastern Cape. This expansion is in response to current links with civil society and South African Government (SAG) and negotiations to provide access for CT services for a total of 200,000 potential CT clients. The Foundation for Professional Development (FPD) anticipates a CT uptake of 50 percent in workplace settings. Three new CT sites were established at faith-based organization (FBO) sites. These sites will be assisted in FY 2009 to market their services more broadly to the community.

ACTIVITIES AND EXPECTED RESULTS:

Key activities include routinely offered and client-initiated CT models in the following settings:

- 1) Medical Settings: A combination of routinely offered and client-initiated CT will be offered at all FPD-partnered SAG HIV/AIDS sites. Tertiary health care settings will emphasize routine offer CT; primary care setting will provide a combined approach of routinely offered and client-initiated CT. Key activities at SAG sites will include awareness campaigns targeting both facility health care staff and potential clientele on the benefits of early testing and available linkages within the facility and/or community.
- 2) Faith-Based Organization Settings: Stigma-free client-initiated CT will be offered at two FBOs in Gauteng and one in Limpopo. These FBOs also serve as HIV care and support centers for clients that are referred by the local SAG and non-governmental organization (NGO) sites.
- 3) Mobile Unit Settings: The mobile units provide CT access to clients for whom time and cost contribute to barriers to access. The CT mobile units have presented opportunities to partner with numerous government departments, companies, institutions and communities in providing CT, often in conjunction with wellness day activities and/or HIV awareness campaigns. FPD's mobile unit's capacity to test in the workplace, schools, tertiary institutions and in communities creates a platform from which to promote a culture to test early and regularly. This is done in an effort to educate clients on early referral and retention in care, as well as breaking down the stigma surrounding HIV/AIDS. FPD's education department will be utilized to provide HIV/AIDS training to managers and supporters in an effort to increase up-take of client-initiated CT and creating support networks.

Ongoing training and supervision facilitate a CT culture of in-depth, individualized counseling tailored to clients' needs. FPD provides access to training to advanced CT skills such as couples, family and child counseling and related skills such as disclosure and prevention. FPD is also training CT staff on tuberculosis (TB) basics in order to promote and strengthen TB screening of all newly identified HIV-infected clients. Additional CT activities will include condom promotion and provision; strengthening down-referral mechanisms and systems through networks; the provision of CD4 testing to determine clinical staging and care or treatment services; and linkages to clinical services to support the assessment, diagnosis and management of sexually transmitted infections (STIs).

In order to improve CT-HIV care integration and mitigate loss to HIV care, the electronic medical record (EMR) utilized at antiretroviral treatment (ART) sites will be expanded to include a VCT module and rolled out at FPD-supported VCT facilities. The EMR was developed at the direct request of the Tshwane District of Health in order to strengthen and harmonize facility-based monitoring systems while ensuring that data quality and data use are integral components of the process. Key activities for the EMR include strengthening the integration of various HIV service points (CT, TB, HIV-palliative care, ART) and optimize inter-connectivity with existing South African Department of Health (DOH) systems (district health information systems and national health laboratory systems). In support of these activities, FPD will place a strong emphasis on didactic training and ongoing on-site mentorship to build sustainable, local monitoring and evaluation (M&E) and health management information systems (HMIS) systems.

The EMR is supported on an integrated virtual private network (VPN) which allows for the electronic transfer and/or access of data between different HIV service points. This inter-connectivity holds great potential in terms of monitoring service integration and continuity of care within a district. In the EMR, the electronic HIV/AIDS data will be held in a physically and technically secure environment with minimum data repositories and limited individual access. Data access will be determined by designated user roles and rights. Key outputs will be an electronic scheduling system for follow-up counseling and/or repeat CT; increased capacity to ensure that newly identified HIV-infected clients receive CD4 counts; an electronic referral system to link HIV-infected clients to care and treatment services; an integrated database to track patient progress and outcomes from a CT starting point; utilization of the defaulter tracing module to track CT clients who do not return for CD4 results and/or do not complete a referral; and improved capacity to monitor continuity of care and barriers of access between CT and HIV care service points. The resulting EMR results in a sound and secure HMIS system to support data use and program improvement at the site which is consistent with and informs the national HIV care and treatment patient monitoring system.

SUMMARY:

This Foundation for Professional Development (FPD) project focuses on promoting early diagnosis of HIV as an entry point to wellness programs and access to prophylactic treatment. FPD will expand counseling

Activity Narrative: and testing (CT) activities through various models ranging from institutional-based CT at antiretroviral treatment (ART) sites to introduce new easily accessible CT at sites based in civil society e.g. pharmacies, faith-based organizations (FBOs), tertiary academic institutions and private medical practices. FPD will focus on offering routine CT (RCT) to all patients admitted to public sector hospitals where FPD supports ART services. All patients who test positive will be referred to wellness programs to reduce loss to treatment initiation. The emphasis areas are gender, human capacity development and local organization capacity development. The activities will directly and indirectly target people living with HIV (PLHIV) and most-at-risk populations.

BACKGROUND:

FPD is a South African private institution of higher education working exclusively in the health sector in southern Africa. PEPFAR funding has enabled large-scale training and substantially increased access to ART. FPD has not received PEPFAR funding for CT activities in the past, even though CT services are an integral part of the comprehensive care package offered at a number of FPD-supported clinics since FY 2004. To date, FPD has provided training for approximately 800 clinicians and nurses on CT. Coordination with provincial Departments of Health (DOH) takes place through Memorandums of Understanding (MOUs). The project will focus on various gender-related activities. It is envisaged that FPD will be the main project implementer, but given that this is a new project activity, sub-agreements with local non-governmental organizations (NGOs) and FBOs may be used to increase community participation and to increase CT services.

ACTIVITIES AND EXPECTED RESULTS:

FPD's activities will be aimed at strengthening the existing healthcare system, promoting closer cooperation between the public sector and civil society institutions, and developing human capacity. It is expected that all activities will offer sustainable and long-term benefits for the South African healthcare system.

ACTIVITY 1: Support to the South African Government at the sites where FPD is supporting treatment activities

FPD will increase dedicated staff who will focus on expanding CT services for couples, infants and children and adults, as well as cross-testing (testing STI and TB patients for HIV and vice versa). Dedicated CT nurses and counselors will offer RCT for all patients moving through these healthcare facilities. Standard registers and negotiated performance targets will be used to drive this activity and monitor its implementation. PEPFAR funds will largely be used for human resources (e.g. nurses and lay counselors). PEPFAR funds will also be utilized for training and to address minor infrastructure needs where necessary for the delivery of CT services at government, NGO, and FBO sites. PEPFAR funds will be utilized for the procurement and distribution of HIV test kits if necessary and may be utilized for CD4 count testing where such tests are required to increase access to care.

ACTIVITY 2: Establishment of New CT Sites

FPD will introduce new civil society-based CT services at easily accessible sites such as private medical practices, private pharmacies, tertiary educational facilities, mobile testing sites and NGOs and FBOs. In addition, FPD will expand of CT services in the existing treatment services sites. Outreach activities will be introduced to create awareness of these services in the larger community with specific emphasis on at risk groups and vulnerable populations. The introduction of new testing sites at NGOs, FBOs, student healthcare services, private practices, and private pharmacies will ensure the widespread and sustainable availability of CT services. Emphasis will be placed on promoting client-friendly rapid testing facilities. The introduction of CT services in venues that are not perceived as having an HIV or AIDS connotation (private pharmacies or private medical practices) will contribute to overcoming stigma induced barriers to accessing CT due to fears of being seen at an "AIDS facility". Staff will be trained on proper recording and data management.

ACTIVITY 3: Human Capacity Development

FPD will provide training in CT services for medical practitioners, lay counselors, and nurses to ensure strict adherence to CT protocols and high quality counseling. This activity emphasize gender issues as all participants and CT staff will be trained on couple counseling, identifying and referring of victims of sexual abuse and violence, and stigma reduction. The program will address gender by creating an ARV-related set of services that will increase gender equity through mitigating the burden of care on women. At the time of CT and other ARV related services women will be identified and -- if they fit the profile -- will be referred to a number of faith-based programs that also support the clinics and CT sites. These faith-based programs provide women with resources ranging from accommodation, to nutritional support and job creation programs. Male norms and behaviors are addressed in the counseling provided at these facilities and all staff actively work towards reducing violence and coercion by identifying victims of violence. The FBO partners provide a shelter for female victims of violence. Training takes place in all provinces for both public and civil society organizations. For public sector training such training is coordinated with relevant human resources departments

ACTIVITY 4: Linkages and Referrals

The strengthening and expansion of referral networks and linkages with care and treatment services for clients identified as HIV-infected will be a central focus of the project. FPD will link with local CBOs, NGOs, and FBOs to increase demand for CT services and to help with referral and follow up. All CT staff will be trained on referrals and linkages. Each CT site will have a list of local service providers that patients can be referred to. All referrals will be bi-directional and followed up to make sure that clients are accessing the services and providers are providing the services. PEPFAR funds will largely be used for human resources (e.g. nurses and lay counselors) in support of CT services.

Activity Narrative: PEPFAR funds will largely be used for human resources (e.g. nurses and lay counselors) in support of CT services. PEPFAR funds will also be utilized for training and to address minor infrastructure needs where necessary for the delivery of CT services at government sites. The government will provide test kits at government sites and kits will be purchased for use at non government sites. Funds may be utilized for CD4 count testing where such tests are required to increase access to care. FPD will also expand new civil society-based CT services at easily accessible sites such as tertiary educational facilities, NGOs and FBOs. Outreach activities will be introduced to create awareness of these services in the larger community with specific emphasis on at risk groups and vulnerable populations. The introduction of new testing sites at NGOs, FBOs, student healthcare services will ensure the widespread and sustainable availability of CT services. Emphasis will be placed on promoting client-friendly, provider-initiated, rapid testing.

The above activities will be continued in FY 2008. Activities will be expanded to at least 20 new sites in FY 2008.

Activity System ID: 22919

USG Agency: U.S. Agency for International
Development

Program Area: Prevention: Counseling and
Testing

Program Budget Code: 14

Planned Funds: \$195,734

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Revision to Activity 1: Training will include special emphasis on counseling and communicating with males to get tested for HIV.

Revision to Activity 2: Male-only support groups will be established in addition to mixed-gender groups to encourage men and teenage boys to get tested for HIV and follow through with treatment, healthy lifestyle, and to become advocates in the community for other males to do the same.

Revision to Activity 4: Due to the positive response and demand for their services, 8-10 additional facility-patient liaisons will be identified, trained and placed in health facilities in iLembe District. Liaisons will be trained to expand their role to provide HIV/AIDS counseling in homes and assist with disclosure to family members.

Additional activity: Because of the relatively low rate of voluntary counseling and testing uptake among males, Medical Care Development International (MCDI) will sponsor a series of male-oriented community events to raise awareness of the importance of testing and the potential for living a positive life as a person living with HIV/AIDS. Events will be organized in conjunction with local male leaders, the Department of Health, local male traditional health practitioners, and other influential community members and organizations that are focused on positive health actions among community males. The program will focus on the facts of HIV transmission, encouraging responsible sexual behavior and respect for women's well-being, reduction of sexual violence and coercion, and male participation in raising and caring for children.

SUMMARY:

Medical Care Development International - South Africa (MCDI-SA) is a U.S.-based private voluntary organization (PVO) that is registered as a Section 21 company or non-governmental organization (NGO) in South Africa. MCDI-SA has been successfully implementing community public health and social support projects in KwaZulu Natal, South Africa, since 1995. Prior to PEPFAR support, projects focused on traditional Child Survival (CS) interventions, reducing HIV through prevention among youth and adolescents, assisting with counseling and testing (CT) and prevention of mother-to-child transmission (PMTCT) site establishment, strengthening the government healthcare system's provision of services to and creating support groups for HIV-infected and TB-affected individuals, and supporting other health-related community-based initiatives.

Building on its USAID child survival program, MCDI-SA will use PEPFAR funding to carry out activities to support the KwaZulu-Natal Department of Health's (KZNDOH) efforts to improve and increase use of the CT services. These activities consist of three components: (a) training local health workers to provide comprehensive counseling and testing services; (b) strengthening the capacity of HIV support groups for networking with CT centers and communities for the reduction of stigma and discrimination; and (c) incorporating community-based, youth-focused, home-based care, outreach and other approaches to promote CT uptake. Target populations children under 5 years, children aged 5-9, adolescents aged 15-24, and adults 25 and over, people living with HIV (PLHIV), and orphans and vulnerable children. The major emphasis areas include gender-related issues (addressing male norms and behaviors, increasing gender equity in HIV and AIDS programs, increasing women's access to income and productive resources, increasing women's legal rights, and reducing violence and coercion), human capacity development (training and retention strategy), local organization capacity building, and child survival and safe motherhood wraparound programs.

BACKGROUND:

This project will expand on and strengthen activities that MCDI-SA has been working on in KwaZulu-Natal (KZN) for the last 10 years through funding from USAID's Health and Child Survival Grants Program. CT will be promoted by (1) training health workers and lay counselors to provide pre-test counseling and CT services for youth and adults in HIV and STI prevention; (2) promoting CT through community outreach, education and advocacy; (3) strengthening the capacity of HIV support groups to become eligible for registration as cooperatives; (4) training HIV support groups to promote HIV counseling and testing in CT and PMTCT sites and in communities with an emphasis on reducing stigma and discrimination; and (5) establishing youth clubs for girls and boys in-school and out-of-school for promotion of CT. Partners include the KZNDOH, The Valley Trust (TVT), the National Association of People Living with HIV and AIDS (NAPWA) and Community Health Committees (CHC).

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training Healthcare Workers

MCDI-SA will continue to improve the capacity of local health workers to provide quality CT services and to educate the community on the importance of CT in preventing HIV transmission and as an entry point for treatment and care. A core team of sub-district trainers will be trained on CT, home-based-care, anti-retroviral (ARV) and TB treatment adherence. In turn, they will train facility nurses on National Department of Health (NDOH) CT and TB/HIV protocols, so that each primary healthcare facility will have at least two nurses trained on current NDOH CT and TB-HIV protocols. This activity will also include training on provider-initiated testing and counseling (PITC).

ACTIVITY 2: Establishing and Strengthening Support Groups

MCDI-SA has demonstrated that the provision of easy access to HIV and AIDS support groups is one key way of combating stigma and discrimination in health facilities and in communities. Existing support groups

Activity Narrative: in Ndwedwe sub-district will be strengthened to become eligible for registration as cooperatives. Sub-districts will work closely with other organizations in a self-sustainable and self-sufficient entity. MCDI-SA will also identify viable CT and PMTCT sites in other sub-districts of Ilembe District to establish additional HIV and AIDS support groups, with the goal of strengthening their capacity to become sustainable registered cooperatives. Support groups members will receive training and education on counseling and advocacy.

ACTIVITY 3: Information, Education and Communication

A mobile education unit, staffed by two trained HIV-infected individuals from NAPWA's support groups, will travel to tribal authorities to conduct information and education campaigns at, and in close proximity to, CT sites. This will assist to (1) raise knowledge and awareness about CT services for HIV, STIs and TB patients; and (2) explain how stigma, discrimination and sexual abuse are undermining the health and well-being of their families, friends and neighbors. MCDI-SA will enlist and train members from community church groups, traditional healers, and traditional leaders to participate in these information, education and communication campaigns. Based on successful workshops conducted in Ndwedwe sub-district as part of a previous project, MCDI-SA will hold additional workshops for influential community members to educate them on CT services and the harmful effects of stigma and discrimination. Support group members will be included in the training to discuss their own experiences with stigma and discrimination and the benefits of using CT services.

ACTIVITY 4: HBC Facility Patient Liaison

Qualified home-based caregivers (HBCs) will be trained by MCDI-SA and placed in each of the seven government hospitals and community health centers in the district to act as a liaison between CT, TB and ARV patients and to educate and counsel TB/HIV clients and suspects in cross-testing, treatment literacy and family directly observed treatment (DOT) support. The liaisons will increase the quality of services provided to patients while facilitating provision of education and counseling services in facilities with high patient headcounts and inadequate staffing.

ACTIVITY 5: Facility CT Service Quality Assessments

Using an assessment tool developed in conjunction with the Ilembe District Department of Health under the current TB/HIV service integration project, MCDI-SA will conduct annual assessments of CT services at the facility level. Each assessment will evaluate the quality of service provision in terms of number, training and tenure of personnel; adequacy of physical space, supplies and equipment; integration with antenatal care, PMTCT, and TB services; consistency of recording and reporting; and other key service points in compliance with NDOH CT guidelines. Results and recommendations will be discussed on site with the service providers and will be compiled and presented to the Ilembe District Health Management Team. Department of Health CT program managers will be trained to use the assessment tool and will be provided with electronic copies of the tool for their ongoing use.

These activities contribute to the PEPFAR 2-7-10 goals by improving access to, and quality of counseling and testing services in order to identify HIV-infected persons and to increase the number of persons receiving antiretroviral services.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 7301.09	Mechanism: UGM
Prime Partner: Right To Care, South Africa	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 22945.09	Planned Funds: \$97,090
Activity System ID: 22945	

Activity Narrative: SUMMARY:

Right to Care (RTC)'s Umbrella Grants Management (UGM) project will support several sub-partner organizations through financial oversight, project management, human capacity development, training, mentorship programs, program development, treatment expertise, and strategic planning in providing adult HIV care and support (ACS) services. With the variety of program activities that RTC currently implements or oversees, they have developed a wide base of skills and capacity to manage a range of organization activities, including organizations that provide prevention, training, HIV treatment, care and support services, as well as pediatric care and treatment, cervical cancer screening, care for orphans and vulnerable children (OVC), home-based care and tuberculosis (TB) care and treatment.

BACKGROUND:

The following proposed activities are designed to support sub-partner initiatives to implement the goals of PEPFAR and the South African Government (SAG)'s comprehensive plan. Over the last two years, RTC has developed a UGM capacity while developing specific skill sets, competencies and capacity to support many sub-grantee organizations. RTC has developed in-house capacity in financial management, pre-award assessments, training functions in financial management and USAID regulatory compliance. In addition, the technical expertise in medical aspects will be supported by internal RTC capacity and through the Clinical HIV Research Unit, an extension of the ongoing activities of the current RTC grant.

ACTIVITIES AND EXPECTED RESULTS:

RTC will carry out five separate activities in this program area.

ACTIVITY 1: UGM Technical Assistance and Quality Assurance

Needs assessment and program planning will be done on a regular basis with sub-partners. Site visits will be conducted alongside sub-partner staff to systematically evaluate needs of capacity, human resources, facility planning, approaches to programmatic areas such as treatment and care, in order to effectively reach determined targets and quality of care. The needs assessments will use the experience of RTC clinicians and program staff to develop proper planning and forecasting to facilitate patient growth. Programmatic technical assistance will be provided on an on-going basis, with clinical mentors responding to requests and providing treatment updates, on-going training, updated guidelines, and case-specific support.

ACTIVITY 2: UGM Financial Management

The finance department at RTC has developed systems to support sub-partners that enable compliance and capacity to manage PEPFAR funds effectively. Support includes a complete range of necessary financial management. RTC will meet with sub-partners annually to align financial and programmatic planning.

Regular oversight and support will be given with monthly financial reports required for all sub-partners. Periodic internal audits will also be conducted at the sites of all sub-partners to establish the quality of financial management and human resources (HR) management, review of asset control and alignment with USAID financial management policies.

The finance department at RTC has developed a state-of-the-art financial software tool, which uses business intelligent tools to monitor and track all sub-partner transactions against budget projections for modeling and cash flow. This integrated program will allow proper management of budget at all sites. Combined with the monthly financial reports, RTC will be able to use this system to produce up-to-date fund accountability statements and fund balances for its sub-partners.

ACTIVITY 3: UGM Monitoring and Evaluation

RTC's monitoring, evaluation and reporting (MER) system (standards, systems, procedures and tools) is established, documented and continuously improved, based on best practices and quality criteria, in the programmatic areas of adult treatment, adult care and support, pediatric treatment, pediatric care and support, TB/HIV, VCT, outreach and training.

All implementation sub-grantees/programs will be provided with support, training and technical assistance to necessary for sub-partners to effectively meet USAID reporting requirements. In addition, RTC programmatic experts will monitor the reports for quality assurance.

ACTIVITY 4: UGM Non-Governmental Organization (NGO) Management and Sustainability

RTC supports NGOs with established policy guidance and procedures that meet the requirements of both the South African labor law as well as the USAID regulations. All sub-partners will have access to the RTC human resources capacity.

Infrastructure support will be given through expertise within RTC for advice and consultation. Through various infrastructure projects, RTC has developed expertise in proper clinic flow, effective interior space design in both comprehensive care, management and treatment (CCMT) sites, as well as TB clinics. Other sub-partners facing infrastructure challenges will be able to make the best use of limited resources which is necessary for increasing clinic capacity.

Sustainability of sub-grantees will be supported through RTC's continued relationship with the Department of Health to ensure that the continued HIV/AIDS response is in line with the strategic plan for South Africa, ensuring that once the PEPFAR program is complete, that the activities of the NGO can be taken over by

Activity Narrative: the South African Government.

Where systems are identified to be inadequate, RTC aims to capacitate NGO organizations to manage their programs independent of RTC. Within the implementation plan and budget, RTC has planned to provide financial reporting systems, management standard operating procedures (SOPs), human resources policies and procedures, clinical guidelines, and monitoring and evaluation systems that will ensure sustainability beyond RTC support.

ACTIVITY 5: Technical Assistance (TA) for HIV Counseling and Testing (CT):

RTC will help sub-partners to support the implementation of CT services through supporting selected antiretroviral treatment (ART) sites and through direct, community-based CT access. CT is used as a prevention mechanism to promote abstinence, being faithful and condom use, as well as an entry point into care, support and ART. It is also an essential tool for fighting stigma and discrimination. Specific sub-partner target populations include adults, pregnant women, HIV-infected infants, couples (including discordant couples), youth, and public and private sector healthcare providers.

FY 2009 sub-partner CT funds will largely be used for human capacity development and for the procurement and distribution of HIV test kits for NGOs and faith-based organizations (FBOs). RTC will also encourage and support sub-partners in obtaining SAG accreditation as CT sites, which would increase sustainability through the SAG's provision of stipends and test kits.

Sub-partners will support healthcare providers in an NGO treatment site to implement provider-initiated testing and counseling (PITC) as recommended in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011.

The strengthening and expansion of referral networks and linkages with care and treatment services for clients identified as HIV-infected remains one of the central focus areas of RTCs CT TA activities. Sub-partner NGOs will be linked with community mobilization and outreach activities and will continue to promote the uptake of CT services and to normalize CT-seeking behavior using community lay counselors and educators. These linkages and capacity building with indigenous organizations will affect long-term sustainability. Prior to all CT activities, referral linkages will be established for direct referral at the time of CT with the network of other RTC-supported NGO, FBO and government clinics.

Prime Partner: National Institute for Communicable Diseases **USG Agency:** HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State) **Program Area:** Prevention: Counseling and Testing
Budget Code: HVCT **Program Budget Code:** 14
Activity ID: 8215.22858.09 **Planned Funds:** \$0
Activity System ID: 22858

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is being funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. This will no longer be funded in FY 2009 due to the existing National Institute for Communicable Diseases (NICD) Cooperative Agreement ending. A new Cooperative Agreement is now in place with the National Health Laboratory Service (NHLS), the parent organization for the NICD, and a smaller Funding Opportunity Announcement is being developed with the Sexually Transmitted Infections Reference Center (STIRC), an STD division within the NICD. The TB/HIV funds earmarked for FY 2009 have been moved into LAB for FY 2009, so that there are only 2 program areas for NHLS in FY 2009, LAB and SI. All existing program activities in these areas will be supported under the new NHLS Cooperative Agreement in the FY 2009 COP. Care, treatment, and a smaller SI budget will continue to be supported, but through a new TBD COP entry for a NICD continuation (STIRC) in FY 2009. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Activity ID: 7932.22863.09 **Planned Funds:** \$699,051
Activity System ID: 22863

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In April 2008 a counseling and testing (CT) and home-based care (HBC) manager was employed to oversee the CT and HBC programs. CT has been extended to include workplace testing in KwaZulu-Natal by way of a mobile clinic servicing the Amajuba and Uthikhela districts in KwaZulu-Natal. In addition to this, CT has been rolled out to include seven bargaining clinics based in the Western Cape. Ten ex shop stewards and South Africa Clothing and Textile Workers' Union (SACTWU) members were employed as lay counselors and underwent an intensive 10 day training course. Two of these counselors are now based at James Bolton Clinic in Durban, one works from the mobile clinic, seven are based at the seven Bargaining Council clinics based in and around the Western Cape and one counselor assists the VCT Manager in doing VCT at factories within the Western Cape. A lay counselor will be employed at each of the remaining sites viz: Gauteng, Eastern Cape and Central and it is anticipated that with additional capacity, the number of clients tested at the workplace will increase. Within the clinics, lay counselors offer counseling and education on prevention to clients in the waiting rooms.

Currently in the Western Cape, patients testing positive for HIV are being referred to public sector clinics. However, it is anticipated that a wellness program will be piloted at Salt River Clinic, one of the seven clinics bargaining council clinics. CD4 counts, viral loads and other baseline tests will be conducted as will sexually transmitted infection (STI) and tuberculosis (TB) screening and testing. The Western Cape Department of Health (DOH) has committed to cover the costs of all lab tests up until the end of Quarter one of FY 2008. It is currently being negotiated that this agreement be extended for a greater period of time.

In March 2008, a mobile clinic was purchased by way of a sub-grant from the Solidarity Center. This will initially be used as a mobile voluntary counseling and testing (VCT) clinic, servicing factories within the Amajuba and Uthikhela districts. STI and TB screening and testing services will also be provided. It is anticipated in FY 2009 that workers that have been initiated on treatment at public sector clinics and are stable, will be "down referred" and managed by this clinic. This clinic is manned by a professional nurse, enrolled nurse and a lay counselor/driver.

During FY 2009, SACTWU has committed to provide lay counseling and adherence training to 30 ex-SACTWU members that have retired or that have been retrenched due to the closure of factories within the clothing and textile industry. Two modules will be conducted once a week over a period of 10 weeks.

Clinical staff will also be provided with "provider initiated counseling and testing" training and phlebotomy training. New staff will be provided with onsite training on the policies and procedures and use of rapid test, injection safety and waste management. Standard operating procedures are provided to all CT service outlets and updated regularly to ensure the provision of a quality service. As the Bargaining Council clinics are family centric, couple counseling and testing is strongly encouraged within these service outlets. Additional training will be provided to all lay counselors in this regard and will readdress disclosure counseling. All staff has been trained on prevention-with-positives and will provide counseling and conduct interventions thereon with emphasis placed on discordant couples.

The Western Cape Department of Health (DOH) has requested SACTWU to assist them in the development of a CT flip chart that will be utilized at all DOH CT outlets within the province.

SUMMARY:

This activity will provide access to comprehensive voluntary counseling and testing (CT) services in five provinces with initial emphasis in KwaZulu Natal. The Southern African Clothing and Textile Workers Union (SACTWU) program will provide training, support and supervision to CT counselors. SACTWU has five existing CT sites and intends to establish two additional sites in KwaZulu-Natal and one site in Western Cape, the two provinces with the largest union membership. Target populations include factory workers, nurses and other healthcare workers. CT services will be on site at the factory health facility.

BACKGROUND:

The Southern African Clothing and Textile Workers Union is South Africa's largest trade union organizing textile and clothing workers. It also organizes footwear, leather and retail workers. SACTWU members form part of the economically active population that has been identified as hardest hit by the epidemic and, due to work constraints, cannot access offsite CT services. Onsite services allows access to all employees including the nearly 66% of SACTWU's membership which is female.

SACTWU has a membership of approximately 110,000 members nationally. The SACTWU AIDS Project is a national program that provides services in five provinces, KwaZulu-Natal, Western Cape, Gauteng, Eastern Cape and Free State. The SACTWU AIDS Project was initiated in 1998 and developed into a national comprehensive program. Prior to FY 2007 SACTWU received PEPFAR funding as a sub-grant from the Solidarity Center. The voluntary counseling and testing (CT) program was initiated in June 2002 and is ongoing nationally, and received PEPFAR funding in FY 2006 through the sub-agreement. In FY 2007, SACTWU became a prime partner and received direct funding to scale up services in KwaZulu-Natal.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Capacity Building for Counseling and Testing (CT) Services

This activity will provide access to workplace CT services for SACTWU members and their dependents who are members of the communities in the five provinces, starting in KwaZulu-Natal. SACTWU has three general settings for service delivery: (1) the clinic setting, (2) the regional office setting, and (3) stand-alone sites within factory-based settings. This project, however, emphasizes is on the factory-based health facility

Activity Narrative: setting. The program also includes training, support and supervision of CT counselors using the National Department of Health (NDOH) training model. PEPFAR funds will be used for human resources to employ nurses and counselors who will provide CT services, infrastructure (minor refurbishment), procurement of test kits, quality assurance using NDOH guidelines and supportive supervision and capacity development of the counselors. The nurses will provide a rapid test while lay counselors will perform pre- and post-test counseling. The site will be a down-referral site for ART and provide dispensing for antiretroviral treatment (ART) and care/support services. Initiation of ART will be done in nearby hospital accredited ART sites.

SACTWU will train lay counselors to provide CT services. The target group for this activity is shop-stewards, industry healthcare practitioners, and volunteers. The training includes pre- and post-training assessments.

ACTIVITY 2: Commodity Procurement

SACTWU will purchase rapid test kits and other expendable materials from a competitive pharmaceutical supplier. Purchasing staff will make sure that the tests used are recommended by the NDOH. Quality assurance testing will be done in compliance with national guidelines.

In FY 2008 SACTWU will expand the CT program to two new sites in KwaZulu-Natal. The national campaign among clothing and textile workers will be increased significantly with the additional funding. Community and Family members are also eligible for CT at the SACTWU sites.

The SACTWU activities contribute to the PEPFAR 2-7-10 goals.

Control & Prevention

Program Area: Prevention: Counseling and
Testing

Program Budget Code: 14

Planned Funds: \$506,812

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Jhpiego's Siyazi project will continue to support workplace integrated HIV counseling and testing (CT) and wellness screening services for workers, their partners and their families at 15 companies or work associations. Jhpiego will provide counseling and testing services to 16,500 workers, their partners and families by September 30, by 2010. Jhpiego will continue to provide technical assistance to 16 fixed road site clinics and provide mobile testing outreach at additional workplaces. The primary geographic area of work is Gauteng-based companies, their work associations and their provincial branches throughout South Africa. The overarching goal of the project is to increase counseling and testing for hard-to-reach populations and link them to prevention, care and support services. Jhpiego will continue to provide technical assistance for policy development, review, dissemination and implementation through work with management and peer educators. With the correct policy environment in place, Jhpiego will support counseling and testing within an overall wellness screening package designed to decrease stigma related to HIV testing. In addition, motivational speaking by people living with HIV will remain a key strategy to encourage people to get tested and eliminate stigma. Jhpiego will initiate and implement GIPA (Greater Involvement of People Living with HIV/AIDS) principles as a means to involve people living with HIV and AIDS (PLWHA) in HIV/AIDS workplace related issues, address stigma, encourage disclosure of HIV status, disseminate information on positive living and human rights for individuals and their families.

The Jhpiego Siyazi project will train 500 peer educators to provide group education for prevention messages and condom distribution. To encourage behavior change Jhpiego will utilize audio visual, other educational materials and facilitate formal and informal workshops to disseminate prevention messages for specific groups. Prevention messages will be developed to suit each target group. In collaboration with other PEPFAR partners, Jhpiego will support the development of a national logo to assist in the identification on quality CT services.

Jhpiego, in collaboration with EngenderHealth's Men as Partners project, will address gender related issues including gender-based violence (GBV) through the training of workplace management as well as peer educators in FY 2009. Peer educators will play a vital role in sensitizing and empowering employees on gender equity and reducing GBV. The Siyazi project will increase counseling and testing access predominately for employed men, their partners, families and female sex workers at the truck stops where the road site clinics are based.

A team of nurses and lay counselors will provide pre-test counseling, tuberculosis (TB) screening using the five TB screening questions, and other wellness and health risk assessments including diabetes, cholesterol, and body mass index. Counselors and nurses will provide 1) pre-test counseling, 2) rapid HIV testing using the parallel algorithm, 3) post test counseling including disclosure counseling, and (4) referral to prevention and care and support services. For individuals testing positive for HIV, nurses will refer employees to in house and to local clinics for on-going care. In FY 2009, the Jhpiego Siyazi project will explore the feasibility of on-site clinical staging and/or CD4 count testing.

Based on approval of workplace partners, Jhpiego will extend couple counseling services to employees and their partners in the workplace by using the national and international HIV/AIDS couple counseling training materials and systems. Jhpiego will pilot a variety of approaches to expand couples CT including issuing invitations to couples and families for CT and wellness services. Jhpiego will also promote couples and family CT during health calendar days such as sexually transmitted infection (STI) week, TB week, World AIDS Day and other CT campaigns throughout the year as well as at the road site clinics for sex workers and truck drivers.

While CT services are widely available in South Africa, a need was identified for the development of a quantifiable system to measure adherence to quality standards for counseling and testing service delivery. In FY 2009, Jhpiego will assist in establishing quality assurance systems that use Standardized-Based Management and Recognition and performance improvement methods for CT in five sites in Gauteng. Jhpiego will also facilitate the incorporation of existing CT materials into an e-learning format to increase the access of partners' staff to self-based individualized learning.

Jhpiego will work with the National Institute for Communicable Diseases (NICD) to ensure quality for testing in the workplace. The programme officer with a nursing background will work directly with the NICD on quality assurance related matters at the testing sites. This will include proficiency testing using panels from NICD and on-site monitoring. NICD will provide training and ongoing support including site visits for testing quality assurance.

The Siyazi project is aligned with the HIV & AIDS and STI National Strategic Plan, 2007-2011 (NSP) Priority Area 2, Objective 5.1- Increase access to VCT services that recognize diversity needs. Jhpiego will institute confidential counseling and testing services in the workforce in both private and public institutions. Jhpiego will design workplace HIV/AIDS programs that respond to individual companies' needs and fulfill the goals of this project thereby addressing the NSP goal for 2008 of 40%. Management, union members, individual employees, and family members will be targeted. Jhpiego will work to ensure that confidential counseling and rapid testing services focusing on risk reduction, will be accessible to all workers and their partners in selected sites.

Jhpiego drafted and reviewed a memorandum of understanding (MOU) for approval with the Gauteng Department of Health Employee Wellness programme. As the workplace program is predominantly with companies rather than the government, Jhpiego does not have MOUs with the South African Government (SAG) at the moment. However, MOUs have been fully executed with the National Bargaining Council for the Road Freight Industry and Ford Motor Company of Southern Africa. For the remaining partners [National Prosecution Authority, Department of Justice and Constitutional Development, State Information Technology Agency, Judicial Officers Association of South Africa], MOUs have been drafted and are being reviewed and/or routed for approval among the leadership of each organization. Jhpiego has re-established the relationship with the City of Johannesburg and will be drafting and MOU for review and approval by the

Activity Narrative: City of Johannesburg.

SUMMARY:

The focus of this project is the implementation of confidential counseling and testing (CT) in the workplace and will link CT with other interventions such as prevention, treatment and support systems. Emphasis areas will be CT service delivery, development of HIV policies in the workplace, training, prevention messages, quality assurance and supportive supervision, and capacity building. Target groups will include women and men of reproductive age, management and trade union members in the work environment.

BACKGROUND:

Under this project JHPIEGO will assist individual companies to create a conducive environment for confidential and voluntary counseling and testing. JHPIEGO will do this by addressing management, unions and employees through the provision of basic but thorough HIV and AIDS information; providing assistance in the reduction of stigma and discrimination and the impact of HIV and AIDS in the workplace; and supporting VCT services.

ACTIVITIES AND EXPECTED RESULTS:

JHPIEGO will institute confidential counseling and testing services in the workforce in both private and public institutions. JHPIEGO will design workplace HIV and AIDS programs that respond to individual companies' needs and fulfill the goals of this project. Management, union members, individual employees, and family members will be targeted. JHPIEGO will work to ensure that confidential counseling and rapid testing services focusing on risk reduction, will be accessible to all workers and their partners in selected sites. JHPIEGO will also incorporate stigma reduction strategies and issues of sexual violence and prevention for positives. The expected results under this objective are: 1) Workplace HIV and AIDS policies developed and disseminated; 2) Counseling and testing sites established and running; 3) Stigma surrounding HIV and AIDS reduced in and out of the workplace; 4) Prevention message dissemination strategies developed and sustained; 5) Peer education programs developed and sustained and; 6) Establish linkages to care, treatment and other interventions.

Throughout the life of this project, JHPIEGO will implement the GIPA (Greater Involvement of People living with HIV and AIDS) principles as appropriate; the GIPA principle supports the substantive involvement and inclusion of people living with HIV and AIDS in all aspects of project design, implementation and monitoring.

These activities will directly support PEPFAR 2-7-10 goals.

Activity ID: 24490.09	Planned Funds: \$0
Activity System ID: 24490	

Activity Narrative: SUMMARY:

Mfesane offers counseling and testing (CT) services in poor communities which have insufficient access to such services. Men are specifically targeted in their work environment. The CT services are done according to the quality specifications of the South African Government (SAG). The activity areas are chosen in cooperation with the local health department. Also people may be referred from other activities of Mfesane such as prevention, church mobilisation and home-based care.

BACKGROUND:

Woord en Daad, a Dutch faith-based organization, will work through its long-standing South African partner organization, Mfesane, to provide quality prevention, counseling and testing, and care services to members of communities in two distinct municipalities: Saldanha Bay in the Western Cape, and Nelson Mandela Bay in the Eastern Cape. Mfesane will target informal settlements and other communities where people are at high risk of infection and are socially dislocated. In Nelson Mandela Bay (NMB), Mfesane has several years of experience. Previously Mfesane worked through coaching Thandi Youth Organisation for three years to consolidate its home-based care and peer education programs. Now an Mfesane programme will be set up, to further scale up the response through directly providing services in Greensfield, a new informal settlement. Poverty is rife in the Nelson Mandela Metropolitan Municipality (NMMM). Employment is very high and there is a high dependence on state grants as a means of daily survival. The target group of the projects is therefore acutely and chronically poor characterize by extremely high levels of unemployment, drug- and alcohol abuse, tuberculosis (TB), crime and food shortage.

ACTIVITIES AND EXPECTED RESULTS:

Mfesane will carry out four separate activities in this program area.

ACTIVITY 1: Recruitment of CT workers.

There will be five teams active in total, three in the Saldana Bay Municipality (SBM) and two in NBM. One team will be newly recruited, consisting of a nurse and a counselor.

ACTIVITY 2: Human Resource Development.

A new nurse and a counselor will be newly hired and will be trained.

ACTIVITY 3: Materials for CT.

The testing kits are purchased through a costshare. In that way Mfesane is recognized as formal player and can benefit from certain materials from government sources. We integrate prevention through providing items with a message for everyone who gets tested.

ACTIVITY 4: Implement CT.

Mfesane will be active in five SBM communities and three NBM communities. These areas are allocated by the government. Different strategies are used in SBM vs in NBM.. In SBM communities Mfesane is active during the day, reaching mostly young women between 15-25 years of age (school drop outs, young mothers etc.). Mfesane mobilizes people by going door-to-door and also through other ways of CT awareness.

Mfesane invites people to CT meetings in a private houses or tents. Prevention is part and parcel of the CT activities. It holds an information meeting and after that, in a follow up meeting, it repeats the information and tests the people who are willing.

Mfesane works with individual informed consent. In big happenings it may have a stand, but this depends on the availability of other service providers. If there is another service provider, it either cooperates or lets them do it. This means that it can't access big numbers easily at such big happenings. Mfesane approaches company managers to target men. Mfesane provides testing and employees provide their time. When invited to test company personnel, Mfesane reminds managers that they are legally obliged to have HIV/AIDS activities for their workers. Mfesane explains up-front that it will have follow up activities after the testing and Mfesane staff come back a few times for information sessions, so that workers are really reached and the prevention has a chance to be effective. Individuals who receive tests are given informational materials ranging from water bottles to bracelets or key tags with a prevention message. In this way it is hoped that the prevention will be more effective. The office is being refurbished so that testing may take place there too, in a private and confidential setting as people may prefer that. When people are testing positively, a second confirmatory test is done. The nurse counsels the person over a period of time, to see whether they want to disclose so that the partner can also be tested. Mfesane refers individuals who test positive to its health support groups and also to a public health facility they are familiar with. Mfesane makes sure to follow up with patients until they are really connected to the referral facility, or until it is clear they really are unwilling to go there. Mfesane also encourages people to disclose their status to their spouse/sexual partner. If they consent it does partner talks in which spouse/sexual partner testing is encouraged.

Mfesane has a referral network and linkages with local clinics (through a formal cooperation Memorandum of Understanding). Clinics provide materials and backup for advanced tests, antiretrovirals (ARVs) and other referrals. Mfesane is part of a network of non-governmental organizations (NGOs) that meets on a monthly basis under the coordination of the Health Department. This prevents overlapping of services and NGOs serving the same people/families. Other services of Mfesane include referrals to support groups for those who test positive as well as referrals to home-based care and voluntary counseling and testing

Activity ID: 13838.24472.09

Planned Funds: \$485,452

Activity System ID: 24472

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY AND BACKGROUND:

All of the above activities will continue in FY 2008 and FY 2009. Activities are planned and implemented in partnership with Department of Health coordinators for HIV/AIDS, sexually transmitted infections (STIs) and tuberculosis (TB) (HAST) at all levels of government. Activities will be in line with the new World Health Organization (WHO) guidelines for counseling and testing (CT).

ACTIVITY 1: Non-clinical CT

The Tuberculosis Care Association (TBCA) had originally planned to hire a community team leader and a data capturer for each supported health facility. Due to limited space in most health facilities, TBCA will hire only one community team leader per health facility who will perform the functions of a data capturer as well.

In FY 2008 and FY 2009, TBCA will hire five voluntary counseling and testing (VCT) teams in Sisonke district, KwaZulu-Natal. These teams will form part of a community outreach team that the district has asked TBCA to pilot. Community outreach teams were proposed in the provincial community-based services plan that has been approved but has not been funded this financial year. Should the pilot be successful, it is likely that the province will create posts for these teams which would ensure sustainability.

TBCA, in collaboration with the Department of Health (DOH) and other NGOs will ensure the implementation of quality assurance (QA) programs for HIV CT in accordance with national QA standards in clinical and non-clinical settings. This will include a program of rapid test QA in which 10% of patients will have blood collected for laboratory-based ELISA for a period of one month biannually. Additionally it will include proficiency testing for those conducting rapid tests and regular on-site monitoring.

TBCA will provide VCT linked with TB and STI screening for officials and offenders in correctional services. Clients who test HIV-infected will be referred for HIV care, TB suspects will be referred for TB investigation and clients with STI symptoms will be referred for STI syndromic management.

ACTIVITY 2: Training and Supervision of Counselors

In collaboration with the Department of Health, TBCA will offer to train health care providers in clinics to provide 'routine offer of HIV CT to TB patients, pregnant women, family planning clients and STI clients. Given that South Africa has a generalised HIV epidemic, TBCA will consult with the Department of Health to consider recommending HIV CT to all patients attending health facilities. The emphasis will be on training health care workers to make HIV testing an integral part of routine medical care, without diverting clinical staff from their other medical duties.

Refresher training will be provided to counselors regarding acute HIV infection and the window period so that they can appropriately advise patients whether a repeat test is required in three months. Advanced counseling training will be provided to counsel couples, families, youth and children as well as clients affected by substance abuse and domestic violence. Advanced training on adherence counseling for TB and antiretroviral treatment (ART) will also be provided. All counseling staff will be trained to complete CT registers.

Professional nurse counselors will be trained to complete monthly reports of key indicators, including the proportion of clients successfully referred for HIV care, TB investigation and treatment and STI syndromic management. They will also be trained to properly perform and interpret rapid HIV testing and to implement quality assurance protocols.

ACTIVITY 3: Measuring Costs and Assessing Cost-effectiveness of Non-Clinical HIV Counseling and Testing

The economic analysis will be informed by technical assistance from the Centers for Disease Control and Prevention (CDC) (eg, Uganda study). This activity will be completed in FY 2008.

SUMMARY:

This project will increase access to HIV voluntary counseling and testing (CT) in non-clinical sites and in facilities with a large number of TB cases. Two mobile services and fixed non-clinical sites in easily accessible areas such as taxi ranks and shopping areas will provide CT services. TBCA will also assist the district in training and supervising counselors in clinical sites. Target populations include the general population, at risk populations, the business community, discordant couples, pregnant women and orphans and vulnerable children.

BACKGROUND:

TB Care Association (TBCA) has been providing community-based counseling, emergency material relief, and support, and TB treatment support in the Western Cape since 1992. Provision of non-clinical CT and counseling mentorship are new initiatives that will be conducted in collaboration with the Department of Health. Women are at higher risk for HIV infection. The provision of CT will therefore benefit women who test HIV-infected and will access care and support. Men utilize health

Activity Narrative: services less than women and will therefore benefit from the provision of CT in non-clinical CT sites. TBCA is exploring the possibility of expanding activities to the Northern Cape province.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: Non-clinical Counseling and Testing

TBCA will hold consultations will be held with key stakeholders from government, non-governmental organizations, community-based organizations and the private sector, to identify sites in which to establish new services or strengthen existing services for HIV counseling and testing. The West Coast Winelands District has suggested that non-clinical CT sites should be established in the taxi ranks in Malmesbury, Saldanha and Vredenburg. Additionally, two mobile CT teams will provide services in underserved rural and peri-urban areas and in private sector workplaces such as farms and factories. In small towns, mobile CT teams will conduct door-to-door community-based CT. A "100% cover" campaign will be piloted. This campaign aims to counsel and test all the population over 14 years and to promote 100% condom use. PEPFAR funds will be used to purchase two vehicles for the mobile CT teams.

Counseling and testing teams will be recruited, hired and trained in collaboration with NGOs that are already providing CT services in the area. Each team will include two lay counselors, one nurse counselor (who will also do the HIV testing) and a community mobilizer funded by PEPFAR. Five CT teams will be hired and trained in the first year of the project.

Gender equity in HIV and AIDS programs will be addressed through the provision of non-clinical CT that will increase access to men. The education provided by the community mobilizer and the risk reduction counseling will help to change male norms and behaviors and reduce violence and coercion. As more people access CT, it is hoped that there will be more discussion of HIV in communities and that stigma and discrimination towards people living with HIV will decrease.

The community mobilizer will provide education on HIV prevention (abstinence, being faithful, using condoms), the benefits of knowing your HIV status, TB and STI symptoms and the importance of being treated for TB and STIs. Couples will be encouraged to go for counseling together. The community mobilizer will also distribute condoms.

Counseling and testing will be provided according to national and international standards. Counseling will focus on personalized risk assessment and risk reduction. Correct condom use will be demonstrated and condoms, procured by the Department of Health will be dispensed. HIV testing will be informed, voluntary and consented. Rapid test kits will be provided by the National Department of Health (NDOH).

Any individual who agrees to HIV counseling and testing will also be screened for tuberculosis and sexually transmitted infections (see TB/HIV Program Area). If symptoms are present, they will be referred to the nearest clinic/hospital where further investigations and/or treatment will be available. All HIV-infected clients will be referred for HIV clinical care and support services and will be counseled on preventing transmission with a specific focus on discordant couples. The CT register will have additional columns to indicate if clients have TB or STI symptoms as well as a column to determine if the patient presents at the health facility to which they are referred.

PEPFAR funds will be used to employ one data capturer for each supported health facility to assist with recording laboratory results and to trace people with positive TB smears to ensure that they are initiated on treatment. The data capturer will also be responsible for informing the CT teams and community health workers if referred patients attend the facilities to which they have been referred.

ACTIVITY 2: Training and Supervision of Counselors

PEPFAR funds will be used to hire a CT Coordinator to train, mentor and supervise the CT teams. Training will comply with national guidelines and will be conducted in collaboration with National Department of Health and the AIDS Training Information and Counseling Centre (ATICC). Additional training will be provided on couple counseling for concordant and discordant couples, counseling for youth, and counseling to address substance abuse and domestic violence. The CT Coordinator will also visit clinical CT sites to provide mentorship and technical support, focusing on TB treatment facilities. The five CT teams, consisting of five nurse counselors, ten lay counselors and five community mobilizers, will be trained. Additionally, one counselor in each of the 11 facilities will be trained, mentored and supervised. In health facilities, routine counseling and testing will be offered to pregnant women and patients with TB or sexually

Activity Narrative: transmitted infections.

ACTIVITY 3: Measuring Costs and Assessing Cost-effectiveness of Non-Clinical HIV Counseling and Testing

To assess the affordability of the interventions, a cost-effectiveness analysis will be done through a sub-contract with the Health Economics Unit of the University of Cape Town. The cost per person post-test counseled will be measured and the cost per HIV infection averted will be estimated for non-clinical HIV counseling and testing compared to standard HIV counseling and testing. The opportunity costs of adding TB and STI screening during pre-test counseling will be measured.

The project aims to counsel and test 10,000 people the first year. These results contribute to the PEPFAR 2-7-10 goals by improving access to and quality of CT services in order to identify HIV-infected persons and increase the number of persons receiving ARV services.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Care and Treatment Scale-up: The stark reality, as one scales up counseling and testing (CT), is that there are insufficient programs which offer care and support or antiretroviral (ART) to ensure that the HIV infected clients access care. The greatest challenge is to ensure that, as testing increases, so does the capacity of the facility to care for the clients and for the overburdened healthcare workers (HCWs). In an attempt to increase access to care and treatment, Zoe Life (ZL) will increase support to more sites, with the intention of supporting CT as a way to engage infected clients with quality care and support programs. ZL will not focus on increasing numbers counseled and tested, to the detriment of the facility or the client, but will rather assist facilities to identify the optimum numbers to be counseled and tested which can then be supported by that facility and its staff. It is clear that not much thought has gone into workforce or spatial planning at facilities, and sites will be assisted by ZL to determine the proportion of time which should be spent by HCWs on CT in relation to the ongoing psychosocial and clinical support of those tested positive and their families. This is important in workforce planning and budgeting. Lessons learned will be shared with district and provincial managers. ZL will continue to strengthen care and support programs at non-governmental organizations (NGOs), in the community and in the workplace to ensure that patients testing positive have access to care and treatment.

Human Resource (HR) Policy Strengthening: Sustainability is a major focus for FY 2008 and FY 2009. The relationship between the eThekweni Municipality (eTM) and the district/provincial government (DDOH/PDOH) is currently a barrier to sustainable CT services. DDOH currently only provides one counselor post per eTM clinic to support CT. This configuration creates productivity challenges as the DOH counselors routinely do not come to work, and when they become ill or die, they do not get replaced by the DOH due to a 16 month moratorium on all posts. HR management is a problem as DOH counselors do not see the need to report to eTM staff, and reporting channels are unclear resulting in unsupervised counselors. The use of ZL counselors in these sites was meant to augment current CT and to initiate new psychosocial services such as partner testing, patient literacy, adherence counseling and other services. However, DOH counselors have almost completely relegated their CT responsibilities to ZL/PEPFAR funded counselors. This is a serious barrier to the scale-up of services/sustainability. However, as CT is the entry point to care and treatment, ZL and McCord Hospital will continue to support a counselor salary at each site as an interim measure to ensure continuity of service provision and to continue to engender a sense of partnership. However a larger percentage of time will be spent strengthening the HR systems between DOH and eTM, advocating for more counselors at sites, and engaging in dialogue that aims to create more efficient methods of service provision.

Human Resource (HR) Management:

A. Psychosocial support services: ZL will start the process of developing clear standard operating procedures and standards relating to service quality with particular attention paid to psychosocial services within the clinic and non-governmental organization (NGO) environment. KZN province currently employs more than 2,500 HIV counselors. Most of the services provided by the counselors have no standard operating procedures or service standards. Neither the quality of services provided nor the program outcomes are currently measured due to lack of standards or operating procedures/ best practices. Counselor mentors employed to mentor and supervise onsite counselors have no guiding protocols or tools to make their work meaningful. ZL has considerable expertise and experience in the provision of comprehensive psychosocial support services, and will begin to develop standards and tools to measure and improve services, to assess the productivity of counselors and effectiveness of the program, and to guide the processes of supportive supervision by counselor mentors.

B. Supportive supervision and mentorship: The concepts of mentorships and supportive supervision are not commonly understood in the South African public health environment. Nor are the benefits of this approach accepted. In FY 2007, ZL started internal use of this system and has found that ZL staff struggle with the concepts. This is due to both lack of exposure as well as lack of skills. In FY 2008, ZL will collaborate to develop a locally appropriate training resource to develop skills and tools in supportive supervision and mentorship. This will be piloted internally and with participating municipal clinic supervisors. ZL will work closely with the provincial DOH and district mentors to ensure buy in and practical input during this process. ZL will advocate for DOH budget to be allocated to training of all district mentors once the resource has been developed.

Workplace Program: ZL would like to explore expanding its workplace program to other parts of the country. This is one program that is not entirely dependent on geographical relationships being built. National companies that have accessed our workplace program services have requested that services be offered in other parts of the country. ZL has started developing relationships with organizations who could link with the workplace program in the Western Cape. If this is financially viable, and referral linkages can be ensured, ZL will explore this option further in discussion and with the approval of the activity manager.

Gender will be addressed by 1) increasing access to partner testing through offering CT services after hours and increasing exposure to partner testing importance; 2) increasing access to working men through the CT services offered as part of the workplace program; and 3) increasing disclosure counseling and couple counseling as a part of CT.

SUMMARY:

McCord Hospital and Zoe Life (McCord/Zoe Life) aim to increase capacity to expand integrated counseling and testing (CT) services within the framework of a comprehensive HIV care and treatment program in seven sites: four municipal clinics and three non-governmental organizations (NGOs). Capacity will be developed by (a) training voluntary lay counselors at the NGOs to provide best-practice services; (b) mentorship of NGO and municipal counselors and clinical staff to provide integrated, provider-initiated CT

Activity Narrative: services; and (c) strengthening continuity of care post-CT through referral of HIV-infected clients by counselors to the HIV care and treatment services. The emphasis areas are the development of referral systems between vertical programs, human resource support, development of a training curriculum aimed at CT of children, strengthening the local organizational capacity to increase CT services, quality improvement, supportive supervision, and in-service training of staff. Specific target populations are the general population, refugees and internally displaced persons (through the KHWEZI AIDS Project in central Durban), and workers within the business community. Counseling and testing will be provided in French and Swahili in the KHWEZI AIDS project to reach refugees and asylum seekers from Central and West Africa who currently reside in the Durban area.

McCord Hospital receives funding for prevention of mother-to-child transmission (PMTCT) and antiretroviral treatment (ART) treatment through the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF). This program described here focuses on strengthening the capacity of public sector facilities, and it is distinct from the hospital-based program funded by EGPAF.

BACKGROUND:

Counseling and testing is the entry point to prevention, care, treatment and support of HIV-infected persons. If access to care and treatment is to be accelerated, then access to CT should be aggressively pursued. In KwaZulu-Natal, lay counselors in municipal and local health authorities have traditionally provided a stand-alone vertical service to persons requesting HIV testing. Uptake of CT services has largely been a result of the PMTCT program, with referral from other programs (sexually transmitted infections (STI) and tuberculosis (TB)) and self-referral contributing a small percentage to the uptake of CT. In the NGO setting, patients are largely referred for CT from community health workers who suspect advanced HIV disease. Thus, apart from PMTCT where CT is provider-initiated, clients who are already symptomatic with AIDS and who require a definitive diagnosis and ARV treatment request the bulk of CT services.

The emphasis of this new project would be to shift the trend of voluntary counseling and testing (CT) to a universal, provider-initiated opt-out service designed to increase uptake of services and to promote early diagnosis of HIV while patients are still well enough to access wellness and health promotion services. This project would also emphasize increasing opportunities to counsel and test children. In addition to increasing uptake of CT, this project seeks to ensure that clients who learn of their HIV status will be seamlessly integrated into care, support and treatment services. Lastly, this project seeks to take CT into the business community to workers who would not otherwise have an opportunity to be counseled and tested. The KwaZulu-Natal Department of Health (KZNDOH) supports these activities. Activities within the municipal clinics will be undertaken with the support of the eThekweni (Durban) Municipality. Gender issues will be addressed by taking CT services into the business community, where many employed men have no access to services. In addition, counselors will proactively encourage partners of women tested in PMTCT services to access testing. Where possible, the technical support team will investigate the possibilities of extended hours of CT services to include weekends or evenings.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

McCord/Zoe Life will work with three NGOs currently providing psychosocial support to HIV-infected clients in their communities using voluntary lay counselors. These voluntary lay counselors have been trained by a variety of organizations. In order to standardize the quality of counseling which will be offered through this project, McCord will train all participating lay counselors. Training will be conducted over 10 days according to the South African national counseling guidelines (minimum standard). Lay counselors employed by the four municipal clinics will have benefited from the 10-day training course as a pre-employment requirement and will not require further training in CT. Staff from all seven sites will be trained in CT of children to increase confidence and skill in this area. Counselors will be trained to conduct pre- and post-test counseling with caregivers and children where appropriate. Clinical staff will be trained in testing of children, which includes skills to draw blood from small children or babies. This is currently a barrier to widespread testing of small children outside of a hospital setting. Counselors who have not already had exposure to training in couple counseling will be trained and urged to encourage partner or family attendance at clinic or NGO activities with the view of encouraging testing and other palliative care services.

In addition, staff will be trained and supported to provide family centered counseling aimed at increasing retention and improving case finding within families. Also, training will be provided to increase skills to counsel and test children and adolescents in both the clinical and community/educational settings.

ACTIVITY 2: Workshop in Provider-Initiated Counseling and Testing Within a Multidisciplinary Team

All staff who participate in this project will attend a preparatory workshop on the concept, advantages and implementation challenges of provider-initiated or opt-out CT services. During this workshop, the seven sites will be assisted in formulating an approach to implementing provider-initiated CT or opt-out counseling as an augmentation to their current services, which would include PMTCT, STI, TB, children's clinic, immunization services. Staff will be assisted to include lay counselors into a multidisciplinary team that will span across vertical programs. Staff will be assisted to develop referral systems that are effective and ensure continuity of care between CT, HIV care and treatment and the other programs. Special attention will be paid to increasing confidence in counseling and testing of children.

ACTIVITY 3: Technical Support to Implement Provider-Initiated or Opt-Out CT

All sites will be supported technically to implement provider-initiated or opt-out CT through weekly mentorship of counselors and clinical staff, facilitation of multidisciplinary and inter-program referrals, and problem solving. McCord/Zoe Life will assist sites to strengthen monitoring and evaluation systems linked to CT. Information relating to the implementation of CT services will be reviewed and fed back to staff at the

Activity Narrative: sites for ongoing quality control and problem solving. Counselor mentors will monitor quality of counseling, assist with complex cases and strengthen referrals. Clinical support will be given to staff that require assistance with testing of children.

ACTIVITY 4: Human Resource Augmentation

In sites where uptake of CT exceeds the staff capacity, PEPFAR-funded counselors will be employed to increase capacity whilst the organization motivates for increasing human resources from the KZNDOH or from other funding sources.

ACTIVITY 5: Mobile CT

Mobile counseling and testing services will be offered to at risk populations or difficult to reach populations such as unemployed, migrant or displaced peoples. These services will be provided as an outreach service linked to the current sites. Sites' staff will be used to link population at risk or in difficulty with appropriate services.

ACTIVITY 6: Increase CT for OVC

Linkages with educational facilities and facilities housing orphans and vulnerable children will be established and counseling and testing services will be offered to these facilities, either on site, or in conjunction with the Zoe-Life/McCord sites, in addition to linkages with care and treatment services.

The McCord Hospital/Zoe Life activities contribute to the 2-7-10 PEPFAR goals and the USG South Africa Five-Year Strategic Plan by strengthening the public sector and expanding access to care and treatment.

Activity System ID: 23701

Activity Narrative: SUMMARY AND BACKGROUND:

The project will expand access to counseling and testing (CT) at community level and strengthen counseling and testing services at health facility level.

ACTIVITIES AND EXPECTED RESULTS:

Africare will carry out two separate activities in this program area.

ACTIVITY 1: Strengthening CT services at health facility level

The project will mentor staff at facility on implementing CT services including provider initiated CT for sexually transmitted infections (STIs), tuberculosis (TB) and antenatal care (ANC) clients. The project will train and place lay counselor at health facilities to counsel and refer clients for CT. All clients testing for HIV irrespective of their results will be referred to the support groups where they will receive more information and support on HIV/AIDS.

ACTIVITY 2: Implementing mobile CT services within the community

The project will implement mobile CT services that will services communities. These mobile services will operate during and after clinic hours. The project will provide mobile CT services whenever there is an event in the community e.g. candle light memorials, World AIDS Day, Stop TB Day, STI week and other sporting events in the community. This service will be coupled with mass media activities (radio talks about the mobile CT services, flyers) and community mobilization efforts to encourage community members to seek counseling and testing for HIV.

Budget Code: HVCT	Program Budget Code: 14
Activity ID: 3114.23891.09	Planned Funds: \$389,896
Activity System ID: 23891	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

While Health Care Improvement (HCI), the follow-on to the University Research Corporation, LLC (URC)/Quality Assurance Project (QAP), will continue to focus on the four key activities described in the FY 2008 COP, with the emphasis during FY 2009 placed on expanding these and other activities, in the following ways:

ACTIVITY 1: Establish Quality Improvement Teams at the Facility Level

By improving and institutionalizing the formation of quality improvement teams at facility and district levels, HCI staff is involved in providing the knowledge and skills required for leadership and sustainability for the program. This is an ongoing initiative, which is specific to each area, district, and province, due to the variable nature of the different stakeholders involved and geographic location of HCI-supported sites and districts.

ACTIVITY 2: Human Capacity Development

As HCI is already in the process of recruiting and placing medical staff and lay counselors in health facilities, these staff will be tasked with ensuring all clients are referred for or offered CT services, as well as provision of clinical services to HIV-infected clients on a day-to-day basis. The medical staff will specifically provide training and mentoring for health facility staff regarding HIV/AIDS care, with specific reference to CT modalities and HIV treatment and care services on a weekly and monthly basis. As part of HCI's sustainability initiatives, HCI staff seek to build capacity and develop local skills, by providing training and support to Department of Health (DOH) clinic staff (doctors, nurses, counselors, pharmacists, etc.) to ensure that providers have appropriate knowledge and skills to deliver quality CT services to all clients enrolled in the program. HCI staff and DOH staff meet regularly to ensure that any additional knowledge regarding newer CT treatment options and research findings are readily shared.

ACTIVITY 3: Referrals and Linkages

Building on lessons from previous experiences, HCI is able to facilitate linkages between different stakeholders within the health system, by coordinating and providing leadership.

To improve existing referral networks, HCI staff members will identify and strengthen linkages between prevention of mother-to-child transmission (PMTCT), CT and antiretroviral treatment (ART) sites, by working with health facility staff at different levels of care and advocating for the development of integrated referral and follow-up networks. All staff at PMTCT and CT sites will be responsible for referring HIV-infected mothers and their newborns for onward care, treatment and support, while staff at ARV sites is responsible for care, treatment, support and follow-up of these patients. It is essential to ensure that all patients receive optimal care and remain within the health care system, ensuring adherence to treatment and an improved quality of life.

HCI staff will also ensure that health care workers are capacitated to provide appropriate infant care follow-up, opportunistic infection (OI) prophylaxis, and basic preventive care to HIV-exposed infants identified in the PMTCT programs. HCI staff will also build the capacity of community-based tracers to identify and follow-up PMTCT, tuberculosis (TB) or ART defaulters, including HIV-exposed babies who have been 'lost to follow-up.'

HCI plans to strengthen linkages between orphan and vulnerable children (OVC) programs, CT, routine maternal and child health and ART services. It is envisaged that this will serve to identify and strengthen existing networks; highlight gaps in the quality of services provided; and provide information about the feasibility of incorporating relatively rapid QA approaches into ongoing OVC programs.

ACTIVITY 4: Strengthening Supervision Systems

HCI has been extensively involved in revision of the Clinic Supervision Manual for Healthcare Facilities, and will continue to lead the implementation and monitoring of supervision systems within the country, by training district and facility-level supervisors in QA methods and facilitative supervision techniques for improving the quality of CT and follow-up services.

ACTIVITY 5: Policy

URC/QAP will actively participate in the development, revision and implementation of the national CT guidelines and CT monitoring and evaluation framework, in collaboration with the national and provincial DOH staff, to ensure long term sustainability of this program.

SUMMARY:

University Research Co., LLC/Quality Assurance Project (URC/QAP) will work in 140 South African Department of Health (DOH) facilities in five provinces to improve the quality of provider-initiated testing and counseling (PITC) services through training, mentoring and introducing quality assurance (QA) tools and approaches. The essential elements of QA support include assuring technical compliance with evidence-based norms and standards, improving interpersonal communication and counseling, and increasing organizational efficiency. The major emphasis area for this activity is quality assurance/supportive supervision with minor emphasis on development of network/linkages/referral systems, training and needs assessment. The activity targets public health workers, community-based organizations (CBOs), faith-based organizations (FBOs), program managers, community volunteers, children, youth, adults, family planning clients, and pregnant women.

Activity Narrative: BACKGROUND:

URC/QAP has been supporting DOH facilities in five provinces (Eastern Cape, KwaZulu-Natal, Limpopo, Mpumalanga, and North West) to improve CT services. The focus of this activity has been on improving counseling skills, as well as better integration of CT in several high-volume services. South Africa continues to face major problems in increasing CT uptake among high-risk groups. Stigma, as well as fear of knowing one's HIV status, remains primary reasons for low uptake of CT. In addition, most men do not visit health centers unless they are very sick, resulting in a low number of men requesting CT. URC/QAP will increase the awareness about CT among communities by creating linkages between public and community-based facilities, and by actively promoting strategies that involve men. Integrating HIV and AIDS services with other high volume and problem-prone health services such as antenatal care, family planning, sexually transmitted infection services, as well as other curative health services, will improve social mobilization and public awareness.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Establish Facility-level Quality Improvement Teams

URC/QAP will work with facilities to identify a core team representing staff from various clinical services. The facility-based teams, with support from URC/QAP and DOH staff, will be responsible for plans for improving uptake of quality of CT services in various clinical settings. Each facility team will conduct a rapid baseline assessment (if this has not already been completed) to identify quality gaps in current CT services. The facility teams will use these assessments and QA tools to develop and implement the quality improvement plan. URC/QAP will assist facility teams in developing strategic plans for improving access to and quality of CT services. PICT services will be linked with high-volume and problem-prone services, such as TB, STI, FP, and antenatal care services, which have large proportions of HIV-infected clinic attendees. URC/QAP will also integrate routine HIV testing services, thereby increasing access to CT in all clinical settings. Emphasis will be placed on increasing recruitment of couples and families, including children and adolescents, to CT services. Facility staff will promote access and availability of confidential HIV testing, ensure that HIV testing is informed and voluntary, ensure effective and prompt provision of test results for all clients who undergo HIV testing, utilize a prevention counseling approach aimed at personal risk reduction for HIV-infected persons and those who have a higher risk of HIV exposure. URC/QAP will ensure that all facility staff are aware that HIV prevention counseling should focus on the client's unique personal circumstances and risk, and counseling should help the client set and reach an explicit behavior-change goal to reduce the chance of acquiring or transmitting HIV.

ACTIVITY 2: Human Capacity Development

Staff will receive QA training which will include specifics on CT quality, the meaning of quality in services, and compliance with national guidelines. Emphasis will be placed on the indicators used to monitor clinical performance, such as the presence of guidelines at facility level or the knowledge and skills of counselors. Specific case studies will be presented during the training, and participants will work in groups to identify quality gaps and suggest possible solutions. URC/QAP will provide job-aids such as wall charts to improve compliance with clinical and counseling guidelines. URC/QAP will visit each facility and CBO/FBO at least twice a month to provide on-the-job support and mentoring to healthcare workers in participating facilities. The mentoring will focus on improving skills of CT and other high-volume clinical service staff on HIV counseling and referring. During these visits, URC/QAP will also review program performance data.

ACTIVITY 3: Referrals and Linkages

URC/QAP is working on a continuum of care model for all HIV-infected persons. The model emphasizes the identification and early referral of all people living with HIV (PLHIV) to care, treatment, and other support services. As part of this mandate, URC/QAP works to link different levels of care (facility, CBO, FBO, home-based organization) and different services to minimize missed opportunities. To ensure that CT is widely available, various innovative CT approaches -- such as family-based, door-to-door, community-based, outreach services, youth focused and within home-based care -- will be incorporated into existing programs. URC/QAP will continue to expand this focus and promote available methods for prevention for all clients, including a specific focus on discordant couples. In addition, URC/QAP will continue to work with local CBOs and FBOs to increase community outreach and support for knowing one's HIV status. URC/QAP will train facility, CBO and FBO staff in analyzing their performance (outputs) and quality (compliance) indicators. The staff will use site-specific data to see if the interventions are increasing uptake of basic healthcare and support services on a monthly basis.

ACTIVITY 4: Building Sustainability

URC/QAP will train district and facility-level supervisors in QA methods and facilitative supervision techniques for improving the quality of CT services. URC/QAP has begun the process of reviewing the national CT guidelines and evaluating the quality of CT at facility level, in partnership with the provincial health departments at all levels. This will be a key focus area in the next 12 months. To ensure the quality and reliability of data obtained at all QAP supported sites, it has been necessary to ensure uniform reporting structures, with the introduction of QAP-specific data collection tools. Only URC/QAP staff utilize these tools, as DOH facility staff have their own reporting registers which are facility and district specific. URC/QAP will conduct quarterly assessments in each facility/CBO/FBO to assess whether the staff are in compliance with the NDOH CT guidelines. At least once a year, sample-based surveys will be undertaken in a small number of QAP and non-QAP sites to assess the differences in compliance and other performance indicators.

URC/QAP will assist PEPFAR in reaching the vision outlined in the South Africa Five-Year Strategy by increasing access to CT services. URC/QAP work contributes to the PEPFAR goal of providing care to 10

Activity Narrative: million people affected by HIV.

Mechanism: CAPRISA Follow On

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Prevention: Counseling and Testing

Program Budget Code: 14

Planned Funds: \$266,028

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The counseling and testing (CT) activities at the CAPRISA eThekweni site have been enhanced in the following way: Negotiations between management of the Prince Cyril Zulu Communicable Diseases Centre (PCZCDC) and CAPRISA ensured that tuberculosis (TB) patients presenting at PCZCDC would be actively referred by staff to the CAPRISA site. This has been the single-most successful step in ensuring that the CT coverage of the TB facility increased. In order to manage the high volumes of patients coming across from PCZCDC group pretest counseling sessions are held at the CAPRISA clinic and a shortened one-on-one pretest counseling session is conducted with those patients that accept the test. Informed consent is obtained from all patients that accept testing. Since the initiation of the group pre-test counseling, there has been a significant increase in the number of patients testing for HIV. This in turn increases the number of patients entering palliative care and entering onto treatment.

SUMMARY:

Activities are carried out to support comprehensive counseling and testing (CT) services in the rural area of Vulindlela and the CAPRISA eThekweni Clinical Research Site, which is located next to the TB clinic in Durban. In addition, activities will involve the continuation of expanding CT among two high-risk groups at two established treatment sites in KwaZulu Natal. These high-risk groups include sexually transmitted infection (STI) patients, and an adolescent population in rural Vulindlela. CAPRISA follows the National Department of Health's recommended algorithm for rapid HIV testing.

The primary emphasis area for this activity is Human capacity development, with minor areas of emphasis on community mobilization and on information, education and communication. Specific target populations include children and youth (non-OVC), out-of-school youth and men and women of reproductive age.

BACKGROUND:

CAPRISA was established in 2002 as a not-for-profit AIDS research organization by five major partner institutions: University of KwaZulu-Natal, University of Cape Town, University of Western Cape, National Institute for Communicable Diseases (NICD), and Columbia University. The headquarters of CAPRISA are located in the Doris Duke Medical Research Institute at the Nelson R. Mandela School of Medicine, University of KwaZulu-Natal. The PEPFAR-funded CAPRISA AIDS Treatment (CAT) Program was initially started as a supplemental effort to deal with the large volume of HIV-infected clients that were screened out of CAPRISA's other research studies. The existing counseling and testing services at two treatment sites will be continued with FY 2007 funding. The strength of the current CAT program is that it provides an integrated package of prevention and treatment services and provides an innovative method of providing antiretroviral treatment (ART) by integrating the TB and HIV care at both an urban and rural site. In 2006, CAPRISA began offering counseling and testing services to two high-risk populations in order to enhance the uptake of counseling and testing in these populations. This service has enabled the CAT program to create a synergy between treatment and prevention services while simultaneously identifying high-risk HIV individuals to enhance their prevention potential through ART.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Voluntary Counseling and Testing

The voluntary counseling and testing (VCT) services will be continued in the rural primary care clinic in Vulindlela and the eThekweni Clinical Research Site based at the Prince Cyril Zulu Communicable Disease Centre (CDC) in Durban. All CT is currently offered in conjunction with an NGO, known as Open Door, to patients attending these two facilities. The CT that is offered includes prevention education and condom distribution.

ACTIVITY 2: Provider-Initiated Testing and Counseling

Provider-initiated testing and counseling (PITC) will be offered to all TB and STI patients at the Prince Cyril Zulu Communicable Diseases Centre (CDC). The Centre is a large local government clinic that provides free diagnosis and treatment of TB and sexually transmitted infections (STIs). Annually, approximately 4,000 cases of STIs, are treated at this clinic, with an average of about 135 STI patients per day. Given the high HIV prevalence of 63% in this group, these patients are a high-risk group for acquiring and transmitting HIV. The clinic sees approximately 8,000 TB patients per month, with a HIV/TB co-infection rate of approximately 65%. All patients attending both the STI clinic, as well as the TB clinic are routinely offered counseling and testing by the STI nurses and the health educators located in the TB facility. Male and female patients seeking STI or TB care at the clinic are offered group counseling and individual HIV testing. Those who test HIV-infected are individually post-test counseled and referred for ongoing supportive counseling and medical care in the CAT program. The CAT program has partnered with a community-based organization, (CBO), TAI for the provision of health education, peer education and support to program participants. Although the TB clinic sees approximately 8,000 cases per month, more than 95% of these are repeat visits for either follow-up clinic visits, or X-Ray visits. Approximately 400 newly diagnosed TB patients are counseled each month. It is likely that the Centre will reach the target of 7,500 when efforts are combined with the STI patients and with the activities for adolescents described below.

ACTIVITY 3: Routine Testing for Adolescents

This program targets the adolescent population in rural Vulindlela. South African adolescents, particularly young women, are at high risk of acquiring HIV. Adolescents in the area, primarily those utilizing the primary healthcare services for antenatal, family planning or STI services are routinely offered counseling and testing. The counseling and testing is coordinated with other programs and projects in the area. In addition,

Activity Narrative: youth peer educators have been integrated within this program.

Thus far, antiretroviral treatment rollout activities have targeted those people that are most accessible, like those people visiting health facilities. This implies that activities has have not met the challenge of using ART provision to enhance prevention, especially prevention in HIV-infected individuals. In FY 2008 CAPRISA plans to continue targeting the two high-risk groups with client and provider-initiated testing and counseling. The expanded counseling and testing program will continue to exploit the synergy that exists between the promotion of counseling and testing and availability of high-quality HIV care to enhance both prevention and treatment in TB patients, STI patients and adolescents. HIV-infected persons will be referred to the CAT Program for follow-up treatment and care. HIV negative persons will be referred to other CAPRISA, government or NGO prevention programs. Importantly, this strategy begins to address the ethical dilemma of how scarce resources for HIV can be used effectively by focusing on high-risk groups and utilizing access to ART to enhance counseling and testing for treatment and prevention.

During FY 2008, the expanded counseling and testing service will not require additional counselors or field workers. However, the counselors and fieldworkers will receive ongoing training in counseling with role-playing to ensure high quality counseling and testing. As part of an internal quality assurance process, a senior counselor often analyzes counseling sessions, and training is based on common areas of deficiencies identified. A constant review process has been established to reflect of reasons for refusal of uptake of CT, and strategies have been implemented to address common reasons for refusal. A high refusal rate for testing was initially seen by male patients counseled by female counselors, and this was addressed by having male counselors on hand to see male patients. In addition, regular debriefing sessions are scheduled to allow counselors suffering from burnout to distress and support one another.

These results contribute to the PEPFAR 2-7-10 goals by improving access to and quality of CT services in order to identify HIV-infected persons and increase the number of persons receiving ARV services in three high risk groups; TB patients, STI patients and adolescents.

Budget Code: HVCT	Program Budget Code: 14
Activity ID: 23711.09	Planned Funds: ■

Activity System ID: 23711

Activity Narrative: SUMMARY:

The HIV Counseling and Testing (CT) activities had previously been implemented by the Medical Research Council (MRC). However, this year these activities will be re-competed and a partner yet to be determined (TBD) will be implementing them to continue the work started by the MRC.

BACKGROUND:

MRC's That's It project began three years ago with the aim of integrating tuberculosis (TB) and HIV programs in public health facilities. This project was started as a pilot project but now has expanded to about 30 sites across South Africa and has become more of a service delivery project. Therefore, these activities are going to be moved from being implemented by the MRC, which is more of a research-oriented partner.

ACTIVITIES AND EXPECTED RESULTS:

This TBD partner will carry out two separate activities in this program area.

ACTIVITY 1: Expand CT for TB patients

The partner will seek to improve CT uptake for TB patients in order to increase their access to HIV care and treatment. Efforts will be made to work with public health care workers to routinely offer HIV testing and document their HIV status in TB registers.

ACTIVITY 2: Community Outreach

The partner will also implement community outreach to improve uptake of couple-counseling and testing and follow-up on referral. This is achieved by the utilization of a mobile clinic vehicle that attends to farm communities, businesses, factory workers and mothers and children at home in informal settlements and local townships. Health education is given on methods of TB and HIV prevention (group and individually).

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 481.09

Mechanism: N/A

Prime Partner: Living Hope

USG Agency: U.S. Agency for International
Development

Funding Source: GHCS (State)

Program Area: Prevention: Counseling and
Testing

Budget Code: HVCT

Program Budget Code: 14

Activity ID: 23737.09

Planned Funds: \$59,487

Activity System ID: 23737

Activity Narrative: SUMMARY:

Living Hope will offer counseling and testing (CT) and adherence counseling services in partnership with government clinics and hospitals of the Deep South Peninsula of the Western Cape as well as a mobile clinic in partnership with Stellenbosch University. This will be achieved by the placement of trained counselors or lay counselors in the identified sites, and utilising the facilities made accessible through the partnerships.

BACKGROUND:

Living Hope endeavours to maintain a family centred approach by encouraging partners, husbands and children of the CT and PMTCT clients to come for testing and receive referrals to HIV care and support services. In particular, Living Hope's CT and PMTCT programme targets partners of pregnant women to provide them with couples CT and a referral network for prevention services and other health information or services they may need. Living Hope offers support for disclosure and encourages couples counseling to reduce stigma and potential violence in the community. The involvement of men in the programme also improves prevention with positives and provides interventions for discordant couples. Living Hope provides CT services through partnerships with government hospitals and clinics, as well as using its own facilities where the government does not have a presence. Living Hope offers the following training through the AIDS Training Information and Counseling Centre (ATICC): A 10 day information course, a 20 day intensive counseling course, a 10 day ARV course, and a 5 day paediatric counseling course. The two primary government partners are False Bay Hospital in Fish Hoek and the Nozamo clinic in Masiphumelele. These partnerships contribute to improving the links and proper function between HIV services which encourages community members to utilize them. The CT programme and the related PMTCT element also feeds HIV individuals into a confidential support group system whereby members receive ongoing health, nutrition, sexuality and HIV education as well as psycho-social support.

ACTIVITIES AND EXPECTED RESULTS:

Living Hope will carry out six separate activities in this program area.

ACTIVITY 1: Training

Living Hope offers the following training via other service providers: Nutrition counseling and breast feeding (with the support of a nutritionist from the Provincial Administration of the Western Cape), condom training and register training (with a sub-district co-ordinator), couples-counseling (through the Provincial Administration of the Western Cape), and support group facilitation training (with Philippi Trust). Living Hope also offers counselors in-house training via volunteers and its prevention manager on leadership (with Rolling Hills), dealing with stress (with Brentwood), public speaking (with Shades Mountain), personal motivation, and the "Seven Laws of the Learner" course.

ACTIVITY 2: Counseling

Living Hope provides pre- and post-test counseling in cooperation with Department of Health (DOH) at seven clinics in six different communities including Fish Hoek, Muizenberg, Ocean View, Masiphumelele, Simons Town and Red Hill. We also partner with government clinics and hospitals in Fish Hoek and Masiphumelele to provide help to lay counselors for the pre- and post-test component of the desperately needed voluntary counseling and testing (VCT) services.

ACTIVITY 3: Referrals

The clients that test positive for HIV are referred to False Bay Hospital, Ocean View clinic, Masiphumelele clinic, Living Hope's In-Patient Unit (hospice) or home-based care (HBC) service, depending on the patient's needs and location. The referrals involve access to services such as prevention of mother-to-child transmission (PMTCT), antiretroviral therapy (ART), HBC, social services, counseling, chaplain care and support group meetings. In addition, Living Hope counselors network with Living Hope support group facilitators to refer clients to prevention or care services. This referral system ensures ongoing support for clients going through the CT programme and creates a better safety and service net of HIV services for the community.

ACTIVITY 4: Partner Counseling

Lay counselors continue to counsel the partners of post-test clients to educate them on the risks of HIV/AIDS, as well as encourage them to come for testing. The result has been a slight increase of males coming for testing and it is hoped that the partners will provide each other with mutual support as well as remaining sexually faithful to one another.

ACTIVITY 5: Facilitative Support to Access PMTCT

Living Hope also provides testing and counseling for pregnant mothers and encourages them to take up PMTCT services. After delivery, Living Hope follows up with new mothers to counsel them on proper feeding and encourages mothers to test their children for HIV. During her pregnancy, if a pregnant woman finds out that she is HIV-infected and has received counseling from a Living Hope counselor, she is referred to a Mother 2 Mother mentor who becomes her companion and mentor during the pregnancy. All HIV-infected pregnant women are also encouraged to attend regular support groups which are co-led by a Living Hope counselor, a Living Hope support group facilitator and a Mother 2 Mother mentor. After the delivery of the baby Living Hope discovered a gap of care for the mother and baby as they seem to get "lost in the community." Living Hope seeks to follow up with the mothers up and encourages them to continue to attend a support group where they are taught parenting skills, provided with information about early childhood diseases and development, and encouraged to continue to follow all that they were taught in the

Activity Narrative: PMTCT programme such as no mixed feeding.

ACTIVITY 6: Community Outreach

As part of the CT programme, LH will also participate in community outreach and awareness campaigns to raise awareness of HIV services, reduce stigma and increase the demand for CT services. To do this LH has embarked on partnering with other community organisations or using volunteer teams to work alongside its staff and offer blood pressure and sugar glucose testing at sites in the community, together with HIV testing and tuberculosis (TB) screening. The volunteers have assisted in providing entertainment for the community, while they wait for their respective tests to be done, as well as promoted the services offered at Living Hope.

Living Hope disaggregates gender data to help maximize data use for informed decision making, program design, budget allocation and developing recruitment strategies to improve the quality of the programme.

Activity System ID: 23617

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. PEPFAR funds were allocated to VCT through the Integrated Primary Health Care Project (IPHC), a collaborative project between the National Department of Health, the provincial Departments of Health in the Eastern Cape, KwaZulu-Natal, Limpopo, Mpumalanga and North West provinces and the United States Agency for International Development (USAID) awarded in 2004 and extended until December 2010 to Management Sciences for Health (MSH). Since this project has a ceiling which cannot be exceeded, no further funding can be added since the contract has reached its ceiling. MSH will work with the DOH to ensure that activities are sustainable to the maximum extent possible. The VCT activities of MSH will be completed according to schedule in 2010. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Table 3.3.14: Activities by Funding Mechanism

Mechanism ID: 1066.09	Mechanism: PHRU
Prime Partner: Wits Health Consortium, Perinatal HIV Research Unit	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 3100.23642.09	Planned Funds: \$750,509
Activity System ID: 23642	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

IMBIZO: The IMBIZO men's health project will become more integrated with mainstream counseling and testing (CT) services. Rather than providing a separate and distinct service for men, the project team will visit CT centres and train staff to provide better services to men. In addition, the team will do outreach activities at places where men congregate such as shebeens, sports venues and hostels to encourage men to test, and provide follow-up counseling and services for men.

In all programs, the Perinatal HIV Research Unit (PHRU) will implement a system by which counseling will link in with prevention for clients who test HIV-negative and with relevant HIV-services for those that test HIV-infected. A CD4 count test is therefore the next step in the chain and PHRU will ensure that people are tested and that they receive CD4 count results. PHRU will investigate rapid CD4 count technologies to determine if this improves retention in care. All clients testing HIV-negative are encouraged to come back for a further test in six weeks to three months because of the window period which is explained to them, and then to return every six months to a year for retesting.

Counseling men includes addressing male norms and behaviours such as family responsibility, responsible sexual behaviour, safe disclosure and domestic violence. The focus on men increases gender equity in the South African context where more women than men access HIV-services.

PHRU will expand its CT services at the PHRU clinic such that clients will be offered a range of services to encourage clients to return on a regular basis. These will include tuberculosis (TB) and sexually transmitted infection (STI) screening, CD4 counts, counseling, treatment readiness and family planning advice. Clients suspected of having TB after screening will be referred to TB treatment sites and followed-up to see if they get treatment. Clients will be linked with other services such as family planning services as the need arises.

PHRU will provide training around issues such as counseling couples, men and adolescents. As described under human capacity development, PHRU in collaboration with HIVSA has developed an accredited training program for counselors. These counselors will now have a career path and will be able to specialise in some of these aspects of counseling.

All people who are doing rapid HIV-testing will undergo an annual proficiency test and a random sample of blood taken for rapid testing will be sent for an Enzyme-Linked Immunosorbent Assay (ELISA) test to confirm accuracy of results given in the field.

SUMMARY:

The approach taken by the Perinatal HIV Research Unit (PHRU) is one of comprehensive, high quality care and support for people living with HIV (PLHIV). PHRU will use PEPFAR funds to promote voluntary counseling and testing (CT) through HIV prevention workshops and health promotion activities, and to pregnant women at PMTCT to increase uptake of CT for HIV. In particular, services will be promoted to men in an effort to increase gender equality in HIV and AIDS programs and make them available to adolescents as part of a prevention program. The major emphasis area is human resources; minor areas include local organization capacity development, community mobilization/participation, and information, education, and communication. The target populations are the general population with a focus on men and adolescents.

BACKGROUND:

This CT program is an ongoing activity operated in partnership with a local non-governmental organization, HIVSA, and other CT organizations in Soweto (Gauteng). The program will be expanded to rural Limpopo and Mpumalanga. Women have mainly accessed HIV services in Soweto and this project aims to improve gender equity in these services. In June 2005, the IMBIZO project, which broadens access to HIV and AIDS information, was established. This project was designed to enhance male involvement in counseling and testing and other health services. IMBIZO drop-in centers operate five days a week and are located close to areas where men congregate and are easily accessible. The concept of the IMBIZO program is one designed by men for men and evolved from research that indicated that men preferred to be counseled by men at locations away from the primary healthcare clinics. Within the project, marginalized communities such as men who have sex with men are encouraged to access CT. A focus of this program is to reduce stigma associated with HIV, to encourage disclosure, to support partners and family members with HIV and to promote active engagement with HIV services. A program promoting IMBIZO to partners of pregnant women is being run in the antenatal clinics, with the aim of increasing male involvement in PMTCT and fatherhood. Reduction of violence and coercion, also main components of IMBIZO, is a major focus of the program. Outreach activities take place in prisons, workplaces, hostels, sports matches and other places where men congregate. PHRU offers a couple counseling service called "Tshwarisanang" through external foundation funding and all other PHRU CT services can refer to them.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: IMBIZO - Men's Health Centers

Male IMBIZO centers are funded by PEPFAR. The project receives approximately 300 drop-in clients and performs approximately 140 CT each month. A male registered nurse manages the program. Clients are referred to local clinics for HIV services and treatment. Stigma decreases men's uptake of CT services and innovative strategies to increase men using CT are being developed. At-risk male populations such as men who have sex with men, migrants, and prisoners are focus populations. This program will expand to rural Mpumalanga provinces. Information on TB, PMTCT, HIV services, prevention, nutrition, etc., is available. Clients are counseled on prevention and condoms are distributed. Support is given to clients to encourage disclosure, to decrease stigma, to mitigate domestic violence, and to provide support to partners. To

Activity Narrative: increase male support of PMTCT programs, pamphlets have been designed for male partners of pregnant women that explain PMTCT, encourage active involvement in fatherhood, and encourage men to access the IMBIZO centers and to go for CT. Outreach activities take place regularly with community organizations, workplace programs, and health services. Mobile CT is used to take CT to communities that do not have easy access to healthcare services. A focus of this program is to reduce stigma, increase male involvement in all services relating to HIV thus increasing gender equity. U.S.-volunteers will support the rural program.

ACTIVITY 2: Adolescents

Adolescents have special healthcare needs which they are often reluctant to address; some of these are sexuality, pregnancy, drug and alcohol abuse, sexually transmitted infections (STI), gender and mental health issues, coercion, violence, transgenerational sex and abuse. They are at high risk of contracting HIV and other STIs. Through a proposed specialized adolescent clinic PHRU will address these needs with FY 2007 PEPFAR funding by offering comprehensive counseling and care services that are youth-friendly, confidential and empowering to clients so that they may make informed and responsible healthcare choices, including being empowered to abstain and delay sexual debut. Through CT, education and counseling, PHRU will increase awareness of HIV. The clinic in Soweto will be based close to places to where adolescents congregate. Services will comprise CT and confidential and free care; information, education and counseling on sexual and reproductive health; health information; counseling and appropriate referral for violence abuse and mental health issues; contraceptive information and counseling on individual choices; STI information, including information on effective prevention; and syndromic management of STIs. PEPFAR funds will be used to establish and staff this project.

ACTIVITY 3: CT Plus

In the Western Cape a mobile CT program providing counseling and testing, point of care CD4 counts, TB screening and referral into care and ART services programs will be supported. The Western Cape has very high TB prevalence. This program will provide CT to underserved populations.

ACTIVITY 4: Couple Counseling

PEPFAR funds will be used to expand an existing couple counseling program operating at the PHRU in Soweto. Specialized counseling for couples has proven to be effective for preventing further infection particularly in discordant couples. In many programs lay counselors do not have sufficient expertise to counsel couples and therefore a referral service is essential.

ACTIVITY 5: Farm Workers

A CT activity linked to care and ART for farm workers in the Westcoast winelands region of the Western Cape will be expanded to other districts in the region. The male CT program will expand to target all men including men who have sex with men and other vulnerable male groups in Soweto (Gauteng) and Bushbuckridge (Mpumalanga).

These activities will contribute to the PEPFAR 2-7-10 goals by increasing access to and improving quality of CT services, particularly to hard-to-reach populations of men and adolescents in urban and rural districts in South Africa.

Budget Code: HVCT

Activity ID: 8255.23095.09

Activity System ID: 23095

Mechanism: N/A

USG Agency: U.S. Agency for International
Development

Program Area: Prevention: Counseling and
Testing

Program Budget Code: 14

Planned Funds: \$194,181

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009, LifeLine Rustenburg will focus on superior service delivery by ensuring competent personnel to provide counseling and testing (CT) activities to increase the number of persons who know their HIV status. It will also add tuberculosis (TB) CT to its existing activities, expand and enhance couple counseling to include home-based family and child counseling inclusive of counseling and support on adherence for those on antiretroviral treatment (ART), and concentrate on increasing partner disclosure through more intensive counseling, support and referrals.

Lifeline will also augment its existing monitoring and evaluation activities with a state of the art data management and reporting system. This will enhance monitoring and evaluating activities to ensure accurate and reliable data compilation to guide and improve programs and aim for implementing future research activities.

Other activities include facilitating an increase in uptake of voluntary counseling and testing (VCT) of males, youth, adults, most at risk populations, and persons in the 15-24 year age group; implementing a more effective referral network system with existing and other partners to enhance consistent condom use, family planning, counseling and testing and substance/alcohol abuse services to increase prevention education to a wider population; reduce risk perception and promote risk reduction, and use evidence-based information to address the key drivers of the epidemic. Clients who are tested positive will receive counseling and guidance with regard to disclosure, with emphasis on partner and family disclosure. The client will then be referred to the TrendSetters in the prevention program for education on family planning, discordant partners, and correct, consistent condom use. Thereafter, clients will be referred to the local family planning services.

SUMMARY:

This project benefits from contributions from other donors such as Anglo Platinum Mines, which has committed to three-years of cost sharing. In particular, they are funding a vehicle that will be used in the mining areas, and covering traveling costs and stipends for a nurse and driver. Through the mobile unit operation, counselors and nurses provide counseling and testing services. Willing clients receive a group HIV information session, individual pre-test counseling, followed by a rapid test with an accompanying verifying test, finally a post-test counseling session with further referrals, if necessary. Counseling and testing sessions occur at designated hot spots where the mobile unit is operating and follows strict policies of informed consent and confidentiality. This project also includes couple counseling and testing.

Target populations include men and women, boys and girls, discordant couples, pregnant women, persons living with HIV, young people who are sexually active, mobile populations and people who engage in transactional sex but who do not identify as persons in sex work. Though they are not targeted directly, the project hopes to reach out to most-at-risk populations including sex workers, truck drivers, and mobile populations, by targeting the general population.

Relationships formed with local government and municipal departments will assist to ensure the continuity of the project. Equipment purchased for the project in the first year will not need to be replaced for many years. Salaries and other costs can be sustained through increased corporate training and workplace programs that garner substantial revenue for LifeLine.

BACKGROUND:

LifeLine Rustenburg is a non-governmental, non-profit, community-based organization, affiliated to LifeLine Southern Africa, and to LifeLine International. Affiliation is awarded annually based on maintenance of standards, adherence to policy and procedures and acceptable performance in areas of service. LifeLine Rustenburg has been operational since 1991. The organization serves an area of approximately 200 kilometers radius. LifeLine Rustenburg works closely with the National Office, who are informed about projects and services run by LifeLine Rustenburg. Bi-annual consultative meetings are held and LifeLine Rustenburg submits quarterly reports to the main office.

LifeLine focuses on counseling and crisis intervention services, provision of life skills and personal development training, capacity building for less established community-based organizations (CBOs), voluntary counseling and testing (VCT), and HIV prevention. To date, the organization has implemented a community counselor project (CCP) that provides counselors to 150 health facilities in Bojanala (in partnership with North West Department of Health). LifeLine Rustenburg has also established a non-medical CT site, provided 24-hour counseling service via a national counseling line, and trained staff at numerous other organizations. Future plans for the project is to place counselors at all health facilities, supply mobile (outreach) CT, support and care to HIV persons and other affected persons, and to provide HIV prevention services to rural and other under-served communities throughout the Bojanala District of the North West province. Care and support activities will be provided through ongoing partnerships with other CBOs and FBOs with expertise in these areas.

During the COP 2007 period, LifeLine Rustenburg used PEPFAR funds to establish a mobile CT operation. The mobile unit and counselors at public health facilities provide CT services throughout the Bojanala District of the North West province. The target groups for the abstinence and being faithful (AB) prevention messages are males and females, 10 years and older, located in the identified hot spots in the province. A hot spot is defined as an area that has a high rate of traffic of vulnerable persons; for example, taxi ranks and the mining hostels. The LifeLine hot spots are currently located in the Bojanala region, and one hot spot has been identified in each sub-district. PEPFAR FY 2007 enabled LifeLine to work in seven such hotspots, although the target for FY 2008 is 12 hot spots.

Activity Narrative: ACTIVITIES AND EXPECTED RESULTS:

LifeLine will continue to provide accessible CT services that promote increased knowledge of personal HIV status. This service will facilitate access to care and support for HIV-infected and affected individuals. This Mobile CT Unit seeks to ensure the public has easy access to necessary information, counseling and testing, and prompt referrals for other relevant services. CT services offered are: pre-counseling group information sessions; individual or couple pre-test counseling inclusive of informed consent; testing and confirmatory testing, where necessary; and finally individual or couple post-test counseling sessions with required referrals. Mobile units will be used to improve access in hard to reach communities. CT services will also be available at the LifeLine centre for neighboring communities. Four nurses and 12 counselors conduct counseling and testing services through two mobile units that service 12 hot spots. All people who test positive are referred to treatment and care services.

Through CT, access to services for men and women will improve and gender issues are addressed accordingly. Statistics show that more women undergo CT at public health facilities. Pre- and post-test counseling sessions enable test-takers to examine their gender role as individuals and are encouraged to outline a plan of action for behavior change to prevent HIV infection.

Human capacity development activities through preliminary and ongoing training ensure sustainability. This ensures that the services are of the high quality and provided by competent staff. LifeLine will report to the National Department of Health on its activities and will comply with South African legislation in carrying out its services.

Table 3.3.14: Activities by Funding Mechansim

Mechanism ID: 9691.09	Mechanism: N/A
Prime Partner: Lifeline Mafikeng	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Prevention: Counseling and Testing
Budget Code: HVCT	Program Budget Code: 14
Activity ID: 22494.23092.09	Planned Funds: \$242,726
Activity System ID: 23092	

Activity Narrative: SUMMARY:

The LifeLine North West Mafikeng Centre seeks to implement a mobile HIV counseling and testing (CT) unit, in the Central and Bophirima districts of the North West Province, building on the experience of our Rustenburg affiliate that operates in the Bojanala District of the North West Province. LifeLine Rustenburg is currently funded by PEPFAR (2007) to implement the mobile voluntary counseling and testing (VCT) service in the Bojanala District.

BACKGROUND:

The project addresses U.S. Government's HIV/AIDS objectives in South Africa by:

1) Improving access to and providing HIV CT services, 2) Implementing HIV prevention activities by promoting the ABCs of prevention; abstinence, being faithful, sexual behavioral change within the context of cultural norms, and correct and consistent male or female condom use, and 3) Improving the quality of life of those infected and affected by HIV/AIDS..

Geographic Reach: Central & Bophirima Districts

The administration and management of the project is based at the LifeLine Centre in Mafikeng while the mobile units will service ten identified sites in the Central and Bophirima Districts, five in each District. While Bophirima district is rural, Central district is a mixture of urban and rural communities, 20% of the provincial population (3.8M) reside in Central while 18% live in Bophirima however, Bophirima is the largest district and the population is very dispersed.

Target Populations:

The identified sites will be locations which are not adequately served by clinics and in which high barriers to individuals' learning their HIV status remain. The sites identified are villages and farming communities that are far from clinics and/or are generally serviced by mobile clinics intermittently. Population will everyone, however more specifically farm workers, youth and the overall rural population.

Proposed contribution to the HIV & AIDS and STI Strategic Plan for South Africa, 2007 -2011 and Operational Plan for Comprehensive HIV and AIDS Care, Treatment and Management for South Africa:

The project contributes the strategic and operational plans through promotion of HIV CT and care and support for HIV-infected individuals and their families.

The project activities fall into three categories that are strongly interconnected in their implementation and objectives. Firstly, a wide array of HIV prevention and marketing activities are designed to increase the uptake of services, disseminate factual, comprehensive information on HIV/AIDS, and encourage behavior that prevents HIV transmission. Secondly, the work of the mobile unit includes conducting HIV CT at designated identified sites in the two districts, five per district. Lastly, LifeLine activities involve intensive human and organizational capacity development, both within LifeLine and through activities with six community based organizations (CBOs) and faith-based organizations (FBOs), with an additional two to be added in the second year.

LifeLine adheres to the principle of voluntary counseling and testing (VCT) with informed consent and upholding the strict confidentiality policy in line with South African law. LifeLine ensures each test-taker receives a high quality pre- and post-test counseling session. Test-takers complete a brief evaluation form upon completion. Those receiving an HIV-infected result are referred to the nearest health facility to their home for medical attention and to a CBO/FBO in closest proximity for psycho-social support amongst other services.

The referral system is a crucial aspect of these activities. When test-takers receive a positive result, they are referred to two places by the counselor. They are referred to the relevant health facility nearest to their home for ongoing CD4 and viral load checks, other medical attention, and the wellness program through the public system, which enables eventual antiretroviral (ARV) treatment. The Department tracks people living with HIV and AIDS in its wellness programs. Secondly, they are referred to the closest partner CBO/FBO, who would provide services such as psycho-social and spiritual support, amongst others.

ACTIVITIES AND EXPECTED RESULTS:

LifeLine will carry out two separate activities in this program area.

ACTIVITY 1: Mobile Counseling and Testing and Health Education Services

LifeLine uses two mobile units to reach high numbers of adolescents and adults in the Central and Bophirima districts of the North West Province. One mobile will be based in Central district and the other in Bophirima district. Each unit will be staffed with one professional nurse, two counselors and two trend setters. Each unit will go out five days a week to hot spots (still to be identified) in each district. Hot spots will be areas of high transmission and farming communities which are under serviced. Each hot spot will be visited on a weekly basis for approximately seven hours per day. The main aim of the mobile service is to increase accessibility, referral to care and support services, create awareness, and provide education and training to the community. The mobile units provide VCT services, offering a full range of VCT services as well as prevention interventions. During the mobile visits, communities are educated on abstinence and being faithful (AB) messages by the trend setters. Counselors are trained in gender-based violence (GBV) and will monitor the impact of GBV on the women clients and refer them to relevant resources i.e. shelters, police etc. Trend setters will conduct educational programmes to encourage behavioural change and stigma reduction.

Activity Narrative: ACTIVITY 2: LifeLine Center

LifeLine center provides a counseling service and is a non medical VCT site with a nutritional supplement programme. The activities are conducted by LifeLine community outreach volunteers and trainers and are similar to those conducted in Activity three in the FY 2008 narrative. The non medical site is based in a high transmission area (HTA) and commercial sex workers will be specifically targetted for prevention and health care information. LifeLine works closely with two organisations that are male dominated and has focus groups which we can utilize to disseminate information regarding specific issues such as GBV and cross-generational relationships.

Program Budget Code: 14

Activity ID: 24738.09

Planned Funds: \$0

Activity System ID: 24738

Activity Narrative: SUMMARY:

The Sophumelela Clinic Incorporated (SCI) has just received funds under the New Partnership Initiative. Funds were received and activities only commenced in September 2008. SCI has been a sub-partner under the Catholic Relief Services (CRS) Track 1 award for the past four years. Additional funds are being used to support HIV counseling and testing (CT) activities not covered under the current award with CRS.

BACKGROUND:

SCI is a non-profit faith based organization that was formed by the First City Baptist Church, Buffalo City, Eastern Cape, South Africa in 2005. SCI exists to provide comprehensive clinical, social and spiritual care to HIV impacted people and their families in a faith environment within the greater Buffalo City Metropolis. SCI began as, and is currently, an ARV roll out Sub-Contractor under the AIDS Relief PEPFAR Track 1 Treatment and Care grant to Catholic Relief services. Soon after opening the ARV clinic the decision was made to form a non-governmental organization (NGO). This was done because of the recognition that the simple provision of antiretrovirals (ARVs) to patients attending our existing clinic did not address their many individual needs and social problems. From its inception the vision of SCI was to provide comprehensive and holistic care services to people infected and affected by HIV/AIDS. There remains a critical shortage of voluntary counseling and testing (VCT) sites within the surrounding area as well as the Eastern Cape province.

ACTIVITIES AND EXPECTED RESULTS:

SCI will carry out the following activity in this program area.

ACTIVITY 1:

SCI will provide CT services at through three main venues: 1) the existing Sophumelela Clinic; 2) Life Line which is within one kilometer of SCI; and 3) after education programs with NGOs, churches and small businesses. SCI will provide test kits, salary and administrative support to secure a more reliable service to both SCI's patients and the broader community. SCI will aim to test all of the children of HIV positive mothers in their ARV program. In addition all partners and family members of SCI's patients will be offered this service. Positive patients will be provided with CD4 tests and will be eligible to enroll in the SCI care and treatment facility.

Program Budget Code: 14

Activity ID: 26199.09

Planned Funds: \$242,726

Activity System ID: 26199

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

1. After discussions with the Centers for Disease Control and Prevention (CDC) South Africa and the National Department of Health, it was decided that the project should be piloted in the Northern Cape first. Therefore the project will be implemented in four clinics in the Northern Cape. The clinics will be selected by the Northern Cape Department of Health.
2. The project sites should be part of the South African DOH antiretroviral (ARV) sites and not the Pathfinder/Planned Parenthood Association of South Africa Youth Friendly Services (YFS) clinics. The sites will function as satellite antiretroviral (ARV) clinics for young people. This approach will mean that we don't have to undergo the lengthy ARV accreditation process for new clinics and also will assist in getting the provincial Department of Health to be a partner in the project. With this approach getting the services up and running will also be faster.
3. Provider initiated testing
4. Nurses to do counseling and testing
5. Sheltering of youth by support groups and peers
6. Nurses to collect the antiretroviral treatment (ART) for young people ready for treatment

SUMMARY:

Pathfinder/Planned Parenthood Association of South Africa (PPASA) will train PPASA nurses and public sector service providers from four existing clinics and the public sector facilities in the PPASA clinic catchments areas to provide youth-friendly voluntary counseling and testing (CT) services to young people ages 15-24. This project will train nurses on pre- and post-test counseling, testing procedures and record keeping related to CT. A comprehensive community-based behavior change communication (BCC) and social mobilization strategy involving youth networks and community groups will promote CT and access to care and treatment services. The emphasis areas for these activities are human capacity development and local organizational capacity development. Specific target populations include young people between the ages of 15-24 years.

BACKGROUND:

All activities related to this project will be initiated in FY 2008. The objective under this program area is to improve access to and utilization of CT by youth by strengthening the capacity of PPASA youth-friendly clinics to provide CT services in four clinics. All activities will be implemented by PPASA and services will be made available in PPASA youth clinics in KwaZulu-Natal, Gauteng, North West, and the Eastern Cape. CT is both a preventive service, to provide information and support for those who are negative, as well as an entry point to care and support services for those who test positive. CT is a necessary component of comprehensive HIV and AIDS services and further provides the opportunity to screen for other opportunistic infections, such as TB and STIs. High HIV prevalence among young people indicates that there remains a significant unmet need for care and support services. In order to meet the needs of these youth, quality youth-friendly CT services must be available and age-appropriate, ensuring that services adhere to basic rights for privacy and confidentiality and that there are adequate staff and facilities to ensure real access.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training of Providers and Social Mobilization

Pathfinder/PPASA propose to train PPASA nurses and public sector service providers from six existing clinics and the public sector facilities in the PPASA clinic catchments areas to provide youth-friendly CT services which will emphasize elements such as respect for youth, confidentiality and privacy for young people ages 15-24. This project will provide refresher training for nurses on pre- and post-test counseling, testing procedures and record keeping.

ACTIVITY 2: Behavior Change Communication

A comprehensive community-based BCC and social mobilization strategy involving youth networks and community groups will promote CT, and access to care and treatment services. The BCC and social marketing interventions will focus on barriers that influence youths' willingness to seek services, particularly misinformation about benefits, perceptions about poor confidentiality and provider bias, and stigma and discrimination in the community and in the facilities. The BCC strategy implemented through community clinics and peer educators will promote the availability of youth-friendly, confidential CT services. Emphasis will shift from the transmission of information to dialogue, debate, and negotiation on issues that resonate with youth and members of the community. In order to support acceptability, young people and communities should know that youth-friendly CT services offer confidentiality and psychological support before and after testing. CT clients will be encouraged to recruit their peers to be tested. Dialogue, debates, and other communication activities through print and audio-visual materials will inform young people about the importance of CT. These materials will be disseminated through youth networks, community groups, clubs etc.

ACTIVITY 3: CT Service Provision to Youth

As a starting point, the project will conduct thorough HIV and AIDS clinical care needs assessment of clinics and upgrade facilities as needed. During general visits to the clinic, providers will offer CT to all clients, and provide crucial information on STIs and HIV and AIDS. Counselors will stress the importance of testing for clients and their partners, provide information on use of condoms for dual protection against STIs/HIV and pregnancy, and discuss primary and secondary abstinence and being mutually faithful in relationships. Service providers will conduct post-test counseling with all clients, as per South African Government standards, and will provide referrals to other adolescent sexual and reproductive health (ASRH) services

Activity Narrative: and care and support services within a facility, as needed. All young people testing positive will be referred and offered enrolment in the clinic's ambulatory care program. Youth testing positive for HIV will also be referred to community resources, such as community home-based care (CHBC) programs. The project will also establish linkages with CT, prevention of mother-to-child transmission and antiretroviral treatment national programs so that youth-friendly sites are under national programs.

Young men and women differ in the decision-making that leads to the use of CT services. Males tend to seek testing independently of others, in part because they fear isolation and abandonment by their peers, who are likely to consider this an example of "male weakness." Young women usually feel compelled to discuss testing with their partners, friends or relatives before accessing the service, thereby creating a potential access barrier since they might be discouraged from taking an HIV test. To increase access to testing, attention to gender issues will be improved in health providers' training, as well as in routine activities and promotion of CT services carried out by peer educators.

These results contribute to the PEPFAR 2-7-10 goals by improving access to and quality of CT services for young people.

Total Planned Funding for Program Budget Code: \$30,003,298

Program Area Narrative:

South Africa's Operational Plan for Comprehensive HIV and AIDS Care, Management, and Treatment (Comprehensive Plan) was approved by the South African Cabinet in November 2003 and guides the roll out of HIV and AIDS care and treatment throughout the public sector in South Africa. The South African Government (SAG) has taken bold leadership in the introduction of antiretroviral treatment (ART) through a five-year phased nationwide equitable roll-out program. The goals of this plan are reiterated in the South Africa National Strategic Plan for HIV & AIDS and STI, 2007-2011 (NSP). The National Department of Health (NDOH) has allocated approximately \$410 million USD for the implementation of the Comprehensive Plan in FY 2009 (prevention, care, and treatment), mainly through conditional grants to the nine provinces. According to the NSP Costing Plan, the total need for funding for ART alone in 2009 is \$710 million for adults and an additional \$128 million for children (a total of \$838 million), clearly indicating the need for additional funding and support to the SAG and civil society. Much of this funding is directed to the purchase of antiretroviral (ARV) drugs, as all drugs for the public sector ART program are procured and supplied by the SAG. The SAG also provides, in some instances, the ARV drugs for non-governmental organizations (NGOs) and private sector programs, with PEPFAR funding other service components. The USG is ideally positioned to support the implementation of the NSP by ensuring equitable access to quality HIV care and treatment through support to the SAG by PEPFAR-funded partners. The FY 2009 USG budget to support ART in South Africa is \$217 million.

The USG ensures that all local policies, guidelines, and processes are adhered to, including the SAG requirement of accreditation for facilities to provide ART services through a formal SAG process. The SAG has established standard treatment guidelines and protocols and uses an extensive process to review and register ARV drugs (including several generic drugs) through the Medicines Control Council (MCC). Due to these stringent controls, parallel importation is not within the SAG policy.

Currently, of the 98 generic ARV drug formulations that have been approved by the FDA and can be purchased with PEPFAR funding, there are only 23 that are also registered by the MCC and can be purchased in South Africa with PEPFAR funding, 12 of which are first-line drugs (as per the SAG national guidelines). However, as most of the treatment partners work in public health facilities, drugs are provided by the SAG and not purchased with PEPFAR funding, allowing resources to be directed to other important treatment-related activities such as training, community mobilization, and human capacity development. Since there are a limited number of PEPFAR partners that procure ARV drugs, most individual partner budgets are not negatively impacted by the availability of generic drugs that can be purchased. In addition, many PEPFAR treatment partners access branded drugs through access pricing mechanisms, resulting in further savings.

Outside of the public sector, PEPFAR funds support NGO partners to expand treatment to specific target groups, including people with TB, men, and people in workplace settings. Another important focus extends ART through general practitioners at community clinic sites, especially in rural communities, which serves to increase access beyond the current SAG accredited roll-out sites. The USG has also developed innovative partnerships with the private sector to provide ART. Some of the private sector partnerships also include public-private partnerships between industry and the SAG. Some of these NGO and private partners either obtain (at no cost) or procure their drugs through provincial health departments.

In FY 2009, there will be an emphasis on creating capacity at the primary health-care level to initiate and manage patients on ART. This would also require the strengthening of drug distribution and storage systems at this level.

South Africa has a strong private pharmaceutical industry. The USG in South Africa does not manage the procurement of drugs and commodities centrally; these arrangements are made directly by PEPFAR treatment partners. Those PEPFAR partners that do purchase ARV drugs obtain them through monthly procurements from reliable private pharmaceutical distributors. Drugs are pre-packaged individually for each patient and delivered to the relevant site. Emergency deliveries can be made within 24 hours. Some of the treatment partners may utilize the Partnership for Supply Chain Management (PFSCM) in FY 2009 for limited procurement, distribution, and to handle emergency procurements in the event of stock-outs.

In addition to supporting implementing partners, the USG supports the ARV rollout by strengthening drug distribution and monitoring systems through logistics management, patient information, drug supply, and training. The National Department of Health awards centralized tenders for all ARV drugs procured by provinces. There were no reported stock-outs of ARV drugs in FY 2008. There were shortages of cotrimoxazole, but this was due to the global manufacturing shortage. Despite this, the SAG's emphasis on strengthening key delivery systems (with PEPFAR assistance) continues to improve distribution systems and overall effective drug management capacity. If stock-outs occur in PEPFAR programs that obtain drugs through the SAG, private sector pharmaceutical suppliers are positioned and ready to provide the necessary back-up supplies in FY 2009.

The first-line regimen for ART in South Africa is stavudine (d4T), lamivudine (3TC) and either efavirenz or nevirapine. Most patients are still on the first-line regimen. Switches are mainly due to side-effects, adverse reactions, and sub-optimal regimens used in the private sector prior to the national treatment guidelines. Stavudine accounts for the highest number of adverse reactions to ART, mainly lactic acidosis. As a result, the SAG is in the process of revising the national guidelines to allow for switching first-line drugs, including tenofovir, to deal with these adverse reactions. These revised guidelines will also raise the threshold for ART initiation to a CD4 count of 250, which will increase the number of people eligible for ART and thus lead to an increase in drug procurements.

The USG also provides critical on-site assistance through its partners at public sector facilities. This assistance aims to strengthen and improve the quality of logistics, recording, and ordering systems to ensure proper management of drugs and other commodities required for treatment. These activities will continue and expand in FY 2009.

The achievements and targets for ART are found in the Adult and Pediatric Treatment sections of the COP.

There are no other donors that provide service delivery support for the provision of antiretroviral treatment, though DFID/United Kingdom provides support to the SAG in strengthening drug delivery systems. The USG and DFID/United Kingdom are collaborating to ensure there is no duplication of effort. The Global Fund supports ART in the Western Cape and KwaZulu-Natal provinces, and one PEPFAR partner, CAPRISA, receives Global Fund support for the purchase of ARV drugs.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SPS has been approached by other PEPFAR partners (i.e. Catholic Relief Services, REACTION, Right To Care) to explore opportunities to use RxSolution for procurement, storage, and distribution of their medicines and for dispensing and down referral activities. In some sites this also implies that an electronic interface with their own patient management system may have to be developed, tested and implemented. The Quantification models will also be updated (if required) to cater for any revisions of the national standard treatment guidelines.

SUMMARY:

With FY 2008 PEPFAR funds, Management Sciences for Health's (MSH) Strengthening Pharmaceutical Systems (SPS) project will continue and expand activities already underway in South Africa to support the effective management of antiretroviral (ARV) medicines. SPS will continue to influence drug provision positively by improving estimation of needs for ARV, opportunistic infection (OI), and sexually transmitted infection (STI) drugs; implementing systems to support drug supply management activities and to monitor drug availability at the institution and district levels; and developing a highly skilled pool of pharmacy personnel to manage them. The objective is also to strengthen the use of Drug Supply Management Information for government facilities at all levels. The emphasis areas are human capacity development, and wraparound programs. Target populations include National AIDS Control Programme staff, other national and provincial Department of Health (DOH) staff, nurses, pharmacists and pharmacist assistants. Opportunities for collaboration with the Partnership for Supply Chain Management will be explored.

BACKGROUND:

Since FY 2004, RPM Plus has been working in close collaboration with the National Department of Health (NDOH) Pharmaceutical Policy and Planning unit, and provincial and local government pharmaceutical services to support the delivery of pharmaceutical services at all levels (national, provincial, district, and institutional). The following activities are a continuation of the activities initiated since FY 2004. Systems and models for drug supply management have been developed and tested. In FY 2008, SPS will continue the implementation of these systems on a larger scale and will monitor the impact on the delivery of antiretroviral treatment (ART) at accredited sites (including down referral and primary healthcare sites). These activities have received the full support of the NDOH Pharmaceutical Policy and Planning unit and the Provincial Pharmaceutical Services. The Department of Correctional Services has requested SPS support in strengthening the delivery of pharmacy services.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Drug Supply Management Information System

RPM Plus developed an integrated, computerized drug supply management information system (RxSolution) to assist hospital, community health center and district level pharmacy personnel to manage drug supply activities from hospital bulk stores to the patients through satellite pharmacies (outpatient and inpatient), wards and down referral clinics. This supports the management of purchase orders, inventory, issues to clients (satellite pharmacies, wards, and primary healthcare (PHC) clinics), and budgets. It also supports the management of patient records, prescriptions and quantities dispensed directly to the patient or through down referral sites. Data links with electronic patient registers have been implemented. The RxSolution system is currently used in five provinces (Eastern Cape, Mpumalanga, Gauteng, North West and Free State) at government and local government sites. In the Eastern Cape alone, the existing sites have contributed to the treatment of 15,000 patients. RxSolution is used at hospitals to support the down referral of patients to a primary healthcare institution, typically patients on chronic medication or stabilized ARV patients. The main objectives are to reduce the burden on the hospital and decrease the cost for the patient. Some of the ARV sites using RxSolution have shown great improvement in the management of their supplies for ART and non-ART medicines. As a result, more ART-accredited sites (hospitals, wellness centers) have requested to use this system. As SPS scales up, different approaches will be used to ensure adequate support and maintenance. In the Free State, the government has hired a pharmacist/IT manager to support RxSolution. SPS will develop an interface between RxSolution and the new provincial warehouse management system. This application is expected to be deployed to additional sites and other provinces. During FY 2007 SPS is expected to develop an interface between RxSolution and Therapy Edge, used by Right to Care, and pilot it at Right to Care (and other) ART sites. This activity is done in collaboration with the Supply Chain Management System (SCMS) Project. Additional joint sites will be identified during FY 2008. RxSolution is currently used in over 100 sites throughout South Africa, Swaziland and Lesotho with RPM Plus/SPS support.

The SPS system goes beyond ARV management. All medicines used at the facilities can be tracked, including drugs for TB and opportunistic infections, as well as any other type of commodity (medical supplies, lab reagents, etc.). The dispensing module of the system allows providers to monitor any lab test (and results) performed for any type of patient. It also allows tracking loss-to-follow-up, defaulters, etc. Lastly, the system is also able to monitor adherence to treatment. Treatment can be classified as first line and/or second line, and can be referenced by the International Statistical Classification of Diseases and Related Health Problems, 10th Revision (ICD-10) as well. All this information should assist in monitoring the overall program and identifying any trends (including prescribed regimen vs. standard regimen). Overall the system can thus provide a mix of logistic (availability, consumption, expenditures) and clinical (treatment, treatment outcomes, use, and disease and prescribing patterns) data.

ACTIVITY 2: Support National/Provincial Quantification

SPS is constantly improving and developing new models to estimate and monitor drug needs using morbidity and consumption data. These models are specifically tailored to the South African National

Activity Narrative: Standard Treatment Guidelines (STGs) for HIV and AIDS, STIs, OIs, other priority diseases and post-exposure prophylaxis (PEP). RPM Plus has trained provincial staff responsible for the submission of provincial estimates, provincial pharmaceutical warehouse managers and pharmacists responsible for the procurement of ARVs and medicines used for the treatment of OIs and STIs at the institutional level (hospital, community health center and district). In FY 2008, training in quantifying ARV-related drug requirements will continue through national and provincial workshops. These workshops provide an opportunity to establish a national network to discuss and report consumption trends and issues, to maintain a dialogue with representatives from the pharmaceutical industry and to prepare reports for the National Comprehensive Care, Management and Treatment of HIV and AIDS forum. Training in quantification needs to be an ongoing function, especially in the public sector in South Africa where community service pharmacists are often in charge of the ARV pharmacy for their year of service, then leave the public sector for the private sector without plans for succession. The quantification models will be shared with the SCMS and joint training workshops will be conducted for PEPFAR partners.

ACTIVITY 3: Data for Decision Making

With FY 2008 PEPFAR funding, SPS will continue the training of pharmacy personnel in using their data for decision making to ensure that the increasing demand for medicines required for the care and treatment of HIV and AIDS and other related programs is met, and to monitor national drug supply management indicators. This also provides an opportunity to strengthen the working relationship between pharmacists and other program managers. Individuals from the Provincial Pharmaceutical Services and from the National Pharmaceutical Policy and Planning unit will be trained. SPS will assist provinces with the national reporting system. All the activities above will indirectly support all HIV-infected clients who will be receiving care and treatment at government ARV accredited sites through the improvement of the delivery of pharmaceutical services.

Activity System ID: 23643

Mechanism: PHRU

USG Agency: U.S. Agency for International
Development

Program Area: ARV Drugs

Program Budget Code: 15

Planned Funds: \$3,522,995

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Perinatal HIV Research Unit (PHRU) will continue with the activities below, but will increase support to South African government clinics to ensure expanded access to antiretroviral (ARV) treatment. This will be done through the training of staff, task shifting, implementing pharmacy management systems and assisting sites to be accredited to dispense ARV drugs. In addition, the importance of client retention and adherence will be reinforced in all the work. The PHRU will use the pharmacy staff to alert outreach staff when clients have missed a visit. PHRU will step up training to pharmacy staff to ensure that quality services are available for everyone including children, adolescents, men and women.

PHRU has assisted many sites to be accredited in Gauteng and rural Mpumalanga and Limpopo provinces and to be in a position to dispense ARV drugs. This has been achieved through the seconding of staff to the clinics in a cost efficient way. PHRU has trained pharmacy assistants to dispense ARV drugs, be able to provide adherence counseling and through drug management systems to manage the pharmacy under the supervision of a pharmacist who may not be on site. In addition, the PHRU has put in robust pharmacy management systems to allow the pharmacy assistant to manage the pharmacy. This has increased the number of sites that are able to be accredited for ARV services and thereby improving equity and the number of people on ARV treatment. This has been particularly important in the rural districts in which they work.

Innovative ways will be sought such as the Zuzimpilo (Franchise) clinic and novel down referral systems to expand access to quality ARV treatment.

SUMMARY:

The approach taken by the Perinatal HIV Research Unit (PHRU) is one of comprehensive, high-quality care and support for people living with HIV (PLHIV). The PHRU will use FY 2008 funds to continue to provide high-quality holistic antiretroviral treatment (ART) and psychosocial support in Gauteng, rural Limpopo and Mpumalanga, and Western Cape. These funds will contribute towards antiretroviral (ARV) drugs and services. Clients are provided with ART, pre-treatment literacy, adherence counseling and adherence support groups. Linkages from CT, PMTCT, basic care and support will be strengthened. The emphasis areas are human capacity development and local organization capacity building. The family-centered approach targets HIV-infected adults, children and infants.

BACKGROUND:

Since 1998 the PHRU has provided comprehensive treatment, care and support to people living with HIV (PLHIV). The PHRU has received funding from PEPFAR since 2004 to support ART services in Gauteng, rural Limpopo and Mpumalanga, and Western Cape provinces. PHRU directly purchases ARVs with PEPFAR funds and has demonstrated the ability to rapidly scale up treatment. PHRU has adopted a family-centered approach and clients are encouraged to bring partners and other family members for testing and treatment. Of patients supported by the PHRU, about one-third is supported through PEPFAR-funded ARV drugs. PHRU is expanding activities to directly support scale-up at government ART sites and support down referral systems. PHRU works with the provincial health departments to ensure safe transfer for the participants to ongoing care within the South African Government (SAG) rollout program to ensure sustainability. PHRU works only in government facilities, where government takes the lead in all aspects of the program. The PHRU together with government counterparts identify gaps that will slow down implementation according to national and provincial guidelines. Upon request from the facility, PHRU provides support through a Memorandum of Understanding to fill the gaps and work towards the provincial financing of related activities. PHRU supports, trains and mentors healthcare workers involved in the management, care and treatment of HIV-infected individuals. All programs follow national guidelines for ARV treatment. Training is adequately and broadly proclaimed by provincial government through training programs that are approved by the province and adhere to all guidelines and standards of the national government. Quality assurance, client retention, monitoring and evaluation form an integral part of the program. PHRU provides regular training for professional and lay staff on ART issues such as adherence, medical treatment, and appropriate regimens.

All sites have psychosocial support programs which provide community-based assistance, support groups and education covering issues such as basic HIV and AIDS information, HIV services, HIV treatment, treatment literacy, adherence, TB, positive living, nutrition, prevention, opportunistic infections and TB. The comprehensive care approach leads to stigma reduction, increased disclosure, and improved adherence to ART.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Adults, Soweto

Funding from PEPFAR supports adults on treatment in the family-centered PMTCT program. The adult treatment program is ongoing and drugs are purchased for patients at the PHRU clinic based at Chris Hani Baragwanath Hospital (Bara). The program provides treatment, monitoring and support for adults who meet the SAG guidelines for treatment. HIVSA, an NGO partner, provides treatment literacy and adherence support. This activity will be continued and expanded with FY 2008 funds.

ACTIVITY 2: Pregnant Women, Soweto

This program was started in the maternity section at Bara in July 2005 by PHRU in partnership with the Department of Obstetrics and Gynecology. In Soweto 8,000 pregnant women annually are identified as positive with an estimated 1,600 needing treatment. Following SAG guidelines, pregnant women who are eligible for treatment are offered HAART. In order to fast-track women onto treatment, PHRU is training and

Activity Narrative: mentoring the doctors and nurses. The program is being expanded to other ART sites in the area with FY 2008 funds. HIVSA, an NGO partner, will continue to provide treatment literacy and adherence support.

ACTIVITY 3: Children, Soweto

The PHRU clinic identifies HIV-infected children who need treatment through PMTCT and children of adults who are already on treatment. This activity will continue and will be strengthened through additional counselors with FY 2008 funds. As part of a comprehensive family-centered approach, children are put onto treatment following SAG treatment guidelines with ARVs purchased by PHRU according to USG and SAG guidelines. ARV drugs for children are supplied through the PHRU pharmacy system. Staff is trained on an ongoing basis in pediatric ARV provision.

ACTIVITY 4: Franchise, Gauteng

This program targets uninsured workers in densely populated areas in Johannesburg. ARVs are made available and affordable through a franchising scheme, and supplied free of charge or at a significantly discounted rate to patients unable to purchase their own medication. Those who can afford to pay for all or a portion of their drugs are expected to do so. ARV drugs are procured and supplied within the service by trained providers. This program provides a stand-alone ART full service clinic in downtown Johannesburg and provides lessons learned about demand for ART outside the public sector, willingness and ability to pay for services, and the cost-effectiveness of this model of delivery.

ACTIVITY 5: Sub-partners

A number of partners in the Western Cape have been identified and are supported to provide ARV treatment. Most of these partners receive ARV drugs from the Department of Health and PEPFAR funds are provided to support the services to expand and develop down referral systems. Pediatric treatment is a priority. It is likely that additional partners will be identified to enable increased access to treatment.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In order to increase TB case finding among HIV-infected patients attending follow-up visits CAPRISA has implemented a quick TB symptom screening checklist. The TB symptom checklist is administered by nurses and consists of a series of questions pertaining to common TB symptoms and requires patients to indicate the duration of symptoms.

Positive prevention strategies implemented at both sites include sexually transmitted infection (STI) screening and management, adopting new STI management guidelines and procuring drugs that have now been introduced in STI management, such as Acyclovir and Cephalexin. Clinicians encourage female patients to go for their pap smears, which are available on-site. Risk assessment combined with risk reduction counseling, follow-up on high risk behavior at subsequent clinic visits, disclosure counseling, with follow-up on barriers to disclosure are some of the behavioral interventions that are implemented.

SUMMARY:

Activities are carried out to continue the provision of antiretroviral drugs to patients already initiated on treatment and to expand access to treatment to additional patients at two established treatment sites in KwaZulu-Natal. The emphasis area is human capacity development. The target population is people living with HIV (PLHIV). Pediatric services will be introduced at our Vulindlela site to move to a family-centered approach to delivering HIV care.

BACKGROUND:

The Centre for the AIDS Program of Research in South Africa (CAPRISA) was established in 2002 as a not-for-profit AIDS research organization by five major partner institutions: University of KwaZulu-Natal, University of Cape Town, University of Western Cape, National Institute for Communicable Diseases, and Columbia University. The headquarters of CAPRISA are located at the University of KwaZulu-Natal. The PEPFAR-funded CAPRISA AIDS Treatment (CAT) program was initially started as a supplemental effort to deal with the large volume of HIV-infected clients that were screened out of CAPRISA's other research studies. The current CAT program provides an integrated package of prevention and treatment services and provides an innovative method of providing ART by integrating TB and HIV care. The CAPRISA eThekweni clinical research site is attached to the Prince Cyril Zulu communicable disease clinic, a large local government clinic providing free diagnosis and treatment of sexually transmitted infections and TB. The antiretroviral treatment (ART) provision at this clinic integrates TB and HIV care into the existing TB directly observed therapy (DOT) programs. This allows for the opportunity to initiate HIV care and ART for patients identified as HIV-infected during TB treatment as well as to be able to continue such management for those who develop TB during HIV treatment.

The CAPRISA Vulindlela clinical research site is a rural facility located about 150 km west of Durban, KwaZulu-Natal. The Vulindlela district is home to about half a million residents whose main access to health care is at seven primary health care (PHC) clinics that provide comprehensive services. The CAT program at Vulindlela is an entirely rural nurse-driven service with doctors available for the initial eligibility assessment and management of suboptimal ART efficacy and for advice regarding OI management and referral.

ACTIVITIES AND EXPECTED RESULTS:

At the eThekweni/Prince Zulu site, all patients in the CAT program with CD4 counts less than 200 see a clinician monthly for clinical and laboratory follow-up. These patients are initiated on ART following a clinical and laboratory safety assessment, and three or more intensive sessions of adherence support counseling. At the eThekweni site, a once daily regimen is used, as per South African treatment guidelines and protocols. This, however, excludes drugs used for contraception, Diflucan, the treatment of TB and drugs used for the outpatient management of OIs, as these are procured from the adjacent eThekweni and Mafakhatini clinic at the respective sites.

In Vulindlela, the first-line regimen includes: Lamivudine, Stavudine and NVP and second-line therapy includes: EFV, AZT, 3TC and ABC. PEPFAR funds are used for the purchase of these drugs. The senior research pharmacist, based at the CAPRISA offices in Durban, places all ARV drug orders. Bulk stocks are received at the central CAPRISA pharmacy in Durban and then distributed to the sites as appropriate. The senior research pharmacist ensures that sufficient study product is always on hand for at least two months' anticipated usage.

At the eThekweni clinic, the first-line therapy used is 3TC, ddI, and Efavirenz. The most common second-line regimen is Kaletra, ABC, and ZDV. The first-line regimen was chosen for its suitability to be co-administered with TB drugs, as well as its ability to be dosed once daily. Thus far, more than 90% of the eThekweni CAT patients are on first-line therapy, with approximately 95% still adherent to the program.

At each monthly visit, the pharmacist does a pill count of all unused medication returns and conducts a real-time assessment of adherence to treatment with each patient. The pharmacist's assessment of adherence at the time may generate additional adherence support counseling of the patient. This pharmacy data may be linked to clinical data such as viral load and resistance testing and may trigger review of existing regimen choices.

Pharmacy records in the form of repeat treatment cards also maintain a detailed chronological log of all non-ARVs prescribed to the participant and may be linked to regimens to inform healthcare workers on the range of side-effects to medication.

The pharmacy maintains a system that allows early tracking of potential defaulters by alerting the tracking

Activity Narrative: department of non-arrivals to the pharmacy for pill collection. The first alert occurs on the day of the scheduled visit if missed and is verified with the trackers for resolution by the end of each week. This indicator also allows for the identification of patients too ill to come into the clinic. A missed visit for pill collection identified by the pharmacy works successfully and allows the program to intervene outside the boundaries of the clinic to ensure that the patients receive the appropriate care when they need it.

As trained pharmacists are a scarce resource in South Africa, pharmacy assistants have been recruited and employed to assist with the large volumes of treatment patients presenting with scripts each day. Tasks that are usually done by pharmacists have been shifted to the pharmacy assistants resulting in an overall increased efficiency in service delivery.

Currently the ARV procurement system meets the needs of the program and purchases are obtained commercially via wholesalers at the SEP (single exit price) or directly from the company (access pricing e.g. Glaxo-SmithKline). Technical assistance will be sought to further strengthen these systems and maintain the optimal stock levels for the duration of the treatment program.

Training and human capacity building: The scale-up of the ART care and treatment program over the past three years in CAPRISA has been unprecedented. The CAT program is producing a skilled cadre of health care workers specializing in the management of HIV and HIV-TB co-infection. These skills range from scaling up voluntary counseling and testing services to monitoring responses to ARVs.

Meetings have been held with representatives from the KwaZulu-Natal Department of Health and there is a commitment to engage in discussion about the integration of services between CAPRISA and the DOH, particularly in the poorly resourced Vulindlela area in the Inadi District. The first steps have been initiated by preparation of the CAPRISA Vulindlela site for accreditation by the DOH. Accreditation as an ARV rollout site is the only way to down refer stable patients into the DOH structures. Accreditation of the Vulindlela site also has the ripple effect of the upgrading and staffing of the clinics in the surrounding areas so that the down referral system is effective and sustainable.

These results contribute to the PEPFAR 2-7-10 goals by ensuring that there is an uninterrupted supply of drugs for persons initiated on ART.

Mechanism: TBD Medical Research Council of SA (MRC)

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: ARV Drugs

Program Budget Code: 15

Planned Funds: ■

Activity Narrative: SUMMARY:

These activities had previously been implemented by the Medical Research Council (MRC). However, this year these activities will be re-competed and a partner yet to be determined will be implementing them to continue the work started by the MRC. The overall aim of this project is to improve integration of TB and HIV programs and public sites.

The partner will support a comprehensive best-practice approach to integrated TB/HIV care that will improve access to HIV care (counseling and testing, care and treatment, screening, referral, pharmaceuticals) for TB patients. This activity will also promote TB screening (and eventual TB treatment as required) among patients attending HIV clinics, with particular reference to provision of antiretroviral drugs (ARVs) to TB patients meeting eligibility criteria according to the South Africa HIV treatment guidelines. Activities are focused in five provinces of South Africa. Specific objectives of the project in the supported sites will be to fast-track down referral systems (to ensure a one-stop service) and prepare all supported TB hospitals in the Eastern Cape for accreditation according to the requirements of the Department of Health in South Africa. In this way bottlenecks in service delivery will be minimized and service delivery improved.

BACKGROUND:

A best-practice approach to integrated TB/HIV care was initiated by the MRC with FY 2004 PEPFAR funding. Early activities included a systematic description of barriers faced by TB patients co-infected with HIV in an accredited ARV site, and the development and implementation of a best-practice model in FY 2005. Preliminary results from the model site confirmed the benefits of an integrated TB/HIV approach, reflected in a drastic reduction in patient mortality, improved quality of life of TB patients with HIV and prolonged survival. Results also confirm the safety and efficacy of dual regimens, showing that antiretroviral therapy (ART) can safely be instituted within the first month of TB treatment.

Expansion of the best-practice approach to two additional sites in different geographical settings was started in FY 2006 based on lessons learned in the start-up sites, including essential human resource needs, the importance of negotiated partnerships with departments of health (DOH), and the challenges posed by dual stigma. Activities in the existing sites will continue in FY 2009, with expansion to additional sites in remote rural settings where active TB screening among people living with HIV (PLHIV) will be implemented. These sites are characterized by extreme poverty, poor health infrastructure, cross border migration and limited health care access for patients. The challenges of novel solutions for treatment delivery in such settings will be specifically addressed, as will strengthening of systems for treatment adherence.

ACTIVITIES AND EXPECTED RESULTS:

Activities include commodity procurement, logistics, distribution, pharmaceutical management, and cost of ARV drugs to confirmed TB patients meeting South African government (SAG) ARV enrollment criteria. Routine offer HIV counseling and testing will be offered to all patients and those qualifying for ART identified as quickly as possible. Initiation of ART will be based on CD4 counts and on SAG policies. Patients (including children) with a CD4 count < 200 will be eligible for ARV initiation after one month of conventional TB treatment, while those with a CD4 count < 50 will be fast-tracked for immediate ART initiation based on clinical status.

ARV drugs will be procured according to projected estimates based on HIV prevalence and the estimated proportion of patients eligible for ART. As per the USG PEPFAR Task Team requirement, only generic drugs approved by the SA Medicines Control Council (MCC) and the US Food and Drug Administration (FDA) will be used. This project will support the cost of ART for initiation in sites not yet accredited or waiting to be accredited by government.

Referral links to an accredited ART site will be established for each TB patient initiated on ART in the participating sites in order to allow seamless transition and ART access upon discharge. Sites that are not yet accredited for ART roll out will be assisted to acquire DOH accreditation, which will ensure the necessary continuity of care. Activities will be directed towards eliminating bottlenecks in ART provision (particularly human resource capacity), addressing weaknesses and limitations in down referral systems, documenting and managing drug adverse effects, and monitoring of treatment adherence.

Integration of TB and HIV services will facilitate quick and seamless patient access to ARV drugs, thereby decreasing patient morbidity and mortality. Review of HIV counseling and testing practices, strengths and weaknesses of TB/HIV referral systems, human resource analyzes, treatment adherence, drug adverse effects and conventional TB treatment outcomes in patients on dual therapy will be recorded. TB patients and PLHIV constitute the principal target populations and include pregnant women (referred to PMTCT services) and children (receiving ART if indicated).

Ongoing quality assessment and quality improvement will be implemented through on-site supervision and external quality assurance mechanisms such as checklists. Regular feedback meetings will be held with project staff to identify potential problems and rapidly facilitate corrective action. Results from the project will facilitate evidence-based policy formulation on expansion of integrated TB/HIV care while increasing and improving access to ART for eligible TB patients. TB services in South Africa will in future form a vital link to accredited government ARV sites. This project will contribute to strengthening of the role of TB services as point of delivery of ARVs, by ensuring that human, financial and infrastructure needs for comprehensive TB/HIV programs are met through equitable allocation of scarce resources and through analyzes of cost-effectiveness and cost-benefit.

Funding will be used to support sites to implement the pharmaceutical elements of the best-practice approach to integrated TB/HIV care, including drug distribution and supply chain logistics to meet SA

Activity Narrative: accreditation requirements for ARV roll out, site staff training, and pharmaceutical management to maintain MCC and FDA quality standards, and the cost of ARVs. Where applicable, sites will be prepared to comply with the requirements of accreditation for ART in order to ensure continuity of care.

Program Budget Code: 15

Activity ID: 17721.23918.09

Planned Funds: \$970,905

Activity System ID: 23918

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

This activity will continue antiretroviral (ARV) drug procurement for approximately 1,560 South African National Defense Force (SANDF) personnel and family members who were previously receiving ARVs via a collaborative clinical trial with the SANDF, HHS/NIH/NIAID, and the U.S. Department of Defense (DOD). The clinical trial, with approximately 1,260 participants currently on therapy, was initiated in 2004 and is in the process of being transferred to an observational cohort study entitled Phidisa IA. This PEPFAR funding will ensure continued ARV therapy for these individuals as they are transitioned from the clinical trial to HIV treatment and care still provided through Phidisa clinics and service delivery personnel. There will also be continued accrual of an estimated additional 475 patients on antiretroviral therapy (ART) in these clinical care programs, as they are identified from a natural history cohort. This is a very high priority for the SANDF and the South African Military Health Service (SAMHS). All subjects transfer from the original trial will remain on their latest ARV regimens and all new patients will be prescribed ARVs and managed according to South African Government (SAG) national guidelines.

The ARVs will be purchased using a fully-functional, effective, existing infrastructure and logistics strategy set up by NIAID via a contractor, Science Applications International Corporation (SAIC). This method of ARV drug procurement and supply chain management is strongly preferred by SAMHS. Under this system, the ARVs are delivered and stocked in the SAMHS depot and distributed to the six clinical sites, as requested by the site pharmacists based on stock levels and needs. The process is carefully monitored and has been effectively used for four years.

Through Phidisa and the implementation of this protocol, capacity to deliver ART has been developed in all three military hospitals and three rural military sick bays. A total of 1,771 SANDF personnel and their family members have been randomized to one of four ART regimens over the past four years. Drug procurement procedures, which were established by HHS/NIH/NIAID and DOD, via SAIC, have been well integrated into the six military base hospitals and clinics and are working effectively.

Activity 1: Procurement and delivery of ART

PEPFAR funds will be used to support treatment for 1,260 SANDF personnel and family members living with HIV with continued accrual of patients at all six sites. This will be conducted within South African Government Guidelines, and through the appropriate leadership of the SAMHS. The Head of Pharmaceutical Services of the SAMHS in coordination with NIH, SAIC, and the Military Health Base Depot (MHBD) acquire and stock drugs at the MHBD, for secure distribution at the six clinical sites. The pharmacist at each site is responsible for ensuring adequate supplies of ARVs at the site, including monitoring of expiration dates of the ARV stock. ARV orders are issued on SAMHS-approved forms, which are forwarded to the SAMHS main ordering pharmacy. These are automatically transmitted to the MHBD, and subsequently activated by the SAMHS pharmacy personnel. Documentation processes have been established to maintain records of ARV supply and demand.

SUMMARY:

This activity will support antiretroviral (ARV) drug procurement for approximately 1325 South African National Defense Force (SANDF) personnel and family members that were previously receiving ARVs via a collaborative clinical trial with the SANDF, HHS/NIH/NIAID, and US DoD. The clinical trial with approximately 1200 participants currently on therapy was initiated in 2004 and will be terminated in early 2008. This PEPFAR funding will ensure continued ARV therapy for these individuals as they are transitioned from the clinical trial to HIV treatment and care still provided through Phidisa clinics and service delivery personnel. There will also be continued accrual of an estimated additional 475 patients on ART in these clinical care programs, as they are identified from a natural history cohort. This is a very high priority for the SANDF and the South African Military Health Service (SAMHS) and all ART will be prescribed and managed according to South African Government national guidelines.

PEPFAR funds allocated to ARV Drugs under this activity will be used by HHS/NIH/NIAID to procure and distribute ARV drugs to the six existing SAMHS clinical sites to continue coverage for 1200 patients. The ARVs will be purchased using a fully-functional, effective, existing infrastructure and logistics strategy set up by NIAID via a contractor, Science Applications International Corporation (SAIC). This method of ARV drug procurement and supply chain management is strongly preferred by SAMHS. Under this system, the ARVs are delivered and stocked in the SAMHS depot and distributed to the six clinical sites, as requested by the site pharmacists based on stock levels and needs. The process is carefully monitored and has been effectively used for four years.

BACKGROUND:

Project Phidisa initiated Protocol II, a randomized clinical trial, in January 2004 at the request of the SANDF, with the support of the US Ambassador to South Africa, and the US DoD. In addition to answering scientific questions important to South Africa, including a comparison on efficacy and toxicity of South African MOH ART regimens, this protocol also helped SAMHS provide access to ARVs for SANDF personnel and their family members. Through Phidisa and the implementation of this protocol, capacity to deliver ART has been developed in all three military hospitals and three rural military sick bays. Approximately 1800 SANDF personnel and their family members have been randomized to one of four ART regimens over the past four years. Drug procurement procedures which were established by HHS/NIH/NIAID and US DoD, via SAIC, have been well integrated into the six military base hospitals and clinics and are working effectively. It is the aim of this PEPFAR activity to maintain continuity of the ARV drug supply chain, which has been well integrated with the military clinical sites and which has been specifically requested by the SANDF/SAMHS, one of the key PEPFAR South African Government partners.

ACTIVITIES AND EXPECTED RESULTS:

Activity Narrative: Activity 1: Procurement and delivery to ART

PEPFAR funds will be used to support treatment for 1200 SANDF personnel and family members living with HIV with continued accrument of patients at all six sites. This will be conducted within South African Government Guidelines, and through the appropriate leadership of the SAMHS. The Head of Pharmaceutical Services of the SAMHS in coordination with NIH, SAIC, and the Military Health Base Depot (MHBD) acquire and stock drugs at the MHBD, for secure distribution at the six clinical sites. The clinical pharmacist at each site is responsible for ensuring adequate supplies of ARVs at the site, including monitoring of expiration dates of the ARV stock. ARV orders are issued on SAMHS approved forms, which are forwarded to the SAMHS main ordering Pharmacy. These are automatically transmitted to the MHBD, and subsequently activated by the SAMHS pharmacy personnel. Documentation processes have been established to maintain records of ARV supply and demand.

These activities will contribute to the number of persons receiving treatment and care in the military, and support the PEPFAR 2-7-10 goals.

Table 3.3.15: Activities by Funding Mechansim

Mechanism ID: 4625.09	Mechanism: N/A
Prime Partner: McCord Hospital	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: ARV Drugs
Budget Code: HTXD	Program Budget Code: 15
Activity ID: 23741.09	Planned Funds: \$394,187
Activity System ID: 23741	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

MODIFIED ACTIVITY: Site Accreditation: Due to the relationship between eThekweni Municipality (eTM) and the Department of Health (DOH), there is currently no service level agreement to support the accreditation of eTM sites. This is also due to the fact that eTM does not procure chronic medications through the DOH Provincial Medical Supply Centre (PMSC). Current accreditation criteria could never apply to eTM sites due to the absence of pharmacies at eTM sites, as well as eTM policy issues. Zoe-Life (ZL) and McCord Hospital (MH) will explore new accreditation criteria for eTM sites. This will not only enable sites to initiate antiretrovirals (ARVs), but will also lay a foundation from which other local governments in the country can base their accreditation criteria.

NEW ACTIVITY: Procurement planning: MH will work closely with the DOH, PMSC and the Financial Director of HIV AIDS STD and TB Unit (HAST) to assist with budgeting relating to decentralization. Provincial and District budgeting with regard to provision of ARVs has been poor, resulting in capping of ARV budgets for many hospitals. This is a real barrier to sustainability and scale up of decentralization. Through regular contact, feedback, training and relationship building at provincial and district level, MH will ensure that adequate budget is allocated to the decentralization processes.

NEW ACTIVITY: TRAINING - Dispensing Licenses: As new sites become ready to provide ARV treatment, nurses will not only require clinical skills, but also dispensing licenses according to legal requirements. This was not taken into account in COP 2008 due to unclear legislation. All nurses involved in ART provision at the primary care level supported by this program will require a dispensing license, which requires training at an approved institution.

GENDER: ZL will ensure that men in the workplace have access to ARV drugs through addressing policy regulation that would allow provision of ART through the workplace program. Access for women will be expanded through prevention of mother-to-child transmission (PMTCT) and through supporting the systems to provide ART at non-governmental organizations in the communities

SUMMARY:

McCord Hospital and its implementing partner, Zoe Life (McCord/Zoe Life) will support and provide technical assistance in the delivery of antiretroviral drugs (ARVs) to patients at seven sites - four municipal clinics and three non-governmental organizations (NGOs). The activity will also extend to participating industry sites for workers without medical insurance in Durban, KwaZulu-Natal. The emphasis areas are human capacity development, local organization capacity building, and workplace programs. The primary target populations are the general population, refugees and asylum seekers, and business community. Refugees and asylum seekers are an important target group, as they cannot access free antiretroviral treatment in the public sector. McCord Hospital receives funding for prevention of mother-to-child transmission (PMTCT) and antiretroviral treatment (ART) through the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF). The program described here focuses on strengthening the capacity of public sector and NGO facilities, and it is distinct from the hospital-based program funded by EGPAF. Note: EGPAF will also be supporting a similar program in three Department of Health (DOH) clinics in the northern sub-district of Durban.

BACKGROUND:

This new project will be implemented by the McCord/Zoe Life team in partnership with the eThekweni Municipality (Durban), three NGOs and private sector sites, to decentralize antiretroviral treatment (ART) provision to primary healthcare settings. Stable patients initiated on ART at local hospitals will be referred to the above sites for ongoing follow-up and for monthly ART dispensing. New stable patients will be initiated on ART at the decentralized sites and continue follow-up and ART dispensing at these sites. McCord Hospital currently dispenses ART to approximately 2,000 patients, and has now become an accredited site with the KwaZulu-Natal Department of Health (KZNDOH), which will ensure long-term sustainability of ARV drug supplies. The KZNDOH is committed to increasing the number of patients provided with ART in the province. The project described here to support public sector and NGO sites is supported by the metropolitan and provincial health departments. KZNDOH ARV guidelines will be used in the provision of ARVs wherever appropriate. Gender issues will be addressed through increasing access to ART in workers (assuming most are men) in a workplace program, and by ensuring that a family-centered treatment approach is offered to partners and family members of index patients via access to couple counseling, community-based referrals, provider-initiated palliative care for partners and active case management of families. The project will also increase access to ART for refugees. There will be links between ARV use data and laboratory and clinical data for overall program improvement.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Site Accreditation

McCord/Zoe Life will support a process of site accreditation at four metropolitan clinics through negotiation with the metropolitan and provincial health departments to ensure sustainability and ongoing provision of ART drugs to these sites. Once the sites are accredited, they would be able to access ARVs through the KZNDOH.

ACTIVITY 2: Accreditation Guidelines

McCord/Zoe Life will assist the KZNDOH to develop accreditation guidelines for NGOs and workplace programs to ensure ongoing provision of ART to these sites.

Activity Narrative: ACTIVITY 3: ART to Decentralized Sites

This activity will support and strengthen systems on site to provide ART efficiently at decentralized sites. This will be done through meetings with various stakeholders, particularly the provincial and district pharmaceutical services, to look at the logistics and processes required to supply ARVs sustainably to community-based sites. The McCord hospital pharmacy currently manages the ART supply chain for more than 2,000 patients. This project will hire staff to expand this service to decentralized sites and to strengthen current systems. ARVs will be selected from national regimens according to trends from previous forecasting. Drugs will be procured, stored and regulated by the McCord Hospital Dispensary which is registered as a hospital pharmacy, where necessary. Systems will be developed to procure ARVs for the municipal clinics from their nearest ARV initiating hospital (RK Khan). As McCord Hospital is accredited with the KZNDOH, ARVs will be ordered from and supplied by the central Department of Health Pharmacy. Two month's buffer stock is stored. All drugs received by the pharmacist will be stored in the McCord Hospital dispensary under the care of the pharmacists who adhere to good pharmacy practice conditions. Drugs will be ordered twice a month. Systems are in place to select, procure, store, track and distribute the drugs privately from alternative sources if there are stock-outs. Monitoring of purchases and distribution is done both manually and electronically. If stock-outs (less than five days) occur, stock will be purchased from an alternative source. Discussions will be held with the DOH pharmaceutical services as well as the local DOH District office to evaluate the logistics required for ARVs to be supplied to clinics from DOH facilities - from either the closest district hospital or a community health center, following the same process by which other chronic drugs are supplied. A PEPFAR-funded pharmacist will liaise with the pharmacists at municipal, NGO and industry sites to forecast ARV needs on a weekly basis. ARVs will be prepackaged for the decentralized sites and delivered weekly to each site. Pediatric formulations will also be delivered to sites weekly. The McCord/Zoe Life team will provide technical support to ensure that onsite storage and dispensing systems are in place before ARVs are dispensed. Scripts will be written by dispensing nurses at the decentralized sites and kept in a register in the pharmacy. In clinics without a pharmacy, drugs will be stored in a secure cupboard. A register of scripts and drugs dispensed will be maintained at each clinic by a senior dispensing nurse. Records will be captured in the logistics database on a weekly basis. Excess or expired medicines are disposed of through a waste management company. Sustainability is addressed at provincial level through accreditation of municipal sites and development of accreditation policies for NGO and corporate sites. Human capacity development is strengthened through technical support and mentorship of pharmacists and senior nursing staff at the sites to improve logistics management regarding ARV supply. Staff will be trained in monitoring and evaluation to strengthen the efficiency of the systems, and to optimize tracking of missed drug pick up, liaising with the multidisciplinary team who will follow up these clients. The McCord Hospital/Zoe Life activities contribute to the 2-7-10 PEPFAR goals and the USG South Africa Five-Year Strategic Plan by strengthening the public sector and expanding access to care and treatment.

With FY2008 reprogramming funds, McCord/Zoe Life will purchase additional antiretroviral drugs due to a shortfall in the allocation from the KwaZulu-Natal Department of Health (KZNDOH) for drug procurement. This is as a result of overspending by the KZNDOH in the 2007 fiscal year for HIV services; including treatment (demand exceeded the funding available). This is an interim measure, and it is expected that the full budget will be restored in the KZN 2009/10 fiscal year.

Activity System ID: 22960

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

A specific drive will be initiated to promote family-centered services through integration of services and by creating booking systems that allows a family group to gain access to services on the same day. The retention of family members in care services will be tracked through the EMR system and retention barriers will be identified.

SUMMARY:

The Foundation for Professional Development's (FPD) treatment activities focus on building public and private sector capacity to deliver safe, effective and affordable antiretroviral therapy (ART). PEPFAR funds will be used to procure ARVs and other drugs to support the expansion of faith-based organization (FBO) treatment services in Pretoria (Gauteng province), one facility in the inner city and one in a nearby township. Services will be expanded at the Pretoria Inner-City Clinic (PICC) in collaboration with a faith-based coalition, the Tshwane Leadership Foundation and at Leratong Hospice. Both sites have been developed by the not-for-profit private sector, and antiretroviral drugs will only be provided to residents who cannot access public sector treatment for specific reasons. The Leratong Hospice will begin providing ART through PEPFAR funding in 2007. For all of the Gauteng Department of Health (GDOH) facilities assisted by FPD other than the PICC and Leratong Hospice, drugs are provided through the South African Government's (SAG) ART roll-out program. The emphasis areas are construction/renovation, gender, human capacity development (HCD) and local organization capacity building. Target populations for the activities include the general population and people living with HIV (PLHIV). FPD will consider using the Partnership for Supply Chain Management to assist with the procurement of drugs.

BACKGROUND:

FPD is a South African private institution of higher education working exclusively in the health sector in Southern Africa. Previous PEPFAR funding has allowed the training of thousands of healthcare professionals and supported the provision of ART to thousands of PLHIV in South Africa. It provides assistance to over 25 large public sector ART roll-out facilities. Although the SAG has a robust ARV roll-out program, it is not universally accessible. This project provides ART and related services to vulnerable groups living in the inner-city of Pretoria and in one of the surrounding townships who cannot afford private care and do not have access to public sector care due to factors such as long waiting lists, inability to pay minimum public sector user fees, fear of discrimination, and stigma.

Started with FY 2006 funding, this project partners FPD in a strategic alliance with the Tshwane Leadership Foundation and the Leratong Hospice who operate clinics that do not provide ARVs. Both partners are FBOs that currently provide social welfare services to PLHIV in the city, including hospice care. FY 2006 funds were used at one of these facilities to serve as a rapid initiation and stabilization site for patients whose lives are at risk due to long waiting lists. Negotiations are currently underway with the GDOH to have these clinics accredited as down referral sites for the major ART clinics at Tshwane District Hospital and Kalafong Hospital (both already supported by FPD). Every effort is made at all facilities to reduce stigma through staff training, one-to-one counseling, and counseling for families and support groups. Sustainability is partially addressed through the public-private partnership (PPP) with the Tshwane Leadership Foundation. This organization brings together a large number of churches in the city and has access to additional funding sources to support the project. In addition, the government supports all drugs and labs. It is only at one clinic where FPD provides drugs. FPD is working on getting this clinic accredited so that the provincial government will supply the drugs. FPD is also working with government to transfer responsibility for salaries when positions are filled.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Procurement and Distribution of Drugs

These sites provide an integrated ART service including treatment, palliative care, wellness programs and psychosocial support for adults and children, and income generation schemes for women. The sites have a minimum target of 10% of patients who will be children. PEPFAR funds will be used for the procurement and distribution of ARV drugs for the PICC and the Leratong Hospice, supporting the salaries of necessary doctors, nurses, pharmacists, social workers, counselors, and administrative staff. This project has a close working relationship with an FBO consortium that supports the community of the inner-city and it is envisaged that they will provide palliative care services and psychosocial support. Subject to needs assessments, PEPFAR funds may be used to address minor infrastructure needs. Technical assistance and systems strengthening will be provided for forecasting drug needs, procurement, storage, and related data systems.

ACTIVITY 2: Human Capacity Development

Human capacity development is promoted by requiring all clinical staff at the three sites to attend mandatory training. Training for staff at these sites will include training on supply chain management to ensure proper procurement and related systems. The pharmacist that will supervise dispensing at all sites will also receive refresher training. As part of the overall FPD program, FPD training ensures a cadre of skilled healthcare practitioners able to provide care to PLHIV. Healthcare workers are trained in various courses, including clinical management of AIDS and TB, counseling and testing, palliative care, adherence and workplace AIDS programs using a proven short-course training methodology. PLHIV form part of the faculty to help with stigma reduction among participants and to articulate the needs of PLHIV. To maintain knowledge, an alumni program including regular continuing medical education (CME) opportunities, meetings, journals, newsletters and mentorship has been developed. This program provides alumni with membership in a relevant professional association (Southern African HIV Clinicians Society). FPD's public-private partnership (PPP) with Eskom (large power and utility company) and Discovery Health (private health insurance

Activity Narrative: company) also financially support this training. All staff at the three PEPFAR-funded facilities will access all of the training opportunities.

ACTIVITY 3: Quality Assurance/Supportive Supervision

Quality assurance mechanisms developed through a strategic alliance with JHPIEGO will be expanded to these sites. These quality assurance mechanisms allow clinic staff to rate all aspects of service delivery from drug procurement to patient care. This process will lead to continuous improvement of quality and will be rated once a year by an external consultant. In addition, monitoring of CD4 counts, viral loads, and resistance testing are part of the monitoring system.

Program Area: ARV Drugs

Budget Code: HTXD

Program Budget Code: 15

Activity ID: 3298.23072.09

Planned Funds: \$2,542,799

Activity System ID: 23072

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Netcare Group is the largest single purchaser of medical supplies in South Africa outside of the South African Government (SAG), and effective supply lines exist for the procurement of all commodities required by the program. The prices of products are continually updated and staff ordering stock have the latest prices at their disposal.

The program currently supports antiretroviral therapy (ART) at 15 primary health clinics, a youth clinic as well as two dedicated ART clinics. It is largely anticipated that the funding requirements in this budget period will be reduced as accreditation processes are completed and clinics are able to draw stock from SAG supplies.

All freight costs involved with delivering the medication to outlying areas has been included, and existing infrastructure is used in providing for the delivery and receipt of medicines and related commodities.

The clinic sites provide palliative care to all patients and all uncomplicated opportunistic infections are treated as part of the comprehensive ART care package offered. This includes the treatment of sexually transmitted infections.

SUMMARY:

HIVCare will use FY 2008 PEPFAR funds to work with the Free State Department of Health (FSDOH) to provide antiretroviral treatment in a private health facility to patients who do not have medical insurance and who are referred from the public sector waiting lists for treatment. The Medicross Medical Centre, a well-equipped private primary healthcare center, provides the main resource base and in conjunction with thirteen other sites, will provide an effective means of properly distributing ART to patients who are either referred from public sector facilities or who access the site by word of mouth. The emphasis areas for this program will be human capacity development and local organization capacity building. The target population includes men and women; families (including infants and children) of those infected and affected, factory workers and other employed persons, and government employees - specifically teachers, nurses and other health workers (who do not have medical insurance). A further specific population that will be targeted will be secondary school children. The most significant target group is those persons that cannot access services in the public health system.

All treatment administered is done in strict accordance with South African Government (SAG) guidelines and with due regard to the need to transfer the patients back to SAG facilities when feasible. Additional attention will be given to the screening and treatment of TB among the patients attending the program. The linkage with the youth center will ensure that HIVCare reaches a larger proportion of younger persons, specifically adolescents aged 10-14 and 15-24. This focus on the youth should further encourage involvement with street youth and it is anticipated that the program will be marketed among NGOs working with street youth as a testing and treatment site.

BACKGROUND:

PEPFAR funding for the HIVCare project commenced in June 2005. The main thrust of the activity was to match the FSDOH with private-sector partners (in this case Netcare, the largest private sector health provider in South Africa) in order to build private sector capacity and to absorb some of the burden from public sector facilities. Many FSDOH centers have waiting lists of people for ARV treatment. Patients from these waiting lists who meet the eligibility criteria for this program are referred from these public sector clinics to one of the four primary health centers in Bloemfontein and one in Welkom for treatment. The FSDOH is a collaborating partner in this public-private partnership, and they have committed to incorporate HIVCare patients into existing FSDOH treatment sites on cessation of PEPFAR funds. An intermediate project that is underway is the credentialing by the FSDOH of the HIVCare sites so that ARV medication can be drawn from state supplies. This will dramatically reduce the requirement for external purchases.

ACTIVITIES AND EXPECTED RESULTS:

Drugs and other commodities used in the treatment process are procured through the Netcare purchasing system, the single largest purchaser of medical supplies outside of the South African government. The drugs, specifically regulated in terms of South African legislation, are distributed to treatment centers via the Netcare pharmacies in Bloemfontein and Welkom and are dispensed to patients by qualified pharmacy staff. All medication issued to patients is done on presentation of a prescription issued by the treating physician. All other products are purchased within the procurement system of Netcare and some products are specially packaged for the program. Maximum use is made of volume discounts where possible although current SA legislation makes this problematic in respect of medicines. The Netcare purchasing department continually receives pricing updates from all major suppliers and all purchases are subject to competition amongst said approved suppliers. All antiretroviral drugs procured are in line with national treatment guidelines, and generic drugs purchased are FDA-approved and registered by the Medicines Control Council. All medication and supplements are stored off site and delivered either daily or weekly as required. Due to the availability of medicines, a month's buffer stock is available at any time while two months stock of other products is maintained. Due to space limitations within the clinic itself, large deliveries are impossible and smaller frequent deliveries are made. Medication is delivered to the clinic weekly.

HIVCare also includes a parcel of nutritional supplements with the medication to improve treatment efficacy. The supplements provide a single fortified meal per day for each of the indigent patients on ART and aids in the absorption of the medication. Patients are assessed based upon their body mass index and general condition. The benchmark weight among patients starting ART at the center is just 55 kg (-5.2). In previous years the nutritional supplements were obtained with private funds, but in FY 2008, these will be purchased with PEPFAR funds in line with the Food and Nutrition guidance.

Activity Narrative: The program is subject to regular management review through the Netcare management and the medical director. This forms a crucial aspect of continuous improvement as practiced by the company. Both clinics are equipped with software specifically designed to monitor and manage patients. This program, coupled with individual patient folders, follows the specifications, definitions and classifications listed in the WHO 2006 patient monitoring guidelines for HIV care and antiretroviral therapy. The list of collected data includes demographic information, family status (partners, children and their HIV status when known), treatment supervisor details, clinical relevant information (symptoms, opportunistic infections, staging, TB status, family planning method or pregnancy status, weight, and height) and laboratory results. All of the abovementioned indicators as well as prophylaxis and antiretroviral treatments, starting dates, interruptions, reasons, side effects and severity are recorded. These data form the basis of internal management reports used to improve systems.

The existing program is small and makes use of existing infrastructure and skills. Training focuses on skills enhancement takes the form of mentorship and on-the-job development. Formal training is restricted to addressing identified skills gaps.

The following procedures are followed to ensure the optimal follow-up for the patient: (a) scripts are written by the doctor (full-time HIV trained doctor); (b) scripts are delivered to the designated pharmacy; (b) drugs are prepared, labeled, named and packed for each patient; (c) parcels are sent back and stored at the clinic, pending collection; and then (d) treatment is dispensed to the patient after consultation and recording patient adherence, side-effects (if any) and weight in the patient folder. These details are captured using the software described above.

The software allows the clinic staff to monitor any relevant information as side-effects, complications, opportunistic infections, TB statistics, etc.. Clinic management reports are distributed to the local treating doctor as well as to the medical director. Procedures are in place to address matters arising with staff in the form of corrective action and training.

By providing comprehensive ARV services to patients and promoting ARV services to a large population of underserved people living with HIV (people without private insurance) and school-going children, HIVCare is contributing to the PEPFAR goals of placing 2 million people on ARV treatment and providing care for 10 million others who are infected with HIV. These activities also support care and treatment objectives outlined in the USG Five-Year Strategy for South Africa by expanding public-private partnerships and expanding care to an underserved population.

Activity System ID: 22940

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

Right to Care (RTC) supports the South African Government in the implementation of the HIV and AIDS Program. However, in areas where health systems are weak and there are no ARV services, NGO treatment sites are capacitated by RTC as requested by government to provide comprehensive HIV and AIDS services. These sites which are earmarked for accreditation as government sites once governments budget becomes available serve a large number of very poor individuals who are mostly based in rural settings and cannot afford to access health care services. FY 2009 funding for ARV drugs will be used to only expand government requested assistance in developing non-governmental (NGO), faith-based organization (FBO), and community-based organization (CBO) clinics. Thusong, a private practitioner program for indigent patients is the treatment model used in areas where there are no government systems in place. The Thusong program is not planned for expansion, patients have started to be transitioned into the government program and this will continue in FY 2008 and FY 2009. However,, this program will remain operational to allow RTC to treat patients under this program where necessary. No new NGO treatment sites will be started without the support and commitment of government. The areas of emphasis where PEPFAR funds are used include: human resources (direct salary support for government seconded pharmacists, pharmacist assistants and therapeutic counselors and sub grants for NGOs), human capacity development, drug and commodity procurement and distribution, quality assurance, supportive supervision, infrastructure, and training. All of the government sites that RTC supports receive its drugs through internal government systems and the drugs are not procured using PEPFAR funds.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2009, pharmaceutical procurement and supply will continue to be managed by RTCs partnership with Rightmed Pharmacy, this partnership has enabled all RTC supported facilities to have no stock-outs to date on any drugs despite global shortages of stavudine and lamivudine.

PROCUREMENT AND STORAGE:

The wholesalers deliver medicines to Rightmed and these are signed for by a pharmacist, the medication is checked against the invoice and stored at Rightmed under temperature-controlled conditions which are monitored and recorded daily.

PRESCRIPTIONS:

Prescriptions from the NGO treatment sites are either couriered or faxed daily (with follow up originals to be couriered weekly) to Rightmed and are dispensed as they are received and then batched for courier collection with the drug arriving at the sites within 48hours depending on the area of the site. All prescriptions must contain the patient's weight and site identifier as well as all information required by the South African Pharmacy and Medical Regulations. All prescriptions are checked to ensure all regimens and dosages conform to SA HIV treatment guidelines.

DISTRIBUTION AND DISPENSING:

A pharmacist or a qualified post basic pharmacist assistant is responsible for retrieving, labeling and packing the ordered medicine. The medication is individually labeled using labels printed by the Pharmassist software program. The labels will show the following information: the date the prescription was processed, drug trade name, drug strength, drug quantity, directions of use, prescription number, patient initials and surname, dispenser name and telephone number, prescriber name, pharmacy address and contact details. Patient details and treatment history are stored in an electronic dispensing program, which assigns prescription numbers to all prescriptions and chronologically stores all the prescription details. A second pharmacist quality assures the shipment by verifying that the correct drug was dispensed to the correct patient as well as all other dispensing and shipping details. It is highly unlikely that the patients need come to the pharmacy but they may, they may also call the pharmacy and speak to the pharmacist at any time during office hours or call the 24-hour toll-free line for after hours advice. All the pharmacy staff that work at Rightmed are highly trained and experienced in the field of HIV treatment. The expertise from Rightmed Pharmacy will continue to be used for training and mentorship for various government and NGO sites.

ACCOUNTABILITY:

A Complete Drug Accountability Record is kept at Rightmed with the following information: drug description (name and strength), batch number, expiry date, prescription number (which holds all script details), number of containers dispensed, and dispenser initials. The medication is packed into a carton and shipments are processed one shipment at a time. A packing list is sent with every shipment. Once the medication arrives at the site, the site checks the medication, signs the packing list and faxes it back to Rightmed. Drugs are then securely stored at the site and are issued to the patients on a monthly basis, in remote areas where it is hard to attract and retain scarce skills like pharmacists; this model removes the requirement to have a pharmacist on site because the drugs have already been dispensed at Rightmed. As the patient numbers grow and where the sites are able to harness the capacity of a pharmacist, direct procurement is facilitated. The medication is issued to patients by the site clinician who counsels the patient and ensures that the patient understands the directions. All the staff at the RTC supported sites is offered comprehensive HIV, TB and counseling training courses free of charge. The patients receive their drugs at no cost as this is funded by Right to care. Any unused medicine is returned to Rightmed for incineration or destroyed at site level using the services of a medical waste disposal company. At any one time a three-month buffer supply of stock is held at Rightmed so as to ensure uninterrupted drug supply to the patients. If there are any transferred or deceased patients, the site managers inform Rightmed so that pharmacy records are updated.

Activity Narrative: Following DOH accreditation of the NGO and CBO clinics, government takes over the costs of the drugs, labs and some staff salaries and the funding which was used for that is re-channeled to other areas that still need strengthening within the site or to other sites that need support. RTC is working with each site to ensure that there is a plan in place for the government to take over these salaries as soon as feasible and a RTC hand over to government has already occurred in the Mpumalanga province. In an effort to support the government to address the chronic shortage of pharmacists, RTC has embarked on a program to train pharmacist assistants in partnership with government using PEPFAR funding. This crucial training program will continue to be supported as the learners are earmarked for placement government sites once they are qualified. With the graduation of NGO sites and the training of pharmacist assistants sustainability is addressed. RTC will also expand the current pharmacist expertise in pediatric treatment. The provision of additional staff that are trained and the clinical infrastructural improvements contribute to the improvement of quality treatment outcomes.

With FY 2009 funding, RTC will continue to use PEPFAR funds for direct salary support for pharmacists and pharmacy assistants at government treatment sites to enhance the widespread and sustainable availability of ARV drug services. Subject to government requests, PEPFAR funds may be used to upgrade infrastructure and equipment needs at government sites and at NGO and FBO clinics. RTC will also expand the current pharmacist expertise in pediatric care and procurement.

With FY 2009 funding, RTC will procure and supply ARV drugs to RTC-supported treatment programs and sites, directly contributing to the 2-7-10 goal of two million people treated. RTC will support the PEPFAR vision outlined in the Five-Year Strategy for South Africa by expanding access to ART services for adults and children, building capacity for ART service delivery, and increasing the demand for and acceptance of ARV treatment.

SUMMARY:

Right to Care (RTC) will use FY 2008 PEPFAR funds to procure and distribute antiretroviral (ARV) drugs to partner antiretroviral treatment (ART) sites and programs in five provinces to expand ART for eligible HIV-infected individuals. Funds are used to procure ARV drugs used in non-governmental and faith-based organizations (NGOs, FBOs), and remote treatment sites. RTC will continue to refer HIV-infected individuals identified through counseling and testing (CT), care, and support services, when indicated, into ART services. The emphasis areas are human capacity development, renovation, and local organization capacity building. Populations to be targeted include people living with HIV (PLHIV) and pharmacists.

BACKGROUND:

Since 2005 PEPFAR funds have been used for human capacity development and for consultant and sessional salaries for employees that augment NGO clinics and government sites. Pharmacists are employed at each site as it grows and as numbers of patients on treatment rise above 500. RTC will continue ARV drug activities, which have been PEPFAR-funded since 2004, when RTC began supporting the purchase of ARV drugs for patients treated through NGOs, FBOs, and the Clinical HIV Research Unit (CHRU). Pharmaceutical procurement and supply is managed by Rightmed Pharmacy, an independent pharmacy established that meet the South African pharmacy regulations.

ACTIVITIES AND EXPECTED RESULTS:

With FY 2008 funding, RTC will consolidate and expand its existing activities, building on past successes in procuring and supplying ARV drugs to its treatment sites/programs. RTC sites have had no stock-outs to date on any drugs despite global shortages in stavudine and lamivudine. All RTC-supported government sites receive drugs through internal government systems.

PEPFAR funds will continue to be used for the procurement and distribution of ARV drugs via Rightmed Pharmacy for the current NGO and FBO clinics as well as for the Thusong program. The Thusong program provides ART to those unable to access care through Department of Health (DOH) sites. ARV scripts are forwarded to Rightmed, which handles all the procurement, logistical and pharmaceutical management, dispensing and distribution of ARVs. The drugs are delivered to the treatment sites via an independent courier company on a weekly basis. Treatment sites receive batches of drugs for multiple patients, with drugs labeled and dispensed on a patient-named basis. Drugs are then securely stored at the site and dispensed to the patient on a monthly basis. Where sites are able to harness the capacity of a pharmacist, direct procurement is facilitated. Sub-awards for clinics will also include funding for pharmacy staff.

Following DOH accreditation of the NGO and FBO clinics, the South African government will take over the costs of the drugs and labs. RTC will re-channel funds that were allocated to ARVs and labs to supporting additional staff, human capacity development and minor infrastructure adjustments. Additional staff, including dieticians and social workers, may be hired to meet the full staff complement for an accredited ARV clinic as defined by government. RTC is working with each site to ensure that the South African government takes responsibility for these salaries at accredited sites as soon as feasible. With government taking over the cost of ARVs, and the increased number of pharmacists receiving training, sustainability is addressed. The provision of additional staff that are trained and the clinical space adjustments will contribute to the improvement of quality treatment outcomes.

In FY 2008, RTC will use PEPFAR funds for direct salary support for pharmacists and pharmacy assistants at government treatment sites to enhance the widespread and sustainable availability of ARV drug services. Subject to needs assessments, PEPFAR funds may be used to upgrade infrastructure and equipment needs at government sites and at NGO and FBO clinics. RTC will also expand the current pharmacist expertise in pediatric care and procurement. Expertise from Rightmed Pharmacy will be used in training and mentorship at various government and NGO sites.

Activity Narrative: In FY 2008, RTC will procure and supply ARV drugs to RTC-supported treatment programs and sites, directly contributing to the 2-7-10 goal of two million people treated. RTC will support the PEPFAR vision outlined in the Five-Year Strategy for South Africa by expanding access to ART services for adults and children, building capacity for ART service delivery, and increasing the demand for and acceptance of ARV treatment.

Activity ID: 3806.22766.09

Planned Funds: \$436,907

Activity System ID: 22766

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The ARV drugs funding will be used to supplement a Department of Health (DOH) ARV drugs budgetary shortfall anticipated at McCord Hospital. While there have been promises by the KwaZulu-Natal DOH to review the current insufficient budget, there has been no official revised budget to cover the anticipated shortfall.

Gender is a critical issue in HIV treatment, care and support services, with implications for the quality and effectiveness of the care provided and the disproportionate burden on women and girls to provide care. EGPAF will work with the DOH to ensure equitable access for both women and men to medicines and other care and support services and resources.

EGPAF overall support is in line with National DOH treatment policies and guidelines. National Strategic Plan (NSP) 2007-2011 Priority Area 2, Treatment, Care and Support, goal 6 and 7 are taken into consideration.

SUMMARY:

The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will support all of its care and treatment partners by increasing access to antiretroviral treatment (ART) and care for those that need it. The emphasis areas for this activity are renovation, human capacity development and strategic information. Primary populations include infants, men and women, people living with HIV (PLHIV), and public and private healthcare providers. The geographic focus is on KwaZulu-Natal, Free State, Gauteng and North West.

BACKGROUND:

The long-term goal of the EGPAF care and treatment program in South Africa is to increase life expectancy among HIV-infected persons. This will be achieved through an intensive focus on increasing access to care and treatment services as well as the service utilization (demand). To achieve these goals and objectives, project Help Expand ART (HEART) will expand the geographic coverage of services during FY 2008. HEART/South Africa is part of a larger worldwide initiative by EGPAF to support care and treatment services, and receives both Track 1 and in-country PEPFAR funding. The program has maintained a focus on integrating PMTCT services so as to provide a family-centered model of care that includes access to treatment for HIV-infected pregnant women, couple counseling, partner testing and screening for TB.

EGPAF utilizes PEPFAR resources to complement activities carried out by the KwaZulu-Natal Department of Health (KZNDOH) and private partners, such as faith-based organizations (FBOs) and other non-governmental organizations (NGOs). These resources are utilized to fund staff, infrastructure, drugs, laboratory testing and provide technical support. EGPAF will identify gaps in the program at the individual site level and implement activities to address the needs. The intent is to facilitate national and provincial plans and work together with the government and other partners to ultimately transition programs to South African government (SAG) support.

EGPAF will provide TA to strengthen quality improvement (QI) by developing or reinforcing Standard Operating Procedures (SOP) and ensuring mentoring and ongoing supervision. HAART regimens used will follow national guidelines. Patient monitoring will be based on immunological, clinical and virological responses to HAART. These responses will be checked against the drug protocols and adherence guidelines used, to dictate the most appropriate change in treatment regimen.

EGPAF has a partnership with a private NGO, the AIDS Health Care Foundation (AHF); this is a cost-sharing relationship (drugs and staff) to support the AHF care and treatment program. In addition, McCord Hospital, a faith-based organization, is a sub-grantee of EGPAF. The EGPAF partnership with the Department of Health (DOH) includes support for human capacity development, infrastructure rehabilitation and technical support for sites in KwaZulu-Natal.

The existing sites are:

- (1) McCord Hospital, Durban;
- (2) AHF (Ithembalabantu Clinic), Umlazi, Durban;
- (3) KZNDOH, Pietermaritzburg Up/Down referral program (Edendale Hospital and four referral clinics, Northdale Hospital and five referral clinics); and
- (4) KZNDOH, Vryheid Hospital plus three referral clinics, Benedictine Hospital and three referral clinics, and Edumbe Community Health Centre (CHC) plus one referral clinic, in Zululand District

The partnership with the Department of Health (DOH) has been expanded to the rest of Zululand district, the whole Free State province, to Ramotshere Moiloa (Zeerust) and Tswaing (Delareyville) sub-districts in the North West, and the Eastern Ekurhuleni and Lesedi sub-districts in Gauteng.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: ARV Drug Procurement

ARV drug procurement will be undertaken for one Track 1 partner (McCord Hospital) and for one in-country partner, AIDS Health Care Foundation. All DOH sites use the DOH ARV drug procurement systems. Generic medications purchased comply with the USG PEPFAR Task Force requirement of FDA approval as well as approval from the Medicines Control Council of South Africa.

ACTIVITY 2: Pharmacy

McCord and AHF are both national DOH accredited ARV sites, and each have a dedicated pharmacist for

Activity Narrative: the HIV and AIDS treatment program. This has resulted in uninterrupted supply of antiretrovirals and individualized adherence counseling to the increasing number of patients.

Systems are in place to select, procure, store, track and distribute the drugs privately. Drugs can be sourced at short notice from private suppliers. McCord Hospital has two purchasing systems currently in operation. These include:

(1) Rolling Forecast System - GlaxoSmithKline access program drugs, that are purchased monthly according to a three-month committed, and nine-month open forecast updated monthly. This forecast is determined by the program batching systems.

(2) Demand Dependant System - 24 hour order to delivery system based on demand and maintained with minimum and maximum stock levels.

Monitoring of purchases and distribution is done both manually and electronically (Pro-Clin and Trakhealth Systems) and produce statistical and detailed reports. If stock-outs (less than five days) occur, stock can be purchased from an alternative source.

As the AHF/Ithembalabantu clinic is a national DOH accredited ARV site, the KZNDOH provides the clinic with two full-time counselors specializing in counseling and testing. AHF Ithembalabantu clinic has an onsite pharmacy, and the clinic has the capacity to serve all of its clients pharmacy needs. AHF has developed pharmaceutical and health commodities management systems to ensure a sustainable supply of ARVs and other relevant supplies.

The clinical and psychosocial support staff at the Ithembalabantu clinic uses a locally developed, highly effective treatment education and adherence program that has resulted in outstanding, sustained rates of therapy success. Treatment adherence and education classes, social service support and counseling, as well as skills development and capacity building classes are all provided onsite. Medication adherence training and support is given before clients begin ART. Adherence counseling is also monitored by self-reporting, pill counting, and follow-up with patients, dedicated family members or friends.

The EGPAF drug procurement program contributes to the PEPFAR 2-7-10 goals by ensuring adequate supply of ARV drugs for patients in treatment.

Budget Code: HTXD

Program Budget Code: 15

Activity ID: 3318.22751.09

Planned Funds: \$980,128

Activity System ID: 22751

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The FY 2008 activities as outlined in FY 2008 COP will be continued. In addition, systems and structures will be built at Ikhwezi Lokusa (ILWC) and Cator Manor to ensure program development and sustainability. The main issue at Ikhwezi and Cator Manor is the growth of the institutions to a point where they have the capacity to receive resources directly from the government and other donors.

Columbia University will support and strengthen the managerial, supervisory, logistics, financial and technical structures within these institutions including the management of the outreach doctors at ILWC. Monitoring and evaluation systems will be revamped to ensure quality, accurate and reliable information on the activities of the outreach team. An additional data officer will be hired to support and complement the current monitoring and evaluation support and to ensure focus and capacity at each of the sites. Issues of regulation, supervision and management of the outreach program will be addressed. These interventions will pave way for direct antiretroviral procurement and supply by the National Department of Health.

A service level agreement will be facilitated between the respective department of health and the Cato Manor and ILWC. This agreement will pave way for the government to supply drugs and laboratory services directly to these institutions while Columbia continues with technical support and assistance. In the longer term, once capacity has been developed at the two institutions, interventions will focus on the accreditation of the two centers for antiretroviral therapy.

SUMMARY:

Columbia University (Columbia), in collaboration with the Eastern Cape Health Department (ECDOH) will support antiretroviral (ARV) drug purchase for two treatment sites and support commodity supply chain-related training, and logistics for 34 current antiretroviral treatment (ART) service delivery sites in the Eastern Cape and two new ART sites in KwaZulu-Natal (KZN). Major emphasis is given to human capacity development, local organization capacity building, and strategic information. The target population will include infants, children and youth, men and women (including pregnant women) and people living with HIV (PLHIV).

BACKGROUND:

Columbia and the ECDOH will continue to support procurement and distribution of needed ARV drugs using PEPFAR FY 2008 funds. In FY 2006 Columbia formed a partnership with the United Nations Children's Fund (UNICEF) to procure ARV drugs from local pharmaceutical companies that are licensed by the South African Medicines Control Council (MCC). These drugs are distributed to two non-governmental organizations, Ikhwezi Lokusa Wellness Center (Ikhwezi) in East London and the Cato Manor Community Health Center in Durban. Columbia purchases generic medications that are in compliance with the USG PEPFAR Task Force requirement for both U.S. Federal Drug Administration and Medicines Control Council (MCC) approval. Columbia provides technical assistance to improve HIV-related pharmacy practices in 34 public health facilities. In these 34 public sector sites, the relevant provincial department of health provides all required HIV drugs.

In FY 2007 Columbia provided support for pharmaceutical services in the Qaukeni local service area in the Eastern Cape and Sisonke districts in KZN. One of the challenges encountered while providing this essential support is the regular stock-out of drugs such as cotrimoxazole. As a result Columbia provided in-service trainings for pharmacists and pharmacy assistants on drug stock management. In addition, Columbia purchased copies of the South Africa Medicines Formulary and the Daily Drug Use for 30 clinics in the same catchment area. Columbia also distributed copies of the Essential Drug List for use in these clinics.

Similar pharmaceutical services support is carried out in Port Elizabeth and this activity will continue into FY 2008.

ACTIVITIES AND EXPECTED RESULTS:

Specific areas of programmatic focus include:

(1) Technical support for ARV stock management and distribution at the pharmacy depot (in Port Elizabeth) and public ART sites. Activities include:

- (a) Train pharmacists and pharmacist assistants in ARV stock management.
- (b) Support the implementation of a province-endorsed pharmacy tracking tool to prevent ARV drug stock-outs at health facilities.
- (c) Support the province-endorsed training of pharmacist assistants at identified health facilities.

(2) Purchase and distribute ARV drugs for Ikhwezi Lokusa Wellness Center and Cato Manor community health clinic. In FY 2006, Columbia initiated discussions with the ECDOH to propose that the ARV drug procurement and distribution for Ikhwezi is managed by the ECDOH. In FY 2007, the ECDOH and Ikhwezi developed an Memorandum of Understanding which will be signed before the end of FY 2007. The ECDOH organized for Ikhwezi to be part of the Pfizer Diflucan donation program and currently patients with cryptococcal meningitis and esophageal candidiasis can obtain free Diflucan for this initiative. Similar discussions with the KwaZulu-Natal Health Department (KZNDOH) are anticipated in FY 2008 and are expected to begin for the Cato Manor community health clinic in Durban.

(3) Utilization of ARV drug pharmacy practice to improve clinical management. In a bid to improve ARV prescribing practices in the Ikhwezi and Cato HIV treatment services, Columbia in FY 2007 and FY 2008, will ensure that information generated that best describes and linkages between prescribed ARV drug regimen and clinical outcomes and laboratory indicators is disseminated to the clinicians in these 2 facilities.

Activity Narrative: Columbia will continue collaborating with the South African Department of Health in support of ARV procurement mechanisms to ensure uninterrupted ARV supply at Columbia-supported sites. The specific quantities of ARV drugs that would be needed will take into consideration relevant medical conditions (TB, adverse drug reactions). Columbia will continue to strengthen the ARV drug distribution system by providing technical assistance at designated pharmacy depots to coordinate distribution of ARVs with the NDOH, as well as participate in furthering the ARV quality assurances activity initiatives as developed by the NDOH.

In the Eastern Cape a public-private partnership consortium outsourced by the ECDOH will manage the Department of Health pharmacy depots. Therefore Columbia will not be providing ongoing assistance at the Mthatha Depot effective 2008. However, Columbia will continue to provide technical assistance for Pharmaceutical services in all SAG supported health services.

By providing ARV drugs and related services, Columbia's activities will contribute to the PEPFAR goal of providing treatment to 2 million people. These activities will also support efforts to meet HIV and AIDS care and support objectives outlined in the USG Five-Year strategy for South Africa.

Program Budget Code: 15

Activity ID: 2913.22610.09

Planned Funds: \$3,544,773

Activity System ID: 22610

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

Aurum Health Research (Aurum) will use FY 2008 PEPFAR funding to continue an ongoing clinical program that works through general practitioners and community clinics throughout the country, and to expand the program to three public hospitals in the Eastern Cape, North West and Gauteng provinces. The emphasis areas for this activity are human capacity development, local organization capacity building, and strategic information. Target populations include infants, children and youth; adults, including men and women of childbearing age; and people living with HIV (PLHIV), including HIV-infected pregnant women, infants and children.

BACKGROUND:

The focus of the Aurum program in the public, private, and non-governmental sector is to provide HIV care and treatment to a large number of persons in a cost-effective standardized manner ensuring a high quality of counseling, patient care and patient monitoring. The model is centrally coordinated and implemented on a large scale in peripheral sites that are resource-constrained and lacking in HIV specialists, information technology (IT) infrastructure, and laboratory and pharmacy capacity. Aurum achieves this by having a centralized system of support which includes the following: (1) training of all levels of healthcare workers to ensure capacity building of clinicians to be able to manage patients in resource-poor settings with remote HIV specialist support; (2) provision and maintenance of guidelines for HIV preventive therapy (including INH and cotrimoxazole), treatment of adults and children, prevention of mother-to-child transmission and voluntary counseling and testing; (3) clinical and administrative support through site visits by staff involved in psychological support, training, clinical support and monitoring data management system; and (4) centralized distribution of medication and laboratory testing.

The S Buys group (a private company) is responsible for the centralized procurement and distribution of antiretroviral and preventive therapy. Negotiations with research-based pharmaceutical companies have ensured that GlaxoSmithKline (GSK) drugs are available at access prices and members of the community without medical insurance are able to access these medications.

ACTIVITIES AND EXPECTED RESULTS:

PEPFAR funds will be used in this program area to purchase, store and distribute ARV drugs. Patients who are medically eligible for, but cannot afford, antiretroviral therapy will receive the drugs at no cost from enrolled sites. The drugs will be prescribed using the South African Government's (SAG) eligibility criteria and drug regimens. Generic medications purchased comply with the USG PEPFAR Task Force requirement of U.S. Federal Drug Administration approval as well as approval from the Medicines Control Council of South Africa.

The pharmacy plan comprises:

- (1) Warehousing and stock control of drugs: A computerized system of stock control will ensure an audit trail and batching abilities from the warehouse to patients.
- (2) National distribution of medication: Through a courier service, S Buys is able to distribute medication anywhere in South Africa within 24 hours of receiving the request. ARV drugs are dispensed centrally on a monthly basis, and Aurum has not experienced any stock-outs.
- (3) Named patient dispensing: Dispensing centrally at the pharmacy ensures that medication is controlled and it facilitates a strict audit trail to the patient.
- (4) S Buys pharmacy has in place stock control, pricing based on volume purchasing (where possible) and has a process for checking compliance with ART guidelines.
- (5) Integration with the Aurum Health Research (AHR) Project: This integration will help ensure adherence to protocols, as well as communication between pharmacists and AHR. It will also allow for the integration of data from drug dispensing sites.
- (6) Aurum is working with sub-partners to ensure Department of Health accreditation for a number of sites, allowing drugs to be provided by the government. A number of sites have already been accredited.
- (7) Aurum will participate in the training of professional nurses in pharmacy skills. The SME Project will utilize the existing drug supply chain to provide medications for patients registered on the project. Funding allocated to SME Project will be directed to support and enhance the above mentioned activities.

Table 3.3.15: Activities by Funding Mechanism

Mechanism ID: 416.09	Mechanism: N/A
Prime Partner: Broadreach	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: ARV Drugs
Budget Code: HTXD	Program Budget Code: 15
Activity ID: 3133.22618.09	Planned Funds: \$715,751
Activity System ID: 22618	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

BroadReach Health Care (BRHC) implements several treatment models in South Africa using PEPFAR funds. BRHC uses PEPFAR funding to procure antiretrovirals (ARVs) for two treatment models involving private sector general practitioners. BRHC uses the majority of its PEPFAR funding to support expanding capacity of South African Government (SAG) health facilities to provide comprehensive care and treatment services. BRHC does not procure ARVs using PEPFAR funding for SAG sites. All ARVs at these sites are provided through the government of South Africa.

SUMMARY:

BroadReach Healthcare's (BRHC) antiretroviral (ARV) drug activities include drug procurement and distribution, training for health professionals on drugs, supporting pharmacy staff salaries, training patients, quality assurance (QA), and data management. BRHC's emphasis areas are human capacity development, local organization capacity building, and strategic information. Primary target populations include children, adolescents, adults, pregnant women, and people living with HIV (PLHIV).

BACKGROUND:

PEPFAR funds support BRHC initiatives that provide HIV and AIDS clinical management, care and support services to HIV-infected individuals in areas where the South African Government's (SAG) rollout has not yet been implemented and assists ART rollout in the public sector. The BRHC PEPFAR program began in May 2005 and now operates across five provinces. An additional province will be added in FY 2008. BRHC is supporting approximately 5,000 individuals directly with care and treatment and 15,000 indirectly. BRHC taps private sector health professionals to provide comprehensive care and treatment, fostering capacity building initiatives within the public health system, and supporting community-based programs. BRHC leverages PLHIV support programs to identify and assist with treatment literacy, adherence support and ongoing community mobilization, prevention education activities, and positive living initiatives. BRHC also works to build capacity in public health facilities, focusing efforts on human capacity development (HCD) activities, including clinical didactic training, clinical mentorships, patient training and operational assistance training. BRHC is expanding its provision of staff and infrastructure support to SAG facilities. Finally, BRHC is expanding its involvement in the design of scaleable down referral models in partnership with faith-based organizations (FBOs), community-based organizations (CBOs), and public-private partnerships (PPPs).

ACTIVITIES AND EXPECTED RESULTS:

The primary goal of this program area is to ensure that new patients are started on antiretroviral treatment (ART) when clinically qualified, and enrolled patients continue to receive high-quality care and support. Monitoring of CD4 counts, viral loads, and resistance testing are part of the monitoring system. For continued program sustainability, BRHC continues to work on the transference of costs to government, and already in the North West province, the provincial government provides all drugs.

ACTIVITY 1: Drug Procurement and Distribution

BRHC will continue commodity procurement of ARVs through its supply chain vendors including its courier-based pharmacy partners. BRHC will oversee the delivery of drugs to the accredited community-based providers. In some instances, the community-based providers will be paid a capitated rate per patient and those providers will be procuring drugs according to PEPFAR standards and national guidelines. BRHC will negotiate best available pricing for USG and SAG approved ARV drugs. Community-based providers are trained in drug forecasting, procurement and supply chain management.

BRHC partners with a private mail order pharmacy provider, Pharmacy Direct (PD), in its procurement and distribution efforts for the BRHC general practitioners (GP) network. Pharmacy Direct liaises directly with the BRHC GP network to manage patient prescriptions, dosing, medicine delivery and pick-up of returned medicines. In partnership with Pharmacy Direct, BRHC manages patient adherence through monitoring of medicine collection and regular data reports.

ACTIVITY 2: Human Capacity Development (HCD)

BRHC will continue to provide comprehensive HIV and AIDS training to its network of providers including doctors, nurses, pharmacists and other healthcare professionals through a variety of initiatives including remote decision support, telemedicine, web-based training, didactic training, and clinical mentoring from experienced HIV and AIDS clinicians. Topics include drug supply chain logistics, operational improvements for drug management, tracking for expiration dates, comprehensive ART management, adherence, management of complications and side-effects, prevention and pediatric HIV management. BRHC-supported human capacity development activities, such as training and clinical mentoring, will also take place within SAG facilities.

ACTIVITY 3: Support to SAG

BRHC will support capacity development for drug procurement and pharmaceutical management at partner SAG facilities. BRHC has conducted a needs assessment that examined the operational processes for drug procurement, forecasting, stock management, and dispensing, and has used this assessment to streamline its supply chain management.

ACTIVITY 4: Quality Assurance/Quality Improvement

BRHC maintains a close relationship with its drug procurement and distribution client. The client provides regular feedback and reports to BRHC regarding delivery problems, missed medicine pick-ups, and collects

Activity Narrative: all unused medicines. Drug distribution, pick-up, and returns data is collected and maintained in the BRHC program database. This data feeds into numerous reports including doctor-specific feedback reports and patient exception reports.

This activity facilitates the ARV service delivery component of the project, which contributes directly to the PEPFAR 2-7-10 goal of two million people receiving treatment. BRHC will contribute to PEPFAR's vision outlined in the Five-Year Strategy for South Africa by expanding access to ART services for adults and children, building capacity for ART service delivery, and increasing the demand for and acceptance of ARV treatment.

Mechanism ID: 6155.09	Mechanism: UGM
Prime Partner: Pact, Inc.	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: ARV Drugs
Budget Code: HTXD	Program Budget Code: 15
Activity ID: 12410.22883.09	Planned Funds: \$470,889
Activity System ID: 22883	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

HCD

Pact's primary focus in implementing the Umbrella Grant Management Program (UGM) is the development of human capacity in South African non-governmental organizations (NGOs) and community-based organizations (CBOs) to promote the establishment and strengthening of viable and sustainable civil society organizations. However, the COP guidance is very specific in terms of what can be included in Human Capacity Development (HCD), and for this reason Pact will only address the Leadership and Management development aspects of the UGM HCD activities.

Prior to the signing of grant agreements, Pact provides extensive assistance to partner organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact emphasizes to management staff during this process the importance of ensuring that program and finance units work as a team rather than in isolation. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of management to diversify their funding base and ensure sustainability.

Pact conducts organizational capacity assessments in collaboration with each partner. The core methodologies used in all of Pact's capacity building activities are as follows: assessment of sub-recipient organizational and technical capacity, development of institutional strengthening plans, delivering capacity building services, reassessment and refinement of institutional strengthening plans (ISP). Several individuals from partner organizations participate in the assessments in order to ensure that feedback is obtained from staff at all levels. This process develops the skills of senior management to objectively assess organizational strengths and weaknesses and utilize the results to develop a realistic strategy that will ensure that organizational objectives are achieved (including retention strategies for staff) and identified gaps are addressed. The strategy also details what interventions and support will be provided, by whom, when and how organizational change will be measured.

Pact also conducts workshops that primarily target senior management and board members. A resource mobilization course is offered annually to provide information to partner organizations on sources and strategies for diversifying their funding base. One day of the three-day workshop is devoted to developing the skills of participants in writing proposals. Board training is also offered annually to address issues related to fiduciary, legal and ethical roles and responsibilities of board members. Although Pact's Monitoring and Evaluation (M&E) course targets M&E staff and Program staff, senior management members of partners organizations are encouraged to attend in order to ensure that they understand how to utilize data to make organizational decisions.

Pact, in working with partner organizations over the course of the past four years has recognized that management skills among the leadership of many of the civil society organizations (CSOs) need to be further developed. For this reason, utilizing FY 2008 and 2009 funding, Pact will identify short-term management courses in South Africa that will enhance leadership and management skills. Attendance to leadership courses will be made available to all partner organizations and their sub recipients but will primarily target the partners that have experienced great difficulty in transitioning to the increased funding levels or have new management staff and structures.

Alignment with the National Strategic Plan (NSP) or other South African Government (SAG) policies or plans

In developing program descriptions with partners, Pact ensures that activities are aligned with District and Provincial business plans, the NSP and/or other SAG policies or plans.

Gender

Pact ensures that gender related activities are clearly articulated in partners' program descriptions and implementation plans. Programmatic and technical assistance provided to partners addresses gender issues as part of the assessments and recommendations for strengthening technical and organizational capacity.

SUMMARY:

Currently, the USG PEPFAR Task Force supports institutional capacity building of indigenous organizations that implement PEPFAR programs through four competitively selected Umbrella Grants Mechanisms: Pact, the Academy for Educational Development (AED), Family Health International (FHI) and Right to Care (RTC). The main purposes of these new umbrella organizations are to (1) facilitate further scale-up of HIV treatment services; and (2) to develop indigenous capability, thus creating a more sustainable program. The major emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs), and community-based organizations (CBOs).

As an Umbrella Grants Management (UGM) partner, Pact supports institutional capacity building, technical assistance and grants administration for indigenous organizations that implement PEPFAR programs. Pact's primary goal is to build sustainable institutional capacity and increase the effectiveness of local partners to achieve expanded and high quality services. Primary target audiences include non-governmental, faith-based, and private voluntary organizations, Pact's major emphasis is the enhancement of local sub-partner capacity through the development and implementation of documented organizational systems and procedures and human capacity development at management and operational levels.

Activity Narrative: BACKGROUND:

Since 2004, Pact has facilitated the efficient flow of grant funds during the rapid scale-up of the PEPFAR South Africa program. Pact provides PEPFAR funding and assistance to over 30 PEPFAR sub-partners in South Africa, all playing valuable roles in the fight against HIV and AIDS.

The sub-partners procure USG and South African Government (SAG) approved antiretroviral drugs (ARVs) through supply chain vendors and oversee their distribution to government treatment facilities and accredited private providers. Partners also work closely with providers to develop drug tracking and monitoring systems to facilitate correct and accurate patient uptake, treatment management, and referral. Additional services in support of ARV drug distribution include lab testing, adherence support, patient counseling, telemedicine and quality assurance monitoring. Partners also equip government clinics and hospitals with the human resources including doctors, nurses, pharmacists, and counselors. In addition, these programs provide specialized training addressing appropriate delivery of ART services and the provision of holistic HIV care. Pact has contributed to the 2-7-10 PEPFAR goals through support to 2 partners providing ARV drugs to over 1,000 HIV-infected, uninsured individuals in treatment sites throughout South Africa.

Partners work closely with and in the SAG provincial, municipal and district facilities to facilitate the seamless transfer of patients in and out of public and private networks of care. As a result, their programs continue to grow tremendously in both reach and complexity. This scale-up will require strong financial, monitoring and evaluation, and management systems to accommodate the growth in reach and maximize sustainability. With FY 2008 funding, Pact will continue to provide capacity-building support through training and mentoring to further develop and strengthen partner organizations. Pact will also facilitate the sharing of these systems between emerging and well-established partners and reinforce the use of data and reporting for decision making.

ACTIVITY 1: Grant Management

Pact conducts a participatory assessment of each partner organization and collaboratively develops an organizational capacity building strategy that details planned interventions. These assessment results also inform Pact of what type of assistance is urgently to ensure that the organizations comply with USAID rules and regulations (with emphasis on financial and procurement management).

Prior to the signing of grant agreements, Pact provides extensive assistance to organizations in developing comprehensive program design documents that accurately reflect planned activities and clearly articulate defined goals and objectives. Further assistance is provided in costing program activities and developing a detailed budget that is consistent with program objectives. Pact assists partners in developing realistic cost share levels and emphasizes the sustainability aspect of this requirement. After the signing of the agreement, Pact works with each partner in developing a very detailed annual work plan that includes specific activities to be implemented, timelines, budgeted amounts, target beneficiaries and projected reach. The ability to clearly articulate program goals and activities and develop realistic budgets greatly enhances the ability of partner organizations to diversify their funding base and ensure sustainability.

ACTIVITY 2: Human Capacity and NGO Development

Pact has developed a customized training series to orient new partners and their sub-partners. The training series includes basic and advanced grants and sub-grant management which addresses USAID rules and regulations, good governance and minimum financial management standards. Monitoring and evaluation courses cover basic principles of monitoring and evaluation and PEPFAR data requirements as well as internal data quality assurance. Refresher courses are also offered throughout program implementation. Pact also ensures that ongoing, intensive onsite training and mentoring is provided to sub-partners. On a quarterly basis, Pact assesses the level and type of assistance required by each organization and develops a site visit plan that ensures that the necessary support is delivered to each sub-partner. Pact organizes and supports technical consultation meetings for the sharing of best practices and lessons learned among PEPFAR and non-PEPFAR partners. As required, technical assistance from select regional and international providers is sourced to assist partners in improving their technical capacity.

ACTIVITY 3: Monitoring and Evaluation

Pact SA assists each grantee in developing a results framework that tracks success against both PEPFAR program and organizational indicators. Pact further assists sub-partners in the development of monitoring, evaluation and reporting (MER) plans and systems. Participation in a five-day M&E training is mandatory for all partners prior to full implementation. Pact provides additional M&E assistance to all partners in the following areas: review and development of effective data collection, analysis and reporting tools; setting realistic and achievable targets; establishing and strengthening data quality management systems, conducting internal data quality audits and verifying and validating sub-partner data submissions.

ACTIVITY 4: Program and Financial Monitoring

Pact recognizes the importance of monitoring sub-partner program progress and early identification and resolution of implementation issues. Pact has frequent and regular contact with sub-partners and if technical/programmatic gaps or problems are identified, ensures that issues are promptly addressed and resolved.

In addition to monitoring program progress, Pact closely monitors sub-partner financial management and ensures that grants funds are utilized only for activities approved under PEPFAR funding. All partners submit monthly financial reports that detail and document expenditures. Pact finance staff visit partners every quarter to audit program expenses and accompanying documentation, compliance with USAID rules (including branding requirements) and cost share.

Activity Narrative: ACTIVITY 5: Technical Assistance

Pact will provide and manage direct technical assistance in prevention, care and support strategies for all sub-grantees. Pact technical staff will conduct assessments and provide consultation and training on the development and implementation of programs and services. In addition, sub-grantees will be supported with guidance and ongoing assistance on the design and delivery of partner HIV and AIDS curricula, training modules and publications. Pact will also work closely with partners to ensure the effective incorporation and strengthening of nutrition and food security, protection services, gender mainstreaming, and human capacity development in existing programs.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

BACKGROUND:

While a major activity for SCMS in most SCMS focus countries, procurement in South Africa is unique due to the strict regulatory environment on parallel importing and registration of medicines. All medicines procured need to be registered with the Medicinal Control Council (MCC) in South Africa besides the USG FDA approval requirement. Procurement in South Africa takes place using local suppliers and at Single Exit Price (SEP), a set price at which drugs must be sold. Thus the SCMS mechanisms to drive prices down through use of generics and bulk buying directly from manufacturers do not apply to the South African situation. This also means that this activity has been scaled back, and the activities below will be funded using SCMS pipeline funds. Therefore no FY 2009 funding is requested.

ACTIVITIES AND EXPECTED RESULTS:

In South Africa, John Snow Inc. (JSI), through the JSI/SCMS Project will also work closely and collaboratively with Management Sciences for Health's (MSH) Strengthening Pharmaceutical Systems (SPS) in order to ensure there is no duplication of effort between JSI/SCMS and MSH/SPS technical assistance or other activities, JSI/SCMS will work closely with the USG and MSH/SPS in coordinating work plan development and implementation.

ACTIVITY 1: Drugs and Related Commodity Procurement

Upon request, JSI/SCMS will procure drugs and related commodities for PEPFAR-supported care and treatment partners in consonance with USG agreements with the Government of South Africa regarding adherence to SEP and will make these commodities available via the South African domestic market.

JSI/SCMS will continue to focus procurement activities with SANDF. JSI/SCMS started procuring ARVs for the South African National Defense Force (SANDF) at the beginning of this reporting period using a locally developed procurement strategy specific to the South African regulatory environment. As of end of July 2008, JSI/SCMS has processed a total of seven orders for the SANDF and one for the Centre for AIDS Program Research in South Africa (CAPRISA). A total of 37,359 units at a value of ZAR 3.608 million (roughly \$533,000) have been procured to date.

JSI/SCMS was looking forward to assisting the provincial Government of the Western Cape (PGWC) with ARV procurement, but application to Treasury made by PGWC for additional funds required to expand the ARV program in that province was unexpectedly granted thus allowing for the expansion of ART services without JSI/SCMS assistance.

JSI/SCMS will only explore the feasibility of procuring for other partners with the USG's concurrence. A small amount of commodity funds have been put aside to assist with future ad hoc or emergency requests from IPs, if necessary. JSI/SCMS will continue to assist implementing partners (IPs) with strategic supply chain information and link them to relevant resources as requested and appropriate.

ACTIVITY 2: Assistance to the Provinces

Technical assistance (TA) to the provinces will focus on the following areas: warehousing, quality assurance, inventory management, and distribution logistics management information systems. JSI/SCMS will collaborate closely with MSH/SPS project to avoid duplications and to fill-in the gaps. TA will be provided by local staff and partners with possible support from international JSI/SCMS staff. TA will focus initially on Mpumalanga province where the Department of Health and Social Services has requested JSI/SCMS assistance in establishing their new Provincial Pharmaceutical Depot in Middleburg. JSI/SCMS has also been requested by the Limpopo Provincial Government to conduct an assessment of their depot and to make recommendations on system improvements. Other provinces such as Gauteng have also expressed interest along similar lines.

JSI/SCMS offers expertise in a comprehensive range of technical areas relating to warehousing and distribution including needs assessment, capacity planning, structural and systems improvement, human resource skills assessment and development, security and risk evaluation, standard operating procedures (SOP) development, and Good Manufacturing Practices (GMP) audit process design.

While official government letters expressing interest in JSI/SCMS's technical assistance have been received, no commitments have been made for these activities to date. JSI/SCMS has shared this information with USAID and further actions will be considered only if provincial MOUs are secured.

ACTIVITY 3: Human Capacity Development

JSI/SCMS offers a unique training opportunity in supply chain management in collaboration with its South African partner, the Fuel Group, as it has established a state-of-the-art pharmaceuticals freight forwarding and logistics service at its Regional Distribution Center (RDC) in Centurion. This facility is also utilized as an on-the-job training site. The Fuel Group's Pharmaceuticals & Healthcare Distributors (PHD) division operates the RDC and offers warehousing and distribution training through practical, hands-on work in the RDC itself.

SUMMARY:

The Supply Chain Management Systems (SCMS) Project is tasked with supporting PEPFAR by strengthening secure, reliable, cost-effective, and sustainable supply chains that procure and deliver high-quality antiretroviral drugs (ARVs) and related commodities to meet the care and treatment needs of people living with HIV (PLHIV). The major emphasis areas are human capacity development and local organization

Activity Narrative: capacity building.

BACKGROUND:

In September 2005, SCMS was awarded an agreement by USAID to support PEPFAR in terms of strengthening supply chains for ARVs and related commodities, with an initial focus on fourteen African countries, including South Africa. In collaboration with in-country and international partners, the SCMS mandate is to deploy innovative solutions to enhance supply chain capacity, ensure accurate supply chain information is gathered, shared and used, and provide quality, best-value healthcare products. The SCMS project team includes three organizations based in South Africa: the Fuel Group, where SCMS has established a regional distribution center to service Southern Africa and beyond; North West University which houses the only WHO-accredited quality assurance laboratory in sub-Saharan Africa; and Affordable Medicines for Africa (AMFA) which has provided medicines to faith-based organizations throughout Africa for many years.

ACTIVITIES AND EXPECTED RESULTS:

The SCMS Project will work closely and collaboratively with Management Sciences for Health's (MSH) Strengthening Pharmaceutical Services (SPS) project in assisting PEPFAR treatment and palliative care partners to improve the cost-effectiveness of their supply chains for the following: ARVs and related commodities, including drugs for opportunistic infections and palliative care; drugs for sexually transmitted infections (STIs); drugs and supplies for home-based care; drugs for TB; rapid HIV test kits; laboratory equipment and supplies; and other medical supplies. In order to ensure there is no duplication of effort between SCMS and SPS technical assistance or other activities, SCMS will work closely with the USG in coordinating work plan development and implementation. SCMS activities will focus on technical assistance and human and organizational capacity building in supply chain management and related areas and is prepared to assist the National Department of Health (NDOH) and provincial health departments should it be requested.

Activity 1: Drugs and Related Commodity Procurement

Upon request, SCMS will procure drugs and related commodities for PEPFAR-supported care and treatment partners in consonance with USG agreements with the Government of South Africa regarding adherence to Single Exit Pricing (SEP) and will make these commodities available via the South African-based Regional Distribution Center on an ongoing basis. All procurement will follow SEP pricing unless and until the PEPFAR Task Force is open to SCMS attempting to leverage lower pricing in South Africa that the project is able to secure through direct negotiations with manufacturers on a global basis. SCMS will also provide quality assurance for all commodities procured through the regional distribution center utilizing SCMS partner North West University drug quality assurance laboratories where appropriate. SCMS will focus procurement initially on Western Cape and the South Africa National Defense Force (SANDF) but will explore the feasibility of procuring for other provinces and PEPFAR treatment NGOs.

Activity 2: Technical Assistance

Technical assistance (TA) will focus on the following areas: quantification and forecasting, procurement, quality assurance, freight forwarding and inventory management, distribution (including pharmacy services for individual patient treatment packs), logistics management information systems, and assistance to manufacturers and suppliers. TA will be provided by local partners as well as international SCMS staff. TA will focus initially on Mpumalanga Province where the Departments of Health and Social Services has requested SCMS assistance in establishing a Provincial Pharmaceutical Depot in Middleburg. SCMS will explore similar opportunities in other provinces.

Activity 3: Human and Organizational Capacity Development

SCMS will provide training as requested in technical areas of supply chain management for both PEPFAR treatment partners and provincial and NDOH counterparts. SCMS will take advantage of the in-house capacity of the Fuel Group's state-of-the-art Regional Distribution Center facilities and supply chain expertise, and the North West University's quality assurance laboratories and expert training staff to provide hands-on training and experience in freight forwarding and inventory management and quality assurance. Training will also be provided by international SCMS staff.

Activity 4: Pain and Symptom Control

Anecdotal evidence suggests that PLHIV in PEPFAR-supported care and treatment programs experience pain and symptoms related to HIV disease, opportunistic infections and/or side effects of ARV therapy which are not adequately addressed by health providers. Increasingly, ART clients are switched to second-line ARV treatment regimens due to medication side effects or other symptoms, raising questions as to whether symptoms could be more effectively managed first, without resorting to sudden changes in treatment regimens. In FY 2007 SCMS will assist the USG PEPFAR Task Force and its partners to review the occurrence of common symptoms and pain experienced by PLHIV, current strategies to manage symptoms and pain, including indications for switching PLHIV to second line treatment regimens.

Activity 5: Western Cape Support

In FY 2007 Plus Up Funds will enable PEPFAR to assist the Western Cape Department of Health with procurement of ARV commodities. Western Cape requested assistance from the USG to expand ART services to 13 new sites covering an anticipated 800 children and 7,000 adults. Specifically Western Cape requested trained ART staff for the new sites, funding to pay for the required HIV testing, and ARVs - the USG in turn requested SCMS to procure the ARVs. SCMS has a procurement plan in place for this procurement and is ready to initiate the procurement once Western Cape has approval from the National

Activity Narrative: Treasury to accept this donation within the strict tendering and related regulatory environment which governs the pharmaceutical marketplace in South Africa.

FY 2008 COP Activities:

ACTIVITY 1: Procurement

If the Western Cape procurement is successful, it is anticipated that additional provinces will request procurement assistance. For example, Limpopo Province is unable to keep pace with the influx of new ART patients, many of whom are entering South Africa from neighboring countries, especially Mozambique and Zimbabwe. Indeed the demand for services continues to outstrip the ability to respond across South Africa. Clearly, provision of adequate supplies of ARVs will be critical to expanding the national response.

ACTIVITY 2: Technical Assistance

SCMS will continue to provide technical assistance (TA) in warehousing and supply chain. Assuming the successful establishment of the Provincial Pharmaceutical Depot in Mpumalanga Province in FY 2007 (TA already requested from SCMS), it is anticipated that additional provinces will request TA in warehousing design, equipment specification, as well as inventory control, commodity tracking, and management systems. SCMS offers expertise in a comprehensive range of technical areas relating to warehousing and distribution including needs assessment, capacity planning, structural and systems improvement, human resource skills assessment and development, security and risk evaluation, standard operating procedures (SOP) development, and Good Manufacturing (GMP) audit process design. SCMS will also provide TA in quantification, forecasting, quality assurance, and logistics management systems. SCMS will work closely with SPS colleagues and the USG in coordinating these TA activities to ensure there is no duplication of effort.

ACTIVITY 3: Training

SCMS offers a unique training opportunity in supply chain management in collaboration with its South African partner, the Fuel Group, as it has established a state-of-the-art pharmaceuticals freight forwarding and logistics service at its Regional Distribution Center (RDC) in Centurion, and this facility is also utilized as an on the job training site. The RDC is currently distributing PEPFAR-funded ARVs and related commodities on behalf of SCMS to several sub-Saharan countries. The Fuel Group's Pharmaceuticals & Healthcare Distributors (PHD) division operates the RDC and offers warehousing and distribution training through practical, hands-on work in the RDC itself, where trainees learn about and experience best practices in action and develop work plans for how their new skills and knowledge can be transferred to practical systems improvements in their own workplaces in their home countries. Trainees to date have generally been from national warehouses. In the South African context, where there is no national warehouse, SCMS will offer the Warehousing and Distribution Excellence Course (one month) to interested Provincial Depots, starting with Mpumalanga Province that has already requested technical assistance and can benefit significantly from the RDC training. SCMS will contribute significantly towards meeting the PEPFAR goals by assisting treatment and palliative care partners to establish and sustain secure, reliable, and cost-effective supply chains of high quality products to meet the needs of HIV-infected care and support and ARV treatment patients.

Activity ID: 12408.22565.09

Planned Funds: \$520,890

Activity System ID: 22565

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Academy for Educational Development's Umbrella Grant Management project (AED-UGM) will continue providing TA and capacity building (CB) to new and ongoing sub-partner organizations using the same strategy as mentioned above.

AED-UGM has one sub-partner, Population Council, working in this program area. Given the fact that Population Council is an organization that has a strong organizational structure and is technically sound, the AED-UGM views them as a partner who could potentially assist other sub-partners in the following ways: 1) sharing Strategic Planning and Organizational Management and Human Resources tools and expertise; 2) exposing them to ideas for project development and design; 3) sharing of administrative, financial and HR updates; 4) helping them to explore ways to incorporate men into HIV and AIDS programming; 5) helping to improve scientific writing skills; and 6) sharing experiences in networking and advocacy.

With FY 2009 funding, AED-UGM will organize and conduct Leadership Seminars, forge twinning relationships and convene trainings where Population Council's expertise will be used to strengthen sub-partner organizations. Examples of year two planned activities in this area are: 1) Leadership Seminar on Community Mobilization; 2) Leadership Seminar on HIV and AIDS operations research findings and thematic topics; and 3) exchange visits/twinning relationship between Population Council and GRIP on Rape Crisis Interventions, exploring opportunities for increasing access and adherence to ART.

Although no domain scores were assigned when conducting the Population Council's CB assessment in year one, their staff emphasized the benefit and usefulness of attending the AED-UGM's Monitoring and Evaluation workshops and would like to participate in future training of this nature. Additional areas where technical support would be helpful include: 1) Index training for improving their filing systems, 2) accessing long term support to address staff educational needs, and 3) exposure to research and thematic topics on HIV and AIDS-related issues. To date, the Population Council has received support from AED's Educational Training Fund (ETF) for participation in two courses: one on the Essentials of Human Resources and one on USAID Rules and Regulations; both offered by external training providers. It is anticipated that Population Council will continue to benefit from staff professional development courses sponsored by the AED-UGM.

AED-UGM is a capacity building program which ensures that sub-partner organizations collaborate and coordinate with the South African Government (SAG). AED-UGM seeks to ensure that all sub-partner service delivery strategies are aligned with the four priority areas in the NSP, namely: (i) Prevention; (ii) Treatment, Care and Support; (iii) Research, Monitoring and Surveillance; and (iv) Human Rights and Access to Justice.

AED-UGM is committed to gender equality and has established systems, procedures and monitoring and evaluation instruments to ensure sub-partners are sensitive to this issue. Since gender equality and gender equity are concerned with ensuring that the needs of women, men, girls and boys are addressed in all phases of program planning, AED-UGM monitors the integration of gender concerns in situation analyses, the formulation of objectives, program activities and MER plans. Thus, AED-UGM goes beyond the mere counting of the number of females and males attending training courses by actively promoting gender equality and gender equity, and providing support to sub-partners to enable them to address this issue effectively. As part of this process, sub-partners are required to report on gender-related activities in their quarterly monitoring reports. Gender equality consultants will also be engaged to strengthen the expertise of AED-UGM in this area.

Sub-partner organizations sign MOUs with provincial and district departments. Details concerning the status of MOUs in different provinces will be provided in sub-partner COPs. AED-UGM ensures that sub-partners report progress on SAG collaboration efforts and MOU status on a quarterly basis.

SUMMARY:

Currently, the USG PEPFAR Task Force supports institutional capacity building of indigenous organizations that implement PEPFAR programs through four competitively selected Umbrella Grants Mechanisms: Pact, the Academy for Educational Development (AED), Family Health International (FHI), and Right to Care (RTC). The main purposes of these new umbrella organizations are to (1) facilitate further scale-up of HIV treatment services; and (2) develop indigenous capability, thus creating a more sustainable program. The major emphasis area is local organizational capacity development. Primary target populations are indigenous organizations, including non-governmental organizations (NGOs), faith-based organizations (FBOs), and community-based organizations (CBOs).

As an Umbrella Grants Management (UGM) partner, Academy for Education Development (AED) supports institutional capacity building, technical assistance (TA), and grants administration for indigenous organizations that implement PEPFAR programs. These partners and sub-partners consist of indigenous NGOs, FBOs, and CBOs that were selected through the Inter-Agency PEPFAR Annual Program Statement (APS) and have met the criteria for full and open competition. The main functions of the UGM program are: (1) to facilitate further scale-up of HIV and AIDS care services and (2) to develop indigenous capability, thus creating a more sustainable program. The emphasis areas are human capacity development, local organization capacity building, and strategic information.

BACKGROUND:

AED has extensive experience managing grants programs on behalf of USAID with PEPFAR funds. Prior to award of the UGM under the South African APS, AED was already managing grant programs funded with PEPFAR dollars in Ghana and Honduras, and providing TA and capacity building to PEPFAR partners on palliative care and OVC work in Mozambique and Kenya. In addition, AED has been sourced as USAID's

Activity Narrative: exclusive partner for capacity building to the 23 NGOs funded under the PEPFAR Round One New Partners Initiative. As such, AED is well experienced in providing TA and capacity building on the broad array of technical areas related to PEPFAR programs, monitoring and evaluation, organizational development and finance management. In addition, AED has also been a key PEPFAR implementing partner in South Africa, and is thoroughly familiar with working on HIV and AIDS programs within this context.

As a UGM partner, AED will not directly implement program activities, but rather act as a grants administrator, technical assistance provider, and mentor for sub-recipients, who in turn carry out the assistance programs. AED closely collaborates and coordinates with the South African Government (SAG) in supporting PEPFAR partners through the umbrella grant mechanism. Although some of the partners work closely with various SAG Departments, AED's primary interface with the SAG is through the Senior Management Team (SMT), which includes key staff from USAID, National Departments of Health and Social Development, and representatives from the provincial departments. Under AED, between 6 and 11 indigenous partners will be supported via sub-grants and technical assistance, some of whom implement treatment-related activities. Under the umbrella grant mechanism the reach of sub-grantees for treatment is expected to be substantially expanded, which includes the purchase of antiretroviral drugs, drugs for treating opportunistic infections, treatment of symptom and pain management, and other treatment-related commodities (e.g. test kits).

ACTIVITY 1: Grants Management

AED will award and administer grants to partners selected through the South Africa PEPFAR APS competitive process to implement treatment activities. This involves an array of related activities including award and administration of grants, monitoring of grant progress, meeting reporting requirements, financial oversight, ensuring compliance with USG regulations, and grant closeout. AED will monitor treatment partners' program implementation and adherence to financial regulations. This involves provision of extensive technical assistance to partners on project development and implementation, financial management, monitoring and evaluation, and reporting.

ACTIVITY 2: Capacity Building

AED will support institutional capacity building of indigenous organizations. (Capacity building activities are defined as activities that strengthen the skills of indigenous organizations to implement HIV and AIDS programs efficiently, with diminishing reliance on internationally-based technical assistance and support.) AED will support activities to improve the financial management, program management, quality assurance, strategic information (M&E) and reporting, and leadership and coordination of partner organizations implementing treatment activities.

ACTIVITY 3: Monitoring and Evaluation (& Reporting)

AED will provide support to treatment partners on monitoring and evaluation, in order to strengthen measurement of the implementation and impact of program activities, an eventual achievement of PEPFAR goals. In addition, AED will provide supportive supervision to provide guidance, monitoring, mentoring and oversight through site visits, technical assistance, and performance evaluation. The management of service delivery programs under this project will contribute to the PEPFAR goals to provide treatment to 2 million HIV-infected people; prevent 7 million HIV infections; and provide care to 10 million people infected by HIV and AIDS, including orphans and vulnerable children.

Activity System ID: 22649

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Monitoring and Evaluation

In order to improve data collection, analysis and reporting, AIDSRelief plans to introduce an appropriate upgrade to the existing monitoring and evaluation system, in the form of an electronic database to be utilized at the site level (for data collection) and central level (for data consolidation and reporting purposes). The system is based on the system developed by the sub-grantee of the program, the Institute for Youth Development South Africa (IYD-SA). The draft database has been presented to CDC team members and development is continuing based on initial feedback provided. The final product will be technically appropriate to the level of skills available at the site level as well as able to report on PEPFAR and South African government (SAG) indicators under the program.

Laboratory Services

Given that AIDSRelief sites operate in rural and remote areas, where technical capacity and infrastructure is lacking, heavy emphasis is put on provision of laboratory services through a quality service provider. To overcome this challenge, a Johannesburg-based Toga Laboratories, another PEPFAR-funded partner, has been selected as the laboratory service provider for laboratory tests to be conducted under the program. The company has been established by Prof. Des Martin and Dr. John Sims, both long-time South African virology experts. Toga Laboratories has an ongoing quality assurance (QA) program to monitor and evaluate, objectively and systematically, the reliability of the laboratory data. There is an in-house laboratory quality unit which coordinates external quality assurance. For every test performed in the laboratory, there is a quality control plan stated in standard operating procedures (SOP). Internal quality controls (IQC) are performed daily on all instruments as well as for manual tests and recorded. External quality assessments include the UK National External Quality Assessment Scheme (UKNEQAS) as well as National Health Laboratory Services (NHLS) assessment programs, among others.

Collaboration with SAG

Due to increased access of quality services provided by the SAG, patients from two AIDSRelief sites (Sinosizo clinic in Groutville near Durban in KwaZulu-Natal and the Sisters of Mercy home-based care program at the Bethal District Hospital in Mpumalanga Province) have been fully absorbed into the public health care system and the AIDSRelief non-governmental organization activities became redundant, with funding reallocated to other resource-poor sites. At the same time, significant progress is being made collaborating more closely with SAG in other geographic areas. These include the Masibambisane treatment center in Eastern Cape Province, which moved into the Stutterheim District Hospital and subsequently have been successfully accredited as the SAG roll-out site. In this instance, AIDSRelief is providing staff and technical assistance while the SAG is providing laboratory tests and ARV drugs.

SUMMARY:

Activities support procurement of antiretroviral (ARV) drugs under the comprehensive ART program carried out by Catholic Relief Services (CRS) in 25 sites. Coverage extends to eight provinces in South Africa (excluding the Western Cape). The emphasis areas are human capacity development and local organization capacity building. The target population includes people affected by HIV and AIDS as well as higher risk populations such as migrant workers and refugees.

BACKGROUND:

AIDSRelief (the Consortium led by Catholic Relief Services) received Track 1 funding in FY 2004 to rapidly scale-up antiretroviral therapy (ART) in nine countries, including South Africa. Since FY 2005, in-country funding has supplemented Track 1 funding, and this will continue in FY 2008. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and the Institute for Youth Development South Africa (IYD-SA).

ACTIVITIES AND EXPECTED RESULTS:

With funding provided in FY 2008, AIDSRelief will continue implementing the activities in support of the South African Government (SAG) national ART rollout. In the interest of maximizing available funds the focus will be placed on strengthening the existing sites' provision of services rather than on assessing and activating new sites. Utilizing technical assistance from AIDSRelief staff members and South African experts, ongoing support and guidance will be provided to sites in the form of appropriate refresher medical training courses, patient tracking and reporting, monitoring and evaluation mechanisms and other necessary support.

ARV drugs are provided to all qualifying HIV patients who present at the sites, irrespective of their age, gender, nationality, religious or political beliefs. The access to non-South Africans is particularly significant, as the public sector rollout program is restricted to South African and legal refugees and asylum seekers. However, South Africa has a large displaced population, including economic migrants who do not have South African identity documentation. Historically, about 90% of adults and 10% of children with HIV have been receiving ARV drugs through the 25 partner sites.

ARV drugs purchased will be used by the 25 sites to treat ARV patients through clinic-based and home-based activities aimed at optimizing quality of life for HIV-infected clients and their families. For most of the 25 sites, ARV drugs are currently being purchased centrally through a Johannesburg-based pharmaceutical company, and delivered via courier to the field sites monthly on a patient-named basis. CRS is billed once a month for all site deliveries after verification of drugs delivered to each site. The opportunity of accessing preferential cost drugs is being utilized through cooperation with GlaxoSmithKline where available. Although the AIDSRelief sites have not experienced stock-outs in significant volume, they have been experienced on a limited number of occasions. Efforts to address or prevent such occurrences in the future include substitution by a more expensive drug on stock (all approved by the appropriate regulatory authorities of the

Activity Narrative: host country and the donor). Generic medications purchased comply with the USG PEPFAR Task Force requirement of FDA approval as well as approval from the Medicines Control Council of South Africa.

All activities will continue to be implemented in close collaboration with the SAG's HIV and AIDS Unit and the respective provincial authorities to ensure coordination and information sharing, directly contributing to the success of the SAG's own rollout and the goals of PEPFAR. These activities are also aimed at successful integration of AIDSRelief activities into those implemented by the government, thus ensuring long-term sustainability. All sites operate in terms of a Memorandum of Understanding with the provincial Department of Health in which they operate, observing the national and provincial treatment protocols. There is a concerted effort at each site to ensure sustainability by either having the SAG provide antiretroviral drugs, or by down referring stable patients in to the public primary healthcare clinics after providing training for the SAG clinic staff. St. Mary's Hospital, which accounts for more than a third of patient numbers, has already been accredited as a SAG rollout site. Sinosiso is receiving drugs from Department of Health due to its status as a down referral clinic for Stanger Hospital. At Centocow and Bethal, all patients are already receiving drugs through the SAG rollout.

In terms of the actual drug procurement, AIDSRelief in South Africa has a centralized procurement system of ARV drugs, which already provides the economies of scale in terms of drug pricing to the extent possible (outside of the SAG-mandated single exit price). This centralized procurement system buys drugs in volume, and keeps sufficient stock levels to supply the AIDSRelief sites with drugs and ensure no stock-outs occur. The centralized procurement system also manages losses due to expiry of the drugs, and ensures compliance with FDA and MCC (Medicines Control Council of South Africa) requirements. Each patient has their 6-month repeat prescription originally assigned by the doctor and then dispensed by the pharmaceutical supplier, which is revised where necessary (in line with SAG guidelines). In terms of monitoring of the program, the majority of the AIDSRelief sites are utilizing the centrally-based laboratory services provider Toga (a PEPFAR prime partner) that conducts blood tests (CD4, viral load etc.) for the sites, using the courier service available in country to deliver the blood samples, and reporting back to the sites on the results through either e-mail or an online electronic reporting system setup by the Laboratory services provider. Due to good existing infrastructure in South Africa, AIDSRelief sites are able to perform viral load and CD4 tests once every six weeks, to monitor the treatment progress and possible failure on the individual patient level. These analyses are conducted by each of the AIDSRelief sites, using the data provided by the Laboratory services provider, as part of the clinical management of the patients. The majority of the AIDSRelief sites also use hand-held lactate meters (provided for free by the laboratory services provider) to screen for hyperlactatemia, which is the most common severe side effect of patients who have been on treatment for prolonged periods of time. Feedback on program level of the progress and viral suppression is regularly provided by a clinical expert at the Desmond Tutu HIV Foundation, using the laboratory data provided by Toga Labs on patients whose blood was tested through their facilities.

FY 2008 COP activities will be expanded to include increased collaboration with the SAG to ensure long-term sustainability of the program, through different arrangements that vary from one province to another. These include the transfer of "stable" patients (on ART for 6 months or longer) to public sector health facilities, and then enrolling additional patients at the AIDSRelief partner site. Other options include provision of free ARV and opportunistic infections drugs and laboratory tests for SAG-accredited facilities run by AIDSRelief, or those that are physically located on SAG-owned premises, thus allowing them to receive free drugs or services. As in the case above, this allows the AIDSRelief sites to enroll additional patients on ART. Other examples include provision of ARV drugs by the SAG, and home-based care and support and adherence follow-up by the AIDSRelief-run partner site. All the different models of collaboration are individually discussed with the provinces where the partner sites operate, and largely depend on specific needs and operating environment of each treatment site and SAG authorities, but are designed to ultimately allow long-term sustainability and success of the program.

Activity System ID: 22644	

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

Activities funded with Track 1 funding are integrated with the local funding, and this comprehensive program (including progress and planned activities) is contained in the local funding COP entry.

AIDSRelief implements a comprehensive HIV care and treatment program in South Africa that is funded with Track 1 central funding, as well as South Africa COP funding. The activities do not differ across the funding mechanisms, and this entry is thus a repeat of the South Africa COP entry. All targets are reflected in the South Africa COP entry.

SUMMARY:

Activities are implemented to support procurement of antiretroviral (ARV) drugs under the comprehensive ART program carried out by Catholic Relief Services (CRS) in 25 sites. Coverage extends to eight provinces in South Africa (excluding the Western Cape). The emphasis areas are human capacity development and local organization capacity building. The target population includes people affected by HIV and AIDS as well as higher risk populations such as migrant workers and refugees.

BACKGROUND:

AIDSRelief (the Consortium led by Catholic Relief Services) received Track 1 funding in FY 2004 to rapidly scale-up antiretroviral therapy (ART) in nine countries, including South Africa. Since FY 2005, in-country funding has supplemented Track 1 funding, and this will continue in FY 2008. The activity is implemented through two major in-country partners, Southern African Catholic Bishops' Conference (SACBC) and the Institute for Youth Development South Africa (IYD-SA).

ACTIVITIES AND EXPECTED RESULTS:

With funding provided in FY 2008, AIDSRelief will continue implementing the activities in support of the South African Government (SAG) national ART rollout. In the interest of maximizing available funds the focus will be placed on strengthening the existing sites' provision of services rather than on assessing and activating new sites. Utilizing technical assistance from AIDSRelief staff members and South African experts, ongoing support and guidance will be provided to sites in the form of appropriate refresher medical training courses, patient tracking and reporting, monitoring and evaluation mechanisms and other necessary support.

ARV drugs are provided to all qualifying HIV patients who present at the sites, irrespective of their age, gender, nationality, religious or political beliefs. The access to non-South Africans is particularly significant, as the public sector rollout program is restricted to South African and legal refugees and asylum seekers. However, South Africa has a large displaced population, including economic migrants who do not have South African identity documentation. Historically, about 90% of adults and 10% of children with HIV have been receiving ARV drugs through the 25 partner sites.

ARV drugs purchased will be used by the 25 sites to treat ARV patients through clinic-based and home-based activities aimed at optimizing quality of life for HIV-infected clients and their families. For most of the 25 sites, ARV drugs are currently being purchased centrally through a Johannesburg-based pharmaceutical company, and delivered via courier to the field sites monthly on a patient-named basis. CRS is billed once a month for all site deliveries after verification of drugs delivered to each site. The opportunity of accessing preferential cost drugs is being utilized through cooperation with GlaxoSmithKline where available. Although the AIDSRelief sites have not experienced stock-outs in significant volume, they have been experienced on a limited number of occasions. Efforts to address or prevent such occurrences in the future include substitution by a more expensive drug on stock (all approved by the appropriate regulatory authorities of the host country and the donor).

Generic medications purchased comply with the USG PEPFAR Task Force requirement of FDA approval as well as approval from the Medicines Control Council of South Africa.

All activities will continue to be implemented in close collaboration with the South African Government's HIV and AIDS Unit and the respective provincial authorities to ensure coordination and information sharing, directly contributing to the success of the South African Government's own rollout and the goals of the President's Emergency Plan. These activities are also aimed at successful integration of AIDSRelief activities into those implemented by the South African government, thus ensuring long-term sustainability.

All sites operate in terms of a Memorandum of Understanding (MOU) with the provincial Department of Health in which they operate, observing the national and provincial treatment protocols. There is a concerted effort at each site to ensure sustainability by either having the SAG provide antiretroviral drugs, or by down referring stable patients in to the public primary healthcare clinics after providing training for the SAG clinic staff. St. Mary's Hospital, which accounts for more than a third of patient numbers, has already been accredited as a SAG rollout site. Sinosizo is receiving drugs from Department of Health due to its status as a down referral clinic for Stanger Hospital. At Centocow and Bethal, all patients are already receiving drugs through the SAG rollout.

In terms of the actual drug procurement, AIDSRelief in South Africa has a centralized procurement system of ARV drugs, which already provides the economies of scale in terms of drug pricing to the extent possible (outside of the SAG-mandated single exit price). This centralized procurement system buys drugs in volume, and keeps sufficient stock levels to supply the AIDSRelief sites with drugs and ensure no stock-outs occur. The centralized procurement system also manages losses due to expiry of the drugs, and ensures compliance with FDA and MCC (Medicines Control Council of South Africa) requirements. Each patient has their 6-month repeat prescription originally assigned by the doctor and then dispensed by the pharmaceutical supplier, which is revised where necessary (in line with SAG guidelines).

Activity Narrative: In terms of monitoring of the program, the majority of the AIDSRelief sites are utilizing the centrally-based laboratory services provider Toga (a PEPFAR prime partner) that conducts blood tests (CD4, viral load etc.) for the sites, using the courier service available in country to deliver the blood samples, and reporting back to the sites on the results through either e-mail or an online electronic reporting system setup by the Laboratory services provider.

Due to good existing infrastructure in South Africa, AIDSRelief sites are able to perform viral load and CD4 tests once every 6 weeks, to monitor the treatment progress and possible failure on the individual patient level. These analyses are conducted by each of the AIDSRelief sites, using the data provided by the Laboratory services provider, as part of the clinical management of the patients. The majority of the AIDSRelief sites also use hand-held lactate meters (provided for free by the Laboratory services provider) to screen for hyperlactatemia, which is the most common severe side effect of patients who have been on treatment for prolonged periods of time.

Feedback on program level of the progress and viral suppression is regularly provided by a clinical expert at the Desmond Tutu HIV Foundation, using the laboratory data provided by Toga Labs on patients whose blood was tested through their facilities.

FY 2008 COP activities will be expanded to include increased collaboration with the SAG to ensure long-term sustainability of the program, through different arrangements which vary from one Province to another. These include the transfer of "stable" patients (on ART for 6 months or longer) to public sector health facilities, and then enrolling additional patients at the AIDSRelief partner site. Other options include provision of free ARV and OI drugs and laboratory tests for SAG-accredited facilities run by AIDSRelief, or those that are physically located on SAG-owned premises, thus allowing them to receive free drugs or services. As in the case above, this allows the AIDSRelief sites to enroll additional patients on ART. Other examples include provision of ARV drugs by the SAG, and home-based care and support and adherence follow-up by the AIDSRelief-run partner site. All the different models of collaboration are individually discussed with the provinces where the partner sites operate, and largely depend on specific needs and operating environment of each treatment site and SAG authorities, but are designed to ultimately allow long-term sustainability and success of the program.

Activity System ID: 22876

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SABCOHA, will have identified a treatment partner to assist in the implementation of the treatment component of the program.

The treatment component of this SABCOHA initiative will initially be implemented in at least three provinces namely: Gauteng, Mpumalanga and KwaZulu-Natal. The SABCOHA Vendor Chain and BizAIDS counseling and testing (CT) programs will identify HIV-infected individuals will be referred into ARV treatment (ART) services. The major area of emphasis is commodity procurement. The minor areas of emphasis include Development of Network/Linkages/Referral Systems and Training. The primary target group for these activities are men and women of reproductive age who are employed in small, medium enterprises, truck drivers, factory workers.

The Vendor Chain and BizAIDS components of the existing SABCOHA program will begin a CT component that will identify HIV-infected individuals. These individuals will have access to Treatment/ARV Drug network.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Procuring and Supplying ARV Drugs

SABCOHA will be responsible for establishing systems to procure and supply ARV Drugs for its treatment sites and ensure that there are no drug stock-outs on any drugs despite global shortages in stavudine and lamivudine. PEPFAR funds will be used for the procurement and distribution of ARV drugs to HIV-infected individuals who are unable to access government facilities by ensuring that they are provided via a network of trained general practitioners. A system will be set up where the ARV prescriptions are forwarded to a pharmacy, which handles all the procurement, logistical and pharmaceutical management, dispensing and distribution of ARVs for this project. The drugs will then be delivered to the treatment sites via an independent courier company on a weekly basis. Treatment sites receive batches of drugs for multiple patients with drugs labeled and dispensed on a patient-named basis. Drugs are then securely stored at the site and dispensed to the patient on a monthly basis. Where sites are able to harness the capacity of a pharmacist, direct procurement will be facilitated.

SABCOHA will support the PEPFAR vision outlined in the Five-Year Strategy for South Africa by expanding access to ART services for this program's target audience, building capacity for ART service delivery and increasing the demand for an acceptance of ARV treatment.

Table 3.3.15: Activities by Funding Mechanism

Mechanism ID: 8711.09	Mechanism: N/A
Prime Partner: Tshepang Trust	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: ARV Drugs
Budget Code: HTXD	Program Budget Code: 15
Activity ID: 19520.22822.09	Planned Funds: \$881,678
Activity System ID: 22822	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Under the PEPFAR-funded Workplace Intervention Program, the Tshepang Trust will continue to offer teachers, health care workers and people from the small medium and micro enterprises (SMMEs), together with their spouses and immediate dependents, life saving antiretroviral drugs (ARVs) in a safe, confidential, private and patient-friendly environment that promotes destigmatization through private general practitioners (GPs) in their consulting rooms.

The mode of delivery of ARVs is that they are couriered into GPs rooms already dispensed, labeled and patient-ready on a monthly basis through a reputable pharmaceutical distributing and dispensing company within a 48-hour turnaround period. Every time the drugs are delivered, the patients receive text messages on their cell phones from this company to alert them that their medication has arrived and is ready for collection at the GP's office. The same company uses text messages to alert the patients for repeat blood tests a month before they are due and to alert GPs to write repeat prescriptions for active patients a month before prescriptions are about to expire.

When the Trust started, it was using ethical drugs as it had negotiated preferential access prices with all the major pharmaceutical companies providing ARVs. However, it now accepts generic ARVs that are Food and Drug Administration and Medical Control Council-approved in order to bring the costs of medication down and increase its chances of putting more individuals on treatment.

INTEGRATED ACTIVITY FLAG:

Activities are linked to others described in Counseling and Testing, and ARV Services. This is a follow-on activity to the American Center for International Labor Solidarity.

SUMMARY:

This activity is a follow-on to the partnership with the American Center for International Labor Solidarity to treat South African educators and their spouses and dependents through the Prevention, Care and Treatment Access Program. This activity as part of the COP between PEPFAR and Tshepang has been expanded to include individuals in the SMME and Healthcare Sector. With FY 2007 PEPFAR funding, the USG issued an Annual Program Statement to solicit partners to provide comprehensive testing, care and treatment services in a workplace setting. The HIV and AIDS TREATMENT activity includes, doctor consultations, ARVs, related medications e.g. for minor opportunistic infections for a 1,000 patients.

BACKGROUND:

Whilst business has become somewhat more responsive to the needs of its employees to encourage testing for early detection and treatment of its employees to encourage testing for early detection and treatment of its employees in larger corporations, the reality is that there are still very low levels of counseling and testing in the workplace. Employees still do not trust that by enrolling in workplace HIV programs, they will not be discriminated against. The situation is worse in the small medium enterprises (SMEs) because unlike big corporations, SMEs are failing to follow the lead of their counterparts in providing counseling and testing services to their work force. As a result, SMEs need assistance in providing and developing a workplace response to HIV and AIDS.

The Tshepang Trust (also known as Tshepang) is the South African Medical Association (SAMA)'s HIV and AIDS program initiated to bridge the gap in medical resources using private general practitioners (GPs) in the public private partnership model in order to assist the South African government fight against HIV and AIDS. SAMA has more than 5000 private medical practitioners in the private practice trained in HIV clinical management. Tshepang has been in existence since June 2003 and is a registered local non governmental organization (ngo) operating as a trust under Section 21 of the South African Companies Act. This is a workplace program targeting small medium enterprises (SMMEs) employees, their partners and dependents using general practitioners and their consulting rooms as sites. For this initiative Tshepang trust is in the process of forming collaborative relationships with two South African corporate companies to establish a HIV and AIDS workplace program. In addition to this initiative, Tshepang will work with the healthcare sector, targeting personnel in hospitals and clinics within the Gauteng area. Lastly, Tshepang will continue to provide services to educators who received services under the Solidarity Center program which is ending in December 2007. Tshepang Trust currently has strong evidence of leadership support from the South African Government through a public private partnership with the Gauteng provincial department of health to enhance the scale up of HIV counseling and testing (CT) and treatment in Gauteng's ARV sites. Tshepang currently serves under serviced rural areas in South Africa utilizing general practitioners who are located mostly in rural areas. Using this model, Tshepang has developed a public-private partnership between SMEs where employees and their dependents can access private general practitioners in areas close to where they are employed without fear of discrimination of being absent from work. In addition all of the general practitioners are within reach of the targeted audiences and are local and indigenous and therefore able to relate to the target population according to their culture and in local languages. The geographical coverage area for this project is national. The emphasis area for this workplace activity is development of networks, linkages, referral systems. The target population for this initiative is men and women of reproductive age working in SMEs, healthcare and education sectors, their partners and dependents. This includes factory workers, teachers working in the education sector and healthcare workers working in the public healthcare sector. The major emphasis area for this activity will be commodity procurement as is ARVs and medication for minor opportunistic infections and side effects, with minor emphasis placed on development of network/linkages/referral systems.

ACTIVITIES AND EXPECTED RESULTS:

Through a public-private partnership among workplaces, NGOs and government, participating workplace

Activity Narrative: programs will employ the services of doctors to provide antiretroviral therapy (ART) to workers who qualify for treatment. The doctors will be trained in HIV and AIDS clinical management and will have experience in drug purchasing, ART and PMTCT treatment and surveillance. The doctors will perform a clinical examination and staging, including taking blood for CD4 testing. A viral load test will be done before the start of treatment. An adherence counselor will be assigned to each patient and will be responsible for the continued home-based support and monitoring of the patient's condition. The counselor will also liaise with the doctor. The treatment services will utilize South African Department of Health standards and guidelines. All patients will receive their drugs from the doctors' offices. The doctor will ensure that the delivery system keeps stock of and is able to deliver antiretroviral therapy medications to any physical address. Special care will be taken to ensure that patient confidentiality is not compromised.

By providing comprehensive ARV services, including patient eligibility testing and drug procurement, workplace HIV prevention programs will provide HIV-infected workers in small and medium enterprises in the health and education sector with care and treatment.

These activities will directly contribute to the PEPFAR goal of providing comprehensive HIV and AIDS care to ten million people and ARV treatment to two million people. These activities will also support the care and treatment objectives laid out in the USG Five-Year Plan for South Africa.

Activity Narrative: Funding allocated for 2009.
NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for these activities. As the Medical Research Council of South Africa (MRC) is dealing with research and not the implementation of programs, a decision was made during the PEPFAR South Africa Interagency Partner Evaluation to discontinue the TB/HIV multi-drug resistance budget as well as treatment, care and counseling activities, and put them under a TBD Funding Opportunity Announcement. Therefore there is no need to continue funding this program area with FY 2009 COP funds.

Program Budget Code: 16 - HLAB Laboratory Infrastructure

Total Planned Funding for Program Budget Code: \$5,889,767

Program Area Narrative:

In 2001, South Africa restructured its public sector medical laboratory service and created the National Health Laboratory System (NHLS), a parastatal organization funded through the National Department of Health (NDOH) and further supported by its fee-for-service revenue generating activities. The NHLS is accountable to the NDOH through its Executive Board and is responsible for public sector laboratory service delivery to approximately 85% of South Africa's health systems. The NHLS governs activities and funds the National Institute of Communicable Diseases (NICD) to provide surveillance, research, and programmatic operations. The NHLS also funds the National Institute of Occupational Health (NIOH) to develop policies and to support occupational health exposure surveillance. The public service delivery arm of NHLS is comprised of approximately 260 laboratories, which include all provincial diagnostic pathology labs, tertiary level, secondary, and primary laboratories in the nine South African provinces and their associated district hospital laboratories. Each district laboratory supports a network of local clinics that provide primary care services.

In previous years, PEPFAR has provided limited direct support to the NHLS with a significant portion of COP activities focused within the NICD to carry out the majority of laboratory related activities in the COP. In FY 2008, a new Cooperative Agreement was awarded to the NHLS, expanding laboratory support activities across the NHLS, NIOH, and providing continued support of the existing PEPFAR supported NICD activities. PEPFAR funds will be used to continue to address gaps identified by the NDOH, NHLS, NIOH, and NICD, and to address laboratory-specific unmet needs and policy or administrative issues that impede full implementation of public laboratory programs, which support the national antiretroviral treatment (ART) rollout and the Tuberculosis Strategic Plan for South Africa, 2007-2011. Consistent with the priorities identified by the NDOH, and implemented by the NHLS, NIOH, and NICD, PEPFAR will continue to provide funding to assure the accuracy and quality of testing services in support of rapid scale-up of HIV testing and TB diagnostic capacity, and to build long-term sustainability of quality laboratory systems in South Africa. In addition, PEPFAR funds will be used to fund Toga Integrated HIV Solutions (Toga), a second year PEPFAR partner that aims to establish a network of HIV monitoring laboratories and associated service access tools to ART settings in resource-constrained areas where existing public NHLS laboratory coverage is limited or stretched.

Toga is an organization based on the framework of an existing private molecular diagnostics laboratory. Toga provides molecular diagnostic support to Ampath (National Pathology Support Services) and, as such, has become an integral part of the suite of pathology services offered by that organization. Toga is comprised of a cohesive team consisting of clinical virologists, scientists, and technologists who have accumulated considerable experience in the field of molecular biology. Toga is a valuable resource that assists with HIV laboratory support and clinical management. Toga is committed to driving increased access to molecular HIV diagnostic testing and treatment monitoring for all South Africans under the framework of the national HIV and ART rollout and scale-up.

With the continuing expansion of HIV and TB services within NHLS and with significant increases in multi-drug and extensively drug-resistant TB (MDR/XDR-TB) cases within South Africa, additional support is required to strengthen HIV and TB diagnostic capacity and information management infrastructure. NHLS has responded to this need by planning to expand HIV diagnostics and treatment monitoring capabilities in all nine provinces. There are 54 CD4 laboratories in the 9 provinces within the NHLS system, but coverage within each health district is limited. There are only 14 laboratories in 5 provinces that are able to provide viral load testing, and only 9 laboratories in 5 provinces are able to provide infant polymerase chain reaction (PCR) diagnostics. NHLS will expand services to provide at least one CD4 laboratory per health district and will ensure that viral load and infant PCR services are available in all the provinces. NHLS also recognizes their limited TB laboratory capacity due to high burden and inability to capture and report MDR/XDR-TB cases to the National TB Control Programme (NTP). In response, NHLS will roll out the line probe assay in 20 existing facilities. There is an urgent need to provide increased access to TB diagnoses and referral services and to strengthen the management and reporting of MDR/XDR-TB cases, data mining activities, and surveillance analysis from the existing NHLS Data Warehouse (DISA). Finally, it is critical that data is integrated into the existing national Electronic TB Register (ETR.Net) surveillance system. The NHLS DISA system can extract laboratory data from existing NHLS laboratory information systems and data can be imported into the ETR.Net database. The current system does require strengthening and NHLS is actively working to improve the capacity and utility associated with this system, as well as a new patient management system to be piloted this year.

National policies and standards on infection control programs within laboratories are limited. The NIOH is authorized to develop policies for occupational health. PEPFAR funds will be used to promote an infection control network, and to develop robust and manageable infection control policies and surveillance activities. Collaboration with other PEPFAR partners will assist in the development of such policies and will lead to enhancement of existing infection control measures and implementation of national infection control standards and monitoring for laboratory staff and other healthcare workers.

With the availability of significant technical and scientific resources within South Africa, NICD and NHLS are well placed to continue to provide regional laboratory support within Sub-Saharan Africa. Both organizations will expand and strengthen existing regional support mechanisms and will enhance collaboration with other PEPFAR-funded countries through the African Center for Integrated Laboratory Training (ACILT). Expansion of services includes, but is not limited to, extending external quality assurance (EQA) programs, TB and HIV laboratory diagnostic technical support and services, regional HIV rapid testing kit evaluations, integrated TB/HIV training programs, and other HIV and TB related laboratory technical assistance. All regionally supported activities will be funded by requesting countries within their COP submissions, and are not directly funded by South African

PEPFAR monies.

During FY 2009, PEPFAR funds will be used to continue support to NICD. Support includes: a) evaluating HIV incidence testing methodologies; b) using EQA to monitor PCR DNA testing of infants and of molecular testing associated with ART for the NHLS; c) providing quality assessments of HIV rapid test kits for the NDOH; d) assisting the NDOH in training staff in 4,000 VCT sites on proper HIV rapid testing procedures and quality management systems, utilizing the WHO/CDC HIV Rapid Test training package; e) implementing an operational plan to scale-up early HIV diagnosis in infants utilizing PCR testing of dry blood spots; f) assisting the National TB Reference Laboratory in equipping and readiness preparation when completed in late 2008; and (g) providing laboratory training for clinical laboratorians and renovating temporary student housing to accommodate long term-training sessions under ACILT.

NICD will continue to support important strategic information activities to help inform the decisions of policy makers and program officials regarding their HIV prevention and ART roll-out programs. These activities include HIV-1 and TB national drug resistance and transmission surveillance; sentinel surveillance of opportunistic bacterial and fungal pathogens in HIV-infected persons; microbiological etiological and antimicrobial resistance surveillance for other opportunistic infections; provision of training for South African epidemiologists and laboratory workers; and collection of trend data on HIV incidence. Detailed descriptions of these activities can be found in the Strategic Information section in the COP.

New collaborative NHLS activities aim to: a) increase national coverage of HIV and TB diagnostics (line probe assay rollout in 20 facilities) and treatment monitoring capabilities; b) ensure uniform quality assurance measures among laboratories; c) support activities to initiate new and strengthen existing EQA programs; d) strengthen laboratory reporting systems in support of rural clinics and laboratories; e) promote efforts to synchronize infection control activities in collaboration with the NIOH; f) investigate, assess, validate, and implement new automated laboratory diagnostic equipment and high capacity instrumentation for high burden diagnostics and service delivery needs; and g) expand upon the regional support and collaboration with other PEPFAR-funded countries through the established ACILT.

Toga aims to increase national coverage of HIV diagnostics in remote rural areas by engaging local and provincial government and placing four additional Togatainers in FY 2009. Toga has developed a Togatainer laboratory based on the MeTRo (Measure to Roll Out) principle as a means of rolling out treatment capacity and developing a near real time laboratory information management system. Togatainer addresses the need for peripheral deployment of these required laboratory services, recognizing that laboratory services in the public sector are provided through regional centralized laboratories, with limited peripheral capacity for specialized testing (e.g. CD4 and viral load).

Table 3.3.16: Activities by Funding Mechanism

Mechanism ID: 7316.09	Mechanism: CARE UGM
Prime Partner: Wits Health Consortium, NHLS	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Laboratory Infrastructure
Budget Code: HLAB	Program Budget Code: 16
Activity ID: 16285.22722.09	Planned Funds: \$166,899
Activity System ID: 22722	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: Technical assistance and scale-up of early infant diagnosis

Using FY 2009 funding, this activity aims to assess the implementation challenges and develop guidelines to scale up early infant diagnosis for infants born in PMTCT programs. Technical assistance will be provided to the provinces (& other countries on request) to help escalate the rollout of early infant diagnosis services. This project was specifically requested by the Gauteng Province DOH, with strong support from NDOH and its PMTCT Early Diagnosis Committee. Technical assistance for the introduction of the new automated Taqman assay to replace the HIV DNA polymerase chain reaction (PCR) assay will be provided. In particular, monitoring the performance of this new assay in the field will be done in relation to the new dual therapy PMTCT program, the age of the infant and the ability to use the assay for viral load monitoring on dried blood spots. Monthly PCR test statistics for monitoring the progress of the program will be provided to HIV program managers in Gauteng & the monitoring database will be upgraded to a national level (except for KwaZulu-Natal data); incorporation of rapid HIV tests for infants and children; updating of diagnostic algorithms for children in an evidence-based manner; and establishing a system for feedback from clinics for central monitoring, e.g., service issues, quality control, etc. A program that increases peripartum HIV testing of women to improve identification of HIV-exposed infants is being assessed. All women are offered HIV testing in the peripartum period, newly diagnosed HIV-infected women's babies are given post-exposure prophylaxis and infants are followed to 6-weeks of age for PCR testing. Monitoring of the accuracy of the rapid tests supplied by DOH is done using Determine as a gold standard test because healthcare worker confidence in these tests that are frequently changed is low.

ACTIVITY 2: Capacity Building

In FY 2009, The Wits Paediatric HIV Clinics (WPHC) and National Health Laboratory Service (NHLS) will continue to facilitate training of clinic healthcare workers including nurses, doctors and lab technicians in the area of early infant diagnosis and update training content as practice evolves. The training will ensure that infants exposed to HIV accessing immunization clinics at six weeks of age are offered PCR testing. Training will help facilitate an average increase in test volumes from 3,500 to 4,500 per month in the Johannesburg laboratory. Serum panels from infants and children will be prospectively stored for testing of rapid HIV tests which are currently evaluated only on adult samples.

ACTIVITY 3: Linking the expanded program for immunizations (EPI) at primary healthcare clinics (PHC) with early infant diagnosis. In FY 2009, WPHC and NHLS will continue to explore systems to ensure PHC clinics act as entry points for HIV-affected children by identifying HIV-infected children (and other family members) for comprehensive HIV medical care, including referral between PHC and hospital facilities.

SUMMARY: The Wits Paediatric HIV Clinics (WPHC) & National Health Laboratory Service (NHLS) will use PEPFAR funds to expand a demonstration project that was implemented with FY 2006 and FY 2007 funding. The project is aimed at increasing access to early HIV diagnosis for infants, and developing guidelines for rollout of the project on a national level. This project was specifically requested by the Gauteng provincial Department of Health (DOH), with strong support from the National Department of Health (NDOH) and its Prevention of Mother-to-Child Transmission (PMTCT) Early Diagnosis Committee. Local organization capacity building, in-service training and ongoing operational research validating suitable HIV assays will be the major emphasis areas for this program, with minor emphasis given to commodity procurement, development of networks, linkages, and referral systems (especially between immunization clinics, early infant diagnosis and treatment, care and support), and logistics. The primary target population will include HIV-exposed infants (birth to five years old) and infants who are not infected, and secondary target populations include lab workers, doctors, nurses and South African government policy makers.

BACKGROUND:

Early infant diagnosis of HIV is vital for monitoring PMTCT programs and identifying HIV-infected children to receive care. Diagnosing HIV in children is more complex than in adults because of the interference of maternal HIV antibodies during infancy and ongoing exposure to the virus during breastfeeding. To date, HIV diagnostic services for children in low resource settings have been neglected and healthcare workers are not familiar with its theory or practice. About five million people in the country are HIV-infected and it is estimated that about 500,000 of these, which include 60,000 children, are in urgent need of antiretroviral (ARV) therapy. One frequently cited reason for so few children accessing treatment is the fact that mechanisms to diagnose infants early are not in place. Although NDOH Guidelines have made provisions for early diagnosis with HIV DNA PCR, in most places this has not yet replaced the previous protocol of using HIV ELISA tests at 12-months of age. In reality, infants are not followed up and either die before accessing care or only present once they are already ill with their first HIV-related illness. Lack of early diagnosis for exposed infants and the integration of PMTCT services with services providing ARV drugs have been identified as keys to improving access to care for HIV-affected children and their families, and thereby increasing the number of HIV-infected people receiving treatment.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Technical assistance and scale up of early infant diagnosis

Using FY 2008 funding, this activity aims to assess the implementation challenges and develop guidelines to scale-up early infant diagnosis for infants born in PMTCT programs. Technical assistance will be provided to the provinces to help facilitate the rollout of early infant diagnosis services. This project was specifically requested by the Gauteng province DOH, with strong support from NDOH and its PMTCT Early Diagnosis Committee. Technical assistance will be provided to improve lab infrastructure to conduct early infant diagnosis and scale up these services around the province. Technical assistance will be provided to establish dried blood spot testing in all HIV DNA PCR laboratories; to make monthly PCR test statistics

Activity Narrative: available, e.g., to "Concerned Pediatricians" to monitor progress; to optimize current & new HIV assays used; to update diagnostic algorithms for children in an evidence-based manner; and to establish a system for feedback from clinics for central monitoring, e.g., service issues, quality control, etc.

ACTIVITY 2: Capacity Building

In FY 2008, WPHC & NHLS will continue to facilitate training of clinic healthcare workers including nurses, doctors and lab technician in the area of early infant diagnosis & update training content as practice evolves. The training will ensure that infants exposed to HIV accessing immunization clinics at 6 weeks of age are offered PCR testing. Training will help facilitate an average increase in test volumes from 3,000 to 4,500 per month.

ACTIVITY 3: Linking the expanded program for immunizations (EPI) at primary healthcare clinics (PHC) with early infant diagnosis

In Fy 2008, WHPC & NHLS will continue to explore systems to ensure PHC clinics act as entry points for HIV-affected children by identifying HIV-infected children (and other family members) for comprehensive HIV medical care including referral between PHC and hospital facilities.

The NHLS early infant diagnosis demonstration project directly contributes to PEPFAR's 2-7-10 goals by increasing the number of infants accessing treatment in Gauteng, and serving as a platform for expansion of early infant diagnosis programs throughout the country. These activities support the PEPFAR Five-Year Strategy for South Africa by supporting government efforts to improve quality of and access to care and treatment for HIV-infected children.

Program Budget Code: 16

Planned Funds: \$186,899

Activity Narrative: SUMMARY:

The International Centre for AIDS Care and Treatment Programs (ICAP) will enhance its technical, financial and managerial support to the National Health Laboratory Services (NHLS) to strengthen the laboratory infrastructure, capacity and services in the rural ART sites to ensure efficient and quality laboratory services for care and treatment scale-up in the Eastern Cape (EC).

BACKGROUND:

The National Guidelines for Antiretroviral Treatment (ART) recommends CD4 cell counts as a prerequisite for the initiation of ART and subsequent six monthly monitoring of treatment outcomes. It also recommends baseline plasma viral load before starting ART in addition to periodic monitoring. In the rural ART sites of the EC and KwaZulu-Natal (KZN) provinces where the HIV epidemic is most severe, care and treatment services are compromised by deficient and often non-existent laboratory infrastructure, expertise, networking and access. As a result, laboratory services are often not performed in a timely manner, despite the massive scale-up of care and treatment services. Therefore, ICAP supports the NHLS to strengthen the laboratory infrastructure, capacity and services in the rural ART sites. With this support, an effective network of laboratories and the rural ART sites have been established to ensure efficient and quality laboratory services.

ACTIVITIES AND EXPECTED RESULTS:

The following activities will be supported and undertaken under the partnership:

ACTIVITY 1 : Assessment, gap identification and interventions to address laboratory unmet essential needs and coverage in the EC, KZN, Northern Cape (NC) and Free State (FS)

ICAP will provide technical, managerial and financial support to the NHLS to overcome barriers that hinder full implementation of laboratory support services for comprehensive HIV care and treatment programs by:

- a) Enhancing laboratory infrastructure to support HIV DNA testing using dried blood spot (DBS) technology, TB diagnosis, CD4 count and viral load testing;
- b) Improving specimen transportation in currently under-served rural areas in OR Tambo and Sisonke districts;
- c) Improving IT and LIS to facilitate transfer of patient details and results between clinical service sites and the laboratories;
- d) Upgrading district hospital infrastructure for basic laboratory assays and specimens;
- e) Expanding laboratory staff training to support increased need for DBS technology, CD4 testing and viral load;
- f) Supporting quality assurance (internal and external) and IT;
- g) Identifying and supporting basic program evaluation priorities in affordable HIV-related diagnostics, monitoring and surveillance.

ACTIVITY 2: Increase TB diagnostic services coverage

In the Eastern Cape the NHLS is performing 24 hour TB tests at the Port Elizabeth and Mthatha laboratories due to the increasing workload and demand for TB diagnostic services. ICAP will provide technical, financial and managerial support to expand access to quality sputum smear and culture. Further decentralization of sputum smear-microscopy will be supported.

ACTIVITY 3: Best laboratory practices

ICAP will promote and strengthen standardized best laboratory/clinical practices (GCLP) and uniform quality assurance measures in the supported laboratories and healthcare facilities in regards to monitoring performance.

ICAP will establish links with institutions that offer GCLP courses and ensure that key NHLS and DOH staff members attend and disseminate the information to others on their return.

Mthatha and Livingstone Hospital (Port Elizabeth) laboratories subscribe to two External Quality Assurance schemes - CDC and Quality control programs for molecular diagnostics (QCMD), for DNA PCR and viral loads. ICAP will support activities that strengthen existing External Quality Assurance (EQA) and Proficiency Testing (PT) programs. Assistance in preparing for accreditation, measuring clinical performance, reporting indicators, and disseminating performance reviews for action will be provided by ICAP.

ACTIVITY 4: Strengthening of the Quality Management Systems (QMS)

ICAP will support the strengthening and provision for QMS training at all healthcare facilities and laboratories that perform HIV rapid testing in line with South African national testing algorithms and policies.

ACTIVITY 5: Strengthening of the procurement systems

A unified approach to procurement and distribution of laboratory commodities will be supported by ICAP.

Provide financial support for a coordinated healthcare facility specimen collection and courier system.

ACTIVITY 6: Investigating new automated laboratory diagnostic equipment

ICAP will work with NHLS to investigate and acquire new automated and high capacity instrumentation for

Activity Narrative: high burden diagnostics in limited staff regions.
New/Continuing Activity: New Activity
Continuing Activity:

Table 3.3.16: Activities by Funding Mechanism

Budget Code: HLAB	Program Budget Code: 16
Activity ID: 14328.22870.09	Planned Funds: \$2,635,683
Activity System ID: 22870	

Activity Narrative: SUMMARY:

Activities will be carried out to address laboratory-specific unmet needs that impede full implementation of national laboratory programs. Activities will increase national coverage of HIV and TB diagnostics and treatment monitoring capabilities; ensure uniform quality assurance measures among laboratories; strengthen laboratory reporting systems; promote efforts to synchronize infection control activities in collaboration with the National Institute of Occupational Health (NIOH); and to expand upon the regional support and collaboration with other PEPFAR-funded countries.

BACKGROUND:

The NHLS is accountable to the National Department of Health (NDOH) through its Executive Board and is responsible for public sector laboratory services. The NHLS also governs activities and provides funding to the National Institute of Communicable Diseases (NICD) to provide surveillance, research and programmatic operations, as well as funding to the NIOH for policy development activities related to occupational health.

ACTIVITY 1: HIV testing at point of care

HIV testing at point of care settings using HIV rapid tests is set to increase in terms of the National strategic plan developed by the NDOH. Project Goals and Objectives: (1) Assess rapid HIV kits performance at a laboratory level; (2) routine monitoring of new lots/batches prior to release to testing sites and (3) produce training materials for HIV QMS, external quality assurance (PT) and internal quality controls (IQC) for testing sites for quality assurance purposes. The target would be 200 sites in 5 provinces over a year period to determine feasibility of the program. This will include piloting of dried plasma PT panels. Project Outputs: The objective of HIV assessment at field level allows for rational decision making in terms of algorithm setting and alternatives to current tests. Post marketing surveillance permits early warning systems to become operative. IQC usage will allow for program managers to become aware of any problems that could be site-specific or systematic. The EQA/PT program will assess overall program performance.

ACTIVITY 2: HIV Rapid kit Quality Management Training

As part of the National Strategic Plan to reduce infections by 50% by 2011 there is a need to expanded services for counselling and testing. Project Strategy: To continue QMS training implemented in 2008 and to provide direct support to the Provinces in terms of a train the trainer-type approach or direct training as needed. The current time spent per training is 2-3 months per province at the trainer level. The outcome will be that at least 5 provinces will be trained by the third quarter of 2009. The training will be integrated with implementation of EQA and IQC programs as well as M&E programs. Project Goals and Objectives: (1) Training of trainers in 9 Provinces in HIV rapid Test QMS and implementation of training at provincial level. (2) Integration of QMS training with implementation of EQA and IQC programs in at least 6 provinces. (3) Implementation of an M&E program that integrates with provincial-level monitoring of HIV rapid testing. Project Outputs: Monitoring of numbers trained: trainers and direct technical assistance, provincial coverage, IQC coverage and EQA scores, M&E evaluation scores in terms of numbers of sites trained and implementation of QMS program.

ACTIVITY 3: HIV-1 NAT EQA

External Quality Assessment (EQA) and IQC will be an integral part of the laboratory quality management system (QMS) that will detect weak spots in performance as well as improve on the reliability and confidence when performing HIV-1 NAT. Project Strategy - Description and Methodologies: The NICD will source local material as well as characterize materials in collaboration with QCMD for HIV viral load and subtyping PT and IQC. NICD will make the program available to 25-30 participating laboratories for two distributions: first and last quarters of 2009. Data will collated by an independent secretariat that includes the NICD and QCMD for data analysis. For the IQC program software development allows for web-based submission of data with real time analysis and trend analysis. A positive standard has been selected (subtype C, 5000 copies/ml) and characterized for this purpose. The program will be introduced in the first quarter of 2009. The NICD intends to introduce IQC program for HIV DNA testing on DBS in the second quarter of 2009 to 11 participating laboratories. Project Outcomes: (1) The implementation of an EQA program that will monitor laboratory performance related to the ART program. (2) Capacity development of the NICD to perform as a molecular EQA provider. (3) The development of an IQC program for HIV viral load testing and infant diagnosis that can provide real time monitoring (4) The use of locally relevant materials to be characterized and included in panels.

ACTIVITY 4: Early Infant Diagnosis

Project Goals and Objectives: (1) To develop a clinical and laboratory infrastructure that supports early testing and HIV diagnosis in infants. (2) To assess the most appropriate method for early and accurate diagnosis of HIV infection in infants. The primary objective is to utilize the DBS HIV DNA PCR as a tool for diagnostic purposes in a setting with approximately 6000 infants over a 12 month period from the second quarter of 2009. The objectives would be the identification of processes that will ensure high throughput that will allow for access to diagnostics, care and follow-up as required. Project Outputs: The primary outcome will be the establishment of technologies that can be applied in the public health setting for the early diagnosis of HIV infected infants as well as monitoring antiretroviral therapy. An algorithm of cost-effective testing will be a primary accomplishment. The application will be at an operational level to ensure that clinical sites that do not have easy access to diagnostic services benefit.

ACTIVITY 5: Increased access of TB culture and referral services

In light of the significant increase in MDR and XTR-TB cases within South Africa, and recognizing that there is a significant lack of laboratory capacity to capture and report suspect TB cases, it has been determined

Activity Narrative: that an immediate expansion of TB culture and referral services are required. TB culture facilities have been established in all provinces but to make a significant impact quickly, it has been proposed that a further 3 TB laboratories be renovated to meet current demands during this funding period, in Mpumalanga, the Western Cape, and KZN. The selected sites would provide a responsive and regional impact in respect to TB culture services and the overall ability to capture possible MDR and XTR-TB cases. The proposed sites would provide relief to the existing laboratory services and improve overall performance and TB diagnostic capacity within the entire region. Proposed funding would be used to provide equipment purchases and renovations for the proposed sites.

ACTIVITY 6: Approaches to increase TB laboratory throughput

With the current number of sputum samples submitted for laboratory smear microscopy and culture already at an all time high and continuing to increase, it is recognized that one of the most significant rate determining factors directly impacting laboratory through-put is that of the NALC decontamination process, a labor intensive processes of sputum concentration and decontamination. In order to streamline this process and to increase overall laboratory through-put of sputum specimens to meet the increased demand and lack of available staff to process such specimens, alternate or automated measures should be investigated. Currently, NICD has vested time in investigating possible automated methods that could significantly reduce and provide standardized decontamination processes. The currently proposed funds would be used, in partnership and through co-funding with NHLS, for the development of automated NALC decontamination instrumentation and technologies. The project with full details and project plan has been submitted. There is strict adherence to the time lines in the project plan and budget. Completion date of project will be January 2010.

ACTIVITY 7: National TB Quality Programs

Proficiency testing: Second line DST EQA for culture laboratories is a priority and will be developed during this funding period, as there is NO PT for second line anti-TB drugs in the NHLS. Description and Methodology: Simulated specimens for DST testing will be prepared and distributed to all culture facilities within the NHLS. The resistance profile among the organisms will vary from organism to organism and measure the proficiency of the laboratories to correctly identify resistance to second line drugs amikacin or kanamycin, ethionamide and ofloxacin. Capreomycin. Objectives of the program include: (1) capacity building, (2) improvement of quality (3) institution of corrective actions where deficiencies are detected and follow up, as well as (4) providing support to peripheral laboratories. Outputs: Second line DST is performed by MGIT liquid culture in the following NHLS Laboratories: Green Point, Port Elizabeth, Umtata, Albert Luthuli, Braamfontein. All these laboratories will be required to participate in the PT.

ACTIVITY 8: Rechecking program

A blind rechecking program is in the process of being rolled out in the NHLS. Goals and objective: (1) Blanket approach of rechecking random selected slides from the laboratory register is inadequate. (2) Selection of sample size is based on implementation and sustainability, rather than rigorous analytical methods. (3) The recommended sample size provides relative information on the sensitivity of microscopy. (4) Sample size is based on annual laboratory volume and the proportion of positive smears. (5) Positive slides are included to achieve blinding, but numbers are insufficient to determine specificity. (6) Guidelines to interpret Discrepancies.

ACTIVITY 9: Line Probes

Project Strategy: 20 NHLS regional laboratories will be identified for roll out of the line probe over the next 24 months. This entails (1) Identify additional space for PCR laboratories (2) Renovate the space for PCR laboratories to an acceptable standard (3) Purchasing of equipment (4) Training newly employed scientists (5) Validation of the assays (6) Institute quality systems for the ongoing monitoring of performance. A partnership will be established with Davies Diagnostics, the local supplier of the Hain line probe, for technical assistance in the training and roll out of the assay. Project Goals and Objectives: The overall goal is the establishment of line probe assays in 20 regional laboratories throughout South Africa for the early identification, isolation and treatment of new MDR-TB cases to improve outcomes in these patients. Project Outputs: PCR Laboratory space would have been identified and renovated, capital equipment put in place and scientists trained to perform the assay. Quality systems will be in place. These laboratories would be confident in performing routine diagnostic PCR investigation on smear positive sputa for the identification of MDR-TB patients.

ACTIVITY 10: National Tuberculosis Reference Laboratory

Molecular Biology: Goals and objectives: (1) With an emphasis on the MDR-TB and XDR-TB strains isolated nationally, molecular characterization of sensitive and resistant M tuberculosis will be commenced on the collection of MDR and XDR organisms from all provinces in South Africa. (2) Molecular investigations into outbreaks will be performed and unique mycobacterial strains and NTM species encountered will be identified and characterized by conventional, molecular and HPLC technology. (3) Molecular genotyping on a sample of the isolates obtained from drug resistance survey (about 14,000 strains) to accurately reflect the genotypic epidemiology of M tuberculosis in South Africa. Outcomes expected: (1) Characterizing general circulating M tuberculosis strains, MDR-TB strains and longitudinal characterization of repeat isolates from MDR-TB patients (2) Sequencing the resistance genes of M tuberculosis MDR-TB strains and promoters, (3) Molecular investigations into outbreaks (4) Characterizing general circulating M tuberculosis strains, MDR-TB strains and longitudinal characterization of repeat isolates from MDR-TB patients. Assays planned to be performed in the NTBRL include RFLP, spoligotyping, sequencing of drug resistance loci.

ACTIVITY 11: ACILT - African Centre for Integrated Laboratory Training

Objective: Recent reviews of TB and HIV laboratory practices throughout Africa have affirmed the principle

Activity Narrative: that accurate laboratory results are not only based on the number of people employed in laboratories, but on the quality of their work. This is chiefly a matter of better training, motivation and management according to good laboratory practices. The primary objective is to train technical staff from across Africa in current technologies and methodologies for TB and HIV. Strategy: It is proposed that a Technical Advisory Committee be formed which would provide technical expertise to the Centre management on issues related to management, laboratory curriculum development and training programs, review the training centre's training priorities and strategies so that they are in line with the regional requirements and targets, and give support to the faculty. Outputs: courses to be focused on in the short-term are: (1) TB culture/DST and molecular diagnostics. (2) Early Infant Diagnosis PCR (3) Laboratory management (4) Quality management systems (QMS) (5) Commodity management (quantification).

ACTIVITY 12: CDC Management & Administration

The NHLS/NICD has implemented financial and administrative processes to ensure improved focus and oversight of the funding of this Cooperative Agreement. These processes are broadly divided into two, being 1) processes around the budget development and the funding needs affecting the application, and 2) financial controls for project finances. Budget development and funding needs affecting the previous application were addressed by having a centralized budget development function. All the budgets and carry-forward requests are consolidated in conjunction with individual PIs, the Cooperate Services Manager of the NICD, the NHLS Cooperate Services and the PI managing the CDC grant overall. Secondly, financial controls affecting funds have been investigated and are currently being implemented in alignment with NHLS policies and procedures. The processes followed for committing expenditure and the treatment thereof have been documented. This forms the basis for the implementation of financial controls, including monthly reporting of expenditure, and the review of these expenditures by the relevant PIs.

Program Budget Code: 16

Activity ID: 12307.22835.09

Planned Funds: \$2,172,108

Activity System ID: 22835

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

It is anticipated that service access will increase the number of patients tested at existing sites from 4000 to 6,500 patients. Three new Togatainer deployment sites have been identified. The implementation will provide laboratory testing for an additional 2500 patients. The implementation of additional White Rabbit reporting and requesting systems is anticipated. Thirty healthcare professionals in the vicinity of deployed Togatainer will be trained in the implementation and management of ARVs. The clinical support service will be expanded to include these healthcare professionals. The emphasis in FY 2009 expansion activities will be the strengthening of healthcare systems where little resource exists, contributing to greater uptake of patients. Alignment will be sought with public partners.

The White Rabbit (WR) deployment has been problematic to date with the current IT system. Therefore, the WR enhancements of the Toga in-house IT system strengthening will be accelerated during FY 2009. This is a high priority area.

The development of a clearly defined sustainability plan is a key focus for FY 2009. Part of the roll-out program is to ensure its sustainability. In support of this process currently, once a site is identified a feasibility evaluation is performed on the possible support of other stakeholders or partners surrounding the area. The access to affordable testing allows patients to receive treatment, and the greater the number of patients served through the container, the greater opportunity exists for sustainability and cost reduction. The networks with local Department of Health (DOH) as well as voluntary organizations and individual clinicians will allow for each laboratory to run as business units allowing for surplus funds to be applied to further the interest of patients and care and enhance sustainability efforts. The Training of Healthcare workers is not limited to the clinics directly involved with Togatainer but is also open to allow interested partners to be exposed to advanced training as well as supporting the container as part of a community project further enhancing sustainability.

SUMMARY:

Toga Integrated HIV Solutions (Toga) is a new PEPFAR partner, awarded funding in July 2007. The project aims to establish a network of HIV monitoring laboratories and associated services in resource-constrained antiretroviral treatment (ART) settings.

Toga will use FY 2008 funds to deploy three Togatainer laboratories. These laboratories are mobile, prefabricated structures, ideally situated near ART clinics. The index unit has been operating in Gugulethu, Cape Town since March 2004. Three units are being deployed with FY07 funding. Many lessons were learned, including the importance of having staff that can multi-task, and work with minimum supervision. Communication technology is important, particularly in rural areas, and Toga has redesigned software and equipment to allow for light data transfer. Toga has also developed special redundancy technology. Each Togatainer will serve a sub-network of referrals White Rabbit electronic requesting and reporting systems.

BACKGROUND:

In South Africa, regional centralized laboratories serve the public sector, but these have limited capacity for specialized testing (e.g. CD4 and viral load). The private sector is served by centralized laboratories in Johannesburg, Cape Town and Pretoria with Stat-labs proximal to high patient, predominantly urban settings. The Togatainer addresses the need for peripheral deployment of laboratory services, specifically HIV treatment monitoring and utilizing a unique set of robust assays.

The Togatainer concept is based on the MeTRo (Measure To Roll Out) principle as a means of rolling out treatment capacity. The core output of a laboratory is information in the form of patient results. The chronic disease nature of HIV as well as the efficiencies that are attainable when structuring information appropriately is central to Toga's contribution. Patient data and results are consolidated in the laboratory information system to allow for cumulative reporting. This information can be used to down-refer patients in a structured way, thus relieving pressure on scarce clinical capacity. The general of viral load tests on site empowers healthcare staff to make appropriate management decisions. On-site viral load tests facilitate the down-referral of patients to peripheral clinics, thus decreasing the load on central clinics. This fulfils an objective of the WHO down-referral strategy.

Sustainable strategies must be cost effective. Experience and modeling suggests that the cost of testing peripherally can be done at a rate that is at least equal to a long distance logistical service structure to a central facility. However, even a cost per unit comparison may not reflect the real programmatic costs. Statistical variance on lost specimens/results in a small remote program may appear to have insignificant impact on patient care, but as programs expand, the impact of such variance will result in increased demand on other programmatic resources (staff, drugs, logistics), and on healthcare systems. South Africa's testing capacity (public and private) is estimated at 250,000 to 350,000 patients on treatment, most of whom are catered for by central facilities. Adding capacity to central facilities is expensive, and invariably results in increased service failure during renovations. Togatainer's modular approach to capacitating ARV treatment clinics is sustainable and capable of reaching treatment demands of South Africa. Adequate laboratory support will protect current first-line regimens by minimizing unnecessary switching to more costly second-line regimens.

Local and provincial government support will be garnered prior to the implementation of each Togatainer. Toga will be responsible for the implementation of all Togatainers, though local contractors may be used to assist with infrastructure development. Sustainability is addressed by employing and training medical technologists from the communities. As medical technology is the chosen profession of many females these Togatainers are likely to enhance female careers. The provision of on-site and quality laboratory services will enhance the standard of care to for rural and peri-urban women and children.

Activity Narrative: ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Togatainers

Three Togatainers capable of performing the tests for HIV, CD4 and lymphocyte, syphilis, and HIV disease monitoring will be deployed. Deployment includes preparing the site and laboratory infrastructure, sourcing equipment, testing, calibration and implementation. The Togatainers are low maintenance environments, with a focus on preventative maintenance. A Togatainer supply system has been set up to ensure the timely replenishment of laboratory reagents and consumables.

Ongoing activities will include training and supervision, as well as structured internal and external quality assurance programs. The selection of suitable sites is ongoing and tentative at the time of this submission, as funding has only been awarded in July 2007.

Staff retention may be a challenge. Staff that work in remote rural areas are often the only person in the laboratory. In addition to the regular monitoring, the program will rotate Togatainer technologists to a Toga central laboratory for ongoing development and training. Telephonic contact will be made on a regular basis. Togatainer technologists will report weekly in writing to the Peripheral Laboratory Manager. Computer access from the central laboratory to the site allows monitoring of turn-around times, workload, output, and quality. The peripheral manager will visit sites each quarter to evaluate staff performance. Toga will award bursaries to three final-year medical technology students, offering them the opportunity to work in a training environment after completion of the academic component of their course. All Toga medical technologists will receive a five-week training at Toga's training laboratory in Johannesburg.

This training will focus on virology, clinical pathology and infectious diseases. One-on-one courses are conducted in the laboratory, with a strong focus on practical skills development. The course includes quality control, workflow management, laboratory information management, materials management, laboratory administration and reporting of key performance indicators, viral load assay and techniques, CD4 assay and techniques, chemistry testing, hematology testing and service management.

ACTIVITY 2: Laboratory Monitoring

Toga expects to conduct HIV monitoring tests for 2,000 PEPFAR- funded patients at peripheral settings, and 1,000 non-PEPFAR funded patients by the end of the first year. Additional funding will be solicited from other NGOs, private companies, and government organizations. These tests include viral load, CD4 count, full blood count, aspartate aminotransferase (AST), alanine aminotransferase (ALT), and urea & electrolytes (U&E). Provision has been made for hand-held lactate testing devices.

Toga's White Rabbit electronic requesting and reporting system functions seamlessly with laboratory operations and is not dependant on uninterrupted internet connectivity. A key advantage of this system is the reporting of patient measurement in a historically consolidated way. This software caters to specific treatment needs based on individual treatment program parameters. Secure access is a controlled feature of the software. The White Rabbit software is a significant improvement on reporting efficiency as it is updated on a near-real time basis from the laboratory information management system. Data is stored on two independent SQL servers. Data is not accessible via the internet, thus reducing the risk of fraud and data corruption. The White Rabbit software is continually enhanced to improve and broaden functionality. The software ensures unique patient identification and data integrity, which results in improved in patient management and clinic efficiency and reduced costs.

Data communication technology (GPRS data cards or wireless local area networks) will be used where possible. The White Rabbit system includes a sample tracking facility. Each specimen container is robotically pre-labelled with a unique bar code that is electronically associated with each sample collection event and unique patient identifier. Toga provides on-site training.

South African reporting requires unalterable results. Consequently, results are electronically published as pathology reports, though data is electronically consolidated to enhance the usability of information. Reports may be electronically requested as event, graphical or tabular reports. Critical values will be available on the system as they become reported, supported by telephonic notification to clinical staff.

Public Health Evaluation**Food and Nutrition: Policy, Tools, and Service Delivery****Food and Nutrition: Commodities****Economic Strengthening****Education****Water****Table 3.3.16: Activities by Funding Mechanism****Mechanism ID:** 262.09**Mechanism:** N/A**Prime Partner:** National Institute for Communicable Diseases**USG Agency:** HHS/Centers for Disease Control & Prevention**Funding Source:** GHCS (State)**Program Area:** Laboratory Infrastructure**Budget Code:** HLAB**Program Budget Code:** 16**Activity ID:** 2959.22859.09**Planned Funds:** \$0**Activity System ID:** 22859**Activity Narrative:** NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is being funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. This will no longer be funded in FY 2009 due to the existing National Institute for Communicable Diseases (NICD) Cooperative Agreement ending. A new Cooperative Agreement is now in place with the National Health Laboratory Service (NHLS), the parent organization for the NICD, and a smaller Funding Opportunity Announcement is being developed with the Sexually Transmitted Infections Reference Center (STIRC), an STD division within the NICD. The TB/HIV funds earmarked for FY 2009 have been moved into LAB for FY 2009, so that there are only 2 program areas for NHLS in FY 2009, LAB and SI. All existing program activities in these areas will be supported under the new NHLS Cooperative Agreement in the FY 2009 COP. Care, treatment, and a smaller SI budget will continue to be supported, but through a new TBD COP entry for a NICD continuation (STIRC) in FY 2009. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Table 3.3.16: Activities by Funding Mechanism

Mechanism ID: 500.09

Prime Partner: National Department of Health, South Africa

Funding Source: GHCS (State)

Budget Code: HLAB

Activity ID: 23600.09

Activity System ID: 23600

Mechanism: In Support - CDC

USG Agency: HHS/Centers for Disease Control & Prevention

Program Area: Laboratory Infrastructure

Program Budget Code: 16

Planned Funds: \$728,178

Activity Narrative: SUMMARY:

In close collaboration with the National Department of Health (NDOH) and the National Health Laboratory System (NHLS), the CDC Laboratory Branch will provide HIV and TB laboratory programmatic support to the national and provincial departments of health. The aim of the "In Support of the NDOH Laboratory Infrastructure" project is to provide technical assistance to the NDOH and provincial health departments to ensure expansion and strengthening of existing laboratory services in all nine provinces. Activities will be carried out to address laboratory-specific unmet needs that impede full implementation of national laboratory programs, ensure uniform quality assurance measures and effective monitoring and evaluation among laboratories; strengthening of laboratory reporting systems; and promote efforts to synchronize infection control activities in collaboration with the National Institute of Occupational Health (NIOH); The major emphasis area is policy driven, with additional support in training, accreditation, establishing Public Private Partnerships (PPPs), Quality Assurance and Quality Control (QA/QC), strategic planning, technology development and establishing possible collaborations and coordination of training and other possible support networks for laboratories in South Africa.

BACKGROUND:

With the establishment of a Laboratory Branch within the South Africa CDC, Global AIDS Program in FY 2008, current funds will be used to support the implementation and to provide support to the National Department of Health (NDOH) through collaboration with the NHLS, National Institute of Communicable Diseases (NICD), and NIOH. The NHLS is accountable to the NDOH through its Executive Board and is responsible for public sector laboratory services. The NHLS also governs activities and provides funding to the NICD to provide surveillance, research and programmatic operations, as well as funding to the NIOH for policy development activities related to occupational health.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: National Policy

Collaborate and support the development and implementation of effective NDOH laboratory monitoring indicators and assessment mechanisms to assist in the monitoring of national laboratory quality, HIV rapid testing, and to assess overall laboratory coverage; Establish a working group with Public/Private laboratories to strategize further collaborative partnerships, and to establish a national lab advisory committee

ACTIVITY 2: Training

Promote and strengthen quality of HIV testing in public Counseling and Testing (CT) sites within SA and with PEPFAR partners; Strengthen specimen collection techniques and result management activities in public and PEPFAR TB and HIV sites; Strengthen laboratory safety and infection control practices within laboratories in TB and HIV sites; Continue to provide regional and local laboratory support through the established African Center for Integrated Laboratory Training (ACILT).

ACTIVITY 3: Services

Support Public/Private laboratories in acquiring International Standards Organization (ISO) and the South African National Accreditation System (SANAS) accreditation as requested that are involved in TB & HIV activities.

ACTIVITY 4: Capacity Development

This activity is broadly focused on capacity development and improvement of laboratory activities within public primary health facilities.

ACTIVITY 5: QA/QC

Support activities to improve quality of HIV testing in public CT sites and NHLS laboratories and with PEPFAR Partners

ACTIVITY 6: Geographical Information Systems (GIS) Mapping

Identify specific laboratory service coverage issues within SA and with PEPFAR partners; Integrate existing PEPFAR partner GIS data with laboratory GIS data for further strategic planning.

ACTIVITY 7: Technology

Continue to support technology development to decrease lab burden and increase laboratory throughput and turn around time; Continue to support the development of an integrated laboratory patient management system with NHLS (biometrics) to increase the ability of clinics to track patients and to incorporate real-time laboratory test results.

ACTIVITY 8: Conferences/Workshops

Establish a Public/Private Laboratory Conference to discuss possible collaborations and possible coordination of training and other possible support networks.

New/Continuing Activity: New Activity

Continuing Activity:

Program Budget Code: 17 - HVSI Strategic Information

Total Planned Funding for Program Budget Code: \$16,992,903

Program Area Narrative:

For FY 2009, South Africa (SA) Strategic Information (SI), as part of the larger PEPFAR program, is oriented toward further aligning health management information systems (HMIS) and monitoring and evaluation (M&E) systems to South African government (SAG) standards. SASI will enhance the use of SI with an emphasis on strengthening surveys and surveillance, understanding data quality and using geographic information systems (GIS), and moving toward comprehensive SI capacity building activities. SASI accomplishments include: 1) developing and using an electronic, web-based partner reporting system, the Data Warehouse (DW); 2) incorporating systematic data quality assessments into partner performance cycles; 3) developing a South Africa SI Manual (the South Africa-specific indicator guide) for use by implementing partners; 4) hosting M&E capacity building workshops held several times per year; and 5) conducting innovative evaluations of partner performances, which are embedded into the FY 2009 COP process, and include key members of the SAG and USG HQ technical staff.

Despite these accomplishments, the SI team faces significant challenges in FY 2009 including: 1) the disparate nature of HMIS among PEPFAR-supported implementing partners, the SAG systems supported by the Departments of Health and Social Development, and partners' systems supported by other donors; 2) the tendency for abundant collection and reporting of results-oriented data among all stakeholders without due attention paid to data quality or an understanding or appreciation of their broader use; and 3) a lack of human capacity in the country team, resulting in SI team members spending much time on COP issues and partner management rather than core SI functions. Addressing these challenges is an essential goal for FY 2009; implementation plans are outlined below.

Functioning of Strategic Information Team within the Country Team

The SI team comprises one M&E Advisor each from CDC and USAID who both serve as the SI liaisons to OGAC. An additional M&E Advisor is seconded to the National Department of Health (NDOH). The team has expanded to include two M&E assistants, one each at CDC and USAID, an HMIS specialist, and an epidemiologist/surveillance officer based at CDC. In FY 2009, a USG SI Knowledge Management specialist based at USAID will take the lead on developing the USG GIS strategy, in addition to serving as full-time manager of the USG DW. Like other PEPFAR focus countries, the SI team also relies upon key in-country partners to help implement the USG SI vision. In SA, John Snow International was recently awarded a contract to assist the SI team to implement activities such as training, provision of technical assistance to implementing partners and the SAG, GIS data use, etc.

The SI team plans and implements activities as one USG team and receives final inter-agency vetting and approval. In previous years, the team deliberated within the context of an SI Technical Working Group (TWG) consisting of members from the other USG agencies and program areas. The "Staffing for Results" exercise conducted in 2008 led to a decision to disband the SI TWG. With the added strength of the new hires mentioned above, the SASI team plans to develop a more broadly based Technical Team that will greatly enhance its ability to plan and lead SI activities that benefit the program.

The SASI team developed the DW to which PEPFAR partners submit their plans and reports. All USG partners currently use the same templates and reporting guidelines. Results for OGAC reports are jointly drafted by all USG agencies. In FY 2009, a high priority is set on the transition of the DW from an in-bound reporting platform to an interactive database that will allow users to customize queries on indicator results by program area, by site, and by geographical unit across reporting periods. The new USG DW manager will develop a scoring system per quarter to track the transition; all changes will be vetted and approved by DW user groups. The SI team views the DW as a hub for a broad set of data use activities; hence, the long-term goal is to expand the DW beyond its narrow PEPFAR reporting functionality to a role that can be widely used and appreciated by SAG stakeholders.

The SI team leads the formulation and review of country targets. Direct targets are a sum of partner targets. The USG Activity Managers and SI Advisor review partners' targets to ensure that they are reasonable and achievable. All partners report treatment activities on a quarterly basis by site. A customized version of the Track 1 treatment form is used. All other partners report on a semi-annual and annual basis.

The total targets for prevention of mother-to-child transmission and TB/HIV are based on national estimates to which PEPFAR contributes. For FY 2009, the SI team will provide substantial leadership and technical assistance toward finalization of a national orphans and vulnerable children (OVC) management information system, which will be linked to the OVC results reporting templates of PEPFAR-funded partners, and to other non-PEPFAR OVC organizations. This activity will be implemented in response to requests from the National Department of Social Development (DOSD) and is an important example of how SI contributes to the third of the Three Ones. Upon completion of this national harmonized database, the SI team expects to have acquired the necessary OVC data to estimate the number of OVC benefiting from USG indirect support.

The antiretroviral treatment and counseling and testing targets are based on current uptake and projections and reflect modifications in national policy. The total HIV care and support target is difficult to measure since it is not collected at the national

level as defined by OGAC. The SI team has a wealth of experience in formulating targets and in developing data systems to assist with the supporting of results reporting against such targets. During FY 2009, the SI team will further enhance the underlying reporting and data systems and will continue to provide technical assistance to USG and to the OGAC SI Division in how results and targets are formulated, interpreted, and reported in the field.

Overarching SI System

M&E is a priority in the South Africa HIV & AIDS and STI National Strategic Plan, 2007-2011 (NSP) and the USG will continue to respond to these needs by providing direct funding and targeted technical assistance to various SAG departments. In collaboration with the National Department of Health (NDOH) and other key stakeholders, the USG has contributed to the development of the NSP's M&E framework. During FY 2009, the USG aims to increase collaboration and harmonization of M&E systems. Currently, a District Health Information System (DHIS) exists, but it is not implemented in all provinces, and the quality of the HIV data is variable. The SI team plans to align the PEPFAR results reporting systems with the DHIS. Additionally, the SI team continues to emphasize data quality of reported results via targeted capacity development workshops involving SAG M&E personnel that affects DHIS reporting as well as PEPFAR required results. Finally, data are included in the UNGASS report but timeliness and reliability of data reporting remain a concern.

Several SAG departments work independently of the NDOH on HIV issues. While the USG embraces the goal of supporting one M&E system, it is often necessary to assist in building M&E systems within the different departments, taking care to assure integration whenever possible (see above example with DOSD and the national OVC database).

The SI team emphasizes rapid and comprehensive responses to SAG requests for technical assistance in SI. For FY 2009, the response strategy involves forming close partnerships with relevant SAG stakeholders so that assistance is more sustainable (i.e., all SI tools are shared and adapted for the particular context). The team's long-term goal is to turn over SI functions and activities to SAG counterparts and local partners. The strategy is based on rigorous M&E capacity development at increasingly lower levels and harmonization of measurement and data collection objectives.

The SI team has worked with several provincial departments of health to provide technical assistance in M&E in the past year; this support will be continued in FY 2009. Coordination with the NDOH had been strained, but collaboration is expected to accelerate during FY 2009. This is partially because of the groundwork laid during FY 2008 and partially because of the new enthusiasm for public health and HIV activities engendered by the new direction and leadership within the NDOH.

Surveys and Surveillance

Seroprevalence and behavioral surveillance activities in the general population are primarily supported through the National Institute for Communicable Diseases, the Medical Research Council (MRC), and the Human Sciences Research Council (HSRC). These organizations and the SAG drive the process; PEPFAR provides partial support for these surveys, and the SI team provides technical assistance with survey design and implementation. Johns Hopkins University in collaboration with USG PEPFAR partners will implement the next national communication survey during FY 2009 to monitor trends in behavior in relation to media exposure. The SI Team plans to incorporate these surveillance activities and survey findings into its capacity development activities to enhance data use among partners and stakeholders. Thus, the analysis and further use of these survey results will be an important set of activities for FY 2009.

The USG continues to provide technical assistance for these activities, including direct personnel support at the national and provincial health departments, development of surveillance systems, and training to specific NDOH programmatic units.

Health Management Information Systems (HMIS)

To date there is not a comprehensive SAG HMIS strategy. As a result, the SI team looks for key opportunities to leverage PEPFAR resources toward the use of systems that complement existing SAG systems and help pave the way toward harmonization. For FY 2009, the USG HMIS strategy addresses the challenge of harmonizing systems toward national standards. PEPFAR supports HMIS at the partner level, but the USG has not been prescriptive about design and implementation. Many treatment partners have developed systems in the absence of a national or provincial MIS. An HMIS assessment of treatment partners was conducted in FY 2008. Results indicated the importance of harmonization of such systems to ensure communication with facility level systems and interoperability with the DHIS, which will be the focus of data quality improvement activities.

Monitoring and Evaluation

A local PEPFAR contractor routinely conducts Data Quality Assessment (DQA) to build partner M&E capacity, and to ensure results reported to OGAC are valid and reliable. Through FY 2008, the rapid increases in PEPFAR funding and number of partners in SA limited the time and resources that could be expended on evaluating partner performance and using data effectively for program planning. The SA Team awarded a contract to a SA organization to enhance the ability of USG Activity Managers to measure partner performance and to assess data quality. The SI team has made considerable progress in improving data quality among implementing partners; however, data quality within the SAG M&E system remains a concern. Priority for strengthening data quality with the SAG systems is a priority for FY 2009.

The USG conducted a substantial partner evaluation in FY 2008 as part of COP preparation. The evaluation critically reviewed partners' performance, current and future plans, and budgets. Results of the evaluation directly affected FY 2009 COP budgets awarded to implementing partners and provided useful feedback to partners on current and future implementation strategies. SAG members were fully involved in this partner evaluation process. A further refined methodology will be used during the FY 2010 COP preparations.

The USG supports a comprehensive and systematic approach to partner M&E capacity building that will continue during FY 2009. These activities include: 1) M&E workshops that assist partners in developing M&E plans; 2) DW enhancement to assist USG and partners with the collection, reporting, and analysis of data; 3) DQA initiative mentioned above; and 4) the establishment of a fellowship program to place recent South African master's degree graduates with partners in need of more intensive M&E training. The success of these four initiatives is substantial and has been documented in previous COP narratives. The plan for FY 2009 is to go beyond the standard five-day M&E training workshops and offer a series of trainings that reflect a broader range of SI topics to a wider set of participants. The SASI team intends to test various methodologies and metrics to evaluate training effectiveness. The vision for capacity building involves a comprehensive program in SI training, akin to a graduate program in an applied field with an emphasis on developing cadres and networks of skilled SA practitioners.

Finally, in January 2009, the SI team has requested that a team of people with SI expertise from USG HQ agencies visit South Africa to conduct an external evaluation of the SI portfolio. The primary objective of this visit will be to guide a long- and short-term vision of the SI strategy in South Africa.

Table 3.3.17: Activities by Funding Mechanism

Mechanism ID: 4625.09	Mechanism: N/A
Prime Partner: McCord Hospital	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Strategic Information
Budget Code: HVSI	Program Budget Code: 17
Activity ID: 23587.09	Planned Funds: \$204,861
Activity System ID: 23587	

Activity Narrative: SUMMARY:

McCord Hospital (MH) and Zoe-Life (ZL) will strengthen strategic information systems at both facility level and health management level at eThekweni municipality (eTM) clinics, at 5 non-governmental organizations, at organizations working with orphans and vulnerable children (OVC) linking with services supported by MH/ZL, and in workplace programs. Emphasis areas are development of strategic information systems which support data collection, patient tracking and referrals across vertical programs (CT, PMTCT, TB/HIV), community programs and to secondary and tertiary facilities; local organization capacity building (major emphasis); strategic information systems to support quality assurance, improvement and supportive supervision; strategic information support to training programs; and strategic information systems to report on and manage workplace programs. The primary target populations are the general population, people affected by HIV and AIDS, refugees and the private sector (workers without health insurance).

BACKGROUND:

Until recently, public health utilized strategic information at a very high level using aggregated data which was not often used at facility or patient level. The HIV pandemic has highlighted the need for robust strategic information systems to not only be in place, but to be used for policy making, systems improvement, program management, workforce planning and indeed, individual patient management. The millennium goals of the five ones carry a consistent theme of one monitoring and evaluation system which will support the strengthening of services. In developing countries with no patient linked strategic information systems, and outdated facility-based health management information systems (HMIS), it is evident that there are multiple layers of strategic information development required in order to fill the data gaps which are evident. Many of the data elements and source documents required for comprehensive HIV care and treatment are available at hospital level and are functioning relatively well in an environment where audit and technology are available and expected. At primary health level however, a different environment exists where individual patient care is not the norm and technology or even paper-based systems to support the HMIS required for comprehensive HIV management is not available. In addition, primary health standards and procedures are not yet standardized for adults. Primary health care standards for children with HIV have not linked with the integrated management of childhood illness (IMCI) strategic information systems to form a combined HMIS. Without these systems in place at primary health care level, comprehensive integrated management of people with HIV at community level will continue to be of substandard quality and decentralization will cause more harm than good.

This project seeks to work on some of the strategic information gaps at primary health level and to develop simple user friendly methods of integrating and using data.

ACTIVITIES AND EXPECTED RESULTS:

SI will continue to be a focus for FY 2009. The following elements will be integral to the program:

ACTIVITY 1.

Program level data: ZL will continue to develop and implement an SI system within the eTM clinics which will enable them to monitor and evaluate the implementation of new HIV services at their clinics. This data will be in line with National Department of Health (NDOH) requirements. ZL will continue to feed data back to eTM management for decision-making purposes. New in FY 2009 will be engaging eTM management in the analysis and presentation of data. This is key to sustainability. It is vital that the eTM management own the data, rather than the data being collected and presented by ZL. ZL will increasingly hand over responsibility of the data collection, analysis and use to the eTM management so that they can start to make program related decisions, including cost analyses and workforce planning. This will strengthen their appeal to the NDOH for increased budget for HR and other requirements relating to implementation of HIV services.

ACTIVITY 2.

HMIS: Implementation of a paper-based HMIS at all facilities will be a priority in FY 2009. Lessons learned during implementation will be documented, analyzed, and presented to both eTM and District/Provincial Information Officers to assist with the District/Provincial scale up, as well as to encourage eTM to implement in all their other clinics. If practical and appropriate, ZL will work with other stakeholders to develop an electronic version of the HMIS.

ACTIVITY 3.

Other technologies: ZL will start to develop ideas and engage other stakeholders/partners with the idea of developing an HMIS which integrates Adult, Pediatric integrated management of childhood illnesses (IMCI) and TB care algorithms and M&E onto a hand-held PDA which can be used both in the clinics and NGOs as well as in the community with GPS and GPRS functionality. The aim of the PDA would be to integrate care and support prompts, patient tracking and scheduling, family coordination and data collection into a simple tool which has internet connectivity for web-based data collection, text message reminders to clients, lab connectivity for real time results, drug dispensing and ordering options and blended learning capacity. This would be a significant intervention that would require a different funding source. However, lessons learned during the implementation of the pediatric care and support, adult services, and HMIS scale-up will inform the needs and possibilities with regard to this proposal and will be further explored in FY 2009.

ACTIVITY 4.

Psychosocial support services monitoring and evaluation (M&E): ZL will continue to develop standards, procedures, tools and measurement protocols to bring qualitative measurement to psychosocial services offered at facility and community level. Currently there are few measurement tools or indicators to measure

Activity Narrative: the effectiveness of the psychosocial support services, the program productivity or impact on client well being and adherence to care/treatment. ZL will continue to develop this aspect of monitoring and evaluation together with the District and Provincial Department of Health and other psychosocial providers. This, in turn, will strengthen the health services through establishing a professional standard with regard to HIV counselors and psychosocial service providers and will strengthen the case for a professional body for HIV psychosocial service providers. The data which can be gathered from these tools and standards will assist in workforce planning and budgeting at all levels.

ACTIVITY 5:

GENDER: Currently programming around gender has not been well informed by supportive evidence. ZL will incorporate gender indicators into all aspects of M&E to inform program improvement and intervention design. This will include trends relating to access of care by men, improvement in partner testing, and reporting of sexual coercion by girls attending psychosocial support services.

FY 2009 will see a more significant drive towards eTM management taking over all data related activities from ZL. This will require mentorship and training at a management level, advocating for budget from the NDOH for eTM to employ data capturers at all eTM clinics, and integration of the eTM data systems with the NDOH reporting systems for HIV. There will also be a need to strengthen IT support at the eTM. ZL will provide IT training in Microsoft Excel and Access to equip eTM management to use data more effectively. This strengthening will be to prepare for the possible use of an electronic HMIS used to enhance the paper-based HMIS. ZL will explore the development of an electronic HMIS, or will use whatever electronic HMIS that has been developed by the provincial Department of Health for use in HIV patient management.

Activity ID: 19708.23630.09

Planned Funds: \$3,107,866

Activity System ID: 23630

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

The Enhancing Strategic Information (ESI) project will provide a broad program of technical assistance and other targeted project support to improve the quality, availability and use of strategic information (SI) in South Africa. The SI activity will contribute to strengthening programs, improving accountability and reporting, and information sharing within PEPFAR partners.

BACKGROUND:

The proposed activities are new and focus on providing M&E technical support to PEPFAR implementing partners and USG/SA. The ESI project is managed by John Snow Inc. along with its partners Khulisa Management Services, Health Information Systems Program (HISP) and Tulane University and aims to further strengthen M&E capacity of PEPFAR partners in the area of data management, data quality, data usage, and basic evaluation techniques through sustained technical support by Technical Task Leads, strengthened by partner support from Khulisa, Tulane and HISP. The project also intends to conduct a series of capacity building activities to strengthen M&E and program management at the implementation level.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Partner Capacity Building

(1) ESI will continue the implementation of basic five-day M&E trainings for PEPFAR partners. Where possible, partners will be requested to send both M&E and program management staff to enhance the likelihood of establishing an M&E culture in their organization post attendance at this training.

(2) ESI proposes to further strengthen the M&E unit of the University of Pretoria (UP), School of Health Systems and Public Health, to establish its role in substantial M&E training for South African government employees, USG IPs and other NGOs. Project ESI will emphasize the adaptation / development of instructional materials for new (high level) courses geared towards PEPFAR implementing partners, provide collaboration and mentoring through team teaching, joint provision of technical assistance, and administrative and logistical support. ESI will contribute to strengthening the capacity of the UP Centre for Excellence and the regional M&E capacity-building (CB) teams through the following activities:

- a. Collaborate with relevant institutions to develop and pilot higher level M&E courses on subjects such as data analysis, questionnaire design, survey sampling, economic evaluation biostatistics, and introductions into various statistical, survey and other M&E software packages.
- b. Begin collaboration with other regional partner institutions to identify a core group of M&E training facilitators in order to guard against high turnover and ensure the sustainability of capacity to conduct M&E training at the regional level.
- c. Begin identification of regional institutions, upon approval by USAID, to lead capacity building efforts.
- d. Begin the establishment a national network of M&E training facilitators, whose role will be to work towards a common understanding of M&E concepts, harmonize/streamline M&E training tools, and upgrade skills and knowledge among M&E professionals and trainees.
- e. Facilitate annual meetings of regional CB teams in the context of the national network of M&E training facilitators.
- f. Development of a tracking system that will enable institutions to follow up with trainees.
- g. Development of a central SI listserv to enable continuing education and information sharing.

(3) Partner-specific workshops: ESI will provide direct technical assistance to PEPFAR IPs, the USG and other stakeholders as appropriate. TA will be provided by project staff and CB partners, including the UP centre for excellence and the regional SI CB teams. Much of this TA would be linked to other Tasks (Task 2, 3, and 4) and focused on building capacity in those areas and includes:

- a. Partner specific action plans to address identified gaps in SI capacity of IPs to collect, collate, analyze, report and use data.
- b. Provide CB related to the locally tailored data quality assessment tool (Task 4). Project ESI will tailor TA to help partners self-assess their data management systems and data quality as well as provide Post Audit TA to assist partners addressing the identified audit issues.
- c. Provide targeted TA, using a multi-disciplinary team approach for the implementation of action plans to fill identified capacity gaps.
- d. Institutionalize targeted TA in the Center of Excellence and the Regional Teams to enable local institutions to provide targeted TA in the future.
- e. This activity will address needs for M&E and enhancing SI for IPs; this includes the development of IP specific program M&E workshops designed to optimize monitoring of specific areas under/in the PEPFAR program. Such programs include ART, PMTCT, OVC, TB/HIV, VCT and other prevention areas.

(4) Technical Assistance to IPs:

- a. The ESI Team will also address the organizational and behavioral aspects of information systems development. In FY 2009, this process will begin with a situational analysis.
- b. ESI will use a participatory approach to providing TA, allowing the team to interact with users at their level, and gradually increase their skills, and develop organizational capacity. ESI will use Data Users Groups to provide opportunities for organizational issues to be highlighted. TA activities will also link to ESI Task 6 to integrate spatial data into HMIS systems and encourage GIS data use for program planning.
- c. Training in Data Quality: ESI will use existing curricula on data quality (as adopted by USAID) to serve as the basis for specially tailored data quality workshops (to be led by HISP as the lead for ESI Task 4) under this project (linked with Task 1). ESI, with extensive in-house experience in data quality assessment (DQA),

Activity Narrative: will ensure that HISP and other partners' staff who may be involved in DQA workshops, are fully trained and prepared. ESI will conduct at least two levels of training - an introduction to data quality for new partners and partners with weaker data management systems, and an advanced training for partners that have begun to implement data quality initiatives.

(5) Additional capacity building activities

- a. ESI will undertake to synthesize all trainings conducted by USG implementing partners. The aim of this activity will be to ensure that all trainings relating to M&E have been documented and based in a repository and that the development of new trainings will be built on existing or previous curricula.
- b. The CB lead will ensure a presence of CB activities on a web-based system to access training materials and PEPFAR partner reporting tools. The aim of this exercise is also to create a repository for CB materials and to enable wide-spread dissemination of all activities through the internet. Partners in South Africa have relatively well developed IT infrastructure and the CB lead will update this periodically with new and relevant CB materials.
- c. ESI will have a presence at CDC/USAID treatment meetings to support discussions on HIV care and treatment M&E and provide up to date strategies on CB, data quality and overall M&E.
- d. ESI will also aim to synthesize and document capacity building methodologies for training and mentoring implementing partners. ESI's CB approach to the implementing partner or the Department of Health has to be systematic and methodical and soft skills management play an integral role in the delivery of high quality technical assistance. ESI staff will be well versed on soft skill management prior to conducting work with any stakeholder and the methodology for this will be documented and taught.

ACTIVITY 2: Collaboration with USG/SA SI team

(1) Provide strategic and operational M&E support to the USG team, including support for the regular updating of the South Africa Strategic Information (SASI) modular manuals, intermittent compilation and analyses of partner result reporting and facilitation of in-house training.

(2) Facilitate regular M&E CB sessions in the context of PEPFAR partner meetings (and linked with the data use groups mentioned above). These will increasingly focus on areas such as data use and evidence-based decision making and provide opportunities for continuing education.

ACTIVITY 3: Increased demand, availability and utilization of SI

(1) ESI will make use of a Decision Support System (DSS), an automated data analysis and results reporting tool designed to facilitate the process of turning data into action.

- a. Activities in FY 2009 will focus on conducting a situational analysis, development of methodology (in agreement with USAID) and subsequent work plans to operationalize activities under this task.
- b. Using simple bar charts, line graphs, tabular reports and thematic mapping, the DSS translates raw data into easily understood graphics at health facility, district, regional or national level. Indicators can be examined in multiple ways by changing the administrative level, periodicity, geography or reporting source. ESI will use a two-pronged approach for DSS implementation: 1) a desktop solution with an import facility (using DW aggregated data or pre-populated databases) for those users that have limited access to the DW and do not want instant analysis on current data in the DW; and, 2) a web-based DSS that sits on top of the DW database and can do instant dynamic online queries.

(2) ESI Task 6 focuses on GIS systems in the broader concept of data use and dissemination. GIS uses tools to map and analyze characteristics of people, objects and events in space and over time. Spatial analysis allows an understanding of relationships between variables that are otherwise difficult to determine using traditional approaches. Potential applications for the PEPFAR program for SA include:

- a. Coverage of the PEPFAR program and/or coverage broken down by program areas;
- b. Determining and planning for underserved areas on the basis of weighted multivariate criteria;
- c. Determining areas where possible double counting occurs (link to Task 4)
- d. Distribution of NGO, private, CBO, FBO assisted programs;
- e. Spread and density of PEPFAR investment vs. people supported;
- f. Obstacles or favorable conditions for program roll-out;
- g. Determine geographical distribution and variation of the illness presentation;
- h. Analyze spatial and temporal trends in program uptake;
- i. Monitor diseases and interventions over time;
- j. Manage materials, supplies and human resources;
- k. Monitor the utilization of service points;
- l. View the PEPFAR program in relation to the rest of the health system; and,
- m. Develop a PEPFAR support atlas.

(3) Linking GIS with the DW and Decision Support System: The majority of analytical GIS needs would be met by the mapping component within the decision support system of the DW. GIS will contribute specific special analyses as requested to support the mapping needs of PEPFAR. Some users will only require basic maps and will be able to access these quickly via the Data Warehouse. Other users will require more complex GIS applications/analyses and will make requests to the GIS specialist under ESI Task 6 to conduct these analyses. An industry standard GIS software package such as ArcGIS 9.0 will be procured for the creation of multi-dimensional maps. Similarly the GIS Task lead will coordinate with Task 5 to provide technical assistance for data analyses and GIS mapping in the DW using the DSS.

SUMMARY:

This partner will provide a broad program of technical assistance and other targeted project support to improve the quality, availability and use of Strategic Information (SI) in South Africa. The SI activity will

Activity Narrative: contribute to strengthening programs, improving accountability and reporting, and information sharing within PEPFAR partners.

BACKGROUND:

MEASURE Evaluation supported this activity in FY 2005 and FY 2006. The MEASURE activities will be recompeted in FY 2007 and it is anticipated that the same partner will continue these activities in FY 2008. The goal of this activity is to improve the collection, analysis, and use of SI in planning, policy-making, management, monitoring, and evaluation of the South Africa PEPFAR program.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Partner Capacity Building

This partner will work to strengthen the capacity of PEPFAR implementing partners to monitor and evaluate their programs. The PEPFAR South Africa approach is multi-faceted and includes the following activities:

- (1) M&E capacity building workshops: The five-day basic M&E workshop will be offered to PEPFAR partners three times a year.
- (2) M&E workshops on specific topics: There is increasing interest among PEPFAR partners for more specialized M&E training on such topics as data analysis, qualitative methods and research and evaluation methods for program improvement. Trainings will be implemented in collaboration with a local South Africa partner.
- (3) Partner-specific workshops: There are a number of large partners (or primes who have many sub-partners or sites) that want to deepen their M&E capacity. FY 2008 funds will be used to conduct partner-specific workshops to respond to this need.
- (4) Technical Assistance: Individual M&E technical assistance will be provided to PEPFAR implementing partners as needed.

ACTIVITY 2: Collaboration with USG/South Africa (USG/SA) SI team

This partner will work closely with the USG/SA SI team on the development and implementation of SI systems for the PEPFAR program. Specific activities include:

- (1) South Africa Strategic Information Manual: Update and disseminate a compendium of information and procedures to support PEPFAR.
- (2) Partner M&E Meetings: Coordinate and facilitate partner meetings.
- (3) Ongoing collaboration: Support collaboration among PEPFAR partners given the growing data and reporting demands of PEPFAR.

ACTIVITY 3: Increased demand, availability and utilization of SI

This partner will utilize multiple strategies for increasing the demand, availability and utilization of SI in South Africa by both USG and South African partners. In November 2004 MEASURE Evaluation contracted with Khulisa Management Services to develop the Data Warehouse (DW). Initially Khulisa focused on developing the PEPFAR reporting system, but in the future Khulisa plans to make the DW more useful for partners and USG staff. This partner will develop ways to improve data management and data use by supporting a database that stores and provides easily extractable information received from PEPFAR partners in South Africa.

These activities contribute to the overall goals of PEPFAR at both a local and global levels by providing valuable information for decision making.

Development**Funding Source:** GHCS (State)**Program Area:** Strategic Information**Budget Code:** HVSI**Program Budget Code:** 17**Activity ID:** 23614.09**Planned Funds:** \$169,908**Activity System ID:** 23614

Activity Narrative: SUMMARY:

The Reproductive Health Research Unit (RHRU) will continue to support the development by the South African government, of key technical documents, programmatic implementation plans, policies and position papers in the areas of HIV and reproductive health.

BACKGROUND:

RHRU, a unit of the University of the Witwatersrand in Johannesburg, currently provides technical support to the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa, which includes the national ARV roll-out. Through PEPFAR funding since FY 2004, RHRU has provided regular on-site support, direct treatment, training and quality improvement to Department of Health sites in three provinces. RHRU will continue these activities, and will continue both an inner-city program (Johannesburg), rural and urban programs (Gauteng and North West provinces) and a district-wide program (Durban), focusing on providing support to complete up and down treatment referral networks. In addition, RHRU will continue the provision of counseling and testing (C&T), palliative care and prevention services. RHRU will seek to develop models of service delivery that can be replicated and expanded, and produces findings from lessons learned and targeted evaluations to disseminate and share with others. It should be noted that the success of antiretroviral treatment (ART) scale-up depends on the comprehensive approach detailed in other program areas. In particular, the strengthening of referral from other primary health care programs such as tuberculosis (TB), family planning, antenatal/postnatal and STI services is critical. Prevention is an integral part of this system and RHRU will focus its prevention program on high-risk groups such as commercial sex workers and their clients, people infected with HIV, on reducing MTCT and also on building capacity of health care workers, CBOs and NGOs with which it works. RHRU will also continue to develop strategies to address underserved communities affected by HIV, such as couples (both concordant and discordant), high risk groups such as young people, and gender-based interventions with women at risk, and commercial sex workers, and men.

ACTIVITIES AND EXPECTED RESULTS:**ACTIVITY 1: National**

Key PEPFAR-funded RHRU staff participate in strategic policy making bodies such as the South African National AIDS Council (SANAC) and the Southern African HIV Clinicians Society. These staff members work on developing policy in support of the NSP. ECHO staff members have been integrally involved in development of updated PMTCT guidelines which have been implemented since April 2008. RHRU and ECHO staff members have, in conjunction with other partners, developed a training program around this and will continue to support Provincial Guidelines in the provision of dual AZT and NVP to mothers and babies.

ACTIVITY 2: Provincial

RHRU will provide the Department of Health at provincial, district and facility levels with technical assistance for strategic information activities. This will include the training of NDOH and sectoral staff in implementing national and provincial monitoring and evaluation systems and health management and information systems. Focus areas include data collection, analysis, interpretation and dissemination. This will serve to strengthen the monitoring of national outputs against targets, internal RHRU outputs with concomitant reporting of results to government, donors and civil society.

Table 3.3.17: Activities by Funding Mechanism

Mechanism ID: 6777.09	Mechanism: N/A
Prime Partner: National Health Laboratory Services	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Strategic Information
Budget Code: HVSI	Program Budget Code: 17
Activity ID: 23603.09	Planned Funds: \$3,472,753
Activity System ID: 23603	

Activity Narrative: SUMMARY:

Activities will be carried out to address laboratory-specific unmet needs that impede full implementation of national laboratory programs. Activities will increase national coverage of HIV and TB diagnostics and treatment monitoring capabilities; ensure uniform quality assurance measures among laboratories; strengthen laboratory reporting systems; promote efforts to synchronize infection control activities in collaboration with the National Institute of Occupational Health (NIOH); and to expand upon the regional support and collaboration with other PEPFAR-funded countries.

BACKGROUND:

National Health Laboratory Services (NHLS) is accountable to the National Department of Health (NDOH) through its Executive Board and is responsible for public sector laboratory services. The NHLS also governs activities and provides funding to the National Institute of Communicable Diseases (NICD) to provide surveillance, research and programmatic operations, as well as funding to the NIOH for policy development activities related to occupational health.

ACTIVITY 1: Point of care testing

HIV testing at point of care settings using HIV rapid tests is set to increase in terms of the National strategic plan developed by the NDOH. Project Goals and Objectives: (1) Assess rapid HIV kits performance at a laboratory level; (2) routine monitoring of new lots/batches prior to release to testing sites and (3) produce training materials for HIV QMS, external quality assurance (PT) and internal quality controls (IQC) for testing sites for quality assurance purposes. The target would be 200 sites in 5 provinces over a year period to determine feasibility of the program. This will include piloting of dried plasma PT panels. Project Outputs: The objective of HIV assessment at field level allows for rational decision making in terms of algorithm setting and alternatives to current tests. Post marketing surveillance permits early warning systems to become operative. IQC usage will allow for program managers to become aware of any problems that could be site-specific or systematic. The EQA/PT program will assess overall program performance.

ACTIVITY 2: HIV Rapid kit Quality Management Training

As part of the National Strategic Plan to reduce infections by 50% by 2011 there is a need to expanded services for counseling and testing. Project Strategy: To continue QMS training implemented in 2008 and to provide direct support to the Provinces in terms of a train the trainer-type approach or direct training as needed. The current time spent per training is 2-3 months per province at the trainer level. The outcome will be that at least 5 provinces will be trained by the third quarter of 2009. The training will be integrated with implementation of External Quality Assessment (EQA) and IQC programs as well as M&E programs. Project Goals and Objectives: (1) Training of trainers in 9 Provinces in HIV rapid Test QMS and implementation of training at provincial level. (2) Integration of QMS training with implementation of EQA and IQC programs in at least 6 provinces. (3) Implementation of an M&E program that integrates with provincial-level monitoring of HIV rapid testing. Project Outputs: Monitoring of numbers trained: trainers and direct technical assistance, provincial coverage, IQC coverage and EQA scores, M&E evaluation scores in terms of numbers of sites trained and implementation of QMS program.

ACTIVITY 3: HIV-1 NAT EQA and IQC

HIV-1 NAT EQA and IQC will be an integral part of the laboratory quality management system (QMS) that will detect weak spots in performance as well as improve on the reliability and confidence when performing HIV-1 NAT. Project Strategy - Description and Methodologies: The NICD will source local material as well as characterize materials in collaboration with QCMD for HIV viral load and subtyping PT and IQC. NICD will make the program available to 25-30 participating laboratories for two distributions: first and last quarters of 2009. Data will collated by an independent secretariat that includes the NICD and QCMD for data analysis. For the IQC program software development allows for web-based submission of data with real time analysis and trend analysis. A positive standard has been selected (subtype C, 5000 copies/ml) and characterized for this purpose. The program will be introduced in the first quarter of 2009. The NICD intends to introduce IQC program for HIV DNA testing on DBS in the second quarter of 2009 to 11 participating laboratories. Project Outcomes: (1) The implementation of an EQA program that will monitor laboratory performance related to the ART program. (2) Capacity development of the NICD to perform as a molecular EQA provider. (3) The development of an IQC program for HIV viral load testing and infant diagnosis that can provide real time monitoring (4) The use of locally relevant materials to be characterized and included in panels.

ACTIVITY 4: Early Infant Diagnosis

Project Goals and Objectives: (1) To develop a clinical and laboratory infrastructure that supports early testing and HIV diagnosis in infants. (2) To assess the most appropriate method for early and accurate diagnosis of HIV infection in infants. The primary objective is to utilize the DBS HIV DNA PCR as a tool for diagnostic purposes in a setting with approximately 6000 infants over a 12 month period from the second quarter of 2009. The objectives would be the identification of processes that will ensure high throughput that will allow for access to diagnostics, care and follow-up as required. Project Outputs: The primary outcome will be the establishment of technologies that can be applied in the public health setting for the early diagnosis of HIV infected infants as well as monitoring antiretroviral therapy. An algorithm of cost-effective testing will be a primary accomplishment. The application will be at an operational level to ensure that clinical sites that do not have easy access to diagnostic services benefit.

ACTIVITY 5: Increased access of TB culture and referral services

In light of the significant increase in MDR and XTR-TB cases within South Africa, and recognizing that there is a significant lack of laboratory capacity to capture and report suspect TB cases, it has been determined

Activity Narrative: that an immediate expansion of TB culture and referral services are required. TB culture facilities have been established in all provinces but to make a significant impact quickly, it has been proposed that a further three TB laboratories be renovated to meet current demands during this funding period, in Mpumalanga, the Western Cape, and KZN. The selected sites would provide a responsive and regional impact in respect to TB culture services and the overall ability to capture possible MDR and XTR-TB cases. The proposed sites would provide relief to the existing laboratory services and improve overall performance and TB diagnostic capacity within the entire region. Proposed funding would be used to provide equipment purchases and renovations for the proposed sites.

ACTIVITY 6: Approaches to increase TB laboratory throughput

With the current number of sputum samples submitted for laboratory smear microscopy and culture already at an all time high and continuing to increase, it is recognized that one of the most significant rate determining factors directly impacting laboratory through-put is that of the NALC decontamination process, a labor intensive processes of sputum concentration and decontamination. In order to streamline this process and to increase overall laboratory through-put of sputum specimens to meet the increased demand and lack of available staff to process such specimens, alternate or automated measures should be investigated. Currently, NICD has vested time in investigating possible automated methods that could significantly reduce and provide standardized decontamination processes. The currently proposed funds would be used, in partnership and through co-funding with NHLS, for the development of automated NALC decontamination instrumentation and technologies. The project with full details and project plan has been submitted. There is strict adherence to the time lines in the project plan and budget. Completion date of project will be January 2010.

ACTIVITY 7: National TB Quality Programs

Proficiency testing: Second line DST EQA for culture laboratories is a priority and will be developed during this funding period, as there is NO PT for second line anti-TB drugs in the NHLS. Description and Methodology: Simulated specimens for DST testing will be prepared and distributed to all culture facilities within the NHLS. The resistance profile among the organisms will vary from organism to organism and measure the proficiency of the laboratories to correctly identify resistance to second line drugs amikacin or kanamycin, ethionamide and ofloxacin. Capreomycin. Objectives of the program include: (1) capacity building, (2) improvement of quality (3) institution of corrective actions where deficiencies are detected and follow up, as well as (4) providing support to peripheral laboratories. Outputs: Second line DST is performed by MGIT liquid culture in the following NHLS Laboratories: Green Point, Port Elizabeth, Umtata, Albert Luthuli, Braamfontein. All these laboratories will be required to participate in the PT.

ACTIVITY 8: Rechecking program

A blind rechecking program is in the process of being rolled out in the NHLS. Goals and objective: (1) Blanket approach of rechecking random selected slides from the laboratory register is inadequate. (2) Selection of sample size is based on implementation and sustainability, rather than rigorous analytical methods. (3) The recommended sample size provides relative information on the sensitivity of microscopy. (4) Sample size is based on annual laboratory volume and the proportion of positive smears. (5) Positive slides are included to achieve blinding, but numbers are insufficient to determine specificity. (6) Guidelines to interpret Discrepancies.

ACTIVITY 9: Line Probes

20 NHLS regional laboratories will be identified for rollout of the line probe over the next 24 months. This entails (1) Identify additional space for PCR laboratories (2) Renovate the space for PCR laboratories to an acceptable standard (3) Purchasing of equipment (4) Training newly employed scientists (5) Validation of the assays (6) Institute quality systems for the ongoing monitoring of performance. A partnership will be established with Davies Diagnostics, the local supplier of the Hain line probe, for technical assistance in the training and roll out of the assay. The overall goal is the establishment of line probe assays in 20 regional laboratories throughout South Africa for the early identification, isolation and treatment of new MDR-TB cases to improve outcomes in these patients. PCR Laboratory space would have been identified and renovated, capital equipment put in place and scientists trained to perform the assay. Quality systems will be in place. These laboratories would be confident in performing routine diagnostic PCR investigation on smear positive sputa for the identification of MDR-TB patients.

ACTIVITY 10: National Tuberculosis Reference Laboratory

Molecular Biology: Goals and objectives: (1) With an emphasis on the MDR-TB and XDR-TB strains isolated nationally, molecular characterization of sensitive and resistant M tuberculosis will be commenced on the collection of MDR and XDR organisms from all provinces in South Africa. (2) Molecular investigations into outbreaks will be performed and unique mycobacterial strains and NTM species encountered will be identified and characterized by conventional, molecular and HPLC technology. (3) Molecular genotyping on a sample of the isolates obtained from drug resistance survey (about 14,000 strains) to accurately reflect the genotypic epidemiology of M tuberculosis in South Africa. Outcomes expected: (1) Characterizing general circulating M tuberculosis strains, MDR-TB strains and longitudinal characterization of repeat isolates from MDR-TB patients (2) Sequencing the resistance genes of M tuberculosis MDR-TB strains and promoters, (3) Molecular investigations into outbreaks (4) Characterizing general circulating M tuberculosis strains, MDR-TB strains and longitudinal characterization of repeat isolates from MDR-TB patients. Assays planned to be performed in the NTBRL include RFLP, spoligotyping, sequencing of drug resistance loci.

ACTIVITY 11: ACILT - African Centre for Integrated Laboratory Training

Objective: Recent reviews of TB and HIV laboratory practices throughout Africa have affirmed the principle that accurate laboratory results are not only based on the number of people employed in laboratories, but

Activity Narrative: on the quality of their work. This is chiefly a matter of better training, motivation and management according to good laboratory practices. The primary objective is to train technical staff from across Africa in current technologies and methodologies for TB and HIV. It is proposed that a Technical Advisory Committee be formed which would provide technical expertise to the Centre management on issues related to management, laboratory curriculum development and training programs, review the training centre's training priorities and strategies so that they are in line with the regional requirements and targets, and give support to the faculty. Courses to be focused on in the short-term are: (1) TB culture/DST and molecular diagnostics. (2) Early Infant Diagnosis PCR (3) Laboratory management (4) Quality management systems (QMS) (5) Commodity management (quantification).

ACTIVITY 12: CDC Management & Administration

The NHLS/NICD has implemented financial and administrative processes to ensure improved focus and oversight of the funding of this Cooperative Agreement. These processes are broadly divided into two, being 1) processes around the budget development and the funding needs affecting the application, and 2) financial controls for project finances. Budget development and funding needs affecting the previous application were addressed by having a centralized budget development function. All the budgets and carry-forward requests are consolidated in conjunction with individual PIs, the Cooperate Services Manager of the NICD, the NHLS Cooperate Services and the PI managing the CDC grant overall. Secondly, financial controls affecting funds have been investigated and are currently being implemented in alignment with NHLS policies and procedures. The processes followed for committing expenditure have been documented. This forms the basis for the implementation of financial controls, including monthly reporting of expenditure, and the review of these expenditures.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

All three of the FY 2008 activities will continue into the FY 2009 funding cycle. There are a few changes to the specifics of these program area implementation:

ACTIVITY 1: Strategic Partner Evaluations

These partner evaluation activities will be extended to include the following partner organizations:

- A formative evaluation will be undertaken of the John Hopkins University (JHU) new partner The Turntable Trust (TTT) to examine the expectations of the community to enhance and improve program implementation and efficacy.
- Footballers4Life is a project that is coordinated through Matchboxlogy. This evaluation will aim to assess the extent to which the use of former footballers within club settings is meeting the needs of professional footballers and their fan clubs.
- The Lighthouse Foundation will conduct a comprehensive outcome evaluation of the program to explore its impact on the community that it is servicing.
- Cell-Life is a Cape Town-based not-for-profit section 21 company which develops and implements open source technical systems to support the fight against HIV and AIDS. This evaluation will measure the impact that cellular communications is having on prevention, care and support and treatment.

ACTIVITY 2: Dissemination Workshops

Within FY 2008, the ground work and analysis for Second National HIV and AIDS Communications Survey will be completed. This analysis will be extended to include the provincial analyses of findings. These reports will be disseminated to the various provincial departments through capacity building workshops that will aim to build the capacity of provincial governments in undertaking evidence-based interventions.

SUMMARY:

Johns Hopkins University/Center for Communication Programs (JHU/CCP) coordinates the work of 20 South African partners and provides technical assistance and capacity building in communication activities to prevent HIV, provide care and support, and increase treatment adherence and support. JHU/CCP also undertakes program evaluation that aims to ensure that all communication activities undertaken by JHU/CCP are responsive to emerging issues and the changing dynamics of the epidemic within the South African context. The National HIV and AIDS Communication Survey, carried out in early 2006, serves as a baseline for comparing overall PEPFAR and South African government (SAG) communication goals and objectives with a follow-up survey planned for 2008.

BACKGROUND:

JHU/CCP led the undertaking of the National HIV and AIDS Communication Survey in 2006 in partnership with the National Department of Health (NDOH) through Khomanani, Soul City, Health and Development Africa (HDA) and the Centre for AIDS Research and Evaluation (CADRE). The key objectives of this survey were to develop an understanding of the overall HIV and AIDS communication environment; understand communication gaps to inform future communication interventions; and determine the reach and complementarities of national communication campaigns and their contribution to individual level responses. This survey found that 87% of all South Africans were reached with messages dedicated to HIV prevention and living with HIV and AIDS by means of television and radio programs.

In response to the identification of multiple concurrent partnerships as a risky behavior that fuels the epidemic, JHU/CCP undertook a small qualitative study that aimed to unpack the underlying reasons for multiple concurrent partnerships within a hyper-endemic scenario and the manner in which communication can be mobilized to bring about behavioral and social changes. JHU/CCP provides technical support to its partners to undertake programmatic evaluations that enable partners to align their activities to the needs of the communities so that it is responsive to behavioral risk factors and key drivers of the epidemic within communities. This ensures that programs are evidence-based and continually respond to the changing nature of the epidemic.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strategic Partner Evaluations

In line with the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP), all project activities should be evaluated so that they are responsive to the needs of the communities that they service. JHU/CCP works with all 20 partners to evaluate their programs in consultation with evaluation experts that at the same time provides these organizations with the necessary skills and capacity to undertake their own strategic information activities as part of their ongoing project design and implementation.

In particular JHU/CCP supports the Community Health Media Trust (CHMT) to undertake an evaluation of the impact of their Treatment Literacy and Prevention Practitioners (TLPPs) in providing care and support to people living with HIV within public health clinics and the extent to which this task shifting contributes towards improved care and support for patients living with HIV and non-HIV patients as well as investigate their impact on prevention behaviors. The findings of this study will be used to engage national and provincial health authorities on the manner in which TLPPs can be used to task shift from health care workers and

Activity Narrative: provide optimal support to people living with HIV.

DramAidE employs young people living with HIV to act as Health Promoters on the campuses of tertiary academic institutions. The study will examine the extent to which these Health Promoters have impacted on the health and wellbeing of students and on the overall HIV policy and program being undertaken in tertiary institutions. This study will be used to advocate with tertiary institutions for the integration of Health Promoters as an integral component of their response to HIV.

ACTIVITY 2: Dissemination Workshops

HU/CCP will undertake the second National HIV and AIDS Communication Survey in follow-up to the first survey in conducted in 2006. This survey will provide in-depth information about the communication environment in South Africa as well as estimates of the separate and joint impact of various communication interventions. The results of the study will be used to measure progress on program goals and to inform future strategic planning for communication activities. In FY 2008, the main focus will be on the dissemination of the findings through a series of workshops to more than 300 key policy and decision makers throughout the country. The purpose of these workshops is to build national and local consensus on the impact of communication interventions on HIV prevention, care and support, what has been achieved through communication interventions and which program areas interventions need to be strengthened. In addition, the findings from the 2008 survey will be compared to those from the 2006 survey to assess changes in norms and behavior and the impact of various communication interventions.

Findings from the survey and discussion and processing of the findings in the dissemination workshops are, taken together, effective ways to incorporate the role of most-at-risk populations and other populations that contribute to the variation in the HIV and AIDS epidemic in South Africa. This is specifically where the tick boxes in the tables on the following pages are relevant.

This activity will assist in making communication interventions across the different program areas more effective by providing key data for decision making. This will contribute to the overall global PEPFAR goal of averting 7 million new infections.

ACTIVITY 3: Capacity Building for Strategic Information

JHU/CCP partners will work with the University of KwaZulu-Natal, Centre for Cultural and Media Studies to build the capacity of young South Africans in designing, implementing and monitoring strategic communication interventions. This program capacitates students to undertake research that examines the impact of communication interventions in relation to international standards.

A media partner (partner to be determined) will work with South African media institutions including journalists and editors to build their capacity in understanding, analyzing and reporting on HIV and AIDS strategic information to improve media reporting on the state of the epidemic in South Africa.

Budget Code: HVSI	Program Budget Code: 17
Activity ID: 3345.23086.09	Planned Funds: \$1,521,893
Activity System ID: 23086	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Data Warehouse (DW) activity will work closely with the newly-awarded John Snow Inc. (JSI) Enhance-SI project, with JSI focusing more on improving data extraction and outbound reports. A new cube viewer has been developed during FY 2008 and this will be further enhanced to assist users to create custom queries. With the hope that the PEPFAR partner GIS data will be improved as a result of current USG initiatives, the DW team will roll out the online mapping system that was developed this year. Further refinement will be made to pre-populating performance results onto reporting and planning forms. More resources will be put into development testing. Finally, the DW will work with the large treatment partners to allow electronic transfer of data that these partners already collect with existing computerized systems.

For the Data Quality Assessments (DQA) project, in FY 2008 Khulisa initiated a revision of the data quality audit tools with the intention of moving them from a "deficit-oriented" assessment, to a "strength-oriented" assessment. This initiative was taken to further support the PEPFAR goal of making the DQA more collaborative and useful for capacity building. The new tools were still being piloted at the end of FY 2008. Khulisa is also exploring the possibility of aligning the South Africa DQA tool with an adapted version of the Global Fund/PEPFAR DQA tool.

SUMMARY:

The South Africa PEPFAR program works with over 100 prime partners, who in turn work with over 300 sub-partners and 350 service delivery sites, to implement HIV and AIDS activities across South Africa. This immense level of effort poses a significant challenge to the USG in efficiently monitoring and evaluating programs (mainly because there is no single source from which to obtain PEPFAR data) and in building monitoring and evaluation (M&E) capacity among partners. Khulisa helps to address these challenges through a web-based data warehouse (DW) and through on-going independent Data Quality Assessments (DQA) of PEPFAR partners' data management systems. Both the DW and DQA activities prioritize M&E capacity building among PEPFAR/South Africa partners.

This project addresses the emphasis areas of Health Management Information Systems, monitoring, evaluation and reporting, as well as USG database and reporting systems. The main target populations are the USG and PEPFAR prime partners, sub-partners, and sites in all nine provinces.

BACKGROUND:

Khulisa Management Services is a South African-based consulting firm offering quality management and technical services to development projects throughout Africa. With PEPFAR funding, Khulisa has implemented both the DW and DQA activities since FY 2005. With FY 2006 funding, Khulisa conducted DQAs of 26 PEPFAR partners and provided data quality training for USG staff and partners. This exercise provided invaluable feedback on risks to data quality regarding reported PEPFAR data, and also sought to build M&E capacity and improve data management systems (DMS) among PEPFAR partners. These DQAs were more collaborative than traditional audits, allowing partners to receive advice on how to improve practices. The proposed DQAs will continue to build partners' understanding and capacity in M&E systems, as well as improve the overall quality of data they report.

Since October 2004, Khulisa has provided web-based data warehousing services to PEPFAR through a sub-grant through John Snow Inc. (JSI) funded through the MEASURE Evaluation project. The DW has transformed a paper-based COP planning and reporting system to a more efficient web-based system with data integrity. The DW has undergone continuous revisions to address the changing needs of PEPFAR. The proposed project activities will further support the DW and develop a sustainable and replicable system.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1 - Data Quality Assessments (DQAs)

The DQAs are designed as a three-phased approach, using standardized tools based on USAID and other internationally accepted standards. At each phase, the risks to data quality are identified prompting a dialogue between the assessor and the partner about how to improve systems, resolve problems, and resolve data quality risks. The findings of each phase, with associated recommendations, are reported in detail to both the USG and the partner. In addition, the USG receives a summary report for each phase. A plan for technical assistance is developed between the partner and the USG.

Phase 1: Phase 1 assessments are conducted with a new group of partners as identified by the USG Task Force. In this phase, the partner's Data Management System (DMS) and associated processes and procedures are examined through a self-evaluation, followed by a review of the DMS by the Khulisa assessor. The main objective is to prepare the partner for Phase 2 and familiarize them with the DQA process.

Phase 2: Phase 2 involves validation and verification of reported data. The assessor uses two selected indicators (from source) and tracks it through the partner's DMS to evaluate the reported data for validity, reliability, timeliness, precision and integrity. In the process of conducting Phase 2 the assessor derives scores for several dimensions of data quality; these scores are interpreted in the context of data quality risks. Any identified risks are reported to the partner and the USG with recommendations for corrective action. Partners with high risk scores are issued compliance notes indicating data management and quality practices that could be improved in specific ways. The compliance notes also provide recommendations for resolving practices that contribute to compromised data quality of reported results.

Phase 3: Phase 3 is the follow-up visit which is only done with those partners who received a compliance

Activity Narrative: note based on a high risk score in Phase 2. The assessor re-examines the data quality issues found during Phase 2 and assesses whether the corrective action taken by the partners reduces the risks that were outlined. When the assessor and partner achieve consensus on the corrective action, the compliance note is considered closed. This final visit also serves as an additional opportunity for the partner to receive technical assistance from the assessor on data quality practices.

ACTIVITY 2: Data Warehouse (DW)

The DW project is an ambitious and unique activity, and has proven to be a useful tool for PEPFAR reporting and planning. During the last two years, Khulisa built a web-based DW that is password-protected, through which implementing partners can electronically submit both narrative and quantitative information on progress towards their expected results as well as their plan for the forthcoming fiscal year. The DW also allows the USG Task Force to verify submitted data, make adjustments for partner double counts, and to maintain an audit trail by tracking changes made to data.

Over the last three years, substantial progress has been made in developing a PEPFAR reporting system. Multiple tests were performed on the system, which brought about numerous adjustments to improve efficiency and effectiveness. Feedback has been positive so far and USG staff and partners have now become more "fluent" in using the system. Last year, in addition to the reporting side of the DW, a planning side has been added to electronically capture information for the COP, enabling the USG to better manage the large amount of COP data through version control. An online "track changes" function has been added this year to assist activity managers with their final COP edits.

Currently, the DW captures progress reports (quarterly, annual and semi-annual) and COP data; provides tools for managing budgets and targets through online, editable grids; provides a tool for the removal of double counting; tracks data changes through audit trails; and extracts indicator data, sub-partner and site information.

In FY 2008, Khulisa will continue to maintain and host the DW, with a focus on expanding features for better use and analysis of program data at the partner level. Specifically, the project will:

- Continue improving the currently active functions for even greater ease of use by partners and USG staff.
- Further extend the extraction and reporting capacity for indicator data, sub-partner and site information, status information and trend data. The extensions will focus on online graphical representation of data including maps. Manually-produced maps are already a significant aspect of data use and their availability online, in real time will improve the usage of this data.
- Further improve partner-level data usage and data quality through site-level data capture for partners (other than the treatment partners who currently do so). Site-level capture will be started for partners who request it, starting with Orphans and Vulnerable Children partners and likely followed by Counseling and Testing partners.

EXPECTED RESULTS:

These two activities will allow the USG Task Force to make better, data-driven programming and planning decisions at the macro level, as well as assist partners develop and utilize more effective M&E systems. The sustainable impact of the system will be the partner's ability to make better programming and planning decisions for their own programs based on accurate and reliable data.

This activity will assist the entire PEPFAR program achieve its goals through effective M&E of partner achievements in meeting South Africa's portion of the 2-7-10 goals.

Activity System ID: 23691

Activity Narrative: SUMMARY:

This project aims to screen 1,500 youth for a number of key sexually transmitted infections (STIs), which may enhance both HIV acquisition and transmission. Many STIs in youth are asymptomatic and will thus not be treated in the syndromic management approach adopted by South Africa. There are very limited data available on the burden of asymptomatic STIs among youth. Youth will be screened for gonorrhoea, chlamydial infection, trichomoniasis, and, if a genital ulcer is present, for chancroid, syphilis and genital herpes. All youth will be offered serological screening for syphilis and be offered on-site rapid tests for HIV and HSV-2 antibodies. Sera, de-linked to patient details, will be tested anonymously for HIV and HSV-2 antibodies in the laboratory to obtain prevalence data for all youth who undergo serological screening for syphilis. All STIs diagnosed will be treated etiologically by the project nurses, and contact tracing initiated. Sex partners are encouraged to return to the project site, or else to local health care facilities, for appropriate STI treatment, prevention activities (including training on use of male and female condoms and provision of condoms), and routine offer of HIV testing and counseling. As well as providing important surveillance data on the burden of HIV and STIs in youth, the activity is anticipated to contribute directly to PEPFAR's 2-7-10 goals by increasing HIV VCT outlets, training of staff on STI and HIV management, detection and treatment of STIs, and detection of new HIV cases and onward referral to HIV wellness/treatment sites.

In the FY 2009 COP, the STI microbiological surveillance activity will be modified in that only the youth component of the five groups mentioned in the FY 2008 Activity Narrative will be pursued in terms of this new STI Reference Center (STIRC/NICD)-DSTD(CDC-Atlanta) follow-on co-operative agreement.

The proposed activity will now use two nurses rather than one in order to address gender-specific requests for genital examinations by the youth. Two counselors rather than one will also be employed to ensure that youth do not have to wait long for HIV counseling/results and will allow counselor sufficient time to assist with provision of negative STI results and HIV prevention messages to youth. In addition, the employment of two nurses and two counselors will overcome the sorts of operational difficulties experienced on other PEPFAR funded activities undertaken by the STI Reference Center in FY 2008 when staff left for other positions (one 'care' project had to stop for several months pending appointment of a new nurse) and to ensure cover is available for sickness, other leave and training.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is being funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. This will no longer be funded in FY 2009 due to the existing National Institute for Communicable Diseases (NICD) Cooperative Agreement ending. A new Cooperative Agreement is now in place with the National Health Laboratory Service (NHLS), the parent organization for the NICD, and a smaller Funding Opportunity Announcement is being developed with the Sexually Transmitted Infections Reference Center (STIRC), an STD division within the NICD. The TB/HIV funds earmarked for FY 2009 have been moved into LAB for FY 2009, so that there are only 2 program areas for NHLS in FY 2009, LAB and SI. All existing program activities in these areas will be supported under the new NHLS Cooperative Agreement in the FY 2009 COP. Care, treatment, and a smaller SI budget will continue to be supported, but through a new TBD COP entry for a NICD continuation (STIRC) in FY 2009. Therefore there is no need to continue funding this activity with FY 2009 COP funds.

Activity System ID: 22962

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Due to requests from both PEPFAR partners as well as fellows, the majority (80%) of master's degree fellows work timeframes will be extended from the current six-month period to that of one year placements on the monitoring and evaluation (M&E) systems of South African PEPFAR partners.

A PEPFAR Partner Host Organization orientation process will be added in order to improve on the supervision, management and appropriate skills development of fellows; stable hosts will be identified for repeat placement of Fellows.

Due to experience to-date with the logistical implications of laptop packages and internet contracts provided to fellows as functional support and the maintenance and risk management complexity there-of, host organizations will be expected to provide such facilities to fellows in future. Only in selected circumstances will this service be provided to fellowship placements with the primary focus on smaller organizations with limited funding and resource possibilities.

Higher focus will be placed on placements with South African government (SAG) facilities that require and request SI-related technical support.

The fellowship training program will be expanded to include a broader range of skills and will be facilitated throughout the 12 month placement timeframe to create follow-up, feedback and mentoring sessions to maximize the element of leadership potential and management skills development.

SUMMARY:

The Foundation for Professional Development (FPD) program supports the expansion of access to comprehensive HIV and AIDS care by focusing on human capacity development (HCD). The project aims to develop human capacity in strategic information (SI) at AIDS service organizations by having master's degree fellows work for a six-month period on the monitoring and evaluation (M&E) systems of South African PEPFAR partners. The emphasis areas for this activity are strategic information and local organization capacity building. In FY 2008, this fellowship program has been offered to other PEPFAR countries whereby they can provide funds to support fellows who are recent graduates of South African universities but must return to their country of origin after they complete their coursework. This practicum experience with a South African PEPFAR partner will provide them with skills for future work in M&E when they return to their countries. FPD has also offered to teach other PEPFAR countries how to start a similar program in their country. This new activity aims to improve south-to-south capacity development.

BACKGROUND:

FPD is a South African private institution of higher education working exclusively in the health sector in Southern Africa. With PEPFAR funding, FPD supported treatment to thousands of people living with HIV (PLHIV) and training for thousands of healthcare providers and managers. This activity, started in FY 2006, supports the more formalized approach to human capacity development (HCD) needs in South Africa. It will be scaled up through the FPD given their ability to expand to all universities. FPD, as a nation-wide training institution, is well placed for implementation of this activity as training and other HCD activities are their core business and FPD has well-developed relationships with other academic institutions in the country. These relationships will create a conduit to recruit master's degree fellows from a variety of these institutions. FPD also provides training to various PEPFAR partners and other health service institutions. FPD will facilitate the placement of fellows with PEPFAR partners who need to strengthen their M&E capacity. With FY 2008 funding, FPD will support the expansion of access to comprehensive HIV and AIDS care by focusing on HCD. In addition to training and mentoring, this activity will close the gaps in capacity in a number of South African institutions implementing PEPFAR-funded activities. M&E expertise is lacking for many partners, who must develop systems and overall capacity to document progress toward implementation of the South African PEPFAR program. Emphasis will be placed on ensuring gender representation in the recruitment of fellows.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Human Capacity Development

The project is aimed at improving the skills of graduate students at masters degree level who have a specialization or interest in SI by partnering them with implementing PEPFAR partners or other related AIDS service organizations. The fellows who will provide M&E and SI assistance and support to these organizations will be recruited from South African universities that specialize in SI-related qualifications. Both the fellows and the organizations will be technically supported by FPD, university and USG M&E staff. In addition, an effort will be made to design projects that are of interest to the fellow, so both the organization and the fellow will benefit.

ACTIVITY 2: Local Organization Capacity Development

The project further supports the ability of such organizations to engage in SI activities by providing them with a fellow with specialized knowledge in SI related disciplines. The aim of the fellowship is not just to do reports for the organization, but also to provide technical assistance in the development and maintenance of M&E systems. It is required that the organization accepting the fellow has a full-time M&E Officer, so the systems built during the fellowship are sustainable. Funding will be utilized to appoint a dedicated project manager, pay stipends and transport costs for fellows and to allow FPD to coordinate with various universities and recipient organizations with regard to recruitment, placement and evaluation of the program. The sustainability component of this project revolves around the premise that some of the recipient organizations will recruit the fellows at the end of their placement period. It is also expected that fellows will have effected a substantial improvement in the strategic information capacity of the recipient

Activity Narrative: organization during their placement and that this improvement will be maintained after their departure.

FPD will contribute to the PEPFAR 2-7-10 goals by developing the capacity of organizations to expand access to antiretroviral therapy services for adults and children, building capacity for monitoring ART service delivery.

Program Area: Strategic Information

Program Budget Code: 17

Planned Funds: \$235,444

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Building on the expansion of Training Information Monitoring System (TIMS) in FY 2008 to the National PMTCT Unit, Northern Cape, KwaZulu-Natal, Department of Public Service and Administration and Mpumalanga provinces, Jhpiego will continue to support the existing TIMS sites in FY 2009 by providing technical assistance with intermittent troubleshooting. The on-site technical support will entail visiting sites for support on data cleaning, generation of reports, and trouble-shooting for the sites established in 2008. The technical support provided for sites established prior to 2007 is mainly trouble-shooting, depending on site requests. Furthermore, Jhpiego will expand TIMS to Gauteng and Free State provinces in FY 2009.

In FY 2009 Jhpiego proposes to intensify PMTCT monitoring and evaluation (M&E) on-site supervision and follow-up to four additional sites in the North West province. Jhpiego proposes to use the PMTCT M&E and supervision tool developed in the Northern Cape, which outlines PMTCT M&E standards. This intervention will be coupled with PMTCT program support aimed at capacity building and quality improvement in service delivery within the North West province, bringing about synergy to Jhpiego's interventions. Facility-based health-care workers will be assisted to implement interventions to improve M&E capacity. Jhpiego's TA will focus on interventions such as record keeping, data quality, interpretation of data and reporting, as well as the use of information for decision making. Jhpiego will encourage facilities to use the M&E performance tool as an internal method for supervising their effectiveness for M&E.

SUMMARY:

JHPIEGO will continue (a) conducting monitoring and evaluation (M&E) training in PMTCT for staff from the National Department of Health (NDOH) and provinces; and (b) implementing and expansion of the training information monitoring system (TIMS). In addition, JHPIEGO will also strengthen PMTCT supervision skills for provincial and district PMTCT program managers.

ACTIVITY 1: Monitoring and Evaluation

Since FY 2004, JHPIEGO has provided technical assistance in strengthening PMTCT M&E and has trained approximately 250 HIV and AIDS program managers and coordinators from the NDOH and eight provincial departments of health in M&E fundamentals. In FY 2007, JHPIEGO provided intensive on-site supervision and follow-up to targeted sites in the Northern Cape using a supervision tool outlining PMTCT M&E standards. JHPIEGO assisted facility-based health-care workers to implement interventions to improve M&E capacity. Technical assistance focused on interventions such as record keeping, interpretation of data and reporting. JHPIEGO encouraged facilities to use the M&E performance tool as an internal method for supervising their effectiveness for M&E. PEPFAR funding will be used to support technical assistance costs (M&E expert consultants) to facilitate this process at the site level. The activities will continue in FY 2008 and will be expanded to additional sites.

ACTIVITY 2: Training Information Monitoring System (TIMS)

Building on the expansion of TIMS in FY 2007 to the National PMTCT Unit, Northern Cape, and North West provinces, JHPIEGO will continue to support TIMS in FY 2008 by providing technical assistance with intermittent troubleshooting to the provinces and exploring web-based TIMS. As a result of this activity, the NDOH PMTCT and TB units and three regional training centers in Gauteng, Mpumalanga and Limpopo will be able to capture training data on both national and provincial levels. This data will permit them to assess their progress and ongoing needs for capacity building. TIMS allows program planners to determine where training needs are greatest and prioritize their investment of training resources accordingly.

ACTIVITY 3: Training in PMTCT Supervision

As partners under the USAID Population and Health Integrated Assistance project, JHPIEGO developed and implemented supervision training for reproductive health supervisors in Kenya, Malawi and Ethiopia. In FY 2008 JHPIEGO proposes to address training-related PMTCT supervision problems through the adaptation and implementation of the supervision learning package. Supervision is an essential intervention to maintain the performance of the healthcare provider, and improved supervision is unanimously recognized as important for the delivery of quality HIV and AIDS services. The supervisor plays a critical role in ensuring that members of the community receive quality healthcare services. To perform effectively, the supervisor not only needs to acquire the knowledge and skills to do the job, but needs to work in an environment that will allow the supervisor to have a positive effect on the quality of services. Most health professionals charged with supervision responsibilities in the PMTCT program lack the full range of knowledge and skills to perform their job effectively. Most supervisors are limited in this capacity because they have received not received training in this area or any support or reference materials on supervision. In addition to a lack of knowledge and skills, other causes of poor performance include: insufficient funds for transportation, lack of supervision tools (to be addressed in part through the development of the supervision learning package), infrequent supervision visits and inadequate national supervision guidelines. To maximize the effect of the training interventions, it is essential that these other causes of poor performance be addressed concurrently with the training of supervisors.

These activities will indirectly contribute to the overall PEPFAR objectives, as supervision will indirectly increase access due to improved quality of service.

Funding Source: GHCS (State)	Program Area: Strategic Information
Budget Code: HVSI	Program Budget Code: 17
Activity ID: 3343.23163.09	Planned Funds: \$1,891,322
Activity System ID: 23163	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

In FY 2009, second generation HIV surveillance will continue to be the main focus of Strategic Information (SI) activities. FY 2009 funds will be used to:

- (1) Conduct analyses of trends in HIV and risk behavior using surveillance information from past national household HIV surveys conducted in 2002, 2005, and 2008;
- (2) Conducting training and preparatory work for the 2011 national household HIV survey (a NEW activity);
- (3) Developing and enhancing M&E capacity; and
- (4) Work with SAG partners to harmonize health management information systems (HMIS) (a NEW activity).

ACTIVITY 1: 2008 HIV Prevalence Survey

No FY 2009 funds will be used for the 2008 national household HIV survey because fieldwork and primary analyses will have been completed. A portion of FY 2009 funds will be used to conduct analyses of trends in HIV and risk behavior using surveillance information from past national household HIV surveys conducted in 2002, 2005, and 2008.

ACTIVITY 2: Surveillance of HIV and Risk Behavior Among men who have sex with men (MSM)

No FY 2009 funds will be used for this activity because FY 2008 funds are sufficient to complete this activity.

ACTIVITY 3: Surveillance of Discordant Couples and Assessment of HIV Prevention Strategies and Support Needs

A portion of FY 2009 funds will be used to support this activity because the scope has increased. A population-based survey will be conducted to identify HIV serodiscordant couples. In order to estimate the prevalence of HIV discordance with a 4% margin of error, an estimated 7,200 households will need to be visited in order to obtain 2,880 eligible couples. Preparation for this study (protocol development and approval) and preliminary fieldwork will be done using FY 2008 funds. However the bulk of the household survey activities and analysis and write-up of results will be done using FY 2009 funds.

ACTIVITY 6: Preparation for the 2011 national HIV household survey

This is a NEW activity that will start in FY 2009. FY 2009 funds will be used for preparatory activities for the 2011 national household HIV survey including:

1. Formative research using qualitative methods (e.g. focus group discussions) to collect in-depth information on survey-relevant topics in preparation for the 2011 national household HIV survey;
2. Development and pre-testing of questionnaires and survey instruments in preparation for the 2011 national household HIV survey;
3. Recruitment and training of fieldworkers and survey staff in preparation for the 2011 national household HIV survey;
4. Conducting studies to assess the feasibility of providing participants with HIV test results in the 2011 national household HIV survey, and to devise practical methods for providing participants in the 2011 survey with voluntary counseling and testing (VCT) under the field conditions and methods used in previous national household HIV surveys. (The provision of VCT in the 2011 national household survey will be a departure from previous national household HIV surveys where anonymous unlinked HIV testing (UAT) has been used, in keeping with WHO and UNAIDS guidelines for HIV testing in population-based surveys.)

The methods used for preparatory activities for the 2011 national household HIV survey will be modeled on those used in preparation for previous national household HIV surveys.

ACTIVITY 7: M&E capacity enhancement and M&E support for the national strategic plan (NSP)

Some of the core indicators specified in the NSP, required for effective M&E of the HIV epidemic in South Africa, are not currently available from routine information sources. Measures will be taken to ensure that information is obtained for all critical indicators required by the NSP.

The HSRC will use FY 2009 funds to provide ongoing technical support and training to enhance M&E capacity within the South African National AIDS Council (SANAC). The HSRC will provide technical support to the deputy-chairperson of SANAC, as well as research advice, scientific reviews, and expert input to SANAC through the Research Sector. Training will be provided to HSRC/South Africa staff, SANAC staff, and relevant government officials in the analysis and use of strategic information, and ongoing mentoring will be provided.

ACTIVITY 8: Harmonization of HMIS

This is a NEW activity that will start in FY 2009. The HSRC will partner with Statistics South Africa (StatsSA), the NDOH, and other relevant organizations, to ensure the availability and optimal use of data obtained in previous national surveys. This activity will ensure that key national HIV data are properly archived and are made available to a wide range of stakeholders. This will assist with the development of a coordinated national M&E system and will support the dissemination of data.

SUMMARY:

The Human Sciences Research Council (HSRC) will use PEPFAR funding to support the South African national population-based HIV prevalence and behavioral risk survey in 2008. Data will be used to enhance

Activity Narrative: national HIV and AIDS program indicators and to compare South Africa's HIV epidemic to the global pandemic. FY 2008 COP activities are expanded to include surveillance activities among most-at-risk populations (MARPs) including C (MSM), discordant couples, and refugees, as well as an evaluation of the impact of the national antiretroviral treatment (ART) rollout.

BACKGROUND:

The following section provides background for the listed activities.

1) The HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP) assigns the HSRC the task of conducting national HIV prevalence and behavioral surveys every two to five years. The results of the previous two surveys have succeeded in drawing attention to gender inequalities in the HIV epidemic in South Africa. Preparatory activities will take place in 2007 and the fieldwork will begin in early 2008. The Nelson Mandela Foundation, the Nelson Mandela Children's Fund, the Swiss Agency for Development and Cooperation, and the HSRC funded the surveys conducted in 2002 and 2005. The HSRC received support from PEPFAR and the National Institute for Communicable Diseases to conduct HIV incidence testing on dried blood spot samples (using the BED assay) in the 2005 survey. HIV incidence could be estimated for the first time in a national population-based sample of the general population. HSRC plans to seek co-funders for the 2008 survey.

HSRC is considering a couples sub-study as part of the 2008 national household survey to obtain an estimate of the prevalence, patterns, and factors associated with discordant HIV serostatus among people in established sexual partnerships. This sub-study is contingent on mobilizing adequate funding and human resources, and devising a sampling strategy that does not compromise the main survey.

2) During the 1980s, the South African HIV epidemic was largely confined to MSM and people who had received contaminated blood products. The epidemic became generalized in the early 1990s, and attention shifted away from MSM. HIV prevention programs generally do not include messages or interventions targeting MSM. The gap in knowledge about HIV in MSM and services for this group is a priority area in the NSP.

3) Information on the number and characteristics of serodiscordant couples in South Africa, and the strategies they use to prevent HIV transmission to the uninfected partner, is lacking. As people in long-term partnerships tend to have unprotected sex, and the majority of people living with HIV (PLHIV) in South Africa are unaware of their status, it is probable that a substantial portion of new HIV infections are acquired from primary (as opposed to casual) sexual partners. The uninfected partners constitute an important but neglected MARP, and current HIV prevention programs do not address the needs of discordant couples.

4) Refugees face many challenges in accessing HIV prevention treatment and care services. Specific challenges include poverty, migration, a lack of social support, language barriers, xenophobia and discrimination. Political and economic upheaval in several African countries has led to dramatic increase in the number of refugees (both legal and illegal) in recent years. Although accurate statistics are unavailable, it is believed that South Africa has one of the largest refugee populations.

5) South Africa currently has the largest number of people receiving ART, as well as the largest number of people needing ART (but not currently receiving treatment). Since the national ART rollout in 2004, the number of people receiving ART has expanded rapidly, but falls short of the goal, in part because resource constraints have not been able to keep up with demand. Task shifting of treatment provision to less specialized health workers (nurses instead of doctors), and making use of primary health-care centers rather than hospitals have been used to try to meet the demand. One of the two key goals of the NSP is to ensure that 80% of those needing ART have access to ART by 2011. To date a number of evaluations of local programs and programs of specific providers (e.g. workplace programs provided by the Anglo group of companies) have been conducted, but there has been no broad-based national evaluation of the national ART program.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: 2008 HIV Prevalence Survey

HSRC will use PEPFAR funds to conduct the 2008 national population-based HIV prevalence survey in South Africa. The survey will include children, youth, and adults of all ages. The survey will include children under the age of two for the first time (UNICEF will partially fund this). A large portion of funding will be devoted to HIV antibody testing and other related tests at an accredited national laboratory. Funds will also be used to support the analysis and the publication of a report, scheduled for release on World AIDS Day. Results will be analyzed by gender, thus providing information for increasing gender equity in HIV and AIDS programs. In addition, HSRC will conduct a detailed risk assessment on a sample of youth, which will provide information on male norms and behaviors. Following the publication of the report, additional secondary analyses will be conducted including an assessment of trends using data from the 2002, 2005 and 2008 surveys. The 2008 survey will be the third survey to conduct population-based HIV surveillance combined with behavioral surveillance on a national level and this will provide new knowledge and will provide a benchmark for the M&E objectives of the NSP. In addition, qualitative methods (e.g. focus group discussions) may be used to collect in-depth information on select topics to provide a better understanding of the findings of the national household survey. Lastly, as part of the survey, HSV-2 behavioral questions and biologic markers will be obtained for seroprevalence, behavioral and demographic data on HSV-2 and HSV-2/HIV co-infection, allowing for the monitoring of trends, and for the development of the evidence base for improving HIV prevention programs and local and national guidelines and policies.

ACTIVITY 2: Surveillance of HIV and Risk Behavior Among MSM

HSRC will conduct an assessment of the prevalence of HIV and risk behavior among MSM. This activity will

Activity Narrative: complement the surveillance information on the general population, and will provide strategic information about MSM as identified in the NSP. This evaluation will be conducted in nine or ten large South African cities. MSM aged 18 years and older will be recruited by means of respondent-driven sampling (RDS). RDS is the best method of recruiting a representative (generalizable) sample of MSM because no sampling frame exists, and other methods are more prone to sampling bias. As RDS is only suitable for use in urban areas and no satisfactory method is known for recruiting MSM from rural areas, rural MSM will not be included. Participants will be tested anonymously for HIV, provided with voluntary counseling and testing and asked questions about sexual and other risk behavior using a structured questionnaire, based on the one used to collect demographic and behavioral surveillance information on youth and adults in the national household survey. Additional questions, specific to MSM will be added. Semi-structured interviews will be conducted with MSM recruited through gay organizations, including HIV-infected MSM, and key informants in order to assess the HIV prevention, treatment, care and support needs of MSM in South Africa. The results of this activity will help meet the objectives of the NSP and will be used to develop recommendations for addressing current program deficiencies and barriers to accessing services among MSM.

ACTIVITY 3: Surveillance of Discordant Couples and Assessment of HIV Prevention Strategies and Support Needs

This project aims to estimate the number of PLHIV whose primary sexual partner is HIV-negative, and to ascertain the demographic and social characteristics of discordant couples. HSRC will assess barriers and facilitators to disclosure of HIV-serostatus to one's primary partner, and strategies that discordant couples are using to prevent HIV transmission to the uninfected partner. A combination of qualitative and quantitative methods will be used, and interviews will be conducted with couples, as well as individual interviews with both HIV-infected and uninfected people. This activity will address an important gap in strategic information, as outlined above. The results will be used to raise awareness of discordant couples among the general population (including people who are unaware that they are in discordant partnerships) and among policymakers, and will inform the development of prevention programs for discordant couples.

ACTIVITY 4: Assessment of HIV and Risk Behavior Among Refugees

A small exploratory study will assess the prevalence of HIV and risk behavior among a sample of registered refugees. Refugees will be recruited using information from the United Nations High Commission for Refugees (UNHCR) database. Methods of measuring HIV and risk behavior will be similar to those used in the national household survey. This activity may be expanded to include a larger number of refugees and illegal immigrants in subsequent years.

ACTIVITY 5: Assessment of the Impact of the National ART Roll-out

An evaluation will be conducted by means of a retrospective cohort study of a selection of patients from government-accredited ART sites in all provinces. Information will be collected by means of individual interviews with patients receiving ART, and patients who have discontinued ART, and by means of reviews of medical records (including the records of persons who have died).

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

BACKGROUND:

To ensure the HIV and AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP) is successfully implemented in all sectors and at all levels, costing and tracking government expenditure is key in the implementation and success of the NSP. With limited skills and capacity in costing identified in HIV and AIDS activities within all government departments, more departments are in need of capacity and skills in costing to ensuring appropriate resource allocation; therefore the increase in activities.

Due to the specific needs from the South African government for technical assistance in strategic information, the GOALS model will not be applicable to the South African context and to address the technical gaps in planning, reporting and tracking HIV and AIDS interventions, the Health Policy Initiative (HPI) will develop tailor-made models and capacity building activities. This will support evidence-based program planning and the overall success of the NSP.

ACTIVITY 1: National Department of Health (NDOH) HIV and AIDS, Comprehensive Care, Support and Treatment Sub Directorate Costing

HPI will continue to work with NDOH HIV and AIDS, Comprehensive Care, Support and Treatment Sub Directorate (CCMT) focusing on capacity building programs for costing of HIV and AIDS care and treatment interventions at the provincial level. The programs will also include costing for TB and sexually transmitted infections (STI). The objective of this activity will expand in scope by developing a tailor-made costing model for the HIV and AIDS, Comprehensive Care, Support and Treatment Managers. This model will standardize and guide a benchmarked approach within all provinces in ensuring effective resource needs required for HIV and AIDS care and treatment in their specific province. This will impact greatly on producing more realistic budgets and will ensure adequate funding. Consensus will have to be reached on the use of a single costing model for all provinces to ensure accurate and provincial specific budgets. The workshop program will be initiated to capacitate DOH staff with the aim to create provincial-level budgets which are based on clear and realistic assumptions about resource needs in the area of care and treatment. Available data on unit cost relating to treatment programs specific to South Africa, needs to be collated for the use in the development of a costing model.

HPI in collaboration with Futures Institute will develop the model for the NDOH. The tools will be piloted through a consultative workshop, drawing participants from selected provinces, and later implementation to all nine provinces. The tools will focus on costing national and provincial response to treatment, care and management as well as ensure capacity to provide adequate budget justification and explanations to executive management.

CCMT program managers will be trained on the model, and followed-up on the application of the model within NDOH and PDOH. To strengthen the above costing activity and ensure that there is enough evidence to proof human capacity development in costing for program managers within NDOH and PDOH in HIV/AIDS, HPI will carry out a rigorous monitoring activity to measure the impact, successes and results of the application of the model within all the NDOH and PDOH.

ACTIVITY 2: Department of Public Service and Administration (DPSA) Costing

HPI will continue workshops at provincial-level departmental staff in the use of the DPSA Costing Model to support the implementation of the model nationally. However, the focus in provinces will be monitored to ensure proper and effective use of the model to design improved budgets for HIV and AIDS workplace interventions in the public sector. The aim of the monitoring process is to ensure successful institutional capacity implementation as well as social capital within the departments. The experiences of the provincial departments in the use of the DPSA costing model will be captured and fed into the finalization of the guideline for the costing model. Any significant data that will improve on the quality of this model will be used for updating the model. An online version of the DPSA costing model will be designed to ensure that government departments are able to access the latest version of the model as well as updated costing through the internet.

While the application of the model is monitored, lessons from this process will be utilized to finalize a national costing curriculum. This curriculum will be integrated into public servant training courses within the South African Management and Development Training Institute (SAMDI) and other universities in the country. The curriculum will illustrate how costing can be used to address questions of efficiency, equity and sustainability of HIV and AIDS activities for which program managers are responsible for.

ACTIVITY 3: National Department of Transport

The National Transport Sector Council (NTSC) on HIV and AIDS requested technical assistance from HPI in the development of the sector's monitoring and evaluation (M&E) plan to complete the NDOT strategic plan. HPI in partnership with ILO provided technical assistance through a consultative platform to develop the transport sectors' M&E plan. HPI will continue supporting the NDOT and the NTSC to build their capacity to implement a standardized M&E framework. This will be done through sector workshops, collaborative, consultative and informed dialogue between member organizations of the council as well as support of the implementation of the HIV and AIDS M&E system to all member organizations.

SUMMARY

The Health Policy Initiative (HPI) will carry out capacity building activities and provide technical support to ensure improved national and provincial level financial planning and effective resource allocation for HIV

Activity Narrative: and AIDS. The target populations are host county government workers at national and provincial levels, with a specific focus on AIDS Control Program staff; and the emphasis area for this activity is other strategic information (SI) activities, to include healthcare financing and local organization capacity development.

BACKGROUND

HPI has significant expertise in providing assistance to governments and donors in planning and allocating future resources to manage national HIV and AIDS programs. This is an ongoing activity in South Africa, first initiated in 2001 with the collaboration of the National Department of Health (NDOH) and several other government departments. Since 2004, the activities were funded by PEPFAR and included provision of technical assistance and training for staff at the Health Financing and Economics Unit (HFEU) of the NDOH in applying the GOALS model. The GOALS model is a computer model designed to support HIV and AIDS planning by linking expenditure on specific program interventions to coverage of the population in need and to program goals, such as infections averted and deaths averted. HPI will continue to support the NDOH in preparing resource allocation and human capacity building plans to implement the NDOH's HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP) effectively. HPI has made it a priority to strengthen the capacity of provincial governments to cost their Provincial Strategic Plans and to align it with the NSP. HPI will provide technical assistance to all nine provinces and use information from the COP or other sources to identify gaps in budget allocations and providing information on what set of interventions can most effectively contribute to achieving the South Africa prevention and treatment targets.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Resource Allocation

In this phase, financial staff from the NDOH HIV and AIDS, Comprehensive Care, Support and Treatment Unit, will form part of the national training team to roll this intervention out further to the provinces. Training and technical assistance will be provided to national trainers to conduct national and provincial training for technical working group members on resource allocation, the use of data for decision making to prepare for HIV and AIDS human capacity needs, programming and financing of the NSP. Financial staff from the HIV and AIDS Care and Support Unit will also be trained to use the GOALS model and to teach staff at the provincial level on the use of the GOALS resource model to design programs, and to allocate financial and human resources. HPI staff will follow-up throughout the year with the HIV and AIDS, Care and Support trainers to provide additional capacity building.

This activity will contribute substantially towards meeting the vision outlined in the USG Five-Year Strategy for South Africa. It will contribute to reaching the goal of averting 7 million infections through improved planning and resource allocation.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

PEPFAR funds will support the National Department of Health (NDOH) to implement Epidemiology and Strategic Information (ESI) activities in the HIV and AIDS programs. Emphasis areas include the development of Health Management Information Systems (HMIS) strategies and their implementation monitoring and evaluation (M&E) support, epidemiologic use of data, expansion of survey and surveillance activities and additional staff for ESI. Target populations include South African policy makers, members of the National AIDS Control Program, and other staff in the NDOH. Activities described in this COP entry have been requested by the national or provincial Departments of Health.

BACKGROUND:

The NDOH lacks trained M&E personnel for specialized information gathering and management tasks. Data on disease surveillance and HIV and AIDS service uptake are often not up to standard or not transmitted in a timely manner, negatively affecting the NDOH's ability to analyze epidemiological trends effectively. CDC has provided technical support for M&E since 2003, including developing standard indicators, policies and guidelines, and training tools. Funds will be used to expand the NDOH's M&E activities, especially its human capacity development at the national and provincial levels.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

This activity is ongoing and in the past year has primarily focused on improving data in the CT, PMTCT and Care and Support programs.

Funds will be used to supplement the cooperative agreement funds with the NDOH and will be used to conduct M&E trainings for HIV and AIDS program staff at the national, provincial and district levels. The M&E trainings will include both program and information officers and will cover the importance of M&E and epidemiologic use of data in measuring the effects of the HIV epidemic. In addition, focus will be given to the new PMTCT indicators created by NDOH and currently being rolled out to provinces. Staff will be trained to use the District Health Information System (DHIS), health indicators, and more sophisticated M&E techniques for program planning. HIV and AIDS program staff will also be trained in data management techniques.

ACTIVITY 2: Staff

There are seven ESI positions included in this COP entry.

- (1) An M&E Advisor, who is seconded to the NDOH HIV and AIDS Directorate, will continue to provide technical assistance to the NDOH and provincial health departments to support data use and analysis efforts at the NDOH.
- (2) An M&E Advisor based at the CDC office will continue to work closely with the NDOH and with other PEPFAR implementing partners on data issues, reporting and other program monitoring and evaluation activities.
- (3) A Health Management Information Systems (HMIS) Specialist will continue to work closely with the NDOH and with other PEPFAR implementing partners to develop and implement HMIS strategies and ensure alignment at the national level.
- (4) An M&E Assistant will continue to work closely with the M&E Advisor based at the CDC office to provide feedback to NDOH and other PEPFAR implementing partners with regard to data quality and analysis of data from the data warehouse.
- (5) A Surveillance Program Specialist/Epidemiologist will be hired to expand epidemiologic technical assistance to the NDOH and other PEPFAR implementing partners involved in surveys and surveillance.
- (6) A HMIS assistant/GIS Mapping Specialist will be hired to provide technical expertise to the NDOH and other PEPFAR implementing partners to utilize mapping techniques and to inform our strategy.
- (7) A Statistician will be hired to provide technical assistance to the NDOH and other PEPFAR implementing partners for study design and sampling determinations and various analyses.

Additional funds will be used to support SI staff as per recommendations from the Staffing for Results exercise or NDOH requests.

ACTIVITY 3: Support to the South African government (SAG)

Relations between the United States and South African governments are steadily improving. In an effort to continue to strengthen this relationship, funds have been budgeted for technical assistance that both the national and provincial Departments of Health frequently request on an ad hoc basis. These requests are increasing on daily basis. Recent examples include technical assistance to the KwaZulu-Natal Premier's Office for improving data quality and data use in the province, to the NDOH for conducting a Data Quality Assessment of the TB/HIV data management system in the NDOH, to the North West province providing M&E related activities and to the Northern Cape Department of Health providing data management and capacity building.

ACTIVITY 4: Strengthening Management Information Systems

PEPFAR South Africa has prioritized the harmonization and coordination of MIS within PEPFAR-supported partners and with the SAG M&E systems. The USG recognizes that as PEPFAR programs are scaling up and a need exists for a more strategic plan for developing and implementing systems that focus on patient care, community-based care, and managing aggregated data. The USG HMIS staff person will provide

Activity Narrative: support to partners, especially those working in the public sector, and will provide technical assistance to the NDOH for harmonization of health systems and to the Department of Social Development on an MIS for orphans and vulnerable children. In order to provide guidance to PEPFAR partners on the use of new technologies when designing added functionalities to existing HMIS, FY 2009 will be expanded to allow for new technologies to be trialed and tested using structured evaluation and assessment methodologies. These technologies will include (but are not limited to) digital pens, quick forms, smart cards and cell phones.

Improving the NDOH's ability to collect, process and utilize SI will directly contribute to improvements in HIV and AIDS service delivery by having the information available for decision-making purposes. These improvements, in turn, will have a positive impact on South Africa's ability to prevent new infections, care for patients living with HIV, and to provide treatment for those with AIDS, in support of PEPFAR's goals. These efforts also support the USG Five-Year Strategy for South Africa by building capacity within the South African government.

ACTIVITY 5: GIS/Mapping

FY 2009 will be expanded to include mapping activities for PEPFAR related sites and services, geospatial analysis and to acquire geospatial data sets and related consulting services. Internal GIS and mapping capacity will also be built by staff attending selective training, acquiring the necessary software and hardware tools and appointing the necessary skills.

ACTIVITY 6: Surveys and Surveillance

FY 2009 COP will be expanded to include survey and surveillance activities that involve sentinel surveillance, TB/HIV co-surveillance, facility surveys and epidemic modeling. Triangulation and/or cross-validation studies may also be developed and conducted to strengthen the information that has already been collected.

SUMMARY:

PEPFAR funds will support the National Department of Health (NDOH) to implement M&E activities in HIV and AIDS programs. The major emphasis area for this program is the development of health management information systems, with minor emphasis on improving information technology and communication infrastructure, M&E and reporting, and proposed staff for Strategic Information (SI). Target populations include South African policy makers, members of the National AIDS Control Programme, and other staff in the NDOH. Activities described in this COP entry have been requested by the national or provincial Departments of Health.

BACKGROUND:

The NDOH lacks trained M&E personnel for specialized information gathering and management tasks. Data on disease surveillance and HIV and AIDS service uptake are often not up to standard or not transmitted in a timely manner, negatively affecting the NDOH's ability to analyze epidemiological trends effectively. CDC has provided technical support for M&E since 2003, including developing standard indicators, policies and guidelines, and training tools. Funds will be used to expand the NDOH's M&E activities, especially its human capacity development at the national and provincial levels.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training

Funds will be used to conduct orientation sessions on M&E for HIV and AIDS program staff. The sessions will focus on new and existing M&E officers, and will inform staff of the importance of M&E in measuring the effects of the HIV epidemic. Staff will be trained to use the District Health Information System (DHIS), an electronic database that tracks disease and health indicators, and trained to use relatively more sophisticated M&E techniques for program planning. HIV and AIDS program staff will be trained in data management techniques. This activity is ongoing and in the past year has primarily focused on improving data in the PMTCT program.

ACTIVITY 2: Staff

There are four SI positions included in this COP entry.

- (1) An M&E Advisor, who is seconded to the NDOH HIV and AIDS Directorate, will continue to provide technical assistance to the NDOH and provincial health departments to support data use and analysis efforts at the NDOH.
- (2) An M&E Advisor based at the CDC office will continue to work closely with the NDOH and with PEPFAR partners, on management information systems, data issues, and activities with the Western Cape Department of Health.
- (3) A Management Information Systems (MIS) specialist, who has recently been hired, will conduct an assessment of USG-supported MIS.
- (4) An M&E Assistant will soon be hired to improve the data analysis of PEPFAR data and assist in providing feedback to partners and the South African Government (SAG) about PEPFAR activities. The USG is currently engaging with the provincial departments of health to improve collaboration and communication about PEPFAR-funded activities. This position will assist in facilitating these activities in the future.

Additional funds will be used to support SI staff as per recommendations from the Staffing for Results

Activity Narrative: exercise.

ACTIVITY 3: Support to the SAG

Relations between the United States and South Africa are steadily improving. In an effort to continue to strengthen this relationship, funds have been budgeted for technical assistance that the national and provincial Departments of Health frequently request on an ad hoc basis. Examples include technical assistance to the KwaZulu-Natal Premier's Office for improving data quality and data use in the province and assistance with conducting a Data Quality Assessment of the TB/HIV data management system in the NDOH.

ACTIVITY 4: Strengthening Management Information Systems

The South Africa PEPFAR Task Force is prioritizing the harmonization and coordination of MIS within PEPFAR-supported partners and with the South African Government M&E systems. The USG recognizes that as PEPFAR programs are scaling up, there is a need for a more strategic plan for developing and implementing systems that focus on patient care, community-based care, and managing aggregated data. The new USG HMIS staff person will develop an investment strategy in MIS and work towards aligning or improving communication between systems. He will provide support to partners, especially those working in the public sector, and will provide technical assistance to the NDOH for harmonization of health systems and to the Department of Social Development on an MIS for orphans and vulnerable children.

Improving the NDOH's ability to collect, process and utilize SI will directly contribute to improvements in HIV and AIDS service delivery by having the information available for decision-making purposes. These improvements, in turn, will have a positive impact on South Africa's ability to prevent new infections, care for patients living with HIV, and to provide treatment for those with AIDS, in support of PEPFAR's goals. These efforts also support the USG Five-Year Strategy for South Africa by building capacity within the South African government.

Activity ID: 3796.22713.09	Planned Funds: \$355,025
Activity System ID: 22713	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

ACTIVITY 1: The Rollout and Training on Child Healthcare Problem Identification Program (Child PIP)

The training package has been developed and will be available to all sites. It will be used for training at the provincial workshops as well as by individual provincial coordinators at sites.

ACTIVITY 2: Saving Children Report

The process of compiling the fourth Saving Children Report will begin during FY 2008 and the report will be published and disseminated during FY 2009. The executive summary will be published as a separate advocacy document and distributed widely.

ACTIVITY 5: Provincial Workshops to be Held During FY 2008

The provincial coordinators have planned workshops that will suit the needs in each individual province.

Four of the provinces will be conducting individual provincial workshops (Eastern Cape, Free State, KwaZulu-Natal and Western Cape). Gauteng and North West will be conducting a combined promotional workshop, and Mpumalanga and Limpopo a combined training workshop. In the Northern Cape, the provincial coordinator is conducting smaller Child PIP training sessions in each district.

SUMMARY:

The Child Healthcare Problem Identification Programme (ChIP) is a University of Pretoria prevention of mother-to-child transmission (PMTCT) monitoring project aimed at improving the quality of PMTCT service delivery. Using PEPFAR funds in FY 2005, FY 2006 and FY 2007, the foundations for ChIP were established. FY 2008 funding will be used to continue monitoring the impact of:

- (1) properly managing HIV-infected pregnant women and their children;
- (2) the intervention on perinatal and infant mortality; and
- (3) cotrimoxazole prophylaxis, infant feeding choice and antiretroviral therapy on HIV-infected children.

The premise of ChIP is that through ongoing monitoring and analysis of data on child deaths, key indicators can be identified, which will provide health-care providers and policy makers with the necessary empirical basis from which to advocate for the design and implementation of improved quality of care strategies. In the long term, this approach should make a significant contribution toward reduced childhood mortality from HIV and other causes. The major emphasis of the work falls in Health Management Information Systems, with a lesser emphasis on monitoring, evaluation and reporting, as well as other strategic information (SI) activities. Target populations for the activity include infants and children, HIV-infected pregnant women, HIV-infected infants and children, policy makers, and public and private health-care workers.

BACKGROUND:

HIV infection has a major impact on fetal, infant and child mortality. The impact on fetuses is mostly indirect, resulting in pre-term delivery, growth restriction or infection; whereas, children younger than age 5 tend to die from the direct results of the HIV infection. The Perinatal Problem Identification Programme (PPIP) currently monitors perinatal mortality in South Africa. Prior to FY 2005, there was no routine collection of information on the causes of death in children, nor was there a methodology to determine the impact of PMTCT. With FY 2005 and FY 2006 PEPFAR funding, and in collaboration with the National Department of Health (NDOH), the PPIP system was updated to include fields for antiretroviral therapy (ART) during pregnancy and neonatal nevirapine administration. These updates will allow the NDOH to determine the uptake of antiretroviral treatment (ART) in children and the number of children dying from HIV-related infections, as well as provide an indirect proxy for the impact of PMTCT.

Health-care workers were trained to use the PPIP and ChIP monitoring systems. Analysis of the 2005 data from 26 sites indicated that only 65% of children who died had an HIV test and of these, 82% were exposed or infected. In addition, of the children who died, 49% did not receive appropriate cotrimoxazole prophylaxis, and only 15% of those children qualifying for ART received it. Although the purpose of ChIP is to monitor the causes of death in children, particularly as they relate to HIV, it also enables hospitals to identify preventable causes of death and identify strategies to address them. Health professionals from these sites were trained to use ChIP, and to understand how the data obtained from the program can feedback into improving the quality of health care for children. Because of this quality improvement feedback mechanism, ChIP has become a valuable tool that affects morbidity and mortality, and service delivery as a whole.

ACTIVITIES AND EXPECTED RESULTS:

Five activities will be carried out in this program area.

ACTIVITY 1: The Rollout and Training on ChIP

FY 2008 funding will be used to continue promoting, supporting, and expanding ChIP implementation across South Africa. This will include a national data sharing workshop and the development of training packages for 22 sites (12 established and 10 in-training sites). A minimum of two health professionals from each site will be trained, better ensuring sustainability. Sites will be monitored and evaluated annually to assess quality and sustainability, as well as to ensure that ChIP is used as a quality improvement mechanism. The project has established linkages with the national and provincial departments of health, and will continue to liaise with the NDOH.

Activity Narrative: ACTIVITY 2: Saving Children Report

With FY 2005, FY 2006 and FY 2007 funding, ChIP used data from the existing sites to develop three annual versions of the Saving Children Report. In FY 2008, data from established sites will be used to compile the fourth annual Saving Children Report. The target audience for the report is healthcare workers and policy makers. It is anticipated that the fourth report will be used to highlight gaps and challenges within child health service delivery, giving special attention to HIV, as well as to advocate for the implementation of recommendations aimed at improving quality of care for HIV-exposed and -infected infants and children. The reports will be disseminated at national and provincial level to ensure continued communication with the NDOH and to ensure further expansion of the project in FY 2009.

ACTIVITY 3: Strengthening Linkages

This activity focuses on strengthening the linkages between ChIP and PPIP sites to provide information on improving the quality of PMTCT service delivery. Data from the updated PPIP (which focuses on PMTCT compliance) will be analyzed and the impact of PMTCT at these sites will be assessed using ChIP data. Improved PMTCT service delivery will be achieved through feedback of this information to the department of health at facility, provincial and national levels.

FY 2008 activities will be expanded to include:

ACTIVITY 4: Setting up a ChIP Technical Task Team

During FY 2007 a ChIP Technical Task Team was established. The team is comprised of the ChIP Exco, a representative from each province, as well as one or two specialist members. The roles of the Task Teams are to provide provincial leadership (identify, train and support local sites, liaise with the Maternal, Child and Women's Health (MCWH) Unit and strengthen links with PPIP); to assist with planning of the national and provincial workshops; to contribute to the Saving Children report; and to provide general assistance to the ChIP Exco.

ACTIVITY 5: Provincial Workshops to be Held During FY 2008

FY 2008 funding will be used to conduct provincial ChIP workshops in each of the nine provinces. Data will be presented and further training offered to strengthen sites and expand ChIP. These workshops will also provide healthcare workers with the opportunity to share quality improvement projects that were implemented as a result of the site specific and provincial data that can be abstracted from ChIP.

ChIP contributes to the PEPFAR goals by strengthening PMTCT information and monitoring systems, and ensuring a quality of care feedback mechanism aimed at improving quality of care for HIV-infected children. In addition, this project contributes to PEPFAR's 2-7-10 objectives by early identification of children born to HIV-infected mothers and linking them to appropriate treatment and care programs.

South Africa**USG Agency:** HHS/Centers for Disease
Control & Prevention**Funding Source:** GHCS (State)**Program Area:** Strategic Information**Budget Code:** HVSI**Program Budget Code:** 17**Activity ID:** 8044.22927.09**Planned Funds:** \$995,177**Activity System ID:** 22927

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Medical Research Council of South Africa (MRC) has already conducted systematic reviews of the monitoring and evaluation (M&E) system in the Western Cape and developed participatory approaches towards addressing them. This has led to the establishment of a unified approach with the information, M&E and program managers meeting and planning jointly. FY 2009 funding will focus on getting better M&E processes implemented at the district levels. It will also further develop tools and approaches for strengthening M&E systems in KwaZulu-Natal.

ACTIVITY 2:

The focus will be to institutionalize the use of Respondent Driven Sampling (RDS) Surveys for surveillance at the NDOH and build capacity at the provincial level to incorporate the outputs from HIV and behavioral surveillance systems into decision making, planning and implementation of HIV prevention interventions.

ACTIVITY 3:

This will no longer be part of the COP in FY 2009.

ACTIVITY 4:

This activity has been moved to prevention.

SUMMARY:

This Medical Research Council of South Africa's project focuses on improving the performance of HIV services in the public health sector. This will be achieved through a mixture of directly strengthening HIV prevention services through interventions at the clinic level such as improving prevention activities. It will also provide important new surveillance data on high-risk groups and increase the capacity of managers to use data for decision-making.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Strengthening Health Information Systems

With FY 2006 and FY 2007 funds the Medical Research Council (MRC), in collaboration with Western Cape Department of Health (WCDOH), have engaged with senior and district level managers to empower them to use data for decision making. Managers have assessed primary health care (including TB/HIV) information systems. Important changes in the way that data are collected and used have been made. Management teams now regularly analyze routine data to measure performance of programs. To date these activities have been conducted in select districts in the Western Cape province, but with FY 2008 funds this activity will expand to cover the entire province. The MRC will consolidate the lessons learnt in strengthening health information systems, and this will be used to support the expansion of a comprehensive TB/HIV program including implementing changes in responsibilities for data collection and analysis. The organization will produce a series of user-friendly guides and manuals to allow replication of the process of assessing and improving information and monitoring systems in other provinces. The MRC is currently in negotiation with the KwaZulu-Natal provincial government where a similar process of audit and quality improvement will be implemented. Technical support to other provinces in using the materials and tools will be provided on an ad hoc basis and as requested.

ACTIVITY 2: Respondent Driven Sampling (RDS) Surveys

With FY 2006 and FY 2007 funds, the MRC in collaboration with the WCDOH conducted two surveys using RDS to gather behavioral and epidemiological surveillance data. These surveys capture high-risk groups that have been missed by other surveillance methods. Specifically, these groups include men who have multiple younger female partners and women who have multiple older male sex partners. The information gathered from these surveys is used to guide the development of HIV prevention activities, especially those targeting male norms and behaviors. With FY 2008 funds, the MRC will provide training and technical support to allow the replication of RDS surveys in other parts of the country. Partner organizations that have the capacity to perform surveys in other provinces such as KwaZulu-Natal and Gauteng will be trained and supported to conduct RDS surveys and to perform the appropriate analysis. The MRC will also continue to conduct surveys in the Western Cape in particular to evaluate interventions with men and women who have multiple partners.

ACTIVITY 3: Implementation of Male Intervention the Western Cape

Following the findings of the RDS survey in 2006 that found very high levels of risky sexual behaviors among a large network of peri-urban men, the WCDOH requested the MRC to assist them in designing, managing and evaluating an intervention specifically targeting older men who have multiple younger female sexual partners. The intervention will be aimed at shifting the social norms around multiple, concurrent partners and increasing the availability and use of condoms. In the first year of the intervention the MRC will complete the design of the intervention, gain permission from the relevant authorities and stakeholders, recruit and train facilitators, and pilot the intervention. The intervention will be based upon the peer opinion leader approach in peri-urban setting. The intervention will build upon the RDS methodology to recruit men who have characteristics of peer opinion and then work with them to model HIV safer attitudes and behaviors.

ACTIVITY 4: Evaluation of a Prevention with Positives Intervention

Activity Narrative: With FY 2007 funds the MRC in collaboration with WCDOH and Human Sciences Research Council has developed an intervention to reduce high-risk sexual behavior among people living with HIV (PLHIV) and in particular among those who are on antiretroviral treatment (ART). The intervention is based upon two interventions that have been previously used in the United States: Healthy Relationships, and Options for Health. The former intervention is based on small support groups of PLHIV and typically builds on existing support groups where they already exist while the latter is health-provider driven and builds upon existing opportunities created during one-on-one clinical consultations by PLHIV receiving care and treatment. The MRC will measure its effectiveness by measuring self-reported behavior changes and recording changes in incidence of sexually transmitted diseases. In the second year of the intervention the MRC will aim to reach all clinical settings that are providing ART in the Western Cape.

ACTIVITY 5: Strategic Information (SI) Activities Requested by the South African Government

The MRC will use a portion of the FY 2008 funds to conduct Strategic Information activities at the request of provincial or national Departments of Health. The MRC has a close working relationship with the South African Government and frequently receive requests for technical assistance in areas such as those described in Activities 1 and 2. These exact activities have not yet been determined but the MRC will work closely with the SAG as such opportunities for collaboration arise.

These activities described in this section are in line with the South African Government's priorities and those described in the PEPFAR South Africa Five-Year Strategy.

Funding Source: GHCS (State)

Budget Code: HVSI

Activity ID: 22902.09

Activity System ID: 22902

Program Area: Strategic Information

Program Budget Code: 17

Planned Funds: \$825,269

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Scientific Medical Research (SMR) activity area for FY 2009 COP within the Center for Disease Control and Prevention (CDC) was changed from "Counseling and Testing (CT)" to "Laboratory, Infrastructure, Strategic Information and Policy" because SMR's activities are broader than one activity area.

To further the activities described in FY 2008, SMR implemented the high-level evaluations of partner organizations which are linked to strategy development.

ACTIVITIES AND EXPECTED RESULTS:

A) Development of pilot tools for CT:

In FY 2008, SMR developed the CT evaluation tool, and held a workshop with CDC on the draft tool. The tool evaluates fourteen thematic areas: Management/Staffing; Infrastructure; Policies, Process/Systems; Rapid HIV Test QA; Training; Integration; Consultation; Marketing; Sustainability; Data/QA Plan; M&E; Project-Specific Objectives; VCT Client Profile; and Budget. Input and comments from CDC were taken into consideration in finalizing the tool which was then approved by CDC for pilot testing. In parallel to this process, an evaluation Standard Operating Procedure (SOP) was also developed by SMR, and following CDC's input and comments, a final SOP was approved by CDC.

B) Pilot testing of the tool in the field with partner organizations:

The CDC approved the evaluation tool and SOP which were piloted initially with two partners, one offering a client-initiated CT, while the second partner operated in a provider-initiated CT environment. Following the pilot, a report back meeting was held with both the evaluated partner and the CDC. Both the tool and the SOP, together with the strategic recommendations were made to improve partner's efficiency and alignment with PEPFAR were well received by the evaluated partners. Feedback on issues raised from both the partners and the CDC was used to further improve and refine both the tool and the SOP. Additionally, two partners were evaluated after March 2008 and provided with feedback and strategic advice on how to improve their program's efficiency at a combined partner/CDC report back meeting, and the recommendations were again well received. Of importance, is the fact that one of the evaluated partner operates in a private sector setting, while the other partner is in a provider-initiated CT environment. Thus, a total of four partners to date have been evaluated and provided with strategic advice on program improvement and alignment with PEPFAR.

For FY 2009:

C) Development of additional tools for further partner program areas:

Draft tools for two additional program areas have been developed, i.e., Care and Treatment, and PMTCT. A workshop for the draft Care and Treatment tool has been held with CDC, and the tool is currently being finalized and will be presented to CDC in September 2008 for final review and possible approval, and once approved, it will be pilot tested at selected partners before rolled out to a larger number of partners. A workshop will also be held with CDC to discuss the draft PMTCT tool.

The CT evaluations that have been done to date have been very well received by both CDC and the partner organizations. The challenge is now to scale up these activities to new levels, so as to impart as much strategic wisdom as possible to the partner organizations, so that they may operate as optimally as possible and be well-aligned with the national program. The tools have also been streamlined by sub-dividing them into Part A which evaluates common business, administrative and logistic thematic areas; followed by Part B which addresses the HIV program-specific thematic areas.

FY 2009 COP activities will be expanded to include: (1) expanding program monitoring and evaluation at additional CT, Care and Treatment, and PMTCT sites as identified by CDC, Pretoria; (2) developing additional monitoring modules for the following program areas: TB-HIV Services, and Laboratory Services; (3) monitoring and evaluation at additional sites for care and treatment program area, PMTCT, and with additional partners for: TB-HIV, and Laboratory program areas, as identified by CDC, Pretoria; and (4) assessing feasibility of (in consultation with CDC Pretoria) expanding the CHAQA monitoring and evaluation model. SMR activities are also aimed at Health Systems Strengthening for sustainability of HIV/AIDS services in multiple program areas.

SMR's FY 2009 COP activities are synergistic/additive to activities contemplated in the upcoming South Africa PEPFAR Partner Performance Assessment (SAPPPA) contract, and SMR would be willing to work in conjunction with (and mentor) the organization selected for contract implementation.

SUMMARY:

Scientific Medical Research is developing an innovative monitoring and evaluation program that (a) assesses the quality and impact of HIV programs in the public sector; (b) generates regular feedback to the programs and donors; and (c) aims to improve the quality of service to the communities and program implementing institutions through appropriate feedback mechanisms.

BACKGROUND:

This program is a continuation of a Tucker Strategy supplementary PEPFAR funding proposal which commenced on 1 December 2006 for the initiation of this novel comprehensive assessment mechanism. Funds used for the initial set-up phase are allocated to the employment of a small core of appropriately qualified persons to drive the establishment of this process, and to a relatively small consumables budget.

The response to the HIV epidemic in South Africa is expanding, as public and private institutions scale up

Activity Narrative: their efforts to prevent new infections, as well as care for and treat those who are already HIV-infected. These programs are either self-funded or funded by external agencies such as PEPFAR. The quality of HIV services, however, varies dramatically in both public and private sectors. Many people only have access to a limited package of prevention measures and/or counseling and testing (CT), while others have access to a comprehensive package of education, prevention and care including antiretroviral treatment. Even where CT (and other) services exist, the impact and quality of services varies substantially.

There is currently no agency that assists both public sector funding agencies and implementing institutions to make objective, external evaluations of the quality of workplace-based HIV programs, and use that information in a positive way to improve the quality of care offered. A gold standard by which they can assess the HIV-related activities will tend motivate towards more and better corporate interventions. In the absence of adequate external review and quality assessment of HIV programs, both donors' and implementing institutions' management are unable to monitor the successes and failures of the programs, and where required, institute appropriate changes to improve the quality of the programs.

Scientific Medical Research is an independent organization that has no ties any HIV services providers. Its staff will comprise a mixture of skilled staff able to develop the systems for this organization as well as staff with the ability to assess/audit medical programs. The company is "black empowered," in keeping with the aims of the South African Healthcare Charter.

ACTIVITIES AND EXPECTED RESULTS:

In the initial 12 months of this project, Scientific Medical Research will carry out three activities.

ACTIVITY 1:

A small core of appropriately qualified persons will be employed and trained to drive this process. Staff will attend relevant monitoring and evaluation courses and conferences.

ACTIVITY 2:

In consultation with CDC Pretoria staff, program assessment methodology will be piloted, initially at two sites. The pilot will be followed by review and where necessary, modification of the assessment methodology. Additional sites will be assessed as advised by CDC.

ACTIVITY 3:

Scientific Medical Research will establish appropriately designed databases to manage the program assessment activities. FY 2008 COP activities will be expanded to include: (1) expanding monitoring at additional CT sites as identified by CDC, Pretoria; (2) developing monitoring modules for care and treatment; (3) monitoring at care and treatment sites, as identified by CDC, Pretoria; and (4) assessing feasibility of (in consultation with CDC Pretoria) expanding the CHAQA monitoring model to other program areas and sharing with other countries.

These results contribute to the PEPFAR 2-7-10 goals by strengthening the ability of local institutions to implement programs efficiently, especially improved quality assurance and leadership through evaluation of national prevention, care and treatment efforts.

New/Continuing Activity: New Activity

Continuing Activity:

Table 3.3.17: Activities by Funding Mechanism

Mechanism ID: 588.09	Mechanism: Strengthening Pharmaceutical Systems
Prime Partner: Management Sciences for Health	USG Agency: U.S. Agency for International Development
Funding Source: GHCS (State)	Program Area: Strategic Information
Budget Code: HVSI	Program Budget Code: 17
Activity ID: 23196.09	Planned Funds: \$242,726
Activity System ID: 23196	

Activity Narrative: SUMMARY:

With FY 2009 PEPFAR funds, Management Sciences for Health's (MSH) Strengthening Pharmaceutical Systems (SPS) project will continue to support the "HIV & AIDS and STI National Strategic Plan, 2007-2011" (NSP). Under Strategic Information (SI), SPS will assist selected provincial pharmaceutical directorates to: 1) conduct follow-up surveys (to the ones conducted in 2006-2007) in order to assess compliance with legislation of health facilities providing pharmaceutical services, including the development of standard operating procedures; 2) review and/or develop performance indicators to monitor the delivery of pharmaceutical services at all levels and also develop provincial monitoring and evaluation plan; and 3) implement medicines information centers to support the treatment program.

BACKGROUND:

At the SPS launch held in August 2008, Heads of Pharmaceutical Services for all provinces, Metros, the Department of Correctional Services and the South African Military Health Services requested support in the area of monitoring and evaluation of pharmaceutical services at a national and a provincial level, assistance in reaching legislative compliance in all activities relating to the supply of medicine and the monitoring thereof, the development of Standard Operating Procedures and the provision of medicine information.

ACTIVITY 1: Compliance with legislation

SPS will continue to assist provincial and Metro authorities to ensure that pharmaceutical services provided at provincial and Metro facilities comply with the legislation relating to the supply of medicine. Compliance with legislation facilitates the accreditation of facilities to provide antiretrovirals. This activity includes providing training of health care providers as well as training at a pre-service level regarding the legislative requirements. Assistance will be provided to at least three of the provinces in conducting a full survey of provincial facilities to assess the state of compliance. Data will be analyzed and reports prepared.

One of the key aspects of legislative compliance is the availability of standard operating procedures (SOPs). Workshops will be conducted in the provinces and Metros on the principles of the development of SOPs. Assistance will then be provided to provinces in the development, review and/or revision of sets of generic sets of SOPs for pharmaceutical services and the adaptation thereof for use at facility level. Once SOPs are finalized support will be provided in the implementation thereof. A key focus of this activity will be capacity building and the transfer of skills to personnel of the province or Metro to ensure sustainability.

ACTIVITY 2: Monitoring and evaluation of pharmaceutical services

Workshops will be conducted in all nine provinces to provide training on the basic principles of monitoring and evaluation and the application of these principles to pharmaceutical services. Technical assistance will then be provided in the development of provincial indicators to be used in the monitoring of service provision. Aspects that will be addressed will include all aspects of medicine supply management, the availability of medicine including medicine used in the prevention and treatment of HIV and AIDS, TB and associated morbidities, compliance with legislation, quality of care provided to patients, pharmacovigilance and the rational use of medicine. Assistance will be put in place to ensure routine collection of the data needed for the monitoring pharmaceutical services as well as the preparation of reports. Assistance will also be provided in the evaluation of specific projects as needed. A key focus of this activity will be capacity building and the transfer of skills to personnel of the province or Metro to ensure sustainability.

ACTIVITY 3: Medicine information

Work will continue in setting up systems for the supply of medicine information in selected provinces, whenever feasible this activity will be conducted jointly with a provincial academic institution.

Table 3.3.17: Activities by Funding Mechanism

Mechanism ID: 274.09	Mechanism: Masibambisane 1
Prime Partner: South African Military Health Service	USG Agency: Department of Defense
Funding Source: GHCS (State)	Program Area: Strategic Information
Budget Code: HVSI	Program Budget Code: 17
Activity ID: 2981.22789.09	Planned Funds: \$48,545
Activity System ID: 22789	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Support similar to that given in FY 2008 is required for FY 2009. There will be a need to purchase computers, printers and fax machines for the new and existing antiretroviral roll-out sites to maximize monitoring and evaluation (M&E).

Training of the Nodal HIV and AIDS coordinators on M&E, Project Management and other management related courses. In addition, it has been identified that a certain percentage of members from the Multi-skilled development (MSD) program will be trained in basic recording and capturing of data at clinic-level to improve the reporting system.

There will not be a knowledge, attitude and practice (KAP) Survey in FY 2009, but rather a focus on the implementation of intervention programs. There will, however, be preparation for the KAP survey which will be conducted in 2010.

SUMMARY:

The Monitoring and Evaluation (M&E) plan for the South African National Defence Force (SANDF) Masibambisane program addresses all components necessary for a comprehensive M&E system for an HIV and AIDS program. One major component is the health management information system (HMIS), which was expanded during FY 2007 to encompass HIV and AIDS specific data. During FY 2008 the focus will be on enhancing the system by developing data collection tools, updating the software package to enable the efficient tracking of HIV and AIDS data, and training in M&E.

BACKGROUND:

The development of a more comprehensive M&E system for the Masibambisane program has been supported by PEPFAR since its inception in FY 2004. This plan has continued to develop over the past few years as the HIV and AIDS program continues to expand. The HMIS used by SANDF is quite robust; however, it has taken significant work to incorporate all relevant HIV and AIDS data that are required by PEPFAR, the National Department of Health and the SANDF program managers.

ACTIVITIES AND EXPECTED RESULTS:

During FY 2007 a total of 25 HIV and AIDS regional program managers were trained on M&E in order to strengthen reporting at the regional level. During FY 2008 this base of training will be enhanced in terms of quality as SANDF's Strategic Information (SI) requirements continue to expand.

ACTIVITY 1: Review development of data management system

In FY 2008 the SANDF SI team will review the ongoing development of the HIV program HMIS with the larger SANDF HMIS. Systems enhancements will be undertaken as per this review.

ACTIVITY 2: M&E and SI training

The focus of this activity is the continued SI training for SANDF staff and ensuring that all have internet and information technology access to improve reporting capability. It is important to note that internet and information technology access is extremely important in light of PEPFAR/South Africa's dependence upon a web-based reporting system for the quarterly, semi-annual, and annual reporting of results. To date SANDF has had difficulty meeting USG reporting deadlines due to connectivity constraints. Moreover, data quality is potentially compromised when results that should be reported electronically must first be manually transposed and then reported in an altered format. This SI activity will also include training of regional and unit level data collectors in data quality management and reporting. This is important because currently the extent to which SANDF data management systems are capable of aligning with the reporting requirements of PEPFAR is not consistent across data collection points, thus affecting reliability of reported results. An NGO (outside contractor) has conducted an initial consultation and is being considered as the contractor to implement a systems-wide data quality evaluation with associated training and mentoring.

ACTIVITY 3: Seroprevalence study

The partner will conduct an organizational seroprevalence study to determine an epidemiological baseline for impact measurement of the SANDF's HIV and AIDS program. The key step toward enabling a useful evaluation to occur during later years is the establishment of a robust baseline of seroprevalence within SA DOD populations. This baseline will be the main activity in this area during FY 2008.

ACTIVITY 4: Data Quality and Managerial Audits of M&E Systems

During FY 2008 a series of internal audits and site visits will be conducted in order to verify data, services, and facilities. These activities will enable the SANDF to report effectively the contribution of the Masibambisane program elements and targets that contribute to the overall PEPFAR objectives for prevention, care and treatment. Data obtained through the M&E plan as developed with the support of PEPFAR funding is utilized to determine successful program components and to identify program gaps to be addressed. The establishment of the data management system developed in FY 2006 is in the final testing stage, and gaps identified are being addressed.

New/Continuing Activity: Continuing Activity

Continued Associated Activity Information

Activity System ID	Activity ID	USG Agency	Prime Partner	Mechanism System ID	Mechanism ID	Mechanism	Planned Funds
13829	2981.08	Department of Defense	South African Military Health Service	6625	274.08	Masibambisane 1	\$50,000
7442	2981.07	Department of Defense	South African Military Health Service	4419	274.07	Masibambisane 1	\$50,000

Program Budget Code: 18 - OHSS Health Systems Strengthening

Total Planned Funding for Program Budget Code: \$21,416,356

Program Area Narrative:

The South Africa HIV & AIDS and STI National Strategic Plan, 2007 – 2011 (NSP) emphasizes the strengthening of health systems as one of the key pillars in mitigating HIV and AIDS and meeting the Millennium Development Goals. During the last two years, PEPFAR has aligned its programs to strengthen the public health system through programming. Some of the main areas of focus for health systems strengthening has included: a) developing management and leadership at national, provincial and district levels; b) developing and implementing policy at national and provincial levels; c) strengthening monitoring and evaluation capacity of civil society organizations and the National Department of Health (NDOH); d) improving quality of services at district and facility levels; e) integrating HIV and AIDS programs into other primary health-care services; f) strengthening pharmaceutical systems within the public sector; g) strengthening the National Health Laboratory System (NHLS) and developing capacity at district and provincial levels to train health-care providers on HIV and AIDS and TB programs; and h) strengthening the human resource system.

Strengthening Capacity of Host Government Institutions

PEPFAR South Africa has and will continue in fiscal year (FY) 2009 to strengthen the capacity of the South African government (SAG) to develop policies that are in line with international guidelines, while taking cognizance of the local context of HIV & AIDS and TB. PEPFAR South Africa has and continues to support parastatal organizations such as the Human Sciences Research Council and Medical Research Council to conduct HIV prevalence and behavior change studies that will inform policies at national and provincial levels.

PEPFAR South Africa will continue to strengthen the national laboratory system by building on existing activities. These include support for strengthening the national laboratory information management system for multi- and extensively drug-resistant TB; support for the African Centre for Integrated Laboratory Training, a southern African regional activity; and renovation of 20 national laboratories to allow NHLS to perform line essays on sputum that will allow for two-day turn-around time on TB sputa. (See Lab Program Area Narrative, and NHLS COP entry.)

The University of Washington I-TECH, a PEPFAR-funded partner, will continue to assist the NDOH to strengthen their Health Promotion and Quality Assurance Training Centres through direct technical assistance to the Human Resources for Health Unit. These centers are the hub for knowledge translation and in-service training and quality assurance for the primary healthcare system in all provinces. The Health Promotion and Quality Assurance Training Centers are mandated to manage the training of health-care providers at district level within each province. These centers are currently funded through the South Africa national conditional grant but the provinces lack the capacity to set up these structures and systems to implement the programs. PEPFAR, through its partners, provides technical assistance to these training centers in development of curricula, assessment of curricula, integration of HIV and AIDS training into existing PHC training programs, updated training programs to reflect policy changes (e.g., prevention of mother-to-child transmission (PMTCT) policy), and provision of mentoring to staff at the centers in the management and implementation of such programs.

Strengthening Leadership and the Policy Environment

The PEPFAR program in South Africa will continue to address strengthening policies and capacity in FY 2009 through support to the national government, particularly through the placement of CDC activity managers within the national HIV & AIDS and STI Directorate to assist in policy development.

In FY 2008, PEPFAR South Africa assisted the NDOH in developing the new PMTCT policy that now authorizes dual antiretroviral treatment for pregnant mothers. In addition, PEPFAR assisted with the development and implementation of the new counseling and testing policy that recognizes routinely offered counseling and testing. In FY 2009, the focus will be on implementation of these policies through training of healthcare providers and through PEPFAR partners. Health Policy Initiative will continue to work with the NDOH's HIV and AIDS Comprehensive Care, Support, and Treatment (CCMT) sub-directorate focusing on capacity building programs for costing of HIV and AIDS care and treatment interventions at the provincial level. The programs will also include costing for TB and sexually transmitted infections (STI). This activity will expand in scope by developing a tailor-made costing model for the CCMT managers. This model will standardize and guide a benchmarked approach within all provinces in ensuring effective resource needs required for HIV and AIDS care and treatment in their specific province. This will greatly affect the production of more realistic budgets and will ensure adequate funding.

PEPFAR continues to encourage partners to integrate gender-related issues into all program areas to address gender violence, male norms, and behaviors within the cultural context, women empowerment, and alcohol and substance abuse in relation to violence and HIV transmission. Approximately 60% of partners have a gender-related component in their COP.

Strengthening Leadership and Policy Environment for HIV Care and Treatment for Children

In FY 2009, PEPFAR South Africa will continue to provide direct technical assistance to the National Department of Social Development to set standards for quality of care for orphans and vulnerable children (OVC) and to assist in the development of a policy framework on the Children's Act (see OVC program area narrative).

Pediatric Care is highlighted this year as a new program area. Although PEPFAR partners have been providing Pediatric Care as a component of the care and treatment programs in the past, several activities will be highlighted in FY 2009. The focus will be on a family-centered approach to pediatric care, support, and treatment and on integration of pediatric HIV care and treatment into routine primary health-care settings. There will also be a special focus on the community component of the Integrated Management of Childhood Illnesses (IMCI) to integrate pediatric HIV care and treatment into these modules. In addition, community health workers and home-based caregivers will be trained on IMCI to strengthen infant follow-up and to improve child health outcomes at the district level. PEPFAR will work closely with counterparts at the NDOH to integrate pediatric HIV care into existing child health programs (e.g., IMCI and the immunization program). PEPFAR aims to meet some of the Millennium Development Goals for child survival by strengthening and integrating the PMTCT program into the mother-child and women's health programs with a special emphasis on the community aspect.

Strengthening Quality of Care

In FY 2009, the United States government will continue to strengthen and expand quality of care at facility and community level in the following areas: 1) external Quality Assurance (EQA) for laboratory services; 2) CDC/WHO quality management systems training to ensure quality HIV rapid test kits; 3) laboratory surveillance system to identify and record opportunistic infections (there are currently 15 sentinel sites country-wide); 4) quality assurance implementation by partners in all program areas with a special emphasis on therapeutic monitoring of patients on antiviral treatment and pharmacovigilance; and 5) proficiency testing for viral loads and infant polymerase chain reaction (PCR) tests.

Strengthening Strategic Information

PEPFAR will continue to train local organizations in monitoring and evaluation, recording and reporting on data, and using information in decision-making. Direct technical assistance will continue to be provided to the national, provincial, and district health system in the use of information for decision-making.

The United States government will also continue to strengthen the national health system to improve patient care through: 1) harmonizing health information systems (lab, pharmacy, patient information systems, etc.); 2) strengthening pharmaceutical management systems (see SPS COP entry); and 3) improving infection control for TB programs at all levels of government.

A significant focus of South Africa's PEPFAR program addresses institutional capacity issues by building the capacity of local non-governmental, faith-based, and community-based organizations. The goal is to build institutional capacity to increase the effectiveness and capacity of these partners to achieve expanded and quality services while strengthening the management of their financial and human resources. Pact, Care, and the Ambassador's Community Grants Program include formal training, on-site mentoring, improved monitoring and evaluation systems, good governance, and resource mobilization.

Strengthening the GFATM Management Structure and Improving Donor Coordination

The South Africa PEPFAR team works with other donor organizations in coordinating efforts in South Africa through participation in the donor coordination forum. PEPFAR collaborates with other donors to maximize support to strengthen the South African health system. PEPFAR is represented on the European Union (EU) Plus Working Group on HIV and AIDS where information sharing and programmatic issues are discussed. The USG is also represented on the NDOH Donor Coordination Forum. There are several health system areas where joint funding is coordinated (e.g., the national Human Resource Information System (UK Department for International Development (DFID) and PEPFAR) and the Clinical Associates Program (DFID, PEPFAR, EU, and WHO).

PEPFAR continues to support the Global Fund to fight AIDS, Tuberculosis and Malaria (GFATM) management structure through representation from our partners on the South Africa National AIDS Council (SANAC) and its Resource Mobilization Committee, which serves as the coordinating and management structure for the GFATM.

Table 3.3.18: Activities by Funding Mechanism

Mechanism ID: 274.09	Mechanism: Masibambisane 1
Prime Partner: South African Military Health Service	USG Agency: Department of Defense
Funding Source: GHCS (State)	Program Area: Health Systems Strengthening
Budget Code: OHSS	Program Budget Code: 18
Activity ID: 7916.22790.09	Planned Funds: \$48,545
Activity System ID: 22790	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

More focus will be given to the capacity development of the human resource component in terms of training. For example, training will be provided in project management, monitoring and evaluation (M&E), good clinical practice, Diplomas and masters programs in HIV/AIDS and management training.

Training material of the South African Military Health Service (SAMHS) will be evaluated for quality assurance by external moderators/experts so that all training material may be accredited. Furthermore, a structured quality assurance process will be implemented for the evaluation of the peer educator program, starting with the training of the peer educators to the implementation of activities by peer educators at the unit level. M&E activities will be further enhanced by more organized data capturing, collation and reporting to the appropriate levels for management reporting.

SUMMARY:

The main components of this program area are planning and coordinating workshops for all the relevant role players, and building the capacity of those role players to strengthen this program. Most of the training provided within the South African Department of Defense (SA DOD) HIV and AIDS Training program has been developed internally by utilizing the knowledge and skills of members in the organization. Training development workshops are now needed to update training content. The major emphasis areas of these activities are policy and guidelines and training. The target population is public healthcare workers.

BACKGROUND:

The Masibambisane program was established in 2001, and has received PEPFAR funding from FY 2004. It is an integrated prevention, care and treatment program in the SADOD, addressing the management of HIV and AIDS within the Department by interventions that target SADOD personnel and their dependants. The prevention programs include mass awareness; workplace programs with condom distribution through condom containers in military units and sickbays (container supplies monitored by workplace managers); information, education and training; gender equity and substance abuse programs delivered by social workers, psychologists, occupational therapists, peers and peer educators. The program uses communication and education through a wide range of media such as pamphlets, posters, industrial theater (dramatic plays that address coping with stigma and discrimination in the workplace) and videos.

The funding allowed the program to expand and to address program elements that were not possible before. The program currently consists of seven generic disease processes each with various projects and sub-projects, namely: prevention, promotion, diagnostics, treatment, rehabilitation, palliative care, research and development. These are managed by the HIV and AIDS management structure in the office of the Surgeon General with the Director HIV and AIDS, advisory board, coordinating committee and regional program managers in each province and each military hospital. The SA DOD HIV and AIDS Management Structure that facilitate program development, planning, execution, monitoring and evaluation. As the program expands, various additional role players (new personnel that are coming onto the program, e.g. doctors, nurses, psychologists, social workers, and nurses) become involved that need to be provided with induction training, and existing role players need to be provided with strategic guidance towards comprehensive planning and effective coordination to ensure an integrated approach to HIV an AIDS management in the SA DOD. This is done through workshops and training.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1:

SA DOD will conduct training for regional and national SA DOD HIV coordinators and sub-program and project coordinators in the strategic objectives of the program. This training will consist of a workshop that reviews the results of the Knowledge, Attitude, and Practices (KAP) study and discusses strengths and weaknesses of the program to help plan for the following year's activities.

ACTIVITY 2:

SA DOD will conduct strategic and operational planning work sessions to ensure integrated program development and coordinated execution of program elements (e.g. PEPFAR M&E training which members of SA DOD attend and then cascade to other regional coordinators). These work sessions will be led by the Monitoring and Evaluation (M&E) Director at South Africa Military Health Services. Representatives from all provinces that collect data will be invited to participate. The sessions will address strengths and weaknesses of the M&E processes and will include training in new M&E activities and guidelines issued by PEPFAR.

ACTIVITY 3:

SA DOD will hold training development workshops to assist in the establishment of new HIV-related training courses and updating of training contents in existing HIV-related training curricula for SA DOD. Training development will include courses specifically targeted at mid- and upper-level leadership concerning the prevention of and identification and remediation of stigma and discrimination in the workplace.

A number of training opportunities and workshops have been funded since the inception of PEPFAR and these opportunities have contributed to the success of the Masibambisane program. The Masibambisane program is implemented through a cascade of national and regional program coordinators, trainers and sub-program and project coordinators. These individuals are responsible for the development, planning and execution of the program to address all the components necessary to ensure a comprehensive HIV and AIDS Program in the South Africa Department of Defense.

19529	19529.08	HHS/Centers for Disease Control & Prevention	Education Labour Relations Council	8682	8682.08		\$450,000

Table 3.3.18: Activities by Funding Mechansim

Mechanism ID: 4763.09	Mechanism: N/A
Prime Partner: Xstrata Coal SA & Re-Action!	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Health Systems Strengthening
Budget Code: OHSS	Program Budget Code: 18
Activity ID: 22743.09	Planned Funds: \$291,271
Activity System ID: 22743	

Activity Narrative: SUMMARY:

Re-Action! will assist the Department of Health (DOH) to strengthen health service delivery through public-private partnerships within three additional provinces (Limpopo, North West and Northern Cape) in eight health districts. This will focus on district-level improvement and support activities that build on existing public-private mix (PPM) projects that Re-Action! has been implementing with Xstrata Coal in Mpumalanga province. These activities will strengthen service delivery networks within these districts, prepare facilities to meet provincial and national healthcare standards (NHS) towards accreditation and increase the points of access to services.

BACKGROUND:

The PPM health systems strengthening approach identifies all public and private sector contributors to address identified systems constraints to scaling up HIV and TB services within the target districts. This is conducted in partnership with district health management teams and local government.

Expansion of these partnerships into the additional provinces will be a developmental activity leading to signing a partnership and co-investment agreements with companies and Memorandums of Understanding with the provincial Departments of Health.

ACTIVITIES AND EXPECTED RESULTS:

Re-Action! will carry out nine separate activities in this program area.

ACTIVITY 1: Developing the Competencies of DOH District Management Teams

ReAction! will develop the competencies of DOH district management teams for effective stewardship, planning and management of district-level services through training (including human resource management and leadership training), mentorship and responding to specific technical assistance needs. An organizational and leadership development practitioner will be appointed for this. A technical support network will be established for identifying and procuring short-term technical assistance from external contractors.

ACTIVITY 2: Strengthening Referral Networks and Service Linkages

ReAction! will strengthen referral networks and service linkages by engaging all health service providers at a further three public sector hospital and primary care clinic sites (to a total of eight); at least five additional private general practitioners; two company occupational health clinics; and community-based service organizations. This requires appointing an additional 3 PPM Project Coordinators (one per province) to identify providers, establish service networks and facilitate training, with supportive supervision.

ACTIVITY 3: Improving Clinic Infrastructure

The aim of this activity is to increase service delivery capacity by refurbishing and equipping a further three health facilities, and continuing to upgrade a total of seven facilities.

ACTIVITY 4: Strengthening Public Sector Pharmaceutical Supply Management

This will contribute to improvements in antiretroviral therapy (ART) management, procurement, storage, distribution and use to increase access to quality HIV treatment at seven down-referral sites, whilst contributing overall to improving the capacity of district health services.

ACTIVITY 5: Improving Health Management Information Systems (HMIS)

This activity will focus on HMIS improvement through strengthening patient monitoring within health facilities; conducting service availability mapping; collecting household-level health risk assessment data; and building the technical capacity of public service managers for using strategic information in planning and service improvement.

ACTIVITY 6: Healthcare Worker Recruitment

Assisting the DOH to recruit health workers for approximately 40 vacant staffing positions, that will be contracted out to Human-Scale Resources. This includes temporarily placing not more than five additional health workers in critical service posts whilst these are being filled through public sector recruitment.

ACTIVITY 7: Providing Clinical Mentorship and Training

Clinical mentorship and in-service training will be provided to 50 health workers through clinical outreach teams visiting service sites on a periodic basis. An additional two full-time equivalent professional nurses, two counselors; part-time nutritionists and social workers will be appointed for this.

ACTIVITY 8: Community Health Worker Capacity Building

An additional 20 community health workers will be recruited and trained based on the national 59 day training curriculum, up-skill of 40 existing community health workers, and providing supportive supervision to household-level health service outreach, covering communities of approximately three million people.

ACTIVITY 9: Monitoring and Setting Standards

This activity will focus on documenting progress and establishing good practices through service quality

Activity Narrative: improvement activities. This requires appointing a health advisor and procuring specific additional external technical assistance, as required.

Overall, these activities will strengthen facility and community-based health services in both the public and non-state sectors, to increase points of access, improve service linkages and align basic service planning and delivery with government plans and programs.

Activity Narrative: NO FY 2009 FUNDING IS REQUESTED FOR THIS ACTIVITY:

This activity was approved in the FY 2008 COP, is funded with FY 2008 PEPFAR funds, and is included here to provide complete information for reviewers. No FY 2009 funding is requested for this activity. Based on the PEPFAR South Africa Interagency Partner Evaluation, the review panel felt that this Medical Research Council of South Africa (MRC) activity was not a system strengthening activity and was better placed under the Other Sexual Prevention program area. The activity has therefore been moved to the Other Sexual Prevention program area. Therefore there is no need to continue funding this program area with FY 2009 COP funds.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Provincial coordinators will primarily be dedicated to monitoring and evaluation (M&E). Regional leaders will be specifically trained on M&E, data quality and effective data use to guide program implementation in their areas.

Technical support, training and financial support will be provided to strengthen the capacity of the trade union movement to participate in the development of public policies and policies within the union structures and at the workplace, in this case, within schools. Technical support and training will be provided via workshops on ways senior school management, employers, senior union leadership and co-workers can mainstream HIV and AIDS issues into routine workplace activities. Support will also be provided to develop workplace policies and strategies on HIV and AIDS.

ACTIVITY 1: Capacity Building and Mentorship Program

PEPFAR funds will be used to train and establish a mentorship program for a large number of peer educators, within the union. These peer educators will be provided with technical assistance to conduct HIV and AIDS prevention education programs for fellow educators, and community members. Peer educators will be responsible for the following key HIV and AIDS prevention efforts: 1) develop strategies to increase awareness of HIV and AIDS, sexual transmitted infection and tuberculosis among union members; 2) increase the involvement of unions in the development, implementation and monitoring of HIV and AIDS workplace policies and programs.; 3) increase the involvement of men in HIV prevention efforts and in efforts to combat violence against women; and 4) develop strategies to reduce stigma and discrimination against HIV-infected members in the workplace; and finally, 5) develop strategies to promote healthy lifestyles and the adoption of risk reduction behaviors among union members.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

The University of the Western Cape (UWC) program forms part of the University Technical Assistance Program (UTAP), which is aimed at strengthening human capacity development and ensuring sustainability of efforts in multiple program areas. The activities in this program area focus on improving human resource information systems (HRIS) that enable managers at the district and sub-district levels to more effectively use the information collected for human resource planning and management. Another key emphasis is on strengthening the management capacity of health and human resource managers within health departments. The project also focuses on expanding health-related resources and promoting effective partnerships between the education and health sectors, through the establishment of health promoting schools at the secondary school level.

BACKGROUND:

During FY 2008, this project identified and started working with three secondary schools in a low resource community in Elsies River, Cape Town. Teachers, learners and parents of learners have participated in workshops at individual schools. Using FY 2009 funds, the project will continue to work with the learners, teachers and parents in the three identified secondary schools. There will be workshops with the learners, teachers and parents. There will be mentoring of teachers. There will be leadership camps for the learners. Links will also be made between the schools and community groups. Joint initiatives will be developed between the three schools. Also, the English language version of the training manual will be completed.

The training involves a series of workshops for parents, teachers and learners that will be held over a period of 10 months. Empowerment activities will be used to build self-esteem and support healthy school-community and family values. Forty-six individuals (15 teachers, 15 learners, 15 parents, and 1 school nurse) will be trained. Twenty learners will participate in a leadership camp which will focus on empowering activities while learning about addressing HIV and TB. Local community groups, such as the theatre group Sound Track 4 Life and Children's Resource Centre will be involved in this training.

ACTIVITIES AND EXPECTED RESULTS:

UWC will carry out three separate activities in this programmatic area.

ACTIVITY 1: Management and Leadership Training for HIV/AIDS Program Managers and Human Resource Managers at the Provincial and District Levels

This activity aims to strengthen the overall capacity of both human resource managers and HIV project managers to deal with the ever-increasing challenges faced in their workplace through the provision of a leadership and management training program. The program is designed to improve the management and leadership skills of these health personnel.

The goal of the project is to improve the skills, knowledge and competencies of new HIV project managers and emerging human resource managers, so that they may be better equipped to deal with the challenges of their work at local and provincial government levels. The assumption is made that most HR managers have already received some management and leadership education/training. The training program within this activity is more relevant to people who have either newly entered the field of management or are aspiring to become managers in the near future.

Using FY 2009 funds, local and provincial government officials will be consulted to review the five-day training program developed in FY 2008. The training will continue to be rolled out in FY 2009, with 30 new HIV project managers. Additionally, 30 emerging or up-coming human resources managers at provincial and district levels will be trained in public service leadership and management. The training program will be evaluated by participants and outcomes will be measured through assessment processes. In addition the effectiveness of the training will be measured by the increase in demand for the training program. The course will be accredited through UWC and the Health Professions Council.

ACTIVITY 2: Human Resource Information Systems for District Level Planning and Management

Background: Planning and managing programs are often hampered by the unavailability of reliable human resources information. Developing good health program information systems is a labor intensive and time consuming process and the staff that operates them must be trained and supported. Over the past 10 years and still currently, the School of Public Health at UWC has been at the forefront of developing and supporting the implementation of routine district and program health information systems (specifically human resource information systems) and enabling health workers and managers to systematically and routinely, collect, collate, analyze, interpret and utilize information. This project contributes to the strengthening of capacity for the collection of data and use of human resource information to manage programs like the HIV/AIDS program. The aim of the project is to improve the quality of health care provided through developing a sustainable, decentralized capability to operate and maintain integrated district-based HRIS, as well as increasing the use of information by health care providers. A participatory approach will be used with the established task team to develop the tools and collect the data required for decision making. Training will be targeted at both the producers (task teams) and the users (managers) of the information. The project strategy includes both a bottom-up and top-down approach. The approach requires the participation of the district and the National Department of Health. A task team was established in FY 2008 at the district level and regular communication specifically aimed at participation in the development of the system with the national and provincial Department of Health. In addition, regular formal feedback sessions are provided to the National Department of Health to ensure that the development of the human resource information system is in line with the current and new national policies.

Activity Narrative: Using FY 2009 funds, the framework for a district-based HRIS developed in FY 2008 will be piloted in one district in the Western Cape. A training and mentoring program will be developed in consultation with a five-member task team, reaching at least 20 managers. The training will focus on the use and monitoring of human resource information; as well as training of the tool developed. The HRIS tool will be piloted in one district in the Western Cape (West Coast), with the on-going training of district and sub-district managers. Monthly mentoring visits will be conducted to provide support mentoring on the collection and use of human resource information. The managers will be supported in compiling a district human resource management report based on the data collected.

ACTIVITY 3: Addressing TB and HIV Through the Development of Health Promoting Schools

Background: Multiple factors lead to the spread of TB and HIV in the school community. While poverty is the underlying social determinant, in many of the communities in the Western Cape substance abuse, including alcohol and drug abuse, and violence are also factors that lead to risky sexual behavior. Consequently a holistic approach is needed to address TB and HIV effectively.

The World Health Organization has identified schools as effective settings for the promotion of health. This project focuses on training to strengthen human capacity using the holistic health promoting schools framework to address the problems of TB and HIV. The National Department of Health, Health Promotion Unit has identified the development of health promoting schools as a priority. It is in the process of reviewing its Draft Guidelines on Health Promoting Schools. The outcome of this project will feed into this process.

The UWC Health Promoting Schools Forum is a partnership between academics at UWC, the Western Cape Reference Group for Health Promoting Schools, the Western Cape Education Department (WCED) and the Western Cape Department of Health (Health Promotion). The forum has been active in supporting the development of health promoting schools in the Western Cape. There are currently approximately 130 health promoting schools in the Western Cape. Until this project began development had only taken place in primary schools. This project aims to develop secondary schools as health promoting schools.

The broad goal of this project is to reduce the spread of TB/HIV in the school-community in South Africa. The specific aim of this project is to build and strengthen human capacity among all in the school community. This includes, firstly, to promote sexual abstinence and delay sexual debut and, secondly, among older adolescents, teachers, and parents, to develop and strengthen the ability to make healthy choices related to sexual behavior in order to reduce risky sexual behavior. The project also seeks to enhance the care of young people who are HIV affected within the education system and improve referrals for treatment and care.

This project contributes to the Policy Analysis and Systems Strengthening target, specifically the development of a district-based human resource information system. This project is directly linked to the provision of management and leadership training for new HIV program managers and HR managers at the provincial and district levels.

SUMMARY:

The University of Western Cape (UWC) is implementing multiple activities aimed at improving human capacity development to address HIV and AIDS in South Africa.

BACKGROUND:

The 2004 report of the Joint Learning Initiative on health human resources states that "after a century of most spectacular health advances in human history, Human survival gains are being lost because of feeble national health systems." The HIV and AIDS emergency has undoubtedly contributed to this problem, particularly in South Africa. The pressure on health care workers is immense and with the crisis of attrition and out-migration of personnel, systems in South Africa are challenged as never before. This has been placed in stark relief by the urgent need to respond to HIV and AIDS epidemic, and especially the current imperative to deliver antiretroviral therapy (ART) to large numbers of sick people who are often living in areas where health systems have been poorly developed. This project focuses on strengthening and expanding the development and implementation of comprehensive HIV and AIDS prevention in South Africa in order to mitigate the impact of the HIV and AIDS epidemic. The emphasis area for these activities is human capacity development, training, including pre-service and in-service training. The minor emphasis area is local organization capacity building. Target populations include public and private sector health care workers including human resource managers and HIV program managers.

ACTIVITIES AND EXPECTED RESULTS:

HIV and AIDS require a comprehensive approach with a view beyond the health system. Consistent with this approach, the activities in this program area demonstrate a multi sectoral approach to targeting a variety of health professionals. There are two separate activities in the program area.

Activity 1: Provide management and leadership training for new HIV program managers and human resources managers at the provincial and district level:

This activity aims to strengthen the overall capacity of both human resource managers and HIV project managers to deal with the ever-increasing challenges faced in their workplace through the provision of a leadership and management training program. The goal of the project is to improve the skills, knowledge and competencies of new HIV project managers and human resource managers so that they may be better equipped to deal with the challenges in their work. The objectives of the project are to provide a training program that would aim to introduce participants to the concept of "self-management"; provide participants

Activity Narrative: with an understanding and overview of the management functions of planning, organizing, and leading; familiarize managers with the concept of innovation and allow them to apply creativity techniques so that managers may be able to lead projects to meet new innovative ideas and introduce problem solving and decision making processes and techniques applicable to their work environment. In this activity a training curriculum approved for continuing education credit through the UWC Division of Lifelong Learning will be implemented. Twenty new HIV project managers will be trained in public service leadership and management and ten human resource managers at the provincial and district level will be trained in public service leadership and management.

Activity 2: Human Resources Information System

UWC's current work with the NDOH has initiated a process of conducting a human resource information audit in South Africa and developing a framework of national indicators for human resource management, development and planning. This activity will take this process to the next level by developing a district based human resource information system (HRIS) for general human resources information, with a specific focus on HRIS requirements for HIV and AIDS program delivery. Planning and managing programs is often hampered by the unavailability of reliable human resource information. Yet, developing good health program information system is a labor intensive and time consuming process and the staff that operates them must be trained and supported. The aim of the project is to improve the quality of health care provided through developing a sustainable, decentralized capacity to operate and maintain integrated district based HRIS, as well as increasing the use of information by health care providers. This activity will develop a framework for district-based HRIS for the management and planning of human resources and will also develop a training program for the data collectors and information users on the development and use of human resource information. In addition, a group of data collectors and information users will be trained on the district based HRIS for piloting.

These activities contribute to the PEPFAR goals by training HIV program manager and developing a district based HRIS. This will lead to improved human capacity development for the implementation of HIV and AIDS services.

Prime Partner: University of Washington	USG Agency: HHS/Health Resources Services Administration
Funding Source: GHCS (State)	Program Area: Health Systems Strengthening
Budget Code: OHSS	Program Budget Code: 18
Activity ID: 3335.22683.09	Planned Funds: \$2,118,999
Activity System ID: 22683	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

This activity has been extensively expanded in FY 2009 to provide a foundation for building sustainable in-country training and mentoring services. Activities include providing technical assistance (TA) to the National Department of Health (NDOH) to plan, manage and implement its national Health Promotion and Quality Assurance (HPQA) Centre initiative; strengthening leadership and management at provincial HPQA Centres; developing the human capacity of HPQA clinical/mentoring teams and healthcare professionals (HCPs) to provide quality prevention, care and treatment to persons infected with HIV, AIDS, STIs and/or TB (HAST); and developing integrated pre- and in-service HAST educational/training programs at Walter Sisulu University (WSU).

- Recruitment of additional in-country I-TECH staff including a clinical advisor, a monitoring and evaluation (M&E) specialist, a fiscal lead and an instructional design specialist: Preference will be given to South African applicants. The clinical advisor will oversee all clinical matters and programming related to development of pre- and in-service programs and HPQA capacity building through clinical mentoring programs and other clinical training support modalities. This position will assume some of the responsibilities and leadership provided currently under the I-TECH University of California San Diego (UCSD) subcontract. The M&E specialist will work with individual HPQAs to identify their 2008-2011 goals and objectives for increasing their institutional capacity and to set/monitor benchmarks/milestones. This approach, with involvement from the NDOH and provincial DOH, will assure achievements are maintained and that threats to maintenance are foreseen and addressed. This position is also responsible for mentoring HPQA M&E staff on evaluation methods and working with them to implement and review newly introduced forms allowing for more regular and robust capturing of clinical mentoring outcomes/impact and technical assistance events. The fiscal lead position is a requirement of I-TECH headquarters. The instructional design specialist will work with and mentor HPQA Centres to build their curriculum/instructional design capacity. It is anticipated the in-country instructional design specialist will need substantial mentoring by the Seattle Training Development Team (TDT) team to meet I-TECH's standards. Over 12 months, Seattle TDT will work with this individual, ultimately transferring curriculum and instructional design responsibilities to the Pretoria Office. The I-TECH in-country mentor will be transferred to the Eastern Cape (EC) HPQA, thereby expanding the HPQA's clinical mentoring capacity and expertise. Also the EC technical advisor to the Pretoria office will become the training program manager to allow for expansion of I-TECH activities to all provinces.

- Expansion of intensive I-TECH SA health system strengthening TA to the Limpopo DOH and Mpumalanga DOH HPQA Centres: In addition to providing a wide array of on-going TA for the development of HPQA Centres, TA will also centre on 1) the accreditation of curricula and training credentialing; 2) development of instructional design/curriculum/training programs; 3) the development and maintenance of on-line resource libraries; 4) the development of clinical practice sites for hands-on learning; 5) distance learning strategies; 6) building of M&E expertise and capacity at the HPQA level; 7) training of HPQA staff on TrainSMART (I-TECH open source training database) and data quality issues, as requested; and 8) development of training standards per individual HPQA Centres and initiative at the NDOH for monitoring and assessing performance against these standards. I-TECH will provide in-country TA to assist in the capacity building for the support and local development of these components. It is estimated that this will take several months spread throughout the duration of the year.

- TA will be provided to the WSU School of Medicine to build the following components: 1) a faculty development program for developing HIV expertise among the faculty and attending physicians at the teaching hospitals; 2) the creation of an HIV fellowship program; and 3) the development of a formal inpatient HIV consultation service at Nelson Mandela Academic Hospital and Umtata General Hospital, staffed by HIV fellows and faculty participating in the faculty development program. This set of activities represents a major undertaking and will be supported by UCSD physician faculty, the I-TECH clinical advisor position, and I-TECH headquarters TDT. I-TECH has a strong track record in developing, implementing and evaluating pre-service course materials and faculty development programs (Mozambique, Haiti), and fellowship offerings (India). It will use the lessons learned, in-house expertise, advice and consultation from the Stellenbosch Africa Center for HIV/AIDS Management, and existing products to support rapid scale up of this initiative.

- Support certificate and diploma courses in HIV/AIDS at WSU for practicing HCPs at the facility level: The in-service course will be largely practically conducted in students' place of work allowing the obtainment of specialized knowledge and skills specific to actual job responsibilities while they are performing their care and treatment duties. These activities support the establishment of an integrated HIV/AIDS training/education strategy and provide the structure for a career path. Such activities may help address worker shortages and provide HIV/AIDS clinical leadership in areas where none exist.

- Customization of existing I-TECH nurse training materials for South Africa to strengthen clinical skills, clinical acumen, and the expansion of their role at the facility level (e.g. expansion of prescribing rights): This work is to be done at the request of WSU and/or EC HPQA.

- The development of an advanced diploma in HIV/AIDS for nurses will help prepare nurses for increased responsibilities in the care and treatment of persons with HIV, AIDS and TB. I-TECH will use its HIV/AIDS Nurse Specialist course (which has didactic, preceptorship, and on-site clinical mentoring components) as a primary reference, based on the success of the program in Ethiopia and current adaptation by Zambia partners.

- TA to the University of Pretoria to develop, implement and evaluate a HAST module into the new Clinical Associate program and TA to the WSU program upon request: The Clinical Associate program serves to broaden the range of health care workers who can address various health issues and assures the HAST knowledge and skills of pre-service HCP. I-TECH will draw upon its pre-service materials recently developed for Mozambique, as well as other existing in-house curricula and clinical materials. This work assumes close and positive collaboration with the named universities and other SA universities providing similar programming, and an academic-based curriculum review and approval process.

- Ongoing TA to the NDOH to strengthen its capacity to plan, manage, implement and evaluate its HPQA Centre initiative. It supports the development of local leadership and ownership, and assures program sustainability.

- Implementation and evaluation of two one-and-a-half day clinical treatment updates (80 participants total) for Mpumalanga and Limpopo DOH HPQA Centre trainers, provincial DOH district trainers, and project

Activity Narrative: managers (i.e., doctors and nurses from Mpumalanga and Limpopo antiretroviral clinics). See page 22 under Comments on Past Performance. EC HPQA Centre trainers, DOH district trainers and project managers who did not attend these updates when offered in the EC in FY 2008 may attend one of the trainings in Limpopo or Mpumalanga provided sufficient space and funding.

- Provide TA on the modification of a basic HAST course and four specialized in-service training curricula (i.e., counseling skills, mother and child HIV care and treatment, STI care and treatment, TB/HIV). These curricula will be promoted to the other eight DOH HPQA Centres. A training of trainers workshop and orientation of Mpumalanga HPQA and DOH staff to these materials will be developed and conducted. The I-TECH South Africa M&E specialist, I-TECH curriculum integration specialist, and I-TECH HQ Quality Improvement Team will assess if the curriculum integration project is successful in reducing the number of training days HCW are away from the clinics, as well as greater training delivery efficiency (i.e., improved materials, better participant selection criteria). This evaluation component is necessary if NDOH or other HPQAs consider either replicating or adopting similar processes, training program designs, or curriculum products.

Three laptops, 3 printers, 2 LCDs, 25 tables, and 50 chairs will be purchased for Limpopo HPQA and satellite sites. A partial contribution toward the renovation of a training center may be made as well.

SUMMARY:

I-TECH activities are currently carried out to support sustainability of HIV, AIDS, TB and STI care and treatment programming in the Eastern Cape (EC) province through four components: 1) establishing I-TECH field offices in South Africa (SA); 2) providing organizational development and human capacity building technical assistance (TA) up to three Regional Training Centers (RTC); 3) supporting the EC Department of Health (ECDOH) HIV and AIDS program; These activities are continued in FY 2008. The primary emphasis area for these activities is local organization capacity building. Strategic information and human capacity development are secondary emphasis areas. The primary target population is a non-governmental organization.

BACKGROUND:

I-TECH has been working in the EC since 2003 to develop the capacity of the RTC to train/mentor clinicians in the care and treatment of HIV, AIDS, TB and STI. The majority of activities described here (exceptions include expansion activities) were first funded between FY 2003 and FY 2007. I-TECH established an office in the EC beginning January 2007, is collaborating with other EC PEPFAR partners, and has/will conduct field assessments of TA needs with 16 EC PEPFAR partners to identify programmatic TA activities which could be supported by I-TECH. I-TECH is working in SA at the invitation of the ECDOH, and its activities are supported by the NDOH HIV/AIDS Directorate. All activities described under this program area with the exception of TA related to the development of clinical care information systems will be implemented by the primary partner. TA related to clinical care information systems will be implemented by the primary partner and its subcontractor, UCSD Owen Clinic.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Technical assistance to NDOH Human Resource Department (HRD) to develop Regional Training Centres (RTC) nationally

I-TECH as part of its HCD program will assist the National Department of Health HRD responsible for the establishment and monitoring of RTC in each province to develop policies and guidelines to strengthen provincial RTCs and improve the quality of HIV/AIDS/STI/TB (HAST) training programs. I-TECH will also work with the national department to develop tools to monitor the quality of services rendered by these RTCs, identify provincial RTCs in need of technical support and develop a plan of action to assist those identified.

ACTIVITY 2: TA to Mpumalanga RTC

I-TECH will assist the Mpumalanga and Limpopo RTC in:

- Developing policies and guidelines and a governance structure for the RTC.
- Develop capacity of RTC staff in developing assessment tools to assess training needs of health care providers in the province
- Develop the capacity of RTC staff in developing yearly HAST training plans for the province and conducting quarterly reviews of training and develop skills of RTC and district training staff to monitor quality of training programs
- Develop skills of RTC staff in curriculum development and integration of new national and international guidelines into existing curricula and seeking accreditation with SAQA
- Develop capacity of RTC staff to track, monitor and assess HAST training done by other NGO within the province
- Develop capacity of RTC and other district trainers to monitor quality of training and assessment of skills transfer.
- Develop facilitation skills of district trainers in Mpumalanga, Eastern Cape and Limpopo provinces
- Development and production of HAST training manuals for accredited training
- Purchase of teaching aids such as data projectors, lap tops, demonstration models and other visual aids to be used by the RTC to train health care workers

ACTIVITY 3: Development of training and facilitation skills of trainers

I-TECH will develop capacity of district and RTC trainers to ensure a pool of qualified trainers are available in each of these provinces (Mpumalanga, Eastern Cape and Limpopo) to continue developing capacity of health care workers. These training programs will utilize a variety of training techniques to ensure transfer of skills. These trainings will also include the techniques on assessing training programs. For this activity I-TECH will utilize the services of a local service provider accredited to conduct such trainings.

Activity Narrative: ACTIVITY 4: Prevention with Positives

I-Tech will develop capacity of trainers at the Regional Training Centre in 3 provinces (Mpumalanga, Eastern Cape and Limpopo Provinces) to integrate Prevention with Positive for PLHIV into the HIV and AIDS training curriculum and content material for both health care professionals and lay health care workers. This integrated curriculum will ensure that HIV and AIDS training programs are updated with messages and programs on Prevention with Positives.

ACTIVITY 5: Training

I-TECH will also train the trainers of all three RTCs on prevention with positives, develop their skills to impart these trainings to others and mentor them on conducting the actual training. I-TECH will also assist the RTCs in developing and disseminating quick reference guides on Prevention with Positives to be used by health care providers and lay health care workers in all settings (i.e. facility, community and home based settings). These quick reference guides will serve as prompt tools for health care providers and lay health care workers.

Budget Code: OHSS

Program Budget Code: 18

Activity ID: 3016.23066.09

Planned Funds: \$1,165,086

Activity System ID: 23066

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The activity that has been changed is the support to the Crossroads Helping Hand Project. The project has been closed due to the fact that HPI supports the National Baptist Church of Southern Africa, the mother body of the Helping Hand Project. Further support has also been extended to the Nelson Mandela High School in Crossroads, Cape Town where the Helping Hand Project is housed.

No capacity building will be provided by HPI to any tuberculosis (TB) NGOs since no activities have been approved for TB services and organizations for 2009. The TB modules in the diploma program in HIV/AIDS Management in the Workplace and AIDS and Development in Society address the importance of TB/HIV integration and focus on identifying TB and HIV co-infected individuals in the workplace. TB and the emerging M/XDR-TB epidemic represent a major challenge to HIV care and treatment programs and therefore the activities will remain as part of the HIV and AIDS policy development course material for 2009.

SUMMARY:

Health Policy Initiative Task Order 1 (HPI TO1) provides an enabling policy environment as a foundation on which to build quality, sustainable HIV programs and services. The HIV epidemic in South Africa (SA) cannot be addressed by the health sector alone-it requires a strong, coordinated multisectoral response from workplaces, faith-based groups, and civil society organizations to ease the burden on the health system. They also have critical role to play in reducing stigma and discrimination (SD) against people living with HIV (PLHIV) which is essential for encouraging counseling and testing, disclosure, and antiretroviral (ARV) treatment. Multisectoral engagement, including involvement of PLHIV and other vulnerable groups, is critical to ensure that: needs of those most affected are met; community leaders break the silence; stigma that hinders HIV prevention and treatment is eliminated; and resources for implementation are mobilized across all sectors.

In response, HPI proposes three activities that will strengthen HIV policies and programs of public and private sector workplaces; reduce SD; and build HIV-related institutional capacity of civil society groups. HPI will provide technical assistance to partners to build capacity to analyze and use data to enhance evidence-based decision-making, and to identify and address operational barriers to effective HIV and AIDS programs. HPI will also assist organizations in translating policies, strategic plans, and operational guidelines into effective programs and services.

BACKGROUND:

The National HIV, AIDS and STI Strategic Plan for SA, 2007-2011 highlights "World of Work" as an important sector for future management of HIV and AIDS in SA. Workplace policies in public sector and National Operational Plan for Comprehensive HIV and AIDS Management, Treatment Care and Support have been developed to support implementation of HIV and AIDS strategies. Adequacy of existing structures should be assessed, and capacity to develop and implement public and private sector HIV and AIDS programs should be strengthened. Workplace policies need to be developed and implemented in both private and public sector, with special focus on encouraging acceptance of HIV-infected employees and promoting open discussion of HIV and AIDS and non-discrimination.

IN FY 2007, HPI TO1 developed "Managing HIV and AIDS in the Workplace: A Guide for Government Departments" as a guide in implementing the Minimum Standards on HIV and AIDS. Use of this guide within the Department of Public Service and Administration (DPSA) has mostly been done at national and provincial levels for managers leading and developing HIV and AIDS programs. HPI TO1 has launched several HIV and AIDS Management Programs for senior managers and executive leaders in 2007 with key tertiary institutions (TIs). Primary objective of the leadership training programs is to secure commitment by leaders in South Africa to actively and openly address HIV in their business environments.

For many years women have been suffered from discrimination. Gender inequality hinders social and economic development and is a critical element of the transformation agenda in SA. HPI TO1 will strengthen capacity of women by conducting a leadership course for women to capacitate and mobilize them in leadership to play vital role to ensure accountability and gender sensitive responses that will increase reach of HIV and AIDS programs run by them.

Evidence from programs in South Africa suggests that people still fear testing for HIV and treatment. In partnership with HPI TO1, Center for the Study of AIDS (CSA) has implemented the Siyam'kela Project,, focusing on HIV-related stigma. To date, the project has been successful in developing conceptual and theoretical tools to understand and mitigate stigma for government and civil society to inform the mitigation efforts, build capacity, design advocacy messages and materials, and offer training and technical assistance (TA) around stigma.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: HIV and AIDS Workplace Programs

A. Program Managers and Graduate Students. HPI TO1 has worked closely with University of Stellenbosch to design training modules and facilitate training sessions as part of its diploma course on HIV program management and the workplace. As a follow-up to this activity, HPI will identify graduates of the program who have become HIV policy champions in their workplaces. HPI will provide capacity building and TA to these policy champions to strengthen development and implementation of HIV workplace policies and programs in their respective workplaces. In addition, HPI will assess the impact of the overall diploma course. HPI will identify a sample of 50 graduates to explore extent to which they are engaged in HIV workplace policies, dialogue, advocacy, and program implementation.

B. Executive Business Leaders. HPI TO1 will build leadership capacity of key business personnel to

Activity Narrative: strategically and effectively respond to HIV in their work environments. Training participants will include senior managers and executives, from both public and private sectors, who enroll for Masters in Business Administration (MBA) and Executive Leadership courses through six TIs. These institutions will assist in educating key role players and their contribution is in the form of integrating the HIV & AIDS workplace module to the MBA and Executive courses. HPI expects to initiate, strengthen and improve more appropriate workplace programming in the private sector.

C. Women Program Managers. HPI TO1 seeks to strengthen technical expertise, leadership abilities, and program management skills of women working to prevent spread and mitigate effects of HIV. This responds to need for greater and more meaningful involvement of women in designing and guiding HIV and AIDS programs. Through their current programs, the national departments for Gender will help select women to participate in the program who are from civil society, religious, and government bodies and are involved in or manage HIV programs. Women's leadership courses will help improve focus, ensure accountability, and increase reach of HIV programs by incorporating strategies that are gender sensitive.

D. DPSA and Government Departments. In partnership with DPSA, HPI TO1 will assist 30 departments to plan, develop, implement, and maintain HIV workplace policies and programs within human rights and gender framework. DPSA has mandate of instituting, strengthening, and upholding effective and efficient human resource practices in all government departments in nine provinces. Heads of Departments will oversee development and implementation of HIV workplace policies and programs. Heads of Departments follow the "Managing HIV and AIDS in the Workplace: A Guide for Government Departments," which provides guidance on Minimum Standards on HIV and AIDS. HPI will work with DPSA to develop and improve existing guides and monitoring tools to strengthen HIV & AIDS programs in public sector workplace.

ACTIVITY 2: Stigma Mitigation

SD has had a negative impact on HIV prevention in SA and has affected efforts to improve care and support for PLHIV. This has been exacerbated by lack of concepts and theoretical tools to understand and measure SD and their impact. Through ongoing implementation of Siyam'kela Project, capacity building for PLHIV organizations and families was done to advocate for stigma mitigation. With FY 2008 funds, the activities will focus on providing training to PLHIV organizations and their members at provincial levels on SD mitigation using the National Stigma Framework (NSF). Training will take place in all nine provinces of SA and through NDOH's HIV, AIDS, STI and TB directorate - Care and Support Unit; selection will take place to ensure departmental representation of all provinces. Representatives of PLHIV networks in different provinces will be included. Training and subsequent follow up will focus on implementation of NSF and sector plans to reduce HIV-related stigma. Through NDOH sector plans resources have been allocated for M&E of activities related to SD in provincial health departments. HPI TO1 will work with 405 representatives from NGOs, PLHIV groups and provincial health departments. HPI TO1 will provide TA to the HIV, AIDS, STI and TB directorate - Care and Support Unit to ensure implementation of their stigma plans. Evaluation will be conducted to report on progress and implementation of NSF.

ACTIVITY 3: Civil Society Organizational and Institutional Capacity Development

The SA Government's AIDS Action Plan spearheaded a national capacity-building process for the interfaith sector, in collaboration with POLICY Project which resulted in establishment of an interfaith program, FBOs in HIV/AIDS Partnership (FOHAP), in 2002. As a continuation of assistance started in 2007, HPI TO1 will provide institutional capacity building to two national FBOs, the National Baptist Church of Southern Africa in Crossroads and an African traditional FBO such as the Zion Christian Church or the Shembe, as well as three NGOs in three provinces which have been identified by the NDOH as key outlets in high prevalence areas for support to strengthen their capacity to: 1) develop strategic plans for program implementation; 2) provide institutional capacity building by facilitating governance and organizational development workshops to respond to the need for designing and implementing HIV prevention programs; and 3) build capacity of TB organizations to enable them to integrate HIV activities into their work. HPI TO1 is engaged with the three organizations providing TB outreach under the palliative care section. These activities will result in stronger TB/HIV technical programming and operations for the organization. HPI TO1 will provide institutional capacity building to 5 organizations and 180 staff for COP FY 2008.

Budget Code: OHSS	Program Budget Code: 18
Activity ID: 23197.09	Planned Funds: \$728,178
Activity System ID: 23197	

Activity Narrative: SUMMARY:

With FY 2009 PEPFAR funds, Management Sciences for Health's (MSH) Strengthening Pharmaceutical Systems (SPS) project will continue to support the "HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011". Under Health Systems Strengthening (HSS), SPS will continue to support the national, provincial pharmaceutical directorates and other statutory bodies by: 1) assisting with the review and update of national standard treatment guidelines, policies and procedures related to medicines legislation; regulations and pricing; and pharmacy practice, 2) promoting best practices for infection control practices, and 3) strengthening medicines supply management information systems.

BACKGROUND:

After the launch of SPS in August 2008, most of the provinces and metros requested additional support in new areas to support governance (e.g. management and leadership, strategic planning, and project and financial management). Therefore SPS will continue to provide assistance to all provinces in monitoring progress towards compliance with the Pharmacy Act and Medicines Control Act legislative requirements that relate to the delivery of pharmaceutical services as well as the applicable standards for the accreditation of health institutions (hospitals and community health centers) to provide ART.

ACTIVITIES AND EXPECTED RESULTS:

SPS will carry out the following three separate activities in this program area.

ACTIVITY 1: Policies and Procedures

SPS will provide assistance with the development of policies and procedures at all levels. It will also support the development and implementation of models of service delivery to support the provision of quality service to patients with HIV/AIDS, tuberculosis (TB) and other diseases, capacity building in the areas of governance, pharmaceutical care and monitoring and evaluation of pharmaceutical service delivery.

SPS will continue to provide technical assistance to non-governmental organizations such as the SA Pharmacy Council (SAPC) and the South African Qualifications Authority (SAQA) in a wide range of services such as the development of staffing norms for pharmaceutical services, accreditation of facilities, etc.

SPS will also continue to support the development and review of the standard treatment guidelines, pricing regulations to promote equitable and affordable access to medicines, and maintain its involvement with the Medicines Control Council (MCC).

ACTIVITY 2: Infection Control

The Infection Control Assessment Tool (ICAT) has been approved as the National Standard for assessing infection control. SPS will continue to provide technical assistance to national and provincial Departments of Health (N/PDOHs) to improve infection control programs in hospitals.

Planned activities include but are not limited to the following:

- Conduct training of trainers (TOT) workshop in the Western Cape province
- Finalize and officially launch the tool
- Print and disseminate hand hygiene posters
- Continue the on-going collaboration with the Soul City producers on the hand hygiene public awareness campaign
- Work with the NDOH and Medical School of the University of KwaZulu-Natal on the infection control manual
- Train pharmacy personnel on infection prevention and control practices

ACTIVITY 3: Medicines Supply Management Information Systems

SPS will continue to deploy its computerized medicines supply management (RxSolution) and quantification models at the facility level. SPS focus will to train manager on using information to support decision making.

Program Area: Health Systems Strengthening

Program Budget Code: 18

Planned Funds: \$427,198

Activity Narrative: SUMMARY:

Johns Hopkins University (JHU) coordinates the work of 20 South African partners that cover a total of 11 PEPFAR program areas through providing technical assistance and building capacity. JHU's support for the HIV & AIDS and STI Strategic Plan for South Africa 2007-2011 (NSP) includes in-service healthcare worker (HCW) training and skill building, along with accreditation by the National Department of Health (NDOH) for HCW promotions and advancement. Instructional technology via satellite and computers is utilized with provincial healthcare workers. Other activities include supporting Health Promoters at tertiary institutions (TIs) working on stigma reduction as well as Treatment Literacy and Prevention Practitioners (TLPPs) working in government clinics as advocates for a comprehensive treatment, care and support program within communities.

BACKGROUND:

Mindset Health

The Mindset Health Care Workers (HCW) channel has an MOU with the NDOH (a founding member) along with several provincial Health Departments. The MOU calls for the installation of the hardware and provision of software so HCWs are enabled to access the latest information 24 hours per day, upgrade their skills and test their knowledge for promotions and accreditation. Mindset also works with the PEPFAR partner Foundation for Professional Development and uses their materials (and vice versa) on the HCW channel.

DramAidE

The Health Promoters (HPs) project is entering its 6th year with PEPFAR funding. The HPs are HIV-infected young men and women living openly on 24 TI campuses. They work closely with the TIs' healthcare system and Peer Educators (PEs) program. Over the last few years several of the better resourced TIs have picked up the salary and benefit costs of the HPs. The HPs will continue to work on the high profile media project, SCRUTINIZE, and train peer educators on how to use support materials and to translate messages into the different national languages. They also work on stigma reduction, gender-based violence (GBV), and men's participation in HIV programs including voluntary counseling and testing (VCT).

Community Health Media Trust (CHMT)

CHMT is an activist organization that works with the Treatment Action Campaign (TAC) on treatment, care, support and prevention programs. CHMT trains both JHU partners and other community organizations on developing local plans and policies related to GBV, treatment rights, and stigma reduction. CHMT is a unique communication organization that is directly linked to the leading activist organization in South Africa, TAC, and has worked closely in helping to formulate policies with the national and provincial governments leading to programs supporting the PEPFAR 2-7-10 goals.

Wits University

Wits media project has articulated the media's role in articulating issues and policies that have both helped and hindered HIV programs in the country. A responsible, dedicated press is necessary for an informed citizenry and policy makers on HIV. JHU support to local and national HIV communication programs has helped to move from an events focus to a strategy driven program.

John's Hopkins University South African Staff

The NDOH's Khomanani campaign receives on-going technical assistance from local JHU staff. Both the contractors and NDOH staff attend workshops and receive other capacity building support from JHU that includes how to conduct large and small scale research interventions, management of research organizations, data utilization for strategic planning and program implementation.

ACTIVITIES AND EXPECTED RESULTS:

Johns Hopkins University will carry out five separate activities in this program area.

ACTIVITY 1: Mindset Health

In FY 2009 twenty hours of new video material will be developed along with print and web-based support materials under this COP. The materials will be available to other PEPFAR partners, both those working with JHU and other organizations.

ACTIVITY 2: DramAidE

DramAidE activities include 1) training of PEs on 24 campuses on stigma reduction, GBV and male participation, 2) conducting post-test counseling, 3) establishment of HIV organizations on campuses of people infected and affected by HIV, 4) conducting community outreach programs that build capacity in local schools and communities that interact with their local TIs to mutually support policy development on GBV, stigma and treatment that reflect local community needs and values.

ACTIVITY 3: Community Health Media Trust

In FY 2009, CHMT will provide assistance to 25 organizations within the provinces as well as work with 4 provincial governments in the above program areas. They will facilitate discussions between communities and the local health care and judicial systems.

ACTIVITY 4: Wits University

The Wits Journalism program and the Perinatal HIV/AIDS Research Unit (PHRU) of Wits will continue working with the print media, journalists and editors, to engage them in professionally reporting on key HIV/AIDS issues. In-depth, comprehensive and non-sensational coverage of key issues (including GBV,

Activity Narrative: treatment rights, stigma, etc.) plus strong investigative reporting is essential to creating an informed public and to enabling key decision-makers to make fact-based policies. This intervention will include a minimum of three dissemination events, workshops with journalists and editors as well as two special reports by professional journalists (broadcast and/or print).

ACTIVITY 5: Technical Assistance Provision from John's Hopkins University South Africa Staff

Local JHU staff will continue providing technical assistance to the NDOH and provincial health departments in strategic communication.

All of these activities work to strengthen the public sector and civil society's capacity in prevention, treatment, care and support. By providing HCWs in over 250 hospitals and clinics throughout the country with up-to-date information twenty-four hours per day that is aligned with the local needs of the staff, the HCWs are better able to respond to the public's needs. With over 1 million students, faculty and staff at the TIs throughout the country, the HPs are uniquely equipped to provide information that builds institutional capability to respond to their constituencies.

Table 3.3.18: Activities by Funding Mechanism

Mechanism ID: 9382.09

Mechanism: N/A

Prime Partner: Medunsa University

USG Agency: HHS/Centers for Disease Control & Prevention

Funding Source: GHCS (State)

Program Area: Health Systems Strengthening

Budget Code: OHSS

Program Budget Code: 18

Activity ID: 21634.22971.09

Planned Funds: \$242,726

Activity System ID: 22971

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

SUMMARY:

Using FY 2009 funding, the Medical University of South Africa (Medunsa) will develop a training curriculum for home-based carers based on the information gathered in the program evaluation and the new national guidelines on minimum skills units for community care workers. Medunsa will develop the training manuals (participant manual and trainers guide) using adult learning principles, and will conduct training of trainer workshops for PEPFAR partners involved in home-based and community care.

ACTIVITIES AND EXPECTED RESULTS:

Medunsa will carry out two separate activities in this program area.

ACTIVITY 1:

Medunsa will either newly develop or modify existing national training program materials for home-based carers, based on information gathered from the evaluation of the home-based care program and the new recommendations from the National Department of Health for training of home-based carers. These new training modules will reflect the key competences for home-based care and the national requirements for minimum skills for these categories of health care providers. The training units will incorporate home-based clinic care, HIV/AIDS counseling, TB/HIV (including infection control in the home), water and sanitation, and psychosocial support (including bereavement counseling and other aspects of the program from the evaluation and South African government requirements. Medunsa will then seek accreditation for these training materials from the South Africa Qualifications Authority.

ACTIVITY 2:

Medunsa will train PEPFAR partners implementing home-based care services using the new training materials. The focus will be on both training trainers and training home-based carers where organizations do not have access to qualified trainers.

SUMMARY:

MEDUNSA will work in collaboration with CDC to conduct a training needs assessment and take stock of training and skills transfer that have been implemented to date under the USG South Africa PEPFAR program.

BACKGROUND:

USING FY 2007 funding, MENDUSA will work with CDC, South Africa to conduct a training assessment. The objectives of the assessment include auditing the training programs funded by CDC, assessing the extent to which the training has impacted on service delivery, and assessing the extent to which task-shifting has occurred from higher to lower levels of workers because of training. The assessment will be conducted in all nine provinces of South Africa. The target population for this activity is USG staff and USG staff in country, as the finding of the assessment will be used to provide input into training programs being implemented by partners and will help direct future funding in the area of human capacity building. The primary emphasis are for this activity is local organization capacity building, strategic information and a minor emphasis area is training with a focus on task shifting.

ACTIVITIES AND EXPECTED RESULTS

ACTIVITY 1: Auditing training

Using FY 2007 funding, MEDUNSA will conduct an audit of all PEPAR funded training. The assessment will be initiated with organizations implementing training for community health care workers and lay counselors. MEDUNSA will contact PEPFAR partners to solicit information on their training programs and will develop a catalogue of training being offered through the PEPFAR program. This catalogue will enable USG to identify gaps in training activities for community health care workers and lay counselors as well as duplication of efforts. The catalogue will be used to strengthen the PEPFAR programs in the area of training for this cadre of health care workers.

ACTIVITY 2: Assessing the extent to which training has impacted service delivery

Based on the finding of the training audit, MEDUNSA will conduct formative work looking at the impact of training on service delivery. To do this, they will work with health facilities to determine what the training needs are and assess whether the training being implemented by partner organizations addresses this need. This will be done by examining training curriculum and comparing what is in the training to the training needs of the health facilities for community health care workers and lay counselors.

ACTIVITY 3: Basic program evaluation

Medunsa will conduct a Basic Program Evaluation of the Home-based Care programs support by CDC with PEPFAR funds in South Africa. The aims of the program evaluation are as follows evaluate the training received by home-based carers supported by our partners in terms of quality of training, methods of training, training curriculum used, mentoring of carers to implement the skills they have learnt. Evaluate to what extent task shifting has taken place from nurses at primary health care clinics to home based carers. Evaluation of the tasks carried out by home based carers supported by our partners.

Activity ID: 22795.09	Planned Funds: \$3,670,020
Activity System ID: 22795	

Activity Narrative: SUMMARY:

The International Center for AIDS Care and Treatment Programs (ICAP) will support the development and functioning of the national health system in Eastern Cape (EC), KwaZulu-Natal (KZN), Free State (FS) and Northern Cape (NC) provinces of South Africa, as guided by the Strategic Priorities for the National Health System 2004-2009 focusing on: (i) strengthening the capacity of the Department of Health (DOH) institutions (district, local service area (LSA) and health facilities) on planning, management and implementation of HIV care, treatment and support programs, including the pharmaceutical procurement and logistic systems; (ii) strengthening local partner organizations, particularly in management, leadership and policy development; (iii) supporting construction and renovation; and (iv) human capacity development. These activities relate to priorities four, five and six as indicated in the Strategic Priorities document.

BACKGROUND:

ICAP has been a South African government (SAG) and PEPFAR partner since 2004. ICAP recognizes that the rapid scale-up of HIV care and treatment programs in South Africa requires support for diverse needs in the areas of human capacity development and health systems strengthening. Hence ICAP has developed a comprehensive approach to health systems development and human capacity development - the Clinical Systems Mentorship (CSM) program - in recognition of the fact that context, or systems, are fundamental to the sustainability of HIV care and treatment programming. CSM is a methodology that broadens the principles of traditional clinical mentorship to the context of public health programming and health systems strengthening. The approach seeks to develop and improve competency and capacity in not only individual providers (traditional clinical mentorship) but also teams of providers (including the patient), health care facilities, local partners and the entire healthcare system. The foundation of CSM is a continuous process of assessment, data-driven intervention, and re-assessment, which may occur in an integrated fashion at multiple levels among ICAP staff or at the health facility, district, or provincial levels. The methodology relies on the use of tailored assessments appropriate to the strategic priorities of the national health system. CSM highlights the importance of integrating and aligning country program activities under a unified, tailored initiative, so that support to sites, districts, and provinces are systematic, context-specific, concrete, and oriented toward achieving the defined goals and objectives.

ACTIVITIES AND EXPECTED RESULTS:

ICAP will carry out four separate activities in this program area.

ACTIVITY 1: Strengthening the capacity of the DOH institutions in planning, management and implementation of HIV care and treatment programs, based on the clinical systems mentorship approach.

ICAP will conduct baseline and continuous assessments to ensure data-driven and continuous quality improvement; a successful transition to a continuity of care model that provides high-quality, comprehensive, family-focused HIV care and treatment services; and local capacity building for service delivery at the district, sub-district and 46 ICAP supported sites. It will also participate and support the creation of systematic plans for multi-tiered clinical systems mentorship roll-out from the province to the facility level in EC, NC and FS. Technical experts/advisors will avail the DOH, districts and health facilities in EC, FS, and NC to support the development of services and systems for comprehensive HIV care and treatment programs in the following ways:

- Support the development of leadership and management skills for HIV care and treatment providers at the facility, district and provincial levels through hands-on technical assistance; and support, training and mentorship.
- Provide technical support to the DOH in the strengthening of site supervisory structures and systems at all levels to oversee site level activities and ensure continuous quality improvement.
- Participate in technical working groups at the DOH on topics of PMTCT, TB/HIV, CT, psychosocial support, pediatric and adult HIV care, pharmacy, laboratory, and M&E.
- Support the definition, development/adaptation and implementation of a facility specific comprehensive package of HIV care and treatment services at 46 sites to provide general health services in support of HIV care and treatment services.
- Facilitate the development and maintenance of multi-disciplinary teams (MDTs) at all levels: The ICAP-SA clinical team will continue to ensure that all the 42 and additional 18 health facilities have MDTs that meet regularly to discuss cases, attend educational presentations, and plan for the facility.
- Assess and support community involvement and enhance patient education, support and empowerment through meaningful involvement in HIV care and treatment interventions.
- Facilitate the establishment of systems for linkages, referrals and communication within the health facilities and with external organizations.
- Provide technical and managerial support for the implementation of appropriate procurement systems for drugs (ARVs and OI Drugs), essential supplies and equipment to minimize shortages and stock outs.
- Integrate M&E and tracking systems into regular programming. M&E is a critical component of the comprehensive HIV/AIDS plan. Technical support and assistance will be provided at the provincial, district and site levels to ensure data use for program management in EC, KZN, NC and FS. ICAP has developed an M&E framework that includes M&E tools for care of HIV-infected adults, care of HIV-infected and exposed infants, care of HIV-infected pregnant women, TB/HIV integration, PMTCT, psycho-social support and adherence support. The framework is designed to measure progress towards the achievement of comprehensive HIV care, treatment and support components at each of the supported sites, as well as at the district and provincial levels.

In FY 2009 the current mechanisms will be strengthened to improve data collection and flow to ensure data quality, validity and accuracy for program use at the provincial, district and health facility levels. Existing data collection mechanisms are being improved and new systems are being developed to respond to the ever changing data needs of the SAG, USG, health facilities and the ICAP program based on the components of comprehensive HIV care and treatment programs. The mechanisms are also designed in a manner that ensures data confidentiality. Data collection, validation and use from the service point level up

Activity Narrative: to the national office will be facilitated by deployment and redeployment of essential M&E staff and creation of commitment and dedication of members of the MDTs to use data collection tools and report data. Information on the standard of care indicators will be available incrementally during FY 2009.

ACTIVITY 2: Strengthening local partner organizations, particularly in management, program implementation, leadership and policy development, as follows:

- Disease Management Systems (DMS): ICAP will continue to support the DMS program in 3 sites of Port Elizabeth to implement a patient-centered health management information system (HMIS) to allow for improved efficiency in the treatment of HIV-infected patients at the ART sites.
- Health Information System Program (HISP): Managerial, technical and financial assistance will be provided for HISP to implement a comprehensive patient level software and program database that will improve and enhance HMIS.
- University of Fort Hare (UFH): ICAP will continue to provide managerial, technical and financial support to the University of Fort Hare to place HIV care and treatment essential staff at the ICAP-supported health facilities in East London, Eastern Cape.
- Ikhwezi Lokusa Community-based Organization: ICAP will continue to provide technical, managerial and financial support to Ikhwezi Lokusa Wellness Center in Eastern Cape to ensure scale up of care and treatment through private general practitioners in rural Eastern Cape.
- Nelson Mandela Metro Municipality (NMMM): Through its network of PHC clinics, ICAP will continue with technical, financial and managerial resources support to NMMM to ensure human capacity and health systems strengthening to scale up HIV/AIDS care, treatment and support services in 20 facilities in Port Elizabeth, Eastern Cape.
- Foundation for Professional Development (FPD): ICAP will support capacity building for rural sites through the provision of managerial, technical and financial support to FPD to ensure human capacity development for comprehensive care in three hospitals and affiliated clinics in Qaukeni and Umzimkulu sub-districts.

ACTIVITY 3: Supporting the construction and renovation of health facilities to ensure appropriate space for the implementation of HIV care and treatment programs.

ICAP will renovate 10 existing facilities in order to ensure appropriate space for patient privacy and confidentiality in EC, KZN, FS and NC. It will also provide temporary structures to facilitate comprehensive, family-focused care and treatment interventions based on assessment of space and priority needs in EC, KZN, FS and NC.

ACTIVITY 4: Human capacity development, based on the South African National Department of Health Human Resource Plan for Health (HRH), which underscores the need for continued training, mentoring and skill development.

ICAP will assess and enhance key provider competency on HIV care and treatment at the district, LSA and facility levels through one on one and small group teaching of clinical skills, support to professional development and growth, and collegial support to clinicians and lay health workers on an ongoing basis at the ICAP supported sites. It will do so through the following sub-activities:

- Ensure the availability of technical, financial, managerial and logistics support for the implementation of training programs for the 46 supported sites in EC, KZN, NC and FS on the minimum package of care that ensures comprehensive and family focused care and treatment programs.
- Support the development of non-traditional health care cadres and task shifting strategies through trainings in collaboration with local accredited training partners (Foundation of Professional Development, Small Projects Foundation and ATTIC) for peer educators and field caregivers on HIV care and treatment.
- Provide continuous mentorship to nurses to acquire appropriate knowledge and skills to provide comprehensive HIV care and treatment services.
- In collaboration with the University of Fort Hare (UFH) Department of Nursing Science and the Stellenbosch University (SU) Ukwanda unit, continue supporting the post-basic Advanced Certificate in Clinical Management of HIV/AIDS course for 30 nurses with the aim of developing specialists in HIV care and empowering them to take a leading role in the management of both adults and children with HIV infection in the rural facilities.
- Provide technical and financial assistance to Small Projects Foundation (SPF) to continue with a training program (accredited by the South African Health and Welfare Sector Education Training Authority) for 50 caregivers in Umzimkulu as ancillary healthcare workers.
- Support healthcare workers to attend a training program at Tygerberg Children's Hospital at the University of Stellenbosch, in support of indigenous human capacity development to successfully implement pediatric care and treatment services.
- Ensure continuous medical education through an outreach program and mentoring for clinicians in rural Eastern Cape and KwaZulu-Natal to provide quality HIV care and treatment services in partnership with the Stellenbosch University Ukwanda Project.
- Facilitate HIV specialist forums that bring together specialist physicians to discuss the clinical management of more complex HIV issues. The ICAP clinical team will technically and logistically spearhead these forums at the regional level.
- Produce and disseminate behavior change communication/information education and communication materials in order to facilitate service delivery at all 46 sites. The ICAP-New York Clinical Unit and the South African government will produce the materials.
- Provide technical, managerial and financial support to the ECDOH for the two-year basic pharmacist assistant apprenticeship course designed in partnership with Frai Health Management Training and the Nelson Mandela Metropolitan University to ensure regular availability of essential drugs (antiretrovirals (ARVs) and opportunistic infection (OI) medications) and supplies at health facilities.
- Ensure availability of post exposure prophylaxis and psychosocial support for all health workers at the 46 facilities through the ICAP psychosocial support unit.

Table 3.3.18: Activities by Funding Mechanism

Mechanism ID: 193.09	Mechanism: N/A
Prime Partner: Elizabeth Glaser Pediatric AIDS Foundation	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Health Systems Strengthening
Budget Code: OHSS	Program Budget Code: 18
Activity ID: 22827.09	Planned Funds: \$1,135,958
Activity System ID: 22827	

Activity Narrative: SUMMARY:

The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) will use FY 2009 PEPFAR funds to support its existing prevention, care and treatment partners, namely the National Department of Health (NDOH) and provincial DOHs in KwaZulu-Natal (KZN), Free State, North West and Gauteng provinces. EGPAF will also support McCord Hospital and the AIDS Healthcare Foundation (AHF) in KZN. It will strengthen health systems through supporting renovations to improve patient flow at supported sites and mobile clinics to increase access to services in rural areas. It will also provide human capacity development support and technical assistance at all levels of service delivery, including engagement in policy development and reviews.

The key objective is to increase access to prevention of mother-to-child transmission (PMTCT), care, and treatment services at supported sites, especially the most disadvantaged and rural sites. Primary populations to be targeted include infants, men, women (especially pregnant women and HIV-infected pregnant women), people living with HIV (PLHIV), and public and private healthcare providers.

BACKGROUND:

EGPAF support is aimed at strengthening health systems to ensure long-term program sustainability. In addition to limited human capacity, space to provide consulting and counseling services is a serious challenge at some of the EGPAF-supported sites. Patient privacy and the quality of counseling are therefore compromised. To address existing space constraints and maintain patient confidentiality, EGPAF will provide additional consulting and counseling space in the form of minor renovations and purchasing of prefabricated buildings. Mobile clinics will be procured to provide services to the resource limited, disadvantaged rural and farming communities.

ACTIVITIES AND EXPECTED RESULTS:

EGPAF will carry out the following three activities.

ACTIVITY 1: Renovations

Some EGPAF-supported sites are not able to incorporate care and treatment services into the existing community health centers or hospitals due to lack of space. In these instances, when requested by the Department of Health, EGPAF will conduct a site assessment to determine specific needs (providing additional consulting space, partitioning rooms to provide patient confidentiality) and if needed, will provide renovations, or temporary space through provision of prefabricated buildings.

ACTIVITY 2: Mobile clinics

In expanding to Free State and North West provinces, which have greater needs for services in the agricultural and farming areas, EGPAF has been asked by the respective DOHs to support increasing access to PMTCT, care and treatment services through mobile clinics. In partnership with the DOH, EGPAF is exploring the feasibility of supporting mobile clinics and dedicated staff to reaching resource-limited rural and farming communities. Because these activities would be supported in partnership with the DOHs under the existing Memorandum of Understanding, these services would be sustainable because at the conclusion of direct PEPFAR support, these activities could be maintained by the respective DOH.

ACTIVITY 3: EGPAF will support human capacity development by providing additional staff based on staffing needs; training healthcare workers on comprehensive HIV/ AIDS prevention, care, management and treatment based on training needs identified; and providing ongoing on-site coaching, mentoring, preceptorship and supportive supervision. EGPAF will continue to provide technical assistance to the DOH at the national, provincial, district and site levels. EGPAF will provide technical assistance on HIV-related policy development and implementation to community-based organizations (CBOs) that provide care and support services in an effort to build local capacity. The CBOs' personnel will be trained on stigma and discrimination reduction as well as community mobilization for HIV prevention, care and treatment.

Overall EGPAF support aligns with national DOH health systems strengthening policies and guidelines (Treatment, Care and Support) of the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011, which aims to strengthen the health system and remove barriers to access is taken into consideration to ensure long-term program sustainability.

Planned Funds: \$322,340

Activity System ID: 22878

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

The South African Business Coalition (SABCOHA) will implement through the Vendor Chain Management and BizAIDS sub-partnerships. The major emphasis for this program will be the development of a workplace program, with minor emphasis given to community mobilization and participation; training and linkages with other sectors and initiatives; and the development of information, education and communication materials. The target population will include adults (men and women of reproductive age), truck drivers, factory workers, the business community and HIV/AIDS affected families. The project will focus on gender by addressing male norms and behaviors; and tackling issues associated with violence, coercion, stigma and discrimination.

ACTIVITIES AND EXPECTED RESULTS:

SABCOHA will carry out three separate activities in this program area.

ACTIVITY 1: Vendor Chain Management

In the Vendor Chain Management program, during the capacity building of companies, there will be discussions on the HIV/AIDS workplace policies, procedures and human resources (HR) issues. This will result in drafting of policies with the participating companies and in ensuring that the HIV/AIDS programs can be linked to the existing company systems without unnecessary duplication of work and/or roles. Managers will be trained on stigma and discrimination as part of the management training. One of the components will include the discussions on HIV/AIDS workplace policies, procedures and HR issues specifically relating to performance management, compensation, industrial relations and the management of incapacity and disability in accordance with the Code of Good Practice, which aims to ensure a non-discriminatory work environment. The program will also include managing misconceptions and prejudice and the development of supportive relationships amongst employees.

ACTIVITY 2: Peer Education

In offering HIV-related education, counseling and support in the workplace, peer educators are in many respects at the front line of the epidemic. SABCOHA will strengthen the existing peer education forums in the five provinces where they exist. Using FY 2008 PEPFAR funding, the trained HIV coordinators and peer educators in the Vendor Chain Management program will be linked to the strengthened and fully functional peer education forums. As the Vendor Chain Management program unfolds in other provinces, SABCOHA will develop more peer education forums.

ACTIVITY 3: BizAIDS

A personal participant handbook forms the basis for participants to develop personal plans of action to mitigate against the risk of HIV/AIDS and its potential for disruption of small business. BizAIDS training materials have been developed in English, as research has found that small businesses owners prefer to have the training delivered in English as they believe English is the language of business. When translating areas of uncertainty, translators generally switch to the vernacular. Training handouts include information on HIV/AIDS prevention, abstinence, being faithful, voluntary counseling and testing (VCT), treatment options and guidance on how to link into local business, treatment and legal assistance services. These materials come from strategic partners such as the Khomonani campaign (the communication campaign implemented by the South African Department of Health, the AIDS Law Project and Metropolitan Health. Linking the business owner, their employees and family to VCT and treatment services is the next necessary link.

Providing effective prevention messages and leadership education to employer associations, businesses, worker representatives and union members in a cross-section of South African industry will contribute to PEPFAR's goal of preventing seven million new infections. The activities described here will also support the prevention objectives identified in the United States government's Five-Year Strategy for South Africa.

Table 3.3.18: Activities by Funding Mechanism

Mechanism ID: 10271.09	Mechanism: TBD Twinning
Prime Partner: To Be Determined	USG Agency: HHS/Health Resources Services Administration
Funding Source: GHCS (State)	Program Area: Health Systems Strengthening
Budget Code: OHSS	Program Budget Code: 18
Activity ID: 23706.09	Planned Funds: ██████████
Activity System ID: 23706	

Activity Narrative: SUMMARY:

The awardee will work with four local universities (Walter Sisulu, University of Pretoria, Wits University and the Medical University of South Africa) to develop their capacity to implement the Clinical Associates (CA) program. The CA program is a new mid-level worker program which is a three-year degree program similar to the Physician Assistant program in the United States (U.S.). The NDOH has requested assistance for the universities to build their capacity through North-to-South and South-to-South mentorship from already established programs.

BACKGROUND:

The CA program is a new mid-level worker category introduced by the NDOH in response to the HRH crisis in the face of the HIV/AIDS pandemic. The South African universities, although willing to implement this three-year degree program lack the experience to do so. The request from the NDOH is to establish mechanisms for learning from other established programs through North to South and South to South exchange.

ACTIVITIES AND EXPECTED RESULTS:

The awardee will carry out five separate activities in this program area.

ACTIVITY 1: North-to-South Twinning

The awardee will establish twinning relationships with U.S. universities to mentor local universities in curriculum development, training of students, integrating HIV/AIDS management into the CA program, assessment of and new program development. It is expected that the local universities will benefit from other established programs in the design, implementation and assessment of the local CA program.

ACTIVITY 2: South-to-South Twinning

The awardee will establish a South-to-South relationship with other CA programs from Tanzania and Malawi. This will strengthen the regional relationship by providing opportunities to share African experiences, to adapt curriculum to fit local contexts and establish opportunities for South-to-South learning, mentorship and academic exchange. The local universities will be provided with opportunities for learning from other African countries on their experience in integrating HIV/AIDS programs into the curriculum and system for supervision of CA graduates in light of the critical shortage of doctors.

ACTIVITY 3: Establishment of Academic Forum

The awardee will establish a forum for ongoing academic exchange with universities both in Africa and in the U.S.. This will be mainly through electronic medium e.g. video conferencing, internet group discussions etc. This activity will also comprise a yearly academic meeting between other African CA programs for face to face exchange of ideas and program development.

ACTIVITY 4: Establishment of a Sustainable Supervision Model for Students

The awardee will work with the universities to develop a model for supervision of the CA students and graduates within the district health system. The awardee will do this by assisting the universities to draw on experience and lessons learned especially from other African countries and experiences in other South African programs to establish a mechanism for on-going supervision and support that can be sustained at a district level.

ACTIVITY 5: TB/HIV

The awardee will provide training and mentoring to strengthen the ability of CHSR&D to manage data and effectively disseminate research findings. The partnership will enhance the University of the Free State's Centre for Health Systems Research and Development's (CHSR&D's) role as the critical link between policymakers, care providers, and other stakeholders in translating research findings into effective policy and practice. This will ensure the development of referral and supervisory systems for the management and monitoring of TB/HIV co-infected patients; implementation of provincial TB registers to document treatment outcomes; and surveillance for and management of drug-resistant TB. Through the partnership, CHSR&D will have the capacity to play a central role in implementing, reporting, and recording systems for TB/HIV surveillance data and M&E of TB/HIV integration.

Table 3.3.18: Activities by Funding Mechanism

Mechanism ID: 10285.09	Mechanism: TBD Health System Strengthening CDC
Prime Partner: To Be Determined	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Health Systems Strengthening
Budget Code: OHSS	Program Budget Code: 18
Activity ID: 23738.09	Planned Funds: ██████████
Activity System ID: 23738	
Activity Narrative: SUMMARY:	

Increasing and strengthening human resources for health is essential not only to meet objectives of the President's Emergency Plan for AIDS Relief (PEPFAR), but also for most developing countries to meet their broader health objectives and health-related Millennium Development Goals. This activity will work with the national and provincial Departments of Health in South Africa to strengthen their existing Human Resources Information Systems (HRIS). The system allows policy and decision makers to obtain and use accurate human resources data for health to quickly answer key planning, policy and management questions affecting health care service delivery.

BACKGROUND:

Developing countries cannot plan and manage their public health workforce because of information deficiencies and inaccuracies. South Africa has an HRIS based at the Health Professionals' Council. However, it is not used to its capability because of a lack of training and equipment. In addition, it is not fully institutionalized.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Training and Capacity Building

Human resources personnel will be trained at the national and provincial level to use the HRIS for program decision making and planning. Ongoing technical assistance will be provided to support the staff to ensure that the HRIS becomes institutionalized. The focus will be on data collection, analysis and workforce planning methods in country-level HR studies to account for different gender roles and life cycle needs in relation to career progression, deployment and working hours. Policies and plans will aim to address direct and indirect discrimination and promote equal opportunities to be educated, trained, hired, promoted, compensated and socially protected without regard to gender.

ACTIVITY 2: Equipment

One of the gaps that the South African government has noted as a weakness in the utility of the HRIS is the lack of a server to operate it effectively. FY 2009 funds will be used to purchase the required equipment.

Funding Source: GHCS (State)	Program Area: Health Systems Strengthening
Budget Code: OHSS	Program Budget Code: 18
Activity ID: 13876.23893.09	Planned Funds: \$706,333
Activity System ID: 23893	

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

As the Health Care Improvement (HCI) project is relatively new, it will continue to focus on the four key activities described in the FY 2008 COP narrative. The emphasis during FY 2009 will be on expanding these activities, maximizing on gains and consolidating lessons learned. One of the important activities through FY 2009 will be to start the process of acquiring South Africa Qualifications Authority (SAQA) accreditation for the Quality Assurance (QA) training modules, which is often a lengthy and daunting process.

SUMMARY:

Through introduction of quality assurance (QA) tools and approaches and practical work, University Research Co., LLC/Quality Assurance Project (URC/QAP) will train 600 staff members of PEPFAR partners to gain a better understanding of quality improvement and quality assurance tools and approaches. Emphasis will be put on practical application of the quality assurance and improvement concepts in HIV/AIDS care, support and treatment settings. The training will also look at quality improvement and how its links with overall system strengthening activities. The training will seek to improve the quality of PEPFAR programs in general and HIV and AIDS programs in particular.

The essential elements of QA include technical compliance with evidence-based norms and standards, interpersonal communication and counseling and increasing organizational efficiency. The major emphasis areas for this activity are QA and supportive supervision, with minor emphasis on development of networks, linkages, referral systems, training and needs assessment. The target populations include policy makers, public and private healthcare workers, community-based organizations (CBOs), and NGOs.

BACKGROUND:

This is a new activity, initiated at the request of the South African USAID mission and various PEPFAR partners. The Quality Assurance Project (URC/QAP) has been working with the National and provincial Departments of Health in South Africa since 2000 on improving the quality of health services. Over the years, URC/QAP has successfully tested various interventions for improving and assuring quality of healthcare services. Since 2004, URC/QAP has assisted DOH facility staff in five provinces in applying these same tools and approaches for improving the uptake and quality of HIV and AIDS services. Currently, URC/QAP is supporting HIV and AIDS programs in 120 healthcare facilities in five provinces as well as two community-based organizations. The use of QA/QI tools and approaches have helped facility teams in integrating services (HIV testing with antenatal care program, TB and HIV integration among others), enhancing quality (increasing compliance of healthcare workers with national guidelines and patients/caregivers with treatment regimens). This has resulted in increased uptake of services as well as improved treatment outcomes. URC/QAP has conducted a number of studies to evaluate the impact of the use of QA/QI models on various services (neonatal health, TB, etc. over the past two years). These studies have highlighted both improvements in patient outcomes as well as program sustainability.

In order to broaden the reach of the QA/QI model, which has been integrated within the South African Government DOH QA Program, many USG partners have requested QA/QI training to improve the quality of their respective HIV/AIDS prevention, care and treatment programs.

ACTIVITIES AND EXPECTED RESULTS:

In FY 2008, URC/QAP has been requested to implement a QA training program for up to 600 staff members of 20 PEPFAR partners to improve the theoretical and practical understanding of quality improvement. These partners will be identified in consultation with USG. It is envisioned that this training will be designed for PEPFAR partners who work in public health facilities and who request the QA/QI training.

ACTIVITY 1: Identify PEPFAR Partners for Capacity Building

This activity was initiated at the request of the South African USAID mission and various PEPFAR partners. An assessment will be done to identify PEPFAR partners who work in public health facilities and who request the QA/QI training. URC/QAP will work with USG partners to identify who all should participate in the QA/QI training program.

ACTIVITY 2: Finalize training package

URC/QAP will conduct a rapid needs assessment of various partners for QA/QI training. Based on the assessment results, URC/QAP will design targeted training for various types of partners (clinic, community, faith-based etc.). The focus of training will reflect clinical or community-based interventions implemented by targeted partners. The training will include the following key elements:

- Basic QA/QI principles
- Integrating QA/QI in clinical settings
- Integrating QA/QI in community-based settings
- Monitoring quality of clinical and community-based services
- Tools for improving quality of services
- Plan-Do-Study-Act
- Story-boarding for dissemination of results

ACTIVITY 3: Conduct Training

URC/QAP will conduct training sessions for the PEPFAR partner staff. Each course will last 3 days in and

Activity Narrative: will not include more than 30 participants. The training programs will be interactive and participants will use case studies for learning various QA/QI tools. URC/QAP training will also facilitate linkages between different organizations by emphasizing training and compliance of facility staff with national guidelines and implementing quality improvement plans including process re-design, integration of services, and enhancement of network development with CBOs to improve referral patterns. URC/QAP staff will emphasize the strengthening of referral networks and URC/QAP staff will demonstrate that promoting integration of services at the facility level ensures the development of links between services such as sexually transmitted infections, family planning and VCT, promoting holistic care. It is envisaged this will serve to identify and strengthen existing networks; highlight gaps in the quality of services provided; and provide information about the feasibility of incorporating relatively rapid QA approaches into ongoing routine health care programs.

ACTIVITY 4: Follow-up Support

URC/QAP will assist the partner staff to develop a strategic plan for improving the quality of specific HIV and AIDS services. Interventions will include: (1) use of QA tools to improve compliance with national and provincial guidelines; (2) re-design of clinical processes to improve patient flow and service times; and (3) train QI teams to analyze their performance and compliance in relation to standard indicators. URC/QAP will at least visit each partner organization once or twice in a year to provide hands on TA in improving the quality of services. All partner staff supporting specific HIV and AIDS programs will be capacitated to ensure that programs are in compliance with the national guidelines and to assess compliance with quality assurance standards and other key performance indicators. URC/QAP will also be involved in training district and facility-level supervisors in QA methods and development of supervision techniques to improve the sustainability of QA within HIV and AIDS programs. The training will be done in collaboration with NDOH staff, to ensure accountability and long-term sustainability of the program URC/QAP staff will also capacitate organizations to train other members of staff with their "train-the-trainer" program, where at least 2 members of each organization will be invited to attend an extended QA/QI training workshop. This will ensure transfer of skills & capacity building of local organizations.

Activity ID: 8270.24545.09

Planned Funds: [REDACTED]

Activity System ID: 24545

Activity Narrative: SUMMARY:

The U.S. government is committed to supporting the South African government's Human Resource for Health (HRH) plan. The National Department of Health HRH unit has asked for assistance to support the implementation of the national HRH strategy for health. The NDOH has identified three areas for support: the Nursing Council of South Africa, HRH research for the purpose of informing policy decisions, and, management and leadership in health, given the impact of HIV/AIDS on the health system.

ACTIVITIES AND EXPECTED RESULTS:

The awardee will carry out three separate activities in this program area.

ACTIVITY 1: Support to the South African Nursing Council

The NDOH HRH unit has asked each of the professional health councils to develop a human resource plan to reflect the current health needs of South Africa. The Nursing Council is struggling to develop the plan due to the fact that they have no system to track the number of nurses that is currently registered and working in South Africa in both the private and public sectors. The Centers for Disease Control and Prevention (CDC) South Africa will provide technical assistance to the South African Nursing Council to develop an administrative system to track the number of nurses that are currently registered, active and working in the country. This system will serve as the foundation for the human resources information system for tracking health professionals.

ACTIVITY 2: Management and Leadership Training for Health Managers

through the Sustainable Management Development Program, CDC will assist the NDOH in implementing a sustainable management and leadership training program for health managers at provincial and national level. This program will have a special emphasis on management and leadership of a comprehensive multi-sectoral HIV/AIDS plan. This program will not only focus on training using various training methods including in-service training but also on mentoring of trainees.

ACTIVITY 3: HRH Research

CDC will fund an HRH person at the director level at the NDOH HRH unit to lead HRH research to inform policy and assess the impact of policy for HR within the health sector. This person will coordinate HRH research, prepare protocols for research, coordinate the dissemination of results and assess the impact on policy. S/he will also make policy recommendations based on research findings and develop HRH indicators to monitor progress and impact of the national HRH plan.

Activity Narrative: ACTIVITY UNCHANGED FROM FY 2008

SUMMARY:

Funding is set aside by USAID under 'To Be Determined - HCD' to address task-shifting within the health care system with a special focus on primary health care personnel especially nurses, auxiliary staff and lay health-care workers.

BACKGROUND AND ACTIVITIES:

Task-shifting within primary health care settings and from specialized health workers to lay and community health workers is one human resources for health strategy that can increase the pool of health workers in countries with limited human resource for health capacity. Task-shifting creates both job opportunities and a bridge to the community, complements but does not replace health professionals, and allows for the greater involvement of people living with HIV/AIDS. PEPFAR partners should use lay and community health workers within the context of a system that ensures proper support and supervision, and that is integrated into the overall public and private health system. Partners will be able to enhance quality of care through standardization of competencies and tasks, initial training and periodic retraining, and support through supervision and teamwork.

The South Africa PEPFAR Task Force has already engaged in three successful inter-agency Annual Program Statement (APS) processes. Through these, the current approximately 120 prime partners and over 200 sub-partners are funded to provide prevention, care and treatment services. The APS involves a rigorous review process, and review panels include staff from the US Government (USG) and South African Government. Applications are reviewed in two phases, with an initial proposal review (eight pages), and then a full proposal (30 pages) review to finally select organizations to be funded. The final selection process is overseen by senior USG staff, including the Ambassador. The HCD TBD funds will be utilized for a new call for proposals through an interagency Annual Program Statement (APS) which will encourage, local regional and international organizations to submit proposals to conduct: (1) assessment of tasks performed by a variety of health care practitioners (doctors, nurses, pharmacists and lay or community workers) at primary health care levels comparing this with the current prescribed scope of practice for these categories and the need/demand within the health care system; (2) and make recommendations for other categories/levels of health care workers with a prescribed scope of practice; and (3) link into pre-service training institutions and development/updates of pre-service medical and nursing curriculums focused on new cadres and preceptor programs. This activity will be carried out in collaboration with the NDOH and the professional councils with a special focus on the nursing services since they bear the brunt of burden. This work will also include the development of job descriptions and job competency requirements for all cadres of health care workers in the health system that can feed into work at a national and provincial level with Human Resource Information Systems. Outcomes of this work may feed into agreements on job competencies between NDOH and NDOE and sharing of curricula to non-profit, government and private sector as well as increasing support for national strategies with innovative approaches to motivate and retain health care workers.

Activity ID: 23902.09

Planned Funds: \$2,912,714

Activity System ID: 23902

Activity Narrative: SUMMARY:

ACTIVITY 1: Clinical Associates Program

This program is a foundation for building sustainable services and other interventions. The South Africa national Department of Health, in joint collaboration with three South African universities (Pretoria, Walter Sisulu and Witwatersrand), has adopted the training of clinical associates which is a new three-year degree program to address the human resource crisis in health care. The proposed program is meant for hiring of trainers and to train the new cadre of healthcare providers that will provide support for the doctors and nurses and relieve them to carry out more specialized care.

ACTIVITY 2: Youth and HIV Prevention

The NDOH has ongoing efforts to promote abstinence and being faithful strategies amongst youth in the country. This is done in joint collaboration with NGOs that render HIV/ AIDS prevention through abstinence and being faithful messages.

ACTIVITY 3: Health Systems Strengthening

The NDOH plans to strengthen the entire health system. This involves strengthening human resources through workforce planning and rationalization. The human resources information systems improvement approach aims to manage the public health workforce by addressing information deficiencies and inaccuracies. The human resources management approach sets policies and procedures to minimize ineffective human resource management systems that demoralize health workers and stand in the way of producing desired results. These approaches will develop more supportive work environments by strengthening human resource competencies and managing facilities more effectively to improve productivity and better service delivery. They address worker shortages that are due to high staff turnover, high mobility, low worker retention, skill mix imbalances, uneven distribution, and HIV/AIDS morbidity and mortality among health workers. These processes also involve the improvement in health information systems through alignment with the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011. The plan is to allocate adequate capacity (human resource and financial) and to develop and implement effective workforce recruitment, training and retention strategies to ensure improved health service delivery and improved health information systems.

Activity ID: 23588.09

Activity System ID: 23588

Program Area: Health Systems Strengthening

Program Budget Code: 18

Planned Funds: \$368,944

Activity Narrative: SUMMARY:

McCord Hospital (MH) and Zoe-Life (ZL) plan to leverage lessons learned, networking and internal experiences to inform and strengthen the capacity of the South African government as well as leverage other learning opportunities for non-governmental organization (NGO) service providers, to more effectively provide increasing access to quality care and treatment services for adults and children. This will be achieved through advocacy, management and leadership strengthening; human resource strengthening, (supportive supervision, blended learning, quality assurance, and training); and organizational development at the levels of local government (eThekweni Municipality-eTM), district Department of Health (DDOH) and provincial Department of Health (PDOH). This strategy capitalizes on the strong relationships built over time at each level of influence.

BACKGROUND:

South Africa has emerged as a fledgling democracy in the wake of an explosive epidemic. Systems and structures required to support this epidemic are still under reconstruction post-apartheid, and are dependant on fully functional organizations with specialized human resource expertise to drive a consolidated and efficient response to HIV/AIDS. The reality of the health system is that at no level is it able to contain or manage the epidemic. Not from an infrastructural, organizational, human resource or political perspective. In order to provide contained and effective management of patients within a crumbling reforming health system, considerable planning, effort and resource is required to stabilize and equip the health system to provide all the supporting and systemic services required to manage the epidemic. With a skills shortage at all levels and financial and infrastructural constraints, it is important to capitalize on lessons learned, both in the practical implementation of HIV programs and in other sectors that enable the health system and the fragile state of human resources to remain intact and retain expertise into the future. This addresses the critical question of sustainability of services, particularly with respect to the systems and staff required to manage ever increasing numbers of HIV-infected patients entering the health system.

MH has a long history of service within KwaZulu-Natal (KZN) province, and has strong relationships with many organizations and facilities providing services. These relationships and shared learning between organizations will be harnessed. ZL has a strong innovative and implementation background, which drives the desire to do things better, to improve or change systems, and to innovate solutions to the many challenges of HIV care. ZL believes that sharing best practices, improving skills and strengthening systems happens most effectively in an environment of strong relationships, ongoing support, and practical technical assistance and training. In addition, ZL believes in setting service and performance standards which are achievable and that can be monitored for the purposes of ongoing improvements.

In FY 2009, ZL/MH will continue to build on the foundations of good relationships, shared learning, innovation, blended learning and performance appraisal to find the interventions, tools, skills and resources that will make the biggest impact to service delivery at the organizational, facility, and community levels, as well as at the level of defining strategic policy.

ACTIVITIES AND EXPECTED RESULTS:

ZL/MH will carry out eight separate activities in this program area.

ACTIVITY 1: Advocacy

There are multiple levels of advocacy required which have been highlighted in each activity area. These include pharmacy (discrepancies between pharmacy and nursing responsibilities with regard to dispensing of drugs at the primary health level), counseling and testing (counselors being able to perform finger pricking), human resource and sustainability (task shifting, provision of human resources by provincial Department of Health to eThekweni municipality to support HIV services at sites). ZL/MH will work closely with the provincial and district units as well as the eThekweni municipality and other stakeholders to assist with this aspect of health systems strengthening.

ACTIVITY 2: NGO Organizational Development:

ZL will engage with local and international organizations to assist the PEPFAR funded NGOs to strengthen their leadership and management capacity and build sustainability. ZL will work with the NGOs on a three-year sustainability plan which will include financial and human resource sustainability as well as service sustainability. This will be achieved through providing tools, skills training (HR, management, fundraising, financial management) as well as facilitating linkages with potential supporters and sponsors. Currently relationships are being built with SANGONET and Frank Julie, who are leading organizational development specialists in South Africa, as well as ukuZwana Project Management Solutions.

ACTIVITY 3: Management and Leadership Strengthening

ZL will focus on relationship building at the management level within the eTM, district and provincial health departments to ensure credibility. ZL will explore partnerships with organizations that provide management, leadership support and training in order to leverage expertise to support leadership and management through mentorship or training. Relationships are being established with Willowcreek and ukuZwana Project Management Solutions, which will start to input in this area. The ZL training department will provide at least one training opportunity in FY 2009 to eTM, district or provincial managers in collaboration with external organizations. In addition, ZL will provide at least one training opportunity in teamwork and management to all clinic and NGO leadership.

ACTIVITY 4: Human Resource Strengthening

During FY 2008 and FY 2009 ZL will continue the process of defining an expanded scope of practice of

Activity Narrative: healthcare workers (HCWs). This will start with HIV counselors and counselor-mentors and will extend to enrolled nurses and community workers involved in HIV care. It will also include data capturers to support career progression in the M&E field. This process will entail clear job progression and understanding the expanded scope of practice, which includes task shifting.

ACTIVITY 5: Blended Learning

ZL recognizes the impracticality of traditional training with regard to HIV care and management. In order to implement effective programs, training cannot occur as a once-off event. Training must be linked with specific site needs and must be driven by the particular goals of service implementation, available human resources, and individual training needs. Training must include regular implementation support and must include integrated and practical components of M&E and management and change methodology. Whilst ongoing training and onsite support is so vital, human capacity is limited. As a sustainability and resource management priority, ZL will develop the concept of blended learning at four sites and attempt to source funding for development and implementation. If funding allows, interactive materials will be developed for use by all HCWs at sites. Training will be initiated with a short didactic component, which will also include the use of the onsite training approach. Each site will be provided with a computer in a cubicle. Training will be provided on a DVD. HCWs will be able to go through modules on site. Pre- and post-module questionnaires can be completed onsite and stored on the computer for retrieval and analysis by ZL data supporters. A training data base will be developed to monitor progress and inform support requirements. Sites have the option of requesting specific support, and the ZL training team will be able to ascertain whether this support can be offered via interactive onsite training modules, or requires a visit by a technical support staff member. ZL will seek professional collaborations with institutions that have used blended learning in order to share best practices. In this way, ZL seeks to minimize time away from work and maximize the impact of onsite training, which should not be focusing on transfer of information, but on supportive supervision and practical skills strengthening.

ACTIVITY 6: Quality Assurance/Psychosocial Support Services

Linked to human resource strengthening as described above, ZL will start the process of developing clear standard operating procedures and standards relating to service quality, with particular attention paid to psychosocial services within the clinic and NGO environment. KZN province currently employs more than 2,500 HIV counselors. Most of the services provided by the lay counselors have no standard operating procedures or service standards. Neither the quality of services provided, nor the program outcomes are currently measured, due to lack of standards and operating procedures. Counselor-mentors employed to mentor and supervise onsite counselors have no guiding protocols or tools to make their work meaningful. ZL has considerable expertise and experience in the provision of comprehensive psychosocial support services, and will begin to develop standards and tools to measure and improve services and to assess the productivity of counselors and the effectiveness of the program. It will also guide the processes of supportive supervision by counselor-mentors.

ACTIVITY 7: Supportive Supervision and Mentorship

The concepts of mentorship and supportive supervision are not commonly understood in the South African public health environment, nor are the benefits of this approach accepted. In FY 2007, ZL started internal use of this system and has found that ZL staff struggle with the concepts. This is due to both lack of exposure as well as lack of skills. In FY 2009, ZL will collaborate to develop a locally appropriate training resource to develop skills and tools in supportive supervision and mentorship. This will be piloted internally and with participating municipal clinic supervisors. ZL will work closely with the provincial HIV/AIDS/STI/TB (HAST) unit and district mentors to ensure buy-in and practical input during this process. ZL will advocate for DOH budget to be allocated to training of all District Mentors once the resource has been developed.

ACTIVITY 8: Workplace Wellness

- HIV Human Resources (HR) Policy: A representative proportion of ZL staff is HIV-infected. ZL has grappled with the HR inefficiencies that do not allow for HIV-infected workers with low CD4 counts to prioritize health seeking without losing sick and annual leave benefits. ZL will explore ways to improve HR policy around management of HIV-infected staff with low CD4 counts to maximize employees' health improvement rate without compromising productivity. This is a huge issue within the workplace environment that requires urgent revision at a policy level. ZL will develop and implement an internal policy which can be used as a pilot to inform legislation and companies seeking advice as part of the PEPFAR-funded workplace program.
- Compassion Fatigue: In FY 2007 ZL began to look at baseline assessments with regard to compassion fatigue in the clinics. In FY 2009 ZL will begin to develop interventions to address compassion fatigue and will assess their success based on the baseline assessments. This will then serve as the basis for further implementation in FY 2010.
- Quality Assurance and Career Progression Psychosocial Support Services: Once standards have been developed for all psychosocial support services, ZL will develop an outcomes-based accredited curriculum for counselors which will be accredited by the Council for Higher Education and provide an entry into an undergraduate degree related to HIV. The modules will be developed to be integrated into the first year subjects of either a degree in social work, psychology or education. This is a retention and integration strategy and would ensure that if counselors left their posts to study further, that they would enter another career with a strong HIV service background which would enhance the cross-cutting integration of HIV support.
- Supportive Supervision and Mentorship: After piloting a training resource and tools, ZL will advocate for training to be provided to all KZN District Mentors and Mentor coordinators. ZL will also seek additional funding to ensure that this takes place.
- Blended Learning: ZL will continue to seek opportunities, collaborations and funding to develop the critical strategy of blended learning and to pilot this in a variety of settings.
- Workplace Wellness: Based on the results of the internal HR HIV policy, ZL will share lessons learned

Activity Narrative: and, if appropriate, engage in policy revision activities with relevant stakeholders.

All ZL activities will integrate gender by encouraging men to be responsible in child rearing and to respect women. This will come through all trainings, particularly those focusing on leadership and management, as well as in supportive mentorship messages. Workplace wellness activities will integrate gender by placing special attention on women with children who need to access care and treatment services.

These activities contribute to the overall PEPFAR 2-7-10 goals through strengthening the health system and the human resource element to provide quality health care management for individuals on treatment, to avert infections and to provide services for people in care.

Activity System ID: 23616

Activity Narrative: SUMMARY:

The Reproductive Health Research Unit (RHRU) will continue to provide technical assistance to the South African government for policy development and program planning in HIV; reproductive health; and tuberculosis (TB).

BACKGROUND:

RHRU, a unit of the University of the Witwatersrand in Johannesburg, currently provides technical support to the Operational Plan for Comprehensive HIV and AIDS Care, Management and Treatment for South Africa, which includes the national antiretroviral (ARV) roll-out. Through PEPFAR funding since FY 2004, RHRU has provided regular on-site support, direct treatment, training and quality improvement to National Department of Health (NDOH) sites in three provinces. RHRU will continue these activities, and will continue both an inner-city program (Johannesburg) and a district-wide program (Durban), focusing on providing support to complete up and down treatment referral networks. In addition, RHRU will continue the provision of counseling and testing (CT), palliative care and prevention services. RHRU will seek to develop models of service delivery that can be replicated and expanded, and produces findings from lessons learned and targeted evaluations to disseminate and share with others. It should be noted that the success of antiretroviral treatment (ART) scale-up depends on the comprehensive approach detailed in other program areas. In particular, the strengthening of referrals from other primary healthcare programs such as TB, family planning, antenatal/postnatal and sexually transmitted infection (STI) services is critical. RHRU views prevention as an integral part of this system and will focus its prevention program on high-risk groups such as commercial sex workers and their clients, and people infected with HIV. Its prevention program will also focus on reducing mother-to-child transmission (MTCT) and building the capacity of healthcare workers, community-based organizations (CBOs) and NGOs with which it works. In addition, RHRU will continue to develop strategies to address underserved communities affected by HIV, such as couples (both concordant and discordant); high risk groups, such as young people; and will employ gender-based interventions with women at risk, and commercial sex workers, and men.

ACTIVITIES AND EXPECTED RESULTS:

RHRU will carry out the following two separate activities in this program area.

ACTIVITY 1: File Audits

RHRU has developed systems for the analysis and accurate reporting of indicator data to district and provincial health departments. A key strategy here is the use of systematic retrospective patient file reviews to provide evidence on the quality of care and treatment outcomes at ARV initiation sites. To-date files of all patients accessing care at five hospitals/clinics (urban and rural) were reviewed and key information was collected including demographic data, gender breakdown, CD4 and viral load at initiation and current patient status. Data related to opportunistic infections, regimen changes and the causes thereof are documented and analyzed. The findings have identified key areas in need of program improvement, and have been used as baseline information to initiate defaulter tracing programs. They have also improved data systems and quality of care at various sites.

Comprehensive findings are presented to appropriate NDOH staff and joint implementation plans for improvement in quality of care are developed. This is a time and labor intensive activity with a further challenge being the need to conduct reviews outside of site operation times. RHRU will conduct three file audits at selected sites across our areas of operation.

ACTIVITY 2: Task-Shifting Models

RHRU will roll out a NDOH-approved task-shifting model and will evaluate how well it is being implemented. These activities include nurse initiated ART at PHC sites and use of counselors for HIV and TB case finding. The implementation of standard operating procedures (SOPs) and guidelines for decentralizing and integrating HIV care and related training of health providers and health management is key to successful, comprehensive task-shifting programs. RHRU will provide training and dissemination of good practice and lessons learned in this regard.

Performance Assessment

USG Agency: HHS/Centers for Disease
Control & Prevention

Program Area: Health Systems Strengthening

Program Budget Code: 18

Planned Funds: \$2,912,714

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

This contract has recently been awarded to Khulisa Management Services. Implementation has not yet commenced but activities are expected to remain the same in FY 2009.

SUMMARY:

The Quality Monitoring and Assessment Program (QMAP) is a new activity for FY 2008, and was added in response to the additional funding made available to South Africa for this fiscal year. The purpose of the activity is to assess performance in adherence to USG and agency-specific policies and guidance; administrative and financial practices and procedures; evidence-based sound clinical care and management; evidence-based, sound interventions at the community level; and the policy and practice of partners in providing support services through on-site visits and consultation. The QMAP is not an individual partner quality improvement program. These on site monitoring assessments will provide Activity Managers (AM) with information to identify challenges to partner implementation and ensure that PEPFAR funds are maximized in promoting evidence-based and quality programming under each program area. Since 2004, the South Africa PEPFAR team has experienced rapid growth of the HIV and AIDS prevention, care and treatment programs from over \$8 million in FY 2005 to an anticipation of almost \$600 million in FY 2008. Management and Staffing has not proportionately increased in an effort to apply the bulk of funds into program areas. AMs from the larger agencies (USAID and CDC) have responsibility for upwards of 25 partners and fiduciary responsibility for as much as \$15 million. Given the increase in resources, the ratio of staff to partners or dollars will grow in FY 2008 despite new recruitment. The PEPFAR Task Force and partners utilize several approaches that aim to monitor partner performance. Quarterly and bi-yearly reports with follow-up; interim progress reports; partner meetings; and requested budget draw-downs are examples that are currently in use. On-site visits to partners and subs funded through PEPFAR are rare due to the heavy and growing workload of AM. In FY 2008, the PEPFAR Task Force agreed to prioritize site visits for the purpose of monitoring quality and assessing performance. This activity is considered an essential aspect of strategy development under the PEPFAR reauthorization.

The following activities are to be included:

ACTIVITY 1: Establishment of a QMAP Leadership Team to determine the goals and objectives of the program

The team membership should consist of South Africa Government (SAG) and appropriate Agency representatives (technical leads and/or AM). A contractor will be named to carry out the tasks. The leadership team will collaboratively develop the goals and objectives for the QMAP in each technical and administrative area. The scope of work for the contract will be developed and bid in limited competition so as to restrict competition to include only bidders from South Africa-based organizations.

ACTIVITY 2: Review of existing tools

In conjunction with the SAG, USG and PEPFAR partners will carry out a review of currently existing assessment and performance monitoring tools for healthcare settings. Current PEPFAR partners and international agencies have developed, piloted, and implemented assessment and monitoring tools that may be modified for this program. It is important to evaluate those already existing tools to minimize duplication of effort. Appropriate tools developed by other countries will be included in this review. In addition, in conjunction with the SAG, PEPFAR will develop new tools to monitor performance in any areas where appropriate tools have not yet been developed.

ACTIVITY 3: Site visits

After development and validation of the QMAP tools, the QMAP Leadership Team will collaboratively develop a calendar to visit sites of PEPFAR partners. The intent is to conduct site visits and implement the QMAP for 70% of partners in the first year. A partner review may include, but will not be limited to a file review; on-site interview of leadership and staff; on site review of administrative, financial, clinical and support services (in a clinical setting); review of curricula, plans and observation of activities (in a community setting); focus group interviews with clients who are receiving services; and each partner will conduct a follow-up consultation to provide appropriate technical assistance or modify program activity as needed. SAG involvement will ensure buy-in and strengthen a sustainable health care system for persons affected with HIV and AIDS.

Activity System ID: 23687

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Human Resources and Services Administration (HRSA) agreement with Georgetown University is ending so HRSA will re-compete this activity.

SUMMARY:

Nurses SOAR! (formerly known as the Global HIV and AIDS Nursing Capacity Building Program), is an ongoing three year program to strengthen the leadership, education and clinical capacity of nurses to provide HIV and AIDS services to those infected, or affected by, HIV and AIDS. Nurses SOAR! works in close partnership with Ministries of Health and other stakeholders and PEPFAR in-country teams. The program is currently active in South Africa and Lesotho. Scale-up to Swaziland is expected in FY 2008.

BACKGROUND:

Needs assessments during FY 2007 in South Africa with in-country nurses, other stakeholders and partners strongly directed this program to initially focus its work in KwaZulu-Natal (KZN) province. Additionally, the need for nursing curricula and national standards for South African nurses caring for persons with HIV and AIDS led to initiating collaborative activities with the South African Nursing Council (SANC), the Universities of KZN and Zululand, and in-country/region organizations (some PEPFAR supported). Nurses SOAR! is active with national partners (such as the SA-based Foundation for Professional Development - FPD, and SADC AIDS Network of Nurses and Midwives - SANNAM). The Anglican Diocese of Johannesburg has engaged Nurses SOAR! to capacity build for VCT and ARV delivery; these activities will maximize collaboration with PEPFAR partners and provide opportunities for Nurses SOAR! to scale-up nationally. During FY 2008 and 2009, Nurses SOAR! will continue to build capacity within national nursing entities while strengthening regional nurse capacity in KZN, Lesotho and Swaziland.

ACTIVITIES AND EXPECTED RESULTS:

ACTIVITY 1: Needs Assessment

After permission to be active in-country was gained in January 2007, a comprehensive needs assessment of the capacity to provide HIV and AIDS nursing leadership, clinical care, and education was the initial activity completed at each selected site. These data provided specific priorities for HIV and AIDS nursing capacity building activities (at pre-service and in-service levels) to improve the HIV and AIDS prevention, care, and treatment for South Africans. During FY 2007, 10 nurse faculty, 10 nurse managers, 50 clinical nurses and approximately 30 other stakeholders (e.g., SANC leaders) were engaged in the process (over 20 organizations involved). In FY 2008 and FY 2009, needs assessment data will be collected at each additional program site to guide training plan development. Activities 2 and 3 address the findings of the needs assessment.

ACTIVITY 2: Capacity Development by Systems Strengthening

This activity consists of four components: i) Leadership activities have been designed to develop a critical mass of nurse leaders who can provide leadership in the AIDS pandemic and bring voice to the profession that highlights the nursing contributions to the African response. The program mentors a cadre of nurses committed to HIV and AIDS care, developing and implementing individualized plans for professional leadership development. Activities focus on communication, policy development, and strategic planning for the delivery of HIV and AIDS services (improving outcomes of care at the local, national, and regional levels). Nurses SOAR! engaged others working in this area (see activity 3). Currently, Nurses SOAR! is working with 20 nurses at all professional levels. In FY 2008, the cadre will increase to approximately 40 nurses, and in FY 2009, to approximately 70 nurse leaders.ii) Education: this component a) enhances efforts to integrate HIV and AIDS educational content into the local and national nursing curricula; and b) builds the HIV and AIDS knowledge base of clinical nurses and nurse tutors building on prior activities by partners (e.g. Foundation for Professional Development - FPD). Activities included a) didactic HIV/AIDS trainings; b) inserting HIV and AIDS content into nursing curricula, classroom instruction, and clinical education (at colleges and universities); c) collaborating with the SANC to integrate nursing standards into pre-service training and post basic education in HIV and AIDS prevention, care, and treatment. In FY 2007, approximately 150 nurses or nurses in training received such support. In FY 2008, this will increase to 400, and Nurses SOAR will support the scholarly development of nursing faculty to increase their contribution to the South African HIV and AIDS literature. South African nursing faculty expressed a need for support in conducting their research. Finally, great interest was shown by the SANC to incorporate HIV and AIDS into the national curricula. However, due to managerial changes at the Council, efforts have been slowed. Efforts will be made in FY 2008 to accelerate the integration of HIV and AIDS content into pre-service education, and in FY 2009 to consider the development of a post-basic education for primary care nurses and effective evaluation of nurse competencies. iii) Mentoring: Nurses SOAR! utilized clinical nurse experts from Southern Africa and North America to serve as mentors that provided targeted on-site clinical precepting. Nurses, nurse tutors and the nurse tutor/student dyad were mentored in the application of didactic knowledge to real life clinical settings to improve delivery and outcomes of nursing care. Activities included working one-on-one with the clinical nurses and the nurse tutors/dyads in their work settings. In FY 2007, approximately 20 nurses were mentored. In FY 2008 and FY 2009, the number of nurses engaged in the program will significantly increase. iv) Nurse Retention: Nurses SOAR! also focused on building nursing capacity by addressing the health and well-being of current and future nurses. Activities included reducing nurse morbidity from exposure to AIDS-related multiple loss and grief by conducting uniquely designed Loss & Grief retreats. Local religious and spiritual leaders were engaged to build a sustainable program to address the continued burden of grief and multiple loss issues of nurses that contributes to nurse burnout and migration. The program also supports HIV-infected nurses to encourage their access to appropriate support, care and treatment. Maintaining the health and wellbeing of nurses requires the reduction of stigma and establishing a confidential support system. Nurses SOAR! has engaged 29 nurses in the Loss & Grief

Activity Narrative: program; it is expected that 150 nurses will participate in FY 2008 and 250 nurses in FY 2009.

ACTIVITY 3: Capacity Development by Partnership and Network Development

The Program facilitates partnerships, collaborative systems, networks, and resources that build and sustain a nursing workforce to meet the increasing need for nurses to deliver quality HIV and AIDS prevention, care, and treatment services. The Georgetown team, and its partners the US Association of Nurses in AIDS Care (ANAC) and the University of Incarnate Word (UIW), collaborate with key stakeholders such as SANC, SANNAM, the Universities of KZN and Zululand, and other partners currently working in nurse development such FPD. These relationships assure that the Nurses SOAR! Program is an 'additive' program, filling high-priority gaps in nurse capacity building and strengthening networks by a) facilitating the creation of a professional network of nurses who deliver HIV and AIDS services; b) establishing a train-the-trainer (TOT) network to provide on-going HIV and AIDS clinical mentoring for all levels of nursing; c) fostering focused professional development and d) facilitating collegial relationships between nurse leaders, clinicians, educators, and nurse mentors to enhance the quality of HIV and AIDS care.

FY 2008 COP activities will be expanded to include: down referral clinical sites that feed into the St Mary's Hospital site (Mariannhill); nurse training support to the nurses delivering HIV and AIDS prevention, care, and treatment services in the Mtubatuba rural area in KZN and in northern KZN (partner: Catholic Medical Mission Board); nurse training support to the nurses delivering HIV and AIDS prevention, care, and treatment services in Johannesburg (partner: the Anglican Bishop of Johannesburg); nursing association technical assistance services for South African professional nurses; building academic capacity building with nurse educators at the University of KZN to integrate HIV and AIDS content into graduate curricula, increase HIV and AIDS nursing research, and disseminate HIV and AIDS data; extending nurse leadership skills building to a second cadre of nurse leaders; increasing the caregiver support for HIV-infected nurses; and extending the clinical mentoring to develop nurse experts in palliative care, pediatric HIV and AIDS, and midwifery (including prevention of mother to child transmission).

Prevention: Although the program's main technical area is not 'prevention', its work very closely supports and facilitates increased prevention activities. The main prevention areas currently addressed are a) the occupational transmission of HIV in the clinical setting; b) the upgrading of tutors' knowledge, nursing curricula and effective teaching methods to assure that students integrate HIV prevention messages into their clinical practice and c) an emphasis of the role of all nurses in reinforcing prevention messages for vulnerable young adults (including tutor messages for nursing students).

Gender Issues: The Nurses SOAR! Program focuses on nurses, who are predominately female. The needs assessment data identified several training topics influenced by gender inequalities. Nurses requested training in empowering female nurses in professional interactions with male colleagues (e.g. usually female nurses and male physicians). They also requested strategies for including males in the "family-centered" provision of HIV and AIDS prevention, care and treatment services.

Activity ID: 24968.09

Planned Funds: \$194,181

Activity System ID: 24968

Activity Narrative: SUMMARY:

Jhpiego's activities support efforts by the national Department of Health (NDOH) to expand the Comprehensive HIV and AIDS Care, Management, and Treatment (CCMT) plan to ensure increased access to services in antiretroviral therapy (ART) and other forms of care. Jhpiego has provided technical assistance to the NDOH in increasing access to ART services through task shifting efforts focusing on Nurse Initiated and Managed ART (NIM-ART).

BACKGROUND:

Jhpiego has been working with the NDOH since 2004 to improve institutional capacity for implementation of the CCMT program through training and dissemination of national HIV and ART guidelines and through the placement of a Care & Treatment Technical Advisor to the NDOH. Through a separate funding mechanism, Jhpiego partnered with the Foundation for Professional Development (FPD), to initiate a Standards-Based Management and Recognition (SBM-R) approach for improving ART services. Under COP 2007, Jhpiego has supported the development of a practice directive of nurse initiated ART in public health facilities, a policy environment that will encourage a health care culture supportive of nurse-initiated and managed ART; a policy environment that will ensure that these front-line nurses have the training, funding, and ongoing support they require; and a strategy that ensures South African training institutions are strong partners in the efforts to achieve the targets set in the HIV & AIDS and STI Strategic Plan for South Africa, 2007-2011 (NSP). The NSP aims to increase the proportion of adults and children started on ART by nurses. Jhpiego will continue to implement these interventions aimed at improving access to quality HIV and AIDS service delivery.

ACTIVITIES AND EXPECTED RESULTS:

Jhpiego will carry out these three separate activities in this program area.

ACTIVITY 1: Continued support for the development of a policy framework and guidelines for NIM-ART centering on the dissemination of the NIM-ART policy guidelines to managers at national, provincial and district levels.

The dissemination entails detailed orientation to the guidelines and training on issues of SBM-R, an approach that ensures quality, efficiency and proficiency of service delivery. The ART SBM-R comprehensive tool has a total of 165 standards in ART Treatment Readiness in Adults; ART Treatment Commencement in Adults; Follow-up and Management of ART Complications in Adults; ART Treatment Readiness in Children; ART Treatment Commencement in Children; Follow-up and Management of Complications in Children; Laboratory; Pharmacy; Marketing; Information Education and Communication (IEC); Community Participation; Medical Records and Information Systems; Human and Physical Resources; Management System. ART SBM-R enhances the quality of ART management through assisting the facilities in setting their performance standards from the onset.

ACTIVITY 2: Implementation of NIM-ART

Jhpiego is currently piloting the SBM-R approach in five FPD-run facilities in Gauteng and North West provinces. With NDOH approval, Jhpiego will integrate SBM-R into NIM-ART roll-out to ensure adherence to treatment protocols, infection control measures and pharmacology vigilance. Jhpiego is already working with Limpopo, Northern Cape, North West, Eastern Cape and NDOH on site-readiness for accreditation of Primary Health Care (PHC) facilities. It is in the accredited facilities that NIM-ART will be implemented. Jhpiego will conduct two-day workshops for nursing schools; the Nursing Council; managers at national, provincial and district levels; and other key stakeholders in the implementation of a nurse-driven model for ART services. At the workshops the managers will gain more insight into task shifting and will outline the strategies they plan to use in the deployment of staff, especially given the enhanced role of nurses in initiating ART.

ACTIVITY 3: Technical Assistance in Institutional Capacity Building

Jhpiego will conduct more intense follow-up sessions with fourteen institutions to assist in a more strategic focus, such as line item budget development and developing plans for integrating NIM-ART guidelines into their specific organizational infrastructure. The plans would focus more on staff training and task re-orientation, drug procurement and budgetary issues critical to the implementation of the program. This activity will target institutions providing ART services, including provincial Departments of Health (PDOHs), the Department of Defense (DOD), correctional institutions and non-governmental organizations (NGOs). Jhpiego will work in consultation with NDOH in prioritizing the organizations for institutional capacity building. It is anticipated that Jhpiego's technical staff will be able to respond to requests at national and provincial levels to interpret and unpack the policy guidelines disseminated. For cost-effectiveness, Jhpiego will link this activity with the other components of ART2Scale up given that the activities target the same providers and managers.

New/Continuing Activity: New Activity

Continuing Activity:

The interagency team implemented a Staffing for Results exercise in July 2007 and is in the process of recruiting this staff. New positions were approved in last year's COP. The management committee is responsible for reviewing and addressing on-going staffing issues. Although the South Africa budget is likely to decrease over the next five years, staff needs will not diminish for a number of years, given the overall size of the portfolio. Historically, PEPFAR South Africa has very low administrative costs, with a ratio of management and staffing to overall country budget of 4%. This year, however, funds have provisionally been set aside by USAID and CDC for the purpose of obtaining new office space given critical building constraints, raising the ratio to 7% for the first time.

In FY 2008 the Country Team conducted the PEPFAR South Africa Interagency Partner Evaluation. Interagency panels reviewed the accomplishments to date and FY 2009 plans of all partners grouped by Program Area. Panel members included representatives of USG agencies, the South African government and headquarters-based technical working groups (in some cases by DVC and in other cases in person). For the sake of objectivity, activity managers did not participate in reviews of their own partners, except to answer questions. The PEPFAR team jointly drafted technical program considerations against which partners' plans were evaluated to ensure that proposed activities were aligned with USG and SAG priorities. The panels' recommendations led to significant modifications in the budget, and provided the basis to make the cuts needed for this year's overall country reduction. This was a highly successful activity and will be repeated in future years with a few minor modifications.

The South Africa PEPFAR Team has created management efficiencies through use of several interagency mechanisms. A major accomplishment in FY 2008 was the award of a contract for the monitoring and assessment of activities of PEPFAR sites throughout the country, in every technical area. This contract, in the process of being finalized, is managed by CDC, and will provide services to both CDC and USAID, and potentially other agencies working on PEPFAR. The end result will be improved quality at PEPFAR sites. Another efficient mechanism are the umbrella grants to organizations that provide grants management, and financial and technical assistance to local grantees, thereby reducing the government cost of additional employee salaries. Both CDC and USAID have developed these mechanisms.

State 00112759 requested missions to report best practices for interagency coordination. The PEPFAR South Africa Team considers itself to be overall a best practice in terms of interagency collaboration. All of the practices mentioned above contribute to our successful interagency collaboration. Other best practices include several joint interagency processes listed below. An interagency Annual Program Statement (APS) is used to select partners. To date, PEPFAR SA has conducted four solicitations for new partners through the USAID-let Annual Program Statement (APS). The CDC Procurements and Grants Office has agreed that this competitive solicitation can be used to also make awards for CDC. The announcement is developed and agreed upon by both agencies, applications are reviewed by all USG agencies and new awardees are selected and allocated to the most appropriate agency. This reduces the burden on USG staff to conduct multiple solicitations for new partners and ensures that new partners allocations are agreed upon by all USG agencies.

All PEPFAR partners report on the same indicators and in the same format on a quarterly, semi-annual and annual basis via a single web-based reporting system (Data Warehouse). USG staff have access to all partner reports. With over 130 partners reporting and more than 500 sites reporting ART data, this facilitates timely reporting of data and enables aggregated data analysis for program decision making.

In January 2008, the USG Strategic Information and Treatment teams conducted a joint assessment of ART patient monitoring systems (Interagency HMIS review). The objectives were to gain a better understanding of USG-funded systems, provide guidance to partners on issues such as system interoperability, and gather technical assistance needs from partners. A dissemination meeting was held in April 2008 to provide feedback to all USG partners on the results and recommendations from the assessment and to provide a forum for sharing of tools between all USG ART partners.

Every year, the USG PEPFAR team conducts joint Data Quality Assessments (DQA) on 12-14 PEPFAR partners to ensure that the data that are reported are valid and reliable. An external contractor, guided by the USG team, conducts these audits and uses standard tools and methods across all partners.

Finally, personal commitment on the part of all agency staff contributes to the well-functioning South African interagency process.

Table 3.3.19: Activities by Funding Mechanism

Mechanism ID: 10620.09	Mechanism: New Office Space Procurement Fund
Prime Partner: US Centers for Disease Control and Prevention	USG Agency: HHS/Centers for Disease Control & Prevention
Funding Source: GHCS (State)	Program Area: Management and Staffing
Budget Code: HVMS	Program Budget Code: 19
Activity ID: 24976.09	Planned Funds: \$0
Activity System ID: 24976	

Activity Narrative: These funds have been set aside to secure adequate secure space for the USG PEPFAR Team. Office space is a major challenge facing the interagency PEPFAR team and constrains the ability to provide responsible oversight and management of the programs. The move of USAID's Regional Southern Africa staff from Botswana to Pretoria has filled the existing USAID building to capacity. Offices are shared, with as many as four staff in one office space. New "Development Leadership Interns" will be stationed in South Africa and it is not clear how the building could be reconfigured to accommodate the new influx. At the same time, CDC's lease ends soon and thus CDC will need to move to new quarters. The Embassy annex will not be completed until 2013 and has seats for only 55 CDC staff. The Embassy currently is above the capacity for which it was planned. To address this situation, USAID and CDC are looking into the feasibility of co-locating in a new space and maximizing staff efficiency. Secretariat staff, currently based at the Embassy, could join the rest of the PEPFAR Team. One possibility is obtaining space on property adjacent to the USAID compound. Since security is a major issue in South Africa, this appears to be an appropriate solution. Discussions among State, USAID and HHS were on-going about whether it would be possible to lease or purchase the property at the time that the COP was being finalized. See Activity ID #24975.09 for the USAID Building Construction Fund entry.

Budget Code: HVMS	Program Budget Code: 19
Activity ID: 23897.09	Planned Funds: \$404,226
Activity System ID: 23897	
Activity Narrative: These funds partially support the management and staffing expenses of the HHS/CDC/South Africa office. The funds will cover ongoing and new staffing needs to provide technical, financial and contractual oversight of estimated 60 CDC partners implementing the PEPFAR program in South Africa. The total management and staffing budget for CDC is approximately \$11,000,000. Of this, just over half is charged to GHAI and the remainder is charged to the CDC/GAP base budget. Within the total budget, the cost of ICASS is estimated at \$538,235 and Capital Security Sharing is estimated at \$235,537, ITSO charges estimated at \$416,340. In FY 2008, the HHS/CDC/South Africa office was responsible for the obligation of about over \$220,889,321 in PEPFAR funding. In FY 2009, this amount will increase to roughly over \$204,082,145. CDC staff also has oversight responsibility for al most \$29,067,840 of Health Resources and Service Administration (HRSA) projects. Staff responsibilities include monitoring design, implementation, and evaluation of funded activities; providing technical direction and assistance to assure that activities are implemented in accordance with OGAC technical guidance; and working closely with in-country and international partners to assure synergy and avoid duplication. Staff participates actively in the Inter-Agency Task Force to design the overall comprehensive PEPFAR program that meets the needs of South Africa and OGAC. Moreover, HHS/CDC staff participates in Technical Working Groups (TWG) of the Task Force to coordinate all partners in a particular technical area to ensure complementary and synergistic activities. Staff is also regularly tasked to participate in ad hoc working groups to address specific issues as they arise.

Staff responsibilities include monitoring design, implementation, and evaluation of funded activities; providing technical direction and assistance to assure that activities are implemented in accordance with OGAC technical guidance; and working closely with in-country and international partners to assure synergy and avoid duplication. Staff participates actively in the Inter-Agency Task Force to design the overall comprehensive PEPFAR program that meets the needs of South Africa and OGAC. Moreover, HHS/CDC staff participates in Technical Working Groups (TWG) of the Task Force to coordinate all partners in a particular technical area to ensure complementary and synergistic activities. Staff is also regularly tasked to participate in ad hoc working groups to address specific issues as they arise.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAY:

CDC has contracted with Comforce to support nine staff positions. The budget includes salaries, travel, training, work permits and other benefits for non-personal service contractors providing direct technical support for activities and programs being funded through PEPFAR. These staff include Information Technology Specialist, Prevention Advisor, Medical Officer, Grants and Contract Specialist, Palliative Care Advisor; the Strategic Information Advisor; a Laboratory Advisor; and two consultants working with the National Institute for Communicable Diseases on the Field Epidemiology and Laboratory Training Program.

 CDC has contracted with Comforce to support four staff persons. The budget includes salaries, travel, training, work permits and other benefits for non-personal service contractors providing direct technical support for activities and programs being funded through PEPFAR. These staff include: one Palliative Care Advisor; the Strategic Information Advisor; a Laboratory Advisor; and a consultant working with the National Institute for Communicable Diseases on the Field Epidemiology and Laboratory Training Program.

USG Agency: Department of State / African Affairs

Funding Source: GHCS (State)

Program Area: Management and Staffing

Budget Code: HVMS

Program Budget Code: 19

Activity ID: 8481.22669.09

Planned Funds: \$220,000

Activity System ID: 22669

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The U.S. Ambassador's HIV/AIDS Community Grants Program in South Africa will use PEPFAR funds to continue to support South Africa's most promising small community and faith-based organizations making significant contributions to the fight against HIV and AIDS. The organizations will receive grants in the amount of \$10,000 and will enter a one-year contract with the USG. Major emphasis areas are commodity procurement and human resources. The activities target PLHIV and their families and caregivers, community volunteers, CBOs and FBOs.

The Community Grants program is managed in four locations: Embassy in Pretoria, Cape Town Consulate, Durban Consulate, and Johannesburg Consulate. Currently, the Coordinators in Pretoria, Cape Town and Johannesburg have job-sharing positions in place in which each individual works 20 hours per week and shares the responsibilities of a full-time Coordinator. The Durban Consulate has a full-time person working 35 hours per week. Due to the increase in program funding and administration, each location has also been allocated a part-time administrative assistant position working 16 hours per week.

The Embassy Community Grants Coordinator is responsible for administering grants in a particular geographic region and responsible for overall program coordination. This person is the liaison for the program to key stakeholders at State Dept, CDC and USAID.

The positions at the Consulate are each responsible for administering grants in a particular geographic region. They report to the Consul General.

The U.S. Ambassador's HIV/AIDS Community Grants Program will support approximately 1,250 caregivers, across 100 community- and faith-based organizations, with stipends as the result of FY08 PEPFAR funding.

Non-PEPFAR funded positions:

The POL Officer at the Embassy is the Grant Officer and facilitates the legal and technical matters with the grant agreements. This person oversees the overall management of the program.

An FSN, POL Assistant, works in Pretoria to assist with the grants. 50% of his time is devoted to helping manage this program.

POL Office Assistant provides some administrative support to this program. This person spends approximately 15% of her time in this role.

PEPFAR funded positions: The Small Grants Program in South Africa will use PEPFAR funds to continue to support South Africa's most promising small community and faith-based organizations (CBOs and FBOs) making significant contributions to the fight against HIV and AIDS. The organizations will receive grants in the amount of \$10,000 and will enter a one-year contract with the USG. Major emphasis areas are commodity procurement and human resources. The activities target PLHIV and their families and caregivers, community volunteers, CBOs and FBOs.

The Small Grants Program is managed in four locations: Embassy in Pretoria, Cape Town Consulate, Durban Consulate, and Johannesburg Consulate. Currently Cape Town, Durban and Johannesburg Consulates have half-time positions and Pretoria has had a full-time person (Embassy Small Grants Coordinator) since November 2006. Due to the increase in program funding and administration, Cape Town, Durban and Johannesburg Consulates will increase staffing hours so that there will be full-time positions at each location.

The Embassy Small Grants Coordinator is responsible for administering grants in a particular geographic region and responsible for overall program coordination. This person is the liaison for the program to key stakeholders at the State Department, CDC and USAID. The positions at the Consulate are each responsible for administering grants in a particular geographic region. They report to the Consul General.

Non-PEPFAR funded positions: The POL Officer at the Embassy is the Grant Officer and facilitates the legal and technical matters with the grant agreements. This person oversees the overall management of the program. An FSN, POL Assistant, works in Pretoria to assist with the grants. Fifty percent of his time is devoted to helping manage this program. The POL Office Assistant provides some administrative support to this program. This person spends approximately 15% of her time in this role.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

Additionally FY 2009 PEPFAR funding will support a Monitoring and Reporting Coordinator who is responsible for coordinating the collection of HIV/AIDS data. This entails training Peace Corps Volunteers (PCVs) in the use of a pilot Peace Corps Volunteer reporting Tool (VRT), which is a light-weight Excel worksheet, and ensuring that the data and narrative information is complete and accurate. At times, s/he may have to travel extensively, especially to assist Volunteers who do not have reliable Internet connection, to collect data using this as an opportunity to produce photographic records of HIV/AIDS activities in which Volunteers are involved. To support the M&R work in the field, a PEPFAR-funded driver is required.

PEPFAR funding supports (a) a full-time Peace Corps HIV/AIDS Program Assistant, who facilitates the HIV/AIDS training (b) a fulltime driver to support her in implementing the workshops that will be conducted on a quarterly or tri-annual basis for the PCVs (N=~150) and their counterparts (N=~150) in the five provinces where PCVs live and work and (c) by a fulltime PEPFAR/VAST Coordinator who will train PCVs and their counterparts in project design and management and project proposal writing and will be responsible for the initial screening of proposals, monitoring project implementation, reporting on project results, and liaising with the Task Force.

Activity ID: 3104.22712.09

Planned Funds: \$4,818,000

Activity System ID: 22712

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAY:

These funds partially support the management and staffing expenses of the HHS/CDC/South Africa office. The funds will cover ongoing and new staffing needs to provide technical, financial and contractual oversight of estimated 60 CDC partners implementing the PEPFAR program in South Africa. The total management and staffing budget for CDC is divided between the Global HIV/AIDS Initiative (GHA) and base so these funds represent almost half of the management and staffing budget. Within the total budget, the cost of International Cooperative Administrative Support Services (ICASS) is estimated at \$538,235, Capital Security Sharing is estimated at \$235,537, and Information Technology Services Office (ITSO) charges are estimated at \$416,340. In FY 2008, the HHS/CDC/South Africa office was responsible for the obligation of over \$220,889,321 in PEPFAR funding. In FY 2009, this amount will increase to more than \$204,082,145. CDC staff also has oversight responsibility for almost \$29,067,840 of Health Resources and Service Administration (HRSA) projects. Staff responsibilities include providing program monitoring, design, implementation, and evaluation of funded activities; providing technical direction and assistance to assure that activities are implemented in accordance with Office of Global AIDS Coordinator (OGAC) technical guidance; and working closely with in-country and international partners to assure synergy and avoid duplication. Staff participates actively in the Inter-Agency PEPFAR Team to design the overall comprehensive PEPFAR program that meets the needs of South Africa and OGAC. Moreover, HHS/CDC staff participates in Technical Working Groups of the PEPFAR Team to coordinate all partners in a particular technical area to ensure complementary and synergistic activities. Staff is also regularly tasked to participate in ad hoc working groups to address specific issues as they arise.

These funds partially support the management and staffing expenses of the HHS/CDC/South Africa office. The funds will cover ongoing and new staffing needs to provide technical, financial and contractual oversight of over 52 CDC partners implementing the PEPFAR program in South Africa. The total management and staffing budget for CDC is divided between GHA and base so these funds represent almost half of the management and staffing budget. Within the total budget, the cost of ICASS is estimated at \$538,235 and Capital Security Sharing is estimated at \$235,537. In FY 2007, the HHS/CDC/South Africa office was responsible for the obligation of over \$140,000,000 in PEPFAR funding. In FY 2008, this amount will increase to over \$220,000,000. CDC staff also has oversight responsibility for almost \$30,000,000 of Health Resources and Service Administration (HRSA) projects. Staff responsibilities include program monitoring, design, implementation, and evaluation of funded activities; providing technical direction and assistance to assure that activities are implemented in accordance with OGAC technical guidance; and working closely with in-country and international partners to assure synergy and avoid duplication. Staff participate actively in the Inter-Agency Task Force to design the overall comprehensive PEPFAR program that meets the needs of South Africa and OGAC. Moreover, HHS/CDC staff participate in Technical Working Groups (TWG) of the Task Force that work to coordinate all partners in a particular technical area to ensure complementary and synergistic activities. Staff is also regularly tasked to participate in ad hoc working groups to address specific issues as they arise.

Program Budget Code: 19

Activity ID: 24975.09

Planned Funds: \$0

Activity System ID: 24975

Activity Narrative: These funds have been set aside to secure adequate secure space for the USG PEPFAR Team. Office space is a major challenge facing the interagency PEPFAR team and constrains the ability to provide responsible oversight and management of the programs. The move of USAID's Regional Southern Africa staff from Botswana to Pretoria has filled the existing USAID building to capacity. Offices are shared, with as many as four staff in one office space. New "Development Leadership Interns" will be stationed in South Africa and it is not clear how the building could be reconfigured to accommodate the new influx. At the same time, CDC's lease ends soon and thus CDC will need to move to new quarters. The Embassy annex will not be completed until 2013 and has seats for only 55 CDC staff. The Embassy currently is above the capacity for which it was planned. To address this situation, USAID and CDC are looking into the feasibility of co-locating in a new space and maximizing staff efficiency. Secretariat staff, currently based at the Embassy, could join the rest of the PEPFAR Team. One possibility is obtaining space on property adjacent to the USAID compound. Since security is a major issue in South Africa, this appears to be an appropriate solution. Discussions among State, USAID and HHS were on-going about whether it would be possible to lease or purchase the property at the time that the COP was being finalized. See Activity ID #24976.09 for the CDC Building Construction Fund entry.

Activity ID: 3120.22781.09

Planned Funds: \$8,853,227

Activity System ID: 22781

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

These funds support the management and staffing expenses of USAID/South Africa (USAID). The funds cover the costs of ongoing and new staff who provide technical, financial and contractual oversight of over 68 USAID partners implementing the PEPFAR program in South Africa. The total USAID PEPFAR management and staffing budget is \$12,866,206 including ICASS estimated at \$120,000 and the IRM tax which is estimated at \$135,000. In FY 2008, USAID was responsible for the obligation and management of over \$332 million in GHAI funds. In FY 2009 this amount will fall to approximately \$316 million. Recruitment for staff identified in the 2007 Staffing for Results exercise is on-going and many positions are close to being filled; by the time this COP is reviewed it is anticipated that all but two will be filled. Of the new staff, three will be overseas hires and the rest locally employed staff.

The USAID Health Office comprises three divisions: (1) Care and Treatment, (2) Prevention and OVC, and (3) Cross Cutting (SI, HCD and others). Including the new hires, the Health Office staff will include approximately 26 professionals and eight administrative and project assistants. As of September 2008, 15 professional were on-board, managing an average \$25 million each. When recruitment is completed, the 26 professionals will manage an average of \$14 million each. While this dollar-to-staff ratio will still be relatively high, the country team has developed innovative mechanisms to strengthen management and oversight that has proven successful through the last year of implementation of the Umbrella Grants Management mechanisms and the new South African partner assessment contract, which is managed by CDC and serves both agencies.

USAID, under PEPFAR, is also placing staff in several locations outside of Pretoria. PEPFAR coordinators will be placed in the consulates in Durban and in Cape Town. Provincial PEPFAR coordinators will also be placed in the provinces in South Africa. The decision to locate this staff provincially was made last year in the Staffing for Results exercise, and approved in the 07 COP. However, at a meeting with all provinces held in June, national level officers of the Department of Health asked for this placement to be delayed until a national coordinator was hired (under a CDC contract). It is anticipated that the national coordinator will be on-board soon and provincial coordinators will be recruited after that.

The Umbrella Grants Management agreement was designed at the beginning of PEPFAR to manage new and small partners. In FY 2007, the Umbrella Grants Management component was re-competed and four separate awards made to organizations to provide financial and administrative guidance and support to 35 small organizations, thereby reducing USAID's management burden. Umbrella Grants Management has been an effective mechanism to assist the USAID PEPFAR team in the mandate to increase new partners and build capacity but with limited staff to provide responsible oversight and technical direction. Funding for the umbrella grants element is included in the individual program areas.

Following negotiations with Washington, USAID is now supporting salaries of ten USDH in the South Africa mission with PEPFAR program funding. These include: three Health Officers; one Program Officer; one Contracting Officer; one Legal Advisor; one Controller; one Contracting Officer; and one Executive Officer. PEPFAR also covers the salaries of support staff in all these offices, as outlined in the staffing data base. Overall PEPFAR is supporting salaries of 58 staff in the USAID mission.

The South African government is undergoing dramatic change and USG staffing needs are also changing. As mentioned elsewhere, after President Mbeki's departure in the fall of 2008, an interim president and minister of health were named. It is unknown whether the new minister will be in the position over the long term. The South Africa PEPFAR team will develop a Compact with the South African government after the new government is in place, which takes into account the expectation that PEPFAR budget allocations for South Africa will decline in the future. A new Staffing for Results exercise, which will complement development of the compact, will need to be conducted to reflect these changes.

These funds support the management and staffing expenses of USAID/South Africa (USAID). The funds cover the costs of ongoing and new staff who provide technical, financial and contractual oversight of over 63 USAID partners implementing the PEPFAR program in South Africa. The total USAID PEPFAR management and staffing budget is \$9,478,000 including ICASS estimated at \$120,000 and the IRM tax which is estimated at \$135,000. In FY 2007, USAID was responsible for the obligation and management of over \$228 million in GHAI funds. In FY 2008 this amount will rise to over \$332 million. In order to provide comprehensive administrative, technical and managerial oversight of the PEPFAR portfolio, USAID will recruit an additional 16 staff to work in the USAID office in Pretoria. Of these, it is anticipated that one will be an overseas hire, and the remainder locally recruited. Many of these positions will be filled by junior staff who will provide basic administrative support as they became more engaged in and knowledgeable about technical issues.

The USAID Health and PEPFAR Office was divided in three divisions to correspond loosely with technical working groups designated during the Staffing for Results exercise. Including the new hires, the Office staff will include approximately 23 professionals, who will manage an average \$14 million each, and seven administrative and project assistants. While this dollar-to-staff ratio is relatively high, the country team has developed innovative mechanisms to strengthen management and oversight. These include the Umbrella Grant Management mechanisms and the new quality assurance program QMAP.

The Umbrella Grants Management agreement was designed at the beginning of PEPFAR to manage new and small partners. In FY 2007, the Umbrella Grants Management component was re-competed and three separate awards made to organizations to provide financial and administrative guidance and support to over 35 small organizations, thereby reducing USAID's management burden. Funding for the umbrella grants element is included in the individual program areas.

In addition to the technical staff, PEPFAR will support staff in support offices including the Contracting Office, Financial Management and Executive Office. Two headquarters-funded regional advisors, a legal

Activity Narrative: advisor and a contracting officer also provide services to PEPFAR. In addition to technical staff who will serve within the Health and PEPFAR Team, USAID/South Africa will recruit additional support staff in the Executive, the Financial Management and the Contracting Offices who will work on PEPFAR programs.

Program Budget Code: 19

Planned Funds: \$388,374

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

The Public Affairs Section completed two baseline surveys in FY 2008 – one of public knowledge and attitudes toward PEPFAR and another on media coverage of PEPFAR. Using this analysis of public perception of PEPFAR, PAS intends to devote more resources to public diplomacy outreach programs that increase awareness of critical PEPFAR messages (prevention and treatment) and overall understanding of PEPFAR's contributions to fighting HIV in South Africa. Targeted media outreach will continue to focus on community radio and print media. PAS and the PEPFAR team will also establish three new health information kiosks in major libraries around the country. The first health kiosk was opened in September 2008 in Mamelodi, the township next to Pretoria. The kiosk is in a dedicated space in the Stanza Bopape Public Library, one of the busiest libraries in the township. It was funded as a pilot and offers over 200 information sources on a range of health topics, especially HIV and TB. Sources include periodicals, books and on-line databases available at five internet accessible computers. Other PAS PEPFAR outreach programs will include messaging give-aways for youth (soccer balls, bracelets, caps), the development of HIV-themed children's books and comic books in native languages, and a reserve of funds will be available for grants to arts and cultural organizations, which run HIV-focused festivals, theater and dance programs, and other innovative, youth-targeted programs.

SUMMARY:

The Public Affairs Section of the U.S. Embassy in South Africa will carry out, with PEPFAR funding, targeted outreach to print and electronic media and the public in support of increased awareness of PEPFAR priorities, projects, and success stories.

BACKGROUND:

Public knowledge of and appreciation for the accomplishments of PEPFAR in South Africa remain lower than desired, due in part to media fatigue for HIV and AIDS issues, as well as limited USG resources, both budgetary and personnel, which have precluded the capacity to orchestrate a continuing nationwide media campaign. Though awareness and exposure have improved in FY 2007, more can be done in FY 2008 to ensure appropriate public appreciation for this unprecedented U.S. investment.

ACTIVITIES AND EXPECTED RESULTS:

A multi-media program of direct placements (paid and otherwise) in print and electronic media is an important means of increasing public awareness of PEPFAR activities in South Africa. As the large majority of South Africans receive their news via radio, this program would focus largely on the development and placement of radio programs around the country. In addition, the program would develop a series of print notices for placement in major newspapers, focusing on key PEPFAR themes and accomplishments, and featuring individuals benefiting from PEPFAR programs, supported by a special website where readers could learn more about PEPFAR and make comments. Finally, this program will support press participation in PEPFAR site visits, training programs, and other activities.

The Public Affairs section will request support to establish a baseline of public knowledge of PEPFAR in early FY 2008 via nationwide survey. (Note: this survey is neither a Public Affairs nor PEPFAR mechanism, but rather a recurring national survey conducted by the State Department's Office of Research. Public Affairs will request permission to incorporate survey content to assess knowledge of PEPFAR programs.) Follow-up focus groups and surveys will measure message penetration.

The Public Affairs Section will conduct programs for journalists and PEPFAR partners to educate them on PEPFAR as a whole and USG health policy and funding priorities in order to promote positive coverage of PEPFAR and expand public recognition and understanding of the program. The Public Affairs Section will also conduct other programs that support public diplomacy activities related to PEPFAR. Projected activities and outcomes include:

- Development and placement of PEPFAR program descriptions, success stories, personal histories, etc. in key national print outlets.
- Continuation of radio features and program profiles in selected provinces (to include KwaZulu-Natal, Gauteng, and Western Cape) to run on key community and commercial broadcasters.
- Targeted promotion of PEPFAR activities, including project launches, Ambassador's media events, and output announcements in regional print and broadcast outlets.

Activity Narrative: ACTIVITY HAS BEEN MODIFIED IN THE FOLLOWING WAYS:

South Africa PEPFAR management is coordinated by a Secretariat that reports directly to the US Ambassador and is located in the DHHS/International Health Office. The Secretariat serves as the central point for planning, communication and coordination on all PEPFAR-related tasks conducted in South Africa by the various USG Agencies, and in doing so, assures that all USG contributions to PEPFAR reflect the consensus of a united and dedicated USG team.

The PEPFAR Secretariat is responsible for the following functions:

- 1) provide the US Ambassador and Mission leadership with information and guidance about PEPFAR;
- 2) coordinate the implementation of PEPFAR with the South African Government;
- 3) communicate with the Office of the Global AIDS Coordinator;
- 4) coordinate preparation of the Country Operational Plan and other required reports;
- 5) prepare reports on issues related to PEPFAR activities in South Africa;
- 6) undertake programmatic and reporting activities to assure coordination and harmonization of USG Agencies' responses to audits and Congressional inquiries;
- 7) organize and keep records of regularly scheduled meetings of the PEPFAR Team and Management Team meetings, and circulate minutes to PEPFAR Team members and the South Africa Core Team at OGAC;
- 8) document Inter-Agency Annual Program Statements (APS) and facilitate review and approval processes;
- 9) serve as a repository and clearinghouse for technical and programmatic information regarding HIV, AIDS, HIV/TB and PEPFAR;
- 10) assist in the preparation of speeches, articles and other communications regarding PEPFAR by USG representatives in South Africa;
- 11) assist the Mission's Public Affairs Section efforts in publicizing and promoting PEPFAR activities in South Africa, and facilitate their public affairs support for implementing partners;
- 12) manage and maintain the South Africa PEPFAR website and photo gallery and SA PEPFAR.NET, allowing easy access to technical resources and information about PEPFAR in South Africa;
- 13) coordinate global health elements of the Mission Performance Plan;
- 14) coordinate the organization of PEPFAR partner and technical meetings;
- 15) coordinate and host VIP visits and audits;
- 16) coordinate collaboration with other major donor Agencies (e.g. European Union, Department for International Development/United Kingdom, UNAIDS and Belgian Technical Cooperation) to ensure programmatic synergies; and
- 17) attend meetings of SA Technical Teams and Ad Hoc Committees and assist in circulation of minutes.

PEPFAR funds support the following staff positions: 1) PEPFAR Deputy Coordinator; 2) Supervisory Program Assistant; 3) Administrative Assistant; 4) COP Manager; 5) Communications Manager; and 6) Health Specialist. Of the 2 positions that are currently vacant, a final selection for the Administrative Assistant is in process and recruitment will begin shortly for the Health Specialist. Additionally, the State Department currently funds a second Health Specialist position. PEPFAR funds also support a series of technical, national and provincial, and partner meetings that may include: meetings with national and provincial governments; a portion of the national South African Aids Conference, the Annual PEPFAR Partners' Meeting; and technical meetings. An organogram detailing the HHS PEPFAR Secretariat staffing is uploaded as a supporting document. In addition to salaries, benefits and travel costs, the management budget includes operating costs (such as utilities, administrative and logistic support, travel costs, office supplies, etc.), and may include other items related to PEPFAR support. The total HHS PEPFAR Secretariat budget for staffing and associated management in FY 2009 is \$989,692

South Africa PEPFAR management is coordinated by a Secretariat that reports directly to the US Ambassador and is located in the International Health Office in the Chancery. The Secretariat serves as the central point for planning, communication and coordination on all PEPFAR-related tasks conducted in South Africa by the various USG Agencies, and in doing so, assures that all USG contributions to PEPFAR reflect the consensus of a united and dedicated USG team.

The Secretariat's roles include: 1) provide the US Ambassador and Mission leadership with information and guidance about PEPFAR; 2) coordinate the implementation of PEPFAR with the South African Government; 3) communicate with the Office of the Global AIDS Coordinator and coordinate preparation of the Country Operational Plan and other required reports; 4) prepare reports on issues related to PEPFAR activities in South Africa; 5) undertake programmatic and reporting activities to assure coordination and harmonization of USG Agencies' responses to audits and Congressional inquiries; 6) organize regularly scheduled meetings of the PEPFAR Task Force, keep records of all Task Force meetings, and circulate minutes to Task Force members and the South Africa Core Team at OGAC; 7) document any Inter-Agency Annual Program Statement (APS) and facilitate review and approval processes; 8) serve as a repository and clearinghouse for technical and programmatic information regarding HIV, AIDS, and PEPFAR; 9) assist in the preparation of speeches, articles and other communications regarding PEPFAR by USG representatives in South Africa; 10) assist the Mission's Public Affairs efforts in publicizing and promoting PEPFAR activities in South Africa, and provide public affairs support for implementing partners; 11) manage and maintain the South Africa PEPFAR website and photo gallery, allowing easy access to technical resources and information about PEPFAR in South Africa; 12) coordinate global health elements of the Mission Performance Plan; 13) assist in the organization of PEPFAR partner and technical meetings; 14) prepare and host VIP visits and audits; 15) collaborate with other major donor Agencies (e.g. European Union, Department for International Development/United Kingdom, UNAIDS and Belgian Technical Cooperation) to ensure programmatic synergies; and 16) attend meetings of SA Technical Working Groups and assist in preparation and circulation of minutes.

PEPFAR funds currently support the following staff positions: 1) PEPFAR Deputy Coordinator; 2) Office

Activity Narrative: Assistant; and 3) one-half OMS position. PEPFAR funds will additionally support the following positions in the coming year: PEPFAR Specialist/COP Manager and Communications Specialist/Web Master. Recruitment for these positions has been completed and they are expected to be filled imminently. In addition, PEPFAR funds will support one-half of the Health Attaché position that is being filled on a temporary basis, but is anticipated to be permanently filled in upcoming months. Additionally, the State Department currently funds a PEPFAR Coordinator position and a Health Assistant position. PEPFAR funds also support a series of technical and partner meetings that may include: meetings with provincial governments; a portion of the national South African Aids Conference; the Annual PEPFAR Partners' Meeting; and technical meetings. An organogram detailing the HHS/OIH South Africa staffing pattern for PEPFAR is uploaded as a supporting document. In addition to salaries, benefits and travel costs, the management budget includes operating costs (such as utilities, administrative and logistic support, travel costs, office supplies, etc.), and may include other items related to PEPFAR support. The total HHS/OIH PEPFAR budget for staffing and associated management in FY 2008 is \$962,418.

Public Private Partnerships Table.xls	application/vnd.ms-excel	10/28/2008	Based on the attached Public Private Partnership Table, it is evident that while a number of the PEPFAR partners are engaging in PPP activities this component of our program is significantly small and underdeveloped. In FY 2009, the USG team will explore options to expand the PPP component of our program by seeking out opportunities that enrich our program. Based on the attached PPP table it is also evident that a number of the PPPs listed in the table are not PPPs in the sense of the OGAC definition as there is not a 1:1 dollar matching. However we felt it was important to include them in the table as they illustrate progress by the team to expand the PPP component of the program	PPP Supplement	MBuchwald
